and not as a piece of machinery. No responsible critic has ever denied the existence of joint planning. The personnel of the Joint Planning Staff was singled out by *The Economist* in an article on March 21st as the nearest approach to the "general" officers required in positions of command, belonging to no single Service, but to all three; and the appointment of Lord Louis Mountbatten to be Chief of Combined Operations, with high rank in all three Services, was hailed last week as a great step forward. The point is that, though there is joint planning, there is not unity of command. In the absence of unity of command, joint planning itself must inevitably be hobbled. The separate Services work together when they come together in specific combined operations; for most of their work, and training, they remain quite separate. The Joint Staff is not in command; the Chiefs of Staff are—men trained exclusively in their own separate services and mainly concerned in their daily duties with their separate administrative problems. The fact that the Chief of Combined Operations attends the Chiefs of Staff Committee to discuss major strategical issues, as well as combined operations, is only a mitigating factor. Command is tripartite. There is no Commander-in-Chief and no true General Staff. Still less is there integration below the highest level. Naval, military and air commands, though they may co-operate and have liaison officers, are separate and independent; they belong to different firms; they manage their own affairs.

To a point, of course, they must manage their own affairs. From top to bottom, modern warfare is a specialised business. For admirals or generals to run air squadrons would be as inappropriate—and as disastrous—as for air marshals to run warships or regiments. The cobbler must stick to his last. This, again, has never been denied—except by Service axe-grinders. For any one Service simply to swallow any other would solve nothing; in this sense, to split up the RAF would indeed be a

"fatally retrograde step"; and the amalgamation of the three services is probably undesirable and certainly impracticable. The problem is rather to secure that they shall work as one; and, to this end, the suggestions which have been made by *The Economist*—humbly and tentatively as befits lay advice—seem still to be unshaken.

Possibly it may aid understanding to rehearse the suggestions. The requirements are unity in command; co-ordination in training and equipment; and co-operation in action. The means proposed to meet these requirements were, first, a Great Captain (to use General Wavell's phrase) and Great General Staff, skilled in the joint problems of all arms but belonging to none; secondly, the "generalisation" of all important commands, so that every Service formation larger than, say, a brigade, is a joint force of all three arms, or at least two, officered by "general" commanders drawn initially from one or another of the three Services, but trained in all common problems; and, thirdly, which would follow from these steps, the interweaving of training and the interchange of personnel.

It may be that, for technical reasons, these reforms could not be applied very easily. No layman can say. But any intelligent observer can say, without danger of contradiction, that the goal at which they aim is the only right one, and that it is still remote. True, political mistakes have been responsible for many military setbacks. But without unity of military command and co-operation between all arms in day-to-day operations and training, no amount of the joint planning machinery described in the White Paper will win victory. Until they are achieved, it is misleading nonsense for the Government to talk of the Services thinking and acting as one—a notion which is sufficiently belied by the way in which, in the current controversy, Service spokesmen are flying at each other's throats, as well as at the throats of third parties.

Pull Devil, Pull Baker

THE seizure of power by Laval is one of the opening moves in the great spring offensive. Its primary significance is military—it has no significance for the real future of France. Neither Laval nor Pétain will survive the war. The struggle between Paris and Vichy will make way for other struggles—or other reconciliations—once the over-ruling power of Germany is removed. But, from the short-term military point of view, the changes in the French Government are obviously of cardinal importance. What has Hitler gained? Is Laval better for the Nazis than ten divisions? What have the United Nations lost? What ought their strategy to be? These for the moment are the questions that have real and direct bearing on the situation.

The military background of the changes is Bruneval and St Nazaire and the promise of Allied raids as efficient and wideflung to follow—a promise immediately fulfilled near Boulogne. The Channel is now the Germans' West Wall and it is by no means as invader-proof as the Siegfried Line. If there is to be a second front, a Peninsula, in this third year of war, it is perhaps in France that the United Nations could most effectively establish it. There is little doubt that a heavy Allied offensive here would evoke immediate response among the French people. After the raid on St Nazaire, it was reported that over 500 Frenchmen had been shot for coming out into the streets with clubs and staves to do what they could to help the British commandos. All over France, arrests and shootings are taking a rising toll.

The Nazis cannot rely on the temper of the French people; and in recent months they have felt less and less able to count on the "loyalty" of the men at Vichy. It is important to realise that the return of Laval represents, not only a new phase of collaboration, but

also an endeavour to redress a balance in France which had been going down more and more heavily on the Allied side. The fuddled politics of Vichy make a little more sense if the atmosphere of the surrender of 1940 is kept in mind. It was essentially a gesture of *sauf qui peut*, based on the belief that the war was over, that Britain would sell out to Germany on the most favourable terms its island isolation could secure and that France must therefore act first to salvage what it could from the German victory. In two years, the position has been practically reversed. Vichy's problem has rather become to salvage something from an Allied victory. Most of the evidence from unoccupied France in recent months suggests that, even in the entourage of Pétain, the anti-collaborationists have been gaining ground and courage—the more so because the aged Marshal was himself no willing collaborationist.

The Germans could thus no longer rely on Vichy not to throw in its lot with the invader—should the invader arrive in sufficient strength. The more the British raided, the more the Germans would need "reliable" men in power in France, and the less reliable Vichy would become. In self defence, the Germans had to find new men who were collaborationists by choice, not by necessity, or who, whatever their real beliefs, had thoroughly identified themselves with the Nazi cause. Paris is full of such men—men who still disbelieve in an Allied victory and who agree with Paul Rives, writing in *L'Effort*, that

French neutrality amounts to a crime against Europe and above all to collective suicide. It could only have a semblance of justification on the hypothesis of a British or American victory in the very near future.

men like Doriot and Déat, who share the ideological frenzy of the Nazis; men like Citroen or Lucien-

Romier, who are economically and industrially committed to the "new order." There was no lack of traitors and Fascists and *gros industrialistes* from whom to choose. The puzzle is why the Nazis picked on the generally unpopular and discredited Laval.

Laval must not be underestimated. The Nazis are not looking for a great popular leader; such a man would certainly be on the other side. They are looking for a man with bravado, which Laval undoubtedly has; with intelligence and powers of negotiation, both lacking in the Doriot-Déat type of fanatic; with ambition and tenacity; with wide political and industrial connections; with deep-rooted cynicism; and above all, with complete ruthlessness and indifference to anything save his own career. With such a man, the Nazis know more or less where they stand. Moreover, Laval is, from the German point of view, safe; he has lost for all time any chance of coming to terms with Britain or the United States.

Yet if Laval was an obvious choice, there were heavy obstacles in the way—the greatest, the extreme antipathy and distrust he inspires in Pétain. The Germans could not get rid of the old man. The Marshal alone preserves the fiction of unoccupied France, and this is the last moment at which the Germans can afford to extend their policing duties over more French territory. The "loyalty" of the armed forces, crucial in the event of a British invasion, depends entirely upon the Marshal. Laval has no standing in the army. On the contrary, he is still identified with the parliamentary regime which a large number of officers came to regard as almost a worse enemy than Germany. Again, Laval has absolutely no status in the colonies. There was a note of menace in M. Buisson's farewell message on his return to Dakar on April 10th. "We count on Pétain only," he said, "and I can answer for the complete loyalty of Black Africa." These are the Marshal's bargaining points, which enable him to insist upon the strict terms of the Armistice—no occupation of the rest of France; no military collaboration; and no surrender of colonial bases.

Yet, in spite of these elements of strength in his position, Pétain has taken back the man most identified with the things he hates—the old parliamentary racket, freemasonry, political cynicism, and moral indifference, all crowned by proved personal disloyalty in the autumn of 1940. There is, however, no real paradox. Pétain has no ground to stand on when anything beyond the Armistice terms is in question. He cannot resist close economic collaboration because there is no determined body of industrialists to back him up. He cannot refuse to work for the German war machine, for without German raw materials French industry would cease, and French workers starve. A severe bread shortage threatens for June, and there is evidence that the Germans have brought very strong economic pressure to bear on the old man in recent weeks. They have suddenly closed a large number of French factories, and are

increasing their drive to get French workers to go to Germany. Again, Pétain cannot make a stand about the composition of his Government because nobody in France cares a pin who governs at Vichy apart from the Marshal himself—and there is no body of men, civil servants, prefects or executive officers generally, who in any way correspond in group solidarity to the officers or the colonial servants, and who would thus collectively and effectively resist changes in the political direction of the country. Pétain can resist only where German military needs and the loyalties left in France give him a little ground on which to stand. Elsewhere he must give way.

This confused position explains the curious dyarchy, or double system of government, that has now been established. Laval is in charge of home and foreign affairs, though personally responsible to Pétain; round him are grouped a very mixed bag of "vils ou nuls," traitors or men of straw. Over against this stands a completely separate hierarchy of army, navy and air force under the supreme command of Admiral Darlan, again personally responsible to Pétain; and Darlan remains the successor-designate to the Head of the State. This new political partition mirrors exactly the uneasy balance of forces which brought it into being.

It seems likely that the Germans have achieved as much as they can for the time in reinsuring against the success of a second front. They have secured a far more ruthless and anti-Allied political set-up. The pursuit of De Gaulle and other "traitors" will now be more savage and effective. A man has been insinuated into the Marshal's most intimate circle who is ready for any degree of collaboration, political, economic or military. But the Germans have not secured the armed forces of France; they have not achieved any modification of the colonial situation; and it is on these points that the greatest pressure will now be exercised. A frontal attempt is unlikely. The Marshal has given sufficient evidence of his determination to abide by the Armistice. But would the use of French warships to convoy supplies nominally intended for France constitute a breach of the Armistice? The transfer of supplies from Tunis to Tripoli? A joint expedition to "free" Syria or Equatorial Africa? The "joint defence" of Dakar? Or Madagascar? Or France's Mediterranean seaboard? The real struggle for military control will now begin. The Marshal has only gained a breathing space.

The policy of the United Nations in all this is clear. The situation has passed beyond diplomacy. It makes little difference whether or not Washington is represented at Vichy, or American observers remain in North Africa. What does matter is the opening of the second front the Germans fear. Laval, Pétain, Vichy are all the unsubstantial creatures of French despair. Give the French people a hope of victory, and the whole structure will collapse. That is the task of the United Nations.

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

New England

A WELL-KNOWN ship-owner has just protested against the existence of "people sufficiently devoid of any responsibility in carrying on the war effort to have the leisure to plan a new earth." The obvious *tu quoque*, that the shipping industry itself is far from able to leave post-war prospects out of its wartime calculations, has been made. The real answer is that a programme for improved and effective social, economic and political policies is a necessary means of victory, denoting the goals of wartime effort and inspiring wartime sacrifice. It is absolutely true that the first task is to win the war. Time and men are scarce; both must be rationed; and the highest priority must go to defeating the enemy. But thought and ideas are not limited; the task is to mobilise these without impeding the war itself—or, rather, with the plain purpose of speeding the war to a successful end.

Reconstruction has already been given a place in the councils of war. Sir William Jowitt is Minister in charge. Sir John Anderson, in the War Cabinet, has the duty of co-ordinating reconstruction projects in the frame of home policy. Lord Portal at the Ministry of Works and Buildings has instructions to consider physical rebuilding. Sir Stafford Cripps, Leader of the House of Commons, takes a special personal interest in the shape of post-war England. Rebuilding, both in terms of bricks and mortar and in terms of planning, has a higher status in the making of domestic policy than it has yet achieved in the determination of international relationships by the Allied Governments, and experts, of the United Nations. The first need there is to devise modes of research and consultation; to sketch the outlines of an agreed world polity and economy after the war. At present, world reconstruction, even the reconstruction of Europe, is being disparately considered. There are *ad hoc* arrangements for the storing of surpluses to feed and clothe the freed nations of Europe when the enemy has been driven back; in the Lend-Lease system, there is embodied the imperative necessity of deciding by agreement the character of post-war economic relationships between nations; in the Atlantic Charter, the objectives of these relationships are stated. The same integration is needed in the foreign field as has been begun in the domestic sphere.

At home, committees and individuals are already at work in search of solutions for the most pressing problems. The Uthwatt Committee is considering the future of land use. The Scott Committee is examining the problems of rural life. The Beveridge Committee is seeking the means of social security for every citizen. In various departments, there are men especially appointed to consider post-war policy; Mr. Crick, at the Ministry of Food, for instance, has the future of food policy under his special care. There are interdepartmental committees on specific questions; and at the head there is the Lord President's Cabinet Committee.

The important need is to make certain that this effort is neither wasted nor misdirected. For this, four conditions are necessary; first, that reconstruction should be regarded in high places, from the Prime Minister downwards, as an inescapable charge upon, and part of, the war effort; secondly, that the men and committees at work on reconstruction projects should produce specific programmes and decisions, and not mere surveys of the problems to be solved; thirdly, that thought about reconstruction should be drawn from the widest possible pool, including men engaged in the public service; and, fourthly, that reconstruction should be given a foothold and a standing in the Treasury itself.

Most of the central themes of reconstruction were explored twenty-five years ago, when the closing stages of the last war brought the need for social and economic betterment to the forefront of public policy. In the inter-war period, they were examined by countless official bodies and private investigators. The tendency for reconstructors to start at the beginning again now, instead of taking up where these forerunners left off, is wasteful and frustrating. It is absurd that bodies engaged, for instance, on land problems should be re-collecting evidence which has been familiar to planning enthusiasts for a generation—and which was embodied, probably in a definitive form, in the evidence presented to the Barlow Commission just before the war. It is for these bodies, and indeed for every individual concerned in reconstruction, to devise specific programmes and practical remedies, on the basis of the extensive known data, as soon as possible. And it is not for them, but for the Cabinet, by broad decisions on the wider aspects of social and economic policy—such as the future of farming, land-ownership of education—to provide the frame for their specific projects.

Obviously, the more minds are tapped, the better rounded will the programmes be. Equally obviously, the best and most informed minds are at present taken up almost entirely by the immediate exigencies of war. Nevertheless, it is the responsibility of all reconstruction agencies to pick up the ideas on reconstruction that inevitably come as by-products of the preoccupation of these minds with war problems. No civil servant should be barred from expressing views about reconstruction in public or in private, formally or informally. The need is for a dish, so to speak, to catch the drops as they fall. Reconstruction should be a live issue in every Government department, represented there by some high officer and kept in mind by every intelligent administrator—not to hinder his war effort but to fortify and broaden it. After the war, reconstruction will either be the policy of every Ministry or be nothing.

Finally, there should be, at the heart of administration itself, probably in the Treasury, say, a Reconstructor General, to be kept cognisant of all the plans. Reconstruction, in the domestic sphere, will fail or succeed according to the skill and willingness with which financial means are used to achieve social and economic ends. In the war, the orthodoxy of British public finance has proved sufficiently sound and, at the same time, sufficiently adaptable, to mobilise the nation's physical resources for a total effort; the same process will be needed to mobilise the nation's resources for total reconstruction. If the Treasury remains an outside spectator—which, of course, it can never be entirely while Mr. Keynes is there—it will no more be an ally of reconstruction when this war ends than it was when the last war ended. Its great and disinterested efficiency will be neutral—and, therefore, in effect, hostile; reconstruction will fail. On the other hand, if the Treasury is made a leading partner in the correlation of programmes into a harmonious and workable plan, that same efficiency and disinterestedness will go a very long way towards ensuring success. There could be no better means of securing the needed high status for reconstruction than to place the Treasury at the administrative centre.

It is time that Parliament and people heard from the Government, possibly from the lips of Mr Churchill himself, of the status and progress of reconstruction. Perhaps the return of Sir Stafford Cripps will bring this statement. At all events, what is needed can be simply stated and generally agreed. The war must be won and the peace must be won; the two are inseparable.

The Unknown Continent

HOW many people know that Latin America covers a larger area than the Soviet Union? That Natal on the bulge of Brazil is 2,000 miles nearer to Dakar than to New York? That Brazil is larger than the United States and has the biggest iron reserves in the world? That Venezuela is the largest exporter of oil? That Bolivia supports life and civilisation at an altitude of 12,500 feet? That Costa Rica and Uruguay are model democracies? For most people, Latin America makes a rather tedious composite picture of tangos, gigolos, Indians in blankets, coffee surpluses and films of the type of "Down Argentine Way." More than Africa, and far more than Asia, Latin America is the unknown Continent.

It is the outstanding quality of Mr Gunther's study* that he makes all the 20 Republics fascinatingly interesting and furiously alive. A book which is primarily the record of a roving journalist's flying visits to each Latin American state cannot—and does not pretend to—go much below the surface. But the surface manifestations—a public figure here, a newspaper there, an economic problem, a scandal, a breath of treason—are chosen with such skill, and picked out so clearly, that it is possible to gather from Mr Gunther's book an impression of Latin American politics in which secular trends of thought and policy and fundamental social changes take their place.

Although the book was written well before the war with Japan—and even before the Russo-German war—

Caribbean Republics are nearest to the United States, Argentina and Chile farthest away. It represents a fundamental struggle between the Axis and the Democracies, between two different principles of social and political organisation, between two different ways of life. The contradiction is apparent in every community. If the regime is dictatorial, some open or submerged opposition is struggling for popular government and the rights of the people. If it is democratic, strong groups among the military or the landowners or the people at large have been caught by Fascist slogans and uphold "order and discipline." The war which is being fought out on the wide battlefields of the world is being fought all over again in the domestic politics of Latin America.

To say that the future of the Continent will be decided by the victory of the Axis or of the United Nations is obviously a truism. If the Axis wins, then the 20 Republics will revert to or maintain dictatorships, more nationalist, more racial, more paternalistic, more repressive than the dictatorships of to-day. If the Germans were to create a super-national framework for the Continent on "new order" lines, there might be continental peace at the price of teutonic colonial exploitation; if the Germans failed in this, the future would be one of futile war and even greater economic misery. But in the event of an Allied victory, what then? The answer can be given with far less certainty, for the future of democracy in Latin America has not so far taken on any clear shape.

The system based on semi-capitalist, liberal economics, party parliamentary government and a class society, which is still the dominant form of democracy in Britain and the United States, is everywhere under fire in Latin America. To give only a few examples, the uneasy alliance of the Popular Front in Chile is held together by the common opposition of its constituent groups to the old landowning oligarchy and by little else. The result? A government unable to agree on major lines of reform and, in spite of its popular sympathies, unable to compel the new President, Juan Antonio Rios, on the extreme right of the Front, to break off relations with the Axis. Or again in Argentina, the Conservative party, representing the dominant social class of great landowners, keeps the numerically superior Radical party from power by gross electoral malpractices, and is compelled, through the acting President, Dr Castillo, to govern by decree; meanwhile, Nazism is gaining ground among the soldiers. Or again, the dictatorial regime in Peru—since 1933 run by General Benavides, since 1939 by his nominee, Dr Prado—holds power only because it has twice manipulated the elections to keep the left wing revolutionary Aprista movement from sweeping the polls. Even in Uruguay, where democratic forms are most respected, there is a bitter struggle between the Blancos, the "out" party, and the Colorados, the Government party, on the question of constitutional reform.

These differences in political life represent deep social cleavages in Latin American society. In most states, the white race is dominant, but practically speaking, only in Chile and Argentina are the whites in the majority. Behind the parliamentary struggle between "ins" and "outs" is often a deeper struggle of the Indians and the poor *mestizos* (men of mixed blood) for some partnership in the community against the predominantly white and completely dominant landowning and business class. Inevitably, the whole economic future of Latin America is closely bound up with the social problem of dispossession and monopoly. Generalisations are of course misleading. But the conventional Latin American unit of economic power tends to be the big private estate producing primary raw materials for export. The owners of these estates are generally Latin Americans, and the benefits accrue to the narrow class of landowners. Occasionally, the owner is a foreign company, for example, the United States United Fruit

the shadow of war lies across every page; and, now that war has come to America, the reactions of these states to the war throw into strong relief the basic problem of Latin America's future development. The Caribbean States—Costa Rica, Nicaragua, Honduras, Salvador, Guatemala, Panama, Cuba, Haiti and the Dominican Republic—have, by declaring war, thrown in their lot completely with the United States, and with the cause of the democracies. Nine other states—Bolivia, Brazil, Colombia, Ecuador, Mexico, Paraguay, Peru, Uruguay and Venezuela have broken off relations with the Axis. Two of the most powerful Latin American republics, Argentina and Chile, have maintained their connection. This difference is not only a question of geography—the

* "Inside Latin America." John Gunther. Hamish Hamilton. 12s. 6d.

Company in the "banana republics," Costa Rica, Nicaragua, Honduras, Guatemala, El Salvador; United States sugar companies in Haiti and San Domingo; the British and American oil companies in Venezuela. (Venezuelan oil is discussed more fully on page 572.) The industrial wealth of the continent has tended to follow the same pattern, exploitation by local owners or foreign companies, without regard for the welfare of the community. Thus, Bolivian tin has made Simon Patiño one of the richest men in the world; but Bolivian peasants and miners live far below the poverty line. The case of Mexican oil is another example. Peru is the most fantastic of all examples of "colonial" exploitation, for there the Americans have the oil, copper, gold and vanadium, the British own the railways and most of the cotton, the Italians the banking, the Germans most of the sugar, the Japanese much of the rest.

Nearly every Latin American Republic—even the most illiberal—is reacting strongly against these various forms of exploitation. Mexico is in the van. There the expropriation of foreign interests has gone hand in hand with a drive to break up the great estates and distribute the land to the Indian and *mestizo* peasants. Other states are tending in the same direction. Brazil is keeping a strict eye on its mineral wealth. Even conservative Argentina is buying out its foreign concessionaires. Uruguay is the most interesting case of all, for here an attempt has been made to combine a free economy with a large measure of public control. Its *Entes Autonomos* are public corporations controlling many of the most important economic interests of the nation—for example, banking, insurance, light, power, hydro-electricity, cement, alcohol, fuel, ports, state fisheries, hotels and most of the big estates.

The struggle between responsible and irresponsible government, between social equality and privilege, between the economics of welfare and colonial exploitation, which is raging under different forms in every Latin

American republic, will not be solved simply by a victory of the United Nations. In many ways, Britain and the United States stand, historically, for the order of "imperialism" and irresponsibility which is in the melting pot. So many of the foreign interests are theirs. So little in their contemporary politics or social attitudes offers a key to the future. True, there are hints and signs of the possibility of a new relationship between Britain and the United States and Latin America—for example Lend-Lease, hemisphere defence, continental solidarity and the Good Neighbour policy. The fact that the newly-formed Anglo-Brazilian Chamber of Commerce is to take the whole of Anglo-Brazilian economic relationships, and not simply trade, as its province, is a small step, but may be a good omen. All the tasks of development and reconstruction that need to be done require capital resources far beyond the present resources of the republics. Can Lend-Lease and the Good Neighbour policy be stretched to a new conception of inter-continental aid? Are the good and constructive relations to-day to be no more lasting than the war crisis? Or are there seeds in them of a genuine "new order"?

If so, let no one fear that they will fall on barren ground. Those who have read Mr Gunther's study cannot but be impressed by the richness of the South American scene—so much wealth ungarnered for lack of resources; so many brilliant men spending themselves unreservedly for their native lands—even for native lands as small as Costa Rica or Cuba; so vast a population, Indian and *mestizo*, whom education, health, even the rudiments of existence have barely reached. The Latin American States are still too weakened by internal uncertainty, material poverty, geographical isolation, and the political isolation that inevitably follows, to take a lead in working out new forms of a free society in the world after the war. But, if a lead is once given, nowhere will the following be so eager or the results so great.

NOTES OF THE WEEK

United Nations

A quarter of the year has gone since Mr Churchill brought back details of the plans made in Washington over Christmas to dovetail Allied strategy and production. On the economic side, the joint arrangements have gone ahead, though they probably staggered and slowed down during the recent change in the personnel of the British Government. Lord Beaverbrook is now in Washington and, a few days ago, Mr Harry Hopkins was in London. On the military side, progress has been uneven, partly because of the swift, sweeping successes of the Japanese, partly (it would seem) because of differences of view among the Allies. The Combined Chiefs of Staffs Committee in Washington is the central body, though the independence of the British Chiefs of Staff Committee is intact. General Marshall's recent visit to London for consultations, and his plain words about offensive action by Anglo-American forces, suggest that operations in the West are being jointly ordered. In the East, there has been more joint action, in desperate defence of Australia and Burma, but more dispute also about methods of collaboration. The fall of Singapore and Java broke up General Wavell's Supreme Command in the South-West Pacific before it began to operate in earnest, and he retired to India. The course of events, as the Japanese broke through the barrier of the Indies, proved to the hilt the unwisdom of co-ordinating strategy and supplies at a Pacific Council in London with the United States unrepresented. But, although it is a month since the American General MacArthur arrived in Australia from Bataan to command "all Allied forces east of Singapore," it is only now that he has been made Supreme Commander (again in the South-West Pacific) after much coming and going; as a preliminary the Australian forces and commanders were reorganised, and the Prime Minister, Mr Curtin, became Minister of Defence. The real Pacific Council is now at work in Washington, with the United States, very properly, at the centre. It was during this strange period of discussion and improvisation

that the first brake was put on the Japanese advance by Australian and American bombing. It is to be hoped that, now, with the commands and combined councils arranged, both East and West, the United Nations will be able to face the tests of the next decisive months with their full force and ingenuity—though it must be admitted that, in the formal arrangements made, Russia and China still rank as associates rather than allies.

Hitting Back from the Air

On land and on sea, the United Nations are still held to the defensive. In Burma, the fighting is going badly; in spite of the recapture of Yenangyuang by Chinese and British forces, it has been necessary to scorch the oilfields, and the counter-attack itself can be little more than a delaying action to screen further withdrawals. But in the air the initiative has, for the time, passed to the Allies. On the Western front, the hammering of Northern France has been maintained, and on April 18th one of the most thrilling raids of the war was carried out by twelve of the new Lancaster bombers. The objective, the Maschinenfabrik Augsburg-Nürnberg, makes half the Diesel engines for Germany's submarine fleet, and so precise was the target that not the factory but certain vital shops in the factory were sought out and bombed. An astonishing feature of the whole raid was the bombers' journey across France and Germany at a height of 20 to 30 feet, roof-top height, literally up hill and down dale. And in spite of the distance and the risk, five of the twelve bombers returned. The German wireless has since paid the RAF the tribute of calling it "the most powerful menace to Hitler's Germany." A day later, the Japanese had their first direct taste of the horrors they have so heedlessly visited on others. American bombers, flying from unknown bases—presumably aircraft carriers—attacked Tokyo, Yokohama, Kobe and Nagoya for several hours. The damage done appears to have been con-

siderable, sufficient at least to warrant a purge in Tokyo's civil defence services. Until more is known of the itinerary of these bombers, it is difficult to say how often and how effectively these raids can be repeated, but General Royce's 2,000-mile round tour to bomb the Philippines suggests that it might be possible to maintain a bombing line of Boeings "serving" Tokyo. The Far Eastern air offensive has not been confined to Japan and the Philippines. Rabaul has been continuously raided, and heavy attacks have been launched against the occupied Andaman Islands and against Rangoon, where the Japanese have disembarked at least another division. The weakness of the Allied position is the immense variety and distance of the fronts that have to be maintained; and since it is essential to get the maximum number of planes to the right point at the right moment, it is good news that the British and Americans are to discuss the pooling of air-power in Ottawa early in May.

Struggle for Railways

The very widespread thaw in Russia is holding up operations on most of the front. Nevertheless, the struggle that is being waged in the mud may well be decisive for the first stage of the summer offensive. It is concerned with the railways. For the next six weeks, on large sections of the front, the railways will be the only reliable means of transport. If front lines are to be reinforced, reserves brought up, tanks massed for the first day of firm earth and fine weather, then it is virtually only up the railways that the material can come. Already the disastrous effects of not being in control of the railways have been felt by the Russian advance guard that drove through the German lines to the frontiers of Estonia towards Pskov. Their way out was smooth, over ice-roads rewatered each night.

Now these have melted away into unbelievable morass. The Germans, for their part, had carefully established themselves at strategic points on the network of railways and have, on the whole, maintained their grip. They hold Velikiye Lugi; the Nevel, Vitebsk, Smolensk sector; direct railway communication between Smolensk, Vyasma and Rzhev; and the whole stretch of line from Smolensk through Orel and Kursk to Kharkov. It is only below Kharkov that the Russians have managed to disrupt communications by straddling the Donetz network. Even so, they have not reached Zaporozhe, the key junction for Mariupol and the Crimea.

Moves in the North

Only in the north is there much opportunity for decisive fighting, but here the stakes are high. Through Murmansk and Soroka runs the British supply route to the Moscow front. From Soroka to Leningrad runs

the railway which, if it were freed, would bring war supplies straight to the beleaguered city. All through the winter a deadlock has persisted, not for want of fighting, but from both sides' inability to reach a decision. The Russians have not dislodged the Finns from the Leningrad-Soroka line. Further north, the Germans and the Finns under General Dietl have failed to cut the Murmansk-Soroka section, even though their artillery has on several occasions come within shelling distance of the line. Since the beginning of March, the possibility of a new German-Finnish offensive in this area has seemed imminent. General Dietl's men have been reinforced and reorganised, and the Finns have been given a larger share in the direction of the campaign. However, the Russians have succeeded in holding off the attack, thanks partly to such successful local offensives as the landing from the sea behind the German lines outside Murmansk towards the end of March, and now again by a determined thrust across the River Svir; thanks, too, to the arrival of heavy British fighter reinforcements. The big German attack is still to come. Its aim will be the complete isolation of Murmansk in the north and a junction between the Finnish and German troops on the Svir in the south. The first move would sever the shortest Allied supply line, the second seal the fate of Leningrad.

Wage-earners' Income Tax

The White Paper on "The Taxation of Weekly Wage Earners" issued at the time of the Budget speech and necessarily deferred until this week for comment, proves to be a very disappointing document indeed. This is not to say that it fails to make its case, but that the case is a very limited one. Granted that the main framework of the income tax is to remain as it is; that the personal allowances are to be made as a deduction from the tax payable; and that different rates of tax are to be payable on the first slice of taxable income and on the rest—granted all this, the White Paper makes a formidable case for the belief that the present method of assessment and collection, with all its admitted defects, is better than any substitute that has yet been suggested. The basic difficulty is that the tax payable cannot be ascertained until the income for the whole year is known, and that any system of collecting tax from current incomes must, therefore, provide for adjustment at the end of the year. The suggestion that, instead of the tax being assessed, the allowances should be assessed and notified to the employer, who would then have the responsibility of deducting tax at the proper rate from what remained of the employee's income, week by week, is subjected to criticisms which, in sum, are convincing. An allowances assessment would be even harder to understand than a tax assessment; the employer would be converted from a collector to an assessor, and he would have to be informed of his employee's family circumstances; the clerical work would be greatly increased both for the employer and for the Inland Revenue; verification of the figures would be

much more difficult. This is true. If the only possible alteration of the present system were the one that the White Paper examines at such length, it would be the end of the matter. But what makes the White Paper such a disappointing document is that it never, in so much as a single line, considers another line of reform which has had at least equally widespread support—namely, that allowances should not be deductions from tax but should be paid in cash, as a separate operation. If that were done, the tax could be deducted at a flat rate, or at a very simple series of progressive rates, with no difference at all from person to person. This solution is not mentioned, and if the White Paper is read, paragraph by paragraph, with such a scheme in mind, it reveals no obstacle that could not be quite easily surmounted. There may, perhaps, be reasons more apparent to the experts of the Inland Revenue than to the layman why such a scheme would be impracticable. But if there are such reasons, no breath of them is to be found in the White Paper. No cause has yet been shown why the pressure, voiced in the Commons Budget debates, for a simplification of workers' income tax, should be relaxed.

Points for Fuel?

Dr Dalton's announcement of a scheme to ration fuel aroused unexpected protests in the Commons. The objectors were unfair to the scheme which, by and large, is likely to be both just and effective. Actually, they would have bombarded any scheme. Their view is that if the production and distribution of coal had not been bungled, no rationing would have been needed. It is a wrong view. Reduced consumption is wanted as well as more output if war needs are to be fully served. It is impossible not to sympathise with the feeling that the Government and the coal industry should have done very much more by way of self-help before the consumer was called for sacrifice. But the fact is that they did not; and fuel rationing is the more needed now. The administrative difficulties of rationing fuel are probably not equalled in the case of any other group of commodities (which, incidentally, was another objection), and the scheme foreshadowed by the President of the Board of Trade smacks of the ingenuity which the country has now learnt to expect from Sir William Beveridge. Its outstanding merit is the decision to base rationing on present needs and not on past consumption, which would be wholly irrelevant as well as grossly unfair to the thrifty and patriotic. Each consumer's ration will be the product of two factors: the size of the house, and the number of persons who live in it. This is an intelligent and equitable proposal and, when the objectors cool down, should remove much earlier antagonism to fuel rationing. The thorny problem of stocks remains. It is broadly true that the poor lack the means and the space to acquire the reserves that the well-to-do have used their greater purchasing power and accommodation to build up. But, in practice, that there is a case for neglecting stocks must be admitted, both because the job of assessing individual holdings would be monumental and because stocks run out and are not replaceable. Moreover, some stocks do represent the results of thrift. The anxiety of the Commons was partly due to fear of being rushed into an unworkable scheme, and the Beveridge Report, or at least the form of it finally adopted by the Government, should be published at the earliest opportunity—which should still their doubts and turn their indignation to the proper target, the production and distribution of coal.

Politicians and the War

A section of the Labour Party is not happy about the political truce. Their leaders insist on its observance. The dissidents are not pleased to see their cause go by default at a time when, whatever their former party allegiance, many electors are anxious to find new spokesmen. Actually, these Labour men are probably mistaken if they think that, with the truce abandoned, the Labour Party would profit, just as they are mistaken if they believe that the Conservative Party is gaining any lasting advantage from the present position. The truth is that the parties, Labour and Conservative, have lost their footholds in public opinion, and only established partisans and the respective vested interests of labour and capital remain loyal. It is symptomatic of the soundness of ordinary common sense that so many people realise that the present parties have missed the tide of events. Neither in their leadership nor in their programmes are they representative of the real issues of the times.

While the war lasts and the parties are in coalition to conduct it, the party truce must remain. There must be no organised battles at the polls to weaken national unity or encourage the enemy. On the immediate issue of the war there is no division, and to jockey for party advantage would be artificial, damaging and intolerable. But by-elections will still be contested by the harbingers of the new parties of the new era, sometimes bizarre, sometimes significant; and an increasing number of electors will vote for them. The nation is solid, but the parties are outmoded and splitting.

India Waits

Sir Stafford Cripps is home again to take up his important work here, after his efforts in India. He refuses to take a gloomy view about India. Though he failed, he believes he came in sight of success, and he is sure the Indian leaders will oppose the Japanese wholeheartedly. Three other statements, all from India, probably sum up the position. Mr Gandhi has called the rejected British offer "idiotic," but he has also said plainly that the Indians must settle their own communal differences, or get nowhere. The Bishop of Calcutta has spoken frankly about the social divide that keeps British and Indians apart—and fosters the mistrust that Sir Stafford Cripps could not dispel. Pandit Nehru has said, like Sir Stafford, that the immediate problem is defence, and he sees it as self-defence, with an Indian Home Guard beside the formal defenders, now reinforced by troops, aircraft and artillery, from the United States as well as from Britain.

Management and Methods

A main duty of the Minister of Production is to raise standards of technique and management throughout war industry, and the news that he has appointed a panel of industrial and labour experts to advise him and to examine hold-ups is good. Mr Barlow, of the Metal Box Company, will head the panel; he will work closely with Mr Ivan Spens, lately Accountant General in the Ministry of Supply and now chief of Mr Lyttelton's Industrial Division. Without a smooth flow of goods from the machines, a smooth flow of plans and orders will be useless; and Mr Lyttelton must take responsibility for both ends of the problem. The shape and composition of the new organisation are still sketchy. It is not perhaps the happiest of coincidences, in view of other practices in other places, that Mr Spens should have come, originally, from the Minister's own sector of industrial enterprise. There is anxiety among some people lest the watch over production should be made too central, and the belated report of the Citrine Committee on the use of regional bodies is eagerly looked for. In general, Mr Lyttelton appears to have started on sound lines, though more slowly and more tentatively, perhaps, than expected. Little definite is yet known about the Minister's intentions. But it is already plain that his success will depend on the power he has—power to act and interfere, not simply to report or advise. In the field of technical efficiency, now specially catered for, he needs the authority to make, remove and transfer managers in the national interest. In his relations with the established supply departments, he needs the full backing of the Prime Minister and the Cabinet for his decisions.

The Disestablishment of ARP

It is nearly a year since this country underwent large-scale air-raiding, and, as the table on page 566 shows, the number of civilian casualties has steadily declined. The cost to the country of locking up valuable manpower in the civil defence services is, therefore, becoming increasingly obvious. It would certainly be a mistake to assume that the time will never return when civil defence will be undermanned rather than overmanned; but at the moment the need is not only for the full mobilisation of the nation's manpower, but also for its full utilisation after it has been mobilised. Thus, the scheme for allowing civil defence workers to do other war work, full details of which were given by Mr Morrison at the end of last week, is welcome. Mr Morrison has agreed to the release of about one-third of the total number of whole-time civil defence workers and about one-sixth of the members of the National Fire Service for employment in war industries. This will mean an addition to the country's labour force of some 80,000 pairs of hands, and the first to go—after the volun-

teers—will be those fitted for professional and skilled work. The advantage to Mr Bevin is obvious, but how seriously will it affect Mr Morrison? There is, first of all, the general proviso that those released will be under an obligation to return to whole-time civil defence in the event of serious air-raids in their districts. Secondly, they will be required to do part-time civil defence work if they are transferred to factories in their own districts and possibly if they are transferred elsewhere. Thirdly, the whole-time paid staffs remaining in the casualty and rescue party services will be reorganised and trained as composite units to work over a larger area—at last, the rigid segregation of civil defence workers in their respective boroughs is breaking down. Lastly, Mr Morrison said that more persons will have to undertake part-time civil defence, which, if it means anything, foreshadows the extension of the compulsion on men to do fire-watching duties to other branches of civil defence—and, it is to be hoped, to all persons between 16 and 60. Now that women are being conscribed into the Forces and directed into industry, it seems foolish to exempt those who escape the net from the obligation, except in special circumstances, to do part-time civil defence work. A further extension of the principle of using the manpower of civil defence workers is the temporary release of some of those who are not transferred to war work. Some will be given temporary employment in war industries for periods of not less than a week, for which they will be paid at the ordinary industrial rates. Others will be used for rush jobs for the Government, local authorities or for private employers; but in such cases they will still rank as civil defence workers and will serve under their own officers for civil defence pay. The sort of jobs that the Ministry of Home Security has in mind are clearing snow or delivering coal, the kind of work for which the pay does not exceed the basic pay of civil defence. The question arises whether civil defence workers, injured while doing these jobs, will be granted compensation at the rates for war service injuries. Presumably they will, because the definition of civil defence is to be widened to include any essential work necessary for the prosecution of the war or essential to the life of the community. Together with the decision to widen the duties of the Home Guard by using it to man anti-aircraft sites, at first in London, but gradually, it is hoped, all over the country, and thereby releasing AA gunners for field formations, the new policy is another illustration that the country's period of sitting passively on the defence has passed. And in this present stage of the war, when mobilisation has gone so far, manpower is far too scarce for any activity, including all the Services, to escape combing-out and rationalisation.

The Daily Mirror's Shareholders

One of the charges unofficially levied at the *Daily Mirror* during its recent appearance in the limelight was that the ownership of the paper was controlled by Mr Randolph Hearst. This was effectively denied, and it was claimed on behalf of the *Daily Mirror* that there was no controlling group of shares held by any one person, but that it was managed by a board of directors and chairman, acting for a large number of small shareholders. In answer to a Parliamentary request, Mr Morrison has circulated the names of the large shareholders in *Hansard*. The ordinary share capital of the company consists of 5,600,000 shares of 5s. each, and it is quite true that the large shareholders, that is, those with 15,000 or more ordinary shares, only account for 1,245,350. Mr Frederick G. Burt and Sir John Ellerman head the list, with 153,725 shares between them, and there are a number of other individual shareholders with holdings ranging from 30,000 shares to 92,672. One then comes to the nominee holding, and it is worth noting that Drummond's Branch Nominees Ltd. hold 250,000 and C.O. Nominees Ltd. 222,740, their aggregate holdings equalling in number the total held by the large individual shareholders. Altogether, the proportion of the shares held by nominees is about 12 per cent of the total ordinary share capital and about 60 per cent of that held by large shareholders. There is, of course, nothing inherently wrong or suspicious in this—any more than in the fact that 1,800 of the 1,920 shares of *Truth* are held by Lloyds Bank nominees. But it is generally accepted that the principle of concealing names of shareholders under nominee holdings is a bad one for any so-called public company; it is far worse when it is adopted by a Press which prides itself on its candour and independence.

Mexican Oil: A Decision?

The joint commission representing the United States and Mexico, which had the job of working out the value of the American oil companies' properties expropriated in 1938, have now reached agreement. Mr Morris Cook and Señor Zebada have set the value of the properties at 24 million dollars, of which over 18 million goes to Standard Oil of New Jersey and over 3 million to Standard Oil of California. This valuation is very much nearer the Mexican Government's previous finding—between 10 and 15 million dollars—than to the original oil company claim of 150 to 200 million dollars. In fact, the discrepancy is so great that there is no guarantee that the oil companies will accept the verdict, unless Mr Roosevelt decides to make it a matter of state. The two Governments are, of course, committed to an understanding, in the interests of hemisphere solidarity. President Roosevelt and President Camacho exchanged telegrams on the publication of the experts' findings and both messages threw significant light on the policy of their Governments. President Roosevelt's cable gave the essence of his Good Neighbour policy—"that the most difficult international problems can be satisfactorily solved when approached with goodwill and in a spirit of fair-play." President Camacho used the occasion to emphasise the moderate line he is pursuing in consolidating the gains of the Mexican Revolution. President Camacho is the "middle way" man, and while he is as determined as his predecessor, President Cardenas, to prevent the improper exploitation of his country, yet he greets the experts' report as a "confirmation of the attitude of my Government in its desire to grant ample guarantees to the participation of private capital, national or foreign, in the exploitation and development of the material resources of this Republic."

Waste of Bread

Last week-end, Lord Woolton again drew attention to the widespread waste of bread. He emphasised his unwillingness to ration bread, but suggested that if waste went on he might have to do so. Actually, there are deeper reasons which may favour bread rationing. There is a considerable popular prejudice which tends to prevent the matter from being discussed on its merits. Because in the past, in other countries, a bread ration has often been associated with conditions of actual starvation, there is a general assumption that it must always portend a food situation which is already desperate. Actually, bread could be rationed in this country now without involving any hardship and with the undoubted advantage that waste would be cut to a minimum. On the other hand, the fact that bread and potatoes remain unrationed provides the rationing system with a buffer which ensures the absence of actual hunger. And, as an alternative to rationing, considerable economy and flexibility could be achieved by adulterating bread, with a mixture of potatoes or other substances. So long as the individual consumer can get as much as he wants of buffer foods, the task of the Ministry of Food is confined to ensuring a fair distribution of other foods and providing variety and vitamin content. The need to ration bread and

potatoes is not actually inescapable until rising consumption, stimulated by shorter supplies of rationed foods, causes a run on the buffers. But, obviously, if the introduction of rationing were left until this state of affairs had appeared it would cause alarm and fears of starvation. If it were introduced earlier, to anticipate and forestall the worst stress, the ration could be so large that these effects could be avoided. At any rate, it is extremely important that the public should be brought to realise that bread rationing is not necessarily a desperate measure; and that there are arguments for introducing it simply to extend the control of the Ministry of Food in the interests of to-morrow's diet as well as to-day's. There is every reason for saying that the step should not be delayed until it is inevitable—unless, of course, it is quite certain that the need can never arise.

Petrol Allowances

The saving of petrol likely to result from the suspension at the end of June of the basic ration to owners of private cars will depend on the conditions in which special allowances are granted. In applying the needs test, two considerations must be borne in mind: no petrol should be granted for journeys which are either unnecessary or can be done by other means of transport. On this definition motoring for pleasure will be prohibited; motoring for business will only be allowed if no other transport is available; inhabitants of rural districts will only be given petrol in exceptional circumstances; but doctors, civil defence workers and the Home Guard will be given a small allowance for essential purposes. The saving on business journeys, for which supplementary, and often liberal, rations have hitherto been given, should be quite substantial. If the test is applied properly, at least one-half of the cars licensed should go off the road. There is no indication, however, that the issue of special petrol rations after June will in fact be governed by these strict conditions. On Friday last week, an official of the Petroleum Department is reported to have stated that the local petroleum officers will have discretion in dealing with cases of urgent domestic need and that, in rural areas, people with inadequate transport services will be allowed small rations for essential shopping journeys. Actually, it should often be possible to save petrol even in some of these cases by the pooling of orders at, and deliveries from, the nearest town. But the official spokesman did not attempt to define the conditions in which petrol will be issued for business purposes. It is essential that all categories of users of private cars should be informed of the conditions in which petrol will in future be issued, and that these should be stringent. Moreover, it is difficult to understand why motor cycles have been exempted from the needs test; the advance in their prices suggests that many car owners intend to use them for purposes for which no petrol will be issued for cars, namely, for unessential purposes.

The Laval Cabinet

The really remarkable thing about the Laval Cabinet is the number of unremarkable people in it. It is composed almost entirely of Laval's creatures or of men who have not even that distinction. The new Prime Minister is clearly determined to have no competition in his immediate entourage. The Déats and the Doriot, who might have been rivals, are conspicuously absent. Pierre Cathala, Dr Grasset and René Bousquet are in a special way Laval's men. Abel Bonnard and Jacques Bérard probably stand nearest to the Doriot group. Lagardelle is an admirer of Mussolini, while Admirals Auphan and Platon, Lucien Romier, Benoist-Mechin and possibly Barthélemy are the Pétainists. A full list is given below:—

Ministers:	
Head of the Government, Minister of Foreign Affairs, Information and Interior	PIERRE LAVAL
Minister of State without Portfolio	LUCIEN ROMIER
Minister of Justice	JOSEPH BARTHELEMY
Minister of Finance	PIERRE CATHALA
Minister of Agriculture and Supplies	JACQUES LEROY-LADURIE
Minister of National Education	ABEL BONNARD
Secretaries of State:	
For War	GENERAL BRIDOUX
For the Navy	ADMIRAL AUPHAN
For Air	JANKEYN
For Labour	HUBERT LAGARDELLE
For Communications	GIBRAT
For Agriculture and Supplies	MAX BONNAFOUS
For the Colonies	GOVERNEUR-GENERAL BREVIE
For Hygiene	DR GRASSET
For the President of the Council	FERNAND DE BRINON
For Information and Propaganda	ADMIRAL PLATON JACQUES BENOIST-MECHIN PAUL MARION

General Secretaries:	
General Commissioner for Sports	COLONEL PASCOT
For the Police	RENE BOUSQUET
For the Ministry of the Interior	GEORGES HILAIRE
General Delegate for Franco-German Economic Relations	JACQUES BARNAUD
Special Secretary to the Head of the Government	M. JACQUES BERARD

Shorter Notes

Malta is the first British garrison of the war to be decorated collectively. The precedent is there, for Ypres and Verdun received the MC in the last war. The choice of the George Cross for Malta recognises the part that the civilian population has played in the island's defence. Malta's stand is not only due to the steadfast AA men and the gallant band of RAF pilots. How is it that the night bombers can still operate from Malta and the day fighters still take off? Because, before the enemy bombing is done, a civilian army is on the job, levelling the airfields and filling in bomb holes under the blast of the next bomb.

The following table gives the number of civilian casualties in air-raids since September, 1940:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept.-Dec., 1940	21,669	30,556	52,225
1941:—			
January-June	18,698	20,451	39,149
July	501	447	948
August	169	136	305
September	217	269	486
October	262	361	623
November	89	155	244
December	34	55	89
1942:—			
January	112	61	173
February	22	21	43
March	21	13	34
Totals to date	41,794	52,525	94,319

Of those killed in March, 18 were men and 3 were women.

Considerable gratitude will be felt that Mr Bevin is revoking, from May 3rd, the Order permitting the maximum hours of work by juveniles in the pottery industry to be extended from 48 to 53 a week. This welcome concession to public opinion will not affect output, since it appears that the industry has adjusted itself to the new situation without a general resort to overtime. But in any case it is probably true that excessive hours, especially by juveniles, would in the long run have had a worse effect on output than retaining them at their pre-war maximum, and it is to be hoped that Mr Bevin will revoke the Order relating to the cotton industry, which raises children's maximum hours from 48 to 52 a week, before signs of fatigue appear instead of waiting until they are general.

In reply to a parliamentary question, Sir Kingsley Wood circulated in *Hansard* of April 21st, the following statement showing how the £5,687 millions, borrowed by the Government between the outbreak of war and March 31, 1942, was made up:—

(£ '000)	
3% Funding Loan	120,000
3% National Defence Loan	120,000
3% War Loan	302,527
National War Bonds	1,316,327
Savings Bonds	666,026
Defence Bonds	432,227
National Savings Certificates	452,901
Tax Reserve Certificates	191,515
Other Debt—External	109,616
Internal	46,036
Floating Debt	2,144,795
Less pre-war debt paid off	5,901,970
Total war budget deficit borrowed	214,910
	5,687,060

In the table showing expenditure out of the Exchequer on page 531 of *The Economist* last week, the figure of estimated total ordinary expenditure in 1941-42 should have read £4,960,185,000, not £4,688,185,000, which was the estimate for the supply services only. In the same table it will have been noticed that in the self-balancing items there is no estimate for broadcasting in 1942-43. This is because in the current financial year the broadcasting vote has been included in the civil votes under ordinary expenditure; similarly, wireless licence revenue is now included under ordinary revenue.

AMERICAN SURVEY

Information, Please

(From Our Washington Correspondent)

March 28, 1942.
WHEN the grape vine flourishes like the green bay tree, it is likely to be for want of more adequate sources of information. The President's warning against "sixth columnists"—those who repeat the tales manufactured by the fifth column—should therefore, perhaps, be coupled with a review of the adequacy of existing sources of facts on the war and the conduct of the war.

The inevitable reorganisation of the five existing information services was noted in a previous letter; a current related tempest in the Washington teapot concerns the erection of a new building (on one of the few remaining green spots in the city) to give a central location to the Office of Government Reports. A new facet of the problem concerns the loss of time from the war effort occasioned by the current operation of Congress's information service—the Congressional committee hearings.

Defects of the Committee System

In spite of the reorganisations of the 1920's, both Houses of Congress have a large number of standing Committees—thirty-three in the Senate and forty-seven in the House. Most of these parallel each other—appropriations, military and naval affairs, foreign relations, and the like. Administrative officers are, of course, subject to call by these committees. They are also subject to call by the considerable number of special or select committees, set up by resolutions in either house. The special committees serve a number of political purposes. Because of the importance of seniority in the standing committees, whereby members who have been persistently re-elected to Congress rise to key chairmanships, irrespective of capacity or even of particularly close contact with the Administration of the moment—several anti-New Deal Democrats are currently most strategically located—special committees sometimes serve as a means of by-passing historic landmarks. Established with a special frame of reference, they often continue for a considerable period, adding new topics for investigation as they go. At times, the special committees assume a competitive relationship to each other: if one group is felt to be leaning pro- or anti-industry another may be set up with a membership that will lean pro- or anti-labour; and the political kudos of having set up a committee is thereby spread.

These committees are chief among the links between Congress and the Executive. The testimony presented at their hearings is the major formal means of Congress informing itself on the day-to-day progress of the war. But

when all of the committees are active, the number of man-hours of executives of the War Production Board or the military departments spent waiting to testify on the Hill, or testifying, adds up to a formidable total. The information requested by the committees, moreover, generally reflects the fact that the special committee hearing made its way into constitutional procedure as a means of investigating abuses sufficiently flagrant to put the rather ponderous Congressional machinery into action; and even the sessions of the standing committees have been important chiefly in respect to appropriation measures, where the members have been cast in a watchdog-of-the-Treasury rôle. Persons testifying have therefore usually been greeted with either a bark or a bite; this approach is hardly the best means of Congress finding out how the war effort is going on.

The case for regularising Congressional contact through some centralised means is strong. The reception of progress reports at scheduled intervals would take proceedings out of an atmosphere in which those testifying must give proof that they are not wrongdoers. Problems could be brought up in general form before they become critical cases—an example is the dollar-a-year-man problem, currently being investigated in connection with the protest resignation of a WPB official.

The establishment of a permanent joint committee on the war would have its own problems. Most obvious is that of Congressional competition for place. Most far-reaching is that of the relation of members of such a committee to the Administration. If the committee were bi-partisan, as it normally would be, what kind of opposition would be forthcoming from the Republican members? Would the Democratic members be regarded by their colleagues as men who had lost their independence. The importance of a well-informed Congress is two-fold: in respect to its future decisions as the Great Debate progresses on the policy of the United States as a world power; and in respect to the information of its constituents.

General MacArthur at his first press conference on reaching Australia said:

There has been nothing more astonishing in the progress of war, which is really the application of the mechanics of force to human nature, than the place that public opinion occupies. One cannot wage war under present conditions without the support of public opinion, which is tremendously moulded by the press and other forces of propaganda. Men will not fight and die unless they know what they're fighting for and what they're dying for.

The Dangers of Silence

This raises the question whether there are not two classes of information in wartime: information that the public should not have because its distribution would help the enemy; and information which the public must have if it is to have the will to beat the enemy. The old scissors technique is not enough—again to quote MacArthur:

"If the people don't know, their confidence is reduced. Silence will begin to react against you."

So far, not much has been done with information as a positive weapon. The MacArthur saga is growing upon the kind of bold forthrightness that gave Churchill's blood-and-tears speech and Roosevelt's first inaugural a place in history. But statements by top leaders are necessarily occasional. What of the day-to-day work of the information service? How can the feeling of urgency of those at the centre, in the know, be generalised through the country so that the directives that are centrally issued are not blunted by indifference at the point where they should take effect? Three stories in current circulation show how the grapevine flourishes:

1. Disregard of priorities by steel companies is curtailing deliveries to shipyards; and companies without priorities are chiselling supplies by the ancient device of Congressional pressure.

2. Tyre rationing is a joke—why, there is an old lady in the X apartment building who has five cars, and the spares she's laid in for them block the store room so that the other tenants can't get their trunks out.

3. Announcement of rayon diversion has caused a run in the stores on rayon garments, yet the diversion actually applies to materials that won't reach the retail market for a year. And big department stores are currently hiring warehouses to bed down cloth for next winter.

These are plainly false reports. Could a functioning information service evoke either self-control or decentralised community control in these matters?

American Notes

The End of Obstruction?

The adoption by the Republican National Committee of a resolution recognising the international obligations of the United States after the war means the end of out-and-out isolation in any party platform. Vaguely worded as the resolution was, it is undoubtedly a victory for the more progressive wing of the party under Wendell Willkie, whose position on foreign affairs has been closer to that of the President than that of some members of the Democratic party. The occasion for the statement is the opening of the primaries, in preparation for the November elections, at which the whole House of Representatives and one-third of the Senate will undergo re-election. In the primaries, the candidates of each party are chosen by the registered members of that party, generally under the control of the party machine. The return of two ex-Isolationists in the Illinois primaries, one with a particularly unsavoury record, is not a happy omen. But it is to be hoped that the success of Republican progressives at the centre will result in an improvement of the quality of the candidates to be selected. The President has urged that the Congressional elections should not be fought on party lines, but on the candidates' records on the defence and war programmes. It is essential that the President should have more support—as well as more responsible opposition—in Congress. Many of the present members have afforded neither. The last elections to Congress took place in November, 1940, and in many respects it has failed to keep pace with the temper of its constituents.

Native Nazis

It is good news that action has finally been taken to bar *Social Justice* from the mails, as part of a programme of silencing the more outrageous home-grown Fascist movements. *Social Justice*, founded by Father Coughlin, of the Shrine of the Little Flower, in Michigan (its ownership has now been prudently transferred to his parents), has been notoriously anti-Jewish and has publicised ideas hardly distinguishable from those of the Nazis. In his letter to the Postmaster-General, Mr Biddle alleged that on one occasion portions of a speech by Goebbels were published

with practically no changes, and with no identification of the source. Another would-be Gauleiter has been rounded up in the person of William Dudley Pelley of the Silver Shirts; George E. Deatherage, of the Knights of the White Camellia, has at last been removed from a 25,000,000 dollar secret naval construction job; and it seems unlikely that Lawrence Dennis, author of *The Coming American Fascism*, will ever receive the captaincy in the US Army for which it was announced he was qualified. There was a mushroom growth of these native Fascist movements during the hungry thirties, and while their importance should not be exaggerated, they are far more dangerous than purely German organisations, such as the German-American Bund, because they speak in the native American idiom, despite their links with Berlin. The most dangerous of all is undoubtedly the Coughlin "Christian Front," directed at America's 18,000,000 Catholics—her largest and most highly organised religious group. Even after Pearl Harbour, its speakers continued to denounce Great Britain and Russia; to throw mud at the Administration; and to support the Isolationist demand that American forces—particularly the Fleet—be brought back to the United States. The influence of these groups has been greatly reduced, but it would be folly to allow them to attack national unity, particularly among the Irish and Italian Catholics, and to continue to act as a ready-made sixth column for Goebbels.

Priorities Reform

Substantial progress is being made toward modifying the priorities system, and substituting for it the allocation of specific amounts of scarce materials to manufacturers. The outstanding defect of the priorities system has been that it placed no limit on the amount of raw materials a manufacturer might secure, and, on the other hand, even the possession of a high priority did not necessarily assure supplies. The result was that some firms obtained more than their share while other equally urgent work was slowed down because of lack of material. It is noteworthy that material shortages are mentioned as much the most important single cause of delay by defence manufacturers in a recent *Fortune* poll. The main difficulty in establishing a system of allocating specific amounts of material to specific undertakings has been lack of information, both as to supply and demand. Work on supply figures is being completed, and as more and more industries are required to file applications for material under the Production Requirements Plan, a picture of demand is emerging. This will make it possible in the coming year to eliminate much of the chaos which has been caused by competition for supplies and the abuse of high priority ratings. The system which is emerging is a compromise; that is, priority ratings will be retained, but they will be attached to a specific amount of goods. A manufacturer may have an A-1 priority for copper, but instead of being able to buy all that he can lay his hands on, he will be assured of a certain amount, but will not be able to secure more than that. In effect, this is rationing of raw materials.

Patent Policy

Patents relating to the production of magnesium have been freed as a result of suits under the Sherman Anti-trust law brought against the Aluminum Company of America and the Magnesium Development Company, a subsidiary owned jointly with the German Dye Trust. Further appropriation of patents controlled by enemy aliens, even though registered in the names of neutrals or American citizens, is expected as the result of a survey being undertaken by the Alien Property Custodian. Many patents have already reached the Government through this source, and are being made available to American producers. Patents appropriated during the last war were eventually returned to the original holders, but President Roosevelt has stated that this will not occur again. A Bill now before the Senate Patents Committee provides that, whenever the President finds that the use or sale of any commodity is in the interests of the nation, he may license patents at a reasonable order or require them "by donation, purchase, or taking." There is practically no doubt that the Government will be granted wide powers to force the freeing of patents during the war; what is less certain is whether there is to be a permanent revision of patent policy. Public opinion has been aroused by disclosures as to the way private ownership of patents has endangered American security.

Letters to the Editor

Coal—A Reply

TO THE EDITOR OF THE ECONOMIST

Sir,—In your issue of April 11th you devoted one and a half pages to an article containing a severe attack on all of the parties who have responsibilities in connection with the war effort of the coal industry, and this was followed on April 18th by an article of one page sketching a plan for what is called "mobilising the industry."

Let me first deal with the plan. It is proposed that the Government shall assume technical and financial responsibility for the conduct of the industry. One of the principal objects is to be a concentration of production in the mines where output is highest. Another important object is to test the often repeated assertion that labour would work far more efficiently if the profit motive were removed.

The last question can be answered without making the organisation of the coal industry the subject of a major surgical experiment in the middle of a war. The Government took control of the industry in the last war at the end of 1916. In the year before control, 310,000 days were lost through disputes. Under control, the figure exceeded a million in each of the first two years, and in the two post-war years of control the figures were 7½ millions and 17½ millions. Moreover, in the present war, it will hardly be contended that performance in the Royal Ordnance Factories is better than in privately managed establishments.

As regards the effect of Government control on output and efficiency, the following figures of output of saleable coal per shift on the last occasion should convey a warning. As compared with the figure of 19.41 cwt in 1916, which was the last year before control, the figures in the years of control were 19.08, 17.23, 14.96 and 14.36 cwt. The figures for the last two years were affected by the introduction of the seven hour day as from the middle of 1919; but, by 1922, the industry under private management had restored the rate of output per person per shift under the seven hour day to 18 cwt.

As regards concentration on the more productive pits in view of the restricted labour force in war time, the writer is wrong in imagining that the financial interests of individual concerns constitute a bar to action in this direction. Concerns with outputs so low that the men could, with advantage to production, be transferred to other pits are usually in financial difficulties, and therefore constrained to apply to the Central Council under the War Emergency Assistance Scheme for the means to continue in operation.

Assistance can only be given so far as it is in the national interest that the pit shall continue in operation. Where the men can be transferred to neighbouring pits with advantage to production assistance is refused. Assistance is made subject to compliance with such condition as to working methods and otherwise, as may be laid down as the result of the technical and financial investigations which are made. The scheme is rigorously administered and many applications have been refused. The difficulty which has been experienced has been rather that of objection from the labour side to closure and transfer.

Moreover, in a number of cases in which men have been transferred to pits with higher rates of output, additional output has not in fact been obtained. How far this is due to dissatisfaction at having had to transfer, how far to unfamiliarity with different conditions of working, how far to being accustomed to produce simply a certain amount of coal, and how far these considerations may be of temporary effect, it is not easy to say. I have before me, however, a recent article by a miners' leader in one district which is largely devoted to a protest against the closure of certain uneconomic pits.

Whatever more it may be possible to do in the way of concentration and increased efficiency, the necessity for replenishing the diminished labour force of the industry is evident and urgent in the view of both sides of the industry. It is suggested in the "plan" that this step should be deferred until we have tried out once again the experiment of temporary nationalisation. The adoption of such a course would spell disaster.

The premises on which the necessity for the plan is based are contained in the earlier article. The attack on

management is particularly virulent. I can only give examples, but they are typical of the whole.

I take first the statement that—

Before the war provision was made for the appointment by the Mines Department, in each of the 17 districts, of a Coal Supplies Officer who was to represent the Department in all matters relating to the production of coal. But, in order to make certain that this machinery of control should be ineffective, the offer was made to appoint the nominee of the Executive Board of the District (i.e., the body set up, representing the owners only, to operate the Act of 1930), provided the Executive Board relieved the Government from all financial liability on account of the official or his office.

The statement goes on to say that the Coal Supplies Officers have retained their position under the District Selling Scheme and been wholly remunerated by the owners, and that it is hardly surprising in the circumstances that these powers have been only rarely and ineffectively used.

The suggestion in regard to the appointment of the Coal Supplies Officers was made by me personally, when consulted by the Mines Department in 1938, and was made for the purpose of securing that, by utilising the experience of the existing Sales Controllers, instead of setting up a duplicate authority without practical knowledge, the machinery of control should be as efficient as possible. The baseless insinuation as to motive I disregard, but I may add that the request that the Executive Boards should continue to be financially responsible came from the Mines Department, and not, as stated, from the coal owners.

The suggestion that, because the Coal Supplies Officers are remunerated by the owners, they have refrained from using their powers is equally unworthy. The fact that the vast changes in the flow of coal that war conditions have called for have been effected by them through the industry's ordinary machinery of sales control, and without the necessity for the exercise of special powers under the Defence Regulations, is the best evidence of the efficiency of that machinery, of the soundness of the advice tendered to the Department in 1938 and of the co-operation of the industry in furthering the war effort.

The statement that the colliery owners "are adamant in refusing to treat with any organisation of merchants" is equally preposterous, and I have the permission of the Chairman of the Chamber of Coal Traders to associate him with this refutation. There is in existence a National Joint Advisory Committee of the colliery owners' and distributors' organisations.

I turn now to the general statement as to the colliery owners' "industrial attitudes," which is illustrated by the statement that—

They accepted with a bad grace even the gift of monopoly selling powers pressed on them by Mr Shinwell's (which should read "the late Mr William Graham's") Act of 1930, and the subsequent Conservative legislation.

The selling powers in the Act of 1930 were simply in the nature of "enabling legislation," incorporating schemes which had already been worked out by the colliery owners themselves, and had the approval of about 90 per cent of the industry. When the Bill was introduced, there were some who still considered it preferable to constitute the schemes on a voluntary basis, but the great majority of the industry welcomed the powers.

The "subsequent Conservative legislation" refers to the central sales control schemes of 1936. The writer of the article will doubtless be surprised to learn that the suggestion for the adoption of this policy as the most effective method of assisting the industry to meet its wages problem was originally made to the Department in 1935 from the industry, with an assurance that it would be welcomed by the industry, and that later the Secretary for Mines conveyed an expression of his appreciation of, and thanks for, the big effort which the industry had made and the hard work which had been done in getting the sales control schemes formulated and put into operation.

I have not space to refute the many other mis-statements. It must suffice to say, in conclusion, that the article is as misleading in the general picture which it draws of the management of the industry as it is incorrect in its individual statements.

Yours faithfully,

W. A. LEE,

Director of the Mining Association of Great Britain.

The RAF and United Command

TO THE EDITOR OF THE ECONOMIST

SIR,—The important editorial entitled "United Command," which appeared in your issue of March 21st, and your notes of April 18th discussed the best method of employing the armed forces of the Crown in the present war. No one, it is safe to say, will quarrel with the idea of a great General Staff, and a centralised striking force of all arms. But, as you suggest, there are misgivings in the Royal Air Force as to the real motives which inspire some of those who have recently (in the House of Lords, for example) put forward views which are at first sight similar to your own.

The development in the views of such writers and speakers has been a curious one. For some years before the present war, and in the earlier stages of the war itself, these (in many instances self-appointed spokesmen of the two older Services) consistently depreciated the importance of air power. They denied the ability of aircraft to sink warships, except in most exceptional circumstances: they suggested that reconnaissance was still the main function of military aircraft. (These views were adopted and taken to their most extreme lengths by the French Higher Command, with the results which we all know.)

The first great engagements of the war, both on sea and land, clearly made these views quite untenable in their old form. Those who held them appeared to make a complete about face. They now not only recognise, but heavily emphasise, the decisive importance of air power, both at sea and on land. They emphasise, and even exaggerate, the impotence of sea and land forces without air support. But this total change of emphasis conceals an underlying continuity in their conclusions. Just as when, in the past, they were belittling the importance of an air force, they concluded that this minor and auxiliary weapon ought to be put under the command of the naval and military authorities, so now, when they are emphasising the decisive role of aircraft, they conclude that the Navy and the Army cannot possibly fight, unless our aircraft are put under the command of admirals and generals! The logic of this argument is not apparent to those responsible air officers who, alone, have given their lives to the professional study of the new, complex, and rapidly developing question of the role of aircraft in modern warfare.

Yet this curious argument has, perhaps from the sheer frequency of its repetition, influenced you. For you write, "the immediate problem is air co-operation with the Navy

and Army respectively." Surely this way of putting it carries the implication, unmistakable even if quite unconscious on the part of the writer, that the Air Force is, or at least ought to be, auxiliary to the two older services? But is not this a most topsy-turvy conclusion to reach from an enumeration of all the victories and defeats of the Allies in which the air has proved to be the decisive element? When Japanese shore-based aircraft sank the *Repulse* and the *Prince of Wales*, we were told that their success proved that half the Air Force ought to be put under the Navy, although the admiral who came to his gallant and tragic death in the *Prince of Wales* was the strongest opponent, in theory and practice, of the view that aircraft could sink capital ships. When, in entirely different circumstances, our bombers failed to sink the *Scharnhorst* and *Gneisenau*, this, too, we were told, only showed the necessity of splitting up the Air Force. Thus instances of either the failure or the success of aircraft are alike grist to the mill of these critics. Was there ever a better example of having it both ways?

No spokesman of the Royal Air Force has ever suggested that the numerous examples given by you, in which air power has proved decisive, teach us the lesson that "the immediate question is naval and military co-operation with the Royal Air Force," or implied that the Army and Navy ought to be made into auxiliaries of the Royal Air Force, under the command of air marshals. Nor will they suggest any such thing. Nevertheless, and however shocking it may seem to minds trained in the older Services, is it not probable that the long-term trend of warfare is in the direction of the emergence of aircraft as the essential striking force, while sea and land forces may gradually tend to become means for transporting aircraft to within range of their targets and of defending their necessary bases? If there is a long-term trend in this direction, would it not be a fatally retrograde step to split up the Air Force in order to make it an auxiliary of the other two armed forces?

This is the real consideration which lies behind the objections voiced by air officers to these apparently benevolent proposals for the "unification" of the services. These objections are often misunderstood and misrepresented as the reflection of a narrow and obscurantist attitude. But I ask you, Sir, to pause before you lend your support to proposals the effect of which would almost certainly be to subordinate the Air Force to the other two Services. Rightly or wrongly, many persons believe that the very existence of this country as an independent nation would be imperilled if such a development took place. That is why air officers consider it their duty to oppose with all their strength any proposals which would have this effect.

Yours faithfully,
X. Y. Z.

THE WORLD OVERSEAS

From Debtor to Creditor

(From Our Ottawa Correspondent)

A REVISION of financial relations between the United Kingdom and Canada is one of the great historic consequences flowing from this war, altering the traditional debtor position of the Dominion. The document that embodies this revision most clearly is Mr Ilsley's United Kingdom Financing Act, 1942. It provided a fresh start with the temporary expedient of granting the Government of the United Kingdom a billion dollars. The purpose of the gift, in the words of the resolution of the Minister of Finance, was to enable "the purchase in Canada of aircraft, tanks, mechanical transport vehicles, guns, ammunition and other munitions of war, foodstuffs, raw materials and other commodities and supplies essential to the conduct of the war and the maintenance of the people of the United Kingdom and to assist in enabling the Government of the United

Kingdom to defray other expenditures incurred in Canada for war purposes."

At the present rate of British procurement in Canada, this sum will last for something less than twelve months. An extension of the gift policy can be foreseen when the amount is exhausted, unless in the meantime an arrangement by which pooling of production surpluses of the United Nations is then in operation. Conceivably, the Canadian surplus might then be pooled and drawn on by the United Kingdom and other allies under terms not yet executed. Other heavy customers of Canadian war materials at present are Egypt, India and Australia in the sterling area and Russia and China outside it. The new Canadian proposal is designed to avoid the growth of an unmanageable war debt between Canada and Britain. Logically it should apply to other allies who share access to Canadian war

output. There is a growing sentiment at Ottawa that an Allied pooling arrangement should be effected speedily. Negotiations with Washington and London are leading to some such arrangement.

The End of a Phase

The billion dollar gift is, therefore, an interim arrangement. It marks the end of a phase of wartime financial relations in which Canada accumulated a heavy sterling balance. The transfer of gold by the United Kingdom to Canada, in the period prior to Lend-Lease, ended in December, 1940, when a total of \$250 millions had been reached. The repatriation of Canadian securities mobilised by the British Government will be limited to the completion of existing operations, with the further transfer of Dominion Government and Canadian National Railway securities held by the British Government, estimated to be \$295 millions. The repatriation account will close at approximately \$714 millions, with an additional amount of \$126 millions financed by the discharge of private Canadian debts to the United Kingdom and sales in the Canadian market of securities vested in the British Treasury.

To complete the settlement of the British deficit in Canada, estimated at \$1,870 millions from the start of the war to March 31, 1942, \$700 millions from Canada's sterling balance will be converted into a long-term loan, with rate and term to be decided after the war, and a balance of \$80 millions will be deducted from the new gift account.

The settlement may be set out as follows:—

(million dollars)	
Net cash deficiency to March 31, 1942	1,870
U.K. sale of gold to Canada	250
Official repatriation	714
Private repatriation	126
Conversion of sterling balance to loan	700
Conversion of sterling balance to gift	80
Total	\$1,870

With the deduction of \$80 millions, the \$1,000 millions gift left a balance of \$920 millions to Britain's credit at the start of 1942-43. "This should provide sufficient funds," said Mr Ilsley, "to take care of Britain's dollar deficit until sometime early in 1943."

Idealism and Business

The Canadian policy has been a mixture of idealism and what Mr Coldwell, the Co-operative Commonwealth leader, called "hard-boiled business." There was considerable pressure in Ottawa for a more thorough and sweeping recall of Canadian securities from Britain than has, in fact, occurred. The temptation to repatriate Canadian Pacific Railway securities may be felt by an exponent of railway amalgamation, just as the desire to repatriate distillery securities may be felt by the advocate of direct Government control of liquor. The balance of British investments in Canada has, in any case, shrunk significantly in recent years, owing to wartime repatriation and other factors. It was approximately \$2,500 millions in 1937, and it is now reduced to \$1,000 millions. Mr Ilsley's estimate was that at present Canadian dollar securities still held in the United Kingdom amounted to \$700 millions, and sterling securities on Canadian property and enterprises amounted to \$300 millions. "That is all," he said, "as far as we know that is left."

Yet the Canadian Finance Minister laid down the principle of preserving for Britain a financial interest in Canada, and the continuance for Canada of a financial interest in Britain. There would be no attempt to cancel all Canadian obligations to Britain against obligations to Canada. He said: "The mutual financial interest which will remain is bound to strengthen the other economic ties between the two countries, which have been of such great value in the past, and will continue to be of great value in the future. The fact that both countries will now be creditors in relation to one another, as well as debtors, reflects the growing economic maturity of Canada."

The fact that Britain has been Canada's best customer in the past, and, as the Conservative leader, Mr Hanson, said that Canada should look to Britain again as a customer in the post-war period, has been a governing factor in the recognition of a limit to the policy of repatriation. Yet the fact that the Minister of Finance felt impelled to defend this view as warmly as he did may be taken as evidence of nationalistic stirrings in Ottawa which, in this connection,

would favour liquidating mutual financial interests more thoroughly. Along with a minority group, which would require more collateral from the British Government, there is a school of thought whose reluctance to see Canada acquire a substantial claim in sterling arises from fear that the post-war settlement would involve a vast increase of competing imports. As Mr Ilsley said, "Experience has shown that countries will accept these payments in the form of imports only to a limited extent on balance, if at all."

The Opposition View

The view expressed bluntly by Mr Coldwell from the opposition benches was that Canadians should have no illusions about the altruism of Canada's gift to Britain. He said: "We are making this gift not only because we want to do something to assist in maintaining the morale of Great Britain, and the winning of the war, but because under a capitalistic economy we dare not allow our best customer to get into our debt." He described as "hard-boiled economic imperialism" Mr Ilsley's argument that the revision of financial relations would preserve for Britain a continuing interest in Canadian prosperity. He would like to see that kind of thing removed from Canadian relations with Britain after the war.

But, except in the extreme Quebec nationalist wing, there has been no opposition to the gift of a billion dollars' worth of supplies to Britain. It satisfies the Canadian feeling that Canada should exceed in generosity the terms granted by the United States in its Lend-Lease Act. There is no doubt that the Canadian proposal does so. It would be unthinkable, as Mr Ilsley said, that any shortage of Canadian dollars would make it impossible for Britain to secure in this country the munitions and supplies she requires. The mingling of practical business considerations with idealism came in his further argument that the new financial arrangement will ensure that the balance of international indebtedness between Britain and Canada will remain on a reasonable and manageable basis.

Venezuela's Oil Trade

[BY A CORRESPONDENT]

March 25th

THOUGH a comparative newcomer to the ranks of oil producers—its petroleum industry is a product of the last two decades—Venezuela is now third on the list, closely following the Soviet Union. As might be expected, therefore, oil is the most important of all Venezuelan exports and the industry forms a highly important branch of the national economy. In the last year before the war, over one-third of the United Kingdom's oil imports came from this source; and, as the nearest accessible supply centre except Trinidad, it still plays a prominent rôle in supplying British oil requirements.

The importance of the oil industry to Venezuela needs little emphasis. It provides employment for a growing volume of native labour; it brings in much foreign exchange; and it makes a handsome contribution to the national exchequer. Indeed, about one-third of the state revenues is derived directly from imports on minerals, and to this total the oil industry contributes the lion's share. But from the national standpoint it is not an unmixed blessing. In the first place, the oil trade is peculiarly vulnerable to international political and economic disturbances. The consumption of petroleum products within the country—estimated at only 2,300,000 barrels in 1940—normally represents little more than 1 per cent of crude oil production. There is thus no buffer to soften the impact of any fluctuations in the demand for Venezuelan oil on the world market, which may consequently have serious repercussions on the employment position and the national finances. This is one danger. Another is the fact that the oil industry is almost wholly financed with foreign capital—the Royal Dutch-Shell and Standard groups being the most important holders, though a number of other American concerns are also represented. Nationalist sentiment in Venezuela is naturally anxious lest these foreign holdings in the country's most important industry should be used as a lever for exerting political pressure.

The oil industry's vulnerability to external disturbances has been well illustrated during the course of the war. The principal pre-war outlets for Venezuelan oil were the countries of western Europe, though the fact is not obvious from an examination of the trade returns. About three-quarters of the total exports are consigned, in the form of crude oil, to the Dutch West Indian islands of Curaçao and Aruba. The finished products were then shipped abroad, mainly to Europe. So far as direct exports from Venezuela are concerned, the United States took about 13 per cent in 1940, the United Kingdom 4½ per cent and France 2 per cent. The remainder went in very small quantities to Canada and parts of Africa and South America. With the Nazi victories of 1940, and the inclusion of virtually the whole of Continental Europe within the scope of the British blockade, Venezuela lost some of its most important markets; total exports of mineral oil consequently fell by 10 per cent—from 198 million barrels in 1939 to 178 millions in 1940. But if these Allied losses in the west affected Venezuela adversely, the closing of the Mediterranean and the enemy's threat to the Middle East had an opposite effect, since it inevitably increased the British call for Venezuelan oil. In addition, larger quantities of Venezuelan petroleum (mainly crude and fuel oil) were imported by the United States—which, although the world's largest oil producer, has a sizeable import trade. Venezuela's exports consequently showed a progressive recovery during 1941. Final figures are not yet available, but the improvement over 1940 (and even over 1939) was substantial.

As has already been pointed out, the bulk of the country's oil exports is in the form of crude petroleum, the proportion being as high as 96 per cent in 1940. Though a home

refining industry has been developed in recent years, its main function is still to supply the domestic market. The reason is that the largest producers—Shell and Standard—operate, on the islands of Curaçao and Aruba, some of the world's largest refineries, and these are run mainly on raw material from Venezuela. This position is not wholly to the liking of the Venezuelan Government, which is anxious, for various reasons, to develop a larger refining industry at home; but little change in the present position seems likely in the near future.

Developing Production

Since practically the whole output is marketed abroad, production is naturally closely correlated with the trend of exports. Crude oil production in Venezuela, which had shown an uninterrupted advance since 1932, reached a peak of 206 million barrels in 1939, but fell back to 185 million barrels in 1940. Last year's output is estimated at 228 million barrels, 23 per cent above that of 1940 and easily the highest in the country's history. This compares with an estimated output of 235 million barrels in the USSR and of 1,392 millions in the United States. The most important producing fields are groups around Lake Maracaibo, the oil-bearing strata extending out under the sea. By erecting the derricks inside reinforced concrete caissons, the producing companies have been able to exploit these underwater deposits and are now working as far as seven miles off the shore.

Though the bulk of the current output comes from these north-western fields, the main hope for future expansion lies in the fields of eastern Venezuela, which are regarded as the south-westward extension of the Trinidad oil structure. Development work was naturally retarded while the export outlook was so uncertain, but is now forging ahead again. A number of companies are working in eastern Venezuela, where four new fields are being developed. These are at Santa Barbara in northern Monagas; north-east of the well-established Oficina field; at Santa Rosa, east of the recently opened El Roble field; and at Guarío, adjoining Santa Rosa and El Roble. The existing pipe-lines from these eastern fields to the Caribbean export terminals are being extended to provide adequate outlets for the growing production of eastern Venezuela. Besides the development of known pools—a good deal of "wildcatting"—drilling in unproved areas—is now going on in this part of the country as well as in central Venezuela; prospects appear to be encouraging.

Friendly Mexico

[BY A CORRESPONDENT]

March 25th

THE comprehensive agreement signed between Mexico and the United States last November, and the subsequent diplomatic reconciliation of Great Britain and Mexico, gave promise of a period of co-operation all the more welcome because of the misunderstandings and bitterness of the thirty years that have passed since the fall of Díaz.

The friendship of Mexico is worth winning. Among the Latin American states, it is only exceeded in size by Brazil and Argentina, and it is second in population. Its importance in metal production is usually thought of in terms of silver, but though some 80 million ounces of silver are produced annually, and some £8 millions worth of gold, Mexico is also a large producer of lead, zinc, antimony and copper. For all these metals there is a big Allied demand, but there are considerable practical difficulties to be overcome before the various products can reach the consumer. These difficulties can be summarised as lack of capital equipment, lack of roads, lack of railways and lack of machinery.

There is a general idea that the virtual embargo on Mexican oil exports imposed by the United States and Great Britain in 1938 knocked the bottom out of Mexican oil exports. This is not the case. In the five years 1936-1940, oil exports averaged 6.8 million cubic metres, and petroleum output averaged 6.9 million, which suggests that the diversion of supplies to other markets was not unsuccessful—a deduction borne out by the figures for the first nine months of 1941.

There has occurred, however, a serious deterioration in the balance of trade. Mexico, in spite of the elbow-room given by the cessation of interest payments on its overseas debt, requires a considerable export surplus to preserve an even balance of payments; but in 1941, so far from this being achieved, there was an excess of imports. The figures

for the full twelve months are not yet available, and the best method of illustrating Mexico's plight is to compare its position with that of certain other Latin American states during the first half of the year:

	JANUARY-JUNE Percentage Change in Imports and Exports; 1941 values compared with 1940	
	Imports	Exports
Argentina	-39	-21
Brazil	-14	+15
Chile	+2	+18
Peru	-5	+22
Mexico	+15	-37

This table clearly reveals Mexico's trading weakness. With the exception of Argentina, it is the only one of the states shown whose exports decreased in value, and, unlike Argentina, the country was unable to rectify matters by cutting imports. In view of the large part played in Mexico's exports by mineral products, perhaps the country with which it should be compared is Chile, and here the figures give the full measure of Mexico's weakness.

A Check to Recovery

This adverse tendency, which was still visible in the autumn of 1941, constitutes a serious check to Mexican recovery. The carefully acquired gold reserve is placed in danger, and an analysis of imports reveals an unsatisfactorily great preponderance of consumption goods. Mexico cannot hope to put its house in order if imports of tractors and tools—and if the newsprint and other consumption goods are financed by bank credit, as is often the case, so much the worse.

Fortunately, the increasing concentration of the United States on essential production will discourage the unhealthy speculative imports of superfluous commodities, and the credits which are being granted as a result of the November agreement will increase the demand for capital goods. Some further improvement in the workers' standard of life will be demanded by the unions, however, for they are in a strong position, and the scope for such improvement is great and fully realised. The dangers are plain to Mexican bankers, who fear a further devaluation of the peso, but it looks as if the workers will have to learn by experience that they may in the long run have to pay the debt arising from an unfavourable balance of payments.

Petroleum Products in Portugal

[FROM OUR LISBON CORRESPONDENT]

April 11th

YESTERDAY'S arrival of a Spanish tanker, the first of three vessels coming with petrol, crude and gas oil to Portugal should correct the extreme shortage felt recently. By drastically cutting down all pleasure driving, and by the strict rationing of supplies to every class of road transport, the Government has ably tided this country over a difficult moment. Further chartering of French tonnage is reported, so that the worst is probably over. The whole situation lends interest to the figures of the SACOR returns for the year ending December 31, 1941. This "Soc. Anon. Concesionária de Refinação de Petróleos em Portugal" closed its year with gross profits of \$31,761,517 (approximately £317,000), or a little more than its present capital of £310,000, which was increased during the year from £250,000. Sales figures give some idea of the scope of this concern; for 1941 they were as follows: petrol, 34,482 tons; petroleum, 21,394 tons; gas oil, 23,087 tons; fuel oil, 12,072 tons; lubricants, 5,091 tons. Through a small subsidiary, known as CIDLA, it also supplies a little butane gas for household use, but as yet this business is trifling. For SACOR the net profits were \$8,135,891—say, £82,000. Special privileges and certain implied obligations make the position of this concern unique in Portugal. It has not, however, yet shown its ability to meet the purpose it was primarily meant to fill. That was the safeguarding of Portugal's petroleum supplies—all products—in the event of just such a position as has arisen during the past twelve months. Had private enterprise been untrammelled by fear of uneconomic competition, it is safe to say that storage facilities and consequent stocks would have been far greater than is the case today.

A LEADING FIRM OF CHARTERED ACCOUNTANTS ON NATIONAL DUTY AND COMPANY INTERESTS

“The first essential at this time in the preservation of Shareholders' interests is the ending of the war with the least possible delay—and one of the contributory factors to that end is Finance. Therefore in our opinion it should be the policy of every Board of Directors to invest as much as possible of a Company's available resources in Government securities thus accelerating the achievement of Victory and safeguarding the interests of those whom they serve”

THE BUSINESS WORLD

Company Control by Publicity

AN article in *The Economist* of April 11th drew attention to the need for a new attitude, on the part of directors and auditors, towards the information to be given in company accounts. The contentions advanced were that the information at present required by law falls far short of what is necessary to enable the shareholder to judge the value of his investment; and that, in addition, certain information ought to be made public in the national interest, even if the shareholder does not demand it, and even if he feels that its disclosure may threaten his rights. If this latter suggestion appears revolutionary to some, it should be borne in mind that the whole system of private enterprise is under fire. The only way to remove misapprehensions, and to remedy abuses, is to make the facts plain. In matters of business, as in public administration, the great engine of democratic control is the utmost publicity.

Whatever economic structure may emerge after the war will still rest in large measure upon private enterprise financed on the joint-stock principle. But the individual contributions to their finance are likely to come increasingly in smaller units from a larger number of people who are less well equipped to exercise effective control over the management of their property. Originally, those who provided the finance were in a position to oversee its use. Now actually they are not, and the only substitute for oversight, under modern conditions, is adequate publicity. Shareholders will then have the assistance of skilled advisers acting upon reliable information; the publication of adequate and truthful accounts would at once raise the

standard of criticism applied to company affairs by bankers, brokers and the press. It would furnish a reliable basis for the assessment of past performance by statisticians and students of industrial affairs, whether they were working for the industry itself, for a Government engaged in planning or in the pursuit of truth for its own sake. It may, of course, be objected that the Government could obtain the details without their being made public. It is essential, however, that, in so far as it is necessary for Government to take part in industry, or to create public boards to provide specific services, Parliament should insist on the fullest publicity.

The main grounds for complaint concerning published accounts in the decade before the war were three; those associated with holding companies, including companies which both hold and operate themselves; lack of information, as regards all companies, about depreciation, tax provisions, and the trading account, associated with an extreme woolliness in statements purporting to explain what figures are given; and, finally, lack of uniformity, both in the material provided and the use of words.

As was indicated in a note in *The Economist* of April 4, the position of the holding company needs drastic revision. In the matter of accounts, if subsidiaries are wholly owned by the parent, all should have the same accounting period. Granted that, it should suffice if the true profits and a statement of assets are incorporated in a consolidated profit and loss account and balance-sheet. In the case of partly-owned subsidiaries and associated companies, either the parent's share should be so incorporated, or it should be made clear where its full accounts may be found. The rule of an identical balance-sheet date should also be enforced if possible. Whatever rules are laid down for companies directly owned by the public would of course be applicable to these concerns also. In the case of large concerns, engaged in a variety of different types of business, it would be desirable to show separate totals in consolidated accounts for each main industrial division. This would indeed be essential if adequate statistics were to be prepared.

The complexities of the tax position and an outline of suggested remedies were given in *The Economist* of December 13, 1941. The position with regard to depreciation is similar, if rather less involved. The ideal would be that the assets should be valued, on a clearly-defined basis laid down by law, at the beginning of the period of account. There should then be shown the cost of new acquisitions and the value realised by sales. The full amount of depreciation should be disclosed, together with the portion of the total allowed for purposes of taxation on account of renewals, repairs, etc. If a similar series of figures were supplied for stock-in-trade and debtors, and if the market value of stocks of materials and of investments were invariably given, it would be possible to determine the true distributable profit, and it would be apparent how much capital was really being ploughed back into the business. This would tend to accelerate the flow of capital into industries where the reward was high and to avoid over-investment in those where it was low or falling. It would also provide a measure of the real return on equity shares, and an indication of how much of the national capital was invested in any given industry. All this information is valuable in any system. It will become essential if the direction of industrial development is to be the subject of control by a national or international body. It is also desirable that the distinction which is frequently made between investments in gilt-edged stocks, in other securities and in holdings associated with the company's business should be made general. In the interests both of the proprietors and of the public, it is desirable that the publication of a trading account should be made obligatory. This should show, as a minimum, what is spent on wages, as well as on commodities, the latter being already required for the details of the stock position.

If all these particulars about assets were given in full, the mystery which surrounds changes in the reserves

of many companies would disappear. But it would still be possible to confuse the issue, to a great extent, by lumping under an omnibus item such different things as trade creditors, reserves for contingencies, tax appropriations, dividend payments falling due, and time deposits. There is no reason why, at least in time of peace, these items should not be stated separately; and, although all these details are perhaps not necessary for the guidance of the owners of the business, they should be available in order to make possible a more complete statistical survey than has hitherto been possible.

If all companies were required to publish the information suggested above, in addition to that already laid down, it would be possible, with a modicum of skill, to interpret accounts, despite the flagrant lack of uniformity in their form and in the language used to describe the various items. There would appear, however, to be no reason for not insisting upon uniformity of form and language once uniformity of information were prescribed. This wider uniformity would tremendously simplify the work of all concerned. It would doubtless be impossible to draw up one form of accounts which would be suitable for a bank, a railway, a manufacturing concern, a rubber plantation company or an enterprise giving advice on industrial management. But it should be possible to prescribe one form for each, and the more complete the information demanded the easier it is to draw up the prescription.

While the above requirements will probably suffice for the normal manufacturing, extractive or plantation company, something more will clearly be needed from public

utilities, especially where these enjoy the special privilege of complete or partial monopoly. It is evidently impossible to give even an outline of the information which should be demanded in these cases; but it is important to establish that monopolies must work in the full light of day. It might very well be the case that concerns enjoying this special privilege should have their accounts examined by an independent public body charged to report to Parliament on the efficiency of the administration—and to report with less delay than has commonly been associated with such bodies in peacetime.

The immediate justification for the demand that light should be let into the dark places of the history of company finance is to overcome the disabilities associated with absentee ownership, to remove abuses and to re-educate the suspicious. The ultimate need for information is even more compelling. Whatever share Government may have in post-war industry and commerce, it can scarcely be imagined that there will not be changes in the method of their direction and management; the field over which it is possible to achieve success by the old, well-proved but much fallible system of trial and error, aided by flair, is now rapidly contracting as that in which scientific assessment is possible expands. It is all but certain that there will be some state dictation of industrial and commercial objectives in the future. A system of uniform and readily intelligible accounts, probing deeper as the degree of privilege conferred increases, is not a heavy price to ask in return for the benefits of limited liability, right of association and legalised monopoly.

Finance and Banking

The Fiduciary Circulation

The further increase in the fiduciary circulation, indicated as imminent after the publication of last week's Bank return, was duly announced on Wednesday of this week. It is the customary £50,000,000 jump which takes the fiduciary issue to £830,000,000. Since the outbreak of the war, when the gold in the issue department of the Bank of England was transferred to the Exchange Equalisation Account and the fiduciary issue was accordingly adjusted to the figure of £580,000,000, there have been five increases of £50,000,000 each, the average length of time separating them being about 6½ months. In 1941, however, the rate of expansion in the fiduciary issue increased appreciably; the life of the £680,000,000 figure was little more than four months before it was raised to £730,000,000 on September 3rd of that year, and a mere three months elapsed before a further increase of £50,000,000 was required. The interval between the latest increases in the fiduciary circulation has widened to about 4½ months; this is an indication of some flattening in the curve measuring the currency expansion, though the rise is still steeper than for the war period as a whole. There is no special new explanation to account for the persistent rise in the circulation. The total wages bill is still rising, and, despite the curtailment in goods available for civilian consumption, the purchasing power mopped up by savings and additional taxation is not increasing as fast as the money income of the nation is expanding.

The Bank Return

The Bank return showing the position on the close of business on Wednesday gives an almost exact picture of the changes following the increase in the fiduciary issue. This is because the items such as notes in circulation, bankers' deposits and public deposits show only negligible alterations over the week, namely, increases of £36,000 and £786,000 and a reduction of £1,419,000 respectively. Government securities to the amount of £50 millions were transferred from the banking to the issue departments following the increase in the fiduciary note issue, and the Bank return shows the Government securities held by the former to have fallen by £52,240,000, while those in the issue department were up by £50,144,000. As more of the notes created this week go into circulation, the securities of the issue department will be allowed to re-expand, thus neutralising the contrasting effect of the larger circulation on the volume of bank cash. The total of bankers' deposits, at £128,668,000, continues to reflect the moderate ease of credit conditions in the short loan market. Most of the banks have been buyers of July bills this week, though they still show a preference for mixed parcels of June and July bills. Money is abundant, and a fair amount of non-clearing money has been available at ¼ per cent. The banks were called upon to pay £40 millions in Treasury deposit receipts. This compares with nominal maturities of £50 millions, though it may be assumed that owing to pre-encashments the actual maturities were appreciably below the fresh payments.

Agricultural Mortgage Corporation

The prosperity of agriculture brings no grist to the mill of the Agricultural Mortgage Corporation. The experience of the Corporation over the year to March 31st last can best be summarised by the following comparison of balance sheet and profit and loss items:—

	March 31, 1941	March 31, 1942
First Mortgage Loans	8,462,518	8,073,268
Improvements Loans	81,682	76,863
Investments	2,801,809	3,261,255
Cash	374,266	350,132
Net Profit	326*	6,060

* Allowing for £10,000 grant by Minister of Agriculture and Fisheries.

The AMC thus remains more "under-invested" than ever. Its agricultural loans fell by £394,069 during the year, and conversely its unnecessarily large holding of cash and gilt-edged securities rose further by £435,312. It is true that, owing to some improvement in the commissions and fees earned and to larger net income from the agricultural properties owned by the Corporation, there was no need last year for the income to be supplemented by a direct grant from the Ministry of Agriculture. But, even so, the income was barely sufficient to pay the heavy cost of the Corporation's debenture charges, and the ordinary capital, subscribed by the Bank of England and most of the joint stock banks, remains dividendless, as it has been in all but two years since the AMC was formed in 1928.

Heavy Debenture Burden

The burden of its debenture capital has been one of the gravest handicaps of the AMC. The policy of the Corporation has been to mobilise resources well in advance of making its loans to agriculture. The timing of these operations proved most unfortunate. The Corporation issued £5,000,000 of 5 per cent debenture stock at par in June, 1929, another £3,500,000 of the same stock in May, 1930, and £2,000,000 of 4½ per cent stock at 95 in April, 1932. All its financing was thus done on the eve of the big slide in interest rates which began with the War Loan Conversion of 1932. In its early years, the AMC had showered upon it a fair volume of the joint stock banks' frozen agricultural loans. But the joint stock banks whose primary concern in the early 1930's was to increase their liquidity are now equally concerned at the persistent decline of their loans and advances. The joint stock banks, though they do not purport to lend on long term, and thus compete directly with the AMC, are in effect offering the farming community all the credit it requires, confident that, given the present prosperity of the industry, the loans they are making will be adequately secured and of short-term and self-liquidating

character. In effect, therefore, the banks are competing with the AMC which now finds itself almost devoid of new borrowers. The tendency, in fact, is for existing borrowers to repay their AMC loans. Small farmers are probably finding the wherewithal for repayments from the exceptional and modestly taxed profits they have been making; the larger farmers would find it possible to repay AMC loans from the proceeds of cheaper borrowing. The basic long term rate for AMC loans is 4½ per cent, while joint stock banks appear to be prepared to lend on short term at a lower rate than this. Unfortunately for the borrowers, however, the loan contract with the AMC provides for gradual repayment over a long period—ranging up to 60 years—and it is only in special cases approved by the directors that repayments other than those provided by the mortgage deeds are allowed. Such permission is being more readily given, and last year, of the £642,172 of mortgage loans repaid, £547,677 represented special operations approved by the directors. None the less, the restrictions on repayments, though fully in keeping with the letter of the contracts between the AMC and the borrowers, are at the present time galling in the extreme to the latter and it cannot be said that the good will of the Corporation is being improved by the present state of affairs.

Future of Agricultural Credit

It is most unfortunate that circumstances should thus have conspired against the AMC, for there can be no doubt that an important rôle awaits it in the post-war reconstruction of British agriculture. In some respects, that construction is taking place at this moment through the improvements to agricultural land brought about by the ditching and drainage schemes now under way. But in common with all other sections of British industry, agriculture is suffering from a considerable depreciation of its permanent assets other than land. Cottages, milking sheds and barns are falling into sorry disrepair, and whereas industry in general began this inevitable wartime running down of its equipment from a relatively high standard of efficiency, that was not, on the whole, true of farming in this country. In this work of renovation, there will obviously be need for long-term credit. If, after the war, it is thought desirable to subsidise British agriculture, there are few channels through which such subsidisation could be more effectively granted than through the extension of really cheap long-term credit for capital works of this character. The AMC would seem to be the obvious vehicle for granting such assistance. But if it is to perform any important rôle in agricultural finance after the war, it would be dangerous to allow the functions of the Corporation to become unduly atrophied during the war. The process of revivification may well demand an immediate downward adjustment of interest rates in the long-term loan contracts of the AMC and the consequent increase in the subsidisation which it receives from the Government.

Investment

Approaching Equilibrium

The stock market continues to suffer from inactivity, with the number of bargains marked not much more than two-thirds that of the period of relatively brisk business which characterised the second half of last year. They are, however, still well above the level of a year ago. In these circumstances, the very natural disappointment at the smallness of turnover cannot be accepted without modification. No doubt, the lack of an agreement with India is a factor making for caution, as are doubts about what the spring is to bring. But in the past these considerations have not been decisive because others of a financial character were dominant. If price movements are to continue small, this must be because the relative values of different classes of security have become adjusted, and because there is no longer any definite pressure of money driving prices up. A study of the figures suggests that the latter is certainly not true. The index of fixed interest securities, compiled by *The Financial News*, fell back to 131.6 in mid-December, and has since touched 135.3. In the corresponding period prior to the entry of Japan into the war, the rise was from 129.8 to 132.5, whereas a year ago it was even less, from 126.8 to 129.0. There is no sign here of any collapse in the stimulus of cheap money. In the case of equities, the move-

ments are rather more complicated. In the sixteen weeks after December 2, 1941, this index lost the whole of the improvement of the preceding 18 weeks, falling back to 74.8. It is now 76.3, having risen slowly, but with few interruptions, for over five weeks. Between early December, 1940, and mid-April, 1941, there was a fall of 3.7 points in the index to 66.3, or almost half as much as the net decline in the corresponding period of 1941-42. In point of fact, market conditions are not very different from those of a year ago, except that there would appear to be rather less to go for, in that equity yields are now more nearly adjusted to the long term fall in the rate of interest than was the case at that time. For this reason, it would perhaps be unwise to look for a repetition of the recovery in both values and business which occurred from June, 1941, onwards. Against this, there is the fact that the next few months may produce developments of even more decisive importance than the entry of Germany into Russia on June 22nd appeared to be at that time. Subject to special developments, particularly in the Indo-Pacific area, it seems reasonable to look for parallel movements in the general run of equities and fixed interest stocks. It can only be hoped that events will be such as to ensure that the direction will be upward.

Strong in Service

(extract from Annual Report and Statement of Accounts)

The Co-operative Permanent Building Society serves the public in England, Scotland and Wales through a network of Seven Regional Offices, Thirty Branches and Five Hundred and Forty-eight Agencies.

Over 60,000 homeowners and 95,000 investors have 164,000 open accounts in the books of the Society.

Funds invested in	
Trustee Securities	£2,356,000
Cash in Post Office	
and Banks	£1,297,000
Share Capital	- - - £22,052,000
Assets	- - - £31,174,000

In support of the Nation's War effort the Society subscribed £853,000 in aid of War Weapons and Warships weeks throughout the country. (To date these investments exceed £1,342,000.)

On the vital question of reconstruction after the war valuable Research work is being undertaken with the help of well-known experts.

New 3 per cent Savings Bonds

The latest development in the Treasury's campaign to push down the rate of interest consists in turning off the tap for the existing 3 per cent Savings Bonds, 1955-65, at the end of the month, and offering a new series on the following day. Like the old issue, these will be sold and repaid at par, but the redemption period is September 1, 1960-70. The ability to borrow for three years and eight months longer than was possible in January, 1941, represents an adjustment to the improvement in gilt-edged stocks over the past sixteen months. It is also an attempt to consolidate the ground already gained, doubtless in the hope of making it the basis for a further advance. It was, of course, inevitable that while the bonds were on tap at par their market price should be par offered. The mere announcement of the new issue sufficed to raise this to par bid, with the result that considerable sales, which had been on hand for weeks or months, were effected. It is likely to take some time to clear off such sales, but once that is done the terms of the new issue will presumably have some effect, although a small one, on the general level of the Funds, and through that on the general return on all securities. There is no need for surprise that the Savings Bonds should be altered while National War Bonds remain unchanged, for the latter have twice had their terms stepped up since they were first issued. The minimum application for both Savings Bonds and National War Bonds is, from May 1st, reduced to £50 for normal applications and to £10 on Post Office and Trustee Savings Bank applications. At the same time, the brokerage on handling National War Bonds, but not Savings Bonds, is halved. The former change is obviously to make it easier for the small man to take up these securities; it is possible that the latter is designed as much to discourage applications, with the intention of an early re-sale, as to reduce the payment to the broker as agent for handling applications.

Railway Receipts and Expenditure

The long-awaited White Paper, showing the incomings and outgoings of the main line railways and the LPTB for last year is at last available, and the forces of obscurantism have been routed to the extent that it gives similar figures to those provided in previous years. Full comment must wait until next week, but, meanwhile, these are set out below. The figures are not strictly comparable, as nothing is charged for War Damage in 1941. Owing to changes in rates and costs, no valid conclusions can be drawn except as to the money sums involved. The figures for 1939 are obtained by multiplying those for the final four months by three.

	1939 (£ millions)	1940	1941
Receipts:			
Passenger.....	90.8	104.8	132.1
Freight.....	120.7	140.5	158.8
Miscellaneous.....	1.7	2.7	2.9
Total.....	213.2	248.0	293.8
Expenditure.....	174.4	203.5	226.6
Net Receipts.....	38.7	44.5	67.2
Ancillary, net debit.....	1.0	1.7	2.1
Available.....	37.7	42.8	65.1

It will be noted that, whereas in 1940 the rise in total traffic occurred mainly under the head of freight, last year the principal expansion was in passenger takings. Further, the rise in expenses was much less steep than that in gross traffic receipts. The net amount available, at £65,125,000, compares with actual payments under the new agreement of £43,469,000. In view of the importance which the companies attach to keeping the conception of the standard

revenue alive, it is interesting to note that 1941 earnings exceed that figure by almost exactly £8,000,000.

Publication of EPT

In an article entitled "Directors and Auditors" in the *Economist* of April 11th, reference was made to "the existing ban on the publication of figures before EPT." That expression does not give a strictly accurate picture of the position, which is that, for reasons of security, certain companies, whose contribution to the war effort is very substantial, are subject to a number of limitations in their published accounts and statements, of which one effect is to conceal their EPT provision. Actually, other companies avail themselves of this encouragement to practise secrecy, and for all practical purposes it is not far from the truth to say that earnings before this tax are concealed for one reason or another. An apology is due for any inconvenience which may have been occasioned by a rather loose use of words; but the matter is taken up again less for this reason than to challenge the validity of the assumptions underlying the prohibition in so far as it does exist. There are evidently cases in which secrecy is desirable, but they are believed to be very few. In a general way, it is very difficult to see what information of use to the enemy could be disclosed by stating that the profit of an industrial firm had risen by 50 per cent before EPT. And to publish the figure would give very valuable information to the investor and make possible an extensive revaluation of equity shares on the basis of the post-war refund, the extent of which is likely to be a matter of outstanding importance. Many factors, other than turnover, enter into trading profits, and the dispersal of industry has been carried to a point where the mere fact that a company had done exceptionally well, or had failed to come up to expectations, would be just as likely to mislead those who were searching to discover the result of past attacks or to locate new objectives, as to help them. This suggestion will be violently challenged, but some of those who would hold it most foolish are prepared to go to the length of suppressing all information which could conceivably furnish the slightest clue on any subject of military or economic importance. That would, in fact, amount to suppressing everything but opinions, which, without a basis of facts, might well prove more dangerous through its effect on morale than the provision even of useful information to the enemy.

Inter-Exchange Consultation

A further development from the agreements reached between London and the twenty-two Associated Stock Exchanges a year ago is about to come to birth. This is the formation of a joint advisory committee, with equal representation for both parties, including a chairman, appointed by the members. The function of the committee will be to study any problem of interest to London and the provincial exchanges, and presumably any member of either will be at liberty to put forward suggestions. Although the body is purely advisory, it will clearly be of tremendous influence if suitably staffed, and it should be well occupied in preparing for the adaptations, which the post-war period will almost inevitably bring to stockbroking, as well as in promoting the general improvement in status which was the ultimate objective of last year's agreement. For the sake of completeness, it is a pity that the Provincial Brokers' Stock Exchange, representing individual brokers who have no exchange, cannot take part, since it has not yet accepted the agreement. It seems inevitable that, by staying out, its members will deny themselves opportunities of presenting their point of view, which may place them increasingly at a disadvantage as co-operation between their bigger brethren becomes closer.

Gas Stocks and Rationing

The passing of dividends for last year, not only the ordinary but on all classes of preference capital of the Gas Light and Coke Company, confirms the worst fears of the unfortunate investor in this one-time gilt-edged class of security. The result was not unexpected, since other concerns with very large interests in central London and the nearer suburbs had done the same. These concerns have not only had to face bomb damage and rising costs,

but they have lost a considerable part of their customers, without receiving a compensating demand from new industries. Further, the raising of charges was considerably deferred. The first five months of last year were a period of heavy raids, which have so far been absent this year. It is also the case that the lag in the adjustment of charges to costs has been reduced. For this reason, there was every reason to hope, that given immunity from bombs—a considerable assumption—1942 would bring better fortunes to holders of London gas stocks than did last year. Now, however, a whole set of new considerations has been introduced by the forthcoming rationing of coal, coke and gas, as well as their alternatives. For the country as a whole, the object of the scheme is to rebuild stocks, while providing for increased industrial production. For concerns whose main outlets will be the sale of gas and coke to rationed consumers, the effect can hardly be other than a fresh setback in earnings, unless profit margins per unit can be increased. The mere absence of outside disturbances will of course have that effect, but it is a nice question which factor will weigh more heavily. In the absence of accounts and informative statements, the investor can only hope for the best. Certainly, current quotations do not suggest that any material improvement is expected for some time.

Company Notes

Cunard Steam Ship Outlook

In the absence of particulars about the trading results of subsidiaries, the accounts of the *Cunard Steam Ship* for last year are not very enlightening. Income is increased from £505,339 to £1,022,287. This includes the maiden dividend of *White Star*, amounting to £500,000 gross, and a further special payment from another subsidiary, which is designed to help in the debenture repayment and the covering of preference dividend arrears. How far these sums were earned in 1941 is far from clear. Against the rise in revenue, the omnibus item of expenses is up from £89,024 to £365,441, largely as a result of providing taxation on the increased receipts, and after meeting debenture charges and depreciation, and setting aside £145,000 against £175,000 for taxation—mainly EPT—there is available

£229,701 compared with £146,111. Two years' arrears of preference dividend, paid during the year, call for £75,000 net, and the payment of last month, extinguishing the remainder of the arrears, will have absorbed the whole of the balance of earnings of the years 1940 and 1941, together with some of those of the current year. The next stage is to deal with arrears of second preference dividend, which will amount to £345,000 net by December. Although the market was disappointed that no scheme was submitted to deal with these, it appears very satisfactory that the chairman, Sir Percy Bates, should be able to express the belief that they can be met in cash this year, and that the company will enter 1943 with a clean sheet. This indicates a considerable further expansion in distributable profits, some part of which will be provided by the repayment of the 5 per cent debenture stock in February last. Of the £3,683,615 held available for this purpose at the end of last year, no less than £3,300,000 was borrowed from subsidiaries, mainly the *Port Line* and *Thos. and Jno. Brocklebank*. In his statement to shareholders, Sir Percy makes no reference to immediate prospects, but he throws out some rather alarming suggestions about post-war possibilities. They add little, however, to the general proposition that the ordinary shareholder, and possibly those who rank before him, will have to rely upon a world in which trade, and the movement of individuals, are made easy, for the receipt of a fair return on his capital. In one matter, however, he carries his argument of last October a step forward, namely when he says that the company will probably have to enter the air transport business in one way or another. Given reasonable freedom of trade and no favour, he believes that the sea will hold its own over a large field, but he evidently anticipates air subsidies. The ordinary stock of £1 fell a trifle on the report to 15s. 3d., while the second preference fell two points to 126½, including 33 points of net dividend up to June 30th next.

Coats' Dividend Reduced

Despite market disappointment, which suggested that the position had not been fully discounted, there was every reason to expect a reduction in the 1941 Coats ordinary dividend. The cut in the final payment of 1½ to

For a century, Milners have been receiving testimonials describing the exacting tests by fire, burglary, and bombardment that their Safes and Safety Installations have withstood. A quotation from a recent letter reads: "Our offices and warehouse were completely burnt out due to enemy action. The fire was of a very fierce nature, due to the contents of the building; but out of this inferno your old Safe emerged, a bit the worse for wear, but with all the contents safe and legible. . . ."

NATIONAL PROVIDENT INSTITUTION
FOR MUTUAL LIFE ASSURANCE

Founded 1835

48 Gracechurch Street, London, E.C.3

5 per cent, making 8½ against 10 per cent for the six preceding years, is necessitated by the movement in available profits. The net figure, after tax and depreciation, is reduced from £1,884,852 to £1,631,816, which gives equity earnings of £1,301,816 against £1,544,852, representing 8.9 against 11.1 per cent. The small surplus is devoted to raising the carry forward from £444,514 to £455,705. The reduction in earnings finds ample explanation in the introduction of clothes rationing and in rising costs. It is, however, clear that the company must have been forced to provide against damage to its extensive foreign assets and must also have suffered a further sharp reduction in the export trade last year. The American assets were, of course, pledged with the Reconstruction Finance Corporation, a necessity which may imply some loss of income from this source also. It is not improbable that the war will make some further reduction in the ordinary dividend inevitable, but the post war prospects of the concern remain excellent, and the market value of the shares quickly recovered the initial loss of 9d. on the publication of the preliminary figures. The £1 ordinary stock at the current price of 34s. 6d. yields £5 2s. 11d. per cent.

British Oxygen Accounts

Consolidated profits of British Oxygen, which in 1940 reached the record level of £1,897,508, last year suffered only a very moderate recession to £1,863,352. The accounts show no appreciable rise in charges against profits, an increase in United Kingdom income tax from £404,228 to £518,598 being compensated by a reduction of £100,000 to £500,000 in the transfer to reserve for EPT, income tax and war contingencies. Thus, equity earnings at £264,875 against £306,313 represent 14.7 against 15.7 per cent, while the ordinary distribution is correspondingly reduced by one point to 14 per cent. After writing back £20,768 adjustment on income tax on the final dividend to the carry forward of the previous year, the current carry forward is raised from £54,975 to £67,478.

	Years to December 31,		
	1939	1940	1941
Consolidated profit	1,387,995	1,897,508	1,863,352
Depreciation	422,053	451,108	460,061
U.K. Income Tax	304,162	404,228	518,598
Retained by Subsidiaries	99,292	86,703	76,506
Preference dividends	55,578	49,156	43,312
E.P.T., Income Tax and Contingencies	134,100	600,000	500,000
Ordinary Shares:—			
Earned	372,810	306,313	264,875
Paid	318,709	291,596	252,372
Earned %	116.5	15.7	14.7
Paid %	114	15	14
Carry forward	140,258	54,975	67,478

These highly satisfactory results suggest that the company has been able to minimise the effects of wartime difficulties and that output has continued to expand. The balance sheet shows a fall in the surplus of liquid assets over current liabilities from £641,080 to £310,806, for which the rise in creditors, including taxation and contingencies, of nearly £500,000 to £1,723,767 is largely responsible. There is an increase in stock of some £230,000 to £963,613 and in debtors of some £130,000 to £969,622, while cash holdings are reduced from £467,886 to £222,215. The statement also shows a substantial rise in loans to subsidiary companies from £240,464 to £367,122. The value of the accounts is considerably impaired by the absence of a consolidated balance sheet. The outlook for stockholders remains promising, although a further moderate reduction in the ordinary payment this year is not improbable. The £1 ordinary stock at 67s. 9d. ex dividend yields £4 2s. 8d. per cent.

NORANDA MINES LIMITED

DIVIDEND NOTICE.

Notice is hereby given that an interim dividend of One (\$1.00) Dollar per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable June 15, 1942, to shareholders of record at the close of business, May 20, 1942.

By Order of the Board.

April 17, 1942. J. R. BRADFIELD, Secretary.
Toronto, Canada.

De Havilland Report

The fall in net profits of De Havilland Aircraft from £260,527 to £108,108 in 1940-41 does not represent a completely accurate comparison, since only in the latter year are profits struck after all tax, including tax on dividends. On a comparable basis there is, however, a reduction in earnings, after tax and depreciation, from £218,027 to £108,108, and, after halving the transfer to staff funds at £10,000, in equity earnings from £188,423 to £92,174. With no bonus on ordinary capital, shareholders receive 10 per cent, against 12½ per cent in the three previous years, covered by a rate of 23.0 against 40.9 per cent. There is no transfer to general reserve, against £75,000, but the transfer to investment reserve is maintained at £50,000 and the carry forward raised from £27,083 to £29,257. The balance-sheet reflects a marked expansion in output which, according to the chairman, Mr A. S. Butler, has reached a new record level. The surplus of liquid assets over current liabilities is rather higher at £793,766, against £737,627, despite a rise in bank overdraft from £419,466 to £875,954. Stock is some £800,000 higher at £2,374,670 against £1,545,528, and cash holdings have fallen from £10,113 to the exceptionally low level of £7,618. The chairman points out that the decline in the total of shares in subsidiary companies and investment in an associated company is due in part to a transfer from investment reserve and in part to the sale of shares in a certain company. The fall in net profits itself is, of course, due mainly to the incidence of higher taxation and rising costs. The £1 ordinary shares, at 36s. 3d. ex dividend, offer the conservative yield of £5 10s. 4d. per cent.

John Summers Profits

The preliminary statement of John Summers for 1941 shows a recovery in trading profits from £553,590 to £874,934, compared with £879,429 in 1939. There is no increase in ordinary dividends, which remain at 6 per cent on "A" ordinary and 2 per cent on "B" ordinary capital, to which they were reduced from 8½ per cent and 4½ per cent respectively in the previous year. Whether, after taxation and depreciation, there will be a substantial rise in the cover for equity payments is not yet clear. Provision for taxation fell from £302,162 to £265,905 in last year's accounts, from which the management was able to deduct £107,000 estimated as recoverable from the 1939 transfer. In any case, it is probable that the management would prefer to devote an increase in the free surplus to raising the transfer to general reserve which fell from £400,000 to £100,000 in 1940. The improvement in the balance on trading account must be especially satisfactory for shareholders after the previous year's setback, which inevitably raised doubts as to whether the new strip mill could be used to capacity in war conditions. Approximately one-third of the "A" shares are held by United Steel. The £1 "A" ordinary stock at 16s. 3d. yields £7 13s. 7d. per cent.

Union Corporation

The full accounts of Union Corporation for 1941 show profits, after general expenses and taxation, of £644,661, against a comparable figure of £637,370, or £664,558 before general expenses. Earnings for dividend are up from £611,512 to £621,381, representing a rate—unadjusted for income-tax—of 64.5, against 63.5 per cent. Shareholders receive the usual 64 per cent, and the carry forward is raised from £122,150 to £127,531. These results were achieved despite certain reductions in dividends from the gold mines in which the Corporation is interested, for which the incidence of higher South African taxation was partially responsible. The directors state that provision for contingencies has been made by writing down certain holdings in the balance-sheet below cost and below market price—in no case are securities valued above market price. Thanks in part to the significant improvement in market valuations which took place last year, the balance-sheet figure of £3,089,597, against £3,186,439, must be considered to conceal an appreciable reserve. The statement shows no striking change other than the reduction of cash holdings from £6,086,679 to £3,036,054, in order to raise the corporation's holdings of British and Dominion Government securities from £602,200 to £4,502,200. The position of the corporation is clearly very strong, and there is every probability that the dividend can be maintained. The 12s. 6d. ordinary shares, at 122s. 6d. ex dividend, offer a yield of £6 10s. 7d. per cent.

Industry and Trade

Design and Speed of Merchant Ships

The appreciation of the part shipbuilding must play in equipping the United Nations with adequate offensive power is reflected in a more critical attitude towards this part of British war production. Some of these criticisms were discussed in *The Economist* of April 4th and 11th. Others deal with the types and design of new merchant ships. It has been suggested that standardisation could be carried further; that the speed of the ships should be increased; and that output should be concentrated on small, fast ships. The merchant shipbuilding programme comprises general cargo carriers of about 10,000 tons deadweight and moderate speed; various types of cargo liners with speeds from, say, 14 to 17 knots; tankers of about 11,000 and 14,000 tons deadweight; a smaller type of tramp ship, or general carrier, with a capacity of approximately 4,700 tons deadweight; coal carriers for the coastal trade of 2,500 and 4,000 tons deadweight; smaller coastal ships carrying general cargo; and auxiliary vessels such as tugs and barges. The proportions in which the various types are built have had to be altered from time to time to meet the requirements of the import programme and changes in sources of supply and to make the best use of production facilities. It is known, for example, that recently a higher proportion than before of refrigerated cargo liners was being constructed. Some of the ships are being built directly for the Government and others have been ordered by shipowners, but in both cases design and equipment have been simplified to assist rapid production. It is probable, however, that simplification could be carried further, particularly in the higher class of tonnage being built privately, without materially detracting from the comforts of the crews, who fully deserve the consideration that is shown them.

The fact that such vessels, which take longer to build, are being constructed at all is not in itself evidence of inefficiency from the standpoint of war demands. They may be better suited to the facilities of the shipyard and to their particular service than a simpler design of ship; they will be able to make more voyages in a given time and they may be able to sail without convoy owing to their greater speed. The last two arguments have often been used to support the case for abandoning the construction of comparatively slow tramp ships in favour of faster vessels. But it is often overlooked that it may be quite impossible for the boiler and engine-makers to supply sufficient machinery of the higher power. Priority for such machinery must be given to naval vessels. The same problem has arisen in the United States, where 8,000,000 tons deadweight of merchant ships are to be constructed this year and, according to General G. C. Marshall, 15,000,000 tons in 1943, against the 10,000,000 tons envisaged by President Roosevelt in his message to Congress on January 6th. The Chairman of the United States Maritime Commission has made it clear that the decision to instal relatively low-powered, old-fashioned engines in the majority of ships being built in America today was governed by the supply of marine engines. It was arrived at reluctantly, for it represented a reversal of American practice, but it was judged to be the best course in existing circumstances. A smaller vessel than the 10,000-ton tramp ship which is the main component of the British shipbuilding programme would have the considerable advantage of presenting a smaller target to the enemy, both ship and cargo. But, in relation to cargo capacity, the smaller ship would take longer to build and would be more extravagant in steel, crew, fuel, equipment and machinery, both main and auxiliary.

Unemployment Statistics

An innovation has been made in the statistics of the numbers of unemployed persons registered at employment exchanges in Great Britain. The figures now given do not include men who have been classified by interviewing

panels as unsuitable for ordinary industrial employment, or women classified as unsuitable for normal full-time employment. The table below shows the corrected figures for February 16th and the registered unemployed on March 16th:—

	Wholly Unemployed	Temporarily Stopped	Persons Normally in Casual Employment
February 16, 1942			
Men	62,935	10,426	8,654
Boys	10,485	238	9
Women	48,663	6,255	311
Girls	11,519	348	1
Total	133,602	17,267	8,975
March 16, 1942			
Men	58,353	4,110	5,621
Boys	9,084	57	6
Women	44,154	3,926	253
Girls	10,055	143	...
Total	121,646	8,236	5,880

To compare the figures with previous months, 26,508 "unemployable" men and 2,065 women should be added to the wholly unemployed on February 16th, bringing the total to 162,175. This makes the grand total for February 188,417, compared with the revised figure of 159,844. On March 16th, the number of persons classified as unsuitable for industrial or normal full-time work was lower; 25,973 men and 1,709 women were so classified. It may be that some had found employment, though many would cease to appear on the registers for one reason or another. Nevertheless, for the March figures to be comparable with earlier figures, 27,682 men and women would have to be added to the total, and this would raise the number in the total unemployed in all categories from 135,762 to 163,444. On both bases of calculation the decline in unemployment from February 16th to March 16th is over 24,000—a larger drop than any recorded in any one month during the winter.

Part-Time Workers

The organisation of part-time work which, in the aggregate, could add appreciably to war production, is still defective. While in certain localities such as the belt round North Western London, the opportunities for women part-time workers definitely exceed the supply of available women, there are many other districts which suffer markedly from the opposite form of maladjustment. In the administrative area of East London stretching roughly from Bow to Barnet and Tottenham and from there to Dagenham, some five thousand women recently registered for part-time work as a result of a recruiting campaign, and there is reason to believe that some thousands more could be found. Yet only a few hundred of those who have registered have been absorbed. There is no evidence of a serious shortage of materials and the proportion of factories in this area working twenty-four hours a day probably does not exceed forty per cent. There is reason to believe that many managements are still reluctant to take on part-time workers, especially in the smaller type of business. It is to be hoped that the promised grouping of small undertakings will bring some improvement. Experience has shown that the solution of the problem might be assisted if foremen and charge hands, instead of participating in bonus payments, were remunerated by a generous flat rate. Where such men participate in the bonus, there is a strong tendency for them to resist the upgrading of a competent

FAMOUS SINCE 1795

OTARD'S
COGNAC BRANDY

worker who might be removed to some more responsible position and make room for part-time workers.

*

On the part of the public, there is a great deal of unco-ordinated effort and enthusiasm for shouldering part of the industrial burden. Thus an interesting experiment is being made by Messrs Harrods to find a form of work which volunteers from their staff can perform on the premises in their spare time. There are also plans elsewhere for organising simple assembly work in such a manner that it can be contracted out to home workers. This system has been known in the Midlands for a very long time. It is not favoured by the more up-to-date types of management because of the technical difficulties and disadvantages. Even so, experiment should be encouraged. A rather less successful move is the encouragement given to its members by the Metropolitan Police to seek part-time work in factories after working hours. These men often cannot give more than two or three hours a day, and it is for this reason almost impossible for an employer to make use of them. The result of the action of the police authorities seems, in many cases, merely to have been to overburden the posts with applications, and to induce a sense of frustration. But the problem of finding work for the police and persons in similar positions deserves further examination.

* * *

Cotton Cloth Prices Controlled

The Control of the Cotton Industry (No. 32) Order, issued last week, provides for the control of the prices of cotton cloths on the basis of fixed margins. The announcement caused some initial confusion in Lancashire, but traders will soon settle down to the new conditions. The first impression was that numerous difficulties would arise in putting the scheme into operation, but after certain points were made clearer it became apparent that on the whole it would be beneficial to manufacturers and would lead to stabilisation and the end of ruthless internal competition. It is laid down in the Order that all contracts are to be net for payment within 14 days of delivery. No discounts are allowed and $\frac{1}{2}$ per cent interest must be charged for each month after 14 days. Buyers pay delivery expenses, as the price provides for delivery at sellers' premises or nearest railway station. No allowance in excess of one per cent can be made for faults or late delivery. Manufacturers may pay one per cent commission to an agent ($1\frac{1}{2}$ per cent if the account is guaranteed), but any commission paid must not be added to the cloth price. The system of calculating controlled prices has met with considerable criticism. Some anomalies have been discovered, but it is reported that the Control office is prepared to deal with any representations and a promise has been made that any injustice will be removed. Throughout the industry the principle of controlled fixed prices has been accepted. The opposition has been almost entirely centred on important details which relate to the working out of prices and comparisons between one cloth and another. As a result of discussions between various parties there should be no difficulty in finding ways and means of reaching agreement on desirable amendments to the scheme.

* * *

Efficiency in Farming

The great depression of 1930-35 provided a considerable stimulus to increased efficiency in English farming. Studies of farm costs indicate that, in East Anglia for instance, the volume of output per person employed (including farmers) rose by some 25 per cent between 1931 and 1936, while the value of output per worker increased by about half, owing both to the rise in farm prices and to the changed character of the output. It appears that the present shortage of labour, coupled with the rise in farm wages, is likely to have a somewhat similar effect. Between 1939 and 1941 the area of tillage in Wales increased from about $3\frac{1}{2}$ to 9 acres per person employed, while the numbers of stock were well maintained, with the exceptions of pigs and, to a smaller degree, of poultry.* Even on the relatively

* "The Supply and Use of Farm Labour in Wales." *The Farm Economist*, Vol. IV, No. 1, Jan.-Mar., 1942.

small and steep Welsh farms, therefore, the fuller use of tractors and other types of modern machinery has led to greater efficiency in the use of that scarce factor, labour. It is true that there has probably been some scamping of maintenance work during the war years, and that the rush periods of spring cultivations, hay-making, and harvesting have led to the working of exceptionally long hours. But even with these allowances, it is clear that the pressure of war conditions has led to what is likely to be a permanent increase in the output per man employed in Welsh farming, and there is no reason to expect that the same trend has not appeared in other parts of the country. This fact is clearly of the greatest importance in any plans for post-war farming. For whatever volume of output British agriculture is called upon to produce after the war will be provided by comparatively few men (judged by pre-war standards), enjoying a comparatively high standard of life. That is clearly a national advantage, since the efficiency of British farming, as of other industries, is better measured by the output per worker than by the total number of workers employed, as some advocates of peasant farming recommend.

* * *

Merchant Shipping Losses

In July last year, the Government decided to suspend the publication of monthly statistics about British, Allied and neutral merchant shipping losses, "because valuable information is by this means given to the enemy." At the same time, it was announced that the publication of losses would be considered from time to time. Apart from an uninformative statement made by Mr Churchill some months ago and from his more recent allusion to a serious increase in losses since last December, no facts have been given since June last year. The Government's decision to stop the issue of shipping losses immediately after the month during which they occurred cannot be questioned; but the objection to delayed publication, say after a lapse of two to three months, is more difficult to understand. True, especially as naval losses continue to be announced, as the United States has since entered the war, the publication of merchant shipping losses has become a concern of the authorities in that country, but the maintenance of a complete statistical blackout might do more harm than good.

* * *

The Production Engineer

British engineers have long been among the best in the world. But in modern industry it is no longer enough to design new and better tools with which to make new and better products, such as motor cars and guns in war times of peace, and tanks, machine guns and guns in war. In order to reduce unit costs of production, the design of the tool must be closely related to the design of the product; both must be as simple as possible; and, especially in large-scale production, the factory must be regarded as one single machine whose many parts must all be carefully adjusted to yield maximum returns. The need, therefore, arose for the production expert, whose main task is to secure the highest possible output from the men and materials at his disposal. To meet this need, which involves careful training and intensive research, with special reference to methods of production, the Institution of Production Engineers was founded after the last war. In a recent review of the record of the Institution, the Rt. Hon. Lord Sempill, its deputy-president, had no difficulty in justifying its existence. In one sense the production engineer has become the key-man of the modern factory, and, somewhat belatedly in comparison with the United States and Germany, where greater emphasis has hitherto been placed on methods of production than in this country, his importance has now come to be recognised. Apart from its contribution to education and research in production engineering, the Institution has prepared a number of useful memoranda containing suggestions designed to speed up the output of war equipment. The latest of these memoranda, which has been submitted to Mr. Lyttelton for consideration, deals with the utilisation of machinery, simplification of designs, rationalisation, and improvements in manufacturing methods. In view of the need for a spurt in production during the next few months, the suggestions of the production engineers would seem to deserve careful examination.

COMPANY MEETINGS

SUN LIFE ASSURANCE SOCIETY

SIR WILLIAM GOSCHEN'S STATEMENT

The annual general meeting of the Sun Life Assurance Society as held, on the 21st instant, at 63 Threadneedle Street, London, C. 2.

The Hon. Sir William H. Goschen, KBE, chairman of the society, issued a statement to shareholders, which took the place of the address usually made at the meeting.

In outline the statement is as follows:—

CHANGES IN DIRECTORATE

My first duty is a sad one, for I have to record with deep regret the death of two members of the directorate. The passing of Lord St. Just after nearly 39 years' service on the board has deprived us of the advantage of his wide experience and intimate financial knowledge which has proved invaluable in our deliberations.

Mr Scott Murray, who died with tragic suddenness, served as director for 32 years, and he will be sadly missed.

It gives me pleasure, however, to refer to the appointment of Mr Otter-Barry as a director of our society. I am confident we shall derive much benefit from his wide legal knowledge and insurance experience.

NEW BUSINESS

I will now deal with the annual report and accounts, and will proceed later to a consideration of the valuation report. You will see from the former that our total funds at the end of the year amounted to over fifty million pounds, a figure which itself marks yet a further stage in the progress of the society. The life assurance new business secured during the year consisted of 12,564 policies for sums assured of £7,055,000.

FUNDS, INCOME AND OUTGO

Turning to the accounts, the life assurance fund has increased by over £1,700,000 during the year, and the renewable premium income, which description, of course, excludes single premiums, was £5,077,000. This figure is slightly larger than that of the preceding year, and it is gratifying that the new business secured during the year has enabled us so to maintain our premium income. The gross rate of interest earned was £4 4s. 11d. per cent. per annum, compared with £4 8s. 6d. per cent. per annum in the previous year. The fall is, of course, largely due to the support which the society has given to the new War Loan issues which bear rates of interest lower than the average rate earned in 1940 upon the funds as a whole.

On the other side of the account death claims are £1,621,000 as against £1,519,000 in 1940, and include war claims amounting to £274,000. Claims by maturity were £2,095,000. Surrenders at £327,000 were less than two-thirds of those of 1940; this reduction would seem to indicate a commendable recognition by our policyholders of the value of their life assurance in present conditions.

REVIEW OF ASSETS

Turning now to the assets of the assurance funds, an important feature has again been the expansion in our holdings of British Government securities, which at £15,351,000, show an increase during the year of over £1,900,000.

In accordance with their policy in recent years, the directors have again made no new investments outside the British Empire and have taken steps as opportunity offered to reduce the society's holdings of foreign securities. I am glad to be able to tell you that no less than 88½ per cent. of the assets is invested in Great Britain, while a further 8 per cent. is represented by other securities within the British Empire.

I am sure you will agree that it is a matter for satisfaction that the assets stand in the balance-sheet at sums which are considerably below their aggregate market value at the close of the year, and I do feel that whatever problems may lie ahead of us our investment portfolio will continue to justify our present confidence.

QUINQUENNIAL VALUATION

I now come to the report upon the quinquennial valuation.

The life assurance business consisted of over £153,000,000 in sums assured and bonus additions upon which the premium income amounted to over £5,000,000 per annum. These figures are substantially higher than those at the preceding quinquennial valuation.

The total liability was £45,927,488, and this figure is approximately £995,000 greater than it would have been if the bases employed at the previous quinquennial valuation had been adopted on this occasion. The total funds were £49,698,719 and the net surplus was £3,771,230.

Whilst no general distribution of surplus is to be made on the present occasion, a further valuation will be made as soon as possible after the cessation of hostilities.

INTERIM BONUSES

The interim bonus regulations for the year 1942 will, however, safeguard the interests of those policyholders whose assurances either become claims or are surrendered during the present year, and it is intended to make similar regulations in future up to the date of the next valuation. I need hardly say that our object will be to safeguard, as equitably as changing conditions permit, the interests of continuing and discontinuing policyholders alike.

STAFF

The complexities and problems created by the war have weighed heavily on the management and depleted staff. I am sure it is the desire of the shareholders to be associated with the directors in paying tribute to the efficiency and loyalty that has been displayed by the staff under very trying circumstances. To Mr Edwards, our general manager, I would record our sense of gratitude for his untiring efforts.

In conclusion, I would like to assure the large number of our staff now serving with the Forces that our thoughts are constantly with them and we wish them God-speed.

B. MORRIS AND SONS, LIMITED

SATISFACTORY RESULTS

The annual general meeting of B. Morris & Sons, Limited, was held on the 22nd inst. in London.

Mr. Arthur James May (chairman and managing director) said that the profit on trading was £19,107 and interest and transfer fees £180. On the other side, rent, rates and taxes showed an increase of £435, insurance an increase of £1,541 and against pre-war insurance an increase of approximately £3,900—a very heavy expense. The other items in the profit and loss account were much the same with one exception. The balance of profit carried to balance sheet showed an increase of £9,407 at £12,086, this being the profit for the year, and was due to increased demand for their cigarettes and tobaccos and marked increases in the sales of their brands of cigars and whiffs.

Great consideration had been given to the question of allocating the profits for the year. These were exceptional times and the directors felt that if it was possible, all shareholders should have some return on their investment. Should their recommendations be accepted, with the arrears of preference dividends out of the way and presuming the company's trading in 1942 turned out as well as expected, a very substantial reduction of the debit balance on the profit and loss account could be looked for next year. No one could prophesy in these days, but he might say that 1942 had opened very well.

A large amount of money had been spent in the past in establishing the business, and there was nothing on the assets side of the balance sheet for goodwill or values of brands and trade marks. In view of the year's results, those items must have a considerable value.

The report and accounts were unanimously adopted; and a dividend on the cumulative preference shares at the rate of 7 per cent per annum for each of the years 1937, 1938, 1939, 1940, and 1941 and a dividend on the ordinary shares at the rate of 3 per cent per annum for 1941 were approved.

ROYAL EXCHANGE ASSURANCE

222nd ANNUAL REPORT

INCREASED LIFE PREMIUM INCOME

RECOVERY IN FIRE DEPARTMENT

STATEMENT BY THE RT. HON. LORD BICESTER, GOVERNOR OF THE ROYAL EXCHANGE ASSURANCE, ON THE OCCASION OF THE PUBLICATION OF THE ANNUAL REPORT AND ACCOUNTS OF THE CORPORATION FOR THE YEAR ENDED DECEMBER 31, 1941

Following the procedure adopted last year, in order that stockholders may be kept as fully informed as possible of the current affairs of the Corporation, I am now enclosing a statement on the year's work, to enable it to be received at the same time as a copy of the annual report and accounts of the Corporation for the year ending December 31, 1941. In view of this, I do not propose to address the stockholders at the annual general court which will be held, on the 29th instant, at the Royal Exchange.

No changes have taken place on the court of directors. From the executive staff, Mr A. L. Kavanagh, our home fire manager, after 37 years of much valued service to the Corporation, has unfortunately had to retire owing to ill-health, and Mr R. R. Hilton has been appointed in his place.

LIFE DEPARTMENT

The premium income of our life department amounted to £1,383,000, being some £6,000 higher than that received in 1940.

The net new sums assured under policies issued in 1941 at approximately £2,715,000 show an increase of £500,000 over the figure for 1940; I attach some importance to this increase as evidence of a remarkably healthy spirit prevailing in the public mind, and as showing a steadiness of outlook towards the future of this country.

Equally, it is satisfactory to record that fewer policyholders have found it necessary to surrender their contracts during 1941.

The gross rate of interest earned during the year 1941 was £4 6s. 8d. per cent. per annum, or 3s. 1d. per cent. per annum less than the corresponding figure for 1940.

On the other side of the account, the amount paid in claims by death shows a decrease, but as was the case in 1940, the amount paid was somewhat heavier as a result of the war. If allowance is made for the premature claims arising directly from war causes, the experience in comparison with the most modern standard tables for assured lives is satisfactory.

BOARD'S WARTIME POLICY JUSTIFIED

Those responsible for the business of life assurance were faced at the commencement of the war with the very grave problem caused by the complete uncertainty as to the possible extent of casualties which might occur among the civilian population from attack by air. I would recall that the Royal Exchange was one of the offices which took the lead in deciding to continue to include cover against the risk of death as a result of enemy action in this country at the normal rate of premium on new policies for approved civilian lives, and it is a source of great satisfaction that this extended service to the general public has so far not imposed the heavy liability which its adoption might quite possibly have laid upon us.

I shall have occasion to refer later in this report to the support the Corporation is affording to the needs of war finance, but I feel that it will be of interest to you to know that the investment reserves behind our life fund are today greater than they were even in the preceding year.

In viewing this result against the background of total war, waged at a cost that is infinitely greater than any the world has yet seen, and in circumstances of stress and strain without parallel in the financial sphere, we decided to pursue a very conservative policy in the investment of the funds committed to our care.

That such a policy must necessarily find some reflection in a further lowering of the gross rate of interest earned on our life investments follows as a matter of course.

ANNUITY BUSINESS

In the annuity department the purchase money and premiums amounted to £92,000, reflecting an appreciable decline in that

particular form of business, following the adoption of a considerate policy of your directors, and the same trend is observable, though to a lesser extent, in the capital redemption account.

It will be noted that one item appears in both the life and annuity accounts for the first time, being sums of £35,906 and £6,599 in respect of War Damage Act contribution. Making together £42,505, this represents the statutory liability arising from the Corporation's investments on both life and annuity accounts in property and mortgages.

The trustee and executor business of the Corporation shows little change from the results which were produced for the previous twelve months. The work of this department, through its nature, is naturally complicated by present conditions, and I feel sure the beneficiaries and others whom our trustee department is designed to serve will recognise the added difficulties, which are not lessened by the loss of so many trained members of our staff who are of national service.

FIRE BUSINESS

The year's business undertaken by our fire department has, as I am glad to say, shown a marked recovery, resulting in a transfer of £133,000 to the general profit and loss account.

This recovery has been made largely in respect of the home business. But it is equally satisfactory to report that in spite of the loss of business from enemy and enemy-occupied countries the results from our overseas trading, other than in the United States of America, have been attended with no less success than that achieved in the previous twelve months. We are, however, in a like position with other British offices operating abroad in being faced with increasingly severe demands for taxes both from Dominion and foreign territories. It is true that at present the increasing tribute is rendered necessary by the cost of the war more especially so far as our Dominions and Colonies are concerned, but it should never be lost sight of that British insurance comprises an integral part of the composition of industrial and commercial affairs, a service which surely merits a modicum of reward.

Conditions in the United States of America have naturally become more difficult, and our trading results there still remain disappointing.

MARINE AND ACCIDENT DEPARTMENTS

Last year in reporting to you on the results of our marine department, I emphasised that the marine market would, during a state of war, be faced with many special difficulties. With Japan fighting against us such difficulties are materially increased. Faced with this harder task, the splendid co-operation which has been apparent in the market as a whole has if anything become closer knit, with the result that means continue to be found to meet new and urgent problems as they arise.

The figures shown in our marine department indicate a further improvement in the condition of that account, and your court now feels that a transfer to the general profit and loss account of £35,000 is justified, and leaves the surplus materially higher than a year ago. Our marine fund now stands at £950,000 being 165 per cent. of last year's income.

Our accident department has had another satisfactory year. The profit of £106,000, although not so high as was reached in the two preceding years, is, nevertheless, good, and completes for the first time in the history of our accident business a cycle of three years each producing an annual profit in excess of £100,000. Much of our accident business overseas is now more difficult to control, and it would seem, at any rate in the motor car section, that our home business is bound to suffer still further from war-time

restrictions. But viewed in proportion these are small matters when weighed against the nation's needs, although it is our hope that while helping the national interests to the fullest extent of our ability, we may also preserve in the highest degree possible our continued service to our policyholders.

IMPORTANT NATIONAL SERVICES

Following on a survey of our departmental results, I should like to refer to certain tasks which have been undertaken by the Corporation in connection with the great struggle in which the nation is now engaged. The Royal Exchange, together with other insurance companies, in spite of a great depletion in personnel, is rendering very important services to the Government.

We have for some time past been acting as their agents in operating the war risk commodity insurance scheme. Now the Corporation's war risk department has also to handle the very large number of insurances which are effected with the Government under the War Damage Act, Part 2, which deals with the contents of business premises and private dwellings.

Schemes for war risks insurance have been introduced in various parts of the Empire, and, as in this country, the liability under these schemes is assumed by the Government concerned. The services of insurance organisations have been utilised for the purpose of issuing the policies and otherwise operating the schemes.

Added to all this, committees have been set up throughout the country for dealing with other sections of insurance work entrusted to us by various Government departments. The Corporation is rendering all these services to the country gladly, but our stockholders will appreciate that such work is making large demands upon the energies and time of all those left to carry on the business of the insurance industry.

FINANCIAL SUPPORT FOR GOVERNMENT

In meeting the financial demands of the war, the Corporation is also playing no small part. It is obvious that from every point of view it is imperative for business institutions such as our own to accord the utmost support to the Government's financial needs.

The result of our efforts in this direction can be seen in the altered figures in our balance-sheet for this year, where it will be found that the Corporation's holdings in British Government securities have risen from £3,302,000 to £4,354,000, an increase of over one million pounds.

Whatever effect this almost total support to the monetary needs of the nation may have upon our future investment income is at present of no matter. No other path is open to us, for without victory the labours of the Corporation for over 220 years would prove to have been in vain.

In dealing with the items of the general profit and loss account, it will be seen that in comparison with the previous year, a satisfactory increase in the transfer from the fire department has occurred, while, as I have already mentioned, the continued improvement in our marine business has now permitted us to take an amount of £35,000 into our accounts. The combined figure for the four departments at £283,000 is some £70,000 better than in 1940.

On the expenditure side, the only figure that shows a greatly increased amount is the provision for taxation, which this year requires £110,000, against £45,000 in the last account.

Altogether, after charging the dividend paid during the year, the balance on our general profit and loss account shows a slight increase.

DIVIDEND 30 PER CENT.

A dividend of 11 per cent. (less income tax) was paid in November last, and the directors are recommending at the annual general court on April 29th a further payment of 19 per cent. (less income tax), making a total of 30 per cent. paid on our capital stock for the year 1941.

It has been my custom to refer to the results of our associated and subsidiary companies. Conditions, especially relating to motor car business, which will naturally be influenced by the gradual diminution of private motoring, have not been so favourable either to the Car and General or the Motor Union companies; but in spite of this both have achieved satisfactory results for the period under review. The State company has shown improved figures.

This brings me to the conclusion of my brief review of the Corporation's work during the past year. It has been a hard and difficult time. War inevitably complicates business; total war multiplies such complications in geometric progression. The Cor-

poration has always been proud of its place in the international field of British enterprise; but it has been manifestly impossible for it to escape from the effects of the varying of our Empire's fortunes over the past two and a half years. Nevertheless, I am happy to say that neither the change in Far Eastern affairs nor the savage devastation which is slowly corroding Europe, has inflicted any grievous harm to the strength of the Royal Exchange as an international commercial concern.

I am sure you would like me, on your behalf, to convey to all those connected with this Corporation in our Dominions and Colonies our warm appreciation of their endeavours. They are constantly in our thoughts. At the same time I would wish to take this opportunity of expressing to our friends in the Dutch East Indies, China, and elsewhere, our sympathy in their trials.

TRIBUTE TO STAFFS

It is with this picture in mind that I wish on behalf of the court of directors and the stockholders to express our very sincere thanks to our staffs both at home and abroad for the magnificent way in which they have seen to it that the business of the Corporation has been carried on with the least amount of dislocation, and the utmost measure of efficiency.

Over 400 men from the Royal Exchange staff at home and abroad are now serving with the Forces, and in other national services, and to them we send our heartfelt good wishes and our appreciation of their endeavours. Eight of their number have fallen in the service of their country. To their relations and friends I wish to extend on your behalf our very deep sympathy.

The continual drain on the man-power of our organisation increases very considerably a problem already acute, but recently there has been the added necessity for the younger women to be allowed wherever possible to join either the women's services or to be enrolled for munition work. For those who remain there are many added duties.

The main burden is therefore falling more and more upon our executive both at home and abroad, but perhaps no better tribute to their conduct of affairs can be paid them than the very satisfactory results, which, through their endeavours, your court is now able to lay before you.

BRITISH TYRE AND RUBBER COMPANY, LIMITED

PLANT FULLY OCCUPIED

The annual general meeting of the British Tyre and Rubber Company, Limited, was held on 23rd inst. at Herga House, Vincent Square, S.W., Sir Walrond Sinclair, KBE (the chairman), presiding.

The following are extracts from the chairman's statement circulated with the report and accounts: The net profit for the year (subject to taxation) amounts to £337,460, to which must be added £72,915 brought forward, making a total disposable balance of £410,375. From this total we calculate it is necessary to set aside £200,000 for taxation and prudent to allocate a further £25,000 to contingencies reserve, which in consequence will now stand at £150,000.

Having regard to the uncertain future outlook, we have this year stepped up to £25,000 the writing off of goodwill, trade marks, brands, &c., thus accomplishing one of our main objects in eliminating from the balance sheet this intangible but nevertheless most valuable asset, which originally stood in the books at £205,000. At the same time, a further £25,000 has been added to the general reserve, which now reaches £275,000.

An interim dividend of 3½ per cent. (less tax) was paid on July 25th last on the ordinary shares. In order to distribute dividends as evenly and regularly as circumstances permit, your directors decided on February 11th this year to pay a further interim dividend of 4½ per cent. together with a cash bonus of 3 per cent. on the ordinary shares.

Throughout the period under review the greatest possible activity has been maintained over the entire field of the company's operations, all the available capacity at the factories, including those of the subsidiary companies, being fully occupied.

The volume of your company's business continued at the abnormal high level during the earlier months immediately following the close of the financial year, but the introduction of Government restrictions in the consumption of crude rubber became fully effective throughout the manufacturing industry on February 7th last. The report was unanimously adopted.

CLERICAL, MEDICAL AND GENERAL LIFE ASSURANCE SOCIETY

SATISFACTORY INCREASE OF NEW BUSINESS

At the annual meeting of the Clerical, Medical and General Life Assurance Society held, on the 22nd instant, at Hamilton House, Victoria Embankment, London, E.C., the following address was submitted by the chairman, Sir Francis E. J. Smith:—

The total net new life assurance business completed in 1941 amounted to £1,096,380, an increase of more than £250,000 upon the figure for the previous year. This satisfactory result affords evidence that the attractions of the exceptionally generous cover provided by the society's contracts are becoming more widely recognised.

Turning now to the accounts, may I first refer to two outstanding features—an increase in the total claims by death and a fall in the amount of interest income brought into account? Both reflect, from different angles, the effects of war-time conditions.

The claims by death, including about £92,000 in respect of war service deaths and civilian casualties, amounted to over £663,000, the largest total ever recorded by the society. The two war years, 1940 and 1941, have presented the common feature that although the claims were heavy in amount the character of the normal claims was favourable, and the inclusion of the war deaths produced only a small mortality loss.

The total interest income received by the society during 1941 was appreciably lower than in the previous year—an adverse feature rendered almost inevitable by the trend of recent events. Out of the interest income received various sums were set aside as internal reserves, thereby further reducing the amount of interest shown in the revenue account. For this and other reasons the published net yield of £3 1s. per cent., applicable to the total funds, does considerably less than justice to the earning powers of the society.

THE SOCIETY'S ASSETS

The customary detailed investigation of the assets by the directors disclosed a satisfactory position, subject to the general hazards of war. The total book value of these assets amounted, at the end of 1941, to about £16½ millions, consisting, apart from minor items, of £7 millions of mortgages, loans and deposits, £5½ millions of Stock Exchange securities, £2½ millions of property investments, and £1 million of shares in subsidiary companies.

The only significant changes in the distribution of the assets have been a reduction of over £650,000 in mortgages and loans, by complete or partial repayments, and an almost compensating increase in the society's holdings of British Government and Government-guaranteed securities which rose, during the year, by £680,000 to £2½ millions. The society's subscriptions to new Government issues since the outbreak of war amounted at the end of 1941 to about £1,700,000, a sum far in excess of the current growth of funds, and it is the intention of the directors to continue this support to the extent of available resources.

SUBSIDIARY COMPANIES

The results of the General Reversionary and Investment Company for the year 1941 have been highly satisfactory, and the shares show, upon the very conservative basis of valuation adopted, a margin of about £150,000 over our book value of £850,000. The true margin of value is, undoubtedly, considerably in excess of that figure.

The Lands Improvement Company has found its new business severely curtailed during the past year by difficulties of supply of materials, but a highly satisfactory standard has been maintained in the collection of interest and principal repayments upon existing advances. The year's working resulted in a reasonable profit, but with a view to further strengthening of reserves the customary dividend, although earned, was not paid.

INTERMEDIATE BONUS

As the result of the society's transactions during the past year a substantial addition was made to the surplus of £1,000,000 carried forward a year ago, the new surplus having been earned upon a scale appreciably in excess of the bonus cost implied by the recent distribution of profits. The directors are pleased, accordingly, to announce that these results justify the continuance until otherwise determined of the scales of intermediate bonuses previously payable upon policies becoming claims by death, maturity, or surrender.

RHODESIA RAILWAYS LIMITED

MODIFICATION OF LEGISLATION

The forty-fourth ordinary general meeting of the Rhodesia Railways, Limited, was held, on the 22nd instant, in London.

The following is an extract from the statement of the chairman, Mr Arthur E. Hadley, CBE, issued with the report and accounts:—

The gross revenue for the year ended September 30, 1941, amounted to £4,970,098, an increase of 10.9 per cent. over that of the previous year. The operating expenditure was £4,506,881, less. As a result of the year's operations there was, therefore, a surplus of gross revenue over working expenditure of £1,920,881, an increase of £533,978. In addition to the operating profit there was an income of £215,184 from investments, a profit of £12,000 from the realisation of certain investments and the annual subsidy of £10,000 payable by the British South Africa Company. There was also transferred £176,327 out of the amount of £547,200 provided during the year for depreciation and renewals towards the annual sinking fund payments for the redemption of the debenture stock. There is £2,335,324 to meet debenture interest £909,069, sinking fund £191,633 and income-tax £555,521, leaving a profit of £679,101 as compared with £332,882 in the previous year.

We have come to an agreement with the Governments of Southern Rhodesia, Northern Rhodesia and the Bechuanaland Protectorate for the temporary modification of certain clauses of the railway legislation in those territories. A dividend of £125,000, less tax, was paid on June 25, 1941. Your directors now recommend that a further £125,000, less tax, should be distributed in respect of the year ended September 30, 1940.

As regards the financial year which ended on September 30, 1941, our traffic continued to be heavy and the approximate results were as follows: Gross revenue £5,730,678, working expenditure £3,204,781, surplus of gross revenue over working expenditure £2,525,897. The working results for the first three months of the current financial year are: Gross revenue £1,428,208, working expenditure £754,199, surplus of gross revenue over working expenditure £674,009.

The report and accounts were unanimously adopted.

BEIRA RAILWAY COMPANY, LIMITED

FAVOURABLE PROSPECTS

The forty-first ordinary general meeting of the Beira Railway Company, Limited, was held, on the 22nd instant, in London.

The following is a summary of the statement of the chairman, Mr Arthur E. Hadley, CBE, issued with the report and accounts:—

The gross revenue at £878,223, was £27,744 less than in the previous year, but expenditure was lower by £8,291, so that the net revenue declined by £19,453. Import traffic, on which we get higher rates than on export, again declined, due to the inevitable effects of the war; but export traffic was, on the whole, well maintained. The net earnings of the line amounted to £433,552, a decrease of £19,453. After the addition of miscellaneous revenue and balance of interest, there is a total net revenue of £452,724.

On the debit side, the item general charges—£6,601, includes a debit on the Savoy Hotel accounts of £6,055, but this is after charging £6,395 for maintenance and depreciation. The main tenance charge was exceptionally heavy, due to the repainting of the hotel, etc. The reserve for taxation—£220,000, is the amount considered necessary to provide for our liability to the date of the accounts, for British, Southern Rhodesia and Mozambique income-tax, and national defence contribution. The cash position is very satisfactory, and investments costing £695,501 were under market prices at date of the accounts.

The result of the year's working is a profit of £99,011, which, added to the amount of £48,534 brought forward from the previous year, makes an available surplus of £147,545. It is proposed to pay a dividend of 2s. per share, less tax at 6s. 2d. in the £, absorbing a gross amount of £105,000.

With respect to the current financial year, we have received at present traffic receipts for five months—October, 1941, to February, 1942. Net earnings for this period amounted to £187,077, as compared with £174,692 in the previous year, or an increase of £12,385. I am, of course, unable to forecast the prospects for the remainder of our financial year, though at present indications appear to be favourable.

The report was adopted.

CUNARD STEAM SHIP COMPANY, LIMITED

BRITISH SHIPPING PROSPECTS

SIR PERCY E. BATES ON POST-WAR PROBLEMS

Sir Percy E. Bates, Bt., GBE., chairman of the Cunard Steam Ship Company, Limited, has issued the following statement, dealing with the affairs of the company, to stockholders, along with the accounts of the company and the notice of the sixty-fifth ordinary general meeting to be held on the 29th instant:—

There are but few explanations necessary to enable the stockholders to appreciate the meaning of the 1941 accounts. These I will try to compress as much as possible. The real interest of the stockholders must lie in what I feel able to say about 1942 and the future.

PROFIT AND LOSS ACCOUNT

The report and balance-sheet I think are self-explanatory, but the first item on both sides of the profit and loss account needs a word or two. On the credit side the dividends have been increased, first by a maiden dividend from Cunard White Star, Limited, and second by a special dividend from another subsidiary company, designed to assist in the special tasks of debt redemption and dealing with arrears of preference dividend. The first item on the debit side includes the figures for income-tax appropriate to the dividends. £145,000 has been set aside out of the earnings of the year to cover possible claims for excess profits tax; the position, however, is still obscure. Apart from this, the new and special dividends together substantially account for the difference between the two years.

My previous statements, as well as the 1939 and 1940 accounts, form the essential background to the 1941 figures, and there is nothing in any of them that I would wish to correct. They are all beads on a string.

PEACE UNCERTAINTIES

As to 1942, it became clear that to negotiate any bargain fair to the first preference, second preference and ordinary stockholders, was out of the question in times of war, and consequently the arrears of dividend on the first preference stock have been paid in cash. My forecast is that the dividend on this first preference stock will be continued on its due dates.

With regard to the second preference stock, the directors hope to be able to adopt a similar policy before the end of the year, and the matter will be considered from time to time in the light of developments as they may occur.

In the absence of unforeseen developments, I expect to see our company enter 1943 with a clean slate, and to be free to consider what it should do with an anticipated margin of earnings in the future.

POSITION OF ORDINARY STOCKHOLDERS

The proper employment of that margin depends on the consideration of a number of factors. Ordinary stock is the interest which takes the ultimate risk and should receive the greatest reward for taking it. The measure of the risk is the appropriate measure for the reward; in other words, our ordinary stock is, and will remain, the speculative investment which it has been since its beginning. Personally, I hope it always will be, for safety means but a form of dullness quite ill-suited to the daring habit of mind which has put mankind, and not one of the lower animals or the more scientific insects, on top of the planet. That there are difficulties ahead of us—and I here refer to the ordinary stockholder—is undeniable. I dismiss the actual war, because, of course, we shall win it, but the peace does present some uncertainties, with which we are directly concerned. Unfortunately, while we know that we shall win this war, we do not yet know when or how or what may be the attendant circumstances.

POST-WAR TRAFFIC

For instance, we do not know whether there will be—as there should—a freedom for every man to go and live and work where he wishes; yet nothing is more pertinent to the future policy of

Cunard White Star than this question. The answer will determine the shipbuilding programme, passenger ships, cargo ships, or ships carrying cargo as well as passengers.

Take our Australasian trade, based on exports from here and on wool and refrigerated cargo homewards. Who knows whether we shall be able to afford refrigerated meat from abroad? We may have to live on dehydrated mutton; very good, I believe, but it would make our refrigerated ships an almost useless luxury.

These uncertainties, and others, are themselves based on another point if current talk and writing may be given any weight. There is argument as to who is going to do the trading! It is strange but true that there is an active collection of people sufficiently devoid of any responsibility in carrying on the war effort to have the leisure to plan a new earth, at all events, after the war is over. This irresponsible section is endeavouring by bland but blind assumptions of the possession of all real knowledge to make it appear that the continuance of State trading in this or that and the nationalisation of this and that is already inevitable, and that only the details remain to be worked out.

EXTRAVAGANCE OF STATE TRADING

It is all very pretty, but it is not common sense. No one has yet been able unaided to haul himself into the air by his own bootstraps; and as we cannot rely on any continuance of the Lease and Lend Act, the country is going to be returned to its normal necessity of paying its own way. This means that for the imported food we need to keep alive our 40 odd millions, we shall have to perform services and offer exports at prices which other countries are willing to agree in exchange. Under any form of nationalisation or State trading, political reputations and, of course, careers, will be at stake, to be lost or destroyed by mistakes. Therefore, the margins necessary for State trading will always be higher than those required by commerce. I do not think we can afford the luxury of these margins, which will entail having to work longer hours and for less money in order to provide them; yet that will be inevitable if we are to have State trading as opposed to commerce. This section of enthusiasts does the people a poor service in concealing the essential and unavoidable extravagance of State trading.

POSSIBLE AIR TRAFFIC COMPETITION

Then, too, we have the air. Just as with ships, so the war will end on a rising curve of production. True, the bombers will not make very good passenger planes for the Atlantic, but the development of production will enable good passenger planes to be produced, and probably fairly rapidly. There will also be many thousands of men accustomed both to flying planes and to their navigation. All this may promise competition from the new element. I think our company will need to enter this element in one way or another, even though given a fair field the sea can probably hold its own. But once the possibility exists it will be availed of, and in any case, there will be a passenger traffic created out of nothing by the new possibility and not in itself competitive with the sea. The situation would change if air traffic were to be subsidised to an extravagant degree, and there will be much pressure in this direction. I think we shall have to take to the air, or at the very least maintain a direct association with it.

It is against a background of this kind that the stockholders, especially the ordinary stockholders, have to regard the future.

TRIBUTE TO STAFF

To the staff on shore the stockholders owe a large debt of gratitude for work carried on with reduced numbers and at times under most difficult and dangerous circumstances. The sea-going staff deserve special congratulation for devotion to duty, involving not only protracted absence from their homes, but also the continuous risk of enemy attack.

LACRINOID PRODUCTS LIMITED

DIVIDEND INCREASED TO 9 PER CENT

SUSTAINED PROGRESS

The fifth annual general meeting of Lacrinoid Products, Ltd., was held, on the 16th instant, at 50, Pall Mall, London, S.W.1.

The secretary read the notice convening the meeting and the auditors' report.

The following is the statement of the chairman, Mr H. R. Thurlow Prior, which was circulated with the report and accounts:

We have passed through another difficult period, but I am glad to be able to announce a net profit for the year under review of £25,457, after making ample allowance for depreciation and general expenses, comparing with a net figure of £16,493 for the previous financial year. Excess profits tax absorbs a large proportion of the net earnings, and a reserve out of the year's profits has been made for taxation in the amount of £19,250, making a total tax reserve of £31,117.

The balance-sheet shows that the current position is satisfactory; current assets totalling £67,783 against current liabilities, including tax reserve of £39,189, leaving a substantial surplus of £28,594.

In view of this sound position, your directors recommend the payment of a final dividend of 5 per cent (less tax), which, with the interim dividend of 4 per cent actual (less tax) paid in September, brings the total distribution for the year up to 9 per

cent, as compared with a total of 7 per cent for the previous year.

VARIED USES FOR PLASTICS

Great progress has been made in the development of new uses for plastics during the last few years, in which this company has played an important part, and I can assure you that we feel that our products will be in great demand during the post-war period. We have achieved an enviable name for quality of design and excellence of service, and under present conditions we are naturally embarrassed that we cannot fill the orders of our many valued customers in the button and clothing industries, and in the building, furniture, electrical and other trades which we supply.

There have been many special problems which manufacturers have had to face during the past year owing to the restriction of supplies and markets and the demands of the war effort on our staff, but we can claim considerable foresight in the building up of stocks of raw materials, which is reflected in the sound condition in which we find ourselves.

The management, staff and workers have carried out their duties faithfully and diligently, and it is my pleasant duty to convey to them an expression of your appreciation of their loyalty in the interests of the company.

The report and accounts were unanimously adopted, the retiring director, Mr. A. Van Beugen Bik, was re-elected and the auditors reappointed, and the proceedings terminated with a vote of thanks to the chairman, directors, management and staff.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

The expansion of business which was expected to develop on the removal of the Budget uncertainties has failed to materialise, in face of the latest developments in France. With the additional factor of the impending German offensive acting as a further deterrent to business, it is not surprising that the past week has witnessed very little change from the conditions of recent weeks in the markets. Firmness in the gilt-edged market was not fully maintained in the early part of the current week, when after small improvements at the re-opening, Tuesday witnessed numerous declines of $\frac{1}{8}$, while Old Consols fell $\frac{1}{4}$. Turnover in the foreign bond market remained small, although the invitation for redemption tenders of the Argentine $4\frac{1}{2}$ per cent sterling bonds occasioned a slight improvement in that country's stocks. Earlier support for Brazilian bonds had little effect on prices which later remained unchanged in rather quieter conditions. Apart from South American issues there was little of interest. A few small declines reflected the general absence of support in the home rail market, Southern preferred lost $\frac{1}{2}$ on Tuesday when LMS 4 per cent preference eased $\frac{1}{2}$ point. Prices in the foreign rail market fluctuated narrowly in quiet conditions with Argentine stocks slightly irregular, but losses nowhere exceeded $\frac{1}{2}$ point.

The industrial market attracted but little business during the past week, price movements were narrow and determined by influences affecting particular shares, but in general the tone remains distinctly firm. Brewery shares enjoyed quiet support which occasioned several small improvements, although Tuesday witnessed a reversal of the trend. Losses, however, were restricted to a few issues, while Guinness continued to advance. In the motor and aircraft group, Rolls-Royce lost $\frac{1}{2}$ after the previous Friday's improvement of $\frac{1}{4}$, but in general most changes were slight. There was little movement in the heavy industrial group, although the sharp

reduction of the Millom and Askam dividend occasioned some dullness, Stewarts & Lloyds deferred and Bolsover easing slightly. Cunard issues again provided the chief interest in the shipping market. After steady support on the hopes of a second preference payment, the absence of any specific promise by the chairman led to a slight recession, but prices later recovered. Among textiles issues J. & P. Coats lost $\frac{1}{8}$ on the lower dividend, but some support was forthcoming for British Celanese issues. Tobacco shares were dull and Imps followed up a decline of $\frac{1}{4}$ before the week-end with a further loss of $\frac{1}{8}$ on Tuesday, when Carreras gained $\frac{1}{8}$. The miscellaneous group reflected the general tendency of the market and was without any feature, Dunlop Rubber weakening on Tuesday.

Sporadic buying by the Cape early in the week relieved the quiet conditions of the kaffir market and produced some small gains. In both the tea and rubber markets intermittent enquiry kept prices steady, tea shares enjoying several improvements of $\frac{1}{8}$. Despite the developments in Burma, Burmah Oil was particularly firm at the re-opening with a gain of $\frac{1}{2}$, while Shell improved $\frac{1}{4}$. Mexican Eagles, however, gave way on the announcement of the valuation of the expropriated properties, while Ultramar weakened slightly on the annual report.

New York

CONCERN over the course of events in France occasioned some weakness on Wall Street before last week-end when declines up to three points were registered. The news of the raids on Japanese

cities gave rise to a better tone in the early part of the current week, and despite profit-taking, a small but general improvement followed.

COMMODITY AND INDUSTRY NEWS

Heavy Chemicals Export.—Under the Export of Goods (Control) (No. 19) Order (SR & O 1942, No. 711), made by the Board of Trade, which came into force on April 21st, the control in respect of certain heavy chemicals has been withdrawn. Apart from certain destinations to which the exportation of all goods is prohibited, no licences will, in future, be required to export chalk, whether ground or not, including whiting; caustic soda; cement, calcareous, ground and unground; salt; sodium bicarbonate; sodium carbonate; sodium silicate; and sodium sulphate.

Distribution of Tomato Crop.—The Ministry of Food is making arrangements for bulk supplies of tomatoes to be moved from the principal surplus producing areas (Lea Valley and Worthing districts) to the main "deficiency" areas. These supplies will be allocated to distribution committees of wholesalers for sale to retailers in deficiency areas, and such supplies will vary according to the quantities produced locally. Tomatoes produced in areas which are considered self-supporting will not be permitted to be sold outside the area. This season's tomato crop is expected to yield as many tomatoes as were normally available in pre-war years.

Oils and Oilseeds.—Production of vegetable oils from recent arrivals of oilseed is fairly good, and both edible and technical industries continue to receive substantial allocations for essential and priority purposes. The outlook for the future is obscured by developments in the war situation affecting two main sources of supplies of raw material. Bombay shippers, however, are offering linseed for shipment from the west coast as freight space becomes available; their quotations show no important change. Calcutta is out of the market for a time. Plate linseed has advanced sharply and shipping is very scarce, and adversely

affecting exports. The Canadian Government is reported to be encouraging farmers to increase the area sown to linseed this season, with a view to the production of 500,000 tons of seed, against 160,000 tons harvested last season, possibly to help supply Great Britain's future needs. The harvest is well advanced in the Central Provinces of India and the condition of linseed is stated to be fair. Trading in oilseeds generally is slow.

Agricultural Wages Advisory Committee.—The Agricultural Wages Board, at the request of the Minister of Agriculture, has set up a standing advisory committee to advise him on matters affecting the conditions of agricultural workers employed by war agricultural executive committees and to act, when required, as a court of appeal on local disputes between workers and the committees. A representative of the war agricultural committees and of the women's land army have been co-opted as members of the advisory committee.

Pottery Exports.—By the Export of Goods (Control) (No. 18) Order (SR & O

1942, No. 707), which comes into force on May 1st, the Board of Trade is to extend export control to cover certain kinds of pottery, including articles of a kind used for domestic purposes, other than sanitary ware, garden pottery and toys. Control under the Order will be effected by the issue of bulk licences to nucleus manufacturers and licences will be required for export to all destinations.

the ability of the Allies to find the ships. The shipping position has become severely more stringent, not merely or even mainly because of the rising curve of losses, but because of the new demands, delays and dangers brought about by the spread of Japanese power in the Far East.

The transport of a modern army, made mobile tactically by its mechanised equipment, is a tremendous task; strategically—at least when the sea must be crossed in face of opposition—its mobility is not high. There is a case for arguing that the bridgehead in Europe will have to be made by commandos, travelling light, and not by panzers; with the RAF, they will go first, and the armoured divisions will follow. But whatever means are contrived to ease the strain, ships remain the crux. Is Lord Beaverbrook prepared to state openly, from his own special knowledge, that the ships for an expeditionary force, as well as the weapons and aircraft, are available, and that it is only intransigence, or worse, on the part of the western Allies, that hold invasion back? These sugges-

tions add up to a capital charge, which should be made forthrightly or not at all.

It is the earnest wish of every Englishman—of every free man everywhere—that the manpower and the output of this country should be thrown in, at the highest price that will buy success, to decide the war this year. It is this year that counts, not next year. They ask for daring and for sacrifice as they have never asked before; they ask to face the ordeals that the Russians are facing for the same cause. The invasion of Europe will thrill England as no event has done since November 11, 1918, even though there will be long months of bitter fighting and heavy losses to follow. But it is a gross disservice to the high spirit of the people to suggest to them, from responsible official positions and without any evidence, that they are being misled, held back, and betrayed at the peak of their resolution—just as it would be a betrayal, indeed, of Russia no less than England, for the Government to prepare a larger and more disastrous Crete or Gallipoli under polemical pressure.

The Latest "Gamble"

THE German people have come to the end of a long and hard winter. In the course of it, they have achieved the great military feat of surviving a winter campaign in Russia. On the home front, the regime has, by a comparable feat in the field of mass psychology, succeeded in maintaining the unquestioning support of a great body of its citizens. Hitler is, for the time being, relieved of his worst fears in the east. The situation is not so critical as in December, 1941, when he made his last direct personal intervention. Nevertheless, one front—and a fundamentally important one—remains. Germany's survival now depends upon the maintenance of the present peak in war production.

It would be unwise to underestimate the stream of material which is still flowing from the German factories; but it seems certain that German industry reached its "all time high" in the autumn of last year, and the need to maintain production near that peak represents quite as serious a challenge as did the military situation last winter. Now that the American colossus has entered the race, Germany cannot set the pace much longer. The war must be won or driven to a stalemate this year. This implies, not only total victory in Russia, but sufficient reserves to make an Allied re-invasion of the Continent impossible. Neither can be achieved without an enormous accumulation and usage of war material. The question is whether, given the present economic position of German Europe, the necessary output can be achieved.

The failure to reach a decision against Russia in 1941 has meant that, for yet another year, the German war effort has had to rely on the production of Europe alone; and Europe's resources are not equal to the strain. The agricultural situation is unhealthy. Harvests were well below the average in 1940 and 1941, and the 1942 harvest promises to be unsatisfactory. The shortage of vital raw materials can be made good by the use of substitutes only at a very great expenditure of man-hours, fuel and plant. The chief bottleneck is labour. The labour force of Europe is working beyond capacity. A further intake of women is impossible without greatly extending day nurseries and kindergartens—which themselves swallow up more labour; the temporary demobilisation of soldiers to work in war factories has not been possible this winter because of the strongly sustained Russian pressure; to bring in more foreign workers would strain factory discipline to breaking point—its unsatisfactory state can be inferred from the greatly increased severity of the penalties imposed for absenteeism and slacking. There is only one possibility—to increase the efficiency of the war industries; but the slack that can be taken in here is probably small, and there is a point at which extra planning from the centre and extra directives to industry defeat their object by destroying flexibility and local initiative.

The situation can perhaps be best summed up in a series of dilemmas out of which some way must be found. Both the army and industry need more men. To bring in more workers from abroad means a decline in the agricultural output of their home countries—and Germany is getting shorter of food. To ration consumption goods still further might create a new margin of labour which could be transferred to war industry, but any cut below the present level would reduce the efficiency of the whole labour force. To rationalise industry further and to introduce a new nationwide drive to root out marginal inefficiency would arouse resentment and opposition in the managerial grades and probably frustrate its own purpose. All these and a host of other dilemmas spring from the fact that the Nazis are trying to make an instrument—in this case the productive capacity of Europe—do more than it can do. It is this combination of obdurate difficulties and sheer necessity that accounts for the latest personal intervention of the Fuehrer.

Since the autumn of last year, a number of significant changes have taken place in the organisation of the German economy. One of the first of these was the appointment of Wehrlein to supervise the transport system and to report back direct to Hitler. This was followed by the appointment of the Gauleiter of Thuringia, Sauckel, to take charge of labour supply. The decree appointing him was signed personally by Hitler and his wife—and rather vague—powers included the control of workers in occupied territory. Little publicity has been given to his activities, but the order prolonging school holidays into the autumn, so that all children over ten can help until the end of the harvest, probably comes from Sauckel's office.

The biggest changes have naturally come at the point where the danger of breakdown is greatest. The last months have seen what amounts to an unscrambling of the original structure of the armaments industry, and of the substitution for it of a new system, originating in decrees personally signed by Hitler soon after the death of Dr Todt. The problem was to combine an increase in efficiency with an increase in direct state intervention. Hitherto, the economic administration had fixed quotas, and allocated materials and labour, while the so-called "self-governing bodies"—in the main, the old cartels—dealt with production on a cost-plus profit basis. The new system, introduced by Hitler in his "Decree for Safeguarding the Armament Industry," is probably not yet fully in operation, but it hinges on the office and personality of Professor Speer, the new Armaments Minister. He is one of the Nazi young guard and before the war had the task of rebuilding Berlin and replanning the cities of Germany. His job in the new arrangement is to deal directly—with the assistance of picked bodies

of skilled engineers—with production problems, with rationalisation, the more economical use of men and materials, the closing of marginal factories and so forth. In a word, he takes over the sphere which was formerly more or less left to industrial federations. In return for abandoning their technical field, the cartels are, apparently, to receive greater administrative and executive freedom. The filling in of forms and the statistical reporting are to be drastically reduced; the allocation of materials and manpower is to be in fact transferred to the federations; it seems that the earlier state economic administration will "wither away" or its officials be absorbed among Speer's shock troops of production engineers, who will infiltrate the whole structure of industry as the representatives of the High Command of Wilhelm II's army infiltrated every military headquarters. It remains to be seen how the new system will work. It is hedged round by heavy penalties, including the death penalty, if false returns are made on the need for materials and man-power. And Speer has his check on this side of production by the provision that he can initiate proceedings against recalcitrant firms and, in collaboration with the Minister of Justice, determine what shall rank as new offences.

The significant point in all this experimentation and change is Hitler's direct intervention. The new officials are all personally responsible to him, they are all tried Party men; they carry with them the prestige of direct access to the Fuehrer. The technique is very similar to the one adopted by Hitler in December last year when he assumed direct responsibility for the army in Russia. Production is now the threatened front, and once again—and this time with the added prestige of success in the military crisis—Hitler is taking a hand. In December last, the military situation, and with it the unquestioning loyalty of the officer caste, was disintegrating under the stress of argument, discussion, dispute, doubts, fierce differences of opinion. The one thing a totalitarian system cannot survive, a breakdown in leadership, was on the horizon. Hitler was already Supreme War Lord, of course; but he chose in December last to underline his position of supreme authority in order to still the questioning and restore absolute discipline. It was a gamble. If the German army had broken, Hitler would have been broken with it. But it is not Hitler's weakness that he is a gambler. So far it has been his strength; he will never shirk a gamble when the alternative is defeat.

In the course of the winter, something resembling this situation has been developing on the production front. The business community has been fretting at inelastic controls and increasing pressure and friction. The Civil Service, which has lost its original Party purity through its vast wartime extension and consequent dilution with non-Party men, has become a hotbed of criticism and discontent. The totalitarian state can destroy all internal corporate activity save only the corporate

activity of the state itself—that is to say, the Civil Service. It is no coincidence that the Russian purges struck at the bureaucrats. The Civil Service is about the only group left in the absolute state capable of inspiring the solidarity that breeds independence of mind and, with it, criticism. Hitler cannot destroy it, any more than he could dismiss all his officers; but he can by-pass it; he can divide it up by splitting it into new sections—for example, the new committees and sub-committees of production engineers who are to work not by industry but by types of manufacture—tanks, aircraft and so forth. He can reinforce Party discipline; finally, he can exercise the magic of his personal intervention and responsibility.

It is against this background that Hitler's speech to the Reichstag must be read. Like the "taking over" of a military Supreme Command which he already possessed, the demand that the Reichstag should endorse powers which he has unquestionably possessed for the last nine years and has been using with a particularly personal emphasis in recent months is a dramatic gesture—a warning to the faint-hearted, an encouragement to the fanatic and the devotee. The speech itself is perfectly straightforward, seen in the perspective of the winter's reshuffling. The demand for full powers is preceded by the reminder that the terrific military ordeal of the winter has been overcome.

When nerves were at breaking point, obedience wavered, or where a sense of duty was lacking in mastering a task, I made stern decisions by virtue of the sovereign right which I believe to have received for the purpose from my German people.

Then Hitler turns to the production front. I have taken the necessary measures to prevent a repetition of a similar period of emergency. The German Reichsbahn will next winter discharge its duties better than during last winter—wherever we may be by then. Beginning from the locomotives and up to the tanks, tractors and motor lorries, our army in the east will be better equipped.

Finally he demands that the right of intervention which has worked such military miracles in the east shall be fully accorded in the sphere of production and on the home front generally.

"One thing I expect, that the nation gives me the power to intervene immediately and to act on my own initiative as circumstances demand . . . The Front and the homeland, the transport system, the administration and the judiciary must be governed by a single thought—to achieve victory.

Can the miracle be worked again? Is the screwing of an even greater productive effort from the overstrained machines and the work-weary labour force of Europe more impossible than maintaining an army unprepared for winter war through the rigours of the Russian cold? That is the question mark hanging over the Reichstag meeting. It would be folly if Hitler's enemies were to assume that this, his latest "gamble," is bound to fail.

The Fuel Ration

SIR WILLIAM BEVERIDGE has been spitefully treated—by the Government, who presented his plan for rationing fuel prematurely and without any details or documentation; and by the critics who have shown themselves only too anxious to condemn the plan unheard. Largely, the extraordinarily violent opposition to this rationing scheme has nothing to do with the merits of the case. In part, it is due to the ham-handed way in which the scheme was presented; in part, to unjustified personal animosities against both Dr Dalton and Sir William Beveridge; and in part, more justifiably, to resentment against the mishandling of the coal situation in the past two years by both the controlling interests and the Government.

No one can deny some justification in some of these arguments. Last week, a letter in the columns of *The Economist* from the Mining Association, by its contention that nothing at all is wrong anywhere in the production and distribution of coal, demonstrated, by proving too much, that something needs to be done, by an impartial authority, to increase the productivity of coal-getting. The one commodity of which this country, potentially, has enough within its own frontiers is coal. It is a reflection upon the foresight of all concerned, and not least the Government, which probably took away mining labour in undue numbers for military service, that this crisis should have arisen. It is imperative that, if rationing is to be introduced, it should be accompanied by the most stringent guarantees that the utmost rationalisation of both output and distribution will be put through at once under strict and direct control by the Government. But these are arguments that the crisis should not have arisen; they do not say that there is no crisis to make rationing necessary; they say the precise opposite. Above all, perhaps, it should be stated that the personal elements in this controversy are deplorable. Dr Dalton is regarded, rightly, it is to be hoped, as a "strong" Minister, determined to impose his will upon the industries that come within his purview; Sir William Beveridge's main fault would seem to be the efficiency with which he does the manifold duties which are entrusted to him.

There are only two questions to be asked about this plan to ration fuel. Is rationing necessary? Will this plan work fairly and effectively? The first question has been answered, with some authority, by Mr Arthur Horner, President of the South Wales Miners, who said on Monday that

there are no measures now conceivable which could guarantee coal production on a sufficient scale to permit the free use of coal as in the past. I see no difference in principle in applying rationing to coal or any other commodity.

Sir William Beveridge's report, published on Tuesday, carries the argument further: none of the alternatives to rationing can ensure fair distribution; if there is no rationing, there will be increased domestic consumption because of increasing purchasing power, with gross inequities reflecting differences in income; it is desirable that rationing should be introduced when it can be mild and done without hardship even to the poorest; it is necessary to provide ahead, for 1943 as well as 1942, because the demand for coal as the war effort grows is bound to rise. Seldom have the right arguments for rationing been so rightly and relevantly stated. Rationing is needed now to prevent shortages and severer rationing in the future.

There is much to be said for the view that, ultimately, rationing of all, or nearly all, essentials is the unavoidable consequence of leaving increased purchasing power in the hands of consumers in face of diminished supplies.

It is a view which the trade unions, in other matters, have been only too ready to endorse. So, too, is the opinion, amply based on experience in the past two years, that "the public will prefer fair compulsion and will reject

appeals." Under rationing, the poorest will get as much as last winter, and in many cases more.

There are no real alternatives to rationing. There are three complementary ways of ending the coal crisis: to increase the efficiency of the industry, which can take effect only slowly; to release men from the Forces, which is especially difficult if hard spring campaigns are ahead; and to ration fuel, which is admittedly complicated. The only commonsense line of action is to apply a dose of all three methods. The point made by Sir William Beveridge to the Press is unassailable; manpower is the crux, and for any man to be getting or transporting coal for non-essential civilian use, when he might be getting coal for the war industries or serving in the Forces, is a gross waste in any circumstances.

With these issues made clear, it should be possible to look at Sir William Beveridge's plan fairly and reasonably. It is symptomatic of the unreasoned bias of some of the protesters that they still make ammunition of the fact that the plan involves the use of 15,000 clerks; they do not add that these are temporary clerks, likely to be required for no more than six to eight weeks. Sir William Beveridge frankly admits in his report the special difficulties of rationing fuel; unlike food, fuel is not consumed evenly week by week, and its consumption cannot be controlled at shops; fuel requirements differ from house to house, from family to family, and from person to person; and control is difficult. On the other hand, it is hard to imagine a plan better calculated to overcome these difficulties than the one now under fire. Necessarily, the scheme embraces all fuels, in a scheme of points rationing with interchangeable coupons. Biggest virtue of all, the double ration, household and personal, is based on present needs, not past consumption.

No scheme could be easy either to work out or to apply. But the one serious problem which the plan leaves only partly solved is the problem of control. What is to be the sanction if the ration of coal, gas or electricity is exceeded? In the last resort, of course, the sanction must be the cutting off of supplies. But the plan especially notes this as a last resort; and it is suggested that small or unintentional excesses should be adjusted to be reductions in the ration for the following period. One possible expedient the report does not mention. The device of selling power and light at a double rate, rising when a certain quantity has been consumed, is well known in commercial practice; it might be possible to apply a similar principle, involving deterrent charges above the ration figure, though obviously this would unfairly favour the consumers with the most money.

It must be admitted that the rationing of fuel, like the rationing of food, is a heavy responsibility. The health and will of the people at war depend at bottom upon the necessities of life. But the argument for fuel rationing is the same as for food rationing. The only way to prevent, not only a shortage of vital resources for the war effort itself, but also hardship and inequity for the workers, is to introduce a ration in time; and there is no time to lose if the fuel ration is to be effective for next winter. Sir William Beveridge has stated categorically that, even to obtain all the 10 million extra tons by civilian rationing need involve no hardship for the poorest consumers, if rationing is begun now. The suspicion in Parliament has been due to the fact that the Commons Select Committee on National Expenditure, having reported some time ago that rationing should not be necessary—which is very now to say that rationing is not necessary—which is by no means the same proposition. It is reported that the plan may be dropped or weakened. This would be irresponsible foolishness; and it is to be hoped that the Government, while showing the utmost sympathy and receptiveness towards suggestions for improvements in the scheme, will be resolute in its determination to carry the scheme through.

Colonial Commandos?

ONCE again British forces are being forced to give up British territory to an invading power. The campaign in Burma, it is true, has not met with the immediate and overwhelming defeat that occurred in Malaya; the Japanese advance is being steadfastly contested; the far too few British soldiers may be tired, but they are not "soft"; and there is real co-operation between them and their Chinese allies. Nevertheless, for the second time British troops have had to fight a losing campaign in the presence of a large native population, whose co-operation with its protecting power might have turned the scales, but which has instead for the most part remained aloof or given help to the invader. Once again, therefore, there is much criticism of this lack of resistance except by the armed forces.

Total war must be fought by more than the organised armed forces. It can be—even in the colonies, as the people of Malta have shown. The guerillas of China and Russia have proved that resistance can be prolonged, to the serious detriment of the enemy, long after the main armies have been driven back. There is no sign that any attempt was made to organise guerilla bands in Malaya, and it is probably too late to organise them in Burma. But there is still time in other parts of the dependent Empire such as the colonies of British West Africa, which have been threatened by Laval's assumption of power and his wish to collaborate with the Germans, who have again bombed the neighbouring territory of Chad.

It is in British West Africa that the organisation of guerilla bands seems particularly suitable, for the nature of the colonies, and especially their social structure, make any other attempts to obtain the active support of their people difficult. When people talk glibly about apathy or treachery, they are apt to forget that backward races, who have been conquered all their history, will still submit to *force majeure*. If, for instance, Vichy or German troops were to invade a Nigerian town, the normal reaction of many of the natives would be to disappear into the bush. Others would remain out of curiosity, and of these a large number would act as guides or porters for the enemy, not for any base reason or indeed for any reason at all; they would simply do as they were told, because they are accustomed to obey and it is not in their nature to reason why. A comparison with the much more advanced and civilised Filipinos is unfair; the Filipino has some idea of the issues at stake which the ordinary African, with his very limited outlook, cannot perceive.

In these circumstances, it is very difficult to enlist the co-operation of Africans in their own defence. So far, the only active policy pursued by the authorities is to encourage enlistment in the local military forces. In British West Africa, the local governments have met with considerable success in their recruiting campaign for the Royal West African Frontier Force. But, relatively to the size of the populations, the RWAFF has only mobilised very small numbers, and in any case it has not skimmed the cream. The only entry is through the ranks, but this democratic method of recruiting makes it impossible for men of native rank and position to enlist. It is not, perhaps, sufficiently realised how feudal and aristocratic is the social structure of most of the Gold Coast and Nigeria. It is probably more unusual and difficult for the son of a native ruler to join up as a private, than it would have been for the son of a noble British family before the last war. Possibly, this reluctance is wrong—it is certainly contrary to modern British ideas—and the British policy of bolstering up such a social structure may be mistaken. But, as the facts are at the moment, there would be a danger of upsetting the whole social and political organisation of the country if young men of noble families were coerced or persuaded into positions where they would be ordered to perform menial tasks by corporals who, in local opinion, might possibly be on the lowest rung of the feudal ladder.

On the other hand, it is these acknowledged leaders

of society who could form the core of organised native resistance to the enemy, and they ought not to be wasted. They inherit from their fathers traditions of raiding and fighting, and their position assures them active assistance whenever they may find themselves in their own territories. At this stage, it is too late to establish African cadet schools for the RWAFF, and in any case it is not certain that the influence and traditions of these men would be best utilised in a purely military framework. But the organisation of guerilla units under their leadership would be a different matter. These units would be formed by the chief, just as in former days his predecessor summoned so many horsemen from each of his villages in time of need, to form an army for defence or attack. Now, as then, the first loyalty of these bands would be to their leaders. Most Africans have no national consciousness yet; but they have a strong local pride, and it would be easier to rally them to fight for their own chiefs than for "democracy."

The main function of the bands would be auxiliary to the activities of the regular armed forces. They would operate as nuisance raiders behind the enemy lines both in defence and attack. The only military training they would need would be practice in the use of small arms, in laying land mines and so on. Obviously, there would have to be some co-operation with the military authorities, and it is suggested that this could best be achieved through District Commissioners, specially selected and seconded, who would command the respect of both the leaders and their followers, and who know the country, the people and the language. The point is, however, that the guerillas would not be immediately under military discipline; there would be no compulsion on them to wear a uniform which many regard as unbecoming to their dignity; and to a large extent they would be left to their own initiative. In organisation, they would be a sort of Home Guard; in function they would be Commandos—in the original sense of the word.

The West African terrain favours the operation of such bands, and furthermore they could live on the country and would be completely independent of lines of communication. Transport, too, would be easy. In some parts, there would be a plentiful supply of horses; in others, the bicycle, which most natives can ride and enjoy riding, would be used—the Japanese took Malaya on bicycles. The Burma campaign has shown that the equipment of an army can be carried too far in tropical countries, and the equipment of the colonial guerillas would be of the lightest. Fresh supplies would be available in caches which the nature of the country readily provides. Moreover, the bands would find it easy to disappear after a raid, and it is highly unlikely that their whereabouts would be betrayed by their countrymen.

This sketch gives only a tentative outline of the sort of scheme that might be adopted for making the best military use of colonial manpower. Obviously, the details would vary greatly from colony to colony. The essential element is to base the plan on the peculiar social structure that exists in each. It may be argued that, in the event, the operations which such colonial commandos could carry out would be insignificant in relation to the scale of modern warfare. But it is the very totality of the present war that makes success in waging it dependent on the active support of the great mass of civilians. Any small operation achieved by the commandos would have a manifold psychological effect on the local population. It would stimulate popular support and assistance for their work; and, above all, it would encourage their countrymen to imitate them by hindering the enemy's forces in a hundred and one ways instead of—as has sometimes happened in Malaya and Burma—collaborating with them because of the complete lack of an organised nucleus of popular resistance. In a very different context, there may be a lesson for India in this plan for local defence, fitted to the people's own ways and traditions.

NOTES OF THE WEEK

Leaven in India

Sir Stafford Cripps reported to the Commons this week on his Indian mission, and the House accepted his findings. His main conclusion was that he had left a new leaven at work in India, especially among the younger men. Already there are signs that this leaven is at work. In Madras, Congress leaders have advocated co-operation with the Moslem League, and have even spoken favourably of Pakistan. There are divisions of opinion nearer the Congress centre, and plainly the old intransigent crust is splitting. Sir Stafford Cripps believes that it was this intransigence, born of an old deep-seated distrust, which wrecked his mission. The occasion of the breakdown was the distribution of defence functions between Indian and British authorities. But this was not a real issue because, as the White Paper on the Lord Privy Seal's mission proves, the British Government in fact met the substance of the Indian suggestions. Only in the dying stages of the negotiations did the real reason for failure emerge, in the shape of the Congress demand for an irresponsible National Government at once; to make this demand was, in effect, to refuse terms. It is worthy of emphasis that, on one ground or another, every organised body of Indian opinion refused in the end—Congress on the National Government issue; the Moslem League on the issue of Pakistan; the Sikhs because of their wish for British protection; and the Depressed classes for the same reason. All the Indian groups either did not trust the British enough or did not trust each other. Sir Stafford Cripps is confident that the seeds of future success have been sown simultaneously with the failure of his venture. Several members in the House showed themselves anxious to help on the process, to give fresh proofs of British honesty of purpose, to reinforce the impression given to India and to the world by the recent offer. It is impossible to expect the British Government to court failure by early renewed proposals: it would be unwise and ineffective. But it is essential that no step should be ignored to increase Indian confidence, especially by the appointment to high posts in India of men with the tradition of sympathy and understanding which Sir Stafford Cripps has done so much to set on its way.

Second Front in the Air

As the Allied air offensive over Europe has been extended and intensified, the *Luftwaffe* has been forced to return to the attack in the west. The bombing of Bath, Exeter, Norwich and York marks an important departure from the German strategic habit of doing one thing at a time. It is improbable that the German High Command really wished to interrupt the long lull in the serious bombing of Great Britain on the very eve of the summer campaign. True, the number of German planes employed in the latest raids has not been large—twenty only are reported to have been used against York. The appreciable damage which they have achieved is the result of concentration on relatively small targets and the use of heavier bombs. The percentage of planes lost has been high—twenty-five per cent are claimed in the case of the York raid. Thus, it is not possible for the Germans to maintain severe raids even on small provincial towns without placing an appreciable strain upon their air resources. There can be no doubt that the resumption of German raiding over Great Britain is as great a triumph for the RAF in its recent crescendo of devastating attacks as the actual damage inflicted on Lubeck and Rostock, Augsburg and Kiel. The enemy has been forced to hit back. The British raids have had to be taken seriously both from the standpoint of damage to output and shock to morale. The matter has had to be discussed in the columns of the German press, and reprisal raids have had to be promised and carried out. There are several signs which indicate that the German reprisals are intended mainly for home consumption. "Baedeker raids" against plutocratic spas may sound impressive to the German people. But they are peculiarly suited to stiffen morale in this country, and it can only be supposed that the Germans indulge in them because they are unable or unwilling to spare air fleets for attacks on more serious targets—at bottom, the Germans no longer believe in bombing as a separate weapon against defended areas.

Advance to Lashio

The land fighting of the week has been chiefly in Burma, for the Russian front is bogging down everywhere in mud, even in the more wintry Svir sector in the north. The battle in Burma has taken a turn for the worse in the development of a new Japanese thrust up the Salween River, a front on which there has recently been but little activity. A fortnight ago it was reported that at least one fresh division had been landed at Rangoon, and presumably the new thrust has been made possible by the arrival of sizable reinforcements. The country into which the Japanese have advanced beyond Taunggyi is mountainous jungle with poor roads; strategically, however, it is of the first import-

ance. The advance has carried the enemy not only to the flank of Mandalay's defences, but has brought him to the gates of Lashio, a key city on the Burma Road, which is now in immediate jeopardy. Probably very little material is passing along the track now. The danger is that it will provide an entry point into the heart of Free China not for goods but for Japanese. The aim of the Burma campaign is, after all, to cut off China from the United Nations. This objective can be achieved more easily up the Salween River than up the Irrawaddy or the Sittang, where, for the moment, the enemy is held.

More Independents

Twice more the Government has been beaten at by-elections. Mr Brown (Independent), the demagogue of the organised Civil Servants, scraped home at Rugby by 679 votes. Mr Reakes (Independent), claiming that his victory was a victory for Mr Churchill, had a ten times bigger majority at Wallasey. The polls were small, at Rugby 40 per cent, at Wallasey 33 per cent. But the tide of events is significant. Any candidate who calls for a more vigorous prosecution of the war will get votes—though Major Cripps, eclipsed by Mr Reakes, forfeited his deposit at Wallasey; and the parties have not enough hold over the electorate to bring voters to the polls in support of the undistinguished candidates whom they set up as lay figures to symbolise national solidarity. The Labour party cannot even prevent its local following, as in both Rugby and Wallasey, from supporting the new opposition. Mr Reakes is an unknown quantity. Mr Brown showed his well-known wrongheadedness as soon as he was elected by prating about "the Government's political differences with Russia." But he, like Mr Reakes, also asks for a more active and efficient strategy. Mr Churchill is in no danger. The Government stands solid. These are only straws in the

wind. But the wind is important; and Ministers would do well to note two things: that the nation is ready and anxious for the most exacting tasks; and that the present official parties are distinctly *vieux jeu*.

Doubts in Italy?

It is difficult to assess the value of the reports which are circulating of a state of alarm and despondency in Italy so strong that King Victor Emmanuel—not noticeably a man of decision and action—is considering a change of government. For one thing, all the rumours come from across the Atlantic. For another, they are all based on the assumption that Hitler's Reichstag speech was that of a "desperate man." It is perfectly true that Italy has on the whole fought this war vicariously. Her triumphs have in reality been German triumphs, and she relies on Germany absolutely for victory. If there were serious signs of a German collapse, it would mean immediate defeat for Italy, and Italian diplomacy might then with its usual flexibility look about for ways of climbing on the bandwagon of the United Nations. But Hitler's speech rather forecast a more ruthless prosecution of the war, and the various consultations that are said to have been held in Rome—between the King, Mussolini, Ciano, Badoglio and others—while they may have pointed to a change of policy, may equally well have been designed to screw up Italy's war effort for the coming ordeal.

Unemployment Fund

The latest reports of the Unemployment Insurance Statutory Committee reveal further substantial increases in the disposable balances of the Unemployment Fund on general and agricultural account. All the trends which were in operation in 1940 were accentuated last year as the prosecution of the war brought full employment nearer. The loss of income to the Fund due to calling up of industrial and agricultural workers was more than balanced by new entrants into employment and by the changes introduced by the Unemployment Insurance Act, 1940, which both raised contributions and widened the scope of the scheme. The decline in unemployment was responsible for a substantial reduction in payment of benefit—from £25,894,000 to £8,874,000 on general account, and from £635,000 to £294,000 on agricultural account. The disposable balance to the credit of the General Account rose during the year to £54,534,577 from £79,805,751, and the Committee estimates that, at current rates of income and expenditure, the balance may be doubled during the current year. The disposable balance on Agricultural Account increased by more than £1,000,000 to £4,894,452. The Committee has decided to recommend that the automatic increase in agricultural contributions of ½d. a week, which was to take place next July (a reduction of ½d. a week was instituted for a period of three years only ending on July 6th this year, in order to reduce the accumulated reserve to £500,000), shall not take place, since the balance on Agricultural Account has continued to increase despite the reduction in benefits. No steps are recommended to reduce the balance on General Account, or to retard its growth, since the Committee hold that its accumulation is due solely to the abnormal conditions of war economy. Since no measures have been announced for the prevention of an unpredictable increase in unemployment after the war, there is at present no basis for calculating the expenditure which the Fund may be liable to meet, and the Committee's view is that it remains essential to build up a substantial reserve, rather than to raise benefits or to reduce contributions. Moreover, the Committee point out that it would be unfortunate to take any step which would place unemployment insurance further out of step with other forms of social insurance, at a time when social security as a whole is the subject of investigation by an Interdepartmental Committee.

Social Security

The reasons given by the Unemployment Insurance Committee for leaving insurance contributions and benefits unchanged have aroused some misgivings. It is argued that the phrase "whether or not it is controllable," applied to unemployment after the war, is unduly defeatist, and likely to cause alarm and despondency. The actual statement in the report is that whether or not it is controllable, the level of unemployment is unpredictable; and it is further argued that this is misleading because, if it is controllable, it is

also predictable. The objection is at once reasonable and unfair. It is reasonable because it should be practicable after this war, by planned demobilisation and a national investment programme, to maintain employment far more successfully than after the last war. Several Ministers have said so, and failure this time will be a political disaster of the greatest gravity. It is unfair because, at least until plans to this end are laid, this Committee within the terms of its responsibility for an insurance fund, must inevitably regard the course of events as "unpredictable." The argument in the report about the correlation of all forms of social insurance is also criticised. It runs as follows:—

The various forms of social insurance are or should be related to one another in respect of benefits. On the side of contributions, they are by nature inseparable. They draw upon common resources; the contribution which it is practicable to exact without hardship for the purpose of health insurance or pensions is affected by the level of contributions of unemployment insurance; the best use of the common resources available ought to be considered in relation to all forms of insecurity and not to one form only; it would be improvident now to commit ourselves to a scale of expenditure on unemployment benefit which made it impracticable later to meet more urgent requirements of another kind.

The fear seems to be that Sir William Beveridge, in his dual rôle as chairman of this Committee, and of the Inter-Departmental Committee that is at work on the future of social security, is too wedded to the insurance principle, with the result that now and after the war social security as a whole will continue to depend upon the financial and actuarial ability of a host of weak and expensively administered friendly societies—and not upon social need. Here again, the criticism is both reasonable and unfair. It is reasonable because it is impossible to establish social security, according to need, on an actuarial basis by the present insurance method, privately administered; it is unfair because the report's argument that, insofar as the insurance method is used, contributions to all forms of social insurance must be aggregated, and regarded as a single contribution from a single source, is perfectly sound. What the critics are getting at is twofold; in principle, that the insurance method is inadequate, and should be replaced or supplemented by state payments; and, in practice, that the employment of approved and friendly societies is hopelessly inefficient. There is no evidence that Sir William Beveridge is not giving the most careful attention to both these considerations.

Laval Has Been Warned

There have been few significant developments inside France in the course of the last week. Laval is settling into office. He has, no doubt, spent his time taking stock of the position and getting the feel of the reins of government. It is already obvious, however, that as far as possible, he means to steer clear of Vichy. The curious duality of power which has been established between the political and the military hierarchy is now to be doubled by an equally confusing geographical duality between Vichy and

More than a century's accumulated business experience and conservative progress form the background of the comprehensive service which the Westminster Bank is able to place at its customers' disposal.

The Bank's vast resources, its constant touch with current affairs and its extensive system of branch offices in England and Wales and agents elsewhere, combine to enable it to offer a wide range of facilities, details of which will gladly be given on request by the manager of any branch.

WESTMINSTER BANK
LIMITED

Head Office: 41 Lothbury, London, E.C.2

Paris. Laval will move between the two centres of administration, leaving his Ministers in Vichy—they are on the whole men who have already served under Pétain—and his secretaries—the newer, wilder lot—in Paris. The possibilities which are thus opened up for bamboozling the Marshal are infinite. The possibility has to be faced that, in spite of the dyarchy which gives Pétain control of the armed forces, Laval will find some way of embarking France on such very doubtful enterprises as “freeing” Syria or “defending” Dakar, in which case it is not diplomacy but force that will decide the relations between Vichy and the United States. The recent landing of American troops in Free French Caledonia was by invitation. The principle may have to be extended to colonies and bases where no invitation has been issued. The President has given Vichy fair warning. He has revealed the fact that American warships are operating in the Mediterranean, and has pledged the United Nations to “take measures if necessary to prevent the use of French territory in any part of the world for the military purposes of the Axis.” Such language is refreshing. It has the added advantage of being the only language Laval—or Abetz—understands.

* * *

New Caledonia and the United States

The political and strategic significance of the American landing in New Caledonia, one of the staunchest and oldest Free French territories, is obvious. Occupied by the enemy, it would be the most important advanced base for an attack on the industrial areas of east Australia and the north island of New Zealand, which are between 800 and 1,200 miles away. Apart from its strategic importance, however, New Caledonia is a source of two vital raw materials of the munitions industry—nickel and chrome. For nickel, the territory is the world's only important producing area outside of Canada. In 1940, the last period for which authentic figures are available, the New Caledonian nickel output reached 17,500 metric tons, that is, more than one-eighth of the world output. Since the fall of France, the whole of the Caledonian nickel has been acquired by the Australian Government, in co-operation with the International Nickel Co. of Canada, and something like four-fifths of the quantity involved in these purchases has been at the disposal of the United States munitions industry. The chrome ore output of New Caledonia in 1940 amounted to 55,790 metric tons, or just under 5 per cent of the world's total, but as the whole of this supply has recently been shipped to the United States, its significance to the United States munitions industry is far larger than this percentage suggests. If the New Caledonian nickel and chrome supplies had been allowed to fall under Japanese control, Japan would have become independent in these vital war materials of which it is at present seriously short. How far supply considerations have influenced the decision of the United States Government to land troops in New Caledonia is not known, but its action has the same effect as the landing of United States troops in Dutch Guiana late last year, by which United States bauxite supplies were protected.

War Damage

The main purpose of the War Damage (Amendment) Bill is to make provision for risks incurred after the end of August, 1941. In view of the uncertainty about the future scale and effect of air raids at the time of the passing of the original War Damage Act, it only provided for contributions up to the end of last August. An interim measure, the War Damage (Extension of Risk Period Act), 1941, provided for a risk period of a further year, but made no provision about future contributions. The main feature of the new Bill is the substitution of a single risk period, that is to say the duration of the war, for successive risk periods of one year. Since the contributions payable in respect of damage up to the end of August, 1941, have been spread over a period of five years, this change is a sensible one. There is to be no alteration in current contributions, either in amount or in number. This has been strongly criticised, but it is difficult to question the decision. The critics argue that the income accruing to the Treasury from contributions exceeds current disbursements, and that, in general, compensation will not be paid until after the war. But it is the total expected payments, the total liability, and not merely current disbursements that should be the yardstick. If the expected receipts from contributions ex-

ceed the total expected payments, then Parliament may reasonably take steps to reduce contributions. But, so far, receipts, inclusive of the Government's contribution of 50 per cent of the expected payments, can hardly have run ahead of the total liability. Apart from the new definition of the risk period and the decision not to alter the rate of contribution, the Bill contains no amendments of major consequence, though there are a number of adjustments which have been found desirable in the light of experience. For example, the Board of Trade is given power to make advance payments under the Business Scheme in case of hardship. Unfortunately, however, the Bill does not meet the criticism arising from the unequal incidence of contributions in respect of property; the argument that contributions should be made proportionate to the amount of the various financial interests in each property, or group of properties, is surely justified by reasons of equity.

Boots and Chains

M. Molotov's second Note on German atrocities committed on Russian territories differs from the first one (published in January, 1942), in that it puts the emphasis on the economic aspect rather than on the policy of physical terror. In a sense, the practice of plunder, described in the Note, is the enemy's indirect acknowledgment of the effectiveness of the Russian “scorched earth” policy. Thus, the enforced transport of Soviet civilians to Germany has, to a large extent, been due to the fact that Germany has not been able to exploit their labour on the spot—the industrial equipment has been either removed or destroyed. But this has been only one of the motives for the wholesale plundering. The main principle underlying the invader's policy has been, from the first, that the conquered peoples themselves must pay the cost of their conquest. The rule has been applied all over Europe; but, whereas in France plunder is still coupled with some appearances of civilised “book-keeping,” no such subtleties have been indulged in the “barbaric” east. And as the cost of conquest there has proved so much higher than in the west, the plunder has assumed prodigious proportions. Among the details enumerated by Molotov is the order issued by the German general Beier forbidding the wearing of boots by the civilians, who are forced to give up their footwear to the occupying authorities. This order will perhaps be quoted in future text-books as one that epitomises the “historic mission” of the Third Reich. It was said of Napoleon's soldiers that they freed the peoples of Europe from their feudal chains, but that together with the chains they pulled off their boots. Hitler's soldiers steal the boots—not metaphorically but literally—and put the chains on the bare foot.

Protest and Counter Protest

The incident of the ten Norwegian ships which sailed from Gothenburg on April 1st, in an attempt to run the German blockade, is in its legal aspect something of a storm in a teacup. The Reich authorities are apparently incensed by the ability of the Norwegian merchantmen to return the fire of German patrol ships, since it is known that they reached Sweden unarmed in 1940. A German protest to the Swedish Government has been followed by a Swedish protest to the British Government alleging that the arms were smuggled on board under cover of diplomatic immunity. It would be a thousand pities if the natural irritation which this incident has aroused were allowed to bulk disproportionately large. In point of fact, there is much solid, mutual understanding between Great Britain and Sweden. Obviously, the precarious foreign policy which Sweden has so far pursued with such great success demands a rigid and formal insistence on the letter of international law. There is little doubt, however, that of international legal institutions, will arouse a touch of cynicism in a country where the critical faculty is still very much alive. It is not so very long ago that the technique of formal protest was regarded as the main, and possibly the sole weapon, in the armoury of the effete democracies, while the successful gangster tactics of totalitarian governments dazzled the neutral world into believing them to be not so much outside the law as above it. The Swedish Government has rightly refused to allow its neutrality to be compromised through the mysterious circumstances which surround the dash which the ten Norwegian ships have made for freedom. So much is understood in this

country. No doubt it is equally understood in Sweden that the German protest, always supposing it to be soundly based, sounds pharisaical to British ears.

A Minister Looks Forward

When a member of the War Cabinet, who is first and foremost a successful business man, publicly sets out in simple terms his hopes for the post-war structure of business life, it is an important event. Mr Oliver Lyttelton's broadcast Postscript last Sunday was refreshing and enlightening. He made it plain that thought about the world after the war is part and parcel of the war effort itself. He refused to take sides in the present heated controversy between private enterprise and State control. Shrewdly, he pointed out that, in theory and in practice, there must be room for both—for private enterprise and individual initiative to bring about economic progress by experiment and effort; and for State control to ensure that all the essentials of decent living are made available to citizens and consumers, and to make certain that the powers of business are exercised, and the fruits of technique harvested, for the benefit of the community at large and not simply in the interest of producers' cliques and corporations.

Post-War Economy

The argument that Britain's economy will be ruined by the war, that it will take many years to recover the pre-war standard of living, has often been refuted by *The Economist*. Britain's main asset is the skill of its people, its productive facilities and capital equipment. Some of the capital equipment may be destroyed or fall into disrepair, but, unless the probable damage greatly exceeds present expectations, physical rehabilitation can be effected fairly quickly, probably within two or three years. But the loss of income from overseas investments and other sources of foreign exchange will be an important debt factor. It will involve an increase in the volume of exports required to obtain a given quantity of imports. The difficulties facing this country after the war should neither be underestimated nor overestimated. A pamphlet published by the (American) National Planning Association, on Britain's trade in the post-war world, perhaps tends to err in the direction of optimism. In its view, the United Kingdom will emerge from the war stronger than before from the “stand-point of technology”—which is probably true. Damage can be repaired in a relatively short time; new plants can be, in time, turned over to the output of the goods of peace; civilian industries, pushed out of obsolete practices, will emerge rationalised for optimum output. But when the writers of the pamphlet, having admitted the probability of a post-war dollar problem, go on to work out a post-war balance of payments, varying with the national income of the United States, they arrive at results which probably add up to too rosy a picture, and are, in any case, highly speculative. As a matter of fact, it is probably impossible at this stage to visualise post-war circumstances with sufficient accuracy to do sums like these usefully.

Canada: No Change

It is difficult to see how the result of the Canadian plebiscite can give very much guidance to Mr Mackenzie King. Of the 4 million voters who were asked to “free” the Government from any restriction on the use of its powers—the relevant commitment is, of course, the undertaking not to impose conscription for service overseas—about 64 per cent have agreed to release the Government. This absolute percentage masks the real significance of the voting, for the great bulk of the opposition came, as might have been expected, from Quebec. Here 940,000 out of 1,370,000 votes cast were against release, and the situation now is almost exactly what it was before the plebiscite, with the bulk of the English-speaking Canadians supporting conscription for service anywhere and the bulk of the French speaking Canadians opposing it. Mr Mackenzie King has summed up the results of the plebiscite thus: “It is a national expression on a national issue. There can be no doubt about the significance of the vote.” Unfortunately, there cannot. The plebiscite has made no difference at all to the attitude of French Canada and now, as before, Mr Mackenzie King must either coerce a powerful minority—or work out some special status for them. The formal

expression of opinion elicited from Quebec by the plebiscite may even make the problem more difficult than it was.

Australian Taxation

The Premiers of the Australian States have rejected Mr Curtin's proposal that they should renounce their rights to levy income tax for the duration of the war. It is not yet certain what Mr Curtin will do, whether he will submit his proposal to the Commonwealth Parliament in its original form or modify it. His scheme would impose a uniform income tax all over Australia from July 1st, which would produce a sum equal to the amount at present collected by the Commonwealth and States. As compensation, the latter would be given £A34,500,000—the average income tax receipts of them all in the last two years. There are obvious administrative advantages in such a uniform tax, but much more important is the strength it would give to the Commonwealth's fiscal weapon for waging the war. So long as there is a discrepancy between the total taxation paid by Australians living in one State and those in another, there must be a margin of taxable income which the Commonwealth cannot touch; and, as Mr Curtin rightly pointed out, Australia's obligation to the Allies could not allow this. Some idea of the discrepancies between the taxation in the different States can be obtained by comparing the total Federal and State taxation paid by a £A1,000 income in 1940-41. This varied from £A205 in Victoria to £A244 in South Australia. For a £A20,000 income, the lowest taxation was again paid in Victoria (£A10,841) and the highest in Queensland (£A13,529). It is very natural that Victoria should protest that the imposition of a uniform tax would penalise those States, like itself, that have been economically governed. On the other hand, it is Victoria and New South Wales—also one of the more lightly taxed States—which are the principal manufacturing centres. If their margin of spendable income, represented by the difference between their taxation and that of South Australia and Queensland, were diverted to the Commonwealth, there would be a considerable gain in their contribution to the defence of Australia.

* * *

Seamen's Pensions

The Pensions (Mercantile Marine) Bill which Sir Walter Womersley, the Minister of Pensions, has introduced into the House of Commons seeks to repair an important defect in the pension rights of merchant seamen. Existing legislation justly puts the merchant seaman, who suffers death or disablement as the result of a war risk, on the same footing as a naval rating in regard to pensions and dependants' allowances. But present legislation does not cover cases of death or disablement as the result of ordinary marine risks, although these have been greatly increased on account of war conditions, nor does it extend to British seamen sailing in Allied vessels. The new Bill, which amends sections three, four and five of the Pensions (Navy, Army, Air Force and Mercantile Marine) Act, 1939, removes

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

from the scope of workmen's compensation legislation all cases of death or disablement due to marine risks which have been increased as the result of war conditions, and brings within the scope of the scheme British seamen on foreign vessels, seamen who at the time of the accident are not attached to any particular ship, and fishermen. This amendment will do much to rectify the anomalous position in which the family of a merchant seaman who loses his life in a particularly dangerous form of active service, but not as the direct result of enemy action, is in a less favourable position than the family of a naval rating who meets his end in similar circumstances. The legislation is to be retrospective to September 3, 1939. The benefits contemplated by the Bill are qualified by the provision that "... an injury or any loss or damage shall be treated as being attributable to the matters specified ... if, but only if, they substantially increased the risk of the peril occurring which caused the injury, loss or damage." Thus, the merchant seaman is not to be placed in a position of complete equality in the matter of pensions with members of the Navy. There apparently remains an obligation to prove that normal marine risks have been increased, an obligation which the naval rating does not have to discharge. This is an appreciable detraction from the benefits of the proposed Act, if the provision is to be rigorously enforced, since it may be extremely difficult for the dead or disabled seaman or his relatives to make out a case. No doubt the matter will be brought up in debate. At the other end of the scale, the pensions payable to widows of naval officers of flag rank who have voluntarily undertaken to serve as commodores on convoy duty appear to be highly inequitable and are attracting considerable attention. It is now plain that the amendment which the First Lord of the Admiralty announced in Parliament in answer to a recent question implies an improvement in the pension rights of a full admiral only. If officers of flag rank are killed in action while serving as commodores, the widows have hitherto received only the pension attributable to a commodore killed in action, instead of, as equity demands, the pension attributable to an officer of their true rank when killed in action. The alternative method of assessment, that of aggregating the pension of a flag officer not killed in action and civil defence volunteer pension rights, would actually reduce the total income below that now drawn by widows of vice-admirals and rear-admirals and of commodores. The arrangement remains grossly ungenerous.

End of an Anomaly

Following President Roosevelt's decision last week to seize enemy-owned patents in the United States, which was discussed in a note in *The Economist* of April 25th (on page 568), comes the news that the Board of Trade has revoked its general licences permitting the filing of applications and the payment of renewal fees in connection with enemy-owned patents. In future, all "trading with the enemy" in the matter of patents will be prohibited, with the sole exception that renewal fees on enemy-owned British patents may be paid by a person who is not an enemy, and who is either part owner of the patent, or holds a licence under it. The revocation of the general licence applies to all enemy-occupied territory and Vichy France. It is understood that the Patent Office will do no further work on applications from enemy and enemy-occupied countries. This decision suggests that the new order does no more than place the patent system as between Great Britain and its enemies in cold storage for the duration. Reports from the United States, however, make it doubtful whether, in the event of an Allied victory, Washington will be disposed to return enemy-owned patents which had been used in America for the prosecution of the war. No doubt it is too early to anticipate the long-term effect of these developments in Great Britain and America, but the important consideration at the moment is that an anomalous form of trading with the enemy, which involved waste of energy and a drain of sterling, and was wholly unsuited to the conditions of total war, has at last been terminated.

Agricultural Taxation

The recent decision to extend the substitution of Schedule D for Schedule B as the basis for taxing farming profits was a necessary complement to the policy of making

farming pay. The old basis of taxation was that of the annual value, determined by the Local Commissioners for Taxes for the payment of income tax on the ownership of land under Schedule A. Last year, all farmers whose land had an annual value exceeding £300 were transferred to Schedule D, under which profit is assessed as in the case of industrial earnings. This year, the new basis is to be extended to all farms exceeding £100 in annual value, and the tax payable on those under that limit is to be three times the annual value, instead of that value itself. At the same time, arrangements have to be made for the valuation under general income tax principles, of livestock and other "stock-in-trade," to borrow the commercial expression. One of the difficulties of applying Schedule D methods to farming has always been that it necessitated the keeping of somewhat elaborate accounts. Under wartime conditions when farmers sell a large part of their produce at dictated prices and secure much of their seed, fertilisers and other requirements on the basis of returns made to the Ministry of Agriculture, it is believed that audited accounts can be dispensed with, and that all that is necessary will be obtainable from the returns themselves, supplemented by such accounts as every competent farmer normally keeps. In any case, it is not the intention of the Inland Revenue to require the keeping of elaborate accounts by farmers whose annual valuation is between the new limits of £300 and £100. Those below the latter figure, who feel that a payment based on three times the annual value is excessive, may claim to pay on actual profits, and in this case even less exacting demands will be made in the matter of accounts. The amounts paid by this section of the farming community—mostly smallholders—will be small, since, on the maximum of £300, earned income and personal allowances for a married man with one child are sufficient to absorb more than half the total.

Shorter Notes

The anomaly in the forthcoming petrol allowances has been abolished. It was announced in the House of Commons on Tuesday that the basic ration for motor cycles would be withdrawn from November 1st. It is difficult to see why the date should not be the same as for motor cars (July 1st), and Mr Geoffrey Lloyd's explanation—that he wishes to get through the abolition of the ration without an increase in staff—is hardly convincing. The number of motor cycles in use is now probably under 300,000, which was roughly the figure before the war; yet Mr Lloyd is allowing another four months to put their owners on a needs test—longer than he is allowing for the million odd car owners—and in so doing is allowing four months unnecessary consumption of petrol.

A Note on page 565 of *The Economist* last week stated that Lloyds Bank nominees held 1,800 shares in *Truth*. This statement was based on the facts given in a House of Commons debate on the ownership of *Truth* in October last year. On October 30, 1941, however, 490 of these £10 shares were transferred to Collin Brooks, the editor, and another 1,000 were transferred to him on February 20, 1942. Thus, out of the total capital of £29,000, the nominee shareholding is now small. On the other hand, on January 19, 1942, a debenture for £10,000 was issued to Branch Nominees, Ltd.

The news that all Government seats were held in the recent series of South African by-elections, is obviously important. The elections provided an opportunity to test the trend of opinion; and the lack of evidence of any increase in support for the Nationalists, despite the possibility of a military threat from Japan, is encouraging. Certainly virulent opposition remains; but the break with Vichy will exercise a salutary influence by discouraging the notion that there can be any compromise either in the matter of Madagascar or in any other aspect of the world war.

Austerity is not to come to the Brigade of Guards. The simplifications in officers' service dress, recently announced by the War Office, have been embodied in a Board of Trade order, which specifically exempts the Brigade of Guards from its provisions.

AMERICAN SURVEY

Against Inflation

THE rapid expansion of US war output has reached the stage when a serious increase in prices can only be avoided by drastic measures. There are indications that the cost of the war programme for the year ended June, 1942, will not only reach, but exceed, the estimate of \$26 billions; the Director of the Budget recently reported that its fulfilment was so swift that expenditure will amount to \$28 billions during this period and that, for the year ended June, 1943, it is likely to reach \$70 billions instead of \$56 billions. This means that, in the current financial year, war expenditure will absorb more than one-quarter of the estimated national income and that the proportion will rise well over a half during the year ended June, 1943. A transfer of the national income of this magnitude and speed can hardly be effected without inflation, in the absence of drastic control over prices and over the incomes of individuals. In order to ensure the orderly transfer of purchasing power with the minimum of disturbance to price relationships, President Roosevelt recommended the adoption of a seven-point programme in a message to Congress on April 27th. His proposals consist of:

1. Heavy increases in taxation to keep personal and corporate profits at a reasonable level, reasonable being defined as a low level.
2. Ceilings on prices which consumers, retailers, wholesalers and manufacturers pay for things they buy, and on rents for dwellings in areas affected by war industries.
3. Stabilisation of the remuneration received by individuals for their work.
4. Stabilisation of agricultural prices.
5. Diversion of earnings of individuals from the purchase of unessential articles into savings.
6. Rationing of all essential commodities of which there is a scarcity in order to ensure distribution according to need rather than to financial ability to pay high prices for them.
7. Discouragement of credit and instalment buying and encouragement to paying off debts, mortgages and other financial obligations.

President Roosevelt's programme is not unlike that introduced in this country. The difference, due to the swifter pace of mobilisation in the United States, lies in the fact that a large number of anti-inflationary measures are to be applied at one fell swoop, whereas in this country they were introduced gradually and by stages. Nevertheless, there are certain differences of emphasis and method which can be ascribed to the special circumstances of the United States. Before it is possible to draw any precise comparisons, it remains to be seen how Congress translates into practice some of the President's recommendations which require legislation.

The Office of Price Administration has followed up President Roosevelt's message by issuing orders fixing maximum prices on the basis of those current in March. Wholesalers' and manufacturers' prices are to be frozen on May 11th, retail prices on May 18th, and those charged by laundries, motor-repair shops and other services on July 1st. Simultaneously, rents in 302 areas of war production are frozen. At present, agricultural prices cannot be fixed below 110 per cent of parity—that is to say, below the figure at which they show an increase of 10 per cent over the prices of other goods on the basis of the relationship between farm and industrial prices in 1909-14. It will be interesting to see whether Congress will alter the law in the face of opposition from the farming community. If they can be enforced, these orders, which go a good deal beyond the efforts hitherto made by the Office of Price Administration, should go a long way towards arresting the rise in the cost of living, which according to the official index, is now about 15 per cent above the August, 1939, level.

So far as wages and salaries are concerned, the Presi-

dent's recommendation appears more specific than the policy hitherto pursued by the British Government, for he suggested that they should be "stabilised." It is not quite clear, however, whether "stabilisation" is to be interpreted as a definite stop on all wages and salary increases. The President appears to be against the freezing of wages by legislation, for he has suggested that the problem should be handled by the War Labour Board.

The extent to which taxation is to be increased will depend on the action of Congress. It is interesting to note, however, that the President recommended a ceiling of \$25,000, or £6,250, a year on individual net incomes after taxation. Although there is no legal ceiling to incomes in this country, income and surtax have been graded so as to put an effective limit to net income at about £4,000 per annum.

In addition to his message to Congress, President Roosevelt has issued a nation-wide appeal in support of his austerity programme. On the whole, it appears to have been well received as an inescapable war measure; but criticism of some of the recommendations by the interests chiefly affected are an indication of the tussle that will inevitably come over the detailed application of an effective anti-inflation programme.

The Supply of Manpower

THE creation of a War Manpower Commission, which has been under consideration for several months, marks an important advance in the organisation of the United States for total war. The Commission, under the chairmanship of Mr McNutt, head of the Federal Security Administration, will

make plans and policies to bring about the most effective mobilisation and maximum use of the nation's manpower in the prosecution of the war.

Mr McNutt has power to issue directives to all Government agencies concerned with the training and distribution of manpower to the Forces, industry, agriculture and Government service. He is to be assisted by an advisory committee made up of representatives of the agencies concerned, such as the Army, Navy, Labour and Agriculture Departments, and the War Production Board, the Selective Service System and the Civil Service Commission; but he is under no obligation to accept their recommendations and is responsible only to the President. If co-operation is not forthcoming, it is expected that Congress will be requested to grant him compulsory powers. By British experience, it is very doubtful whether "voluntary co-ordination" will reconcile the conflicting demands for manpower when the needs become acute. But it is cause for satisfaction that the Commission has been given supervision over the whole field of manpower requirements and supply.

There is as yet no widespread manpower crisis. But there are increasing shortages of highly skilled labour. One of the immediate concerns of the Commission will be the development of a system of priorities to end "labour piracy" and ensure the orderly distribution of skilled labour to the most vital points. Up to the present, there has been little or no co-ordination in the competition for labour by the Forces, Government agencies and private employers, apart from draft-deferments granted to men at the request of their employers.

There is, however, every prospect that there will be real manpower stringency by the end of 1942. It is estimated that by then 10,000,000 additional workers will be needed in the war industries at present employing about 5 millions,

and that the Forces will have absorbed about 2,000,000 men in addition to those already enlisted. It will be the responsibility of the Commission to make the necessary decisions on the distribution of manpower, skilled and unskilled, and to supervise the transfer and training of workers from non-essential occupations to urgent civilian and military production.

The Non-Workers

The labour force, that is those gainfully employed or available for employment, not including housewives, is currently estimated at between 55 and 56 millions. More detailed figures are only available for the end of 1941, and it should be remembered that considerable changes have certainly taken place since then. Civil non-agricultural employment in December, 1941, stood at just under 41 millions, an increase of nearly 3 millions over December, 1940. Estimates of the unemployed and those not normally in employment, who together make up the nation's labour reserve, are given below for December, 1941:

	(Millions)		
	Male	Female	Total
Home Housework	0.1	29.9	30.0
At school	1.5	1.5	3.0
Over-age	3.1	2.4	5.5
Other	0.6	0.6	1.2
All non-workers	5.3	37.6	42.9
Unemployed workers	2.6	1.2	3.8

Of those now unemployed, a proportion must be considered unemployable, and most estimates do not place the number which can be absorbed at more than 1.5 or 2 millions. The new recruits in 1942 are expected to come mainly from women not regularly in employment, who number about 30 millions. The employment of women in war industries has so far fallen notably short of what was accomplished in the last war. Women normally fill one out of every four jobs in civilian industry, and at the height of the last war this proportion was reached in the war industries. But at the end of 1941, the proportion was only one in every ten and the total only half a million. The order establishing the Manpower Commission specifically includes womanpower, and an early date is expected for the voluntary registration of women. The National Industrial Conference Board believes that in the long run as many as seven million women could be drafted for war work, including about a fifth of that number from those already in the labour force. Desirable as it is to attract women into employment, however, estimates for 1942 do not go higher than 2,000,000, partly because of the greater difficulty in training women without experience in employment.

Labour Reserves

The main reserve of labour for the war industries and recruits for the Forces lies in civilian occupations. The size of this pool and changes over the last year are shown by the following table, which indicates the distribution of manpower between civilian and war production in the last quarters of 1940 and 1941. Agricultural workers, domestic servants and the self-employed are omitted:—

	(Millions)	
	1940	1941
War Goods and Services	1.5	5.3
Manufacturing	0.9	3.8
Construction	0.4	0.8
Other	0.2	0.7
Civilian Goods and Services	30.0	29.9
Manufacturing	10.3	9.2
Construction	1.3	1.1
Other	18.4	19.1
Total	31.5	34.7

At the end of 1941 employment in war industries was already more than three times what it was twelve months earlier, and the decline in manufacturing and construction begun then must have gone much further in the four months of belligerency, conversion and increased war contracts. How much further the transfer will go in the next year or two depends upon the willingness of the American people to accept deep cuts in their standard of living, and the efficiency with which the transfer and re-training is organised. It is fortunate that American productive capacity is sufficiently great to allow a substantial transfer before anything approaching a minimum standard is reached. Any estimate of the sources from which the manpower and woman-power will be drawn during 1942 to satisfy the

requirements of the Forces and industry is necessarily only approximate at this stage. The following schedule has been suggested by the Bureau of Labour Statistics: from the unemployed, 1.5 millions; new workers, 2 millions; transferred from agriculture, 0.4 million; from other civilian occupations, 8.5 millions, making a total of 12 millions.

Rationing Labour

[FROM AN INDUSTRIAL CORRESPONDENT]

Cleveland, April 5th

The early steps in rationing manpower are evident. One series of proposals is that which Sidney Hillman, of the War Production Board, presented to the Senate's Labour Committee. It provided for the employment of men at their best skills (with factory inspections to make certain of it); centralisation of training and retraining for the war industries; recruitment of all labour through the local employment agencies; authority for transferring workers from one employer to another in accord with the need for men; staggering of working hours in congested centres; provision for a "mobile labour corps"; curtailment of less essential working forces; and stopping the wastage of skills through enlistment in the Army and Navy.

The last item in the Hillman plan aims to correct a drain of which machine tool manufacturers have been ineffectually complaining for two months. Following Pearl Harbour, these plants began losing to the Services numbers of young men they had trained in the last three years. The local draft boards had been accepting managers' requests for deferment of the most essential men, but nothing has been done to stop the voluntary enlistment of the same or similar men. A social pressure for enlistment exists within the plant.

To all proposals for a greater fluidity of labour, under Government direction, labour unions have replied by advocating a *quid pro quo* which ranges from limiting profits in industry to 3 per cent to giving union officers a voice in works direction.

A high turnover of labour has recently prevailed in the industrial districts of this country, owing in part to the attractions of factories offering large overtime wages. Plants which early installed the three-shift system of eight hours to the turn, some of them at the suggestion of Government agencies, found they had to give it up in order to hold their men. Certain plants, which formerly had run twenty-four hours a day with three shifts six days a week, slipped back to schedules of twenty hours, providing two ten-hour shifts, which paid their remaining workmen 30 per cent more a week. The competition of the plants with more overtime pay and less continuous operation was one of the reasons for manufacturers' opposition to paying premium overtime after forty hours of work.

Brakes on Output

Though strikes have almost disappeared from the industrial landscape, the phenomenon of the conscious slowdown on the job, as an organised affair almost unknown to American history, has appeared sportily as a means of supporting demands for higher wages or compulsory union membership. Some of the older men are still so suspicious of "speed-ups," and so fearful of having to continue after the war the high performance now asked of them, that production there is not what plant managements and Washington production men believe possible. Some of the most refractory of these attitudes appear in shipbuilding, aluminium and machine-tool plants. An aluminium mill in Cleveland was publicly stigmatised by Production Chief Donald M. Nelson for falling short of its capabilities—much to the chagrin of the city's mayor. Several shop stewards were dismissed.

Mr. Nelson's effort to set up production committees of management and labour in factories of munitions contractors and sub-contractors has had mediocre success, or worse. It met with a cool reception among managers of some of the Detroit plants, where it was suspected of being an instrument of union participation in management. In certain plants in Cleveland and elsewhere, union leaders have sought to make it a vehicle for furthering membership efforts in partly organised works. Shops with effective committees are still decidedly in the minority.

One reason for the slowness with which production "campaigns" have been organised in certain plants is the fear that the companies cannot obtain steel and other

THE PENNSYLVANIA RAILROAD

SUMMARY OF ANNUAL REPORT FOR 1941

THE 95th Annual Report of the Pennsylvania Railroad Company covering operations for 1941 will be presented to the stockholders at the annual meeting on April 14, 1942. Operating revenues increased \$136,447,755 or 28.6% over 1940. Operating expenses increased \$104,222,597 or 30.8%. Taxes increased \$22,274,360 or 50.8%. Net income was \$52,383,958 an increase of \$11,608,128. Surplus was \$48,414,588, equal to 7.4% (\$3.68 per share) upon the outstanding Capital Stock (par \$50) as compared with 5.6% (\$2.80 per share) in 1940.

OPERATING RESULTS

INCREASES OR
DECREASES OVER

	1941	1940
TOTAL OPERATING REVENUES WERE	\$614,041,163	I \$136,447,755
TOTAL OPERATING EXPENSES WERE	442,677,275	I 104,222,597
LEAVING NET REVENUE FROM RAILWAY OPERATIONS OF	171,363,888	I 32,225,158
TAXES AMOUNTED TO	66,159,548	I 22,274,360
HIRE OF EQUIPMENT AND JOINT FACILITY RENTS WERE	8,101,852	D 652,204
LEAVING NET RAILWAY OPERATING INCOME OF	97,102,488	I 10,603,002
INCOME FROM INVESTMENTS AND OTHER SOURCES WAS	*41,663,095	I 365,787
MAKING GROSS INCOME OF	138,765,583	I 10,968,789
FIXED CHARGES, CHIEFLY RENTALS PAID TO LEASED ROADS, AND INTEREST ON THE COMPANY'S DEBT	86,381,625	D 639,339
LEAVING NET INCOME OF	52,383,958	I 11,608,128
APPROPRIATIONS TO SINKING AND OTHER FUNDS, ETC.	3,969,370	I 90,205
SURPLUS	\$ 48,414,588	I \$ 11,517,923

*Includes dividend of \$5,000,000 (par value) in securities received from Pennsylvania Co.

Dividends aggregating 4% (\$2.00 per share) were paid during 1941, compared with 3% (\$1.50 per share) in 1940.

The Board takes pleasure in acknowledging the continued efficiency and loyalty of all the employees during this period of great national stress. We know that they will continue to do their full share in meeting the additional heavy responsibilities that have now been placed upon them.

M. W. CLEMENT, President

J. Taney Willcox, Secretary, Broad Street Station Building, Philadelphia, Pa.

materials with sufficient continuity to keep enthusiasm at a high pitch. A failure to get materials steadily, with consequent lay-offs, would play into the hands of prejudiced opponents of "efficiency"—an American labour synonym for "speeding up."

A number of factories have also been handicapped by the psychological effect of seeing goods piling up on the shipping platforms and in the yards. Arrangements are now being made to move out these goods more rapidly, if only to warehouses. Warehouse space is almost entirely taken up. Beginnings of strain on the transport system are noticeable, including the effects of a shortage of lorry tyres, the latter more in prospect than in reality. Goods for overseas have backed up to inland plants in some instances, owing to shipping shortages and the threatened congestion of docks. Railway managements have been able thus far to prevent congestion of the marshalling yards which was so familiar a condition here in the last war. Inequalities between the needs of the more than 100 railway systems and the number of cars they purchased have resulted in the War Production Board taking over the supervision of their deliveries. Car manufacture has been reduced somewhat, with the aim of providing more steel plate for shipbuilding.

American Notes

Dollar-a-Year Delay

The charges made by Robert Guthrie, on his resignation from the WPB, against dollar-a-year industry representatives on the staff of the War Production Board, have been amplified in testimony before the House Military Affairs Committee. In the issue of March 21, 1941, it was noted that Guthrie alleged that conversion and conservation of scarce raw materials had been defeated and delayed by the WPB's industrial consultants. According to Guthrie and other WPB witnesses, decisions to stop the production of radios and refrigerators were evaded or ignored; a recommendation to cut civilian consumption of wool because supply lines to Australia were threatened, and to blend wool with other materials was defeated by the head of the wool section, a Boston wool manufacturer; and stockpiling of nylon yarns to assure adequate supplies for parachutes was opposed by industry unit heads drawn from the textile industries. Curtailment orders for cotton textiles were also evaded, it was stated. Mr Guthrie seems to have had little or no authority over his industry unit heads, and urgent decisions on policy were often spread over two or three months. A large number of industry branches and units continue under the control of men from the industries concerned; Mr Guthrie testified that

At the bottom of all this is the system of getting Governmental responsibility into the hands of men who retain active or dormant personal responsibilities in the very industries which will be hurt by their official decisions. It is difficult for the best of men to serve two masters.

Mr Nelson, on the other hand, has suggested that at bottom it was a case of clash of personalities. There has been some testimony to the effect that Mr Guthrie was not qualified to act as Assistant Chief of the Bureau of Industry Branches. More fundamental issues appear to be involved, however. It is likely that the investigation will be extended to cover further aspects of the relations between industry and the War Production Board, and changes in the industrial personnel of the Board are said to be under way.

The Lewis Threat

The activities of John L. Lewis, head of the United Mine Workers and the biggest personality in the labour field, are an important element in current discussions on labour policy. Publicly discredited when his plan for labour unity was turned down by the President, he has turned his attention to organising dairy farmers and utility workers and clearing out dissident groups from his local branches. There are persistent rumours that he intends to take the Mine Workers out of the CIO and establish a third labour movement. Already "Lewis's Commandos," as one labour leader called them, have begun raiding fields in which CIO organisers are at work. Lewis, politically a Republican, is more likely than other labour leaders to succeed in organising farmers; and in any campaign the plentiful funds of the Mine Workers are sure to tell. Lewis is reported to have referred to the CIO and AFL as "one big company union," and their identification with Government policy will give Lewis an opportunity to exploit any labour

discontent which may arise. Lewis has an unrivalled reputation for getting things done by strong-arm methods, and his existence is a constant threat to the more compliant unions. It puts a premium upon the solution of labour problems by co-operation rather than by compulsory legislation.

Petrol Rationing

The announcement that petrol rationing in fifteen eastern states will start on May 15th has caused no surprise, although there is some dismay at the suggestion that the ration may be as low as 2½ to 5 gallons a week for non-essential motoring. The petrol shortage on the eastern and western seaboard is a result of transport difficulties, and greatly increased industrial demands for fuel oil, and there is no disagreement on the need to convert as many tankers as possible to carrying fuel oil. There appears to have been some conflict on the need for rationing between Mr Ickes, the Petroleum Co-ordinator, and the Office of Price Administration, which has control of any commodity coming under rationing. Mr Ickes has persistently attempted to find a solution other than rationing, which will remove petrol from his jurisdiction; two cuts in supplies to dealers have been instituted; and three attempts have been made, and rejected by the War Production Board, to secure steel for the construction of a pipeline from Texas to the east. The Office of Price Administration is said to be urging nation-wide petrol rationing, not only to conserve petrol, but to lengthen the life of both cars and tyres. From this point of view it is as necessary to ration petrol in the producing states, where there is an abundance, as in the areas where there is a shortage. Petrol rationing will undoubtedly cause some hardship in the United States, where there is more dependence upon the private car, and consequently less development of public transport, than in other countries. Presumably, however, there will be supplementary rations for workers in war industries who, because of the shortage of housing, are unable to live near their work or use public transport facilities. But is the ownership of motor-cars, particularly in the east, as general as is sometimes suggested?

Fortune Poll

America revels in facts and figures; indeed, there is hardly an aspect of life which has not been submitted to analysis by the statistician. The poll as a means of ascertaining public opinion on any given question has long been popular, and the results have often been revealing. Of particular interest are the replies of 5,000 business executives to the question, "What is the most important problem facing your business in the war years ahead?" analysed in the March issue of *Fortune*. They reveal a significant change in the order of importance of the various difficulties from the results of a similar enquiry undertaken a year ago. Thus, the shortage of materials, which heads the list of difficulties in the latest poll, was the least important of the nine factors mentioned a year ago. Similarly, the shortage of personnel has moved up from sixth to third place on the list. Red tape, and other obstacles attributed to the Government, which was the biggest difficulty a year ago, now comes second, after the shortage of materials, and labour problems, other than shortages, also occupy a place farther down the list. A fall in the demand for goods and services appears for the first time as an item on the list of problems. Other difficulties mentioned include plant conversion, finance, taxes, research and post-war adjustments, inflation, and transport. The changes in the order of importance of the various difficulties since last year are symptomatic of the transition from a peace to a war economy.

Shorter Notes

The radio industry, which last year did 240,000,000 dollars worth of business, has ceased production of civilian receiving sets and will concentrate on sets for the armed forces or for lend-lease assistance to members of the United Nations.

The War Production Board has ordered the cotton textile industry to increase its output of material for sand-bags, camouflage cloth and other war uses. A certain percentage of looms must be converted to war production within 60 days.

THE WORLD OVERSEAS

India's War Resources

It is noteworthy [reported the Simon Commission 14 years ago] that, notwithstanding the teeming millions of India's population, comparatively small bodies of invaders have often succeeded in overcoming all opposition and making their way through to the plains, where they have established themselves as conquerors.

INDIA'S war potential cannot be measured by numbers of men. Of the population of 352 millions returned at the last census, only 11 per cent were classed as urban; the remaining 89 per cent were rural, living in some 700,000 villages. According to the occupational census of 1931, two-thirds of the working population were engaged in agriculture, 10 per cent in industry, 5½ per cent in trade, 1½ per cent in transport, and the remainder in miscellaneous non-industrial activities. The bulk of India's population is still engaged in providing the bare essentials of life, and the margin available for other purposes is very small.

But India's industrial capacity is by no means negligible. India is already eighth among the industrial nations of the world, and is undergoing an "industrial revolution." There is already a sizeable iron and steel industry, based on domestic coal and iron ore, and located chiefly in Bihar and Bengal. During the fiscal year ended March, 1940, the output of pig iron and crude steel was 1,838,000 tons and 1,070,000 tons respectively. In steel, India is able to meet the bulk of its own needs, and has been able to export a substantial proportion of its pig iron output to this country. In addition to iron ore, India supplies the United Nations with large quantities of manganese, mainly from the United Provinces, with chrome from Baluchistan, Mysore and Bihar, and mica from Bihar. The Aluminium Company of India, established at Travancore, where cheap water-power is available, will eventually have an annual capacity of 5,000 tons of ingots; a sheet rolling mill for fabricating aluminium sheets is located in Calcutta. On the other hand, India produces only a fraction of its needs of copper, and must import all its tin, lead, zinc and nickel requirements.

The iron and steel and allied industries form the basis for a substantial arsenal in India. There are facilities for manufacturing machine tools needed to convert their output into munitions. There are some 54 firms making a wide range of machine tools, and high-speed steel is now in production. But for the specialised tools, which form a substantial proportion of total needs, India must rely largely on British and American supplies.

War Equipment

Unfortunately, the expansion of India's facilities for producing war equipment was only seriously undertaken in the summer of 1940—though the original programme for ordnance factories, recommended by the Chatfield Mission and involving a capital outlay of £4½ millions, is understood to have been completed by the spring of 1941. In March, 1941, these ordnance factories were backed by 230 other Government and private workshops. It was then stated that these establishments were producing nine-tenths of India's own—still relatively slender—requirements of rifles, machine guns, Bren guns and the smaller types of guns. Early this year, the ordnance factories were able to make some 50 types of arms and ammunition; these included small arms, ordnance and carriages, gun and small arms ammunition, grenades, explosives, respirators and so on. Aero-engines are not yet in production, but air-frames are already being manufactured, though still on a very small scale.

As a result of the entry of Japan into the war, plans have been made for an appreciable expansion in India's output of munitions. These plans, however, will take a considerable time to bring results. Meanwhile, in spite of India's own contribution of small arms, ammunition and many other of the simpler types of mechanism, the armed forces in

India and Burma must continue to rely largely on British and American equipment.

India's shipbuilding and ship repairing capacity, though limited, provides a valuable addition to the Allies' strained resources. The Calcutta yards are capable of building launches and tugs up to 1,500 gross tons; but they have no facilities for constructing ocean-going vessels. Some ten months ago, a subsidiary of the Indian Scindia Steam Navigation Company embarked on a programme of building ocean-going vessels of 6,000 gross tons at Vizagapatam; the first of these ships is expected to be launched towards the end of this year.

Apart from the construction of productive facilities, one of the major problems in expanding India's output of war equipment is the lack of trained labour and of engineering and managerial staff. There is no shortage of recruits, but

there is of training facilities and time. In June, 1940, an order was issued providing for compulsory national service for skilled Indian technicians to supplement voluntary recruits. Private industry has been encouraged to release skilled workers for war production. A scheme for training annually 4,000 mechanics and other skilled workers in various technical institutions at the expense of the Government was adopted, and it appears that the number was recently doubled. It still remains very small.

Industrial Vulnerability

In spite of the difficulties of establishing a large-scale armaments industry in an agricultural country like India at short notice, there is reason to believe that, within the limits imposed by circumstances, a good deal has been done. Unfortunately, however, the Indian provinces which harbour the greater part of heavy industry and a substantial proportion of the war industries are those bordering the Bay of Bengal. Moreover, the ports of the Bay also account for the lion's share in India's sea-borne trade. Of the total number of some 800 engineering works in India before the war, these exposed provinces—Assam, Bengal, Bihar, Orissa and Madras—had 400; of 157 foundries, rolling-mills, refineries and similar establishments they contained 37; and of 26 chemical works they had 17. It has been estimated by

Capital that the provinces of Bengal and Bihar alone possess three-fifths of British India's heavy industries furnishing the sinews of war.

The need for swift action in strengthening India's defences needs no emphasis. Much can be done by India herself. But in the last resort the fate of India depends on the ability of Great Britain and the United States to concentrate the requisite striking power at India's outposts; that is, it depends largely on shipping.

Latin American Manganese

[BY A CORRESPONDENT]

April 7th

THE closing of the Black Sea, which has stopped manganese shipments from Russia, and the Japanese threat to the Indian Ocean, which is likely to affect Indian shipments, have revived the interest of the United States iron and steel industry in Latin American manganese, which in the last war helped materially to overcome the American manganese shortage. Already in 1940, the Metals Reserve Company, a United States Government agency, and the Procurement Division of the US Treasury Department, had, under the provisions of the Strategic Minerals Act of 1939, placed certain contracts for Brazilian, Cuban and Chilean manganese ore. These have recently been extended, and will lead to a big expansion of production in the three countries. As manganese is essential to the production of iron and steel, and as the United States normally imports over 95 per cent of its requirements, it is expected that almost immediately the United States Government will take a closer interest in the development of manganese mining in the Western Hemisphere.

Among the three Latin American manganese producers, Brazil is not only the most important, but also offers the best prospects for further development. Manganese ore is found in a number of provinces of the Brazilian Republic, but so far developments have only taken place in Minas Geraes, Bahia and Matto Grosso. In the past ten years, all mines in Bahia and Matto Grosso have been idle, while the Minas Geraes mines, of which the A. Thun and Cia group and the Cia Meridional de Mineracao are by far the most important, have worked far below capacity. In 1940 Brazil exported 217,300 metric tons of manganese ore, nearly all of which was taken by the United States. This compares with 254,000 tons in 1937 (the highest total of the past ten years), and with the record of 542,000 tons in 1917. If all developed mines are brought back into production, and if the rolling stock of the Brazilian Central Railway, which transports the great bulk of the ore to Rio de Janeiro, is improved, the 1917 output could fairly quickly be repeated and, after further development work, even surpassed.

Cuba, which has fairly extensive manganese deposits in the Province of Oriente, is at present able to produce over 250,000 metric tons of manganese ore per year, but in the past few years the output has fluctuated between 100,000 and 131,000 tons per annum. In 1940 it reached 119,900 tons, but it has since increased, and latest reports indicate a monthly average output of about 15,000 tons. The whole of the Cuban ore is shipped to the United States, but the specifications of the Metals Reserve Company (45 per cent manganese content) are higher than the average content of the Cuban ore (40 per cent), and a major expansion in production depends, therefore, on a revision of the United States Government specifications, which the Cuban Mining Federation is at present trying to secure.

Chile, too, has rich manganese deposits, notably in the provinces of Atacama and Coquimbo, but they have not been extensively developed. Regular production on a sizeable scale has only taken place in the early years of this century, during the last war, and in the last few years. In 1940, production reached just under 20,000 tons, but in that year a United States Government survey came to the conclusion that if it were found possible to improve the concentration methods (which is mainly a question of adequate financial and technical help) the annual output could be raised to 100,000 tons of high-grade ore per year.

In 1940 the United States imported 1,282,000 tons of manganese ore for domestic consumption. As a result of the increased iron and steel output, its needs have since increased to roughly 1,750,000 tons. Even a major production effort in Latin America could, therefore, not meet the United States demand. But with the supplies from British territories in Africa, and the intensified concentration of United States low-grade ore, it could greatly help to reduce the adverse effects of the loss of ore from Russia and India.

Hungary's Difficulties

[BY A CORRESPONDENT]

April 22nd

THE two recent political events in Hungary—the election of a Vice-Regent in the person of Admiral Horthy's son and the replacement of Premier Bardossy by Nicholas Kallay—are probably not unconnected. But while their immediate cause must remain largely guesswork, neither can be interpreted as a change in foreign policy; the new Prime Minister himself hastened to dispel any doubt that may have existed on the point.

Much more has been heard of the fracas and subsequent disintegration of the extremist Arrow Cross party. Some very lively exchanges have taken place, in the course of which rude names—political card-sharper and madman are some of the milder samples—have been bandied about. Lately, the rot appears to have reached even Imredy's more respectable, and therefore more dangerous, pro-Nazi party. But internal politics have always been an exciting game in Hungary.

On the whole, however, public reaction to the war may be best described as apathy. The internal front has been far from strengthened by the worsening supply position. Signs of the cumulative effect of the blockade are multiplying—one of them is a sagging industrial output despite record employment. The main difficulty, however, is shortage of manpower in agriculture, and at this point the problem becomes of direct concern for Germany, which cannot impose both export quotas and army contingents, however greatly it may need both. (At the moment it seems to be more concerned with the second type of delivery, but this preference is apparently not wholly shared in Hungary.)

Already last year's harvest was seriously interfered with by military mobilisation. It was officially described as a medium to poor harvest, and no detailed figures were issued. This year's harvest does not promise to be any more favourable, for not only has the labour shortage increased, but an exceptionally severe winter has held up work. The Sunday rest of agricultural workers has been suspended by decree; the shortage of manpower results also in an exceptional demand for agricultural machinery and implements, which Hungarian industry cannot meet. Now Germany is to deliver various light implements, but is apparently unable to supply the much-needed tractors.

Meanwhile, the area under grains is being reduced for the growing of more oilseeds under an agreement with Germany. Propaganda, "managed prices," and free seed distribution are used on a lavish scale to this end; more recently the sowing of oil-bearing plants has been made compulsory on medium and large holdings, which have to allocate 5 per cent of their arable area for the purpose.

A further strain is placed on production by the absence of the agricultural and industrial workers, numbering over 30,000, employed in Germany. Indeed, their absence has a dual effect: not only are they greatly missed at the moment, but, being encouraged by the German authorities to remit their "savings" home, in addition to swelling Hungary's clearing credit with Germany, they divert purchasing power to Hungary—a most unwelcome factor at present.

Lower Bread Ration

As a visible sign of the increasing drain on Hungarian economy, rationing restrictions are continually extending. The recent reduction of the bread ration from 250 to 200 grammes per day has focused attention on Hungary's main supply problem: the importance of bread, with a normal per head consumption of over 700 grammes, is even greater than in the surrounding countries. Moreover, both the authorities and the public realise that the critical period in the bread position, the summer months immediately preceding the new harvest, is still ahead. Last year, complete bread famine in the capital was only avoided by a matter of days.

The Hungarian Minister of Agriculture has recently submitted to the House of Deputies an ambitious Ten-Year Plan for agricultural development. The immediate aim is, obviously, the raising of production. At the same time, Hungary, like her Balkan neighbours, tries to take advantage of the emergency conditions to enforce radical transformations in the whole agricultural system. In his speech to the Upper House, on March 19th, the new Prime Minister hinted at impending important changes in that direction, but refrained from disclosing their nature.

Russia at War

Labour Problems

SOVIET RUSSIA entered the war after years of intensive industrialisation, during which its resources of labour, and particularly those of skilled labour, were steadily growing. A huge proportion of skilled labour was even in peacetime employed by armament industries, and the problem of mobilising labour reserves for war work offered, in the first phase of the war, fewer difficulties than in other Allied countries.

The number of industrial workers and state employees in Russia was about 31 millions at the outbreak of the German-Soviet war, compared with 27 millions in 1937; during the later thirties, the average increase in employment was about one million a year. Curiously enough, Soviet statistics lump together wage earners, workers and office employees under one heading, so that no official figure of the actual number of manual workers is available. Some hints, however, suggest that the number of office employees was about 5-6 millions; the number of workers can thus be assumed to have reached 25 millions, of whom more than two-thirds were employed in large-scale industries and transport.

The greatest increase in skilled labour was in the metal industries. During the period of the five-year plans, the number of mechanics has increased fourfold, of turners sevenfold, of millwrights fourteenfold and of "technicians" eightfold. Only about a fifth of the total labour was in the territories now occupied by the Germans, though the value of the industrial output of those territories was certainly more than a fifth; technical skill and, consequently, the productivity of labour were higher in the old industrial centres of the west than in any other parts of Russia. The bulk of skilled labour of these western territories was evacuated in time.

As far back as the summer of 1940, immediately after the collapse of France, the labour policy of the Russian Government was re-orientated to meet the anticipated requirements of war. The programme of industrial training was greatly enlarged. The so-called "state labour reserves" were created; 794,000 newly skilled trainees were to enter the factories in 1941, and an additional 887,000 were to be enrolled in railway and factory training schools. By the decree of June 26, 1940, working conditions were radically changed. The *pyatidnevka* (five-day week) was abolished and the seven-day week was re-introduced. Under the same decree, industries returned to the eight-hour working day instead of the former seven hours. These reforms secured a 15 per cent increase in actual working time, which permitted a considerable expansion of metal and armament output between June, 1940, and June, 1941.

Since the outbreak of the war, the training of new workers has proceeded on a mass scale. It is claimed that, between July, 1941, and March, 1942, 600,000 young workers, not yet liable for military service, have been drawn into industrial production. The employment of young people has been even more extensive in agriculture. In Kazakhstan alone, no fewer than 350,000 pupils of secondary schools have been employed in farming. As a result, many schools have been closed down, and the press has been urging local authorities to reopen them and to give up the idea that "teaching has become useless since youth has to work for the duration of the war." The employment of women, which was usually very high in Russia, has also increased. In October, 1941, female labour accounted for 45 per cent of the total industrial employment; and its share has grown since then. Women have been employed as station masters, train drivers, coal miners, and in many occupations usually done by men. The widespread employment of women has again raised the problem of communal feeding and communal care for children. Another re-serve on which Soviet industries are now drawing is the mass of office employees. The proportion between office staffs and factory staffs has been unbalanced in many establishments; it became very common in recent years to transfer able Stakhanovite workers from the benches to administrative jobs. Now the slogan is: "Back to the benches; cut the administrative staffs."

But all these reserves seem not to have fully covered the demand for labour. The Government was compelled to order an all-round industrial mobilisation Under the decree of February 13, 1942, all able-bodied men between 16 and

55 and women between 16 and 45 years, not serving with the forces and not employed in war vital industries, became liable to labour compulsion. The authorities have been empowered to shift them to wherever they may be needed; and aircraft, tank and munition factories, have priority for labour mobilised under the decree. An analogous decree of April 17, 1942, empowered agricultural departments to mobilise labour for farm work.

The training of new workers is carried out in various ways. Factory schools work as the needs of a given factory require; town and regional schools base their work on training programmes laid down by regional or local industrial managements. Besides this, the individual training of industrial recruits by Stakhanovites on the spot is widespread. Newspapers, however, complain of some difficulties, and urge old workers to show more patience with newcomers. The decree of June, 1940, fixing the eight-hour day, is still in force, but this limit is very rarely, if ever, observed. Even before the war, the working day was actually longer; operations such as cleaning and refitting machines for the next day's work were generally done after the eight hours. At present, some Press reports mention with approval cases in which workers are doing a twelve to sixteen hours' day; and hardly any time-limit was observed when reassembling of evacuated works was in progress. Some part of the increase in output per worker may be due to technical rationalisation, and to the fact that masses of Soviet workers have been trained for several occupations, and are able to perform different operations in one factory. But long hours seem to have provided the main basis for higher output.

Labour discipline was very severe in the Soviet Union, even in peacetime. The war has entailed actual militarisation. "Every factory is part of the front," "every worker is a soldier, and every factory manager a commander in action"—these are the slogans. Slackness and neglect are punished with all the severity of martial law.

CHANGE SURVEY No. 3

An enquiry into British War Production

Part I:

PEOPLE IN PRODUCTION

prepared by Mass-Observation

A six-month Sociological study of human factors in war industry—man-power, management, industrial health, hours of work, welfare, the diet of work, transport, absenteeism, billeting, propaganda impact of events upon industrial effort, wages, shopping, part-time jobs, sex differences, day nurseries, war strikes. The Prime Minister has described 1942 as the crisis of man-power, and this report may claim to be the complete manual to the size and nature of the crisis.

War Finance

THE financial year 1941-42 closed with the introduction of an Excess Profits Tax. Profits exceeding 150 per cent of the profits earned in 1938 have been declared excess. Private firms will pay 25 per cent, and companies 30 per cent of these excess profits into a special account of the Exchequer. If the income tax paid by private firms and the corporation tax levied on companies are taken into account, all excess profits in the future will be taxed on the average at a rate of from 80 to 90 per cent. Theoretically, the Germans regard this EPT as part of the original policy of mopping up purchasing power. Actually, during 1941-42, the financial authorities and the price-commissar were forced to improvise and experiment. Up to the end of the financial year 1940-41, there had been no change in financial policy and methods. The war surcharges on income tax and excise duties remained unchanged. Theoretically, all problems were solved. The price stop had been supplemented by a wages stop and by the prohibition of overtime pay, which is the greatest single source of excess purchasing power in a system where foodstuffs and essential consumption goods are completely rationed. Such excess purchasing power and unusable financial reserves as did exist were to be absorbed by savings and by subscriptions to Reich loans and Treasury bonds. The idea was simple. Excess purchasing power had no outlet but the savings banks; and increasing profits were to be abolished by a policy of lowering prices. In other words, the Germans had reversed the policy of the war of 1914-18, when 87 per cent of the war cost was covered by borrowing, and prices and profits rose unhampered. This time, the greater part of the cost was to come from an all-round increase in taxation, and prices and profits were to be reduced. The system did work well for a time, because of the material control exercised over production and consumption and because of the constant increase in material resources—that is, by raw material stocks, productive capacity and manpower taken by conquest during a period of short military campaigns with long intervals of steadily increasing output. In September, 1940, overtime pay was fully restored, which meant a considerable rise in purchasing power; but there was no corresponding increase in available consumption goods, and the controls were to do the rest.

But now the situation, and the policy, have changed. The idea that war economy, which inevitably means a gradual increase in the cost of production, can also mean lowered prices has still not been given up. The idea that a system of stops and controls can prevent excess profits is also still believed in. But, at the beginning of 1941, it became obvious that prices for armaments had considerably advanced on the basis of the German cost-plus-profit system. Financial liquidity stimulated an unprecedented boom in equities, the only outlet for the investor in the controlled capital market. The consumption of unrationed goods was also growing alarmingly. The official index of wholesale prices and the cost of living index had hardly changed; but even German papers admit that these indices are almost fictitious. After long discussion, the principle of a profit and dividend stop was applied; excess profits were to be paid into the Exchequer. But the price commissar decreed that any firm having earned excess profits should reduce prices in such a way that excess profits could not recur. It was hoped to reduce the rising costs of war, reflected in increased borrowing, by reducing prices. But the price commissar was unable to establish effective machinery for assessing excess, or (as the Nazis called it) unjust, profits. Industry was burdened with the almost insoluble problem of assessing "unjust" profits on the basis of the cost-plus-profit system. The first break in the principle of solving financial problems by regulating prices was the introduction of a war surcharge on the corporation tax. A comprehensive policy of "steering" purchasing power soon followed: taxes on tobacco, wine and alcohol were considerably increased; and the system of "iron savings" was introduced. Wage and salary earners who undertake to save under this scheme actually reduce their taxes and contributions to social insurance; but the savings are compulsory once they are undertaken and deducted at the source. Employers and companies were able to pay depreciation and other reserves into special accounts at the Exchequer where they are blocked like the "iron savings" of the

worker. Speculation on the Bourse was discouraged by the registration of shares. The cost-plus-profit system was partly replaced by fixed prices for armaments. Then EPT was introduced as a corollary to fixed armament prices.

All these changes were accompanied by discussions about the principles of war finance. Inflation; the abolition of depreciation accounts; the actual size of the financial resources at the disposal of the Government; and, finally, the size of the national income and the relation of expenditure to it—these were the main points of controversy. The importance of these discussions may be seen by a survey of the financial facts.

FINANCIAL RESOURCES AT THE DISPOSAL OF THE GOVERNMENT (in Million Reichsmark)

	1939/40	1940/41	1941/42
Total Reich Revenue.....	23,575	27,221	32,000
Administrative earnings and war contribution of communities.....	4,800	5,400	6,400
Borrowing.....	21,210	37,590	50,000
Total Domestic Resources ...	49,585	70,211	88,400
Contributions from occupied countries & import surplus.....	1,500	12,000	17,000
Total all Resources	51,085	82,211	105,000
In £, at the rate of Rm. 12 to the £.....	4,250	6,840	8,750

The share of borrowing in total internal resources has increased to 56.8 per cent compared with 43.8 per cent in 1939-40 and 87 per cent during the Great War. External resources, on the other hand, provided 16.2 per cent of the grand total. These are official German estimates. It is not clear whether requisitioned stocks and captured war material are included.

National Income.—Germany's national income was as follows. They are official estimates relating to Greater Germany and the incorporated territories.

	1939	1940	1941
(Rm. million)			
Gross national income at factor cost.....	95,000	100,000	115,000
Gross national income at market prices.....	113,000	120,000	135,000

The German method of estimating these increases in the national income are not disclosed. The figures, which may be taken as indicating that there has been a rise, which may be exaggerated by the incorporation of new territories. After publication of relevant details has been suspended. After deducting the transfer incomes (which are estimated at Rm. 17,000 millions in 1941) from public expenditure, the total outlay of internal resources for public purposes, that is, civil administration and the war, would amount to 52 per cent. This is the official figure. Critics try to prove that the percentage of domestic resources available for private consumption is lower—30 per cent instead of the 48 per cent of the official estimate.

Capital and Savings.—The discussion about the extent to which Germany has been drawing on capital is of great interest. During 1914-18, 42 per cent of the total costs of the war was derived from drawing on capital. Against 44 per cent derived from current national income. In this war the drafts on capital became a more serious problem at the beginning of 1941. Drafts will gradually and probably steeply increase the longer the war lasts. One source estimates the drafts on capital in 1940 at Rm. 12,000 millions or roughly 15 per cent of total expenditure. It is quite possible there was a 100 per cent increase during 1941.

Total small savings, which increased from Rm. 19,800 millions at the beginning of the war to Rm. 36,000 millions at the end of 1941, remained far below the estimated reduction in the consumption of foodstuffs and civilian consumption goods. At the beginning of the financial year 1942-43, Germany is thus seen battling with the problem of restoring some equilibrium—and these are the words used in the German press—between the "money side" and the "goods side" of the war economy. Even the price commissar has tentatively suggested that prices should be allowed to rise for the purpose of skimming off excess purchasing power. It seems that the simple methods used during the first 18 months of the war have become confused and complicated. The real reason is that Germany has chosen to fight a large-scale war which must gradually exhaust its limited, though formidable, resources.

THE BUSINESS WORLD

Railways and State Control

ONE can forgive the railway ordinary stockholder, if he feels disgruntled about the pool net revenue figures for 1941, which were published last week. Last year, railway history was made, for the four main lines and London Transport not merely earned their standard revenues, but exceeded them by the handsome surplus of £8 millions. Under the original surplus-sharing agreement of February, 1940, if other things had been equal (which they were not), the undertakings would have received little less than their standard revenues. If that agreement had not been abrogated, they might have received £54 millions from the pool, a figure which is only £3 millions less than the standard revenues contemplated by the 1921 Act. As it was, stockholders in 1941 drew only £706,000 more from the pool—or, rather, £43,469,000 as the fixed rent charge—against £42,763,000 earned by the pool in 1940.

These are not figures which militant railway stockholders will survey with any relish; those whose capital still goes unrewarded regard it as little less than scandalous that they should receive nothing for a year when the railways broke all financial records. In a dim Stock Exchange this week, the inevitable optimists were at first busy buying the marginal stocks, on the argument that the 1941 figures betoken jam to-morrow, or at least the day after, even if none to-day. But both the pained surprise and the passing burst of life in the railway market seem to be rather superficial reactions to the figures, in so far as they respectively represent the short and long-term view of railway finance.

There is no doubt that the revised 1941 control agreement was advantageous to the general body of the community. It abandoned the fantastic system of adjustment of rates to rising operating costs, which was implicit through-out the old agreement, and set up in its place a policy of stabilised charges, and a fixed guaranteed income for the period of control. Had the 1940 scheme still been in force last year, it is certain that rates would have been increased, and the pool's net revenue would have been even higher than it was. But, significantly, no stress is being laid upon this fact; the stabilisation of charges is universally recognised to be a vital public interest, and the inflationary evils of the original scheme are as universally disapproved.

Nevertheless, some stockholders are feeling sore. Some are demanding a "little extra," and receiving support from certain sections of the press. This does not commend itself as a particularly valid claim. It is a bad argument for a number of reasons. In the first place, it is based on the result of a single year—a year in which increased traffics combined with the full effect of increased rates, authorised in 1940, to produce bumper traffics. Whatever happens to gross pool traffics during the current year, it is fairly certain that costs will rise more rapidly this year than they did last year, and the promise is not for a repetition of last year's record results.

This is not all. It is a not unreasonable objection to the "little more" appeal to answer that, if the pool is producing record earnings, the railways themselves last year received a greater net revenue, and distributed higher dividends (with the sole technical exception of the Great Western) than for any year in the last decade. Admittedly, the railways never experienced nearly the full benefit of recovery in the pre-war period—1937 was no better than moderate and 1938 frankly indifferent. The fact remains, however, that the stockholder is better off under the rental agreement of £43,469,000 per annum for the period of control than he was in the best of the immediate pre-war years. Moreover, there is no yardstick by which any additional payment might be calculated, even if it were equitable. Some commentators have merely been thinking of numbers, rather than resting themselves on any principle of compensation, but it is no contribution to urge that the railways should receive, say, another £2½ millions a year. Doubtless, that would be a welcome addition to the marginal stockholder's equity—indeed, it would of itself restore an equity in the crisis of war which never existed in the most favour-

able peacetime conditions. But it is not founded upon any calculation resting on fact.

The "little more" argument, however, appears to be dispelled by the strict terms of the revised financial arrangement. There is no provision for mutual revision of the new terms as there was under the former scheme. And even if there were, it could hardly be argued that the bumper results of 1941 would constitute a "cause of major character." The plain fact is that the results of 1941, so far as they enhance the stockholder's equity, can only do so in the post-war settlement. The stockholder's post-war position is governed by two alternative possibilities—the possibility of nationalisation or the reversion to the basic structure of the 1921 Act with standard revenue as the cornerstone. It is too early to suppose that last year's results could be anything more than a minor factor if the first possibility should prevail. Before nationalisation could become practical politics, at least two, and possibly several, more years under control must be expected, in which the results may be nothing like so favourable as last year's. Claims based on 1941 will have a pretty hollow ring if, in some subsequent control year, the Government has to make good a deficiency in the pool to meet the annual guarantee.

Stockholders who put their post-war hope on generous compensation by Government purchase, therefore, will

A Complete Banking Service

THROUGH its widespread organisation, Barclays Bank offers the fullest possible facilities for the transaction of every kind of Banking Business, at home and abroad

Full particulars of the various services provided may be obtained from any Branch of the Bank

BARCLAYS BANK LIMITED

MANCHESTER	-	94, Portland Street

probably find that the evidence they can muster in their own support when the terms are being threshed out will not seem so very conclusive, particularly if the political atmosphere of the time should happen to be critical. There is, however, a very solid assurance that their rights under the 1921 Act will be fully restored. The companies themselves have abrogated none of their statutory claims to standard revenue, and they might well find that an appeal for some amelioration of their statutory obligations would

meet with a relatively sympathetic response, as it was receiving before the war. This would seem to be the best line for stockholder's strategy. In any case, the solution must wait for the peace, and for the passing of the period of adjustment and adaptation from war to normal life. Until that time, the purchase of marginal railway stocks will provide an apparently attractive yield, but little assurance of their permanent place in the scheme of investment.

Finance and Banking

Special Assistance

The position in the money market has tightened appreciably during the week. Most of the clearing banks have been making up for their April returns, while at the same time the Government's short-term borrowing from the market has been heavy. The £75,000,000 of Treasury bill payments due this week were £15,000,000 in excess of maturities, while the call on the banks for TDR's amounted to £40,000,000, against nominal maturities of £25,000,000, and effective maturities somewhat smaller than this, given the pre-encashments that occurred last March. In anticipation of more difficult credit conditions, the demand for Treasury bills at last week's tenders sagged appreciably, total applications being £133,005,000 compared with £147,540,000 the week before. The discount market syndicate thus obtained a quota of 44 per cent, against the previous week's 36 per cent. Owing to the scarcity of short loan resources, the market found some difficulty in taking up its substantial quota of bills, and had to seek some assistance from the Bank of England agents; this firm bought June bills on a moderate scale. As is shown by the Bank return, the drain on bank cash has been further accentuated this week by the continued expansion in the circulation. The increase for the week to last Wednesday amounted to £4,008,000, carrying the total of notes in circulation to the new record of £771,154,000. Bankers' deposits are down by £6,041,000 on the week, falling to £122,627,000, a figure which in these days is barely adequate for the banks' making-up week. The main counterpart to this diminution in bank cash, other than the increase in the note circulation, was the flow of funds into Government accounts, public deposits showing an increase of £4,608,000 on the week.

* * *

Treasury Deposit Encashments

The most interesting feature of the April floating debt return is the innovation by which is shown how much of the Treasury deposit receipts redeemed during the 25 days covered by the return were encashed prior to maturity. Of the total of £118,500,000 of TDRs repaid between April 1st and 25th, it is stated that £11,000,000 was paid off before maturity to cover subscriptions to new Government issues. This information will now be given with each monthly return and represents the official concession to the grand remonstrance that followed the recent ban on publication of the figures of effective weekly TDR maturities. That figure was issued once a week under seal of secrecy to the clearing and Scottish banks participating in TDR allotments, but it made its way into the general currency of City news and gossip. It was admittedly a far from perfect figure and of doubtful value to those outside the circle of banks concerned. It showed the following week's effective TDR maturities, as they appeared at the close of business on Thursday. In order to arrive at the true TDR maturities, that figure had to be corrected to allow for encashments of the following week's maturities taking place on Friday and Saturday. The banks concerned could make the required adjustments, since it would be on their own initiative that the encashments would be effected; but to the outsider the Thursday figure might prove, and on certain occasions was, entirely misleading as a guide to the ensuing week's true TDR maturities. They had, however, the virtue of being anticipatory and therefore of some value as a guide to the course of events in the money market. The monthly figures of prior encashments of TDRs are entirely accurate, but being retrospective must thereby lose some of their interest. These prior encashments are seen to have been exceptionally small in the first 25 days of April. This need cause no surprise as there was bound to be a reaction from the abnormally heavy

encashments of the previous month, which included London's Warships Week.

* * *

Floating Debt Changes

Apart from a net reduction of £9,500,000 in the amount of Treasury deposit receipts over the period April 1st to 25th, all floating debt items expanded during this period. The first weeks of the new financial year are normally a period of slack revenue inflow, while on this occasion Exchequer receipts from long-term Government loans suffered from the inevitable post-Warships Week exhaustion. The recourse to short term borrowing was therefore heavy, and the floating debt increased by £120,715,000. Of this, £56,690,000 was contributed by Treasury bills and £56,525,000 by ways and means advances from public departments. Ways and means advances from the Bank of England, which had been cleared at the close of the financial year, were outstanding to the amount of £17,000,000 on April 25th. As the previous debt return did not show the position on a Saturday, it is impossible to classify the expansion in Treasury bills as between tap and tender bills. But by going back for a period of two months such comparison can be made, and it shows that tap bills between February 28th and April 25th increased by £144,600,000. Part of this represents the further accumulation and investment of Empire central bank funds in London, while the balance is accounted for by the investment of resources by public departments and extra-budgetary funds. While the floating debt has risen by £523,545,000 over the past twelve months, no less than £387,000,000 of this total is represented by Treasury bills issued through the tap and £88,000,000 by ways and means advances from public departments. On this evidence the growth in the floating debt is seen to have been a decidedly innocuous movement.

Tin in British Coins

The Chancellor of the Exchequer, acting in his capacity of Master of the Mint, has decided to reduce the proportion of tin in the alloy of Imperial bronze coinage to half of one per cent. The bronze adopted for the coinage of pence, halfpence and farthings in 1860 was an alloy consisting of 95 per cent copper, 4 per cent tin and 1 per cent zinc. In 1922 the tin content was reduced to 3 per cent, that of copper increased to 95½ per cent and of zinc to 1½ per cent. There was neither inordinate shortage of tin nor was an excessive price quoted for it at the time. The modification

ISSUE OF

3% SAVINGS BONDS, 1960-1970.

A first interest payment will be made on the 1st September, 1942. Thereafter interest will be payable half-yearly on the 1st March and 1st September.

PRICE OF ISSUE £100 PER CENT.
PAYABLE IN FULL ON SUBSCRIPTION.

Bonds of this issue are an investment authorised by The Trustee Act, 1925, and The Trusts (Scotland) Act, 1921.

THE GOVERNOR AND COMPANY OF THE BANK OF ENGLAND, by authority of the Lords Commissioners of His Majesty's Treasury, offer the above Bonds for subscription. Subscriptions will be received on Friday, 1st May, 1942, and thereafter until further notice in the "London Gazette." Subscriptions may be lodged at any office of the Banks hereafter mentioned.

Subscriptions must be in multiples of £50 with a minimum of £50. Subscriptions must be accompanied by the full amount payable in respect thereof.

The Principal of and Interest on the Bonds will be a charge on the Consolidated Fund of the United Kingdom.

If not previously redeemed, the Bonds will be repaid at par on the 1st September, 1970, but His Majesty's Treasury reserve to themselves the right to redeem the Bonds in whole or in part, by drawings or otherwise, at par on, or at any time after, the 1st September, 1960, on giving three calendar months' notice in the *London Gazette*.

The Bonds will be registered at the Bank of England or at the Bank of Ireland, Belfast, and will be transferable by instrument in writing in any usual or common form in accordance with the provisions of the Government Stock (Transfer) Regulations, 1941.

Bonds will be transferable in sums which are multiples of one penny. Transfers will be free of Stamp Duty.

A first interest payment, calculated from the date on which the subscription accompanied by payment is lodged to the 1st September, 1942, will be made on the 1st September, 1942; thereafter interest will be payable half-yearly on the 1st March and 1st September. Interest will be paid by warrants transmitted by post and Income Tax will be deducted from payments of more than £5 per annum. The first interest payment will in all cases be payable to the original subscribers or to their nominees.

The Bonds and the interest payable from time to time in respect thereof will be exempt from all United Kingdom Taxation, present or future, so long as it is shown in the manner directed by the Treasury that they are in the beneficial ownership of persons who are neither domiciled nor ordinarily resident in the United Kingdom of Great Britain and Northern Ireland. Further, the interest payable from time to time will be exempt from United Kingdom Income Tax, present or future, so long as it is shown in the manner directed by the Treasury that the Bonds are in the beneficial ownership of persons not ordinarily resident in the United Kingdom of Great Britain and Northern Ireland.

These exemptions will not apply so as to exclude the interest from any computation for taxation purposes of the profits of any trade or business carried on in the United Kingdom. Moreover, the allowance of the exemptions is subject to the provisions of any law, present or future, of the United Kingdom directed to preventing avoidance of taxation by persons domiciled, resident, or ordinarily resident in the United Kingdom, and, in particular, the interest will not be exempt from Income Tax where, under any such provision, it falls to be treated for the purpose of the Income Tax Acts as income of any person resident or ordinarily resident in the United Kingdom.

Subscriptions, which must be accompanied by payment at the rate of £50 for each £50 of Bonds subscribed, may be lodged at the Bank of England Loans Office, E.C.2, or at any office of the following Banks:

IN GREAT BRITAIN:		
Bank of England.	Co-operative Wholesale Society, Isle of Man Bank, Ltd.	North of Scotland Bank, Ltd.
Bank of Scotland.	Ltd.	Provincial Bank of Ireland, Ltd.
Barelays Bank, Ltd.	Coutts & Co.	Martins Bank, Ltd.
British Linen Bank.	District Bank, Ltd.	Royal Bank of Scotland.
Clydesdale Bank, Ltd.	Glyn Mills & Co.	Union Bank of Scotland, Ltd.
Commercial Bank of Scotland, Ltd.	Grindlay & Co., Ltd.	Westminster Bank, Ltd.
	C. Hoare & Co.	Williams Deacon's Bank, Ltd.
		Yorkshire Penny Bank, Ltd.
IN NORTHERN IRELAND:		
Bank of Ireland.	Hibernian Bank, Ltd.	National Bank, Ltd.
Belfast Banking Co., Ltd.	Munster & Leinster Bank, Ltd.	Northern Bank, Ltd.
		Provincial Bank of Ireland, Ltd.
		Ulster Bank, Ltd.

A commission of 2s. 6d. per £100 nominal subscription will be paid to Bankers or Stockbrokers on subscriptions bearing their stamp.

Subscriptions must be made on the printed forms which may be obtained, together with copies of this Prospectus, at the Bank of England Loans Office, London, E.C.2, or at any of the Branches of the Bank; at the Bank of Ireland, Belfast; of Messrs. Mullens & Co., 13, George Street, Mansion House, E.C.4; or at any Bank or Stock Exchange in the United Kingdom.

BANK OF ENGLAND, LONDON,
30th April, 1942.

N.B.—Separate Prospectuses relating to 3% Savings Bonds, 1960-1970, to be held on the Post Office Register will be issued by His Majesty's Postmaster-General (and may be obtained at any Savings Bank Post Office or Bank), and by the National Debt Commissioners on behalf of Trustee Savings Banks. The amount subscribed by any person under the Prospectuses issued by His Majesty's Postmaster-General and by the National Debt Commissioners must not exceed £1,000.

of the alloy was made to render it better suited to the process of minting. The further reduction in the proportion of tin which has now been decided upon is, however, a move dictated by the urgent need to economise in the unessential uses of this metal. The increased demand for currency has called for considerable additional coinage of brass coins, though the movement has to some extent been countered by the increasing use of the new twelve-sided 3d.

coin. Even so, the reduction of the proportion of tin in brass coins to one-sixth of the figure maintained since 1922 should involve the saving of a considerable tonnage of this now very scarce and precious metal. The reduction of tin in the new alloy will be counterbalanced by an increased admixture of copper and zinc in proportions which have not yet been fixed. The change will be quite imperceptible to the public.

INSURANCE NOTES

THE PRUDENTIAL

THE Prudential continues to operate with undiminished vigour, notwithstanding the many difficulties with which it is confronted under war conditions. The chairman, Sir George L. Barstow, KCB, after referring in his statement to the shareholders to the great loss which the company suffered in the death last September of Sir Edgar Horne, who had been a director since 1904 and chairman since 1928, went on to present a picture of these difficulties. In order to minimise the dislocation which might result from enemy air attacks on London and other closely populated areas, the business has had to be largely decentralised. No less than 57 per cent of the pre-war home male staff have been called up for service in the Armed Forces or whole-time National Service, and this has necessitated the engagement of many thousands of temporary employees, among whom are nearly 9,000 women; the task of training and supervising these newcomers has naturally thrown considerable strain on the remaining members of the permanent staff. Sir George claimed with some justification that the Prudential, with other industrial assurance companies closely in touch with the working-class population, was performing valuable service by encouraging saving and thereby helping to counteract the inflationary tendencies inherent in a situation where the public has in its hands an excess of purchasing power over goods available for consumption.

In the first table are exhibited the principal items from the life revenue accounts, both ordinary and industrial. New business in the ordinary branch is substantially higher, and it is noteworthy that the total of £24,804,000 includes as much as £7,315,000 written by overseas branches; premium income records an advance of 5 per cent. By contrast, both new business and premiums are lower in the industrial branch, but the reduction in premiums is artificial in that the 1940 figure included 53 weekly and 14 four-weekly collections; if allowance is made for this, the true result is an increase of nearly £800,000. The severe fall in interest income which was a feature of last year's accounts is fortunately not repeated on this occasion, the further reduction being quite small. Surrenders are substantially diminished in both branches, but expense ratios inevitably show further advances in the conditions presented by the war.

The second table shows the premium income and underwriting profits of the various branches. The profits figures for the ordinary and industrial branches correspond to the surpluses earned during the year and have again fallen heavily. In the valuation report, it is stated that in the ordinary branch a reduction in the valuation interest rate, together with the adoption of the A. 1924-29 Ultimate table of mortality is under consideration; the calling-up of staff has prevented the completion of the detailed work involved, but it is estimated that the reserves held for United Kingdom policies are greater than would be required on the basis of interest at 2½ per cent with the use of the mortality table mentioned. In the industrial branch a reduction in valuation rate from 2½ per cent to 2½ per cent has been put into effect. These changes, actual or contemplated, are no doubt chiefly responsible for the reduced surpluses. Higher premiums are shown for the various classes of business written in the general branch, but profits are less satisfactory, largely by reason of a poor result on the motor account.

The allocation of the profits of the various branches is portrayed in the third table compiled from the directors' report. Investment reserves receive an aggregate of £790,000, which has been used to replace sums applied to writing down investments, and substantial transfers are again made to contingency funds "in view of prevailing world conditions"; the combined cost of transfers to investment and additional reserves and contingency funds is £4,335,000, leaving only £692,000 remaining from the year's profits of £5,027,000. Interim bonuses to policyholders on a modest scale, bonuses to members of the outdoor staff, and income-tax and NDC in the general branch, together cost £1,123,000; the dividends of 11s. 7.79d. (against 11s. 5.56d.), free of tax, on the "A" shares and 2s. (unchanged), free of tax, on the "B" shares absorbs £827,000. In the circumstances an amount of £564,000, plus an income-tax adjustment of £258,000, a total of £822,000, has been raised from the special contingency fund in accordance with article 135 of the articles of association. A similar transfer, amounting to £792,000, was made last year. Notwithstanding the transfer, the combined surpluses carried forward are less by £436,000.

In the balance-sheet the assets amount to £375,000,000, a further advance of £10,000,000 on last year's total of £365,000,000. Holdings of British Government securities increased during the year from £101,000,000 to £125,000,000, the

latter figure representing one-third of the total assets; since September, 1939, the company has subscribed for more than £52,000,000 of War Loans, but the chairman pointed out that so large a figure was only made possible by reinvestment of the proceeds of repayments and requisitions. The values of Stock Exchange securities have been compared with the middle market prices on December 31, 1941, and on the basis of such prices it is certified that the assets, less the investment reserve and contingency funds taken into account, are in the aggregate in excess of the value stated.

Membership of the Prudential approved societies continues to increase, and at the end of 1941 exceeded 4,300,000. Some £3,742,000 was paid during the year in sickness and maternity benefits, and a further £386,000 expended on additional benefits provided from valuation surpluses, the major item being dental treatment.

I.—EXTRACTS FROM LIFE REVENUE ACCOUNTS

Investment

Sporadic Activity

Almost the only feature of the stock market in the past week has been a sudden burst of real activity in home railway stocks, based apparently on the figures of the White Paper, Cmd. 6349, which are dealt with in detail in an article on page 611. There were definite attempts several times in the past few months to get such a movement going, but they were always nipped in the bud by adverse developments overseas. On this occasion, the business appears to have been largely professional, but, towards the end, the public were active as both buyers and sellers. The net result to date is a moderate appreciation in prices which would appear to have little justification in the White Paper figures, since there will be only one element, and possibly a small one, in determining the post-war position of the lines. Meanwhile, markets in general have remained

FIXED INTEREST AND EQUITY SECURITY MOVEMENTS (July 1, 1935=100)
Financial News indices of 20 fixed-interest securities (converted to new base) and 30 ordinary shares

apathetic, with a tendency for the Funds to sag. Some impute this to the possibility of renewed large-scale bombing, but so far there is no evidence that it is more than one of those moderate reactions which usually follow a protracted rise, and which are caused by readjustment of positions and a temporary dis-investment. The reduction in turnover is giving office staffs a chance to get up to date, but a reflection of the further inroads into pre-war personnel is to be found in the proposal that members should be allowed to employ women in the Settling Room. This is an extension, after a rather protracted delay, of the principle conceded a year ago, when the exchange itself employed women on its marking-boards. The Settlement Room is the training-ground for the house clerk, but there is no intention, at present, of opening the sacred floor to women. Whether they get there before the end of the war will depend upon its duration and upon the calling up of men and women employees.

Directors' Remuneration

The increasingly critical attitude of a large section of the public toward private enterprise applies not only to the profits of the proprietors, but also to the emoluments of directors. It may be that in few cases is there any real justification for this attitude, but it is a matter on which the state of the law is such as to invite suspicion. One of the principal proposals for reform in the days when the Act of 1929 was being drawn up was that the remuneration of directors should be fully disclosed. This reform was granted, but those who framed the Act felt that a director who held a salaried post was in a special position, and it is definitely laid down that in all such cases, including the office of managing director, only directors' fees need be disclosed, whereas for directors, pure and simple, all fees,

percentages or other emoluments have to be made public. This, of course, opened the way for abuses. Commenting on this position, *The Accountant* of April 25th says, substantially, every auditor knows that the effect is to produce doubt and difficulty in the drafting of accounts, and the publication of figures which all concerned know to be incomplete and misleading. It has, in fact, another result which is even worse in these days. If the shareholder is ignorant of the facts, the worker very often has a shrewd idea of the true position—and insofar as he has to use his imagination the picture only gains in force in the process. It is perhaps impossible to fix an upper limit of remuneration for a given job, but it most emphatically is the concern, at least of those directly affected, that the basis of remuneration, and the total receipts in cash and in kind, should be disclosed. It is freely conceded that there is no substitute for a good board, and that the labourer, in all spheres, is worthy of his hire. But how many shareholders, if they knew of the fact, would think it desirable that a director's pay should be based on the gross turnover of the business, or that large and undisclosed salaries should be drawn for occupying a post which is virtually a sinecure? It is possibly cynical to assume that such practices are widespread, but the assumption is general. Further, it is widely believed that "expenses," free of tax to the recipient, go far to wipe out the effects of higher taxation. These beliefs are definitely bad for industrial morale, and there can be no doubt that the disclosure of total payments of all kinds ought to be made obligatory. If the aggregate of such payments to the board were published, its division between the members might, perhaps, be left in their hands.

Canadian Pacific Expansion

The full report of the Canadian Pacific Railway shows that freight earnings of 1941 were only surpassed in 1928, the year of the record wheat crop, while passenger takings were the largest since 1930. Non-grain freights were an all-time record, a reflection of the wartime expansion of industry. This movement is likely to continue in the measure that the industrial war effort grows, but the grain traffic is another matter. The Prairie wheat crop fell by 45 per cent, but thanks to the large carryover from 1939 the amount awaiting transport at the end of 1941 was down by only some 25 per cent on the year. It seems possible that passenger traffic will increase with industrial activity. The year saw capital expenditure of some \$21 millions, or \$6 millions more than was sanctioned at the annual meeting. For the current year, the estimate is slightly lower, at just under \$14 millions, of which over half is for new rolling stock. This argues the expectation of a further considerable expansion, although rather less than that anticipated a year before. This should continue to pull down the ratio of transportation expenses to gross receipts, which was 32.62 in 1941 against 33.97 per cent. This is in part explained by rises from 1,747 to 1,759 in freight train load—gross tons, in freight car-miles per day, from 36.13 to 46.20, and in passenger miles per train-mile from 55.67 to 74.33. Meanwhile, there is a fall of \$30 millions in funded debt, but a substantial part of the benefit from this accrued last year. There are a number of forces making for higher gross receipts, but, against this, there is the possibility that price rises, without countervailing increases in charges, will more than offset the effect of more intensive use of equipment. A further point disclosed by the report concerns shipping earnings. These were shown in the preliminary statement as \$2,788,297, compared with \$3,075,909 for 1940. But \$1,319,969 of the 1941 figure represents earnings properly attributable to the preceding year. The immediate outlook thus remains rather obscure for the ordinary stockholder. The country will, however, come out of the war with considerably increased equipment—in what state of repair it is hard to say—and if industrial activity can be maintained—a large assumption—the railways should benefit.

Conversion Ban Again

The announcement in the report of Crosse and Blackwell for last year that Treasury sanction was refused for (Continued on page 617)

(ABRIDGED)

CANADIAN PACIFIC RAILWAY COMPANY

(Incorporated in Canada with Limited Liability)

Sixty-First Annual Report of the Directors of the Canadian Pacific Railway Company

Year ended December 31, 1941

To the Shareholders:—

The accounts of the Company for the year ended December 31, 1941, show the following results:—

INCOME ACCOUNT			
Gross Earnings.....	\$ 221,446,053		
Working Expenses (including taxes).....	175,488,517		
Net Earnings.....	45,957,536		
Other Income.....	13,382,059		
		\$ 59,339,595	
Fixed Charges.....	24,228,698		
Interest on Bonds of Minneapolis, St. Paul & Sault Ste. Marie Railway Company, guaranteed as to interest by your Company.....	749,465		
		24,978,163	
Net Income.....		34,361,432	
Dividends on Preference Stock:—			
2 per cent. paid August 1, 1941.....	564,070	2,521,391	
2 per cent. payable February 2, 1942.....	564,070	2,521,391	
		5,042,782	
Balance transferred to Profit and Loss Account.....		29,318,650	
PROFIT AND LOSS ACCOUNT			
Profit and Loss Balance December 31, 1940.....		\$ 144,045,295	
Balance of Income Account for the year ended December 31, 1941.....		29,318,650	
		173,363,945	
Deduct:—			
Loss on lines abandoned and on property retired and not replaced.....		\$ 649,076	
Exchange adjustment in respect of steamship insurance recovered in sterling.....	1,670,032		
Miscellaneous—Net Debit.....	658,901		
		2,978,009	
Profit and Loss Balance, December 31, 1941, as per Balance Sheet.....		170,385,936	

Net Income for the year amounted to \$34,361,432, being \$14,216,376 greater than in 1940.

RAILWAY EARNINGS AND EXPENSES

The comparative results of railway operations were as follows:—

	1941	1940	Increase or Decrease
Gross Earnings.....	\$ 221,446,053	\$ 170,964,897	\$ 50,481,156
Working Expenses (including taxes).....	175,488,517	135,325,459	40,163,058
Net Earnings.....	45,957,536	35,639,438	10,318,098
Expense ratios:—			
Including taxes.....	79.25%	79.15%	-10
Excluding taxes.....	71.65%	74.61%	2.96

GROSS EARNINGS increased by \$50,481,156, or 29.5 per cent. The substantial increases occurring in the earlier months, as a result both of rising war-time activity and the delayed movement of the 1940 wheat crop, continued to the close of the year, even though the final quarter of 1940 had been a period of relatively heavy traffic.

FREIGHT EARNINGS increased by \$41,569,461, or 30.6 per cent. They were exceeded only in 1928, when the greatest grain movement in the history of your Company occurred. The volume of freight traffic was greater than that of any previous year, amounting to 22,376 million ton miles, 21.5 per cent. above the 1928 peak of 18,423 million. The average revenue per ton mile dropped to 0.79 cents, the lowest since 1917.

Apart from grain and grain products, freight earnings reached a record level, with a gain over last year of 28.1 per cent. This was almost entirely the result of the conversion of the national economy to a war-time basis. Increases took place in every major commodity group, the most striking being in manufactured goods, lumber and bituminous coal.

Earnings from grain and grain products increased by \$11,147,124, or 40.2 per cent. The volume of grain handled was 215 million bushels, compared with 166 million bushels in 1940. This was considerably more than the average of 155 million bushels for the ten years 1931-40, which included a period of severe drought, but was well below the average of 254 million bushels for the five years 1925-29. The increase for the year resulted from larger export clearances and additional storage capacity at the head of the Great Lakes and other terminal ports, which made possible the movement of large quantities of grain from Prairie points.

The Prairie wheat crop amounted to 279 million bushels, as against 514 million in 1940, a decrease of about 45 per cent. However, as a result of the large carry-over from the previous crop, it is estimated that the stock of wheat available for movement from the Prairie Provinces at the close of the year was only 25 per cent. less than in 1940.

PASSENGER EARNINGS increased by \$6,895,040, or 37.5 per cent., and were the highest since 1930. Traffic throughout the Dominion was very heavy, particularly on your Company's transcontinental line. The average passenger journey was the longest yet recorded, rising to 144 miles as compared with 119 miles in 1940. However, the low rates in effect for members of the armed forces, both on duty and on furlough, caused a reduction in the average revenue per passenger mile to 1.91 cents, as against 1.97 cents in 1940, the lowest since 1916.

OTHER EARNINGS increased by \$2,016,655, or 12.0 per cent. The largest increases occurred in sleeping and dining car and news services. Net payments for hire of equipment amounted to \$382,296 as compared with net receipts of \$89,390 in 1940.

WORKING EXPENSES increased by \$40,163,058, or 29.7 per cent. Exclusive of taxes the increase was \$31,095,766, or 61.6 per cent. of the increase in gross earnings. The war-time cost-of-living bonus paid to employees under various Dominion Orders-in-Council amounted to approximately \$4,500,000. The first cost-of-living bonus was made effective on June 1 under Order-in-Council P.C. 7440, as amended by P.C. 4643, being at the rate of \$1.93 per week. On September 1 the rate was increased under these orders to \$3.20 per week, and on November 16, under Order-in-Council P.C. 8253, to \$3.65 per week. The last mentioned rate, if maintained, will involve an annual expenditure by your Company of more than \$10,000,000. The ratio of working expenses (excluding taxes) to gross earnings was 71.65 per cent., as compared with 74.61 per cent. in 1940, and was the lowest since 1917.

MAINTENANCE OF WAY AND STRUCTURES EXPENSES increased by \$7,835,672. During the year 1,546,175 treated and 1,438,834 untreated ties were placed in track and 249 single track miles of new rail were laid. Tie plates to the number of 2,137,550 and rail anchors to the number of 790,380 were installed. Testing of rails for invisible defects by Sperry detector car was continued. These cars traversed more than 5,000 miles of track during the year, and all defective rails indicated were removed. The unprecedentedly heavy traffic now being handled and the desirability in the national interest of curtailing the demand for labour and materials in order to avoid interference with the war effort made it advisable to limit the work of maintenance of track and structures to that required for safe operation. Consequently, it was deemed desirable in the post-war period by including in the expenses for 1941 an amount of \$3,500,000 to create a special renewal reserve equal to the difference between the actual expenditure and that which would have been made under similar traffic conditions in peace-time.

MAINTENANCE OF EQUIPMENT EXPENSES increased by \$7,611,506. Locomotive repairs involved an expenditure of \$10,132,262, and included the shopping of 614 engines for heavy repairs. Nin locomotive boilers and seventeen tenders were replaced and automatic stokers were installed in thirty engines. Expenditures for freight car repairs amounted to \$9,406,014. The programme for the year included heavy repairs to 23,827 cars and application of cast steel truck side frames to 3,525 cars. Passenger train car repairs involved an expenditure of \$5,957,948. General overhauling of 1,387 cars was effected during the year. To meet the demands of traffic ten lounge and five compartment cars were converted into other classes of sleeping and parlour cars and air-conditioned. Steel centre sills and other improvements were installed in six of baggage and express cars. At the end of 1941: 92.3 per cent. of locomotives and 98.0 per cent. of freight cars were in serviceable condition, as compared with 89.5 per cent. and 96.0 per cent. respectively, the previous year. Charges for depreciation of rolling stock on the basis of use amounted to \$12,700,602, as compared with \$10,317,760 in 1940.

TRANSPORTATION EXPENSES increased by \$14,152,798. In spite of higher labour, fuel and material costs, the ratio of transportation expenses to gross earnings was the lowest on record, being 32.62 per cent. as against 33.97 per cent. in 1940. Although the special traffic conditions made unprecedented demands on rolling stock and facilities, a high degree of efficiency was maintained, as indicated by the following comparisons:—

	1941	1940
Freight train load—gross tons.....	1,759	1,747
Freight train fuel consumption—pounds per 1,000 gross ton miles.....	98	97
Freight train speed—miles per hour.....	17.2	16.3
Freight car movement—miles per car day.....	46.20	30.12
Freight car load—tons.....	31.86	30.65
Gross ton miles per freight train hour.....	30,312	55.67
Revenue passenger miles per train mile.....	74.33	

OTHER WORKING EXPENSES increased by a net amount of \$10,563,079, of which \$9,067,292 was attributable to higher taxes.

OTHER INCOME

Other income amounted to \$13,382,059, an increase of \$2,689,895, or 25.2 per cent.

Dividend income increased by \$342,672. Dividends paid by The Consolidated Mining and Smelting Company of Canada, Limited, were at the rate of \$2.50 per share, compared with \$2.25 in 1940, which resulted in an increase of \$420,625 in the amount received by your Company.

Net income from interest, exchange, separately operated properties and miscellaneous sources increased by \$2,253,202. Interest received on deferred payments on land contracts was greater, and income from the Steamship Replacement Fund was accrued for full year for the first time. The net of receipts and payments in currencies other than Canadian during the year resulted in an increase in income from exchange.

Net earnings of ocean and coastal steamships amounted to \$2,788,297, a decrease of \$287,612. Agreement was reached on certain details of hire for requisitioned vessels which were still unsettled at the close of 1940. The present year's accounts include an amount of \$1,319,969, representing additional earnings for the previous year over and above the amount, partly estimated, which was shown in the last Annual Report. The decreased net earnings for the year are accounted for by the fact that fewer ocean vessels

(Continued from page 615)

the repayment of the 6½ per cent debenture issue seems to call for comment. The proposal, as published, was that approximately half the total outstanding should be repaid in cash and the remainder replaced by an issue of 4½ per cent stock. This was to be done without making use of the machinery of a public issue. There appears to have been no special reason for refusing permission, the decision being merely a continuance, in the industrial field, of the policy which forbade conversions of municipal and Dominion loans. The Treasury does not explain its actions. It would be better for the education of the public and its own officials if it were required to do so. To the plain man, it will seem that any step which reduced the yield on other securities would tend, *pro tanto*, to make Government stock more attractive. This would seem to be borne out by the results of the conversions which have been permitted. These, by increasing the demand for the higher yielding securities, have driven up their prices and so, in due course, the quotations for all stock. In any case, there would seem no reason why, having granted their rights to municipal and Dominion borrowers, the Treasury and its advisers should withhold the same right from industrial ventures. In the one case, to insist upon the maintenance of the higher interest injured the ratepayer or taxpayer. In the other, it injures the equity holder—who in this case has had more than his share of misfortune—to benefit the debenture holder who is to continue to receive 6½ per cent when the average yield on debentures in the manufacturing industries is of the order of 4½ per cent. It is to be hoped that, as in other cases, the matter will be reconsidered, although why it should be necessary for a matter of months, or years, to elapse before permission can be given for an action calculated, in however small a way, to further the official policy of cheap borrowing must remain a mystery.

were in operation. Coastal steamship operations resulted in an increase in net earnings of \$387,628.

Net earnings of hotel, communication and miscellaneous properties increased by \$381,634. Every hotel reported improved earnings, and the total increase amounted to \$367,228. The increase in communication earnings was \$266,579, accounted for largely by gains in ordinary commercial telegraph transmissions and telegraph tolls on cable messages. There was a decrease of \$252,173 in earnings of miscellaneous properties.

DIVIDENDS

Dividends amounting to \$5,042,782, being at the rate of 4 per cent. on the non-cumulative Preference Stock, were declared out of the Net Income for the year.

NOTE.—Particulars of securities held for account of the Company, of obligations of the Company in respect of the principal of securities of other companies owning railway lines operated under lease, and of contingent liabilities of the Company are set out in the accompanying schedules.

TO THE SHAREHOLDERS, CANADIAN PACIFIC RAILWAY COMPANY.

We have examined the Books and Records of the Canadian Pacific Railway Company for the year ending December 31, 1941, and having compared the above Balance Sheet and related schedules therewith, we certify that in our opinion it is properly drawn up so as to show the true financial position of the Company at that date, and that the Income and Profit and Loss Accounts correctly set forth the result of the year's operations.

The records of the securities owned by the Company at December 31, 1941, have been verified by an examination of those securities in the custody of its Treasurer and by certificates received from such depositaries as are holding securities for safe custody for the Company.

Montreal, March 9, 1942.

Company Notes

United Molasses Profits

The preliminary figures of United Molasses for 1941 show a decline in consolidated income from £1,291,902 to £831,021. Liability for British income tax is reduced from £495,474 to £257,834 and there is no provision for retrospective taxation, which in the previous year required £140,000. With a cut in depreciation from £230,114 to £199,832, net profits are down by almost £200,000 at £373,355 against £566,314. The setback is not passed on to stockholders, who receive a final payment of 12½ per cent, making 20 per cent for the year, as before. In the previous year, this distribution was covered by earnings of 48.1 per cent before deducting the retrospective tax. The management announces capital profits of £59,873 against £50,010, from which a 2½ per cent cash bonus on ordinary stock, not subject to income tax, is again being distributed. In the previous year, the payment absorbed £48,863, leaving capital reserve at a total of £519,377. There can be no certainty about the cause of the sharp decline in profits until more information is available. It seems, however, extremely probable that the principal cause is a falling off in overseas activity. In 1940, receipts under the Ministry of Supply Agency Agreement amounted to only 15 per cent of combined profits. Even in that year, America was the principal source of foreign activity, and it is not improbable that growing requirements in this country have meant that the group's transport facilities have had to be more concentrated upon satisfying them. In this connection, the offer to acquire Tankers, implemented in November last, is a matter of some importance, and it is to be hoped that the chairman will be able to throw some light on the subject. The 6s. 8d. ordinary stock at 28s. 9d. yields £5 17s. 6d. per cent.

Home and Colonial Group

Preliminary results of the Home and Colonial group suggest that turnover was generally well maintained last year. For the second year in succession, no dividend is being paid on *Home and Colonial* ordinary capital, which received 6 per cent in 1939-40. Gross income of this concern appears, however, to have risen substantially, since net revenue is reduced only from £159,137 to £148,067 after providing £984,330 for deferred repairs and taxation against £594,592 for tax alone in the previous year. The deferred shares of *Maypole Dairy* again receive 4 per cent. Disclosed profits of £300,115 compare with a level of £288,532, after £60,000 against £25,000 has been provided for deferred repairs. Nothing, against £105,000, is provided for EPT. Equity holders in *Meadow Dairy* receive only 2½ per cent against the 5 per cent distributed in the six previous years. Tax liability is up from £173,250 to £322,470, reducing net profits from £106,823 to £94,252. The severity of the fall in available earnings is doubtless due to the impact of EPT at the full rate operating on an unfortunate standard. Investors in the group are in the unfortunate position of failing to participate in the improved results realised by *Home and Colonial* and *Maypole* while suffering to the full from the drop in the equity earnings of *Meadow*. There can, however, be no doubt of the wisdom of the decision to devote surplus funds to deferred repairs, which must by now have assumed considerable proportions. As far as can be judged from the preliminary figures, the results are fully up to expectation.

Alliance Trust

The speech of Mr James Prain at the annual meeting of Alliance Trust contained an instructive analysis of the factors affecting income in the current year. As the chairman points out, the most striking feature of the experience of the trust in recent months is the lack of security which a worldwide spread of investments has provided. Successive requisitions have now reduced American holdings from some 20 per cent to a negligible amount, so that, except for a small interest in Latin America, revenue-producing overseas investments are virtually concentrated in the British Empire. The chairman estimates the income lost from investments in the Far East at some 2½ per cent on the ordinary capital, while the income obtained from investments in India, Ceylon and Australia, and now to some extent endangered, amounts to rather over 2½ per cent. It is, however, clear from the accounts that the 25 per cent ordinary payment is covered by a margin of 14 per cent. Safe and profitable reinvestment of requisitioned moneys continues to present a serious problem and to some extent income has been sacrificed through subscription to Government issues. Profits for the year to January 31, 1942, are as good as could have been expected. The accounts do not show the effects of the Far Eastern losses. No market estimate of the value of investment is provided, but the chairman states that at the date of the balance sheet this was approximately equal to book value, against a depreciation of some 2.80 per cent at January 31, 1940. Mortgage business now only represents 5 per cent of the company's invested funds, and some progress has been made in the liquidation of real estate holdings. The £100 ordinary stock, at £510 ex dividend, yields £4 18s. per cent.

William Beardmore Setback

The full accounts of William Beardmore, the Glasgow marine engineering firm, show a further drop in disclosed profits, after tax and depreciation, from £375,094 to £211,671 in 1941. In the absence of any provision for Schedule A income tax, which required £17,815 in the

previous year, surplus earnings, after meeting preference dividends, amount to £156,770 against £298,635. The ordinary stock again receives 10 per cent, but the cover is reduced from 60.2 to 33.0 per cent. After halving the transfer to war contingencies at £100,000, the carry forward is some £9,000 higher at £224,415. The reduction in equity earnings is, of course, not conclusive evidence that gross profits fell last year. The full rigours of EPT and income tax at 10s., plus the probability that an exceptionally large depreciation provision has been made, may easily account for the fall. War damage insurance of £43,384 has been charged against war contingencies reserve, so that the balance sheet total, after the latest transfer, stands at £256,616 against £200,000. The gross figure of work in progress is up from £3,183,357 to £4,705,370. Thus, if gross revenue was reduced, rising costs and possibly lower contract prices must be held largely responsible. There is a moderate rise in the surplus of liquid assets over current liabilities from £1,773,705 to £1,873,570. Debtors have more than doubled at £1,282,016 against £549,148, while the modest increase in creditors, including tax, from £1,432,816 to £1,533,545, suggests that credit balances have actually been reduced. Bank overdraft, however, has risen from £63,888 to £260,441. From the stockholders' standpoint, the results remain satisfactory, despite the decline in earnings, since it is improbable that the ordinary dividend need be reduced in the near future. The £1 ordinary stock, at 22s. 6d. ex dividend, yields £8 17s. 9d. per cent.

Kaffir Results

Owing to the breakdown of certain underground hoists of *Crown Mines*, tonnage milled and milling grade were lower. Thus, although working costs showed a fractional decline, profits were severely down and the dividend was reduced to 15s per cent, on which basis the yield at 172s. 6d. is around 9 per cent. The annual tonnage milled is around 4,000,000 tons, so the ore reserves are very strong and can stand up to any curtailment of development due to the war or other causes. The report of *Durban Deep* shows another very satisfactory year. Working costs are down and tonnage substantially up, so that profits are higher and dividends increased from 27½ per cent to 35 per cent, on which basis the yield at 56s. is 6.2 per cent. Ore reserves show another substantial increase, and represent 3½ years' supply to the mill. The mine has fully justified the large expansion programme adopted some years ago. The tonnage milled and working costs of *East Rand Proprietary* were not substantially changed, but the grade was lowered, resulting in a decline in profit. Dividends, however, were maintained at 35 per cent, the same as for the previous five years. On this basis, at 36s., the yield is 9.7 per cent. Development in the eastern and western sections continued to be poor, while in the central section it was curtailed by bad ventilation. Conditions in this area will still further improve when the air-cooling plant is in commission. Reserves represent four years' supply to the mill. In spite of rock bursts and profits *Deep*, milling tonnage was more than maintained and profits unchanged. Dividends of 20 per cent were paid, which at 42s. give a yield of 9.5 per cent. The improved development of the values in depth were maintained. Over 40 per cent of the milling tonnage is being obtained from reclamation in the upper levels, and this should continue to be a valuable source of ore for many years, and so release pressure on the ore reserves, which, nevertheless, are somewhat weak. Tonnage milled of *Geldenhuis Deep* was almost unaltered, but the grade fell and costs rose, so that the profit was down by £70,000 at £168,000. Dividends on the reduced capital value of the shares (17s. 6d.) were maintained at 4s. per share. This mine is nearing the end of its life, and the reserves represent only about one year's supply to the mill. At 20s., the yield is 20 per cent, but reduction in dividends and a very short life are inevitable.

Industry and Trade

Mr Lyttelton's Trouble-Shooters

The panel of industrial and labour experts set up by Mr Lyttelton to investigate difficulties and hold-ups in production, under the chairmanship of Mr Robert Barlow, vice-chairman and managing director of the Metal Box Company, is being rapidly completed. Eight of its fifteen members, four of them trade unionists, have already been appointed, and one of them has already begun an important investigation. This panel of trouble-shooters is likely to be of considerable assistance in overcoming difficulties in individual factories, for, acting in the capacity of consulting engineers, its members will be able to gain a good deal of experience and to suggest quick remedies. The services of the panel will be available not only to Mr Lyttelton, but also to the supply departments or firms that ask for assistance or advice. Meanwhile, the Citrine Committee, appointed by Lord Beaverbrook, to investigate the regional organisation of production, is reported to be at last on the point of publishing its report; this should assist in the formulation of the necessary reforms.

Quality Control

In the search of ways and means of increasing the output of war equipment from existing productive facilities, more attention has recently been paid to the control of quality. The proportion of defective materials which has to be rejected is not known; but there can be no doubt that, in the aggregate, it represents an appreciable loss of output. In view of the many additional workers with no previous experience in their present jobs, it is not surprising. Experience has shown that the proportion of rejects can often be appreciably reduced by the introduction of statistical control. Sample measurements plotted on charts

reveal undue variations in quality and enable adjustments to be made without delay. In order to draw attention to the need for the application of the statistical method as a means of controlling quality, a meeting was held on April 15th under the ægis of the institutions of Civil, Mechanical and Electrical engineers with the support of the Engineering Advisory Committee of the War Cabinet. The British Standards Institution has already issued two publications explaining how the new method of control can be applied. In view of the results achieved by statistical control, it is to be hoped that its use will be rapidly extended.

Coal-Mining Royalties

On July 1st coal-mining royalties will be nationalised in accordance with the Coal Act, 1938, and will in future be payable to the Coal Commission. Unfortunately, however, the assessment of the capital value of the royalties has taken rather longer than expected and is still far from complete. The valuation is being carried out by ten regional valuation boards under the direction of the Central Valuation Board. As it is unlikely that the regional valuations, when completed, will add up to the £66.45 millions payable in compensation, the Coal Commission will have to make the final adjustment. In view of the delay in assessments, which it is difficult to understand, the Coal Commission will not be in a position to pay compensation to royalty owners on the vesting date. This contingency has been foreseen by the Act; it provides that a person entitled to receive compensation may claim quarterly payments from September 30, 1942, until the date of settlement. As the completion of the valuation is not yet in sight, the Commission has proposed to make single payments on account at the end of Sep-

Ordinary Dividends Nos. 20 and 21, totalling 25%...	£531,250
Deferred Dividends Nos. 11 and 12, totalling £7 1s. 8d. per share	177,083
Unappropriated profit carried forward	708,333
	68,352
	£2,030,596

ORE RESERVE.—The fully developed ore reserve, as recalculated at December 31, 1941, amounted to 10,600,000 tons of an average value of 4.3 dwt. over 45 inches. (1940: 10,800,000 tons at 4.3 dwt. over 45 inches.)

Copies of the full Report and Accounts may be obtained from the London Secretary, Winchester House, Old Broad Street, London, E.C.2.

tember in order to avoid having to make a large number of quarterly payments ; the proposed payment is 10 per cent of the draft valuation, if made, or one and a half times last year's income, before deduction of income tax, in a reversion case where no draft valuation has been made, provided the Commission is satisfied that that sum will not exceed the amount ultimately due. The nationalisation of the coal-mining royalties is unlikely, in itself, to speed up the concentration of production in the most advantageous pits in the near future ; for this more direct measures will be necessary.

Cotton Cloth Exports

After considerable delay, the Cotton Board have issued to shipping merchants export allocations for cotton cloth for the quarterly period ending June 30th. The allocations announced are disappointing to shippers, though it is realised that for the present it will not be possible to export larger quantities to some important markets, such as the Middle East and South America. Arrangements have been made for priority consideration to be given to the requirements of Dominion Governments, and the first claim upon Lancashire's production will be met in Australia, Canada, South Africa, Southern Rhodesia and New Zealand. After these requirements have been fulfilled, certain British markets will have small quotas. Other outlets will depend upon any surplus output which is available after other customers have received their essential supplies. The receiving countries desire to avoid the importation of goods not deemed essential in the present war situation. With regard to the Middle East, the general accumulation of arrears of cargo for shipment are so large that it is not considered desirable that new production should take place until these arrears are reduced. Some production may become available for South and North America, but no definite allocations are possible at present. The outlook for foreign trade in Lancashire is now considered gloomy. There is a possibility that some Manchester firms may go out of business for the time being, and it is fully expected that some of the small firms will be taken over by the bigger concerns. It is, of course, being urged that contact in foreign markets should be maintained, as these will be wanted after the war.

Hairdressing Wages

The agreement relating to rates of remuneration and conditions of employment which has been reached by the National Joint Industrial Council for the Hairdressing (including beauty specialists) Trade differs from those reached by the JICs in other branches of retail trade. This is perhaps to be expected because employees in the hairdressing trades provide a more directly personal service to the consumer than the salesman; and a special skill is needed, which takes longer to acquire. This is reflected in the minimum wage rates payable, which are lower for the younger employees, but at about the age of 19 rise higher than those received in "behind-the-counter" trades. For both male and female assistants (and this sex equality is a refreshing departure from the earlier retail trade agreements) up to the age of 18, weekly rates are the same, rising from 16s. at 15 to 28s. at 18. At the age of 19, males working in gentlemen's saloons only, and female assistants working in ladies' saloons, or in saloons for both sexes, and beauty culturists, receive

33s., rising to 65s. at the age of 24. Male assistants employed in ladies' saloons or in both ladies' and gentlemen's saloons receive 35s. at the age of 19, and rise to 75s. at the age of 24. Female workers in gentlemen's saloons are the lowest paid, and begin with 16s. at 15, rising to 55s. at 24. There is provision for extra rates, varying from 5s. to 20s. a week, for charge hands, first hands, specialists, foremen and managers. A commission of 10 per cent on all service takings over £4 a week is to be paid in addition to the foregoing rates. Wage rates for receptionists and counter hands follow the lines laid down by the other "counter" trade JICs: males begin with 21s. 6d. at 16, and rise to 65s. at 25; females rise from 19s. 6d. at 16 to 43s. at 24. The rates are to be uniform over the country.

Coastal Shipping

The annual report of the North of England Shipowners' Association, published last week, contains a reference to a shipowners' mutual compensation scheme which appears to have been misunderstood. The scheme is not a new one; it has been under discussion for nearly a year and applies only to unrequisioned coastal tramp shipping. It was discussed in *The Economist* of June 14, 1941, and was also referred to in the annual report of the Chamber of Shipping published last February. The basis of the scheme is the creation of a fund by a percentage contribution from the earnings of the coastal tramp ship owners, out of which compensation will be paid to meet specified "hardships" suffered by individual ships. The need for some such equalising fund arises from the system adopted for controlling freight rates, which is based on average values, costs, voyage times and so on, and makes no provision for the exceptional cases that must arise. The "hardships" covered will be vessels out of service while repairing, or detained in port owing to enemy activity, and new ships with a considerably higher value than the average allowed for in the rates. The administrative cost of operating the scheme, which has the blessing of the Ministry of War Transport, will be brought into the freight rate calculations, but not, of course, the owners' contributions. A company is to be formed to administer it. The principle of this scheme of self-help might be commended to other sections of the shipping industry with a view to reducing the time spent in discussion with the Ministry over the different forms of "hardship" that arise from time to time.

Allied Mercury Supplies

Allied Mercury Supplies

In the early stages of the war, the Allied mercury supply position gave reason for some concern. The metal is urgently needed for the protective under-water painting of both war and merchant ships, for the production of certain types of detonators, for scientific instruments and for a great number of minor war purposes. More than four-fifths of world supplies were controlled by the Italo-Spanish cartel, and alternative sources were insufficiently developed. The Italo-Spanish cartel exploited their position by raising the price of mercury to \$250 per flask, or about four times the pre-war price. This increase provided a powerful stimulus to production in other countries. Both the United States and Mexico reopened a large number of disused mines and expanded production in their working mines. Output in the United States in 1940 reached 37,777 flasks of 76 lb. each, against 18,633 flasks in 1939. Mexico raised

May 2, 1942

its output from 7,376 flasks in 1939 to 11,653 flasks in 1940. According to the United States Bureau of Mines, output in the United States last year reached 44,000 flasks, and private estimates for Mexico, based on actual output of the first nine months, suggest that that country supplied well over 15,000 flasks. Canada began to produce mercury in substantial quantities last year, and Bolivia is also taking steps to raise its output.

Normally, the United States is one of the world's largest mercury-importing countries, and as recently as 1937 its net imports were 18,500 flasks. In 1940, the United States was for the first time since the last war not only independent of foreign supplies, but actually in a position to ship 9,446 flasks to Great Britain and other parts of the British Empire. In 1941 it remained an exporter (during the first nine months net exports were

1,142 flasks), but, owing to increased war demand, shipments had to be made from domestic stocks, which at the end of 1941 still exceeded 12,000 flasks. There are prospects that the United States surplus will increase again this year. Recently the Government introduced a fairly high controlled price, varying between \$191 and \$193 per flask, according to State, against a national average of \$176.9 in 1940. It is expected that output will rise to over 50,000 flasks this year. Moreover, since April 1st non-military consumption in the United States, which in 1941 still exceeded two-fifths of the total national consumption, has been seriously curtailed. In addition, the United States Government, by an agreement with the Mexican Government concluded last autumn, has acquired the whole of the Mexican production, which is now rising rapidly towards 20,000 flasks. The mercury accruing to the Allies is large enough to prevent a serious shortage, even if Spanish shipments to this country should be stopped.

GENERAL ACCIDENT FIRE AND LIFE ASSURANCE CORPORATION, LIMITED

POSITION STRENGTHENED

The fifty-sixth annual general meeting of the General Accident Fire and Life Assurance Corporation, Limited, was held, on the 29th ultimo, at Perth.

Sir Francis Norie-Miller, Bt., J.P. (the chairman) said that the accounts showed such satisfactory results that they were not only able to continue the same ordinary dividend, but their surplus funds, including the carry-forward, had risen to such a substantial amount that they were able to recommend the strengthening of the value of the shares by adding 5s. per share to the paid-up value.

The great strength of their position was shown in the following figures. They had £2,000,000 of a general reserve; in addition they had £600,000 of additional reserves in their fire and accident accounts and a carry-forward of nearly £1,000,000. All those figures were surplus reserves, after they had provided ample funds to meet all unexpired risks, outstanding claims, any possible depreciation of investments, as well as providing £100,000 for war contingency reserve, and in addition a pension fund of almost £600,000. They felt, therefore, fully justified in recommending to their shareholders that £500,000 from the carry-forward be utilised in increasing the paid-up value of the ordinary shares by 5s. per share.

The life assurance fund showed a very substantial increase of over £300,000, and the expense of conducting that branch of their business had now been reduced to the very low ratio of 12 per cent. The prospects of building up a surplus adequate to pay a good rate of bonus to with-profit policyholders in happier times were not unpromising.

The fire account had continued to give most satisfactory profits and the premium income had advanced substantially.

PROGRESS OF ACCIDENT ACCOUNT

The bulk of their profit came from the accident account, which had shown exceptionally good results during the past year. There had been a remarkable increase in the volume of business written, but they might have a swing of the pendulum in 1942, as present restrictions would certainly impose severe limitations on motor-car insurance. Their portfolio of business was sound and all reserves ample, so that they could face any difficulties that might arise in the current year with equanimity.

The improvement in the marine account was most gratifying and had enabled them to build up a strong fund against any vicissitudes of the future.

From the profit and loss account shareholders would observe that in spite of the increased burden of income-tax, their free interest earnings were still more than adequate to meet the cost of the dividends without drawing on their trading profit.

They had always prided themselves on the service they had given to their agents and policyholders. The difficulty of maintaining that service in these years of war was not surprising, when so many of the officials and staff at their head office and branches were absent, bravely fighting for their Country and in the great cause of liberty. Those who were left to carry on their work were one and all giving of their best with loyalty, efficiency and cheerfulness, and the majority were in their spare time actively engaged in assisting the war effort in civil defence and other important duties.

TRIBUTE TO STAFF

He was sure shareholders would agree with him in emphasising their heartfelt gratitude to those members of their staff who were fighting their battles in all parts of the world, and in assuring them that their thoughts and prayers were with them, and that they looked forward to welcoming them back to their various positions with the company. In that connection he must especially include those who were prisoners in enemy hands and their directors, managers and staff in all those countries which were meantime in enemy occupation.

A hard and difficult year had passed, but he could see the sun which was always behind the cloud ready to break forth with the blessings of peace. They had only to continue and, where possible, increase their efforts for their Country and then he firmly believed by this time next year they would be rejoicing in that victory which must come to all who were fighting in the great cause of freedom and justice for all the nations of the world.

The report and accounts were unanimously adopted.

INTERNATIONAL NICKEL COMPANY OF CANADA

GREAT DEMAND FOR NICKEL

PRODUCTION TO BE AUGMENTED

The annual general meeting of the International Nickel Company of Canada was held, on the 29th ultimo, at Toronto.

Mr Robert C. Stanley (chairman and president), in the course of his speech, said: The major problem facing industry in the United Nations at this time is the problem of immediate production. The nickel industry is no exception. Our metals are of vital importance in the production of essential equipment for our armed forces. It has therefore become necessary, because of the exigencies of war, that all our efforts be concentrated on a prompt increase in output.

To meet the unprecedented demand for nickel we have undertaken an expansion programme which will involve a capital outlay of nearly \$35,000,000. This calls for opening additional ore properties, sinking of mine shafts and the installation of surface and underground plant and equipment, as well as the enlargement of concentrating, smelting and refining works. When this expansion programme is completed our capacity will be increased by approximately 50,000,000 lbs. of nickel per year over the 1940 output. This rate of production will be attained in 1943.

RESEARCH ACTIVITIES

Concurrently with the speeding up of operations and plant expansion our research activities have likewise been accelerated. Technical problems dealing with new applications of nickel are being currently solved in co-operation with Governmental Departments. Throughout all of this work the most economical use of nickel is being emphasised. Technicians and sales executives have been loaned to the Governments for aid in perfecting the plans of technical men are working with consumers who are using nickel for the first time, in order that the metal may be effectively and conservatively used. Our field service men are also aiding in every way possible those of our customers who have been deprived of nickel. By recommending new compositions in steel or substitute materials many of these concerns can continue to exist and will undoubtedly return to using nickel after the war.

All of our mines and plants in Canada were operated at full capacity throughout the year. Our Huntington works is on a full-time war production basis. Our plants in Great Britain are all on a war footing and are working continuously on a full-time basis.

THE YEAR'S RESULTS

Notwithstanding increased sales the net profit dropped from \$35,544,772 to \$34,356,401, a decrease of \$1,188,371. This is accounted for largely by higher taxation, by special provision for short-term amortisation of war-time capital expenditure and by higher production costs. While our costs have risen since the outbreak of the war they continue to be satisfactory in view of the pressure on operations due to increased war requirements.

For the fourth successive year our dividend policy remained unchanged and dividends were declared in United States currency in conformity with the practice which has been maintained for 36 years. Four quarterly dividends were paid on each class of stock and amounted to \$1,933,899 for the preferred and \$29,156,338 for the Common, a total of \$31,090,237.

POST-WAR POSITION

Our position in the post-war period will, I believe, depend largely on the manner in which we conduct our affairs during the war. The engineering uses of nickel in war materials are similar to those in peace-time industry, and a peace-time world must eventually be rebuilt. A sound procedure to guide this company would appear to be—First, to enter the post-war period with ample financial resources; Second, to avoid debt with the attendant danger of fixed charges in a possible subsequent period of depression; Third, to enter the post-war period with the lowest production costs attainable. This calls for plant efficiencies all along the line, which will aid our war effort and our future as well; Fourth, to retain the goodwill of consumers of nickel, many of whom have been held to be engaged in production non-essential to the war.

ASSOCIATED PORTLAND CEMENT MANUFACTURERS, LIMITED

DEMAND WELL MAINTAINED

THE POOLING SCHEME

SIR P. MALCOLM STEWART'S SPEECH

The forty-third ordinary general meeting of the Associated Portland Cement Manufacturers, Limited, was held on the 30th ultimo in London.

Sir P. Malcolm Stewart, Bt., OBE, DL, LID (chairman and one of the managing directors), presided, and in the course of his speech said: The profit on trading amounts to £672,020, compared with £749,669 earned in the previous year, a reduction of £77,649 brought about by the excess of increased production costs over the advance in average selling price obtained. The total revenue for the year at £1,160,820 compares with £1,200,548, a reduction of £39,728. After paying the dividend on the 5½ per cent. preference stock for the year and an interim dividend of 2½ per cent. on the ordinary stock, there remains a balance of £262,320, which enables us to recommend the payment of a final dividend of 6½ per cent., absorbing £260,000, leaving a balance of £2,320 to be added to the carry forward, which will then stand at £217,648.

A WISE AND FAIR MEASURE

It is appropriate here to refer to the Pooling Scheme for the industry, which has been negotiated by the Cement Makers' Federation. It is designed to meet the requirements of the Ministry of Works and Buildings in respect of the limitation of profits and the spreading of abnormal charges and costs due to the exigencies of war. The scheme is a wise and fair measure dealing with difficult and varied issues. That agreement has been obtained is evidence of good will and readiness to solve the problems brought about by the war. No provision has been made in the accounts submitted in respect of the scheme, but it is not anticipated any liability will accrue to this company for the year 1941.

The year under review opened somewhat disappointingly, and it looked as though a marked decline would be experienced in home trade deliveries. However, with the advent of spring a good demand set in for Government requirements. This was well maintained, apart from a setback in the autumn, until the close of the year. Thus we effected aggregate deliveries of Blue Circle Portland cement which showed but a slight falling off compared with the figures of the previous year. The increase realised in the average selling price did not offset the increased cost of production, and this is reflected in the decreased trading profit.

Export trade was on a much reduced scale owing to the shortage of shipping facilities. Recent events in the Far East have deprived us of one of our important markets for the time being.

PRODUCTION PROBLEMS

At home the problems of production have presented many difficulties. However, the works have been well maintained despite the shortage of some materials and supplies. The output of cement was at all times equal to the demand. The continuous call for more men for HM Forces caused a shortage of labour. This was partly met by the release of employees from the Army to facilitate the manufacture of our product, which is proving so essential in wartime.

The transition from non-returnable paper bags, so easily filled by mechanical packers and so handy for the consumer, to returnable jute sacks has slowed down the rate of packing, required the formation of a new organisation and installation of machinery to sort, clean and repair the very large numbers of jute sacks which have to be dealt with. A point which I would be grateful if our customers would note is that the quick return of jute sacks in a dry and undamaged condition materially helps the loading position. Efforts are being made to develop the delivery of cement in bulk. The scheme cannot be successfully employed unless the large consumers make special and adequate provision at the receiving end for handling and storage.

Our attention has been drawn to statements that there are occasional shortages of cement. At no time has this actually been the fact. The industry holds adequate stocks of cement and heavy stocks of clinker. The difficulty is that contractors and consumers

make little or no provision for the building up of stocks on the sites where the cement is to be used.

CO-OPERATION WITH GOVERNMENT

The Cement Makers' Federation has completed another year of successful co-operation with the Ministry of Works and Buildings. This is in no small measure due to the work of Mr Hugh Beaver, the Director-General. Lord Wolmer, director of cement, recently resigned on his elevation to Cabinet rank and appointment to the office of Minister of Economic Warfare. He rendered outstanding service to the Ministry in helping to find a solution of the inevitable difficulties presented when an industry passes over from private to Government control. He is succeeded by Mr Norman Daynes, KC.

Our companies have, during the past year, taken a step of importance which it is hoped will afford increased security to their staffs. Since 1914 the Associated company and its main subsidiaries have had in force a joint benefit fund founded to provide their staffs with a lump sum on retirement. Contributions to the cost of this scheme were made by the members and by the companies. In recent years it has been found that the amounts paid under the scheme were somewhat inadequate and the results accruing from the lump sum payment did not always prove satisfactory. The directors, therefore, have had under consideration for some time the conversion of the benefit fund into a pension fund. After consultation with actuaries and solicitors specialising in these matters, a scheme was submitted and approved by over 90 per cent. of the voting members of the benefit fund. That fund has, therefore, been converted into a pension fund as from January 1st this year.

You will be interested to learn that the sum subscribed through the various War Savings groups formed by our staff and employees at the offices and works now amounts to £116,000.

CURRENT YEAR'S PROSPECTS

A sure forecast of the prospects for the current year it is not possible to make. Building operations carried out by private enterprise have virtually ceased. We are entering a period during which many manufacturers of building materials will be faced with the closure of their works, but this will result in the release of more men for HM Forces. The cement industry so far has escaped the general trend of contraction in the demand for building materials. This is fortuitous, since fluctuations in the demand for these normally synchronise.

The relatively better position of cement is due to exceptional circumstances. These are likely to operate for a period, but their duration is an unknown factor. Therefore, it is impossible at this juncture to see clearly very far ahead. However, I anticipate that the demand will be well maintained for some months to come.

With regard to the prospects for the current year's profits, I trust stockholders will deem themselves fortunate if the past year's results are maintained, but they must not be surprised if some falling off is experienced.

At a time when ill-informed criticism, based on a few exceptional cases, has been too generally prevalent, it is gratifying to record the good effort our staff and employees, men and women, have made to carry on under difficult and often dangerous circumstances, and we are especially indebted to our many old hands whose good example gives a lead. Stockholders will, I am sure, join with the directors in expressing our thanks to all members of the staff and employees attached to the various departments of our business at the company's works and depots for their loyal support and co-operation throughout the arduous experiences of the past year. Further, that you will also join the board in expressing our gratitude and good wishes to the 2,400 of our employees who have joined HM Forces.

The report was adopted.

AGRICULTURAL MORTGAGE CORPORATION, LIMITED

ARREARS REDUCED

The thirteenth ordinary general meeting of the Corporation was held on the 28th ultimo in London.

Sir Harry Goschen, Bt., KBE (the chairman), said that during the past year they had granted further long-term loans of £283,303, bringing the aggregate sum advanced to £13,897,528, secured on first mortgage of 938,725 acres of agricultural land valued at £21,789,602. Further loans totalling £187,909 had been approved by the directors, and would be completed as soon as the necessary formalities had been complied with. The aggregate of loans granted under the Improvement of Land Acts had increased to £131,366. He was pleased to report again a substantial reduction in the outstanding arrears of interest and capital repayments. Over 93 per cent. of the amount which fell due during the year had been paid by March 31st, and the total of all arrears was less than one-half of 1 per cent. on the aggregate of loans outstanding.

During the past year, the second year of war, the lands of England had yielded a harvest surpassing, both in volume and quality, all peace-time achievements. Farming had been put to a severe test and, in the face of many difficulties, it had won new triumphs. Much land had been reclaimed and the area under crops had increased by about 45 per cent. above pre-war level, while the output of cereals and straw in 1942 was estimated to reach not less than half as much again as in peace-time.

Corn crops in most parts of the country had given satisfactory yields, and the July rains had come just in time to assure an extra sack or two per acre and gave the root crops the moisture they so sadly needed. Wheat, the mainstay of farming, had done well, and a still larger acreage would be due for harvest in 1942. Turning to livestock, dairy cows and heifers were in strong demand. Other cattle and sheep also found a ready market, but the numbers of pigs and poultry had again probably declined.

The report and accounts were unanimously adopted.

THE ROYAL LONDON MUTUAL INSURANCE SOCIETY, LIMITED

SUBSTANTIAL PROGRESS

ASSETS EXCEED £50,000,000

The eighty-first annual general meeting of the Royal London Mutual Insurance Society, Limited, was held, on the 28th ultimo, in London.

After the secretary (Mr J. J. Pipe) had read the auditors' certificate, Mr J. K. Wiseman, joint managing director, in presenting the directors' report and statement of accounts for the year 1941, said:

The combined premium income of all branches for the year amounted to £7,750,233, the increase in the life branches over the previous year being £376,524. The total income for the year amounted to £9,644,210, an increase of £351,407. The total claims paid, including annuities and surrenders, amounted to £3,716,312. War claims amounted to £268,077. The total of claims paid by the society since its foundation amounts to £61,543,000.

The total assets amount to £51,905,720, an increase of £3,226,826 during the year. For the first time the assets exceed £50,000,000, which is a milestone in the history of the society.

A valuation of investments at the end of the year discloses a very satisfactory position. The market value of Stock Exchange securities exceeds the book value, as set forth in the balance-sheet, the investment reserve and contingency funds remaining intact.

The premium income in the ordinary life branch for the year (including consideration for annuities granted) amounted to £2,028,171, an increase of £129,872 over the previous year. The new sums assured amounted to £3,358,950, an increase of £764,431. The amount paid in respect of claims by death or maturity, annuities and surrenders amounted to £1,080,962, a decrease of £253,637.

As regards war risk on new policies, we have continued our special scheme under which a benefit of 50 per cent. of the full sum assured is allowed on with-profit policies issued at the ordinary rate of premium should death occur in consequence of war or hostilities while the life assured is a civilian. Service as a civilian

in any form of ARP and part-time service by civilians in the Home Guard is included. This scale also applies to women serving at home or abroad in any hospital or auxiliary service. Full cover instead of 50 per cent. may be secured on payment of a small extra premium. In the case of men serving in the Mercantile Marine the war risk benefit on with-profit policies issued at the ordinary rate of premium is 25 per cent. of the full sum assured.

In the industrial life branch the premium income for the year amounted to £5,689,250, an increase of £246,651 over the previous year. Claims and surrenders amounted to £2,608,610, a decrease of £193,642.

The amount added to the fund, namely, £2,052,512, which includes £1,369,908 interest on investments, is money put aside as provision for future payments to policyholders.

The balance-sheet shows that the assets total £51,905,720, an increase of £3,226,826 over the previous year. Stock Exchange securities represent 76.3 per cent. of the total, the remainder consisting mainly of mortgages, loans on public rates, freehold and leasehold properties and ground rents.

Of the Stock Exchange securities, 98.3 per cent. are made up of investments within the British Empire.

The proposition to adopt the report and accounts was seconded by Mr J. H. Skinner (joint managing director) and unanimously carried.

PINCHIN JOHNSON AND COMPANY

MR EDWARD ROBSON'S REVIEW

The annual general meeting of Pinchin, Johnson and Co., Limited, was held at Tigbourne Court, Witley, Surrey.

The chairman's statement was as follows:—
The directors' report has given the salient features of the trading and operations for the year ended December 31, 1941, and the following statement is a brief review for the benefit of the shareholders:—

Such information as can be given to show the importance of the work the company is now doing is of necessity very limited. The company has continued to implement its resources for the manufacture of highly specialised products essential to the country's industrial activities, and the resulting increased output has been well absorbed by the cumulative and growing demands of the national effort.

OUTPUT MORE THAN MAINTAINED

Last year reference was made to the temporary decline in the domestic business of the company. This decline has become more marked during the past year and export has narrowed to such limits as are permitted, having regard to other calls on materials, and transport. In spite of these factors beyond our control, the tonnage output of all our factories in the United Kingdom has been more than maintained. Two months' output from one of the most important of the company's factories was lost through displacement from circumstances outside our control, and profits were adversely affected during the improvisation period.

The facilities since installed are better for present needs than those previously used. Future production effort is dependent upon Government policy as to labour utilisation and control of materials. At Government request important technical officials of the company have been loaned to them so that the authorities may have the benefit of their experience and advice in the national interest as it affects the paint industry.

Referring to the balance-sheet, the stock-in-trade and sundry debtors figures show that the tie-up of cash resources continues, and that this must still dictate the conservative dividend policy referred to by your directors.

From the appropriation account you will note that the sum of £20,000 has been added to the reserve for depreciation of investments and contingencies. The addition will raise this reserve to a total sum of £140,000.

GEOGRAPHICAL SPREAD OF OPERATIONS

Demand for specialised products continues on the upgrade, and extensions to take care of the added load are in operation. Due regard is being paid to the "Service" factor post war in all present planning—the aim being to give rapid distribution allied to intense

specialisation on each industrial need. The geographical spread of the company's operations is a factor of immense value to be exploited. Shortages of natural material are being met by substitutes developed by the technical resources in the organisation, thus proving the value of research done in the past, in the forefront of which activity the company intends to remain.

The chairman then formally moved: "That the directors' report

and the balance-sheet at December 31, 1941, as submitted, be received and adopted and that a final dividend of 6 per cent., less income-tax, be declared and paid to the holders of the ordinary shares on the register of the company at April 14, 1942."

The resolution was carried unanimously.

The retiring directors were re-elected and the auditors re-appointed.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash
WHATEVER the true implications of Hitler's speech, the markets showed no tendency to deviate from the waiting policy of the last few weeks, pending the decisions which the next few months are expected to bring. Price movements were in consequence mixed and narrow, the tone generally remaining steady. The feature of the gilt-edged market was adjustment to the new 3 per cent Savings Bond issue 1960/70, the earlier issue rising above par. Long-dated and irredeemable stocks revealed some weakness in the absence of support, Local Loans, Old Consols and 3½ per cent War Loan all losing ½ on Tuesday. South American issues continue to provide the chief interest in a quiet foreign bond market. Both Chilean and Brazilian stocks showed slight improvement early in the current week, but before the week-end Chinese bonds advanced, the 4½ per cent loan of 1898 rising 2 points. Consideration of the railway White Paper at the close of last week resulted in some active trading in the home rail market. LMS ordinary rose 1½ and LNER 4 per cent second preference 1 point before the week-end, while smaller advances were registered at the reopening for junior issues. The following day, however, witnessed some profit-taking, but declines were slight. Turnover in the foreign rail market remained small, and apart from occasional changes prices were steady.

The industrial market continues to suffer from general inactivity, prices fluctuating narrowly with day-to-day influences. Small improvements for leading brewery issues reflected steady support in the early part of the week, but tobacco shares were dull on fears of reduced consumption, Imps and Gallaher both losing ½ before the week-end. Prices in the motor and aircraft group showed little change, although De Havilland fell ½ on Tuesday, when Raleigh Cycle Holdings improved a few pence. Leading heavy industrial issues were generally unaltered, while interest in the shipping group was slight. Earlier dullness in textile shares in which Patons and Baldwins lost ½ before the week-end was reversed at the reopening, when Fine Cotton Spinners rose 9d. among other smaller gains. In the miscellaneous section, Emmies rose 7½d. on Monday, but eased slightly the following day, when United Molasses weakened on the sharp reduction in trading profits. Among leading stores issues, both Woolworth and Marks and Spencer were weak at the end of last week, but later remained steady.

Earlier inactivity in the kaffir market was relieved in the early part of this week by a revival of buying from the Cape. Although the volume of business remained small, numerous improvements were registered, West Wit Areas advancing ¼ at the reopening, but gains were in general slight. In contrast to the rubber market, where conditions remained dull, tea issues have shown steady improvement on consistent buying over the past week; most gains, however, did not exceed ½. In the oil market, which in common with other sections suffered from lack of interest, Mexican Eagles fluctuated narrowly and were slightly lower on balance at the end of the week, but leading issues were practically unchanged.

New York

FORECASTS of the price and profit controls, together with increased taxation proposals, announced in President Roosevelt's speech on Monday, and the discouraging news from Burma had before the week-end reduced many quotations on Wall Street to the lowest level for nine years. While the volume of selling lessened in the early part of the current week, little support was forthcoming from buyers who are holding off pending details of the economy measures.

CONVERSIONS AND REPAYMENTS

Argentine Estates of Bovril.—The outstanding £138,287 5 per cent. debentures are due for redemption July 1, 1943, at 105 per cent. The company is prepared to redeem it at 105 per cent on May 31, 1942, plus interest accrued. Notice of acceptance of the offer must be received on or before May 14, 1942.

BY TENDER

Colne Valley Water Company.—Tenders invited at a minimum of 146 per cent for 7 per cent "F" Ordinary stock to produce £120,000.

Shorter Comments

Mitchells and Butlers, Limited.—Mr James Henry Greenaway, the secretary, has been unanimously appointed a director of the company, with whom he has been associated for 53 years. The following interim dividends on account of the year ending September 30, 1942, have been declared to be paid May 20, 1942: 3 per cent actual, less income-tax, on the "A" and "B" Preference stock. On the ordinary stock 8 per cent actual, less income-tax. On the 7 per cent maximum ordinary stock 3½ per cent actual, less income-tax.

moval, transport, keeping, storage, disposal or delivery of it. A schedule of prices has been issued, which was settled in consultation with the Agricultural Departments, and as already announced, shows an average increase of 2d a lb. over the whole range of last year's prices.

Crepe Rubber Requisitioned.—All stocks of plantation-finished sole crepes and crude unvulcanised crepes, cut or uncut, held by boot and shoe manufacturers, merchants,

factors and cutters have been requisitioned by the Minister of Supply, in view of the need for crepe rubber for war purposes.

Cotton Wages.—No agreement was reached between cotton operatives' unions and employers before the Cotton Conciliation Board, which met last week to discuss the workers' claim for an increase in wages of 2d. per hour. As a result, the chairman will make an award, which will shortly be issued.

Producer Gas Vehicles.—The Government has decided to equip 10,000 commercial vehicles with producer gas apparatus. The producer decided upon was recommended by a technical committee, which reviewed every producer in operation.

Rubber Waste.—The maximum price for waste tyre covers sold to persons other than reclaimers or certified waste rubber merchants in small lots has been raised to £1 per ton, the price payable for covers in

large quantities, under the Control of Rubber (No. 12) Order, made by the Minister of Supply.

Tyre Rationing.—A deputation of the Commercial Motor Users' Association met the Director of Rubber Tyre Control to discuss certain details of the tyre rationing scheme. As a result, vehicle owners will be allowed to fit their own tyres, and if on investigation it is found desirable for owners to hold a small emergency stock of tyres, facilities for so doing would be granted.

Knitting Yarn Prices.—The Board of Trade have made the Knitting Yarns (Maximum Prices) Order (S.R. and O. 1942, No. 751) by which the maximum prices of knitting yarns marketed by fourteen firms have been fixed. The Order also forbids any rise in the manufacturers' price of other knitting yarns above the prices ruling on February 1st last, and it prescribes a

maximum margin for wholesalers of 2½ per cent on the price paid to the manufacturer (equal to 17½ per cent on returns), and for the retailers, 42.34 per cent on the price paid to the manufacturer of wholesaler (equal to 30 per cent on returns).

THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

CAPITAL (PAID-UP) - £3,000,000
RESERVE FUND - £3,000,000

Branches and Agencies throughout INDIA and the EAST
AFFILIATED BANK IN INDIA

THE ALLAHABAD BANK LTD., with 15 Branches & 30 Sub-Agencies

The Bank offers a complete Banking Service and provides exceptional facilities for financing every description of trade with the East.

Deposits for Fixed Periods or repayable at call or at short notice are received at rates which may be ascertained on application. The Bank also undertakes Trusteeships and Executorships.

Head Office: 38, BISHOPSGATE, LONDON, E.C.2

London: 117/122, LEADENHALL STREET, E.C.3
 Branches: 28, CHARLES II STREET, HAYMARKET, S.W.1
 Manchester Branch: 52, MOSLEY STREET
 New York Agency: 65, BROADWAY, NEW YORK CITY

THE UNION BANK OF AUSTRALIA

ESTABLISHED 1837

LIMITED

Capital Authorised and Issued ... £12,000,000
 Paid-up Capital ... £4,000,000
 Reserve Liability of Proprietors ... £8,000,000

£12,000,000

(Not capable of being called up except in the event of and for the purpose of the bank being wound up)

Reserve Fund ... £3,250,000
 Special Currency Reserve ... £1,600,000

Head Office: 71 CORNHILL, LONDON, E.C.3
 West End Agency: 15 CARLOS PLACE, W.1

Drafts are granted on the Bank's Branches throughout the Australian States and Dominion of New Zealand. Telegraphic Remittances are also made. Commercial and Circular Letters of Credit, and Travellers' cheques issued. Bills are purchased or sent for Collection. Deposits are received for fixed periods on terms which may be ascertained on application.

THE BANK OF AUSTRALASIA

Incorporated by Royal Charter 1835.

Paid-up Capital ... £4,500,000
 Reserve Fund ... 2,500,000
 Currency Reserve ... 2,000,000
 Reserve Liability of Proprietors under the Charter ... 4,500,000

£13,500,000

Court of Directors:

D. F. ANDERSON, Esq. HON. GEOFFREY C. GIBBS.

 C. G. HAMILTON, Esq.
 F. V. C. LIVINGSTONE-LEARMONTH, Esq., D.S.O.
 DAVID J. ROBERTS, Esq.
 SIR JOHN SANDERSON, K.B.E.
 ARTHUR WHITWORTH, Esq.

HEAD OFFICE: 4 Threadneedle Street, London, E.C.2

WEST END BRANCH: 17 Northumberland Avenue, London, W.C.2

Numerous branches throughout the States of VICTORIA, NEW SOUTH WALES, QUEENSLAND, SOUTH AUSTRALIA, WESTERN AUSTRALIA, TASMANIA, and the DOMINION of NEW ZEALAND.

The Bank offers facilities for the transaction of every description of Banking business in Australia and New Zealand. Negotiates or collects Bills, Issues Telegraphic Transfers, Letters of Credit and Drafts, also Circular Credits and Travellers' Cheques available in all parts of the world. Deposits received at interest for fixed periods on terms which may be ascertained on application.

THE ENGLISH, SCOTTISH & AUSTRALIAN BANK, LTD.

Head Office: 5 Gracechurch Street, E.C.3

Subscribed Capital ... £5,000,000
 Paid-up Capital ... 3,000,000
 Further Liability of Proprietors ... 2,000,000
 Reserve Fund ... 1,755,000
 Special Currency Reserve ... 1,585,000

Chief Office in Australia:

Collins Street, Melbourne

and many Branches and Agencies throughout Australia.

With its widespread connections, this Bank offers every facility for the conduct of all classes of Banking and Exchange business with Australia.

J. A. CLEZY, London Manager and Secretary.

BANK OF SCOTLAND

Constituted by Act of Parliament 1695

AUTHORISED CAPITAL ... £4,500,000
 CAPITAL FULLY PAID ... £2,400,000
 RESERVE FUND & BALANCE carried forward ... £2,256,217
 DEPOSITS & CREDIT BALANCES ... £50,593,844

as at 28th Feb. 1942 ...

Head Office: THE MOUND, EDINBURGH

262 Branches and Sub Branches throughout Scotland.

London Offices:

CITY OFFICE, 30 BISHOPSGATE, E.C.
 PICCADILLY CIRCUS BRANCH, 16/18 PICCADILLY, W.

OVER 850
BRANCHES

A complete banking service is offered in every part of Australia, New Zealand and the Pacific Islands by Australia's oldest and largest bank.

BANK OF NEW SOUTH WALES

Incorporated in New South Wales with Limited Liability.

LONDON OFFICES:
 29, Threadneedle Street, E.C.2. 47, Berkeley Square, W.1.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

(Incorporated in the Colony of Hongkong. The liability of members is limited to the extent and in manner prescribed by Ordinance No. 6 of 1922 of the Colony.)

AUTHORISED CAPITAL ... £50,000,000
 ISSUED AND FULLY PAID-UP ... £20,000,000
 RESERVE FUNDS (STERLING) ... £8,500,000
 RESERVE FUNDS (HONGKONG CURRENCY) ... \$10,000,000
 RESERVE LIABILITY OF PROPRIETORS ... \$20,000,000

Head Office, HONGKONG,

temporarily transferred to
LONDON OFFICE, 9, Gracechurch Street, E.C.3.
 Acting Chief Manager: A. MONSE.

BRANCHES AND AGENCIES THROUGHOUT INDIA AND THE FAR EAST, Etc.

HONGKONG & SHANGHAI BANK (TRUSTEE) LIMITED
 9 Gracechurch Street, E.C.3, a Company incorporated in England and an affiliate of The Hongkong and Shanghai Banking Corporation, is prepared to act as Executor and Trustee in approved cases. Full particulars may be had on application.

The Only Way.

HITLER'S recent speech has been called an offensive against the German people. There are signs, in England itself, of an even more insidious and fatal offensive against the English people. Four hundred years ago, Catharine of Aragon found the people of England unstable. "They are too elated by small successes (she told the Emperor) and too cast down by small reverses." Guard is needed now against the same infirmity. March to May is a short time. Yet there are marks already of a revulsion from the austerity then called for. Singapore is two months further distant. The growing strength and initiative of the United Nations have been underlined by a few deeds and many words. So it is possible for men of influence, here and there, to protest against what is called "rationing for rationing's sake," and for vested interests to start up again in their last ditches to fight restriction and control. There is more than the stupidity to be expected from the 1922 Committee in their threat to wreck the plan to ration fuel. It is even possible for a journalist, writing in a newspaper which at the same time cries out for a Second Front, to suggest that the people now resent "the austerity that is imposed on them from above"—an alarming new interpretation of national morale and a gross misstatement.

This trend is as great a menace as the malignancy of the enemy. So far, it is only a hand's-breadth cloud on the

horizon. The nation is sound and steady. The vast majority, in fact, are readier than ever for any sacrifice. The onus lies upon their leaders, in business, in politics, and in the Press, to prove and press the need; and it is there that the traces of faltering have appeared. The view is heard that the screw has been tightened enough, that austerity beyond a point becomes prohibition without need. This is murmured, as yet by a minute few, in clubs, in Government offices, at party headquarters, in trade associations and in trade unions. In part, it is disingenuous. In part, its wrongheadedness has some excuse. One excuse is that austerity has been incompletely planned; it is still possible, because too much excess purchasing power is left in the pockets of the public, and because too many varied and needless goods are still being made and sold, for wartime austerity to take the form of sharp disparities between one citizen and another; the way in which restaurant meals are being tinkered with, when they should be brought as soon as practicable within the ration, is symptomatic. Moreover, it is maddening when restrictions upon ordinary people are called for which might have been less stringent if there had not been mismanagement in the past; the bitter controversy about fuel rationing has been shot through by this sense of justified recrimination. Nor can it be denied that the morale, the health, and the spirit of ordinary working people, living

and working in ordinary working-class conditions, are much more than a matter of sound statistics and subtle economic reasoning. Manpower is men and women, and it is above all imperative, in the war effort, that those who serve should be adequately fed, adequately clothed, adequately housed, and adequately rested and recreated. It cannot be too strongly emphasised that no section of the community should be able, by reason of its income or its privilege, to live through this crisis of the war more cushioned than others against the rigours of war economy.

But shortcomings and mismanagement in the past are not arguments against austerity now. When they are used in this way by the fainthearted, the blind and the stupid or by the spokesmen and sycophants of vested interests, whether labour or capital, they are blatant special pleading. Austerity, in the shape of comprehensive rationing and restriction, will not push the people of this country, even the poorest, beyond the breaking-point. Indeed, austerity is needed to prevent the breaking-point from being reached. The need is to win the war; and in war economy there is nothing, no resources, no wealth, no factor of production, to spare. There is less to spare in the next decisive months of the war than ever before in English history. The whole country cries out for action. The limitations upon output and strategy are set by shipping and manpower. Nothing is unfair or over-harsh that will free men or ships, to-day and not to-morrow. Restrictions have already cut deep into the high British standard of living; and the only reserve of labour for the war effort now is in the so-called essential industries, the only reserve of ships in the so-called essential import or export trades. If 1942 is to be, as every free soul alive wishes, a year of decision, there will be massive demands for both ships and men, and great casualties. The Second Front, like charity, begins at home. It is surely not true that the war workers, and other civilians, who pass resolutions calling for soldiers to be sent out to fight, at whatever cost, are themselves unready to make the further sacrifices needed. There is no excuse for the needless use of a single man or a single ship. A chief aim of all-in fuel rationing is to save men, as well as coal.

Slowly but perceptibly, the people of this country have come to realise that everything is scarce in war economy, if success is sought. There are so many things to be done. Slowly but genuinely, they have come to see that rationing and price control and standardisa-

tion are necessary means to minimise the disparities and hardships of wartime living, as well as to save materials, ships and manpower. It is a betrayal of this understanding and of the nation's resolution that there should be these guides and spokesmen at this moment, however small in numbers and unrepresentative, ready to call a halt to the measures needed to end the chaos and carnage into which the world has fallen. Too many of them are disingenuous creatures lacking, not in knowledge but in integrity, too anxious to preserve the stakes and statuses of present society, and too shortsighted to see the doom that their shortsightedness would court.

The question is not whether a halt should be called to austerity. It is whether more men or more ships can still be saved for the effort and the offensives of 1942. This is the greatest emergency in world history. It should be a set design, determined by the Government and imposed upon all groups and corporations, to root out immediately every needless employment and every needless voyage. It should be asked what further measures can be taken, if they prove necessary. It should be asked, for instance, whether bread may not have to be rationed to cut down a great waste of imported grain, and, at the same time to ensure a sufficiency of bread for every consumer in the months to come. It should be asked whether the emergency has not come in which foodstocks, rather than food imports, should be drawn upon to meet the nation's ration. It should be asked whether the time may not be near at which it would be better to slaughter beef cattle, and feed home barley to milk cows, than to bring in feeding-stuffs by sea. It should be decided, once and for all, that imports of essential war materials must not be cut down in order to hold food imports at the present level, which is reducible; and the new quota of supplies under the Limitation of Supplies (Miscellaneous) Orders, which starts on June 1st, for the range of articles which runs from cork carpets and metal furniture to trunks, cameras, musical instruments, toilet requisites and personal ornaments, should have been set at zero.

The contrast to be reckoned is with Russia and Germany. "The front, the home land, the transport system, the administration . . . must be governed by a single thought—victory." This was Hitler's appeal; and it would be a tragedy for more than England if the tradition of blood, toil, tears, and sweat were to pass over to the enemy. The path to victory is more austere, not less, than the path to defeat.

The Failure of Fascism

THE weeks before each year's spring offensive have tended in this war to be a kind of silly season, during which every kind of inspired rumour and confidential report gets circulated. Each spring the Axis Dictators, by meeting in solemn—and secret—conference, have provided a focus of gossip, and since there has not been much doubt about Germany's attitude on the war, it is Italy's reactions that have come in for the keenest discussion. In 1940, the question discussed was whether Italy would come into the war; in the two following years, last year and this, whether Italy could get out. This year, the Salzburg meeting has once again provided the focus of interest. Once again, old illusions are cropping up.

Mussolini sees all the Italian prefects before leaving. This is read to mean that Italy is seething with unrest and that new security measures have now to be devised—in close co-operation with the Gestapo. The King of Italy is reported to have had audience, not only with the Duce and Ciano, but with Marshal Badoglio, Cardinal Della Costa and other advisers. This is read to mean that he is planning to repeat the coup of 1922 in the reverse direction. The idea of enemy regimes being changed from within, of resistance breaking down and popular revolts settling the course of hostilities, has a morbid attraction for the British people—a legacy perhaps from the last decade of isolationism and passivity. The fact

that Italy "changed sides" in the last war encourages this form of wishful thinking to the point of obsession. This is not to say that there are no grounds for believing that the Italians are dissatisfied and perturbed over the course of the war. The food situation is growing monthly more alarming, and the Fascist party seems to have been singularly inept in its handling of it. The basic difficulty is the extent to which, before the war, Italy still depended upon imports of foodstuffs. The blockade, on the one hand, and the rapidly declining productivity of European agriculture, coupled with Germany's prior claims, on the other, have virtually closed all foreign sources of supply. To this must be added the growing labour shortage in Italy. About half a million men are prisoners of war; at least another two millions are mobilised; and something like half a million skilled agricultural workers will presumably go to work in the German harvest this year. The effect of this shortage is inevitable. Just under 90 million quintals of wheat are needed; about 71 millions have been produced. Of these, 500,000 quintals are already mortgaged to Germany. Halfway through March the daily bread ration was reduced again—to 5 ounces. Although strict rationing has been introduced, the system has proved singularly ineffective—largely because of the indiscipline of the Italian people. The worse the situation grows, the more blatant is the scramble for

wealthy Italians to corner what stocks there are. Since shopkeepers are anxious to line their pockets and peasants determined as far as possible not to sell their produce at fixed prices to the various state pools, a fever of hoarding and extortion has been rampant throughout the winter—the rich interested in the maintenance of the black market as consumers, the poor as producers. Heavy punishments, including the death penalty, have been introduced; but there have been no executions and fines are usually nominal.

Prices are skyrocketing as a result, and the danger of inflation hangs over the community. The Duce, Count Thaon de Reval, the Finance Minister, and the Governor of the Bank of Italy—all have gone out of their way to threaten the speculators and warn the nation. But in practice there seems to be a curious lack of any really effective counter measures. Legislation has been passed; the difficulty lies in securing its application. At first, in July last year—price control was made the responsibility of the Party. The Central Committee for Co-ordination and Control was presided over by the Secretary of the Party. But the local—and national—Party officials, upon whom the working of the scheme depended, were themselves in the black market up to the neck. In some localities, the Blackshirts actually ran the black markets. In January this year, this system of price control was scrapped and an Inter-Ministerial Committee presided over by the Duce himself took its place. Its new executive officers are the prefects. Since one or two of them had already been dismissed for food offences, there seemed no particular reason why the new system should work any better than the old one. It does not appear to have done so. Food is only the most significant shortage. Nearly everything else is in short supply—fuel, soap, clothing. A recent newspaper campaign in some of the leading dailies suggests that gross profiteering has been going on unchecked among landlords. The economic picture is unquestionably one of bitter hardship, shared most inequitably between rich and poor. The newspapers rail against the "vulgar ostentation" of the life of the well-to-do. Nothing is done about it.

The economic failure reflects the basic failure of Italian Fascism in the political sphere. The reason why peasants keep their grain from the state pools, why the people invest any money they have to spare in land or jewellery, why the Fascist hierarchs cynically exploit their position, is that Fascism has not created confidence in its regime, and has not succeeded in generating a sense of social dedication strong enough to counter the inveterate individualism of the Italian people. Underneath the external paraphernalia of Party emblems and ceremonies, and the pompous exhortations of the press, the Mussolinian edifice is crumbling. As the hardships grow and the news from the Russian front gets blacker and the behaviour of the rich and of the Party hierarchs grows more blatantly anti-social, the Italians are losing whatever cohesion, strength of purpose and national enthusiasm the

frantic Fascism of the last twenty years had managed to pump into them. Instead, they are disintegrating into congeries of disgruntled individuals, all fiercely engaged in the day-to-day struggle to get food—and supremely indifferent to world-shaking political decisions, historic moments, national missions, imperialist claims and all the other *ersatz* circuses they are being offered instead of bread. When Ansaldo made his classic "Woe, woe" speech just over a year ago, it was the passivity and indifference of the Italians, not any active opposition, that he attacked. To this must now be added the lassitude of hunger. The danger facing Mussolini is not the revolt of Italy but its disintegration.

There is no doubt that an Italian collapse would be awkward for the Nazis at this moment. It is not that they expect much from Italy's military contribution. Neither its equipment nor its soldiers are up to much more than policing and commissariat work. The point about Italy is that it is a nation of 47 millions and a producer of certain vital foodstuffs and raw materials. The war effort of the "new order" is running on so narrow a margin that Italian labour and Italian war materials are essential to its functioning. However little Hitler may expect from the average Italian performance on the Russian and Libyan battlefields, he has seen half a million Italians at work in the German cornfields, and the "battle of grain" is as grim a matter of survival now as the battle of tanks. The Salzburg meeting was just the routine meeting in which Mussolini learnt what the German General Staff had decided on for the next six months, and what part Italy would be expected to play. Judging by recent comments in the German press on the necessity of pooling Europe's economy absolutely, and the rather worried protests from Signor Gayda that Italy has an important agricultural and industrial part to play in the "new order," it can be guessed that the Germans almost certainly demanded workers and food—two reserves of which Italy is getting very short.

Mussolini cannot refuse—even if he wished to. Italy is utterly dependent upon Germany. Under the economic agreement renewed in February, German coal, iron and steel is to continue to cross the Brenner; German armaments—not always of first-class quality—will still be provided to the under-equipped Italians; there is to be no close book-keeping, and need is to determine the exchange. But Germany is arbiter of what are Italy's needs, and they will be satisfied just in the measure in which Italy is useful to the Reich. The Italians cannot turn elsewhere—the United Nations have still to prove themselves. Fascism is too deeply committed to the "new order" to change sides; and where are the growing points of a new regime in the midst of the apathetic, unorganised, indifferent Italian masses? Hitler's Gestapo men—of whom fresh reinforcements are said to have arrived in Italy—are not there to deal with political unrest. It is non-existent. Their job is to see that Italy delivers the goods, in spite of social discontent and apathy.

Allowances for Children

THE White Paper on family allowances, and some statement of Government policy, were eagerly looked for this week. It has been abundantly proved by clinical inquiries that the main cause of real poverty is children. After years of hesitation the General Council of the Trades Union Congress recently decided to support a universal system of allowances to children. The objection of the trade unions has been based upon a fear that family allowances would exercise a depressing effect upon the wage level. Their view was that the most secure way of providing for the needs of workers' families is to guarantee to all workers a minimum wage sufficiently high to keep their dependants adequately, no matter what their number.

The decision of the trade unions is to some extent the recognition of a *fait accompli*. There now exists a wide variety of allowances to wives and children under wartime schemes to prevent hardship, in addition to the payments made before the war to orphans and widows' children under pension schemes, for the children of the unemployed and under other insurance and compensation schemes. (The allowances to child dependants of serving men are, of course, part of their pay.) The scarcity and dearth of goods in wartime, and the changes in relative incomes, makes family allowances peculiarly necessary in the process of distributing war rations fairly and efficiently. The following table shows the scope of state allowances, of all sorts, for children—and the astonishing discrepancies in their size, which still remain, in spite of the considerable changes that have been made to bring at least the war allowances nearer into line with each other:

ALLOWANCES FOR CHILDREN

(a) Parents pay 6s. weekly for each child, except where means do not permit.
(b) Assistance Board allowances vary from 3s. 9d. weekly for a child under 5 years of age to 6s. 9d. for a child of 14 to 16 years.
(c) Applies to all killed or disabled by enemy action: Armed Forces, Home Guard, Civil Defence Forces and Civilians.

The proposal is that allowances for children should be made general and uniform in amount. To the existing allowances must be added the grants which, again largely under the pressure of wartime conditions, are already made in kind. Children have been given many priorities in the distribution of wartime foodstuffs; milk, cod liver oil, fruit juices, oranges and eggs have been distributed to children of various ages under special schemes.

One question is whether this method of payment in kind should not be carried forward into the payment of allowances under the more normal conditions of peacetime. The trade unions might possibly be indisposed to accept payment in kind—or state truck, as they might call it—as a complete substitute for the payment of money allowances. But there are arguments in its favour. The trade unions have never objected to free education. One obvious difficulty about the general grant of family allowances is their cost: 2s. 6d. per week for every child up to the age of 14 would cost, say, £60 millions a year; 5s. would cost £120 millions a year; 10s. would cost £240 millions

a year—though it is necessary to deduct the cost of some of the allowances already made to children, under existing schemes (an off-set which, even before the war, in 1937, was probably as much as £20 millions a year), to arrive at the net extra cost of a general system of allowances. The cost of allowances large enough to be effective for their purpose would be very considerable; and it would be correspondingly important to ensure that this public money was in fact effectively spent—that is, that it went to the maintenance of children's health and nutrition, and not to any other purpose. In wartime, it has been discovered that parents do not in fact always devote the allowances they receive, on various grounds, for their children to the purposes intended. Plainly, this is to a large extent due, in many cases, to the inadequate total household income of the family; and this situation could only be remedied by the institution of a national minimum income for all families, which would include and go beyond allowances for children. But the fact remains that money allowances are no more than an addition to parents' incomes. Control is clearly much easier when the allowance is given in kind, and administered, say, at school or in a public nursery, where they can be given direct to the beneficiaries.

On the other hand, it would be a gloomy view of family ties and obligations which dissociated entirely children's allowances from the children's parents. Moreover, it would not be easily possible to meet all the needs of every child by schemes of payment in kind. Allowances in kind should probably be used, wherever convenient, as in the case of milk and meals at school; but the onus of feeding, clothing and housing children must, in practice, involve a considerable programme of education to persuade parents that, although these allowances for their children are, in fact, simply an addition to their money incomes, they are earmarked, not for general household purposes, but for the direct benefit of the children. It must involve sanctions too—an intensification of the laws which already exist to penalise neglect.

It will rightly be replied by many people that this argument ignores the fact, already admitted, that parental negligence is very often merely a function of parental poverty. If there is a responsibility upon parents to care for their children, there is an equal responsibility upon the community to make this materially possible. It is for this reason that family allowances, or, more properly, allowances for children, cannot be regarded as sufficient in themselves. They are only part of the programme required. It is still necessary, for instance, to level up the minimum wages payable to the lowest paid individual workers. This is taking place, and £3 a week is emerging as a minimum male adult wage in many occupations. But as a minimum male adult wage in many occupations, because the wage system is insufficient to cater for the needs of families, as distinct from individual workers, because the size of families is not, and cannot be, taken into account. Wages are not based on need, but on supply and demand modified by collective bargaining power and minimum wage regulations. Men receive the same wage for the same work, regardless of their family obligations. The trade unions are now at last prepared to accept in principle family allowances, so long as every care is taken to see that they are in no way a deduction from wages. But the ultimate aim is to ensure that no family shall fall below a minimum standard of subsistence, by reason of its size or of its breadwinner's low earning capacity, or of his or her sickness or disability. The object, therefore, should be to lay down a minimum family income below which no household in the land should fall; and, although allowances for children are an indispensable step towards this end, more is needed to bring above the same lower line the sum of all the various

kinds of income through wages, insurance, pensions and allowances which make up the revenue of the working-class household.

The danger of this pursuit of minimum standards is that the working of the free sector of the economy may

be fatally impeded by the imposition of fixed charges at every point. The time is opportune to work out an immediate programme which, leaving the industrial bargain unfettered except by the widest laws against sweating, will make certain that no families fall into destitution.

Party Government

THE electors of Rugby are fed up with the dominance of the party political machines." In these words Mr Brown, the single handed guerilla who defeated Lord Margesson's friend and would-be successor, explained his victory; and if he is right, if the electors of Rugby really meant to condemn the party manoeuvres and the compromises of 1931 to 1939, then there is nothing in the result for tears except that the defeated candidate was not Lord Margesson, until so recently the pivot of the party machine *par excellence*, in person.

But, having denounced the parties and the machines, Mr Brown does a curious and rather surprising thing. He says what he himself proposes to do. He is going straight off to London and, when he gets there, he will start an organisation. That organisation will start committees. Those committees will start machines. And those machines will run candidates at by-elections. So an argument which opens with a denunciation of parties and machines ends with the announcement of a new party and a new machine straight from the makers. St. George first kills the dragon, then pops round to the nearest breeder and buys a sitting of dragon's eggs, claps them under a broody hen and hatches them out.

That last sentence is not meant as a reflection on Mr Brown's commonsense or even on his consistency. It is rather an attempt to focus the problem which faces every idealist and every iconoclast when the time comes to make terms with Reality, the problem which challenges most reformers, the problem which lies very near the heart of government by democracy. Very many of us dislike the party boss to the point of suspicion and contempt. But many of us have theories and ideas which we should like our fellow countrymen to understand and accept, and unless we can persuade others who share our views to combine with us—unless we can enrol converts and organise them—unless, in a word, we can create a party, then we are sterile and our faith will be packed with us into our coffins when we die. And in a democracy, indeed in any system of government which claims to represent the popular will, beliefs and aspirations, if they are not expressed by an active party, can have no influence on policy. Doubtless God could have made representative government possible without parties, but doubtless God never did.

As, then, an attempt is made with groping hands to fashion the scheme of democratic government as we should like it to emerge from the war, a start must be made by solving this dilemma of the party, the boss and the machine. Somehow the framework of party government, with its practical equipment, its electoral force, and its educative power, must be maintained. But it must be turned into something more representative, something which, instead of smothering ideals and enthusiasms, gives to each of them (for what it is worth) its chance, and permits an ordered balance between conflicting theories of life and politics.

Perhaps the best starting point is to look back over recent history and ask why party government, as it was before the war, led the country so terribly astray. What was it that went wrong with a system which fifty years ago seemed, with all its absurdities and disadvantages, to provide a reasonable government and to ensure, albeit to a decent balance of progress and caution? If the backward glance begins at the crisis of 1931 and the MacDonald-Baldwin-Simon coalition, it is clear enough now where the seeds of disaster lay. The National Government of the thirties was a combination of men who had no common ideals and shared no political principles except an almost paralysing fear of their opponents. They

all believed—no doubt genuinely—that, if any but themselves held office, Britain would be ruined, and that every compromise and any sacrifice of private principle was justified, so that it kept them at the helm. They were so much afraid of the electors that they openly preferred falsehood to the danger of losing an election. They were so much afraid of independence that they filled the House of Commons with tenth-rate yes-men. And they reduced both the electorate and the Commons to such a pitiful state that Mr Baldwin could admit without a blush, and without the risk of a hostile vote, that he had concealed the truth about the foreign peril which faced the country in order to avoid defeat at home at a coming general election. When that could happen without an overwhelming public outcry, representative government had surely reached its lowest point; and the country that swallowed the episode as part of its normal political diet perhaps deserved to suffer even to the brink of ruin.

The first condition, therefore, of efficient party government after the war will be an alignment of men according to genuine principles, not according to personal dislikes, personal jealousies, personal animosities and personal ambitions, stemming as they did in that recent past from the vested interests and social claims of cliques and corporations. Whatever may be possible elsewhere, the party system in Britain can only function if each party has a coherent political philosophy, which expresses the views, articulate or instinctive, of a very considerable body in the country. It may be that the old two party system will be restored; if it is possible to do that, without dragging in or suppressing the extremist and the heretic, then the problem of honest Parliamentary government will have been greatly eased. But the imperative need is for the inspiration of party by principle. To achieve that it may be necessary for all the old parties to break up and be reformed. There are signs that dissolution is proceeding. But only the event can decide. Somehow or other there must be in the parties something more worthy than fear and hatred of opponents, and the determination to cling to office; and unless the politicians can so line themselves into parties as to express honestly the differing theories of government which are entitled to expression, then that more worthy something will be wanting, and the country may drift again, which God forbid, into a Baldwin-Chamberlain-Simon tragedy.

The second condition, which flows from the first, is that a Minister who cannot get the country to accept his genuine beliefs must abjure office until it does. Every Minister must be ready to take office when the people wants the policy in which he believes, and equally ready to resign office when the people changes its mind. This sounds almost too elementary to be put into print, but how often in recent history has it been forgotten? "I have always advocated Free Trade, but you prefer Protection? Let me show you my line in tariffs. I believe the League of Nations to be crack brained, but you like it? Let me display it as the corner stone of my foreign policy. You demand sanctions? In sanctions lies our plain duty. Oh, I beg your pardon. You said you disliked them? Then they are midsummer madness."

If representative government is to survive, there must be an end to all that, and every politician—back or front bench—must be prepared to do his stretch of time in the wilderness rather than carry on without conviction. The code of party government, like the British Constitution, is unwritten, but it is none the less vital, and unless the rules are observed, democracy and party will go down together.

The Northern Neutral

WITH the entry of Russia, Japan and the United States into the war, the position of the European neutrals, who until now have all resisted repeated attempts to implicate them, has become more complex and precarious. Their success so far has depended partly on the conduct of a skilful foreign policy, and partly on certain historical and geographical accidents. In Sweden, the policy of neutrality and independence, which commands practically unanimous support in the country, has so far proved a success. Now, when the war is more than two and a-half years old, Sweden retains its territorial integrity, its political liberty, its non-combatant status, and, generally speaking, the freedom of its press. But a price has obviously been paid. Sweden's insecurity in face of Germany remains. Though neutral, Sweden has an enforced war economy, with all its rigours. Offended by the destruction of near-by free institutions, liberal Sweden has had to stay inactive. All this is widely appreciated in Sweden. Moreover, the end of the war is not yet in sight, and it is recognised that Scandinavia may still become a battlefield. Even if the Swedish Government succeeds, as it is determined to succeed, in remaining neutral and independent to the end, there is reason to believe that the course of the war has modified the Swedish attitude to neutrality and provoked a certain disenchantment.

In the first place, it is plain that a policy of traditional neutrality provides no security against a well-armed gangster nation. Good luck, geographical position, and considerations of German policy, saved Sweden from occupation in April, 1940, and continued immunity is only to a slight degree the fruit of Sweden's own diplomatic or military efforts. The plight of Norway and Denmark has driven home the lesson that it is not enough to be innocuous; and it is no secret that Swedish military equipment in the spring of 1940 was at an exceptionally low ebb, in part because considerable supplies had been sent to the assistance of Finland. Indeed, the failure of Germany to occupy the whole of Scandinavia remains something of a puzzle.

Even the most successful neutrality provides no possibility of escaping the economic influences of a world-war. Neutral Sweden is living in a war economy. Conditions are certainly superior to those in the conquered territories, but not different in kind from those in the actively belligerent countries. With the closing of the Skagerrak, Sweden has been subject both to the privations imposed by the British blockade and to the demands of the German economic order. Indeed, one of the conditions which saved Sweden from German occupation was the ability of the Reich to graft the country on to the new economic order without military effort. The results have been serious for a nation hitherto highly dependent on imports of raw materials and foodstuffs, and exports overseas.

The demand of German Europe for iron ore and certain finished products, Sweden's own rearmament programme and certain civil engineering projects, such as the further electrification of Swedish railways, have prevented widespread unemployment. They have not prevented a significant fall in the standard of living, and in the value of real wages, indicated by the introduction of clothes coupons early this year, and by the severe nature of food rationing. Bread and flour are both rationed, the weekly allowance per head amounting to 3 lb. 9 oz. of bread, or 2 lb. 12 oz. of flour, of which one-quarter must be drawn in the form of wholemeal rye bread or flour. A ration of approximately half a pound of bread a day, inclusive of flour, is distinctly tight. Of tea, coffee and cocoa, the weekly allowance is a choice of 1½ oz. of roasted coffee, 1½ oz. of tea, or 1½ oz. of cocoa. The total fats ration is 9 oz., of which half may be drawn as butter. The sugar ration is large, 15½ oz., but is alternative to syrup. The meat ration amounts to a boneless weight of 15 oz., of which a maximum of 4 oz. may be drawn as pork; there does not appear to be a separate bacon ration. Many necessary raw materials and consumption goods cannot be

imported, and a high proportion of the country's population is necessarily engaged on the production of war equipment.

Nor are the harsh limitations of a policy of neutrality exhausted by considerations of security and economic welfare. The serious attachment of popular opinion in Sweden to liberal institutions, and the democratic way of life, is well known. The violation of these institutions in Denmark, and more crudely in recent months in Norway, has deeply stirred Swedish opinion. Admiration for the Norwegian clergy, teachers and trade unionists, and detestation of the conditions now known to exist in Norwegian prisons, has provoked spontaneous sympathy with the cause of Free Norway. A rigid neutrality is still accepted as the only conceivable policy. Under existing conditions there is probably no alternative. But there is an uncomfortable remembrance that, albeit under duress, transport facilities have been granted to Norway's oppressor. Events in Norway, and to a lesser extent in Denmark, do seem to have provoked a certain change of mind about the value of neutrality; in the face of an emotional anxiety to stand by the Norwegians and mitigate their plight, it is regarded simply as *pis aller*.

At the same time, the position is complicated by the second Finnish-Russian war. During the first war in 1939-40, Swedish opinion was profoundly pro-Finn. A substantial contingent of Swedish volunteers fought against the Russians, and important material aid was supplied. To-day, there is no enthusiasm for Finland's participation in the general war, which is regarded as introducing a tragic cleavage into the community of the northern states. There is general understanding that, when Germany marched against Russia, Finland would seize the opportunity at least to restore its original frontiers; and it is realised that the fact that Finland is fighting Germany's battles is, from the Finnish standpoint, purely incidental. None the less, there was general disappointment that the offer of American mediation was rejected; and the fact that, indirectly, Norway and Finland are fighting against each other does not inspire the maximum Swedish support for Finland in this war. Some malicious pleasure is afforded to all parties by the marked lack of success which has attended German arms on the northern front. But this fact only tends to increase Finnish anxiety for Swedish aid, and to give rise to consequent friction.

The Finnish determination to occupy the whole of Karelia is based on fundamental mistrust of Russian intentions. The Scandinavian states lie where Russian and German interests meet. If they are to preserve and develop those specifically Nordic values which each prizes so highly, some form of federation, in which Sweden, with its special advantages of experience and geography, must assume a position of leadership, is essential. The Scandinavian countries will always be in danger of being split between the spheres of influence of two powerful and antagonistic nationalisms unless, by developing a common foreign policy supported by a common defence policy, they can, in the post-war world, stand together as a strong bloc. The difficulty is that Sweden is at once the strongest member of the group, and the least exposed to attack. Nor can it be forgotten in these days that, in the long run, no separate and independent existence can be assured to any bloc of European states, unless the affairs of Europe as a whole, and, indeed, of the world, are so regulated as to restrain aggressive nationalism effectively. Until it is made plain, as it should be made plain by the United Nations, that the security and independence of Scandinavia is an Allied peace aim, a cleavage of interest must continue to exist in Sweden, and in the group as a whole, between those sections which fear Germany and those which are traditionally hostile to Russia. There is no doubt that unity of Scandinavia policy would be enormously facilitated by a declaration of the importance which the Allied governments attach to the future integrity of these four Northern countries.

NOTES OF THE WEEK

Madagascar

The Madagascar naval base of Diego Suarez was taken with efficiency and speed—although the heat was oppressive and the outnumbered French forces put up a stiff resistance for a time. The justification of this move against a key naval base in the ocean war is so apparent that it is weary work to rehearse it. Pre-Laval Vichy bartered away its Far Eastern territory to the Japanese. With Laval in charge, committed to a policy of collaboration, further transfers were likely to be speeded up. Two Japanese admirals were closeted with him last week. Japanese control of Madagascar would close the United Nations' supply route to the Middle East, to Russia and to India. It would jeopardise the southern route to Australia. Since Vichy could not be trusted, the Japanese had to be forestalled. The logic of the case is absolute and compelling, and the United Nations have made it clear that

no permanent occupation is intended—a guarantee which Vichy officials accepted fully when it was put forward by the Japanese occupiers of Indo-China. Britain's first task is clear, to secure Madagascar for the cause of freedom and to hold it against any future attack. The United Nations can afford to wait for Vichy to make any reply that Laval may decide on. The issue between them is not one of policy but of strength. If the United Nations were strong enough to take the whole of the French colonial empire into protective custody, they would do so at once. This year they have resources only for the most obviously threatened outposts. Next year, the tale will be different. If Laval chooses to attempt to embroil his regime in the struggle—he cannot embroil the French people—he must take the consequences. But it is not clear that he does so desire. There has been a certain reserve in his handling of American opinion. It looks as though he is still anxious to avoid a breach.

Minister from Australia

Dr Evatt, Australian Minister for External Affairs and Attorney-General, who arrived in England on Saturday, has lost no time in getting down to fundamental problems. Coming to this country via the United States, he was in a position to discover how the problems of the Pacific war strike opinion on both sides of the Atlantic. His forthright attack upon those people who still tend to underestimate the strength of the Japanese is well timed and salutary. The Allied cause can only be strengthened by making it known that it is as widely recognised here as in Canberra that the Japanese and the Germans are equal enemies, as Mr Henry Luce has recently argued admirably in the

magazine *Life*, and that it is a very serious error and oversimplification to suppose that success against Germany will automatically produce the collapse of Japan, like a pricked bubble, wherever the Japanese forces may have reached. There is inevitably some difference of emphasis in England and in Australia, and it is as well that the matter should be discussed in public by an envoy with the authority of Dr Evatt. The fallacy that Japan cannot attack both India and Australia must be disposed of—although whether Japan would choose to launch two such vital campaigns simultaneously remains a matter of doubt. It should be made abundantly plain that, whatever the Axis propagandists may suggest, the Allies are determined not only to defend Australia with success, but to make it the base for counter attack. Dr Evatt's presence in London, where he will be a member of both the War Cabinet and of the Pacific War Council (London edition), again attracts attention to the dual personality of the latter body—which met in Washington, in its more representative version, last Tuesday.

Chinese Strategy

Japanese progress in Burma during the last week is a cruel blow to the Chinese forces who have now been at war for close on five years. With the fall of Mandalay and Lashio, the Japanese have reached the Chinese frontier. Astride an important section of the Burma Road, they are attacking China by the back door. Whether the Chinese have dynamited a section of the Burma Road is still uncertain, but there is little doubt that such a move is necessary if the enemy is to be denied the use of a modern causeway leading to the heart of Free China. The fall of Mandalay and Lashio does not imply that China's supply lines have been finally severed. There are four possible lines of communication between China and the outer world: the Burma Road, terminating at Rangoon, and the Burma Road passing via Lashio and Mandalay to India, both of which have now been cut; the Burma Road passing via Bhamo to India, and the new India Road, which is still under construction. The route via Bhamo crosses exceptionally difficult terrain, and has an extremely limited capacity. For the present the supply position is, admittedly, critical. The Chinese estimate, however, that they have supplies to maintain an offensive on all fronts for as long as a year. Meanwhile, the setback in Burma has to be considered in the light of Chinese strategy as a whole. Since the move of the Chinese Government from Hangkow to Chungking, when retreat gave way to stalemate, the Chinese have contained the Japanese invaders on all fronts. With the entry of the United States into the war, stalemate was replaced by a see-saw counter offensive. The Chinese sought to attack the Japanese on the front which was most remote from that on which the enemy gave signs of being strongest. The guerilla raids by Chinese forces on

RISE IN VALUES.

(Chief Office)

numerous cities, including Shanghai, Amoy, Hangchow and Nanking, are a direct reply to the Japanese threat in the west, for enemy forces in occupied China are necessarily thinly spread and depleted. There are Chinese forces still attacking in Burma near Loilem and Taunggyi in the rear of the enemy forces, and it is still conceivable that they may be able to fray, if not to cut, the Japanese supply line. If this is not feasible, there is still every hope that, hemmed in though they will be, these Chinese forces may find it possible to filter back to China.

The Conduct of the War

The planning of strategy was debated in the Lords on Tuesday, and there were fewer red herrings than usual. Too often in discussions about planning and command the matter is made personal; it is said to be an attack on the Prime Minister, the First Sea Lord, the Air Staff or Colonel Blimp. In fact, it has been a rule of political discussion in recent years that this gauntlet of personalities has to be run before any reforms can be secured. Mr Churchill's demand for a Ministry of Supply before the war was treated simply as an attack on Mr Chamberlain, who "had his friends." The call for a Minister of Production more lately was treated as an attack on the Prime Minister, who has many more friends. So, too, is it now with the proposal for a Great General Staff to unify the command of all the Forces, and for general staffs, with no separate Service allegiance, in command of all sizeable fighting units; this is regarded as a personal attack. Actually, of course, it is nothing of the kind. It is a suggestion, with the widest backing of fact and experience, and one which, sooner or later, as in the earlier instances, will be accepted, if there is still time, under the harsh pressure of events. At present, it is at the familiar stage where the Government spokesman—once more Lord Simon—while promising that the suggestion will be borne in mind, points out the "new dangers and difficulties that might lurk in a changed organisation." In this case, the ritual is as dangerous as it is undignified. There was perhaps a good reason for the supporters of Mr Chamberlain to show a prickly sense of inferiority when faced with helpful criticisms. There is none for the supporters of Mr Churchill, whose backing, all over the free world, is bigger than that of any man in history. Mr Churchill, indeed, has his enemies, just as he has characteristic faults to leaven his historic virtues. A few of his enemies work underground, and twist good causes to serve their own bad ends. But if all honest criticism is continually to be treated as enmity, Mr Churchill himself, as well as the nation, will be very badly served by his friends.

Putney's Problem

The failure and future of parties is discussed on another page. This week the electors of Putney have been set a poser in the latest by-election. At the time of writing the result is not known. Again, there was an Independent against a Government candidate. This time—which is a measure of the grave view taken by the Government of recent political trends—the Independent had been cursed bell, book and candle by the Prime Minister himself. In a sense, Captain Acworth is unique; he is the first Independent who has frankly stated that he is anti-Churchill, on the ground that the war has been mis-conducted—which may account for the Prime Minister's unusual intervention. On the other hand, he offered only a poor alternative to the Putney electors. Mr. Churchill charges him with appeasement towards Japan as recently as last February; and there is very little in his known statements about strategy in the past to give authority to his criticisms of strategy now. Against him there was a conventional candidate, backed by Conservatives in the usual Conservative way, and receiving the now usual half-hearted and incomplete support of the other parties. Not much is known about him, except that he is the secretary of the Pharmaceutical Society, one of the many organisations which derives comfort in its vested claims from its Conservative allegiance. Truly, as a well known wit has said, these are "men of straw in the wind." The wind is important, if only because it re-emphasises the bankruptcy of the present ways of finding candidates for membership of Parliament. Until the Government learns that men of outstanding worth are needed even to represent the Government, there will be shocks and surprises at by-elections. A shock at Putney would be a shock indeed, now that Mr Churchill has placed his personal prestige in the scales against Captain Acworth.

The Power of Appointment

Policies are made by the politicians who bear responsibility for them. But they are administered by civil servants, whose duties in modern government rank so highly and are so complex and specialised that, in administering policy, in effect they shape it. It is at any rate certain that civil servants—not the host of lesser clerks but the few who lead and are in charge—can mar as well as mould the policies laid down by politicians. It is for this reason that so much attention is now being paid to the future of the functions now exercised by Sir Horace Wilson. As head of the Treasury, Sir Horace Wilson is head of the Civil Service. Under his control, because of the interest of the Treasury in the expenditure of public money, come Civil Service establishments—and, in particular, appointments to key positions. In wartime, this traditional rôle has been altered, in part because the focus of administration has shifted from the Treasury to the War Cabinet and the Prime Minister, and in part because of the large wartime expansion in the key personnel of departments. Sir Horace Wilson is due soon to retire; and the recent appointment of two young Civil Servants to be Under-Secretaries in the Treasury, following the appointment of youthful establishment officers at the Admiralty, the Board of Trade and the Ministries of Food and Supply has been taken by some commentators to mean that a change is in train already. Actually, there is nothing to suggest that these appointments are other than routine; and they were made under Sir Horace Wilson's own eye. The case for reform is that, just as the wrong men entered Parliament and became Ministers during the twenties and the thirties—so too did the wrong men come to direct departments—the sort of men who were content to see public affairs run as they were run in the Baldwin era. The chance now, with the departure of Sir Horace Wilson and the changes that the war has brought about, is to alter this and to place youth, courage and enterprise, as well as specialised knowledge, in the key places in Whitehall. It is probably desirable that the centre of gravity should remain in proximity to the Cabinet rather than at the Treasury. It is probably imperative that there should be the same sort of freedom for temporary leaders and experts to enter and leave the Civil Service as there is in wartime. All the plans for a New England after the war will be abortive unless they are matched by a flexible, efficient and enterprising Civil Service; and the way to do this is to take from the wartime set-up, not its swollen numbers, but its special virtues of originality, initiative, experience and enterprise, in both the administering and the shaping of the policy that the people want.

Division in India

The break-up of the Nationalist façade in India becomes more evident every day. Congress has split on the question of co-operation with the Moslem League. The attempt of Mr Rajagopalachari, of the Working Committee of the Congress Party, to secure recognition by Congress of Moslem claims failed. He resigned. But his resignation was followed by an offer from the President of Congress to enter into discussion with representatives of the Moslem League. Congress, in fact, is at sea. In no matter is this more clearly shown than in defence. All sections are agreed that India must defend itself, but when the question of means is faced, the only answer Congress has got is to return to non-violence and Mr Gandhi. "The Committee therefore expects the people of India to offer complete non-violence, non-co-operation to the invading forces." The blame is still, of course, thrown on Britain; "they are not prepared to leave our defence in our hands." But actually, events since the departure of the Lord Privy Seal have shown plainly enough where India's main political difficulties lie at this present moment. They distrust one another as much as they distrust the British; and Mr Gandhi's latest astonishing success in securing a Congress resolution in his own pacifist terms is an indication of the state of self-frustration to which the established political groups in India have come.

Delaying Tactics

It is by now all too apparent that the fuel rationing scheme is having to stand up to a storm raised by a number of interested parties rather than to the fire of intelligent and constructive criticism. So much is apparent from tactics which are being employed. The memorandum furnished by Sir William Beveridge pointed out frankly that the rationing of fuel is inherently more difficult than the

rationing of food or clothing. Consequently, if rationing is to be introduced, it must be introduced promptly, so that the maximum period is available for running the system in before the autumn rise in fuel consumption begins next September. If the scheme is to be given a chance, there is no time to lose before setting the new organisation in motion. Immediate and drastic steps will have to be taken to step up the output of fuel, whether there is rationing or not. They are a *sine qua non* of rationing itself. Without rationing, they would have to be much more drastic—and would still be ineffective in saving sufficient fuel and manpower. If there is serious delay at this stage, it will be impossible by any means to regulate the fuel position next winter. This is the context in which the plea of the 1922 Committee for a postponement of this week's debate on fuel rationing has to be read. The Conservative private Members are unconvinced that fuel consumption could not be restricted by some simpler method, or at worst by some simpler form of rationing. They have not the wit, or the willingness, to see that the rationing of solid fuel alone would both fail to solve the problem and cause the worst kinds of inequities next winter between rich and poor. Their suggestion that the "industries concerned" should be encouraged to work out a practical alternative and that, in the meanwhile, the matter should be shelved has a familiar and scarcely forthright ring about it. In point of fact, Sir William Beveridge had no less than eight meetings with the suppliers of coal, coke, gas and electricity in the course of his investigation, as well as consultations with women's representatives and three groups of local fuel overseers drawn from various parts of the country. If the Government gives way next week, the surrender will go much deeper than the immediate issue of fuel. The door will be ajar to the worst kind of defeatism which comes under the false guise of common-sense and anti-bureaucracy. The war effort must have men and fuel. That should be enough for the Government to stand firm.

No Choice

Meanwhile, evidence accumulates that there is no alternative to fuel rationing. Of the 10,000,000 tons of coal a year which Sir William Beveridge claims to be able to save with an average cut of 12½ per cent in the domestic consumption of all types of fuel, it is reliably estimated that three-quarters is large coal passing over a two-inch screen. This type of coal is also used by the railways, for the processing of steel and by many gasworks. Unfortunately, it forms only 50 per cent of the output of the average coal mine, so that its production involves the employment of a disproportionately high labour force. Moreover, at least one million tons of anthracite nuts are used by domestic consumers, while nuts of sizes suitable for domestic consumption form only 20 per cent of the output of the average anthracite colliery. It may be estimated that, if the proposed cut of one-eighth in domestic consumption is not introduced, no fewer than fifty thousand miners would have to be released from the Services, and the number would be even greater if the men were not returned exclusively to mines producing the required types of coal. It has also been estimated that the strain upon the railways imposed by the transport of one-eighth of domestic fuel consumption implies the use of approximately 100 trains in each direction, covering on an average the distance between London and Birmingham on 300 working days, together with the personnel required to work them. The cut would also save 1,000,000 tons of petrol and the services of 5,000 men engaged in distribution. The transport side of the matter is at least as serious as the manpower aspect, which is crucial. The argument from expediency is overwhelming; it is reinforced by the argument from equity which insists upon fair distribution of short supplies. And the technical arguments for the Beveridge scheme are equally cogent. Indeed, the silliest criticism yet advanced is that the project is cumbersome and complicated. To secure an equally fair distribution without recourse to a points system, five different rations would have to be adjusted to the individual needs of every household in the country. It is the task itself that is complicated, and there is no rule of thumb solution such as the 1922 Committee are casting round for.

Post-war Finance

On the second reading of the Finance Bill this week, Sir Kingsley Wood claimed that inflation is not a

dead issue, even currently, in spite of the wartime limitations and controls, and that the policy of making the utmost cuts in purchasing power is still necessary. This truth has by now almost become a truism even to the great mass of wage-earners—though not perhaps to their trade union leaders—but it has not yet become sufficiently realised that the morrow of the armistice will not be the moment for an orgy of pent-up spending. Actually, as the Chancellor said, the economic problems of the early post-war years may be more difficult than those of wartime—it will certainly be more difficult, in view of the psychology of the people then, to impose restraints. In a recent broadcast, Mr Lyttelton stated that there need be no fear of unemployment after the war because of all the labour that will be wanted to replace the consumption goods which have now disappeared. But it will still be necessary—in the words of Sir Kingsley Wood—"to avoid the foolish waste of our productive resources." There will be no deflation; but the wartime system of controls, with suitable adaptations, must continue for some time into the peace, because then, as now, there must be a proper allocation of manpower, plant and materials—to the peace effort—so that a false boom is not generated, only to collapse as in 1921 into depression and mass unemployment. There will still be priorities to be met; and investment, in the period of demobilisation, will need planning as much as in wartime.

Middle Eastern Front

Lend-Lease is to be extended to Iraq and Persia. Turkey and Egypt are already receiving material under its provisions. Thus American supplies now cover most of the Middle East, and the base in Eritrea is being rapidly extended as a centre for assembly and distribution. Everything must be done to strengthen this vital sector. It is the point of intersection of the arcs of German and Japanese conquest, it is the land link of the United Nations, it is a reservoir of precious oil. War hangs very near its frontiers. There are new signs of activity on the Ukrainian front, where General Kleist and Marshal Timoshenko are manoeuvring for position. It has been categorically stated in Germany that the position of Turkey was on the agenda of the Salzburg meeting, and that the Dictators are confident of the Turks' compliance when the appointed day arrives. The Turkish Government is lying very low, but the trial of two Russians and two Turks for the bomb attack on von Papen is being used by Axis agents for strong anti-Russian propaganda and it is disquieting that the Turkish Ambassador to the Soviet Union should, at this particular juncture, have left Moscow for an indefinite period. The tranquil surface of the Middle East hides deep currents of fear and hostility and preparation. On no front is vigilance more essential.

Issues in Strategy

This year may be the supreme year of crisis in modern history. The demand for aggressive action by Britain with all force is based on this realisation. The key question is which of a number of possible courses of action is likely to inflict most damage on the enemy; and only those with full knowledge of the nature of Britain's striking power, of the current and prospective output of war equipment and of the technical problems involved, and with an appreciation of Germany's strength and intentions, that is to say the General Staffs, can answer it. By faulty knowledge or methods, they may be wrong, as so often in the past. But the fact that they make mistakes adds no authority to lay strategy. For example, before deciding upon an invasion of Europe,

THE BRITISH LINEN BANK

it is vital to be clear about what exactly is intended, and on the scale of operation necessary to achieve that object—as well as its implications in other theatres. Any really large-scale operation would involve a reduction, perhaps even a temporary suspension, of shipments to Russia. In addition, there are the purely technical problems of carrying out such an operation. Recent experience has shown that air mastery is essential to the success of any operation of this kind, and Fighter Command is now engaged in establishing it over Northern France—not without sturdy resistance from the large number of German squadrons stationed across the Channel. But, in view of the very limited operational range of fighter aircraft, complete air mastery could only be established over a comparatively narrow strip of the Continental coast-line. Moreover, invasion could only be carried out by withdrawing ships from other duties. Again, the correct timing of an invasion is essential to its success, but only the General Staff can know how long it would take to make the necessary technical preparations and when the moment has come to strike. It is by balancing these and many other technical, strategic and economic factors that it is possible to decide. The General Staff will decide, may indeed have decided already—and all the critics can usefully do is to urge upon them the need for deciding with courage. If the chance to attack exist, if it is real and solid, then it is the chance of a century.

The Japanese Election

The Japanese have held a General Election and General Tojo has announced the overwhelming success of the Government's nominees; of the 466 seats in the Diet, they captured 377. The real puzzle is why they did not capture them all. The old political parties went into voluntary and obedient dissolution in the autumn of 1940, when the Nazi victories in the west suggested to the attentive imitators in Nippon that the era of "liberal democracy"—even Japanese style—was over. The Imperial Rule Assistance Association was set up on the model of the Nazi Party, and logically, elections should now be nothing but plebiscites. The explanation may be that there is still some fight left in the old parties, who were still able in January, 1941, to spike the Government's plan to dissolve the Diet. Alternatively, the cautious statesmen who advise the Son of Heaven may be keeping something up their sleeve. Until final victory over the plutocratic west seems assured, the Japanese will probably keep open some loophole for the Emperor. In the event of defeat he would still be able to "change his advisers," call in the loyal opposition and conveniently forget the Association which was to have Assisted his Imperial Rule.

Sir Kingsley Wood Remains Adamant

During the debate on the Second Reading of the War Damage (Amendment) Bill, Sir Kingsley Wood refused either to lower the contribution payable by property owners or to readjust the incidence of contributions in proportion to the respective financial interests in real property of the landlord and the mortgage owner. Sir Kingsley Wood pointed out that if a reduction in the total contribution was later found to be justified, his inclination would be to remit the fifth and final instalment, rather than to reduce its present rate. Similarly, if an increase in the sum required from property owners was necessary, he would prefer to add another instalment rather than to raise the present rate of the contribution. His reply to the second criticism was less convincing. It was based on the view that "the relationship between mortgagor and mortgagee differs little from that ordinarily subsisting between borrower and lender." He saw no "sufficient reason" why the latter should make a contribution. If it was the main purpose of the original War Damage Act to spread the risk of loss among all property owners, it is difficult to see why the burden of the contribution should be made to fall largely on one section of them. Admittedly, it is difficult to devise a simple formula of contributions, especially for the various types of commercial mortgage, including floating charges and debenture capital. But this does not invalidate the argument of the critics.

State versus Party in Germany

Something very close to a complete reorganisation of Germany's internal structure appears to be in process. The powers which Hitler demanded in his Reichstag speech—"to intervene immediately . . . as circumstances demand"

in every branch of the administration—had already been very widely used last winter, and through the confusion of orders, decrees, speeches and writings the general direction of the changes is beginning to take shape. First of all, the attempt has been made in almost every sphere of government to lighten the load of the central authorities. In a decree published on April 22nd, Hitler ordered that the central administration should be relieved of all work which could be carried out by regional and local offices. At the same time, he decreed an end to the making of decrees save those directly connected with the conduct of the war. The workings of this new administrative set up in the economic sphere were described on page 595 of *The Economist* of May 2nd. It entails a greater executive and administrative activity on the part of the self-governing syndical organisations and, probably in order to equip them better for their new work, Dr Funk has announced the suppression of redundant local organisations and the grouping of others—Chambers of Industry and Commerce, Chambers of Independent Artisans and so forth—in a single Economic Chamber for each *Gau* or province. The judiciary has also been "simplified" by giving individual judges greater jurisdiction and more independence. Finally, in the sphere of political administration, much more work and more responsibility for final decisions have been given to the offices of the various *Gaue*, and to the municipal and rural authorities.

This reorganisation has the obvious advantage of relieving the burden of the hard-driven men at the centre. It is among them that dissatisfaction has been strongest in recent months—inevitably, for they were in a position to judge the magnitude of the problems and the value of the steps taken to meet them. At the same time, they were not by any means all Party members. Instead of the Party swallowing the State—as ideally it should have done—the State administration was showing signs of swallowing the Party. It follows that, while decentralisation serves the double purpose of relieving overworked officials and of taking decisions away from the potentially dissident, a real problem remains. Will the regional and local organisations be any more loyal? Much must now depend upon the extent and strength of Party enthusiasm in the country at large and there are significant signs that Hitler realises how much he must continue to rely on his Party machine. For example, the big decentralising changes in political administration and in justice have all been made in close consultation with Bormann, the head of the Party Chancellery. Similarly in the economic sphere, Sauckel, Wehrlin and Speer are Party men. Or again, the need to reinforce Party enthusiasm is reflected in the decision to transfer the educational activities of Dr Ley's Labour Front to the local SS officials. It is too early to say what will be the effect of this wholesale remoulding of Germany's administrative structure. For the time, it must be an element of weakness—which Allied strategists should obviously take into account. It was the Party as a state within a state that conquered the Reich. Revived as a separate entity, it may preserve the conquest.

Radiography and TB

The Medical Advisory Committee to the Ministry of Labour has turned down the suggestion that mass miniature radiography should be a normal part of the medical examination of men and women before entry into the armed forces. The advantage of this form of radiography is that large numbers of people can be examined in a short time, which makes it far cheaper in terms of both money and manpower than the ordinary X-ray examination. There is, therefore, considerable force in the Committee's view that the pre-entry medical examination of recruits is decentralised at over 200 places, to which individuals are summoned in relatively small numbers, mass miniature radiography is not altogether suitable for this examination. But afterwards when the men are congregated in large numbers in service depots, there is clearly a strong case for the greatest practicable use of radiological examination, and the Committee commends the steps already taken by the Navy, which ensures that almost every man is thus examined every 2½ to 3 years, and the RAF, which has arranged for a similar examination of air crew recruits in this respect, but the use of mass miniature radiography is being developed as apparatus becomes available. It is somewhat disturbing, however, to detect a certain complacency in the

Committee's report. It cites figures showing the very small proportion of cases of pulmonary tuberculosis which radiological examination has discovered in members of the armed forces, and states that the problem of TB in the Services is consequently very small. It is, of course, easy to exaggerate the danger of a rise in TB, or any other disease, during a war. On the other hand, it may be worth pointing out that new recruits into the Services will very soon consist only of the 18-19 age-groups—one of the most susceptible ages to TB—and that at present young women, among whom the increase in TB since the war is most marked, are being recruited in large numbers into the ATS. There should be no tendency to underestimate the problem for the Services so long as statistics for the population as a whole, in respect both of deaths and new cases, show a rising trend. Moreover, the use of miniature radiography in medical examinations might well be extended to school children and to factory workers. A stop on new cases is dependent upon better standards of housing and feeding, which are almost impossible to secure in wartime. But a stop on the TB death rate can be achieved by early detection, which radiology now allows, and—what is more important—by prompt and effective treatment.

Shops and the War

A survey was recently carried out by the National Institute of Economic and Social Research into some aspects of retail trade in wartime and the results have been published in *Supplement No. 2* of the Institute of Statistics *Bulletin* for April 4th. The survey was conducted in Leeds and Glasgow. The results reveal, by no means unexpectedly, that small shops suffer more acutely from wartime difficulties than larger ones; in Leeds about twice as many one-door, one-window shops have been closed as larger ones. Nineteen per cent of Leeds shops were closed between January, 1940, and November, 1941; in Glasgow, the survey was made in June and July and by then 14 per cent had already closed. If Glasgow shops continued to close at the same rate during the second half of 1941 as in the first, 22 per cent would have been closed down

by November, 1941. In Leeds, probably half the closures may be attributed to purely war causes. About 43 per cent were closed as a result of "bad trade," which includes shortages of supplies, and another 14 per cent owing to the call-up of staff or owners. Other reasons for closing would have operated in any case: old age, illness, death, moving and slum clearance. An analysis of manpower showed the about half the workers in shops were women under the age of 41; the comparable percentage for men was 24. Older people are more frequently found in smaller shops, but it is likely that the proportions will change as the younger ones are called up. Conclusions drawn from a survey as small as this one must be treated with reserve. But the results emphasise the heavy burden placed on the small shop-keeper by all the circumstances of wartime. They give additional weight to the plea for some system for the concentration of retail trade, and the compensation of displaced shop-keepers, in place of the present *laissez-faire* policy by which the marginal shop is squeezed out haphazardly and by hardship, through no fault of its owner.

Meals in Restaurants

The draft of the Order limiting the size and price of meals in hotels and restaurants provides for a maximum price of 5s., but allows for extras—cover charge and so on—which will enable the cost of a meal to rise to 16s. or 17s. Thus the position, if the draft is approved, is exactly what it was before the austerity campaign began. The high price will enable unscrupulous restaurants to pay black market prices for controlled foods and will enable them all to pay more than the ordinary consumer for uncontrolled foods. Much more sensible is the provision which would prohibit the sale of fish, game and poultry in restaurants on certain days. But since the object of the Order is to discourage luxury living, the best solution might be the imposition of the double purchase tax on all meals costing more than, say, 2s. 6d. This would still enable the bomber pilot to take his best girl to the Ritz rather than to a British Restaurant, if he wants to pay the price, but both he and "the rich" could only pay it at the cost of a large payment to the State, which would rise *pro tanto* with the amount they ate.

AMERICAN SURVEY

Wages and the Labour Board

UNDER the President's seven-point plan to combat inflation, stabilisation of wages becomes the responsibility of the War Labour Board, established last January under the chairmanship of Will Davis. Mr Davis's interpretation of the President's directive is not likely to reassure the critics of this part of the programme. He has announced that the Board will not freeze wages, but that it "will not allow them to get out of hand"; that it will pursue a flexible, rather than an arbitrary policy in balancing the wage structure. Demands for wage increases will be dealt with more strictly, in view of the fixing of price ceilings for most commodities, but the Board will continue to adjust inequalities and pursue a policy of raising sub-standard wages. Rigid freezing of wage rates over the whole economy is probably both impossible and undesirable, in view of the wide regional and industrial variations in the United States, but the record of the Board—discussed below in a dispatch from a labour correspondent in the United States—is not such as to suggest that a firm policy will be pursued.

The decision to leave stabilisation to the Board was almost certainly the result of union pressure, for both the heads of the AFL and the CIO have declared themselves unalterably opposed to the setting of wage ceilings by Congress. The continued emphasis which Mr Davis places on the relationship between wages and the cost of living underlines the interdependence of the whole anti-inflation programme, and will exasperate those elements inside and outside Congress which have been vocal in demanding that labour should accept cuts in its standard of living—which, in a war economy, are in any case quite unavoidable, whether they come haphazardly and inequitably by inflation

or by stops on money incomes. The question of wage stabilisation will be the most acrimoniously debated aspect of the President's plan, and it is doubtful whether Congress will be willing to allow the Labour Board as much discretion as is contemplated under the President's directive.

The Coming Controversy

[FROM A LABOUR CORRESPONDENT]

Washington, April 5th

INFLUENTIAL blocks of public opinion have fastened on increased wages as the prime villain of the inflation spiral, and the imposition of compulsion on labour is currently being laid before the country in a score of Congressional bills. Labour's back is up against being so singled out. Labour would like to see rigid controls fixed on commodity prices and on profits, and—while skittish about making their declaration—would probably accept the pegging of wages to a cost-of-living kept within bounds by price limits and rationing.

In viewing the forthcoming Congressional search for rigid controls, it is well to have in mind the known behaviour of labour and management under the semi-compulsory powers of the War Labour Board. Its predecessor, the National Defence Mediation Board, founded last December when the closed-shop issue failed to respond to voluntary settlement. In January, President Roosevelt reconstituted the agency as the National War Labour Board, with power to make final determination and, at last resort, to compel arbitration, under the sanction of Presidential seizure of the

plant. The Board has since then given peremptory orders to one recalcitrant employer, and has caused another's enterprise to be seized by the Government. It has compelled acceptance of its order in a case concerning dilution among skilled die casters. It has asserted its jurisdiction over a closed-shop case in the face of employer displeasure. It has compelled an employer to sign an agreement, despite an alleged conflict with the anti-trust laws, on the sole ground of superior wartime powers. Concomitantly, the Board has ordered the discharge of union shop stewards who participated in a slow-down of production, and it has enforced labour compliance with its pledge not to stop work while a case was before the Board. Undoubtedly the Board has not met its severest tests. A policy of flexibility, of meeting each case on the facts, and disclaiming that the decision sets a precedent, has so far successfully achieved the delicate task of settling disputes to no one's complete satisfaction.

In the field of wages, the Board in making its decisions, takes into account the balance attained by past bargaining, changes in the cost of living, wage trends in competing industries, and, when these are duly weighted, the employer's ability to pay. Congress will have to decide whether the sum of these individual decisions amounts to economic wisdom, or whether wage standards should be set by overall administrative action.

Labour would probably rather continue this flexible system than submit its fate to Congress. There is much to support its contention that things are going well. Strikes in war plants are few and of short duration. The loss of war production through strikes and lockouts during January and February was less than one-fifth of one per cent of the labour that went into war production during those months. Both the American Federation of Labour and the Congress of Industrial Organisations move promptly against "wild cat" work stoppages by their affiliates. Labour has given up the payment of double time for Sundays and holidays. The AFL and the CIO have buried their differences in behalf of the war effort. There is no doubt that as citizens the 10,000,000 trade union members are all out for production. CIO steel workers in the Carnegie-Illinois plant, first steel company to adopt joint labour management production committees, point to a world record production at the mill in proof that co-operation pays.

Congress when it addresses itself to over-all restrictions will have special enthusiasm for imposing wage ceilings, tempered by the fact that this is a Congressional election year. Leon Henderson will applaud wage ceilings to match his price ceilings. The country is anxious to learn whether the President's leaning toward voluntary agreements will result in equality of sacrifice.

American Notes

Americans and Austerity

The President's inflation message has precipitated the foremost domestic issue of the war, the problem of how its burdens and sacrifices are to be distributed. The country was prepared for strong measures. On this score there are no complaints. Much of the comment has been favourable, and the bulk of the critics call for more drastic steps, describing the proposals as "half-hearted," "inadequate" or a "political compromise." In the main, these criticisms concentrate on two points. First, there is the failure to provide for an extension of taxation to the lower incomes, thus reducing the great mass of purchasing power, and the failure to provide for the freezing of wage rates by administrative or Congressional action. The success of price-fixing is felt to be unlikely, while so much purchasing power remains at large. The conservative press—and a very large proportion of the influential press is conservative—is almost unanimous in condemning these omissions. The second really contentious issue is that of farm prices; the farm bloc is resentful over the sacrifices the farmer is asked to make (though these consist largely of foregoing prospective income increases), while non-agricultural comment points out that, even with farm price ceilings set at parity, higher prices will still be possible if the cost of living rises, as parity is not a fixed figure, but a relationship between farm prices and the cost of the goods farmers buy. The coming struggle will be over taxation, wages, and farm prices; and the President has, perhaps, lost an opportunity to take a strong line in the matter of wages when contributions are being exacted from other sections

of the community. It may be that he senses that more drastic measures at the moment would seriously reduce enthusiasm for the war effort.

The Decline of Jesse Jones

Before the war, Jesse Jones, the Secretary of Commerce, Federal Loan Administrator, and *de facto* chief of the Reconstruction Finance Corporation, was one of the most powerful men in the United States. Some commentators believed him second only to the President. He had control over loans to banks, railroads, and factories; over the financing of plant expansion for war production, through the Defence Plant Corporation; over the accumulation of stockpiles of raw materials; over parts of the housing programme. A wealthy Texas real-estate operator and banker, Mr Jones, has extensive political influence. He owns newspapers and radio stations, has made large contributions to the Democratic Party, and is said to have a highly developed technique in handling Congressmen. Five months of belligerency, however, have seen the whittling away of much of his power, although he is said to be fighting back. The flood of criticisms and charges covers almost every aspect of his administration. He is accused of being responsible for failure to accumulate sufficient stocks of rubber and tin, for delay in making funds available for plant expansions, and for the production of synthetic rubber, aluminium and magnesium; and of favouring large corporations at the expense of smaller units. On one point all critics are agreed; that he put caution and financial soundness before preparedness, and that the results have been disastrous. As the *Nation* put it, "If the United States loses the war, it will go down to defeat in a thoroughly solvent condition." That this view is shared by the President is suggested by the fact that the past five months have seen the short-circuiting of the RFC in respect to loans for war production, which can now be authorised by the Army, Navy, and Maritime Commission; by the appointment of a rubber co-ordinator by the War Production Board; by the transfer of many powers over the import of materials to the Board of Economic Warfare, and its administrator Milo Perkins, picked as a coming man in Washington; and by the transfer of Jones's housing units to the new Housing Administration.

Steel Plates

The choice between guns and butter has been made by the Government, if not yet fully endorsed by the people and their representatives. The problem now is the allocation of limited supplies of materials between various war needs. Steel plates are an outstanding example, as the shortage of plate has been one of the main obstacles to the fulfilment of the shipbuilding programme, and deliveries to the railroads have had to be curtailed in order to increase supplies to the yards. It is calculated that 1.5 million net tons of plates are required to launch one cargo boat a day for a year, and the United States plans to be building three such ships a day towards the end of this year. The shipbuilding goal for 1943 has been raised to 15 million deadweight tons, from earlier estimates of 10 millions, which means that next year production will be nearly double this year's output. Overall requirements of steel plates are estimated at almost 12 million tons for this year. In 1941, American output of universal and sheared plate amounted to just under 6 million net tons. The deficiency is being made up, though not as quickly as could be desired, from the sheet and strip mills, which in 1941 supplied about 14 million tons to the automobile, forging, stamping, and container industries. Of the country's 28 wide continuous strip mills, 25 produce steel strip ranging from 30 to 92 inches in width. Unfortunately, the use of narrower plates in shipbuilding necessitates more welding and riveting, and delays production. Attempts are being made to persuade the industry's other customers to accept narrower plate for storage tanks and other items, so that the products of the shearing mills may be reserved for ships and tanks. Efforts have been made to standardise plate widths to sizes suitable for the most efficient rolling; the revised schedule eliminates some 100 weight specifications and reduces the total to 25. Strip mills are being converted as quickly as possible to the production of wider plate, and new mills are being built. It takes, however, about a year to erect new plant.

Fair Rents

In the recent order fixing prices, a provision was included to fix rents in 302 defence areas (in 46 States and Puerto Rico) which house more than 76,000,000 people. The only States omitted are North Dakota and Idaho. In 80 per cent of the areas, rents are fixed at the levels current on March 1, 1942, but in 64 areas, where there have been striking increases, levels have been fixed at those of January 1, 1942, or April 1 and July 1, 1941. Previously, action had been taken only in 20 areas, under the powers granted in the price control law. The reaction of landlords, and one of the difficulties inherent in rent-fixing, is suggested by the statement of the Price Administrator a few days later that wholesale evictions of war workers by landlords attempting to evade the regulations will not be tolerated. The flood of workers into centres of war industry had created a serious housing shortage by last year, and the increased pace of turnover to war production this year will make the crisis even more acute. In some cases workers have had to be housed in jails, in box-cars, and in trailers; in fact, the law specifically includes rents of trailers. In 115 areas investigated by the WPA, rents had increased in 114. In order to enforce the restrictions, the OPA may require landlords to obtain licences, may obtain court injunctions, and, in extreme cases, can bring criminal actions against landlords, with the possible imposition of a 5,000 dollar fine or two years in gaol. Tenants may also recover triple damages from landlords charging excessive rents. It may be doubted whether the order will be effective unless vigorous steps are taken to provide more low-priced housing in defence centres.

Second Front

The cautious reaction to Lord Beaverbrook's demand for a second front suggests that there is far more understanding of what this would entail than there was a few months ago, when the pros and cons of invasions anywhere from Spain to Finland were being widely canvassed. The desire for a large-scale offensive is freely admitted, but in almost all cases it is tempered by references to the shipping shortage and to the need of concentrating on deliveries to Russia. Amateur strategists are far less cocky than they were at the beginning of the year. The *New York Times* observed austere that "the layman cannot pass judgment," while less formal journals coined the slogan "No back seat driving." It is appreciated that the combination of commando raids and heavy bombing have created something approaching a second front already, and there is no disposition to urge Great Britain to undertake more than she feels prepared to risk. The Hearst press continues to minimise the importance of Germany as opposed to Japan, sounding the old trumpet call of the "yellow peril," but most commentators agree that the European theatre of war is going to take precedence over the Pacific at least this summer, and the threat of a wide split in public opinion on this subject—which at one time appeared very real—has so diminished as to be negligible.

Income Distribution

Estimates of the distribution of consumer incomes, prepared by the Research Division of the Office of Price Administration, tend to suggest that, relatively, incomes in brackets covered by direct taxation have increased more than others. Consumers' income in 1941 was about 92.6 billion dollars; in 1942 it is expected to reach 103.5 billions. Families and single consumers with incomes above 2,500 dollars a year in 1942 will receive aggregate incomes of 62.5 billions, or 60.4 per cent of the total consumer income, against 51.4 billions, or 55.5 per cent of the total income last year. Consumer units with incomes below 2,500 dollars will receive approximately the same total money income, about 41 billions, as in 1941, but it will be a smaller proportion of the whole, 39.6 per cent, opposed to 44.5 per cent. About 1,500,000 million families and individuals, who formerly received less than 2,500 dollars a year, have moved into the upper group, where in general they become liable to income tax. The aggregate income of those receiving less than 2,500 dollars a year remains at the same figure, but is distributed among 75 per cent of the total recipients rather than 78 per cent as in 1941. The contrast with 1935-36 is very strong, when those receiving less than 2,500 dollars a year were calculated to receive 62 per cent of the total income. Total

income payments then, however, were only 58.7 and 68.1 billions, compared with the estimate of over 100 billions for 1942.

Shorter Notes

Unemployment insurance payments during March indicate a decrease in the number of workers being laid off as a result of conversion and the curtailment of consumer goods manufacture. Initial claims were 4 per cent less than in February and waiting period claims were 26 per cent lower. Presumably this will increase as industries scheduled for conversion in April and May turn over to war production, but no conversion is likely to create as much temporary unemployment as that of the automobile industry.

It has been decided not to hold a nation-wide voluntary registration of women at present, as a sufficiently large number of women are already available for war work. The chairman of the War Manpower Commission has announced that more than a million additional women will be employed in war industries this year and in 1943 the total will be raised to 4 millions.

A Philadelphia weekly newspaper, written mainly in German, has been ordered to show cause why its second-class mailing privilege should not be revoked on charges of sedition.

A bill establishing a War Damage Insurance Fund totaling 1,000 million dollars has been passed by the Senate. Damages up to 15,000 dollars will be provided without cost. The details of premiums to be charged for further coverage have yet to be worked out by the War Damage Corporation, a RFC subsidiary.

Price Control in Canada

(From Our Ottawa Correspondent)

April 2nd

A RECENT remark by Mr Donald Gordon, the chief price controller, that the price ceiling policy has weathered the first four months is the first official claim so far that the policy is working successfully. "Even our well-wishers," he said, "suggested we had bitten off more than we could chew." Sufficient time has elapsed to warrant a preliminary judgment on what Mr Gordon himself referred to as a noble experiment. A substantial success has been scored since the price controllers proclaimed the policy that the ceiling must hold—come hell or high water. Moreover, the effects upon economic life are becoming plainly visible.

The movement of price indices shows that a powerful arresting force is operating. In practice, the policy has been, not to maintain an over-all ceiling on all prices, as the original statement of aims suggested, but to hold the line at the retail price point. Control has been exercised directly and indirectly upon all prices, but the sacred, unbreakable, thin red line of price control, from which no retreat can be admitted, has been the level of retail prices. "We have resolutely held to the principle," says Mr Gordon, "that the retail price ceiling must not be pierced."

The cost of living has receded fractionally since November, 1941. The general index of retail commodity prices has gone down. But the general wholesale price index has still advanced slowly. So have the indices of producers' goods and farm prices. These movements are shown in the following quotations from official statistics:—

	1935-39 100			1926 100		
	Cost of Living	Retail Commodity Prices	Food	Wholesale Prices	Producers' Goods	Farm Products
1941 -						
May	109.4	110.9	109.7	88.5	83.3	69.6
June	110.5	112.7	112.5	90.0	84.3	71.0
July	111.9	114.9	116.6	91.1	84.5	71.7
Aug.	113.7	117.7	121.3	91.8	84.5	72.1
Sept.	114.7	119.4	123.5	93.2	85.6	73.3
Oct.	115.5	120.1	123.2	93.8	85.7	74.1
Nov.	116.3	121.4	125.4	94.0	85.5	74.1
		Ceiling policy established				
Dec.	115.8	120.6	123.8	93.6	85.8	74.6
1942 -						
Jan.	115.4	119.9	122.3	94.3	86.8	77.3
Feb.	115.7	120.3	123.1	94.6	87.2	78.4

One of the liveliest skirmishes in Parliament recently was the battle of the western farm bloc against the establishment of a ceiling on the price of wheat. The base period ceiling would have been 82½ cents a bushel, because of depressed market conditions last September-October. The issue was settled by the Government agreeing to pay an initial price of 90 cents (No. 1 grade at shipping points of Fort William or Vancouver), which was a technical violation of the ceiling policy, while the War Prices Board was satisfied to retain ceilings upon retail prices of all wheat products. This incident showed that considerable flexibility exists in the policy as it affects farm prices, obviously because an exceptional volume of food production is required for Canadian and Allied purposes.

The Supreme Test

A year ago seasonal factors caused a slight decline in the price level, and a repetition of these factors assisted the work of price control during the past four months. But the forces that set in motion a sharp price advance last spring, showing in the May-June-July series of readings, have renewed themselves this year. The price control authorities recognise that the supreme test is at hand. The appearance of inflationary tendencies in the United States,

where President Roosevelt gave warning in January that the battle against inflation had been by no means won, has produced responses in Canada.

The price ceiling is only one anti-inflationary weapon used by Canadian authorities, and there is no inclination to forget the others. The first weapons were, and still are, taxation and borrowing of savings. The control of supply has been exercised by twin agencies, the Wartime Industries Control Board and the Wartime Prices and Trade Board. The former operates within the munitions and supply department, and consists of twelve controllers, each responsible for essential war supply in his own field such as steel, base metals, chemicals, oil, motor vehicles, etc. The latter administers the ceiling and regulates civilian supply where the need arises. The controls have begun to curtail consumer spending. Perhaps a million automobiles are operating on their last thousand miles now, because of the rubber shortage more than the petrol situation.

A Buying Spree

Current Canadian production has been estimated by supply controllers as 50 per cent above pre-war levels, sufficient to provide substantial war requirements without seriously impairing civilian standards. But civilian purchases, officially described as "a buying spree of serious dimensions," have begun to strain supplies. Mr Gordon has issued a solemn warning that a general programme of consumer rationing may have to be established. It is clear that the final weapon against inflation is general rationing, and that the authorities are prepared to enforce it.

Since wholesale prices have advanced while retail prices have remained stationary or have receded, the retailer has constantly faced the risk of being unable to replace his stocks within the limit of lawful retail prices. The adjustment involved in efforts to permit him to do so is known as "the squeeze," in which retailers, wholesalers and manufacturers have been encouraged to simplify, to standardise and to rationalise in order to eliminate waste in the production and marketing of goods. In some cases they have been ordered to effect economies or suffer penalties.

Yet, in the last analysis, many articles must be subsidised if they are to continue to move under the price ceiling. The Commodity Prices Stabilisation Corporation, an agency of the War Prices Board, is beginning to pay such subsidies. No one knows how far the Government is prepared to go in spending money to stabilise the cost of living or the price level in general. The problem is naturally twofold; it involves decisions on the degree of essentiality of imports, and, in regard to domestic manufacture, more complicated decisions of cost accounting and the control of profits. The degree to which the public will accept a Spartan economy will no doubt decide the extent of subsidy payments. Both milk production and the import of grape-fruit juice have been subsidised, for example, and while the former raises no objections from the public the latter lies in a more doubtful category.

The ceiling, as a mechanism of total warfare, is effecting changes in Canadian economic life more rapidly than any agency previously devised. It is forcing the rationalisation of production and marketing of goods. It is eliminating the non-essential variety in many lines of production, and it will undoubtedly eliminate many products entirely. By compelling manufacturers and distributors to operate within price boundaries, it represents a life-or-death power over imports, and over many articles of home manufacture. It is assisting greatly in the conversion of industry to war production. The power to grant or withhold a subsidy, where it means the difference between staying in business or shutting up shop, is a form of extreme economic control.

The power such a policy confers upon the Government

to regiment industry, to convert the civilian economy to war purposes, and to mobilise the nation, has hardly been appreciated yet in Canada. But it has been recognised clearly by the farmers and administrators of ceiling policy. Mr Gordon said recently that total war on the home front required a comprehensive plan of procedure. But he added that the main thing was to bring the entire national productive equipment under control to permit rapid adjustments to new conditions. "I do not mean," he said, "that we should try to make a rigid plan for winning the war and slavishly adhere to it. Events crowd upon each other so quickly in modern warfare that we must be ready to adjust our position at a moment's notice." The civilian population, he said, must be placed on a standard of living which is based on bare essentials.

In a speech to the Toronto Canadian Club on March 20th, Mr Gordon outlined the broad objective in blunt language: "We must demand a complete inventory of our entire productive machinery. Each unit must be studied in terms of maximum production, regardless of vested interest and without too much concern about long-term effects. Arbitrary decisions will have to be made in the light of immediate needs. A definite control of everything produced must be undertaken to decide, first, what is to be produced, second, who is best equipped and qualified to produce it, and, finally, who is to get the production. Selfish or private interest must be ruled out completely. The competitive system must go, to be replaced by one which is based entirely upon the criterion of maximum production, with the most efficient use of labour, machinery and materials to operate steadily without cease except for necessary rest or maintenance."

Germany and French Agriculture

[BY A FRENCH CORRESPONDENT]

April 30th

ON March 29th, Marshal Pétain explained to the French farmers why the Government had been compelled to decree that all surplus grain must be handed over to the authorities by April 21st. This order was preceded by a similar one on December 24th, which requisitioned all wheat and attempted to evade it. That this order was ineffectual, and has had to be renewed, is a measure of the impotence of the Government. Marshal Pétain concluded with a pathetic appeal: "I am fully aware of all your difficulties; you are short of manure, fuel, horses, and means of traction; you are short of labour, and you are anxiously waiting for the return of prisoners. No doubt you are to be pitied, but you are not the only ones, and I am, believe me, better placed than anybody else to realise the urgency of our needs, and to remind everyone of the duties of mutual help and solidarity imposed by present circumstances. . . . Help me once again to give all Frenchmen their daily bread."

This appeal was not unexpected. The transition period between the harvest of 1940 and that of 1941 was an anxious one. In the spring of 1941, the Food Control came to the conclusion that there would be a deficit in the unoccupied zone until the month of August of between five and six million quintals of wheat. There was sufficient wheat in the occupied zone, but there was no transport and no good will on the part of the occupation authorities. Famine threatened central and southern France, and the Vichy Government used this in its negotiations with the United States for the delivery of foodstuffs. The negotiations fell through, but, thanks to a severe reduction in the bread ration, and, it appears, to deliveries from the occupied to the unoccupied zone, the harvest was reached without undue suffering.

The latest harvest, however, after having raised considerable hopes, finally turned out to be extremely mediocre—in any other circumstances it would have been called bad. The official figure is 64 million quintals, against 79 million quintals for the ten-yearly average 1930-39. But it is a marked improvement on that of 1940, which did not exceed 51 million quintals. If a balance of 13 million quintals which was reported to be in hand immediately before the 1940 harvest, but which had disappeared a year later, is taken into account, the total resources available for consumption in 1941-42 were about equal to those available

in 1940-41, on which France managed to exist. If it is considered that rationing and food control in general were organised by then, that the Government had the experience of the preceding year, that transport needs could be foreseen well in advance, it was possible to say that the French grain position had improved.

Hopes Falsified

In fact, up to the end of 1941, all official declarations had the print of a certain optimism. "France's bread is secured," was a statement made on numerous occasions. It was only during the last days of 1941 that the tone of official declarations was modified, and that tempered optimism gave way to the blackest pessimism. What had happened in the meanwhile?

The change of tone is the more difficult to understand because other crops, apart from the wheat crop, generally exceeded the 1940 harvest. Although no official figure was provided, it is learned that the harvest of secondary cereals was as much as 60 million quintals, against 50 million quintals in 1940 and 70 million quintals before the war. The estimates of the potato crop are contradictory. It appears not to have appreciably exceeded the 1940 crop of 80 million quintals, compared with a normal crop of 150 million quintals. The sugar beet crop made possible the production of 600,000 tons of refined sugar, compared with 425,000 tons in the previous year. But, as in the case of wheat, a balance of 170,000 tons in July, 1940, was consumed in 1940-41, so that the quantity available this year did not exceed last year's supply.

In order to explain the deterioration in the French food situation, two sets of factors must be taken into account. In the first place, deliveries of wheat by farmers did not reach the estimated total. If the harvest figures are assumed to be accurate, the farmers must have been hoarding an appreciable proportion of the available food supplies. There is no question of a conspiracy or even of a conscious movement, but it would be sufficient for each agricultural worker to increase his basic stock very slightly for a shortage to appear in the towns. In his appeal, Marshal Pétain declared that if each French peasant retained one extra sack of flour he would be responsible for one breadless month in the towns.

It is perfectly natural that, in present circumstances, the peasant only delivers his produce "across his dead body." The Government has allowed price increases which very markedly surpass the increase in the prices of manufactured goods for private consumption. But manufactured goods have almost completely disappeared from the market. It is, for example, impossible to buy clothes, shoes or cooking utensils. Thus, the rise in agricultural purchasing power in terms of industrial produce is pure fiction. Capital goods—horses, agricultural machinery, and so on—have risen in price very considerably; it is not unusual to pay Fr. 45,000 to Fr. 50,000 for a horse which would have cost Fr. 10,000 before the war, and they are rarely on sale. Moreover, rather than let his livestock perish the farmer tends to feed it on food meant for human consumption.

But none of these factors is new, and they scarcely provide an explanation of the drastic change in the situation which took place at the end of 1941. But this change is not peculiar to France. The European food position as a

whole has deteriorated recently. Even in Germany, where rations have remained very much above the level in the rest of the Continent, and where the sale of potatoes has never even been controlled, new restrictions have just come into force.

German Looting

The fact that the Germans control the greater part of the wheat crop and of the harvest in general has to be taken into consideration. For agricultural purposes, France can be divided into seven natural regions: north, west, central, east, *massif central*, south-west, *midt*, and south-east. The first four roughly correspond with the occupied zone. Moreover, these, and in particular the first two, are the great grain-producing regions. The following table indicates the distribution of the average harvest of 1932-36 between the various regions, and the average production of each region:

	Production Millions of Quintals	Production per Hectare Quintals
North.....	27.1	23.8
West.....	19.5	15.1
Central.....	11.2	15.1
East.....	9.2	16.9
Total Occupied Zone..	67.0	
<i>Massif Central</i>	5.4	11.5
South-west.....	6.7	11.7
<i>Midt</i> and South-east..	4.4	14.0
Total Unoccupied Zone	16.5	

The German Government would hardly have imposed drastic restrictions in the Reich, just when they are speeding up production, without first looting everything possible from the occupied territories. Huge requisitions by the occupation authorities of existing wheat stocks in the occupied zone would account for the sudden aggravation of the French food position, and for the appeals of the Vichy Government. Moreover, the requisition of food stocks and the stopping of food deliveries from the occupied to the unoccupied zones were obviously a means of pressure used by the Germans to force Pétain to take back Laval.

In other spheres of agricultural production, it has been possible since the autumn to find traces of German looting. Attention must be drawn to a remarkable fact—the successive reduction in the metropolitan vine harvest from 70 million hectolitres, which corresponds to a normal harvest, to 50 million hectolitres. This could be the result of climatic conditions, but, clearly, it could also prove a method of concealing German requisitioning from the French public.

Concerning the French meat supply, the official statements are full of obscurity and veiled implications. According to the Minister of Agriculture, the reduction in livestock is of the order of 5 to 10 per cent, while, according to another declaration of the same Minister, French meat resources have fallen from 1,700,000 to 800,000 tons a year. It is possible to explain this discrepancy by the tremendous reduction in the supply of concentrated food-stuffs available to farmers for fattening animals. But it is necessary to fall back on German requisitioning when it is considered that the consumption of meat has been reduced by over 50 per cent. The Minister of Agriculture himself declared that "for practical purposes our resources are much lower than 800,000 tons a year."

Left to herself France could hope for some time to maintain her agricultural production at least at a level which would prevent serious damage to the health of her population. German requisitioning has destroyed this hope. To-day France is on the verge of famine, and the responsibility can only be laid on the invader.

Allied Merchant Fleets

[BY A CORRESPONDENT]

April 30th

The British Merchant Navy has been considerably reinforced by the merchant shipping of the Allied Governments in Britain. The latest data, relating to the last quarter of 1941, show that 1,529 vessels of 500 gross tons and over, totalling about 6½ million gross tons, are in the

service of the Allies. These figures do not include 95 vessels of over 311,000 gross tons, which were formerly under the Danish flag, nor do they cover the Swedish ships on charter to Britain.

The total merchant shipping of the Allies in Britain is made up as follows:

	Ships	Gross Tons
Norway.....	702	3,150,000
Netherlands.....	471	2,160,000
Greece.....	221	930,000
Free France.....	125	590,000
Belgium.....	51	190,000
Jugoslavia.....	48	180,000
Poland.....	31	90,000

The Allied merchant ships are in general manned by Allied seamen. Many of these were in their home ports when the invasion of their countries took place, and it was only at great risk that they succeeded in escaping. Together with the neutral seamen who have volunteered their services, they bring the total of Allied and friendly seamen serving the Allied cause up to over 40,000.

Almost all officers and seamen are cut off from their homes, and get little or no news of their families and their friends. The Allied Governments, in co-operation with the British authorities, are, however, doing their best to make their stay in British ports as pleasant and comfortable as possible. Each of the Allied mercantile marines has its own seamen's pool, and wherever these have been established there will also be found hostels or facilities for recreation. Some of these hostels serve national food; national customs and amenities have been introduced, and the result is that in most of the principal ports, little colonies of life in the created, which preserve many of the features of life in the homeland overseas.

The largest of the Allied merchant navies is the Norwegian, whose gross registered tonnage amounted in June, 1939, to 4,834,902. After Germany invaded Norway, about 90 per cent of the fleet managed to reach safety in Allied and neutral ports. To control such a fleet, consisting of nearly 1,000 ships, and employing nearly 30,000 seamen, the Norwegian Government established the Norwegian Shipping and Trade Mission which also has offices in New York, San Francisco and Montreal. A large number of the Norwegian vessels are driven by Diesel engines, and the average age of the fleet is lower than that of any other in the world. The modern equipment of the Norwegian ships, and the higher speed allowed by the Diesel engine, gives the Norwegian fleet an annual carrying capacity 30 to 40 per cent higher than that of the steam vessels. Its outstanding feature is the large number of oil tankers.

The next in size of tonnage is the Dutch merchant navy, which ranges from big passenger liners to motor coasters and rescue tugs. The fleet includes a large number of modern ocean-going liners, which are used as troopships, and is most efficiently maintained and manned. The newest Netherlands passenger ship, the 20,000-ton liner *Oranje*, was placed at the disposal of the British Empire as a hospital ship, and was manned, maintained, and equipped with doctors and nurses at the expense of the Netherlands East Indies for Australian and New Zealand casualties.

The Dutch Ministry of Trade, Industry and Shipping is assisted by the Netherlands Shipping and Trading Committee. Over 8,000 officers and men of Dutch nationality man this large merchant navy. About 2,500 of these men are coloured, and include some Chinese; the terms and conditions for them are the same as for others.

The Greek merchant navy has suffered most since the beginning of the war. Then, Greek merchant shipping included 319 cargo vessels of over 3,000 gross registered tons, totalling 1,485,215 gross tons; 141 vessels of under 3,000 gross registered tons, totalling 201,683 gross tons; 69 passenger steamers, totalling 55,463 gross tons; one liner of 17,000 gross tons; 19 salvage tug steamers; and a number of sailing boats and fishing vessels. When Greece entered the war, the Greek Shipping Committee requisitioned all ships, and they were later taken over by agreement by the British Government.

During the invasion of Greece, efforts were made to enable all vessels, large or small, lying in Greek ports to escape. The losses, however, were very heavy. Up to November, 1941, of 319 ocean-going vessels, about 45 per cent had been lost; these included those sunk through enemy action, detentions, seizures and marine losses. Of the 141 vessels under 3,000 gross tons, 103 had been lost through war causes. The remaining small vessels, which used to ply between the islands, managed to escape to Egypt, where they are serving the Allied cause in the Near

THE NEW ISSUE OF 3% SAVINGS BONDS

1960-1970

A FULL TRUSTEE SECURITY

Continuously on "tap"—No limit to holdings

Repayable at par on the 1st September, 1970, the Government reserving the right, on giving three months' notice, to redeem at par on or after the 1st September, 1960.

- ★ Price of Issue £100 per cent.
- ★ Payment in full on application.
- ★ Subscriptions of £50 or any higher multiple of £50 will be received until further notice.
- ★ Interest 3 per cent. per annum payable half-yearly on the 1st March and the 1st September.
- ★ Interest accrues from the date of purchase.
- ★ Income Tax is deducted at the source from interest payments of more than £5 per annum.
- ★ Bonds are transferable free of stamp duty.

Prospectuses and Application Forms
obtainable from all Banks and Stockbrokers

There are also for this security a Post Office Issue and a Trustee Savings Bank Issue, of which full details can be obtained at any Savings Bank, Post Office or Trustee Savings Bank respec-

tively. For these issues the minimum first subscription is £10, and for subsequent subscriptions the minimum is £5. Maximum subscription £1,000. Income Tax is not deducted at the source.

ISSUED BY THE NATIONAL SAVINGS COMMITTEE

East. Particularly severe are the losses of passenger ships; of these only three remain, and are in the service of the Allies in Egypt. The Greek liner was also delivered to the British authorities by a special agreement.

The Free French merchant fleet is composed of only a part of France's merchant shipping. But the fleet controlled by Great Britain and Free France includes two giant vessels, the *Ile de France* (53,000 tons), the second largest ship in the French merchant marine, and the newly built luxury liner *Pasteur*. Many of the ships are manned by French crews, whose numbers have risen from 600 in June, 1940, to nearly 3,000 at present. The Free French ships are controlled by the "Direction de la Marine Marchande" and the "Direction du Personnel." The British Government has assumed an obligation to pay for the use of the ships, and to return them to France after the war, or, if they are lost, to pay compensation.

Eire's Financial Position

[FROM OUR DUBLIN CORRESPONDENT]

April 20th

THE Irish Exchequer return for the financial year ended on March 31st discloses the following results:—

	1940 41	1941 42
Revenue	£34,637,659	£36,979,659
Expenditure	£37,772,031	£40,624,567
Deficit	£3,137,372	£3,644,908

When the great increase in expenditure on the army and on other objects because of the war is considered this result is not unsatisfactory. Revenue has shown an elasticity that is surprising in view of the effects of the war on Irish economic life, and the deficit, though growing, is still less than 10 per cent of current expenditure. The financial condition of Eire is better than that of the other European neutrals. The principal increases in revenue were £2,079,000 in income tax, £482,000 in excise and £358,000 in corporation tax. A decrease of £807,000 took place in customs, reflecting the reduction of imports. When figures "under the line" are considered, it is found that £7,920,000 was raised by the 3½ per cent loan and that ways and means advances amounting to £500,000 were repaid. A sum of £2,460,000 was advanced to found a new foreign exchange

account to acquire non-sterling currencies. The balance in the Exchequer on March 31st was £2,394,375 and there was no floating debt outstanding.

The outlook for the coming financial year is doubtful. The intensification of sea warfare will still further reduce the yield of customs, and the receipts of the various taxes connected with motoring will also fall off. Meanwhile, expenditure continues to mount. The army is growing; large sums are being spent on civil defence; and the subsidies on essential foodstuffs to keep down the cost of living are certain to be increased. Expenditure this year will necessarily be greater than last year, and the only question is to what extent it can be covered by further taxation. The Minister for Finance has stated that the fact that the Irish national income is not growing is a reason for refraining from additional expenditure. This is doubtless true, but it is also a reason for refraining from further taxation. There is no analogy between British and Irish conditions. In Great Britain boom conditions prevail. There, gigantic capital expenditure is generating a great expansion of incomes, which must be deflected, in as large a degree as possible, into the Exchequer. Ireland, on the other hand, is experiencing all the symptoms of a slump. Capital expenditure is far below normal. Housing is almost at a standstill, replacements are not being made on the railways or in industry, and stocks are being used up. The growth of employment is, to a large extent, concealed by the increased emigration. It is generally agreed that these are the conditions that justify an unbalanced Budget.

As might be expected in a period of such reduced investment, savings are accumulating. All the available statistics—bank deposits, savings banks and savings certificates—point to an increase of savings in the country. While it is true that part, probably a large part, of these savings will be utilised on the first possible occasion to purchase imports of capital goods and raw materials, a large amount can be safely borrowed by the Government in the current financial year. The banks would welcome the issue of a new Irish security which would yield a higher return than they are able to earn in the London money market, and the public, as was shown by the experience of last year's loan, are also willing lenders on a large scale. In these circumstances, borrowing is definitely preferable to an attempt to squeeze any more out of the direct taxpayer, who is already sufficiently burdened. There are two things that the Minister of Finance should bear in mind when preparing his Budget: first, that conditions in Great Britain and Ireland, far from being identical, are very dissimilar; and, second, that financial "orthodoxy" at the present day prescribes unbalanced Budgets in periods of sub-normal investment.

Russia at War

Front Line Industries

THE distinction between front and rear has become blurred in Russia. By the autumn advance of the German armies, three great industrial centres of a sudden found themselves in the immediate fighting zone. They were the Leningrad region, the Moscow basin and the Donetz basin. In some fields of production, these provinces have held the first place in Soviet economic life. The following figures give some idea of their importance. The Leningrad region alone employed in its industries nearly one million men in 1940; 40-45 per cent out of these were employed in metallurgical plants. About 20 per cent of the total value of the Russian metallurgical output was produced in this region. Engineering, precision tools, shipping, synthetic rubber—these were Leningrad's foremost industries. The number of industrial workers and employees in the Moscow region was over 1.5 million, out of which 25-30 per cent worked in metal industries, mainly in electrical engineering, machine tool plants and motor production; 40 per cent of the Soviet cotton and textile manufacture was in the Moscow region. About 700,000 workers and employees are engaged in the mining and manufacturing industries of the Donetz basin, which accounted for no less than 80 million tons of coal, 60 per cent of the total Soviet coal output in 1938, as well as for about a third of the Soviet iron and steel output, raw and semi-manufactured.

All these great centres sustained heavy losses. Some of them were caused by bombardment and actual fighting; but a great deal of the damage was done by the Russians themselves in pursuance of their "scorched earth" policy. In the Donbass, the flooding and destruction of mines by the Russians did more havoc than enemy fire. The same was true of the Moscow province. The bombardment of Leningrad, on the other hand, though it must have led to considerable stops in production, has failed to cripple its industries. Evacuation, too, has greatly reduced the productive capacity of all the three centres.

The German retreat in the autumn and winter raised the problem of putting the damaged industries back to work. In the Leningrad region, bombardment by both long-range artillery and aircraft went on on a smaller and less frequent scale; and Russia's second capital found itself in a position partly resembling that of British industrial towns in the spring and summer of 1941. Scarred plant was healed, and the clearing of debris was carried out with the help of mobilised civilian labour. Intermittent raids caused no serious disturbances in output; and there has been no resumption of large-scale air raids.

In the Moscow region, industrial destruction was confined mainly to the Moscow province. Coal mines suffered most through flooding. The coal output of the Moscow basin amounts to no more than about 5 per cent of the total. But its importance is much higher. Moscow's industrial and domestic fuel supply largely depends on local output; and transport shortages impelled the Mining Commissariat to insist upon the speediest possible restoration of the flooded pits. Obviously enough, there have been enormous difficulties, and only partial success has been claimed. A part of Moscow's fuel deficit has, however, been met by the use of peat.

Reports from the Donetz basin say that production went on under the fire of long-range batteries during the winter. To stimulate the recovery of flooded pits, "socialist emulation" between miners was organised. It is impossible to find out the proportion of the Donetz mines under German occupation and of those which have been put back to work under the Russians. True, the main coal centre around Shakhty lies to the east of the fluctuating front line. But, here again, the extent to which the Russians have succeeded in undoing the effects of the "scorched earth" policy is unknown. The shortage of fuel has, generally, been very acute throughout the country, but less so than the shortage of iron ore.

The fact that these three industrial zones could, at least partly, recover their losses and keep up production has played an important part in maintaining the productive capacity of the Soviets during the winter. The resumption of large-scale fighting is bound to hamper their industries in the near future, unless a German retreat puts them beyond the range of heavy artillery. Towards the end of April, it was reported from Donbass that air raids on

mining villages and industrial towns were becoming more frequent than before, but at the same time it was claimed that "factories and mines do not stop working for a single hour."

The striking thing about the working of all the three centres is that arms have been produced there, on a mass scale, almost on the battlefields where they were to be used. The distances between factories and fighting outposts were sometimes shorter than those which used, according to "orthodox" rules, to separate the first line of a fighting division from its munition dump.

*

War Loan.—The 1942 "War Loan" was floated on April 14th and the subscription was closed on April 25th. The subscription yielded about 13 milliard roubles, 3 milliards in excess of the sum originally fixed. Compared with State expenditure in 1941 (216 milliard roubles), the sum subscribed amounts to more than 6 per cent. The interest on the new loan has, for some reasons, not been stated; the usual interest on Soviet State loans is 3 per cent, apart from lottery prizes. According to the Soviet press, workers and employees have subscribed sums which, on the average, amount to one month's wages; the new loan will, therefore, have cut down the purchasing power of the town population by about one-twelfth.

The revival of credit, which has taken place in Soviet economy during recent years, is illustrated by the following figures. The First Five-Year Plan Loan yielded 5,900 million roubles; the Second Five-Year Plan Loan 19,000 million roubles; and loans floated during the Third Five-Year Plan, between 1938 and 1941, amounted to 29,000 million roubles. The first "Industrialisation Loan" (in 1927) was subscribed by 6 million people, whereas the number of subscribers to the Third Five-Year Plan Loan was no fewer than 60 millions. This high figure is explained by the fact that subscriptions are drawn from collective farmers, as well as from industrial employees, and from school children as well as from adults. Subscriptions to the latest loan were even made by entire army units in the fighting zones. Besides this, a kind of "moral compulsion" has made it impossible for any Soviet employee not to subscribe to a State loan, even in peacetime. Under such conditions, a loan has usually had about it more of a reduction in wages than of an actual investment. The primary aim of Soviet credit policy has for several years been, not so much to obtain financial means for the State, as to reduce the purchasing power of the civilian consumer.

*

Agricultural Mobilisation.—The labour shortage in agriculture has become acute, according to a statement made by M. Benediktov, the People's Commissar for Agriculture. The shortage has been aggravated by a comparatively high degree of absenteeism on the collective farms. Between 2.5 and 12.5 per cent of farmers in various districts have failed to fulfil their labour quotas. The need for more labour has, at the same time, become even more pressing because of the unusually cold spring, which has delayed the spring sowing in various parts of the country.

The decree on agricultural labour of April 17, 1942, has raised the minimum quota of labour that has to be performed by farmers on the collective fields from 100 to 150 days yearly. These days are so-called basic labour days, for which certain standards of productivity have been fixed. Stakhanovites do two or three "basic labour days" in one day, and the payment (mostly in kind) is calculated according to the number of labour days performed; it may be 300, 400 or even more during the year. The new decree makes agricultural work obligatory for children between 12 and 16 years old, and fixes their minimum quotas at 50 labour days. The earnings of the children must not be paid out to their parents; they will be put on special accounts, with the management of the collective farms. Under the decree, town people aged between 16 and 55 (45 for women) are also liable for agricultural mobilisation. According to Benediktov, 1,500,000 school-children, students, teachers and office employees were being trained for agricultural work before the mobilisation was ordered.

THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

CAPITAL (PAID-UP) - £3,000,000
RESERVE FUND - £3,000,000

Branches and Agencies throughout INDIA and the EAST
AFFILIATED BANK IN INDIA

THE ALLAHABAD BANK LTD., with 15 Branches & 30 Sub-Agencies
The Bank offers a complete Banking Service and provides exceptional facilities for financing every description of trade with the East.

Deposits for Fixed Periods or repayable at call or at short notice are received at rates which may be ascertained on application. The Bank also undertakes Trusteeships and Executorships.

Head Office: 38, BISHOPSGATE, LONDON, E.C.2

THE BUSINESS WORLD

Liquidity v. Profits in Shipping

THERE is apparently a difference of view between those who manage British shipping and those who hold its shares. According to Stock Exchange records, shipping company equities are so well regarded that their average yield at current prices is among the lowest of any group in the *Actuaries' Index*—comparing, at 4.58 per cent, with 7.61 per cent for home rails and 10.91 per cent for aircraft manufacturing. The utterances of prominent shipowners, by contrast, seem as full of foreboding as a Gaelic play. Both points of view, however, can be readily explained, if not reconciled. The investor who likes shipping shares—through the worst days of depression they have always had a faithful clientèle—is aware that wartime operation, under conditions of full employment for available tonnage at guaranteed rates of return, has brought increased profits, for the time at least, and greatly increased financial liquidity. The shipowner or shipping company chairman, on the other hand, sees his fleet more or less continually diminishing, while the cost of such new tonnage as is available, under Government control of shipbuilding, has risen by a third to a half since the war (and more for ships built privately), and may well show a much greater increase when the time for replacement comes after the war. Owners want ships, not money, and their dissatisfaction with the prospect of being progressively metamorphosed into investment trusts, holding large blocks of Government securities, is not diminished by the policy of the revenue authorities in lowering their EPT standards whenever tonnage is lost and cannot be physically replaced.

Many of the industry's fears are too well founded to be dismissed as mere case-making. But some of the more extreme statements which have been made recently have been bound up with the progress of the negotiations between the General Council of British Shipping and the Government, for an agreement allowing owners to replace some part of their shipping lost during the war. On April 22nd, the Parliamentary Secretary to the Ministry of War Transport announced that these negotiations were on

the point of completion. A scheme, he declared, had been drawn up under which new vessels built on Government account would be allocated to owners in replacement of losses. The owners concerned would enter into an agreement to purchase the ships six months after the cessation of hostilities at a price representing the cost of construction, less depreciation on the usual basis adopted by the Inland Revenue. For political reasons, owners have been anxious to stake a claim to the tonnage being constructed by the Government in order to avert nationalisation or state competition. Since replacement of losses by suitable vessels after the war will take time and may be expensive, the prospect of securing ships at current prices, available for profitable employment immediately after the war, is apparently set off by owners against the disadvantage of being saddled with obsolete tonnage.

The tonnage made available under the scheme is likely to fall below the losses sustained. The severity of wartime losses is emphasised by estimates of the Chamber of Shipping that, from the outbreak of war to the end of 1941, about 8½ million tons gross of British, Allied and neutral merchant shipping were lost, making, with 5 to 6 millions of enemy losses, a total of 13 to 14 million tons out of a pre-war world total of 63 million tons. Since the end of last year, it has been officially stated that the rate of Allied losses has increased, and though new building has been proceeding all the time, and is being geared up to huge dimensions, in the United States, the authorities are agreed that total replacements up to now have represented only a part of the total tonnage lost.

Events in the decade before the outbreak of war compelled British shipbuilding to concentrate on a policy of quality rather than quantity. To-day, efforts to introduce mass-production methods are hampered by the fact that technical expedients for reducing the time taken in building and fitting out a new ship—such as the substitution of welding for riveting and the adoption, generally, of "assembly line" methods—are unsuitable to existing

British plant, which cannot readily be converted in the middle of a war. Above all, the volume of merchant ship construction is limited by the huge naval programme, by the large volume of repair work, and by the shortage of labour. British owners, naturally, welcome the prospect of the coming into service of big tonnages of new American vessels from next winter onwards. Their importance for an Allied victory may well be decisive; but they will presumably fly the American flag.

So much for the shipowner's viewpoint. On the shareholder's side, it is indisputable that profits have improved since the war, compared with the period immediately before its outbreak, when earning power had fallen appreciably below the level of 1937, the industry's best year in the pre-war decade. This improvement is attested by the figures in the table at the foot of page 652, in which the results for the latest available years are shown of three large holding concerns, five important liner companies and three sizeable tramp-owning companies. Almost without exception, gross earnings are well above pre-war and ordinary dividends have been either maintained or increased. The Cunard Company has succeeded in paying off all outstanding arrears of dividend on one class of preference shares, and is hopeful of doing the same, before the current year ends, with another class and of making some return to its risk-bearers, the ordinary stockholders, next year.

But the position thus stated needs qualification in two important respects. Some of the profits of 1940 were earned in the period before Government requisitioning took effect, when net receipts were higher than under current conditions. The picture for 1941 is incomplete, as a number of companies have not yet issued that year's accounts. In some instances, however, a declining tendency is evident in 1941 earnings before depreciation, which seems to be the more noticeable the later the date to which published accounts are made out.

The second limiting factor on earning power is the reduction in the size of fleets. One measure of its incidence is the fact that the "book value" of the ships of the companies shown in the table, for companies reporting during the year 1940, even then showed a fall of 8 per cent compared with 1939. The figures for 1941, for those companies whose reports are available, show a further decline of 11½ per cent from the 1940 figure for the same companies, despite the fact that some of the biggest concerns made up their accounts to relatively early dates in the calendar year. If the "book values" for P. & O. are omitted, because their size makes them "overweight" the comparison, and the Cunard figures are left out for the opposite reason—that they are small and unrepresentative of the tonnage in which

the company is interested—then the corresponding decreases are 12 per cent for 1940 against 1939, and 22½ per cent for 1941 against 1940.

The counterpart of these reductions is the remarkable rise shown in liquid assets. For the seven companies whose 1941 figures are available, these increased in 1940 by 150 per cent and in the latest year by a further 100 per cent. There is a high correlation between these changes and those shown under the heading "reserves." The greater part of the increase under the latter head is attributable to a single wartime item: "Fleet replacement reserve." Thus, the difference between the book value of lost ships and the amounts received as insurance money, is a function of two variables—namely, the diminution of available tonnage and the unemployability of the funds received in compensation.

Perhaps the best way of summarising the present position is to say that owners would like to have less "free" resources now, and more after the war. The Government terms of remuneration for the use of ships are revised from time to time to cover owners against increases in operating costs, and their basis of allowance for depreciation, though certainly not generous, would be adequate if only pre-war book values of tonnage were comparable with replacement values, under the conditions the industry will have to face, when the war is over. Unfortunately, they are not, and here any parallel between the shipping and railway transport industries under Government control breaks down. In both cases, existing plant is being worked right up to capacity and is being worn out more quickly than under peace conditions. But the railways, under their agreement with the Government, will be protected, financially, against a repetition of the enormous accumulation of arrears of capital maintenance which arose after the last war. Shipping, on the other hand, will have had a large part of its plant destroyed, while replacement costs will have risen sharply against it.

At the back of the mind of many owners is the fear that some form of Government assistance (which may have to be invoked, anyhow, in the realm of high policy in international shipping relations after the war) may become necessary if the problem of the rehabilitation of the physical assets and earning power of the Mercantile Marine is too big for the industry to tackle unaided. Though facilities such as those to be outlined in the forthcoming White Paper for the allocation of war-built tonnage will be helpful, it seems that a final solution of the problem may well have to await the end of the war itself. For that reason, shipping shares undoubtedly include a certain speculative element under present conditions, which is, perhaps, not fully discounted by an average yield basis which is still lower than that for British industrial equities as a whole.

Finance and Banking

Return to Abundance

The symptoms of stringency which manifested themselves in the money market last week have quickly vanished. The modest special assistance given to the market towards the middle of last week quickly restored the threatened equilibrium, and this week the banks have found themselves abundantly provided with cash and have returned to the discount market as ready buyers of bills. There were £75,000,000 of Treasury bills to be taken up this week as against maturities of £60,000,000, but the discount market saw its allotment at the weekly tender fall from 44 to 37 per cent, and with the banks again good buyers of July maturities the market found no difficulty in taking the new bills allotted to it. TDR's to the amount of £35,000,000 were required from the banks during the week against nominal maturities of £30,000,000 and effective maturities slightly under this figure. These encroachments on bank cash, due to the increased floating debt borrowing, were made good by heavy Government expenditure which, as may be seen from the last Exchequer return, has been running at record levels. The Bank return shows a fall of £4,173,000 in bankers' deposits to £118,454,000, but in reconciling this movement with the easing of the credit position it must not be forgotten that "window dressing" was in progress last week. The main feature of the return is the further increase of £5,796,000 in the circulation. As notes go out, so Government securities in the banking department, which were depleted by £50,000,000 on the occasion of the recent increase in the fiduciary issue, are

being built up again, and last week showed an increase of £6,125,000.

Bank Advances

The individual clearing bank statements for April so far published indicate that the recovery in bank advances which, between the beginning of the year and the closing week of March, had carried this item from £806,718,000 to £837,719,000, had at least been halted last month. The three months' expansion in this item is, unfortunately from the banks' point of view, unlikely to prove more than a temporary check to the long term downward trend maintained since the early months of the war. It had been widely assumed, on the basis of recent clearing bank returns, that the increased demand for credit by war industries had at long last caught up with the contracting effect on advances of the telescoping of civilian industries and the repayment of personal advances. This, however, does not appear to be the case as yet. The bulk of the working capital for the war industries is now provided through the Ministries' progress payments, and the banks have found that there has been little or no reflection in their industrial customers' demands for credit of the recent considerable expansion in their production. The increase in advances over the first quarter of the year may have been in part an echo of the customary seasonal movement which occurred towards the end of every financial year. This is unlikely to have accounted for more than a small fraction of the movement, since the Treasury instructions on the subject of bank

in the shorts, which has in the recent past formed the basis for a further advance throughout the list. A considerable section of the market believes that the time is past when any sustained rise in long-dated or irredeemable Government stocks is to be expected. This argument is based on the supposition that, in the post-war world, it will be impossible to prevent some rise in the rate of interest. In the long run, and insofar as it is necessary to abandon a closed capital market, those who argue thus are probably justified. But it is mere guesswork at this juncture to attempt to assess how far free markets, for capital, or for anything else, will be restored even after a fairly extended period of reconstruction. However this may be, the time will come when the investor prefers once more the prospect of capital appreciation in equities to safety in fixed interest. The week's movements continue to suggest that, except for the adventurous, who continue to buy kaffirs, oil shares and South American stocks, safety is still the first consideration, for the rise in shorts was followed by a considerable improvement in the whole list of Government securities.

London, 28th April, 1942.

lor's words must await the publication of the Finance Bill. Meanwhile, an authoritative opinion largely confirms the views expressed in *The Economist* of April 18th. It is that the refund represents a contingent asset, the date of whose conversion into cash cannot be determined. In these circumstances, it cannot properly be included in the accounts of the company without distorting the financial position. At the same time, the estimated amount of the refund ought to be included as a note to the balance-sheet. It is, of course, a common experience to find that the amount of EPT has not been precisely determined. But in view of the fact that Exchequer receipts for 1940-42 under the head of EPT and NDC amount to some £365 millions, it is evident that a temporary decision has been reached in most cases, and that it would not be impossible for most companies to produce a reasonable estimate of the amount of refund. That this might be substantially varied, or completely eliminated, by the experience of subsequent years is not a sufficient reason for withholding the information, for this is almost equally true of a large part of the information supplied. If this figure were given, it would provide an important new element in the valuation of company investments, and there is no doubt that its disclosure should be made obligatory. There remains to be considered the question of disclosure upon the public interest. It is believed, as was pointed out on page 578 of the issue of April 25th, that the information to be obtained from a disclosure of EPT would not be of any material use to the enemy. If, however, the authorities maintain their attitude—as they will—and if directors and auditors continue to place the interpretation which they have on official advice, it seems very probable that most companies will withhold the information altogether. It is highly desirable that the authorities should be as zealous to compel disclosure, where they do not consider concealment essential to the national interest, as they are to encourage vagueness in other cases.

Local Authority Mortgages

A good deal has been heard from time to time as to the relative cost to local authorities of raising money by Stock Exchange issues and by other means. Few figures are available, and those which come to hand usually lack definition. Some importance, therefore, attaches to a table, showing the composition of the mortgage debt of local authorities at March 31, 1941, for England and Wales, and May 15th for Scotland, supplied by the Treasury and published in *Local Government Finance* this month, which are repeated below. Although 76 local authorities failed to reply to the questionnaire, it is not felt that this seriously distorts the picture. There is some uncertainty about the extreme

Range of Interest Rates	Optional 6 Months or Less		One Year or Less		Over 1 Year	
	Total	Over £5,000 each	Total	Over £5,000 each	Total	Over £5,000 each
3% or less	40,721	24,463	23,777	12,851	137,293	85,116
Over 3% to 3½%	37,729	22,715	7,805	4,835	324,074	220,746
3½% to 4%	13,270	9,115	1,189	812	187,290	140,864
4% to 4½%	2,105	1,245	2,111	423	18,689	13,574
4½% to 5%	1,495	745	5,278	2,880	136,387	101,477
5% or more	784	665	2,178	1,864	111,769	98,812
	96,104	58,949	42,338	23,665	915,502	660,589

range of rates charged, but it is evident that, on the third class of debt, which is most nearly comparable with stock market issues, the average rate is between 3½ and 4 per cent for periods probably shorter than those for loans raised on the market, which at present yield some 3½ per cent and upwards. The interest charge is, of course, not the sole expense of the loan; but, except when the life is very short, it is presumably by far the most important. It is, however, doubtful whether any very precise interpretation can be placed upon the figures in the absence of any information about the life of the mortgages at the date of compilation or about the date of issue.

Company Notes

Marks and Spencer Taxation

The preliminary figures of Marks and Spencer for the year to March 31st last contain a definite surprise. The figure of profit is not comparable, since it is after War Damage premiums which were not called for in the earlier years, but in any case a fall was anticipated. That which

has occurred, from £2,881,925 to £2,050,282, is not greater than might have been expected. It is, however, difficult to explain the fall in tax provision, other than tax on dividends, from £1,519,961 to £472,995. This is less than £100,000 above the figure for 1938-39, when there was no question of EPT, when the standard rate was not much more than half the present level and when gross profits were little if any

	Years to March 31,		
	1940	1941	1942
Profit†	2,860,157	2,881,925	2,050,282

† After directors' fees, all interest, and in 1941-42 War Damage premiums.

higher. The conclusion seems inescapable that, while the bulk of the fall arises from a smaller EPT liability, some of it is accounted for by the fact that the provision of 1940-41, and possibly that of the preceding year, was over-generous. The result is that, after very minor changes in other appropriations, the amount available for the gross ordinary dividend is up from £761,425 to £965,393, representing an earned percentage of 56.3, which is the highest since 1938-39 and compares with only 37.0 for 1940-41. In the circumstances, the maintenance of the 35 per cent distribution on ordinary and "A" ordinary shares is easily explained, but the percentage earnings are valueless as a guide to the true position. The price of the "A" ordinary improved a few pence on the announcement, but subsequently lost more than this gain, falling to 35s. 3d., at which the yield is some £5 os. 9d. per cent.

Johnson and Phillips' Good Year

In common with other manufacturers of electrical equipment, Johnson and Phillips realised a further improvement in 1941, total disclosed profits rising from £516,861 to £543,019—a record for the past decade. The allocation for taxation remains at the £260,000 provided in the previous year, while there is an increase in the total transferred for maintenance of buildings and for depreciation from £57,740 to £72,394. Equity earnings are thus rather higher at £165,987 against £154,572, representing a rate of 26.5 against 23.6 per cent. The ordinary shareholders receive 15 per cent, as in the two previous years, and the transfers of £5,000 to research and development account and of £30,000 to contingencies reserve are repeated. The surplus is devoted to raising the carry forward, which was reduced from £106,026 in the previous accounts to £91,491, through the subsequent allocation of £14,535 for a work people's bonus, to £102,478. It is probable that these excellent results are due mainly to increased turnover, though little clue to the details of the year's experience is provided in the accounts. In the balance sheet, stocks are up and debtors have remained relatively stable; stocks are up from £626,305 to £647,904, an increase no doubt partly due to the rise in the price level, and cash holdings are some £10,000 higher at £67,871. The bank overdraft is unchanged at £250,000, as is general reserve at £400,000. War damage contributions amounting to £20,000 have been charged to contingencies, leaving the fund at £120,000 after the latest transfer from profits. Such steady and apparently effortless progress must command the admiration of shareholders. The chairman's speech will be awaited with particular interest. The £1 ordinary shares, at 60s., offer £5 is. 3d. per cent.

Tankers Report

The report of Tankers Limited for the nine months ending December 31, 1941, discloses profits after taxation of £51,467, against £43,865 in the twelve month period ending March 31, 1941. Despite this improvement, no further payment has been made in respect of arrears on 8 per cent preference shares. In the previous financial period one year's dividends were distributed, leaving the shares in arrears since April 1, 1934, requiring a gross sum at December 31 last of £484,849. Instead, £39,500 against nil is provided for depreciation and the whole of the available surplus of £3,287 is used to increase the carry-forward to £11,809. The improvement in net trading profits is similar to that enjoyed last year by the vast majority of shipping companies and is mainly due to the increase in business, and, of course, to the falling off in sinkings. The company appears to have received the £265,000 due nine months before under War Risks Insurance, and to have used the money in making an advance of £65,000 to an associate and increasing gilt-edged holdings by £174,335. Meanwhile, general investments at £200,000 represent the reinvestment of requisitioned stock proceeds, but this figure is after appropriating £34,232 from general reserve to write these, and other holdings, down to market value. Remaining liquid assets stand at £146,337, against £149,297, whereas current liabilities are down from £87,814 to £75,037. The net result is that the excess of liquid assets over current liabilities has fallen from £901,360 to £814,254, but there is the loan to the associate, which did not exist nine months before. After the draft, the total of reserve stands at £78,812, against £113,044. Further news of the acquisition by United Molasses will be awaited with interest.

Union Corporation Group

East Geduld had a most successful year. Profits were increased, but, owing to higher taxation, dividends were reduced from 70 per cent to 62½ per cent, on which basis

the yield at 8½ is 7 per cent. The ore reserves represent eight years' supply to the mill. The mine is in a very strong position and for many years must remain one of the leading South African mining investments. *Grootvlei* acquired the *Palmietkuil* property during the year, so that available reserves show a substantial increase over those of the previous year and now represent five years' supply of the milling capacity. The tonnage milled was substantially increased, but the plant can now deal with 1,800,000 tons a year. Owing to higher taxation, the dividend was reduced to 20 per cent, on which basis the yield at 4½ is 4.2 per cent. The mine is now a vast property, and with a still higher milling tonnage in prospect should continue to show increased profits. The second year of *Marievale's* production shows satisfactory results. Increased development took place and results in the lower levels are satisfactory, though this does not apply to the mine in general. Dividends amounted to 10 per cent, on which basis the 10s. shares at 20s. 6d. give a yield at present of around 5 per cent. *Marievale* is a young property with reasonably good prospects. The effort to increase the ore reserves of *Van Dyk* failed, and development continued to be disappointing, in spite of increased footages. The reserves represent about three years' supply to the mill. Milling results continued to be satisfactory and dividends were maintained at 17½ per cent, on which basis the yield at 21s. is 8.3 per cent. The mine has continued to suffer from excessive minor faulting and from the fact that the mine workings require more support than was at first anticipated. The report of *Geduld* shows that, in spite of increased development on the Main Reef and work on the Black Reef, the ore reserves show a decline and a fall in grade. These represent about six years' supply to the mill, but the tendency may well be for a further fall in tonnage and grade in the future. The company is becoming increasingly more dependent upon its very substantial holding in *East Geduld*. Dividends were reduced to 67½ per cent, upon which basis the yield at 6½ is 10 per cent. This does not appear to be over generous in view of the potential life of the mine.

Industry and Trade

Motor and Pedal Cycles

Ever since July, 1940, no new private cars and goods vehicles could be purchased except by licence from the Ministry of Transport; the purpose of this restriction was to prevent the use of new vehicles for unessential purposes. A similar restriction was placed on new motor cycles last Monday. Applicants for licences must declare that they require a motor cycle for essential purposes and that they have been unable to obtain a suitable second-hand one. This restriction on the purchase of motor cycles should have been imposed long ago. Moreover, on November 1st, the basic petrol ration for motor cycles will be abolished and applications for allowances submitted to a needs test. The abolition of the basic petrol ration for private cars (on July 1st) and for motor cycles is expected to lead to an increased demand for pedal cycles, which can scarcely be met in full by new supplies for the home market, which have been fixed at 500,000 this year, compared with an annual pre-war output of about 1,500,000. But there is no reason why it should be met in full. The production and use of pedal cycles for unessential purposes is no more justified than that of private cars and motor cycles. For many workers, bicycles are a necessity; but no more of them should be produced than are necessary and, as in the case of private cars and motor cycles, their acquisition might be made subject to a needs test.

Price Control in Cotton Industry

The need for controlling the price of cotton goods as a means of preventing an undesirable rise in the cost of clothing was recognised early in the war. As long ago as January 4, 1940, an Order was issued applying price control at the initial stage of manufacture, that is to say, in the production of yarn; it provided for fixed margins between the cost of raw cotton and the selling price of single yarn. Margin control was subsequently extended to doubling yarns, but the task of fixing margins for weaving, the second stage of production, was not tackled until last month. The Control of the Cotton Industry (No. 32) Order, fixing weaving margins, covers about 80 per cent of the cloth currently produced in Lancashire. Criticism of the Order has been confined mainly to details, and a number of adjustments may be necessary. On the whole, however, the introduction of fixed weaving margins is a big step forward in the control of the prices of cotton goods. It now remains to extend price control to the retail stage. So far as utility goods are concerned, this has already been done. But a large proportion of the output of cotton cloth is made up into essential household goods which remain uncontrolled, and have risen sharply in price.

Cotton Output

At the annual conference of the United Textile Factory Workers' Association, Mr A. C. C. Robertson, in his

presidential address, suggested that the difficulties in which the cotton industry now finds itself are due to the way in which the concentration scheme was carried out. The general uncertainty in the industry which existed at that time tended to attract operatives into munition factories, and no compulsion was applied to them to staff fully the nucleus mills. The result has been that the target output, which was set by the Cotton Controller last January, has not been reached in any week, and has fallen short of it at best by 15 per cent. The few overtime hours are not likely to raise output to the required level. Nor was it expected to do so. In the last week of March, output was raised by the 8 per cent or so which overtime was calculated to yield. Thus, an unfulfilled margin of 15 per cent remains. The target is said to represent "minimum requirements for barest essentials" but is not further defined. The gap should be bridged by making better use of the present labour force, by more efficient work and longer hours if need be, and by a strict redefinition of "minimum requirements" and "barest essentials." Substitutes can be found for cotton for civilian use, and even for some Service requirements. It may be possible to scale down Service requirements, but certainly no civilian use should be made of cotton while real war requirements are not fulfilled.

Unified Coal Control

In the memorandum which has been prepared by the Coal Sub-Committee of the National Council of Labour, in support of the demand of the Mineworkers' Federation for the unified national control of the coal industry, it is emphasised that production and distribution can only be planned through a national authority. It is suggested, therefore, that measures must be taken by the Government to requisition the industry and to bring into existence a national authority composed of representatives of the Government, the Mining Association and the Mineworkers' Federation to deal on a whole-time basis with its affairs. The scope of this authority is indicated in the following paragraph: "The function of the Board would be to plan and organise the industry; to decide on matters which directly or indirectly affect it, including coal production, the allocation of supplies, prices, wages, mining conditions, safety, pensions and welfare; and to settle all matters affecting the financial and labour aspects of the industry irrespective of pre-war interests or post-war prospects." It is added that the Board should have control of the disposition of mining man-power; to review the whole of the production units throughout the country; and to institute new methods and plant wherever it is found to be necessary and to secure a more efficient generation and use of heat and power in existing works. The regional administration of these functions would be carried out by regional boards and pit committees, on which workmen and employers would be equally represented. The memorandum concludes with the expression of the view of the Council

that "the adoption of this plan would further the national interest and would make possible a greater degree of planning and better organisation, and would go far to remove the distrust of private ownership which is so widespread amongst the miners."

Coal and the Guaranteed Wage

An agreement has been reached by the Joint Consultative Committee for the coal industry about the application of the guaranteed weekly wage provision under the Essential Work Order to cases where men are absent or late, owing to the breakdown of the normal transport service between their homes and the pits. When consulted on the point by a deputation from this Committee last February, the Minister of Labour said he had no authority to give a binding interpretation of the condition in the Order making availability for work one of the two basic conditions of the workmen's right to the guaranteed wage, but he expressed the view that, if the workman had made every effort to reach his place of work on a particular day, and failed to do so (or arrived late) through extreme inclemency of weather, or other causes over which he had no control, he should be treated as if he had been available for work on that day for the purpose of a guaranteed wage under the Essential Work Order. Both sides have now accepted this ruling, and colliery undertakings have been instructed to act in accordance with it in future; the agreement is to have retrospective application from January 1st last to claims which have been held up pending the settlement of the question by the Joint Standing Consultative Committee. A management may concede claims outright as they arise, but in cases where the parties are in disagreement over the facts of the case, the dispute must be dealt with by the established machinery for dealing with disputes under the Order. A similar arrangement was already in force concerning miners' rights to the attendance bonus of 1s. per shift; but, while both confirm the original intention of the Order to give miners greater security both of wages and employment, they involve the risk of widening the door for absenteeism and slackness, and both these evils are now, unfortunately, more prevalent than they were when the guaranteed wage and the attendance bonus were applied to the industry simultaneously last June.

Government Tonnage

On April 22nd, it was announced in the House of Commons that a scheme for the transfer to British ship-owners of ships built to Government account was now on the point of completion and that a White Paper would be issued shortly. An owner who has been allocated a ship in replacement of a loss will not receive delivery until six months after the end of the war, but in the meantime, he will agree to buy the ship for the building price, less depreciation at the Inland Revenue rate of 6 per cent per annum up to the time of delivery. The management of the ship will be transferred to the prospective owner. The scheme has been under discussion for many months and its main principles have been common knowledge for some time. The ships will be allocated according to a rota of losses. Because of the rise in shipbuilding costs, this will mean that a shipowner who suffered a loss early in the war will receive a less costly ship than an owner lower down on the rota. Government-built ships are also being transferred to Allied Governments in replacement of war losses. In this case, however, the ships are delivered and paid for and, while under charter to the Ministry of War Transport, are paid a rate of hire similar to the requisition rates for British tonnage. As part of the agreement, the Allied Governments will take over some of the old ships bought by the Ministry early in the war. The tonnage involved is fairly large, replacement being in relation to the losses suffered. British shipowners have complained that this arrangement shows unfair discrimination between them and Allies who will be competitors after the war.

Production Committees in Engineering Works

Details of the agreement, signed on March 18th, between the Engineering and Allied Employers' National Federation, and the Amalgamated Engineering Union, the National Union of Foundry Workers and the Confederation of Shipbuilding and Engineering Unions, providing

for the setting up of joint production committees in engineering works, are given in the April issue of the *Ministry of Labour Gazette*. Its terms correspond closely with the agreement of February 26th, relating to Royal Ordnance Factories, described on page 405 of *The Economist* of March 21st. The principal difference between the two agreements is in the provisions relating to the election of the members of the committees. The number of workers' and management representatives is not to exceed ten. The period of continuous service qualifying workers for election to the committees is two years, compared with one year in the case of Royal Ordnance Factories. Voting is by ballot, open to all adult workers, and conducted jointly by the management and the union representatives in the shops. The representatives of management are to be nominated by the management, and must not exceed the number appointed by the workers. Since the most economic way of expanding the output of war equipment is to increase the "yield" per man-hour and per machine-hour, it is to be hoped that joint production committees will concentrate on this, their vital task.

Zinc Smelting Developments

Largely because of the exceptional fact that the reduction temperature of zinc is far higher than its volatilisation temperature, the refining of zinc offers considerable technical difficulties. As a result, an unusually large part (more than one half) of the world's zinc output is treated in so-called customs refineries—refineries without a mining basis of their own. As the treatment of one ton of zinc concentrate secures the recovery of roughly half a ton of zinc metal plus one ton of sulphuric acid, the chief by-product of zinc smelting, transport considerations favour the establishment of zinc customs refineries near the chief consuming centres of both zinc and sulphuric acid. This fact led to the development of extensive zinc refining industries on the European mainland. Belgium, which before the war used to produce less than 5,000 tons of zinc per year from domestic mines, refined over 225,000 tons of zinc from all parts of the world in 1937. The loss of Belgium, which had already created a serious zinc refinery problem for the Allies in the last war, once again dislocated the supplies of the United Nations in 1940 and 1941.

When Belgium was attacked and occupied by the German army, just two years ago, the world's zinc smelting capacity was approximately 1,900,000 metric tons per year, of which between 700,000 and 800,000 tons were accounted for by the United States and a similar quantity by the Continent of Europe, excluding the United Kingdom. Smelters in this country were capable of refining just over 70,000 tons per year. Canada had a scheduled capacity of 160,000 tons and Australia one of 75,000 tons. The only other zinc smelter open to the United Nations was the Rosita smelter in Mexico, controlled by American Smelting and Refining Co., with an annual capacity of about 36,000 tons. The combined refining capacity outside the European mainland was insufficient both to treat all supplies of zinc concentrates outside Europe and to meet the combined requirements of the United Nations. Since then, Canada and Australia have extended their smelting capacity, but details of these extensions are not known. The United States, however, has just published official data about recent zinc refinery extensions. Its total capacity of both distillation and electrolytic plants at the end of 1941 approached 1,000,000 tons per year, against 754,000 tons in the summer of 1940. Extensions now in hand will raise the capacity of the United States by another 100,000 tons this year. Consequently, the refining capacity for zinc outside the mainland of Europe has practically reached the present limit of ore supplies and should reduce the Allied zinc smelting problem for the remainder of the war to one of shipping space.

MERCANTILE BANK OF INDIA,
LIMITED

INTERNAL RESOURCES STRENGTHENED

SIR CHARLES INNES' STATEMENT

The annual general meeting of the Mercantile Bank of India, Limited, will be held on the 19th instant.

The following are extracts from the statement by the chairman, Sir Charles A. Innes, KCSI, CIE, circulated with the report of the directors and balance-sheet for the year ended December 31, 1941:—

The grave events which have happened recently in the Far East and the implications of those events for the Bank must be fully present to your minds, and quite clearly they limit the range of subjects on which I can usefully comment. For instance, it would be a waste of time to review the course of trade in the past year. International trade in the Far East has to a large extent been brought to an end by the war, but there is one tendency of permanent significance which I must again emphasise.

I referred last year to the way in which the growth of industry in India has been stimulated by the war. During the past year the pace of advance has been accelerated, an astonishing variety of new industries have been started and India is now playing an increasingly important part in the joint productive effort of the Allied nations. This development is an encouraging fact. It means, of course, that India will end the war with a very different economy but, if the result of these developments is a general raising of the standard of living and an increase in the purchasing power of the vast population of India, the effects on the volume of the world's trade in the future may be very far-reaching. Another matter of great significance has been the repatriation since the war began of practically the whole of India's external debt.

LATEST AVAILABLE FIGURES

The accounts present the latest information in our possession but the balance-sheet cannot, of course, give a complete picture of the Bank's position at the end of 1941. Quite briefly, I may say that at the end of November it looked as if, in spite of the many difficulties and anxieties, we should be able to report that the Bank had had another prosperous year and was in a stronger position than ever before. In December, however, the Japanese attack began and before the end of the month our branches at Shanghai, Hongkong, Bangkok and Penang had passed temporarily into their hands. In respect of these branches all we have been able to do is to incorporate in the balance-sheet the latest figures available, namely those relating to the second half of October in the case of Shanghai, and to the first half of November in the other branches. We have had to adopt the same course as regards our Rangoon branch. The final accounts for the year were despatched from Rangoon but we have not received them and we can only suppose that they have been lost in transit.

In the circumstances there are only one or two comments which I think it necessary to make. As in the case of most banks there has been an increase in our current accounts with a corresponding rise in our holding of Government securities. The increase in bills receivable and loans receivable and advances is largely due to lack of shipping and to delay of bills in transit. You will notice that our cash position is again very strong. Normally, of course, we should not keep so large a proportion of our assets idle, but it is part of the policy which we have deliberately followed for the last two years. We had constantly to bear in mind the possibility that the Japanese would enter the war against us, and so far as lay in our power, we tried to provide against this and the other contingencies inseparable from a war so widespread. Losses have inevitably been incurred, but had it not been for Mr Crichton's foresight and prudence, it is fair to say that they would have been considerably greater.

RESULTS OF THE YEAR

The profit for the year at £173,000 is lower than in recent years but you must remember that we have taken no account of the substantial profits made in the second half of the year by the four

branches before they were overrun. Moreover, before striking the balance we have judged it advisable to transfer a considerable sum from the profits of the year to contingencies account as provision for losses so far ascertained. The truth is that, in spite of our misfortunes in December, the profits of the year were good. Nevertheless, we have thought it prudent to reduce by half the second interim dividend which is in effect the final dividend for the year. We have again allocated £25,000 to premises account we have increased our additional allocation to contingencies account from £30,000 to £40,000 and we have slightly added to our carry forward. I regret very much the reduction of the dividend but I am sure that you will agree that circumstances call for a policy of strengthening the internal resources of the Bank.

OPERATIONS RESTRICTED

The overturning of so many of our branches means that for the time being the earning power of the Bank has been greatly reduced. Our operations are now confined to India, Ceylon and Mauritius and, so long as the war lasts, the board must pursue a cautious policy and I am afraid that you must expect smaller dividends than you have been accustomed to in the past. As regards the position in occupied branches, we must wait until the end of the war before we shall know exactly how we stand.

I told you last year that the fortunes of the Bank were bound up with the outcome of the present war. In recent months the Allied Forces have suffered serious reverses in the Far East and, through no fault on our part, the Bank has been caught up in the web of these misfortunes. The bad times will pass, and I have no doubt that in the fullness of time the Allies will recover what has been lost and that our branches will again be opened. Till then we must possess our souls in patience. I can say with confidence that the internal resources of the Bank were never so strong as when the Japanese made their onslaught, and our policy for the time being must be one of rigorous economy and conservation of those resources. The turn of the tide may come sooner than we expect and I hope sincerely that next year I may have better news to give you.

EQUITABLE LIFE ASSURANCE

MR D. ABEL SMITH'S STATEMENT

The one hundred and eightieth annual general meeting of the Equitable Life Assurance Society will be held at 19 Coleman Street, London, E.C., on the 20th instant, at 12.30 p.m.

The following is a summary of the statement by the president, Mr Desmond Abel Smith:—The society had been forced to curtail its efforts to obtain new business because it had released 55 per cent of the male and 25 per cent of the female staff for war service and circularising had been reduced. The few circulars that had been sent out were printed before, or in the early months of the war. In any event, he doubted whether the society would have kept up its new business, as the Equitable appealed largely to professional and business men with fixed incomes who had been financially hit by the war.

Up to now the society had contributed either directly or through the two controlled reversionary societies over £1,650,000 to new Government loans: of this, £428,000 was subscribed in 1941, and this figure had already been exceeded in 1942. The substantial sums paid out for claims and matured endowments had, no doubt, been largely invested by the recipients in Government securities or used to pay death duties. The claims paid on whole-life major profit assurances had given the usual remarkable results; in one case more than six times the original sum assured had been paid. Since the war started £117,658 had been paid in claims as a direct consequence of enemy action; of this, £70,952 was included in the accounts for 1941.

The increased charge to the society for income-tax, the low rate of interest on investments in new Government loans, and other wartime factors had had, and would continue to have, a considerable influence on bonus-earning capacity; however, there was no need to reduce interim bonuses for claims in 1942 below those allowed for similar claims in 1941.

There was a substantial margin in the society's favour between book and market values of Stock Exchange securities, and other securities were conservatively valued.

The great merit of life assurance was the security given by the sum assured (and any existing bonus); as far as could be foreseen these liabilities were amply provided for.

UNION BANK OF SCOTLAND, LIMITED

SUCCESSFUL RESULTS—INCREASED PROFIT

SIR A. STEVEN BILSLAND'S ADDRESS

The annual meeting of shareholders of the Union Bank of Scotland, Limited, was held on the 6th instant, Sir A. Steven Bilsland, Bt., MC, DL, chairman of the Bank, in the chair.

The chairman, in submitting the directors' report, mentioned that the balance-sheet total of £51,700,000 was more than £7,000,000 above the highest previously recorded at April 2nd. This increase was mainly due to an expansion of £4,400,000 in deposits, which totalled £41,045,000. Although the amount of deposits shown in the balance-sheet constituted a record in their long series of published accounts, it was considerably less than the highest figure reached during the year, because the date of the annual balance coincided not only with the close of a period of heavy withdrawals for payment of taxation and for the purchase of tax reserve certificates, but also with the culmination on March 31st of special nation-wide Warship Week efforts.

The general and progressive increase of banking deposits was a direct result of colossal Government expenditure in connection with the war. It must not be regarded in any way as an indication of increased national prosperity. For the same reason, the Bank's note circulation continued to expand rapidly, and at £4,245,000 was £1,073,000 higher than last year and also constituted a record.

The Bank's position continued to be one of great liquidity and strength. Cash and money at call and short notice amounted to £9,693,000, representing over 23½ per cent. of their deposits.

As a result of higher deposits they had been able to increase their support of new Government issues. The Bank's holding of British Government Securities showed an expansion on last year's figure of £4,140,000 and now stood at £20,601,000. Bills discounted showed a decrease of £643,000 on account of a reduction of £815,000 in the Bank's holding of Treasury bills, but this was more than offset by an increase of £1,000,000 in Treasury deposit receipts, where the total held on April 2nd this year was £2,500,000.

Notwithstanding the progressive decline in general banking advances during the past year or two, the Bank's loans and advances at £11,129,000 showed an increase of £1,261,000 over last year, which more than compensated for the decline reported a year ago.

PROFIT AND ALLOCATIONS

Although the margin of profit continued to shrink, their increased resources had resulted in an expansion of earnings, and the profit of £304,000, which was arrived at after full provision for every known liability, showed a moderate increase of £6,000.

This year £50,000 had again been placed to the published reserve, which now stood at £1,900,000, and it had been thought desirable to resume allocations to bank and other premises account by a provision of £10,000. They were being asked to approve of the usual sum of £25,000 being set aside towards liability for pensions and allowances, and after giving effect to these allocations and providing for the dividend of 18 per cent. recommended by the board, the carry forward would amount to £146,000, an increase of £3,000.

The volume of banking transactions showed little, if any, diminution, while the requirements of the Government for services of various kinds, soon to be increased by the handling of clothing coupons, tended to grow, and accordingly they were confronted with the problem of making a maximum contribution in manpower to the national war effort and at the same time endeavouring to maintain an adequate banking service. To some extent the difficulty had been met by closing certain branches and by reducing the period of attendance at others, but a position had now been reached where, with due regard to the needs and convenience of the public, further action in the closing of branches would require to be taken.

In conclusion, the chairman recorded their warm appreciation of the excellent services rendered by both permanent and temporary members of the staff in Scotland and in London during the past year. He also expressed on behalf of the board and the Bank their sincere appreciation of the services of the general manager, Mr Norman L. Hird, whose outstanding qualities as a banker had been of the greatest value to the Bank in the present difficult period.

The report was unanimously adopted and a dividend at the rate of 18 per cent. per annum declared.

Sir A. Steven Bilsland, Bt., MC, DL, was re-elected chairman of the Bank.

CALEDONIAN INSURANCE COMPANY

SUCCESSFUL RESULTS OF DIFFICULT YEAR

The one hundred and thirty-seventh annual general meeting of the Caledonian Insurance Company was held within the company's office, Edinburgh, on the 7th instant.

The chairman, Professor William Annan, CA, in moving the adoption of the report, said: We have continued to support the Government in its financial demands and our investments in the new Loans have now passed the £800,000 mark, while our total holdings of British Government securities at December 31, 1941, as shown in the life and general balance sheets, amounted to nearly £4,000,000.

LIFE DEPARTMENT

The net new life assurances granted during 1941 amounted to £957,964, as compared with £627,450 in 1940. With the reduction, however, which has been taking place in our field staff it is not anticipated that the 1941 figure will be maintained in 1942.

While there is practically no change in the amounts of the death claims and maturities and the premium income at £589,777 is only slightly less than the figure of £591,838 for the previous year, there is a substantial reduction in the surrenders from £87,582 to £41,340.

The expenses for the year 1941, excluding those applicable to annuities, showed a ratio to net premium income of 14.3 per cent. compared with 15 per cent. in 1940.

The average rate of interest earned for the year 1941 on the life assurance and annuity fund, in common with the experience of other offices, has suffered a further reduction. It was £3 7s. 4d. per cent. after deduction of income-tax, as compared with £3 9s. 9d. per cent. for the previous year, the reduction being accounted for by a general fall in interest rates.

As regards the assets, you will notice that the Stock Exchange securities stand in the balance-sheet in the aggregate at less than the value at middle market prices as at December 31, 1941, and the directors believe that the other assets are in the aggregate fully of the value stated in the balance-sheet.

Despite the existence of the considerable unappropriated surplus of £563,752 which the quinquennial valuation disclosed, the directors decided that under existing conditions the wisest course was to carry forward this amount. It is the intention of the directors to take into consideration at the next division of surplus the fact that no profits, excepting interim bonus, have been allotted to policyholders in respect of the premiums paid for the quinquennium ended December 31, 1941. In the meantime, and until further notice, an interim bonus of £1 per cent. per annum is being paid on all ordinary participating policies becoming claims by death or maturity during 1942 in respect of each year's premium due and paid for the years 1937 to 1940 inclusive.

FIRE DEPARTMENT

You will notice that the premium income for the year 1941 was £771,311, as compared with £732,755 in 1940, and that the profit was £53,931, as compared with £14,665.

ACCIDENT DEPARTMENT

The premium income in 1941 was £575,817, as compared with £510,930 in 1940, and the profit in 1941 was £6,208, as compared with £16,520 in the previous year.

MARINE DEPARTMENT

The premium income for 1941 showed a large increase at £351,692, as compared with £255,794 in 1940. After making full provision for all claims paid, outstanding and contingent, I am glad to say we were in a position to transfer a sum of £10,000 to the profit and loss account.

In addition to the funds for the fire, accident and marine departments, there is a general reserve fund of £650,000.

The chairman concluded by paying a tribute to the general manager, officials and staff both at home and abroad.

The report was adopted; the allocation of £20,000 to the staff pension fund was approved, and a dividend of 15s. per share, subject to deduction of income-tax, was declared for the year 1941, payable in equal half-yearly instalments on May 15th and November 11th next.

NATIONAL BANK OF INDIA, LIMITED

PROFITS MAINTAINED

MR R. LANGFORD JAMES'S STATEMENT

The following statement by the chairman (Mr R. Langford James) has been issued to the shareholders with the report and accounts to be submitted at the one hundred and twenty-eighth ordinary general meeting of the National Bank of India, Limited, to be held on the 12th instant:—

As was the case last year, the proceedings at our general meeting will be purely formal. This short statement which accompanies the report and balance sheet is therefore in substitution of the usual address by the chairman.

THE DIRECTORATE

Since we last met, Mr J. K. Michie has been appointed deputy-chairman of the board, and I take this opportunity of expressing our appreciation of the services he is rendering to the bank in that capacity.

In September, 1941, we lost a distinguished and highly respected colleague, Sir John Hewett, who had been a member of the board since 1915. Sir John, who was a great personality, was possessed of outstanding ability. The value of his service to India and, after he retired from the Civil Service, to the companies with which he became connected will not soon be forgotten. To fill the place of our old friend we appointed Mr W. G. Lely, of Messrs Wallace Brothers and Co., Limited, to a seat on the board, and we have every reason to congratulate ourselves on securing his services.

Owing to the war-time uncertainties of the postal service, it has again been found impossible to complete the 1941 accounts at the usual time, and our annual meeting must necessarily be held some few weeks later than the normal pre-war date.

In my last year's address to the shareholders I expressed some apprehension as to prospects for 1941. My fears, however, in regard to the bank's results were not justified as the net profits—amounting to £437,738—closely approximate those of the previous year, after providing a substantially increased sum for taxation and after making full provision for bad and doubtful debts.

In order that there should be no undue delay in payment of the final dividend this was again declared in the form of a second interim, but at the rate of 6 per cent. instead of 8 per cent., reducing the total dividend for the year from 16 per cent.—a rate at which it has stood for the past few years—to 14 per cent.

RECORDS and STATISTICS

STOCK EXCHANGES
London

Note: all dealings are for cash

WHILE the British landing in Madagascar served to improve sentiment, and partially to offset the news from Burma, the effect on prices and turnover throughout the markets was small, except for a slight revival of buying, from the Cape, of kaffir issues. Turnover in the gilt-edged market was moderate, but while irredeemable and long-dated stocks were easier in early dealings, some institutional demand for short-dated issues has occasioned a general improvement among these stocks. The feature of the foreign bond market has been the steady demand for Brazilian stocks. After a general improvement of $\frac{1}{2}$ to a point before the week-end, the 6½ per cent loan rose $\frac{1}{2}$ at the reopening, while point gains were registered for the 5 per cent loans of 1903 and 1914. Peruvian bonds were also in demand and Mexican issues improved slightly on some enquiry. In contrast with the previous week's activity, the home rail market was quiet, but prices showed no marked change. Among junior issues, GW ordinary rose $\frac{1}{2}$ at the reopening, as did LMS ordinary the following day, while preference issues moved narrowly. Interest in the foreign rail market was slight, prices

showing little movement, but elsewhere Canadian Pacific ordinary advanced $\frac{1}{2}$ on Tuesday on the latest traffic receipts. Later there was a distinct rally in long and irredeemable Government stocks, and little feature elsewhere.

Apart from occasional interest in particular stocks on dividend prospects, the relatively small turnover in the industrial market has not affected the firm undertone of the past few weeks. Brewery shares were firm throughout, Guinness, Ohlssons Cape and South African Breweries all showing marked improvement, but tobacco shares continue to be dull, both BAT and Imps easing $\frac{1}{2}$ at the end of last week, although the former recovered this loss at the reopening. Light dealings in the motor and aircraft section gave rise to some irregularity, but apart from an advance of $\frac{1}{8}$ for Rolls-Royce on Monday, changes were small throughout. A gain of $\frac{1}{8}$ for Indian Iron at the reopening was the only feature of a quiet heavy industrial section, although Bolsover was rather weak. Shipping shares, apart from a small improvement in Cunard, were unchanged, but the textile group, while generally quiet, became more active on Monday with interest centred chiefly on Fine Cotton Spinners issues. The maintenance of the dividend by Marks & Spencers occasioned an advance of 9d. in both the "A" and

JAPAN'S ENTRY INTO WAR

Although circumstances have indicated that pessimism as to the 1941 results was not justified, it is patent that the entry of Japan into the war cannot fail to have repercussions on our business. Up to the present we have been relatively fortunate in that, not having any branches farther to the east than Burma, Rangoon and Mandalay are the only places from which it has been found necessary to move (temporarily we both hope and believe). But whatever may be the outcome of the Japanese efforts to penetrate farther to the west, it appears obvious that, until the allied nations can impose greater restraint on the naval activities of our enemies, trade from and to the Bengal ports and the areas they serve must suffer some restriction, and the same may apply not only to other Indian ports on the Bay of Bengal, but to Ceylon also.

This being the present position, shareholders will doubtless approve of our having decided, as a measure of prudence, to make a slightly smaller distribution from the profits, which enables us to add £38,000 to the sum carried forward—raising it to £284,253—after allocating £50,000 to the pension funds and £70,000 to house property account.

SOUND FINANCIAL POSITION

With regard to the balance sheet, the bank's total liabilities and assets are £5,000,000 higher than at the end of the previous year. On the liabilities side this is almost entirely accounted for by an increase in current, fixed deposit and other accounts, while amongst the assets, cash and bullion appear as £1,000,000 higher, British and Indian Government securities are nearly £3,000,000 up, and the figure representing bills of exchange shows an increase of £1,700,000 as compared with the previous year. The long period occupied in transit of mails has again swollen this latter item. Discounts, loans receivable and other sums due to the bank appear at £600,000 less. The ratio of the combined items of cash and Government securities to the bank's total liability on current, fixed deposit and other accounts is 70 per cent., which indicates a sound position.

It is a pleasure to pay a tribute to the staff of the bank both at home and overseas, who have maintained an efficient service notwithstanding the depletion caused by the large number now on duty with His Majesty's Forces which has necessitated their re-employment by a less experienced staff. In consequence an extra strain has been placed on the senior members of the staff remaining with us who have cheerfully overcome their difficulties and enabled our business to be carried on with as little dislocation as possible. Our appreciation of the work of all members, both old and new, is well deserved.

ordinary shares despite the sharp reduction in trading profits, while Woolworth's improved 1s. Elsewhere, Cable & Wireless ordinary improved a point on Tuesday on dividend hopes. In midweek Marks & Spencer and Woolworth lost their earlier rises, but Cable & Wireless stocks remained strong.

A sharp revival of activity in the kaffir market reflected the satisfaction felt by the Cape at the Allied action in Madagascar. After quiet support had occasioned several small advances at the close of last week, widespread buying on Tuesday resulted in further gains for many stocks. Union Corporation rose $\frac{1}{2}$ and West Wit Areas $\frac{1}{8}$, as did Vlaktfontein, although Crown Mines fell $\frac{1}{8}$. With stock in short supply, buying of diamond issues, in particular De Beers and Anglo American, resulted in sharp advances for both shares in the early part of this week. Both the tin and rubber markets were quiet, and the small turn-over left prices practically unaltered, but steady investment demand for tea shares, coupled with small supplies has continued to raise prices. Quiet conditions prevailed in the oil market and changes were in general negligible. Among the leaders, Anglo Iranian and Shell improved $\frac{1}{2}$ and $\frac{1}{8}$ on Tuesday, while Burmah Oil was steady throughout. Later all the oil leaders showed gains, but Anglo-Ecuadorian slumped on the dividend cut.

New York

OWING to the technical position, the past week on Wall Street has seen some improvement from the low levels registered in the previous period. Utilities, in view of hopes of more favourable tax treatment than other sections of industry, have received some support, and elsewhere small gains have been scattered over a wide range of securities, although the volume of buying is still very slight. Later a sagging tendency reasserted itself, with falls in steel, motor, utility and rail shares.

WESTERN REEFS EXPLORATION & DEVELOPMENT COMPANY, LIMITED.
(Incorporated in the Union of South Africa.)

CAPITAL: Authorised £1,500,000. Issued £1,325,000 in 5,300,000 Shares of 5s. each, fully paid.

EXTRACT FROM ANNUAL REPORT TO 31st DECEMBER, 1941.

The Company owns the following property:—
13,069.79 Morgen, Freehold including Mineral Rights.
2,813.14 Morgen, Freehold with Rights under Reserved Minerals Development Act, No. 55 of 1926.
296.96 Morgen, Freehold excluding Mineral Rights.
5,027.93 Morgen, Mineral Rights only.

It also holds the following Government Leases:—

	Morgen.	Square Rods.
Mining Lease on portions of the farms Goedgenoeg No. 62, Nootgedacht No. 53, Vaalkop No. 110, and Witkop No. 46	5,898	128
Prospecting and Mining Lease on portions of the farm Nootgedacht No. 53	2,688	565
Prospecting Lease on portion of the farm Zandpan No. 13	815	40

Tons milled.....294,500		Yield (per ton 4.34 dwts.).....63,851 ozs.	
Revenue (per ton milled 26/5.1)	£536,780	Government Taxes	£18,150
Working Costs (per ton milled 28/7.5)	421,571	Reserve for Liability under Miners' Phthisis Act	1,624
		Dividend No. 1—5%	1,313
Working Profit (per ton milled 7/9.0)	£115,209	Directors' Special Remuneration	404
Expenditure, less Sundry Revenue	516	New Share Issue Expenses	26,952
		Balance unappropriated at 31st December, 1941	2114,693
Total Profit	£114,693		

ORE RESERVE (based on pay limit of 3.0 dwts.):—

	Tons.	Stope Width, Inches.	Stope Value, Dwts.	Inch-Dwts.
1941	2,002,000	60.13	5.58	336
1940	1,509,000	62.22	5.70	355

OPERATIONS.—During the year the mine reached the production stage, and mining started on the 28th June, 1941. The tonnage milled has shown a progressive monthly increase. During July, the first month of crushing, a loss was made, but results for the remaining months of the year disclosed a steadily improving profit.

DEVELOPMENT.—The footage accomplished was 61,739 feet, the percentage payable was 51.1, average channel width 37.85 inches, average assay value 13.02 dwts.

CAPITAL EXPENDITURE during the year amounted to £668,528, of which £508,657 was expended prior to production. Capital Expenditure for 1942 is estimated at £60,000.

REDUCTION PLANT.—No trouble was experienced in starting up the Reduction Plant, and all sections have operated successfully. The average value of the residues for the period of operation was 0.27 of a dw. and reduction costs at 3s. 6.3d. per ton can be considered as satisfactory in view of the small tonnage dealt with. The monthly tonnage milled increased from 35,500 tons in July to 62,500 tons in December, and provided an adequate supply of labour is available, it is anticipated that a progressive increase in the monthly milling rate will be maintained during the current year.

THE FULL REPORT AND ACCOUNTS CAN BE OBTAINED FROM THE LONDON SECRETARIES OF THE COMPANY, ANGLO AMERICAN CORPORATION OF SOUTH AFRICA, LTD., 11, OLD JEWRY, LONDON, E.C.2.

BRAKPAN MINES, LIMITED.

(Incorporated in the Union of South Africa.)

CAPITAL: Authorised and issued—£1,150,000 in 4,600,000 Shares of 5s. each, fully paid.

War and Peace

WE have no Churchill to show us a silver lining," writes a correspondent from Lincoln, Nebraska, rather wistfully. Actually, he is wrong. On Sunday, Mr Churchill spoke his words of confidence and good cheer: all the United Nations. Walter Bagehot once wrote, after the Crimean War:

If any politician had come forward in this country, on the topic of war, with prepared intelligence, distinct views, strong will, commanding mastery, it would have brought support to anxious intellects and comfort to a thousand homes.

This time, there is such a man—*cui par est nihil et nihil secundum*. When he speaks with the vigour and grasp of the Prime Minister's latest broadcast, he brings comfort, not to a thousand homes, but to scores of millions.

The theme of the broadcast was victory; "there can only be one end." The balance of military power is passing to the Allies. In the air, there is the growing strength of Britain and the United States; on land, there is the proved power and vast reserves of Russia. Mr Churchill did not speak of the overwhelming potential resources of the United Nations as a bank balance to be drawn upon in the future; he spoke of them as a treasury which is being expended now.

But the real reason why Mr Churchill can display the silver lining is that he has never hidden the dark clouds. On Sunday, he said little about the further sacrifices that must strew the path to victory. He was counting blessings.

But he did lay down the first condition of victory, which is to "endure and persevere." The one lesson which, above all, the free peoples have learned from the disasters of a decade is that he who wills the end must will the means. Those who call for more austerity, not less, in the years of attack are not upholders of self-denial as an end in itself. They simply know now that the only way to win is to permit no man, no machine, no material and no ship that might be used for the war to be used for other purposes.

The end is victory, the means austerity and endurance. But victory is more than the finish of fighting. There is another condition of victory, to decide upon the world that must follow the peace, the goal. The Prime Minister did not look beyond the fighting. The first and overriding need is to win the war. Other Ministers, in other speeches and broadcasts, have looked ahead. All of them, Mr Lyttelton, Sir Stafford Cripps, Mr Eden and Sir Kingsley Wood, are agreed on certain fundamentals. There must be no mass unemployment; there must be no malnutrition or poverty that can be remedied. It is the responsibility of the state, not always to carry out these cures, but certainly to see that they are carried out. From the Ministerial speeches can be collected the heads of a programme—Minimum Standards for every family; Equal Opportunity for every individual; Regularity for the entire economy.

The coming political controversy will not be about

the programme, but about the means to achieve it. Mr Lyttelton has said that the essence of democracy is to secure a balance between the organising power of the state and the driving force of the free individual. Sir Stafford Cripps has said that, though the responsibilities of the state must grow, the state cannot do everything. Sir Kingsley Wood has said that the peace effort, like the war effort, will require state control over the use of economic resources. It is in the distribution of functions between the state and the organised economic interests that the real conflict of views is already emerging. The corporations will say, "Away with control and red tape." Already the Association of British Chambers of Commerce has made this plea; it has called for the end of state control, and for more power to its own elbow—more power for trade associations to direct state policy. It is a plea which will find quite widespread favour among the public. "The most hateful of all names in English ears is Nosey Parker." Most ordinary busy people are naturally more aware of the frictions and failures of a swollen wartime administration than they are of the pressing necessities, social and economic, which make it inevitable that the effort of a nation towards a single end should be controlled and guided communally.

It is, therefore, above all necessary that this issue of the rôle of the state should be placed in its roundness before the people, and that the alternatives should be plainly shown, so that the people may freely decide. Against the cry of bureaucracy should be put the need for the use of the community's organising power, on the community's behalf, to set standards of life and work below which no individual should fall; to provide the opportunity for any individual to rise as high as any other; and to avert the fluctuations in economic activity which have been the besetting evil of social and economic life for generations. Against the cry "state control is stagnation" should be set the argument that economic feudalism, controlled by corporations in the misused name of free enterprise, is an abuse and a restriction. More important, deeds or the earnest of deeds must reinforce words. It is not enough to speak of minimum standards; a policy of family allowances and a National Minimum is needed. It is not enough to speak of equal opportunity; a new policy for education is required. It is not enough to speak of economic regularity; a national investment policy

is required, by which state investment will always be used to supplement private investment, in order to make up the level of investment needed for full employment. Mr Lyttelton has said that the state must take the initiative in improving the country's capital assets—its transport, its roads, its ports, its towns, its houses and its amenities. He has suggested that, if this is done, a long step will have been taken towards removing the mass unemployment that comes from trade fluctuations and making this "a spacious, active, enterprising, gay country."

The arguments against planning and control after the war cannot simply be set aside. The case must be argued item by item *coram publico*. A twofold process is needed: to obtain agreement about the ends in view—minimum standards, equal opportunity and economic regularity; and to prove in detail that only by the intervention of the state in the free affairs of business can these be secured. The point is not that capitalism has collapsed or failed to deliver the goods, as all sorts and conditions of planners have wrongly argued. It is rather that, for all its technical successes, unemployment, malnutrition and poverty have remained endemic. The chronic tendency of free enterprise has been to leave the rails and become restrictive monopoly; and the state's task, in the interests of citizens and consumers, is to keep it on the straight path, to use and guide the energy of enterprise, not to supersede it—except in those spheres of economic activity where the state must be ready to step in directly to make certain of the necessities of life and their fair distribution.

Nor can the outcry against inefficient bureaucracy be set aside any more lightly. Too often bureaucracy is inefficient, in its procedures and in its personnel; and not the least need of New England is the overhauling of the administrative machine. It is a process which must begin at the top, as suggested in an article on page 672; but it must go right down through the ranks of the Civil Service, until there is free entry to every post for the person best able to fill it and scope for every administrator to do his job with speed and efficiency.

These ends and these means, these objectives and the ways to reach them are the components of victory. They are its definition. They add up to a reinterpretation of Liberty, Equality and Fraternity; and Mr Churchill would strike a great blow for his country and for the cause of freedom if he were to set his personal seal upon them.

Russia's Task

ON the eastern front, the two great armies are massing to strike the knockout blow each side is straining every sinew to deliver. The sudden flare-up of battle in the Kerch Peninsula may even be the first step in a campaign which will roll from the gates of Leningrad to the frontiers of Caucasia. Germany's difficulties, strains and grim measures of reorganisation have been widely discussed since Hitler's speech; but what of the Russians? Are they stronger for the winter respite? What use have they made of the breathing space? Do they emerge refreshed or worn down?

The significance of the winter months does not lie primarily in the military sphere. The Russians have not been able to force a decision, on the scale of the retreat of the Grande Armée in 1812; they have not even achieved what might be termed a "minimum programme," the relief or recapture of vital strategic and industrial centres—Leningrad, Smolensk, Kharkov, Taganrog. The Germans begin the new campaign with good military springboards and in command of a functioning front line railway system. Winter war gave the Red Army a certain advantage. For a few months manpower was more important than machine power. A frozen tank could be at the mercy of a few men on home made skis. But now the pendulum is swinging back to the machine, and the really crucial question is whether, during the five months that have elapsed since the invader was halted before Moscow, the Russians have been able to increase

the striking power of their mechanised armies to match their reserves of men.

The magnitude of the task can be appreciated only against the background of the Russians' original preparations for war. At first, while they were still non-belligerent, they undoubtedly counted on a prolonged struggle in the West. The collapse of France made a sudden reorientation essential. A series of decrees were issued in the first weeks after the French disaster. In the economic sphere, they were directed towards putting Russia on a war footing. They covered such matters as the further cutting down of the production of certain goods, the shifting of industry to the east, a lengthening of the working day, and the decentralisation of the organisation and control of industry. The political decrees were concerned with stiffening home morale, chiefly by way of concessions to the peasants. In the military sphere, less could be done. The Soviets had been manoeuvred into the awkward position of expecting attack, yet of being unable to do anything sensational to forestall it for fear of loosing the avalanche. The Russian armies were not fully mobilised all through the anxious winter and spring of 1941. When the blow fell, the frontier forces were only strong enough to fight an ordered retreat. But in the sphere of discipline, the decrees prepared for the strain of war by introducing a severer system of military authority and a more rigid military hierarchy.

Hitler's invasion burst upon a nation politically,

economically and militarily only partially mobilised. Happily the political front held superbly. Even in the dark days of November and early December, the signs of panic and collapse were isolated and could be dealt with. The political commissars were particularly efficient in their handling of disheartened troops. In the hour of crisis, the reversal of values in recent years—the restoration of the cult of the fatherland, the resurrection of history and patriotism—stood the Government in good stead. Traditional love of "Holy Russia" fused with pride and devotion to the gains of the revolution to produce a fighting spirit which rallied the nation during five months' steady retreat. It was significant how quickly the old witch-hunting ceased to figure in home propaganda. The "enemies of the people" disappeared. They have not re-emerged in the winter waiting. On the contrary, the terrific psychological fact of having once stopped the irresistible, unconquerable German machine has bred a mood of remarkable self confidence—which fresh retreats would be very unlikely to shake. The Germans have been stopped once; *ergo*, it can happen again.

In one sense, the outbreak of war made mobilisation on the economic front much easier. The chief problem was the transfer of industries and of workers to the east. With the enemy on their heels, people were far readier to move, and the war situation made it possible for the authorities to act very drastically. The great trek went on throughout the months of the retreat. The Germans did not catch it up and, in spite of the loss of territory, it is estimated that 60 to 70 per cent of Russia's industrial capacity is still intact. The problem in the winter months was to get this uprooted industrial system working at full pitch, and the evidence goes to show that this supremely difficult task—much more difficult than the actual shifting of the industries—has been achieved. Tens of millions of workers have settled down in the Volga and Ural regions, accepting the makeshift and squalid conditions of camps and billets with typically Russian endurance. The schemes for decentralisation, too, appear to be working well. Regions have their own reserves of raw materials; the regional and local Soviets have been given very wide powers of discretion in the organisation of production, and are being heavily discouraged from referring everything back to the centre—as in the days of super-centralisation—with demands for lengthy instructions in writing. This tendency—which has become manifest only with war—is an interesting parallel to Germany's contemporary efforts at decentralisation through the self-governing industrial corporations. It may have far-reaching consequences. The success of the decentralisation policy—and everything points to it being a success—has encouraged a slackening of the former oppressively centralised control in economic matters; later this may even spread to the political sphere. Men are learning to act independently and responsibly within a larger framework of common purpose and common loyalty. The process is bound to leave its mark.

The winter months have seen the completion of the process of concentrating the whole of industry on war production. Production for civilian purposes has been ruthlessly cut, and most of the increased output in the Urals—the third Five Year Plan catered for something like a 100 per cent expansion—has gone into the war effort. Thus, in spite of the loss of the Ukraine and the difficulties under which the Leningrad and Moscow industrial centres have been working. President Kalinin can claim that Russia faces the second summer offensive better armed and with larger reserves than in June, 1941.

In the military sphere, the stopping of the retreat was naturally the most important factor. The semi-mobilised army of the first few weeks was constantly reinforced during the summer and autumn; but the reserves were thrown into an army already in some disarray, and there was a quite disproportionate loss of manpower and material. The winter pause has altered all this. It has been possible to build up fully equipped and properly integrated armies behind the line, and to prepare defence positions in very great depth behind Moscow.

There is no doubt that the situation in Russia is in many ways far more hopeful than in the spring of 1941. But this is not to say that there is no darker side to the picture. Industrial equipment has been very largely salvaged; but the Ukrainian mining industry is an almost total loss, and without the iron ore of Kivroï Rog and the Donetsk coal, Russia's industrial capacity is bigger than the raw material basis on which it rests. On a short term view, this is not so serious. Stocks have been built up—with great foresight—region by region. Collections of scrap have been made. But stocks and salvage are wasting assets. A decline in output must come sooner or later, and it is probably true to say that Russian industry is reaching a peak this year which it will be difficult to maintain into another year of war.

The same holds good of the labour situation. The massive call up and the great losses of population in conquered territory are producing a serious labour shortage, in spite of the number of new workers who are being trained and drafted into industry, the employment of children and the combing out of women from civilian occupations. The margin for transfer from non-war industries is in any case far smaller than in countries like Britain or the United States, with their higher standards of living and their wide range of non-essential production. The loss of valuable agricultural supplies will also tell sooner or later on the labour force. The workers are working longer hours for less food. The strain is bound to affect the volume and quality of their output.

These danger signals are, however, bound up with the time factor. They show that Russia is reaching its peak this year, and that the war effort must slacken if the campaign is allowed to drag on and on. The Russian slogan "Victory in 1942," which replaced the grim "They shall not pass" of 1941, is simply a plain statement of what Russia needs most if the nation is not

to crack under the strain of the combined industrial and military effort that is being made. Russia's allies are, it is to be hoped, fully aware of this time factor. It must be balanced against their own expectation of maximum military and economic efficiency. It affects the problem of

The Machinery of Government

THE machinery of reconstruction is simply the machinery of government, for reconstruction is only another—and rather misleading—name for governmental policy. Reconstruction—the “peace effort”—if it is to be in any way adequate to the demands of the people, will have to be comparable to the scale of the war effort itself; two years or so of war have brought to light many symptoms of strain and maladjustment in the administrative machine. The first step toward successful reconstruction must be to reconstruct the reconstructors.

It is a measure of the political doldrums in which this country has lain for the last twenty years that the recommendations of the Haldane Report on the Machinery of Government, published in the last boom period of reconstruction, towards the close of the first world war, are still largely unadopted. They were swept away—along with so many other schemes of reform—down the Gadarine descent into “normalcy.” To-day, two of the principles of administrative reform, laid down, twenty-five years ago in this Report, offer a clue to the solution of the whole complex problem of creating an administrative framework within which decisive and forward-looking action can be taken. First, the Report pointed out that:

Many of the departments have been gradually evolved in compliance with current needs, and the purposes for which they were thus called into being have gradually so altered that the later stages of the process have not accorded in principle with those that were reached earlier.

Nowadays it is even more true that department after department has grown out of its original functions and become a thing of patchwork. The second crucial point emphasised in the Report underlines the first; it is the impossibility of combining the task of thinking out a policy with that of directly administering it.

The reason of the separation of work has been the proved impracticability of devoting the necessary time to thinking out organisation and preparation for action in the mere interstices of the time required for the transaction of business.

The war has made it obvious that these two principles—the reconsideration of the sphere of work covered by the departments and the separation of policy-framing from administration—both apply at the highest level of the executive machine, in the Cabinet. Very few departments can be left to “tick over” under the drastic demands of total war. More and more decisions can only be taken at Cabinet level because they involve major developments in policy. A separation of policy from administration becomes imperative in wartime; and this state of affairs will last on into the post-war period, for the work involved in transforming a war economy into a peace economy will make similar demands upon the Cabinet. It is not only the breaking of normal routine that involves more frequent reference to the Cabinet. The point is that total war involves governmental intervention in a much wider sphere of the nation's life and, though the controls will be relaxed when the war is over, the post-war responsibilities of the state during the period of reconstruction will inevitably be greater than they have been in the past.

The War Cabinet will serve as a starting point for reform. The pressure of events has put a limit to the pre-war conception of a Cabinet composed of departmental chiefs under the chairmanship of the Prime Minister. The present War Cabinet goes some of the way towards fulfill-

supplies to Russia. It affects the wider issue of a second front. Whatever the decision, it must not be based on an illusion of a continuously strengthened and expanding Russian economy. The peak has probably been very nearly reached.

ing the second criterion of the Haldane Report. It represents a partial separation of the work of deliberating policy from that of carrying it through departmentally. Four members have no direct departmental responsibility at all. The Peace Cabinet might carry the principle of avoiding direct departmental responsibility further. It might even be composed only of Ministers without Portfolio engaged upon thinking out and deciding policy.

There is, however, an obvious danger that a Peace Cabinet constructed on this basis would lose contact with the machine it had to control and with the realities it had to administer. The departments have the accumulated experience, the knowledge of detail, the expert information on the job in hand. The Cabinet Ministers have the unencumbered minds, the grasp of policy as a whole, and the end in view. The two have to be brought together. Here again the solution is suggested by wartime practice. It almost certainly lies in some form of “regional” responsibility for Cabinet Ministers over groups of departments. One of the reasons why a Minister charged with the administration of a single department is not the most suitable person to decide high policy is because the field of work covered by his particular department—the field therefore with which he is thoroughly familiar and in which he is completely engrossed—embraces such a small part, not merely of the nation's life, but of the particular aspect of the nation's life—defence, social welfare, industrial policy, foreign relations—to which it is related. There is not only need to set Cabinet Ministers free from departmental duties so that they can see the policy of the nation as a whole. There is also need to set them free so that they can see particular aspects of the nation's policy as a whole. It is a need that has been dimly recognised in the Cabinet system for a generation. Every British Cabinet in the last 30 or 40 years has conducted a large part of its business by Cabinet Committees—often based (as Mr Churchill has said) “upon the Ministers, the co-ordination of whose departments is essential to the solution of the problem.” During the war, the method has hardened. There has been the Defence Committee, grouping defence departments; the Production Council (or Executive), grouping production departments; and the Committee under the chairmanship of the Lord President of the Council, grouping departments concerned with domestic policy. More than that, and most suggestive of development of all, single Ministers have emerged from these nuclei, or been superimposed upon them, with a “regional” responsibility over the group of departments. Mr Churchill is Defence Minister; Mr Lyttelton is Production Minister; behind the scenes, Sir John Anderson focuses home policy. Thus, two at least of the present War Cabinet Ministers—Mr Churchill and Mr Lyttelton—while they have no one particular department to administer, have the oversight of a group of related departments. Once again the pressure of war has reinforced the criteria of the Haldane Report; the re-grouping of Ministries on a broad functional principle implies a reconsideration or a reintegration of the field of work they are supposed to cover, while the Minister exercising general oversight works at a sufficient distance from day-to-day administration to make planning practicable; and, at the same time, the way is found to anchor the War—or Peace—Cabinet firmly in the departments.

On the home front, the position of the Lord President of the Council with his Committee of Ministers and the interdepartmental committees of experts working under

him represents a first step towards the integration of the departments dealing with domestic affairs. The future of the coal industry was already being surveyed for the Lord President's Committee when the present coal crisis came to a head. There is probably a case here for a further division between the departments concerned with the social welfare of the citizen (the Ministries of Health and Food, the Home Office, Board of Education, the Assistance Board and so forth) and those which deal with production (the supply departments, the Mines Department, the Ministry of Agriculture, the Board of Trade—under some aspects—the Ministry of War Transport, the Ministry of Labour, again under certain aspects). This second group of departments—those concerned with production—is now over-seen in part by Mr Lyttelton, and for the time being it is dominated by the prosecution of the war. Reconstruction problems, such as the change-over of industry from a war to a peace economy and the location of industry, obviously cannot be adequately dealt with now by the Minister of Production. But it is important that the principle established by his general supervision over war production should be remembered after the war, when the problem of remarrying the nation's productive resources for peace comes to be solved. While the Minister of Production is wholly engaged in war work, the surveys that are being done by experts for certain departments on post-war industries might perhaps be grouped for the time being under Sir William Jowitt—whose position as Minister responsible for reconstruction is curiously outside the Ministerial hierarchy.

There is one sphere of government in which there is so far not even the first sign either of an integration of the sphere of work or of a separation of agencies conduct administration. A large variety of agencies conduct Britain's relations with the outside world—the Foreign Office, the Ministry of Information, the Political Warfare Executive, the Department of Overseas Trade and the BBC—and there is nothing to suggest that their work is being properly brought together. Yet nowhere is it more necessary. Hitler and Dr Schacht between them put an end to the dying era of diplomatic specialisation. Economics, social policy, propaganda are all vital parts of a country's external relations. An effective foreign

policy demands that they should be seen as a coherent whole; nor should it be at all difficult to bring about the necessary administrative changes. Mr Eden is already in the War Cabinet. At present his departmental responsibility is confined to the Foreign Office. It could be enlarged to cover all the agencies dealing with external affairs. Then Mr Eden's position would resemble that of, say, Mr Lyttelton, in that it provided general oversight over an entire “region” of policy and administration.

Thus, in the War Cabinet and in these “regional” Cabinet Ministers, wartime practice has carried administration some way along the road marked out by the Haldane Report. It has done more. In the development of the Cabinet Secretariat by the drafting in of experts, by the addition of staff experts to the various Ministries and by the institution of Mr Lyttelton's general staff, it has pointed the way to efficient governmental planning. For efficient foresight as well as oversight, it is almost certainly necessary to go farther and to reinforce each War—or Peace—Cabinet Minister with his own general staff. The function of the Minister is primarily policy or planning, an impossible task for a man working alone or only with assistance from the pool of experts in the Cabinet Secretariat. Each Minister should have his own Ministerial secretariat made up of precisely the kind of experts who have come in and done so well as temporary wartime civil servants. Again, the field of foreign relations is a glaring exception to the steps that have already been taken in this direction. It is impossible to avoid the conclusion that part at least of the incoherence in Britain's formulation of war and peace aims is due to the lack of any adequate machinery for working them out.

The reorganisation outlined here is only a formalisation and extension of the changes the war has already brought about. As far as the machinery of government is concerned, the problems of peace will not differ so greatly from the problems of war, for the peace effort will lay as heavy responsibilities upon the State as the war effort has done. A Peace Cabinet freed of direct departmental responsibilities; Peace Cabinet Ministers entrusted with the supervision of properly integrated spheres of government and assisted by qualified staffs of experts—the skeleton already exists and the need to articulate and clothe it has been obvious since the last peace.

The Home Guard's Third Year

IT was on May 14, 1940, that Mr Anthony Eden appealed for volunteers for Britain's people's army. Within a few minutes of his broadcast, the police stations were stormed by citizens anxious to seize the opportunity to serve their country actively in its hour of supreme peril. The movement was hastily improvised under the threat of imminent invasion; it was laughed at, sneered at, and threatened by Dr Goebbels; its preliminary organisation contained many defects; its equipment was, at first, pathetic. Yet it survived its teething period and, at first, growing pains, and emerged a real and useful part of Britain's defence organisation—and His Majesty the King has honoured its services by assuming the appointment of Colonel-in-Chief. To some extent, of course, some of the earlier faults remain. Sometimes, it is to be feared, wealth, status in civilian life, or experience in earlier wars, are still the primary qualifications for commissioned rank, and a Mons star sometimes remains an automatic passport for a stripe. But a considerable amount of weeding out has occurred among commissioned and non-commissioned officers, and for the greater part of its first two years the Home Guard has worked out its own training under its own volition, built up its own organisation, and familiarised itself with its weapons and the special part it would have to play in invasion.

The movement enters its third year under new conditions. From February last, the right to resign disappeared. Conscripts will shortly be appearing in the ranks. Members must serve a fixed number of hours each month. How are these changes likely to affect the Home Guard?

Can conscription and regimentation be applied successfully to a movement which, despite the official attitude, has till now persisted in regarding itself as a body of volunteers—the direct descendants of the Fencibles of the Napoleonic period.

To answer these questions, it is first necessary to appreciate the composition of the Home Guard. In the main, it is of necessity made up of the older male members of the population. Its numbers are drawn either from workers in direct war industries (who are working long hours in those industries), or from the remaining key workers in less essential, but still important occupations—the retail trades, transport, banking, insurance, and so on—who are carrying on their civilian occupations under difficult conditions. The average Home Guard is thus a man of mature mental development, perhaps past the acme of physical fitness, engaged in civilian life in work of national importance, and often in a key or executive position. Many fought in the last war, and received training and experience in the use of the primary infantry weapons—the rifle, bayonet, hand grenade, and mortar—as well as a thorough grounding in drill, guard-mounting, and patrol work. The great majority have already spent two years in polishing up this old knowledge and in acquiring new.

The average Home Guard, it will be seen, is a very different quantity from the average full-time soldier. Yet it would still seem that the authorities are not fully aware of the difference—or if they are, that they fail to allow for it. It should, of course, be made clear that some of the

new conditions of service are wholly welcome to the Home Guard. The "housemaid's clause," for example, under which any man could contract out of his obligations at any time by means of a fortnight's notice, was regarded by members as an offence, and no one was more pleased at its demise than the Home Guard—witness the negligible number of resignations last February. The need for effective discipline is also realised, and it is appreciated that the authorities must have some sanction against the minority which has in the past been guilty of absenteeism. Under the voluntary system, the movement was often under strength, particularly in the rural districts, and those who have borne the strain of the past two years welcome the spreading of the burden which conscription will bring.

But other aspects of the new regulations threaten to undermine the spirit which has so far actuated the Home Guard. Generalisations are notoriously misleading, but there seems to be a danger that the ugly but expressive term "browned off" will extend from the vocabulary of the Army to that of the Home Guard. This possibility is indicative of the kind of danger which now threatens the movement. The temptation to transform the Home Guard into a time-serving unit, regardless of how its time is spent, is strong when the movement is regarded merely as an appendage to the regular army, and when its peculiar characteristics are ignored. Under the new regulations, members must serve up to a maximum of forty-eight hours each month, including time spent on night duty. In practice the maximum is seldom reached, a fair average probably being 34-40 hours a month, exclusive of time spent in travelling, cleaning equipment and the like. This is a formidable period, often equal to a normal working week, to men who may be working 60 hours a week in their civilian occupations; but the real point is that it has already proved no easy task to fill the period fixed for training and opera-

tions in a profitable and stimulating manner—there is an obvious limit to the amount of time which can usefully be absorbed, for example, in learning to throw a grenade. Yet the hours of compulsory duty have recently been extended in some areas, and some at least of those directly responsible for the training of the men are at their wits' end to know how the time can be filled. The repercussions of such a state of affairs are obvious. Each motion is spread over the longest possible period of time; of necessity, a "go-slow" policy is the only alternative to one of endless repetition which reduces instructors and men alike to a state of frustrated boredom; and if the members feel that the hours of compulsory attendance are unduly long, or are not properly utilised, then those hours are regarded as an absolute maximum—a call for volunteers for any extra effort falls on deaf ears.

This is not to say that nothing has been done to provide able and informed instructors. On the contrary, much has been done, at week-end schools and the like, to educate platoon commanders and NCOs, and these in their turn have passed on their knowledge, with considerable skill, to the men. Admittedly, greater use could possibly be made, as instructors, of the regular Army officers of 45 and over who are now being retired from active service. And the local administration may at times be at fault. But the root of the trouble would seem to be that the Home Guard is a movement which can reach reasonable proficiency in the arms with which it is furnished in a relatively short period. Provide it with more advanced arms, enable it to co-operate on manœuvres more frequently with the Regular Army, and there will be few complaints, however long the hours its members are called upon to serve. But to force men, whose time is already fully occupied, to become clock-watching automata is to endanger the efficiency and the keenness of a movement which has earned more sympathetic and more intelligent treatment.

NOTES OF THE WEEK

Surrender?

It is good news that the Government intends to deal with the coal problem as a whole, and not piecemeal. Plans covering both production and consumption, and the organisation of the industry will be submitted to Parliament after Whitsun. The target for the industry is efficiency, and the proper method is probably the appointment of powerful and competent district controllers to enforce efficiency, under the supervision of a small board, also chosen for its competence and not for its representative character. It is very bad news, however, that the introduction of rationing (which has not even yet been decided) will be correspondingly delayed; and very bad news indeed that the Government is likely to defer, on the kind of rationing to be adopted, to the views of a phalanx of Conservative back benchers, that is, to some of the most unprincipled, most unintelligent, and most arrogantly opinionated opposition that even this House of Commons has ever witnessed. Every item in the sordid and disingenuous criticism that has clogged Parliament and the Press for three weeks, has strengthened Sir William Beveridge's original case, which he restated with dignity and lucidity in the *Times* on Thursday. It is only necessary to quote the main points of his letter to show to what lengths the combination of stupidity and vested interest represented by the 1922 Committee has gone to confuse the issue:

1. Rationing is not a means of reducing supplies; it is a means of ensuring that whatever supplies are available are shared fairly.
2. Rationing of food is a means of keeping all people sufficiently fed; rationing of fuel is a means of keeping all people sufficiently warm.
3. Once shortage of any essential article is in prospect, the Government cannot escape responsibility for ensuring that it is distributed according to need.
4. To reduce consumption proportionately all round by reference to a datum period is inequitable; that is one half of Sir Arnold Gridley's rationing scheme—for gas and electricity.
5. To have traders to determine the rations to be allotted to their customers is indefensible; that is the other half of Sir Arnold Gridley's scheme—for coal and coke.

6. Last winter many householders went unduly short; next winter the demand for coal in industry will be materially increased.
7. Of course efforts to increase production of coal are required in any case.
8. Unfortunately, with a single exception, all suggestions that can be made for increasing production . . . are highly controversial or highly speculative or both.
9. If the Government and Parliament between them are not able to agree upon an effective and just rationing scheme, they must, in the national interest and for the maintenance of public morale next winter, agree upon that last method [returning men now in the Forces to the mines], even if it means bringing back to the pits nearly every skilled miner in the Forces, irrespective of his unit and rank.
10. Plans for next winter's fuel are already overdue. One of my critics in Parliament described it as frivolous of me to have prepared a scheme of fuel rationing in a month. I can only reply that this was the pace at which we learnt to work for victory in the last war.

It may be, of course, that Whitsun will see an effective and just rationing scheme, as well as a bold plan to re-organise the coal industry, which is the double step sense and necessity demand. But the omens are not good. Only if the Government had adhered firmly to the Beveridge scheme, and introduced it at once, and then proceeded to reorganise the industry, would any proof have been afforded of the right intentions. At least, if an unjust and ineffective scheme of rationing does emerge, the President of the Board of Trade, to say nothing of the Lord Privy Seal, should resign at once.

The Political Scene

Four more by-elections are pending. It will be interesting to see whether the next few weeks bring answers to the two chief questions which the recent infiltration of Independents has aroused. Will the fact that worthy candidates must be found to fight Government seats in itself break the bonds of caucus control on the official side? Will the guerrillas, still riding around in small bands, coalesce for their mutual advantage against Government candidates? Probably,

on the Government side, the caucus in threatened seats will have to give way to the anxiety of party leaders in the Government to stop the rot. The chief obstacle seems to be that the party leaders cannot agree either among themselves or with their respective followers on whole-hearted backing for official candidates. On the side of the guerrillas, there is a mixture of motives. There is a general realisation that the hard-shelled cores of party misrule are now being invaded, and that this trend conforms with both the wishes and the needs of public opinion. Only by party reform now can political revolution at some later date be surely staved off. But the question is which persons are going to take advantage of the trend. Well forward in no man's land is Mr W. J. Brown, casting round here and there—indeed, if various reports are true, everywhere—for companions in his campaign for power. In the dim distance behind, near the base, there are all sorts of other figures, some of them much more eminent even than Mr Brown, who perhaps see in the demagogue's progress a chance for self-expression. On the flanks, there are men of good will, men of good intentions and men of good ideas, who have still to decide whether the right way to make the new world is to convert and lead the many or to penetrate the vital places of political and administrative power as a kind of élite or samurai, pledged to save the people from Hitlers and Horatio Bottomleys, as well as from Baldwins and Chamberlains and MacDonalds. No forecast can be attempted. The present parties must go if better is to come. This is a condition of reconstruction. The progress of dissolution is at work, but nowhere, on or beyond the horizon, has there yet appeared any man or any group of men with the ideals, the programme and the methods needed to bring about the desired transformation.

Confusion in France

An indescribable confusion reigns over the French scene. Madagascar and Martinique are like sunlit rocks jutting out of black, yeasty waters of muddle and contradiction. There at least one knows what is happening—but nowhere else. Ultimately, the French situation depends upon the action and inter-action of five different and contradictory pressures, each possessed of a certain physical strength and commanding certain loyalties. First there are the United Nations. Their desire would be to see the French Fleet and the French colonies collaborating to the full in a victory over the Axis. They are backed by a body of Frenchmen—the Free French—whose goal is exactly the same. In a curiously parallel position are the third "pressure group," the Germans. They, too, are bent on securing the full collaboration of France, the French Fleet and the French Empire. They, too, can count on the unequivocal support of a group of Frenchmen—true, a very small group—the out and out collaborationists of Paris. The Axis position is a little less clearcut than that of the United Nations, because Italy does not want collaboration, but territorial concessions. However, Italy's only significance in the French context lies in the extent to which the Germans make use of her claims to put the screw on Vichy. In between these two main and two subsidiary groups lies the great mass of Frenchmen, the fifth element in the mélange, whose fundamental desire is almost certainly to be left alone. Marshal Pétain's policy of neutrality, like the Third Republic, "divides men least." This is not to say that an active minority—the saboteurs—are not Free French in sympathy although they are still in France. It does mean that a majority of the French support passivity and dislike the British only less intensely than the Boches. It is the pressures and tensions between these groups that produce the incredible confusion, for neither side is strong enough to force the issue. For example, the United Nations have not the military power to take over French North Africa, nor is the Free French movement sufficiently attractive to rally the colonial army and civil service to the cause of renewed resistance. Similarly, Germany's current military commitments are too great for the time being to permit of a frontal attack on Morocco and Dakar or the "reconquest" of Syria. At the same time, Laval and the collaborationists cannot win over the French to a policy of helping the Germans to this end. Neither the rival powers nor the rival loyalties are decisive and Marshal Pétain and his regime float between the two like a celluloid ball held aloft by two opposing currents of air. At the centre—in Vichy—an uneasy equilibrium continues. Wherever strength or loyalty are decisive, the French Empire falls away, to the Axis in the Far East, to the United Nations in Syria, in Madagascar and now, perhaps, in Martinique.

Madagascar and Martinique

Fighting is not finished in Madagascar, and there has been no unconditional surrender; but with the fall of Diego Suarez, the chief naval base, effective resistance has come virtually to an end, since there were no very large concentrations of French troops in the island and the native levies are quite unreliable. Nevertheless, it cannot for a moment be assumed that Britain's troubles are at an end. The island is three times the size of Britain; the capital is not yet reported to have fallen; and the local officials are obviously very anti-British. The refusal to accept the terms and guarantees offered by Britain—to leave French sovereignty inviolate, to transfer Vichy Frenchmen to France and so forth—suggested a temper from which all remembrance of former friendship had been banished. Hostility could turn overnight to treachery if another invader were to appear over the horizon of the Indian Ocean. And it is ominous that the Japanese Ambassador to Vichy has again seen Laval. In Martinique, the situation obviously called for less drastic action. There was no prospect of a transfer of territory, and a military occupation by the Allies was, therefore, unnecessary. The danger came rather from the subterranean usages to which this island base might be put by a complacent High Commissioner and a still more complacent Laval. U-boats are operating all along the Atlantic seaboard. A re-fuelling and reprovisioning base would be more than useful. Moreover the aircraft carrier *Béarn* and the cruisers *Emile Bertin* and *Jeanne d'Arc*, both in fighting trim, lie ready to slip from harbour; the *Béarn's* hundred American aircraft are also reported to be in perfect repair. The United States Government could not afford to leave this potential hornets' nest athwart a main channel in from the Atlantic to the Panama Canal. The area has been patrolled daily, by sea and by air, for nearly two years now; but so was Pearl Harbour. President Roosevelt has now decided to go further. Admiral Hoover and a State Department official, Mr Samuel Reber, have reached the island to negotiate direct with the High Commissioner, Admiral Robert. He is asked to take over "supreme authority" and to comply with certain American requests—the demilitarisation of the warships and so forth. There is to be no reference back to Vichy. Thus a new category of Frenchmen is on the brink of being created—one who has severed his allegiance to Vichy, but is neither pro-Ally nor officially Free French.

Table d'Utilité

The terms of the Order restricting restaurant meals, which were given by Lord Woolton on Tuesday, confirm the fear that the Government is only tinkering with the problem. Public discontent with such meals has arisen from the feeling, first, that the eaters have not to give up coupons for rationed foods and, secondly, that those who can afford to pay the high prices obtain more than their fair share of unrationed foods. To meet the first complaint, the new Order does nothing at all. It is quite true that the amount of rationed foods supplied to restaurants has been very much cut, but there seems no reason why a ban should not be placed on the pat of butter or margarine supplied with the roll of bread and the lump of sugar given with hot drinks. Even if, however, rationed foods could only be supplied on the surrender of coupons, a big cause of discontent would still remain, because the high prices now charged by luxury restaurants are mainly in respect of unrationed foods such as fish and game—meals of rationed meat are now rare. By charging these high prices, the restaurants are able to obtain a mono-

Correspondents in all parts of the World

LETTERS OF CREDIT AND DRAFTS ISSUED

poly of uncontrolled foods, because they in turn can pay high prices to the suppliers, and a black market in controlled foods is encouraged. The new Order, however, only skates round the problem. The maximum price of a meal, which must not consist of more than three courses, is restricted to 5s, and the charges to be made for dancing, cabaret, spirits and beer—but not apparently wines—will also be restricted to prevent restaurants from recouping themselves in this way. On the other hand, catering establishments, "which would not otherwise be able to remain open"—that is, presumably, most West End restaurants—will be allowed to make a house charge in addition, which will not exceed 7s 6d. Thus, excluding drinks and entertainment, a meal may still cost 12s 6d. The ridiculous part of the whole price-fixing policy is that if prices were really reduced, people would be encouraged to eat more often in restaurants than they do at present, though it is true that they would get fewer expensive delicacies. The most sensible provision of the new Order—most sensible because it does envisage an actual limitation of supplies—enables Lord Woolton to prohibit restaurants from serving fish, game and poultry on certain days in order to allow domestic consumers to obtain a reasonable share of the available supplies. But this provision is an enabling one only, and its worth will depend on how often it is enforced. The extent of restaurant eating, both luxury and British, certainly makes any attempt to control it difficult. But the best solution would surely be to bring rationed foods in all restaurants within the coupon—on a points basis—and charge the double purchase tax on all meals over a certain price. This would encourage communal feeding which is economical, and discourage luxury feeding which is not. As it is, the best comment on the new measure is provided by the announcement that the oyster is to be exempt.

The Battle of the Coral Sea

The Battle of the Coral Sea was not an isolated action, but part of Japan's systematic attempt to encircle and cut off Australia. Timor has been reinforced. Repeated attempts have been made to reduce Port Moresby, which has become a solid though beleaguered outpost of Australian defence. Anchorages have been secured in the Louisiade Archipelago, and it is believed that some of the Solomon Islands have already been occupied. The naval forces which were intercepted in the Coral Sea last week, and with whom a running battle was fought over many days, may have been the out-riders of an invasion fleet. They may equally well have been a special force detailed for the cap-

ture of New Caledonia. It is not yet certain that the Japanese intend to invade Australia; but they are determined to break the Pacific link between Australia and the United States and to leave no possibility open that the ports of Australia could be used as bases for a counter offensive. Whatever the purpose of the Coral Sea expedition, it was unsuccessful, and very heavy losses were inflicted on the Japanese—including one aircraft-carrier sunk and one damaged, one heavy cruiser sunk and one damaged, one light cruiser sunk and one damaged, and two destroyers

sunk. No battleships or transports have been mentioned, which suggests that the expedition was not designed for a large-scale landing and that the main body of the Japanese fleet has not yet been brought into action. The Japanese themselves betrayed the seriousness of the set-back by covering it up with fantastic claims of Allied losses, including the sinking of a British battleship and a heavy cruiser, whereas it seems from Mr Churchill's broadcast that only Australian and American ships were engaged. It can be assumed that the Japanese claim to have sunk—among other things—an American battleship and at least two aircraft-carriers has equally little foundation in fact. The final result of this action cannot be assessed yet. Much depends upon the relative losses: the Japanese have certainly lost more, but the Allies may have had less to spare. If the Japanese attack is renewed within the week, the action must be accounted slight; if it is delayed, satisfactory; if it is not renewed, brilliantly successful.

The Use of Gas

It is to be hoped that the German High Command will take note of Mr Churchill's warning that

We shall treat the unprovoked use of poison gas against our Russian Ally exactly as if it were used against ourselves, and, if we are satisfied that this new outrage has been committed by Hitler, we will use our great and growing air superiority in the West to carry gas-warfare on the largest possible scale far and wide against military objectives in Germany.

So far in this war, the peoples of the world have been spared the added terror of chemical warfare. True, Germany signed all the conventions outlawing chemical warfare; but neither legalism nor humanitarian hesitations have had any thing to do with the Nazis' avoidance of gas attack. Their decision has almost certainly been based on the uncertain military value of poison gas, particularly when used against armies in rapid retreat. If the Germans use gas in Russia, it will be either a last desperate expedient when every other military tactic has failed, or an effort to demoralise troops unmoved by the other horrors of war. For it should not be forgotten that gas is, primarily, a weapon of panic and not of universal destruction. There is something inherently horrible and terrifying about a death that enters by throat and lungs or the pores of the skin. But casualties inflicted by gas have normally been less serious in number and in physical damage than those caused by high explosives. Similarly, if gas were used in retaliation in the British raids on Germany, its military effect would be slight, its powers of increasing the "alarm and despondency" of the German people potentially very large. For this reason, it is well that the warning has been given. The camel's back of German home morale is not so strong that the authorities can lightly risk a last, very substantial straw. At the same time, the responsibility has been squarely pinned on the German High Command.

Counter-Attack in Burma

The resilience of Chinese military power was never more strikingly illustrated than by the recent counter-attacks against the Japanese forces in north-eastern Burma. A week ago, the Japanese armies, which had taken Mandalay and Lashio, appeared to be driving unchecked into the interior of China. There was some doubt whether the Chinese forces under General Stilwell which were reported to hold positions between Taunggyi and Loilem were still intact. Then the Japanese mechanised spearhead, which had advanced some thirty miles into Yunnan and captured Wanting on the frontier, was forced to withdraw by strong Chinese forces based on the interior. Wanting was retaken, and something very like a defeat inflicted on the Japanese at Chefang. A dangerous enemy thrust was checked only to be reinforced and resumed later. Meanwhile, the hope of activity in the rear of the Japanese forces was fulfilled by the activities of General Stilwell's army, which by a forced march retook Maymyo near Mandalay. Fighting is still taking place, and it is too early to judge whether the enemy is sufficiently strong to succeed in a fresh advance. It may, of course, have been no more than a move by the Japanese to clear the Chinese flank while the advance on India proceeds; and the Chinese forces near Mandalay, who are still cut off, may have to relapse into guerilla tactics, as indeed has already been reported. In the Chindwin valley, along which the British forces under General

Alexander are withdrawing toward India, activity has been on a smaller scale. Akyab and its airfield are now in Japanese occupation and, significantly enough, the first attacks on Chittagong have taken place. The RAF for their part have bombed the Japanese aerodrome at Magwe from India. The campaign as a whole has reached a critical phase. The question is whether it is the enemy's intention to attempt to force an entry to Free China or to turn the major offensive against India. In any event, Chinese resistance on the Burma Road provides an example and an inspiration for the forces who guard the gates of India.

Groups or Trusts?

Public debate is beginning to centre on the relations between the state and industry after the war; and it is right (as argued in an article on page 669) that this issue should be decided in the open. The danger is that it may be settled behind the scenes. There is a possibility that new economic dominions may be established, like the British Empire, in a fit of absence of mind. A warning has been given by recent discussion of the three hundred export groups, each controlling the trade of anything from a handful to over a hundred companies, which came into being to organise the export drive which is no longer necessary. The point is that these bodies are potential centres of monopoly and exclusion. The argument advanced in some quarters that they are needed to carry through the rationalisation of manufacture and merchandising for export is in some ways dangerous. Britain's only strength in export trade in the future will lie in having a specialised and highly adaptable, and almost endless range of highly finished articles, which must be produced by relatively many firms. There is no reason in the trading interests of the community why new centres of economic power should be created by the elevation of export (and, it is suggested, import) groups to control and determine trade policy. One example of what can happen is the Jewellers War Production Group, formed by forty of London's leading manufacturing silversmiths and jewellers. In so far as this Group gives guidance to firms on the best means of producing wartime articles, its existence is very valuable. But it is disturbing to learn that this body, which is no more than a band of co-operating industrialists, has what is called a "group leader," and still more disturbing to know that traders are "queueing" for membership. Here is the very type of co-operative and exclusive organisation. The export groups are far more than this; but they, too, carry within them the same dangers, which must be watched with the utmost care. Industrial self-government of this sort by the back door would be a disaster.

Chemists Again

The controversy about the sale of drugs has started once more. The Minister of Health's attention has been drawn to the increased sale of pre-packed drugs in chain stores and to the competition to qualified pharmacists resulting from the rapid increase in the sale of drugs by shopkeepers who do not employ trained men. Mr Brown is watching the position. The *Pharmaceutical Journal* is not satisfied. It is emphasised that there may be a shortage of chemicals and drugs, and that the sale of aspirin, cascara, glycerin, bismuth and so on, on bazaar counters will bring about a dearth. The argument is that the Minister of Health should take steps to stop "this depletion of stocks of our valuable drugs." That steps should be taken to limit sales is, of course, conceivable, but that they should be taken by banning cheap sales in one kind of shop is intolerable. It is surely possible for stocks to be limited without making war conditions an extra lever for the assistance of vested interests.

Colonial Administration

Several constructive proposals were put forward by Lord Trenchard in a debate on colonial administration in the House of Lords last week. The first was for a grouping together of different colonies into large administrative units under Governor-Generals. Thus, there would be an East Indian dependency, a West Indian, an East African and a West African. Each dependency would be more autonomous in its administration than at present, and the Colonial Office, which would no longer be concerned with the detailed affairs of over 50 colonies, would devote itself more to major

questions of policy and planning. There is clearly a great deal to be said in favour of this proposal, which has frequently been made of late, because history has shown that, both economically and politically, progress takes place more quickly when small units have amalgamated. But the dependencies that grouped together to form the Dominions, which are generally cited as the best example of this tendency, were geographically compact. In the present colonial empire, the reverse is generally the case. As Lord Moyne pointed out, the chain of British colonies in the Caribbean is over two thousand miles long. The same distance separates the western colony of British West Africa from the eastern, and there are foreign possessions between each. East Africa is more compact; but here the political difficulties caused by the existence of a white settler class in Kenya and Southern Rhodesia are, at present, an insuperable obstacle. Moreover, amalgamations would hardly be successful without the co-operation of other colonial powers with possessions in the same areas. This question was hardly touched on in the debate, but the opportunity now, when such powers have their seats of Government in London, should not be missed, and a precedent has already been set with the establishment of an Anglo-U.S. Commission in the Caribbean. Lord Trenchard's other proposals were mainly concerned with the Colonial Service—with extending the field of recruitment, especially to Africans and other colonial people themselves; greater interchangeability between the staff of the Colonial Office and the Service; and the establishment of a Colonial Staff College where refresher courses would be taken. Almost all his proposals were well received in the House and were given a sympathetic reply by the Colonial Secretary, Lord Cranborne. It is astonishing, in fact, how much agreement in principle there is over what should be done in the colonial empire. The difficulty is to get even a small part actually done.

The Press

In his broadcast, Mr Churchill told of his disquiet about speculations in the newspapers concerning strategy. He told of his relief when Madagascar was attacked without the uninformed punditry of the newspapers having revealed the secret, which they did not know, to the enemy. Mr Churchill should perhaps take heart from the certainty that if, during the three months in which the Madagascar expedition was preparing, there had been no comment about Madagascar in editorials or in the columns of the "military experts," the enemy would have been most surprised and very much concerned to know the reason. A rider to this argument of the Prime Minister's is provided by a recent speech of Sir Stafford Cripps, in which the Lord Privy Seal contrasted the freedom of the British Press with the diametrically different state of affairs which he had found recently in another country, which he punctiliously left nameless. There are two remarkable features about the British Press in wartime. The first is the small extent to which official powers have had to be exercised. The second is the equally small extent to which official trust has been abused. Many charges can be drawn against British newspapers. But they are none of them criminal; if and when such charges do lie, the paper should, of course, be suppressed at once. The dictum that the Press can do no wrong is nonsense. But, in fact, where there have been false reports, wrongheaded comments, wild speculations, and so on, the cause has been not treachery or vice, but simply the same sort of stupidity and incompetence that afflict every industry and are plain enough in the Press at any time. The wit who said that, in view of what the British

journalist would do unbribed, there was no need to bribe him, drew attention to both the strength and the weakness of the newspaper industry—in peace or in war. Sometimes, it fails to do a job of work which matches its traditions. Sometimes, as in the period immediately before the war, concern for the advertising item in its revenue account, warps its journalistic judgment and impedes its sense of responsibility. But, uniquely among all the newspapers of the entire world, British newspapers can neither be intimidated nor bought. The fifth column has never succeeded in securing even a toe-hold in the British Press, and, by and large, allowing for the mistakes which editors and journalists of varying degrees of competence usually do make, it can safely be said that the best way of using the Press in the war effort is to leave the newspapers alone to do what they have done in the past two and a half years.

Melita Effulgens

There are signs that a new phase is approaching in the aerial battle over Malta. The fighter strength of the R.A.F. in the island has been substantially reinforced. This increase in strength came as a shock to the Axis aircraft, who suffered an important defeat in the course of sustained raids last week-end, when no fewer than 112 planes are officially reported damaged in three critical days. This news has to be read in conjunction with Mr Churchill's statement last Sunday that "it looks as if a lot of enemy aircraft have moved eastward." It is possible that the resignation of General Sir William Dobbie will prove to have coincided with the close of the chapter of purely defensive resistance. The new Governor and Commander in Chief, Lord Gort, has taken over at the moment when the tide of the battle over Malta may have definitely turned. Whatever part Malta and its gallant people and garrison may be called upon to play in the strategy of the future, their ability to do so must be attributed primarily to the courage and tenacity of General Dobbie. His ability to infuse a determination to resist into a people who have not only suffered the most sustained air bombardment in history, but who were, at the outset, inadequately defended, is as striking a personal triumph as it is a vital contribution to the successful conduct of the war in the Mediterranean.

Family Allowances

The Chancellor of the Exchequer's White Paper (Cmd. 6354) on family allowances appeared on May 8th. No opinion is expressed about the desirability of paying allowances; but, at the beginning of the memorandum, the Chancellor summarises some of the arguments in their favour, and suggests some questions on which decision would be required. The main interest of the memorandum is its review of

The practical questions which would have to be dealt with if such a scheme of cash allowances were decided upon.

	Every Child in Family	Second and Subsequent Child in Family	Third and Subsequent Child in Family
Estimated number of children (mid-1941)	Millions 10.1	Millions 4.5	Millions 1.8
Estimated number of families	5.6	2.7	1.1
Estimated gross* annual cost of allowances payable to parents:—	£ millions	£ millions	£ millions
(a) To all parents	132 (125)	58 (55)	23 (22)
(b) Compulsorily insured for pensions or with incomes of £420 or less	124 (117)	55 (52)	22 (21)
(c) With incomes of £260 or less	111 (104)	49 (46)	19 (18)
Net cost of scheme linked with income tax at present rates:—			
(a) First year	110	51	21
(b) Subsequent years	64	39	19

* Net figures are given in brackets.

All the schemes discussed have been worked out on the basis of an allowance of 5s. a week for children below the age of 15 or receiving full time education; and on the supposition that allowances might be paid, alternatively, for (a) every eligible child, (b) all but the first eligible child in each family, or (c) all but the first two eligible children in each family. The table above shows the official estimates of the costs of non-contributory payments, financed by general taxation, for schemes of this varying scope. Savings on payments of allowances already made to certain classes of children are estimated at £7 millions (including

£3½ millions saved on billeting payments), if all children are included, £3 millions where the first eligible child in each family is excluded, and £1 million where the first two eligible children are excluded. In determining these offsets, payments for children of members of the armed forces, which are part of their pay, have rightly been excluded. An offset has been made, however, for sums already spent from national funds in respect of unemployment insurance, contributory pensions, payments by the Ministry of Pensions, and need payments, as well as billeting payments. In the case of the first three, payments are made for children because of special conditions which attach to their parents; at least part of such payments would have to be superimposed on any allowance received under a general scheme of family allowances. The memorandum gives the impression that a contributory scheme would be the least satisfactory of those discussed. The contribution could only be levied on employed persons and the amounts required would be 2s. 8d., 1s. 2½d. or 6d. a week, according to the scope of the scheme. In an annex to the White Paper a scheme linking family allowances to income tax is described. The sole possibility that is examined is that family allowances should be paid only where the financial benefit derived from them would be greater than that obtained from the income tax relief in respect of children. The net costs of paying family allowances on this basis are shown in the table. The Chancellor's objection to a scheme linked with income tax is emphatic, on the grounds that if income tax were reduced, the amounts payable in family allowances would be greater. Nowhere has the Chancellor considered the saving which might be made if, in conjunction with a universal system of family allowances, the income tax relief in respect of dependent children were to be abolished. The gross amount on which such relief was given was just over £85 millions in 1936-37, when £60 was allowed in respect of each child under 16—or over 16 if continuing full-time education. In all, the memorandum is seriously disappointing. The impression is that, for false reasons of economy, family allowances are to be shelved; and while the pounds, shillings and pence are being counted, the main prop of a new and better social order will be rejected.

Shorter Notes

The following table, compiled from a parliamentary answer, shows the number of deaths from tuberculosis in Great Britain since 1938:—

	1938	1939	1940	1941*
Respiratory Tuberculosis				
Males	13,841	14,208	15,589	15,631
Females	10,022	10,051	11,108	11,120
Tuberculous Meningitis				
Males	1,116	1,061	1,199	1,463
Females	1,065	1,000	1,172	1,470
Other forms of T.B.				
Males	1,580	1,579	1,668	1,705
Females	1,347	1,250	1,411	1,456
Total deaths	28,971	29,149	32,147	32,845

A note on page 641 of *The Economist* last week stated that the proposed cut of one-eighth in the domestic consumption of fuel would save 1,000,000 tons of petrol. This should have read 1,000,000 gallons.

In reply to a parliamentary question, Sir James Grigg has revealed that 70 per cent of all officers over 55 years of age are being retained as a result of the recent Army Command Instruction imposing a comb-out.

The post-war credit of 6d a day for men in the armed forces will be exempt from income tax.

Total casualties in the armed forces of the British Empire in the first two years of war were, according to a parliamentary answer, 48,973 killed, 46,363 wounded, 58,458 prisoners of war and 29,756 missing, making a total of 183,550. Of this total, 14,687 were officers and 168,863 other ranks.

AMERICAN SURVEY

Loyalties or Royalties

(From Our Washington Correspondent)

April 17th

"NO longer will the management of foreign-owned overseas enterprise be able to assume that its responsibility is exclusively to its shareholders. On the contrary, if foreign investment is to continue it must recognise the responsibility which it has to the country of domicile and to the people of that country."

These sentences were written by an official of a large American corporation with very considerable holdings in Germany in a book published in the fall of 1940. The recent series of consent decrees secured by the Department of Justice under the anti-trust laws have created the impression that a number of similar firms have been so adequately fulfilling obligations to domestic stockholders and foreign sovereigns as to menace the vital interests of the United States.

American participation in international cartels has been given a peculiar form by the existence, since 1890, of laws prohibiting

every contract, combination in the form of trust or otherwise, or conspiracy, in restraint of trade or commerce among the several States or with foreign nations

declaring it to be an offence

to monopolise any part of the trade or commerce among the several States or with foreign nations.

Because of these restrictions, American business men have not been able to take the initiative in the organisation and management of cartels. But they have been able to participate in their operation. The technique used has been that of patent agreements, whereby exchange of information with foreign firms was arranged, and understandings about where that information was to be used by the participating firms were included in the agreement.

Through patent agreements, American connections with a number of German firms, outstandingly with the all-pervasive *IG Farbenindustrie*, have been operative for some years. By amassing evidence of the extent to which these arrangements constitute a restraint of trade—and of trade essential to the war programme of the United States—the Department of Justice has brought a series of indictments. It has secured a number of consent decrees from prominent companies, whereby the companies agree to reorganise their affairs in a specified manner without the case being brought to trial.

Government Indictments

In March, 1940, an indictment was brought against (and a consent decree subsequently worked out with) Bausch and Lomb, producers of optical goods, including range finders, bomb sights and so on, concerning the operation of the agreement made with Carl Zeiss and Company shortly after the close of the last war. This agreement went further than most. Bausch and Lomb paid royalties to the Germans, whether or not the article sold was patented, and including sales to the United States Government—thereby furnishing the Germans with United States procurement statistics. In May, 1941, a decree was obtained covering fertiliser nitrogen. On September 5th, three decrees covered Bayer aspirin, Alba pharmaceutical products, Synthetic Nitrogen Products Corporation. This group attracted the first widespread publicity. The Bayer aspirin case concerned the operations of Sterling Products Company, whose history dates back to the not-too-fragrant period of the Alien Property Custodian of World War I; some of its present personnel was formerly in that office. Negotiator of the consent decree was Thomas Corcoran, formerly of the New Deal Kitchen Cabinet, currently a corporation attorney in Washington; allegations that its relatively mild terms were the product of political pressure were sufficiently persistent for the Department of Justice to hold a special press conference on the subject.

In October, an indictment was brought against General Electric Company, Krupp and others, for restraint of trade in hard metal compositions and products. Mid-December, after Pearl Harbour, saw a considerable group of indictments brought mostly in the field of chemicals, and notably against the General Aniline and Film Corporation, formerly known as American I.G. Chemical Corporation, with a staff closely allied by ties of actual kinship to the key officers of I. G. Farben, of Germany. (Since the filing of this indictment the firm has been taken over by the United States Government and a new board of directors installed.)

Standard Oil

Most spectacular of the decrees to date is that concerning Standard Oil of New Jersey. Domestically, Standard Oil has been a popular symbol of the kind of manipulative capitalism against which the Sherman Anti-trust Act first expressed popular revolt. The original trusteeship, set up by the elder Rockefeller in 1882, was dissolved by court proceedings, only to reappear in 1897 in the form of a corporation (Standard Oil of New Jersey). It was prosecuted a second time, and in 1911 dissolved into thirty-three independent companies—whose "independence" was commented on with grim satisfaction by Gary of U.S. Steel—

"you can't unscramble eggs." In an effort to keep the New Jersey chickens from coming home to roost, various of the other Standard Companies are currently running newspaper advertisements urging that they should not be confused with the indicted company.

In addition to its background in American history, the New Jersey Standard Oil case attracts public interest, because one part of the indictment (which, as a whole, deals mostly with petroleum products) discloses the fact that while Standard under a patent-exchange agreement, gave I. G. Farben the results of its research in butyl rubber, I. G. Farben, pleading interference by the Nazi Government, did not give Standard its results in buna rubber. At the same time, Standard attempted to slow the development of synthetic rubber by other companies in this country.

The relationship between these agreements and our most acute war shortage explains popular resentment at the letter sent from one Standard official to another on October 12, 1939, describing a conference with I. G. Farben officials and containing the sentence—

We did our best to work out complete plans for a *modus vivendi* which would operate through the term of the war, whether or not the US came in. . . . It is difficult to visualise as yet just how successful we shall be in maintaining our relations through this period without personal contacts.

The intensity of feeling about American business dealings with the enemy is witnessed by the fact that three Senate Committees are now holding hearings related to the issue. Mr Thurman Arnold, head of the Anti-Trust Division of the Department of Justice, and Mr W. S. Farish, president of the Standard Oil of New Jersey, have just given testimony before the Truman Committee. Senate Bill 52303 expresses the aim of some Senators to open patents for use during the war, and perhaps institute a reorganisation of the whole body of patent law, and Senate Bill 2438 proposes registration of all agreements made between American firms and foreign countries.

Meanwhile, the companies have been making their side of the case as vigorously as the Department of Justice. The claim is made that the exchange of patents with foreign firms has made research and "knowhow" available to this country that would not have been obtainable any other way. The companies are also making their case in the form of a counter-attack. Standard Oil meets the charge of disloyalty by laying the onus of foreign relations on the Government:

So long as this country maintains normal relations with the rest of the world, the company must also carry on its operations in a normal manner. The company cannot constitute itself judge of the rights and wrongs of international problems. It cannot impose embargoes nor break them, these being the functions of government, not of industry.

At the same time, the companies argue, not unnaturally perhaps, that action against their agreements is not a desirable function of Government at this juncture. They stress the time of high officials required to prepare a defence against government indictment. They give as their reason for accepting consent decrees:

We must settle this case at any cost as quickly as possible so that all our time can be entirely devoted to the defeat of the Axis powers.

In the light of these developments, what of the future of international cartels, of the kind of world economic agreement in which firms of all the main industrial nations have participated? If the abuses connected with the practices of the past have been sufficiently demonstrated what procedure is desirable from now on? The matter presents a major piece of agenda for economic government on a world scale.

American Notes

The Good Neighbour in Action

The struggle between the Axis and the United Nations is mirrored in the internal policy of every Latin American republic. In all of them, if the Government is for democracy, the Opposition is for the Axis, and vice versa. Mr. Henry Wallace has even gone so far as to prophesy a German-inspired insurrection breaking out below the Equator, backed by German agents and covered by Axis and Japanese air and sea power. Perhaps this goes too far. The relatively ineffective armaments, the scattered populations and the great distances of the South American scene

would play into the hands of a determined and ruthless Fifth Column. The United States Government is aware of all this, and is doing its utmost to press forward with a policy of good neighbourliness and hemisphere defence. Arrangements are completed for joint bases in Brazil. Although President Baldomir had to suspend the constitution and outlaw the Herrarist Opposition in the process, Uruguay, too, has provided facilities for joint air and naval bases. President Prado of Peru is just completing a very successful visit to Washington; and the President Elect of Colombia will be the next distinguished visitor. At the same time, measures of economic solidarity are being worked out. South America's chief problem springs, of course, from the disastrous disruption of foreign trade brought about by the war. The United States is, to a large extent, making this good by its massive purchases of strategic raw materials; but as usual shipping is the bottleneck, and U-boats are taking a steady toll of the very small shipping resources of the Latin American Republics. The United States is attempting to meet this by continuing with its purchases and leaving the materials in store in the various countries until shipping space becomes available. To all this work of political and economic collaboration, Argentina still holds aloof. There is even a chance that it will offer a terminus to the Italian Trans-Atlantic Airline, LATI, which has been turned out of Brazil. Argentina is the danger spot, particularly if a direct air-link with German Europe were to be established. It is no coincidence that a great many of the Axis agents, turned out of other states, are making their way there.

Transport Crisis

The strain on domestic transport is serious and certain to grow. Goods are beginning to pile up at plants for lack of transport. To cope with the problem, the Office of Defence Transportation has been given sweeping new powers, including control over all rubber-borne vehicles. Mr. Eastman, Director of the ODT, has the power to forbid pleasure motoring and, if necessary, to requisition private cars. The ODT will have the final word on the allocation of whatever amounts of rubber and petrol are found available for civilian consumption. The main causes of the transport shortage are the growing volume of war production and the necessity of conserving rubber and petrol. Carloads of railroad freight in 1941 were 16% above 1940, but this understates the expansion, for ton-miles increased by one-fourth, the result of transporting larger volumes of war goods over greater distances. Freight ton-mileage for the year was the largest on record. Freight carried by Class I lorries for the first six months of 1941 was 30% higher than the figure for the first six months of 1940. The reduction of coastal shipping has thrown new burdens on the internal transport system; and the recently completed inquiry into transport labour has disclosed a substantial man-power shortage. The consolidation of control over all forms of transport in one agency was a prerequisite to any adequate policy. The new powers are already being energetically applied. Local carriers must cut their mileage by 25% by curtailing deliveries. Freight cars may not be used to transport lots of less than six tons. Tank cars may not be moved less than 100 miles without specific permission, unless they are transporting oil to the eastern seaboard. Grain shipments over the Great Lakes are prohibited to make room for iron ore cargoes. The extension of petrol rationing seems likely to release transport facilities. Hours are being staggered to spread rush-hour travelling. It is realised that an internal transport shortage is second only to the shipping shortage as a possible immobiliser of the war effort.

The Yardstick of Living Costs

The concept of parity for farm prices, which has been an outstanding feature of the New Deal since 1933, may prove a major stumbling-block in any attempt to reduce the American standard of living in conformity with the decrease in supplies of civilian goods. The President has asked for legislation permitting farm price ceilings to be set at 100 per cent of parity, rather than 110 per cent; but as parity prices increase with rises in the cost of living, farm ceilings will increase automatically, unless the cost of living is frozen more successfully than seems likely at present. On the other hand, President Roosevelt has said that increased wage rates, even to compensate for a rise in the cost of living, as in the shipbuilding wage negotiations, are

incompatible with the national interest. This discrimination in the use of the cost of living to adjust incomes is unjust and illogical. There are already some reports from the Middle West that there is a growing schism between farmers and wage-earners. This is presumably due to exaggerated stories of high wages and short hours in war production; there appears to have been a highly organised campaign to spread suspicion of labour, particularly in the west. But if a strict control of wage rates is instituted—and legislation on this subject is still being urged, even by members of the Administration, like the Price Administrator—the shoe may be on the other foot. Unfortunately, this is an election year, and the political weight of the farmers is sufficiently great to make any reconsideration of the concept of parity prices pretty well out of the question.

The Negro Semi-Citizen

It is news—and good news—that the Navy Cross has been awarded by President Roosevelt to Dorie Miller, the negro mess attendant who, when the first bombs fell on Pearl Harbour, raced up from his galley and manned one of the machine guns that, by Navy regulations, no negro is allowed to touch. It is good to hear that an AFL local branch has decided to let negroes work in San Francisco defence industries, and that Ford is now accepting negro apprentices. But these few swallows do not make a summer. The Navy still excludes all negroes from the service except as messmen; prejudice is rife in the army, despite the excellent record of negro soldiers in the last war; and discrimination against negroes in industry and Government service remains the rule, not the exception. It is not surprising that the 13½ million American negroes are "angry, resentful, and utterly apathetic about the war." In spite of a Presidential order last year forbidding colour discrimination in defence industries, employers refuse to hire negroes. Prejudice is not confined to management; white workers threaten to walk out when negroes are brought in; and 24 national and international unions, ten affiliated with the AFL, refuse to accept negro members. In March race riots were reported from Detroit over the admission of negroes to a Government housing project. Of the unemployed, 800,000, or 20 per cent, are negroes, although they make up only 10 per cent of the population. Where negroes are employed it is usually in menial jobs, such as waiters, cleaners or janitors, and even now they are given less opportunity to undertake training than whites. Of the 5½ million coloured workers in 1930, nearly 2 millions were in agriculture, generally as tenants and sharecroppers in the South; 1½ millions were in domestic service; of the million in industry most were classified as unskilled. As the manpower shortage grows, negroes will have to be increasingly used in industry and the Services, but making a virtue of necessity will not win the enthusiasm of those

who feel that this is a "white man's war." Speaking about the Navy's colour bar, Wendell Willkie recently denounced it as "an injustice which makes a mockery of all our fine words."

Dies Lives On

The Dies Committee to investigate un-American activities created in 1938 was extended for another year by a vote of 331 to 46. It will go down in history as the body which suggested that Shirley Temple and James Cagney were Communist fellow-travellers (an accusation subsequently retracted). Moreover, its activities are sinister as often as comic. Among the outstanding liberals whom Dies has tarred with the Communist brush are Mrs Roosevelt, Vice-President Wallace, Supreme Court Justices Murphy and Jackson and Secretary Ickes, as well as many other less-known, but equally sincere, democrats. The Committee has brought out "White Papers" and "Red Papers"; but its interest in Fascist groups has been listless compared with its enthusiasm for unearthing "Communists" in the New Deal. Chairman Fly of the Federal Communications Commission has testified that Dies is the most warmly praised American quoted by Axis broadcasts, and Representative Eliot declared "The Dies Committee's definition of 'subversive' is so fantastic as to defy belief. . . ." A vote against the Dies Committee is a vote for responsible government. Congress has never passed a Dies-sponsored Bill; but it is a pity that only 46 men could be found with the political courage to go on record against the Committee.

Shorter Notes

The Office of Price Administration has announced that the basic petrol ration, starting on May 16th along the eastern seaboard, will be three gallons a week per car. Five types of ration card will be issued, ranging from "A" cards for pleasure driving to "X" cards for essential workers such as doctors and nurses, who will receive unlimited supplies.

The use of iron and steel in 400 civilian products has been restricted, and after 90 days will be prohibited altogether. In effect, this will mean that iron and steel will be entirely reserved for war goods, and many plants will be forced to convert to war production.

Austerity note: The WPB has recommended to ice cream manufacturers that plants restrict their output to four grades for butterfat content, and that each grade be limited to 10 flavours.

THE WORLD OVERSEAS

Canada and the United Nations

(From Our Ottawa Correspondent)

THE Canadian outlook has transformed with the spread of Japanese aggression in the Western Pacific and into the Indian Ocean. Unlike Australia, Canada already possessed well-defined and known military and economic understandings with the United States before the attack on Pearl Harbour. Mr Curtin, Prime Minister of Australia, said on March 14th: "I say on behalf of the Australian Government that we look to America as the paramount factor on the democracies' side in the Pacific." Canadian-American relations had already ripened to the stage in April, 1941, when Mr Mackenzie King could say: "The link forged in the Ogdensburg Agreement is no temporary axis, formed by nations whose common tie is a mutual desire for the destruction of their neighbours. The Hyde Park Declara-

tion is, I believe, a further convincing demonstration that Canada and the United States are indeed laying the enduring foundation of a new world order, an order based on international understanding, on mutual aid, on friendship and good will."

These differences in relation to the United States have been thrown into sharp relief in Ottawa by the recent visit of the Hon. H. V. Evatt, Australian Minister of External Affairs. Australia is now finding a new bearing in orientation to America. Canada grew up as an American nation within the British Commonwealth. The current phase of Canadian-American relations, dating from the 1938 declarations of mutual assistance expressed by President Roosevelt and Mr Mackenzie King, and extending through the military agreement of 1940 and subsequent economic

understandings which have brought a steadily increasing measure of practical co-ordination, is part of a continuing policy.

Throughout this period, Canadian war plans have been evolved on the thesis that Canada's participation lies chiefly in the Western European theatre. It is a remarkable thing that, despite a joint defence treaty with Washington, despite the joint economic agreement of Hyde Park, and such practical working committees as the Joint Economic Board and the Raw Materials Board, the Canadian Army has been created solely as a force to operate with the British Army in the defence of Britain; the Canadian Air Force has been built primarily for western Europe operations; and the Canadian navy has been developed mainly to participate in the battle of the Atlantic. This is far from the global warfare theories expounded in Washington.

The visit of Dr Evatt provided a convenient point at which to appraise the shift of Canadian war plans from the limited western European thesis, upon which they have developed, to the wider thesis of global war. In practice, the change can be noted in Canadian adherence to the centralised machinery of the United Nations now being created rapidly in Washington. Dr Evatt spoke of "the higher direction of the war." He said: "Central in these considerations are matters of supply, munitions and shipping which must be associated with the general strategic position of the United Nations . . . Canada has fulfilled very heavy commitments to the United Kingdom and other countries. . . I believe that we shall completely overhaul the present methods of pooling and allocation as between the Governments so that the strategic authority will itself direct the apportioning of munitions, supplies and shipping by reference solely to the supreme war requirement, that is, defeating the enemy in every crucial theatre of operation."

Ottawa and Washington

Canada is a member of the Pacific War Council, and as a token of its faith, the Prime Minister attended a session of the Council in Washington in person the week after Dr Evatt's visit. The Canadian Government recently appointed Major-General Maurice Pope as the permanent liaison officer for Canada in the premises of the UK-US Chiefs of Staff Committee in Washington. There is talk of seeking full membership in the Munitions Assignment Boards in London and Washington, and possibly in the joint shipping board as well, since Canada is producing a million tons of merchant shipping this year. The Dominion is proceeding with speed to assume obligations in the world hegemony of the United Nations. The views of Dr Evatt were received with warm approval in Ottawa. His request for Canadian assistance came as from one United Nation to another, rather than as from one Dominion to its sister. The willingness of Ottawa to submit the higher strategic decisions, by which the use of Canada's resources will be determined, to the machinery of the United Nations obviously fulfilled all that Dr Evatt had hoped to find.

That Canada's resources of manpower and munitions should be openly recognised as at the disposal of the centralised councils beginning to operate in Washington has not, in any way yet apparent, modified the Canadian plan of expanding its army in Britain. The belief is held in Ottawa that the western European theatre remains the best theatre of operations for Canadian land forces. There is no suggestion of organising expeditionary forces to any other war sector. Obviously, any pooling arrangement must take account of previous dispositions, and that leaves Canadian military plans as they were. Participation in the Washington councils means at present, as far as Canada is concerned, the pooling of munitions. As far as relations with Australia are concerned, it means that Australia's claim to a greater share of the Canadian munitions surplus will be determined in the light of strategy. That, as Dr Evatt made clear, is satisfactory to Australia.

Madagascar

[BY A CORRESPONDENT]

May 12th

MOST vital to Metropolitan France in normal times are the ports of French North Africa—Casablanca, Oran, Tunisia and Bizerta. Other important points held by France on world trade routes are the ports of Dakar in West Africa, Diego-Suarez in Madagascar, Jibuti in North East Africa, Saigon, Cam-Ranh and Haiphong in Indo-China, Papeete

in Tahiti (Oceania) and Fort-de-France in Martinique. Since the capitulation of France, the fate of Vichy Dakar has been a matter of deep concern to the United Nations and Latin America. Indo-China is dominated by Japan; Papeete in the Pacific owes allegiance to General de Gaulle; and the status of Martinique is now being reviewed by the two parties concerned—the US Administration and the French Commissioner of the territory. When the Japanese laid open the Indian Ocean early this year, the fate of Madagascar was in the balance. If this, the third largest island in the world, had fallen into Japanese hands, it would have imperilled the life-lines of the United Nations. General Smuts declared early in February that "the greatest work which was open to us was to keep the Cape route open and to give swift passage to ships, thus keeping open the 'route to victory.'"

Madagascar almost equals in area France, Belgium and Holland. Separated from the mainland of Africa by the Mozambique Channel, the island stretches from Tanganyika in the north to the Transvaal in the south—a distance of one thousand miles. The naval base of Diego Suarez, now occupied by Britain, in the north-eastern tip of the territory, is 700 miles from Mauritius, 800 from Zanzibar, 1,500 from the Cape, 2,000 from Colombo, and 2,300 from Bombay. Including the dependencies of the Comoro archipelago, Reunion, &c., Madagascar has an area of 241,000 square miles and a population of 3,798,000, of whom some 25,000 are French and 15,000 Chinese. A seventh of the island is still under forest, and forestry products form a considerable part of its wealth. The majority of the population, of Malayan stock, with Arabic and negroid admixture, live by agriculture and stock-raising. There are 3,590,000 acres under cultivation, yielding rice, manioc, sugar, tobacco, coffee, cloves and vanilla; there are also 6 million cattle, about 500,000 pigs, and 2,000 ostriches, enabling the island to export substantial quantities of cattle and meat products and raw hides.

The island produces and exports some useful minerals—graphite, mica, rock phosphate, and precious and semi-precious stones. It leads the world in graphite production, followed by Ceylon, Chosen and Mexico. This mineral is used in making crucibles for melting metal alloys. Crucibles made of Madagascar graphite are reputed to be twice as strong and as durable as those made from the Ceylon material. The British blockade of the territory since July, 1940, has prevented graphite shipments to the Axis. Exports of graphite by countries are given below:—

	(In metric tons)					
	France	U.K.	Germany	U.S.A.	Japan	Others
1929 . . .	6,959	5,388	1,535	1,770	366	16,020
1937 . . .	2,830	4,199	332	1,518	1,615	11,102
1938 . . .	3,742	4,225	612	1,627	1,667	12,500

Madagascar exported in the three years 1929, 1937 and 1938, 426, 611 and 626 metric tons respectively of mica. It is noteworthy that the United States is wholly dependent on India, Madagascar, and Canada for many grades of this mineral, which is of great value for the electrical industry, that are not mined locally. In 1939, US imports of mica from the island totalled 320,317 lb, and were 612,697 lb in the following year. The island accounts annually for 6,000 tons of superior rock phosphates; in 1938, it exported 454,000 kilos of precious and semi-precious stones, one-tenth of which consisted of high-grade rock crystal, an important war material. Germany was an important buyer of the finer varieties of the commodity.

The island's total exports in 1938 were valued at 819 million francs, of which 78 per cent went to France. The most important customers were the United Kingdom and the United States. Imports for the same year amounted to 603 million francs, 75 per cent of which came from France, and the balance from the United States, Indo-China, the United Kingdom, and French India. They consisted of oil, steel, textiles, machinery and paper.

Communications are fairly well developed. There are 534 miles of narrow-gauge single-track railway linking the capital, Antananarivo, with the principal port of Tamatave, but the island has also 16,000 miles of roads suitable for motor-car traffic in the dry season. The roads cover the central plateau, and reach down the south and east coasts. Air services connect the important parts of the territory. There are a large number of natural airfields, and an aerodrome at Tulear. The island has 36 Government wireless stations; the one at the capital is a nodal point of the French inter-colonial network. Before the war, two French shipping concerns regularly called at Tamatave, which has a commodious and safe anchorage from April to November, and berths for mail and coastal steamers.

Chile's New Government THE NEW ISSUE OF

[FROM OUR SANTIAGO CORRESPONDENT]

March 23rd

THE President-elect, Don Juan Antonio Rios, who defeated the ex-Dictator, Carlos Abañez, in the recent Presidential elections by a majority of over 50,000 votes, takes office on April 2nd. He is a Radical, who intends to continue the work of the deceased President. His government is, however, more likely to swing towards the centre, since he has a considerable backing from the Liberal Party, and while he received the vote of the Communist Party, he is a bitter opponent of its principles, and it is unlikely that it will have any say in the Government's policy.

Señor Rios has just published the names of his new Ministers; they inspire confidence, and have had considerable experience.

Their names, together with a short history of each, are given below:—

Minister of Interior.—Raul Morales—a Radical. A doctor by profession and a capable organiser. Ex-deputy. Was in charge of the new President's electioneering campaign.

Minister of Foreign Affairs.—Ernesto Barros Jarpa—Liberal. Occupied the same post during the first Presidential term of Arturo Alessandri. A lawyer by profession. Formerly professor of law at the State University.

Minister of Finance.—Benjamin Matte—Liberal. Farmer by profession. Only recently entered politics.

Minister of Justice.—Luis Malaquias Concha—Democrat. Lawyer by profession. Son of the founder of the Democratic Party. Ex-deputy and formerly Chilean Minister to Panama.

Minister of Education.—Oscar Bustos—Radical. State teacher by profession. At present head of primary education.

Minister of National Defence.—Alfredo Duhalde—Radical. Lawyer and farmer by profession. Ex-deputy and occupied the same post in the former Presidency.

Minister of Development.—Oscar Schnake—Socialist. Ex-Senator and candidate of the Socialists for the Presidency, but retired in favour of Rios. Ex-General Secretary of the Socialist Party. Occupied the same post in the former administration.

Minister of Labour.—Leonidas Leyton—Democrat. State teacher by profession. At present chief inspector of State schools.

Minister of Health.—Eduardo Escudero—Socialist. Of the medical profession, and has held administrative posts in the Public Health Department.

Minister of Colonisation.—Pedro Roblete—Socialist. State teacher by profession and ex-Governor of a large agricultural province.

Minister of Agriculture.—Remegio Medina—Radical. Formerly a deputy and Minister. Has had a wide experience of public affairs.

Minister of Commerce and Supply.—This Ministry has not been filled, but it is expected it will be offered to Pedro Alvarez, a Radical and mining engineer.

3% SAVINGS BONDS

1960 - 1970

A FULL TRUSTEE SECURITY

Continuously on "tap"—No limit to holdings

Repayable at par on the 1st September, 1970, the Government reserving the right, on giving three months' notice, to redeem at par on or after the 1st September, 1960.

★ Price of Issue £100 per cent.

★ Payment in full on application.

★ Subscriptions of £50 or any higher multiple of £50 will be received until further notice.

★ Interest 3 per cent. per annum payable half-yearly on the 1st March and the 1st September.

★ Interest accrues from the date of purchase.

★ Income Tax is deducted at the source from interest payments of more than £5 per annum.

★ Bonds are transferable free of stamp duty.

Prospectuses and Application Forms obtainable from all Banks and Stockbrokers.

MINIMUM SUBSCRIPTIONS:

BANK OF ENGLAND ISSUE £50

★ SAVINGS BANKS ISSUES £10

★ For subsequent subscriptions the minimum is £5

ISSUED BY THE NATIONAL SAVINGS COMMITTEE

German. Europe

Technocracy for War

Two events mark far-reaching changes in Germany's economic organisation. Professor Speer, Minister for Armaments and Munitions, has set up an Armament Council (*Ruestungsrat*); and Dr. Funk, Minister for Economic Affairs, has begun the amalgamation of the regional bodies of the so-called self-governing economic organisations—that is, the chambers of commerce and industry, the chambers of independent artisans, the district economic chambers, and the district organisations of the industrial federations. In all, 111 chambers of commerce and industry, 71 chambers of artisans, 27 economic chambers and an unspecified number of district organisations of the federations will be combined into 42 *Gau*-Economic Chambers. Both Ministers explain the reorganisation as a simplification and concentration largely designed for the benefit of private industry, which had been hampered by a cumbersome system of allocating raw materials.

The regional bodies of the self-governing organisations will be virtually amalgamated with the District Economic Boards of the Ministry of Economic Affairs. Goering's Four-Year-Plan Bureaux, responsible for long-term economic planning, temporarily lose all importance. The *Wehrwirtschaft* and Armament Department of the High Command of the *Wehrmacht* sacrifices its independent position by sending its representatives into the new Armament Council; and the District Defence Committees merge with the District Economic Boards of the Ministry of Economic Affairs. Outside the armament industry proper, the Central Boards of the Ministry of Economic Affairs remain responsible for the allocation of raw materials. One important goal of the reform is the creation of clear-cut regional responsibilities. Within the boundaries of each of the 42 *Gaue*, there will be one political, one economic and one military centre. The political Gauleiter has supreme powers; labour dictator Sauckel significantly appointed the political Gauleiters as his regional representatives for the allocation of manpower.

The main object of the reforms is to relieve the central organisations from direct contact with the single industrialist or company. The single industrialist, on the other hand, is relieved from having to report to half a dozen different regional bodies. Hitler's "decree for safeguarding the armament industry" aims at restoring personal initiative, which means, not capitalist initiative, but technical initiative. In other words, private industrialists, or rather their production engineers, may use the raw materials and labour allocated to them as they think fit, but heavy penalties threaten anybody who makes false reports about his demands for materials and labour. The system of fixed prices for armaments and the new Excess Profits Tax are another part of the same process of simplification.

The implications of these may be clearer if the career of Professor Speer, the armament dictator and president of the Armament Council, is considered. Professor Speer is only 37 years old. He studied architecture and had been assistant lecturer at the Technical College in Berlin when he joined the Nazi Party in 1931. His first actual work was a commission for the Party. Subsequently he made the designs for Party buildings and for the rebuilding of Berlin. He has always treated private industry, traditional economic organisations and principles with supreme contempt. The few articles published by him show that he considers economic problems from the point of view of a "technocrat." His main aim now is to give the engineer and designer the place they deserve in production. In other words, Professor Speer holds that the engineer is always right and the administrator, the manager and the accountant are always wrong.

Acting on these convictions, Professor Speer now divides the armament industry according to the different articles that are manufactured for the *Wehrmacht*. Each of the most important articles, for example, tanks, aircraft, guns, etc., are organised by "head committees," divided into sub-committees. These committees are exclusively composed of engineers. The head committees receive the orders from the *Wehrmacht*, subdivide them to the factories and control the execution of the orders. Their activities are directed towards rationalisation in general and towards confining the manufacture of one article to one factory. Professor Speer thinks that the rationalisation effected may

increase production by some 10 to 25 per cent. It is openly admitted at the same time that fresh reserves of manpower and material are no longer available. Economy in material and more efficient production are the only means of increasing output. Stripped of Nazi phraseology, the new organisation is the nationalisation, as well as the rationalisation, of Germany's entire armament industry.

The Reichsbank.—The Reichsbank's total turnover in 1941 exceeded the 1940 figure by 26 per cent. Greater financial liquidity and the increased use of bills in financing the costs of war are reflected in considerable increases in certain items. The most important assets have moved as follows:—

(In million Reichsmarks)			
	1939	1940	1941
Gold	70.8	70.8	70.8
Foreign exchange	224.5	40.9	34.3
Bills and cheques	11,209.9	15,389.6	21,648.9
Advances	30.0	38.0	31.8

Bills and cheques have thus nearly doubled in two full years of war. Correspondingly there has been a particularly heavy expansion in notes in circulation.

(In million Reichsmarks)			
	Bank Notes	Rentenbank Notes	Total Currency
August, 1939	10,907	377	12,949
December, 1939	11,798	957	14,502
" 1940	14,033	1,102	16,770
" 1941	19,325	1,124	22,313

During 1939 and 1940 more notes were required partly because of the incorporation of conquered territories; the increase in 1941, however, is definitely the result of wartime economic and financial tendencies.

The policy of cheap money has been consolidated during the year. For credits obtained from the Reichsbank, the Government paid only 1.77 per cent on the average; and private banking and insurance companies adjusted their business activities to the lowered rate of interest.

Textile Fibre.—*Snia Viscosa*, the leading Italian manufacturer of artificial textile fibres, estimates that world output of rayon increased from 522,000 tons in 1940 to 588,000 tons in 1941, or by 13 per cent. World output of cellulose is estimated to have risen to 672,000 tons, compared with 612,000 tons in 1940. According to the report of *Snia Viscosa*, Germany and Italy are still the leading manufacturers of artificial textile fibres. In 1941, Italy and Germany manufactured 44 per cent of the total world output of artificial textile fibres and 76 per cent of the total European output.

In Germany, the reorganisation of the textile industry is continuing. After the formation of the *Reichsvereinigung Chemical Textile Fibres*, a Co-operative for flax and hemp has been set up. The peculiar relations between growing, processing and manufacturing these fibres had led to the foundation of a separate Co-operative which combines agricultural and industrial organisations. The new Co-operative will regulate the cultivation of flax and hemp and will be responsible for all marketing and manufacturing affairs. The Control Board for Clothing recently prohibited the manufacture of clothing from paper tissues. At the same time, a great number of clothing articles have been declared as unessential, which means that their manufacture is prohibited.

Coal Rationing.—The present system of rationing household coal is relatively simple. The local and district Economic Departments (*Wirtschaftsämter*) are supplied with coal, coke and briquette quotas. These quotas are fixed for a period of twelve months, beginning in April, by the Coal Board in collaboration with the *Reichsvereinigung Kohle*. The supplies are distributed to the coal trade against the delivery of coal forms filled in by households. In these forms, the number of rooms and persons and the actual consumption is stated. The retailer then supplies the customers registered with him according to quantities

available. Each economic Department regulates the distribution of coal according to local conditions. Usually there are five categories of consumers provided for: households using single stoves; centrally heated houses; public buildings, schools and hospitals; farms and other agricultural establishments; and small industries. Consumers are not entitled to a quantity of coal estimated on any point or coupon system. In fact, the present German scheme works because consumers are not entitled to any ration at all; they take what they are given—quite arbitrarily.

Coal rationing was introduced in September, 1939, on the basis of a household coal card. Consumers registered with their retailers and were entitled, on the average, to 80 per cent of consumption during 1938-39; actual supplies were much smaller. During 1940-41, a points system was introduced. One point was equal to one cwt. In April, 1941, the points system was scrapped. The economic Departments were given full power to regulate the distribution of coal according to the conditions prevailing in the district. During the winter of 1941-42, the coal shortage was again acute, and the rationing of gas and electricity was discussed. The industries were unable to find a workable system, and the economic Departments simply decreed

that no consumer was allowed to use more gas and electricity than before. Heavy penalties were imposed if meter readers reported greater consumption. The use of additional electric radiators and the use of gas cooking stoves for heating purposes was prohibited. There is no precedent in the German scheme for Britain, because only in a totalitarian state could the consumer be placed so completely at the mercy of officials and the industry.

Accident Insurance.—The state accident insurance system, which was confined to industries, has been extended by decree to the small shops of the independent artisans, to employees in the banking and insurance business and to domestic servants. The scheme now covers a great number of extra workers—roughly 5 millions—among whom accident risks are relatively small. The decree will therefore considerably increase total contributions; and this seems to have been the main object. The greater part of the accumulated capital of the social insurance schemes is immediately invested in Reich loans. As usual, private insurance companies reveal concern about the extension of state insurance.

Russia at War

The Rôle of Guerillas

FOR the second time in this generation, Russia has been experiencing guerilla warfare. The civil wars of 1918-21 were essentially waged by partisan groups. The old Czarist army had disintegrated, and the setting up of the Red Army proceeded slowly, under enormous difficulties. Lack of cadres, loose discipline and primitive weapons accounted for the fact that, at its inception, the Red Army itself was more like a guerilla organisation than a regular force. In addition, the peasantry showed a preference for partisan forms of warfare until the very end of the civil wars. The tradition of that period of guerillas still exercises a great influence. The number of those who started their military career as members of partisan groups is still considerable among the Soviet officers' corps. It was precisely from among partisans who distinguished themselves in action that most of the pupils of the Soviet military schools were drawn after 1921; and though they may, in the meantime, have acquired a normal military education, they have not yet forgotten the methods, devices and general atmosphere of their first military experience. Old partisans could also frequently be found among civilians. People who in their youth took part in the civil wars are now in their forties; and they have rendered great service as instructors, organisers and fighters.

There is, however, one fundamental difference between the guerillas of 1918-21 and those of 1941-42. The former fought almost independently, and they had very rarely any connection with a regular force. The rôle of the later guerillas has been less independent, and their success or failure has in most cases depended upon the degree of their co-operation with the regular army. In fact, the ups and downs of the guerilla movement of this war have roughly corresponded to the changing fortunes of the "normal" front-line fighting. Reports and hints in the Soviet Press suggest several stages. In the initial phase of the war, the call to partisan warfare did not fall on deaf ears. But the movement, improvised as it was, lacked cohesion and direction. In most cases, the groups were organised in a very loose manner and what was at that time called guerilla warfare actually consisted rather of individual acts of sabotage. The rifle was the partisan's main weapon; but very frequently he had to rely on more primitive implements of war. As the actual front-line shifted eastwards, partisan groups, left far behind in the German rear, gradually found themselves in ever greater difficulties. The conquered areas were policed by enemy detachments; civilians found carrying arms were punished with death; contact with regular army units was cut off; and the single-handed struggle of guerilla bands grew more and more hopeless. The final stage of the Red Army's retreat seems to have been the least encouraging one for the guerillas. The peasants saw the confusion and despondent mood of retreating detachments; and these fre-

quently affected their own morale. Towards the end of the autumn, guerilla activities were at their lowest in the countryside. But they still assumed very large proportions in the East Ukrainian industrial centres; and the Donbass, which was famous some twenty years ago for its record in guerilla warfare, once again came into the limelight. Partisan groups played a very vital part in driving the Germans out of Rostov.

But the real revival of guerilla warfare came during the winter. The halting of the German advance restored the spirit of the regular units, and this acted as a stimulant to the partisan movement. The subsequent Soviet advance made it possible to re-establish steady contacts between the army and the towns and villages in the German rear. The arming of guerillas was facilitated by the quantities of arms and munitions left behind by the retreating Germans. Reports in the Soviet Press reflect to some extent the fluctuations in guerilla warfare; and it was during the winter that reports of partisan activity became very prominent. Most of them related to the northern and central sectors of the front. It was claimed that groups fighting in the north succeeded in maintaining close contact with the defenders of Leningrad; regular meetings and conferences between army commanders and guerilla leaders were said to have taken place. Letters from guerilla groups to Stalin appeared in the papers. They spoke of large "pockets" controlled by the partisans in the German rear, and mentioned instances of localities where the local Soviet administration was still working in its normal manner.

A recent article in *Pravda* summed up the latest stage of the development:—

The experience of ten months has taught the Soviet guerillas a great deal . . . groups are now operating instead of isolated individuals; and these groups have grown into detachments, battalions, regiments and brigades. . . . Inspired by the winter offensive the guerillas have acquired a stronger organisation. . . . Now they have not only rifles; they possess machine guns, automatic rifles, mortars, anti-tank guns and in some places artillery.

It is, of course, difficult to say whether these standards of organisation and equipment have really become typical of the bulk of the guerillas. It is perhaps more likely that the position varies from place to place and that discrepancies are great. But it is certain that in some cases the guerillas have reached a degree of organisation which gives them much of the coherence of normal army detachments.

The partisan movement now seems to have reached a peak. If the Soviets manage to stabilise the present front, or even to move it forward, the guerillas are most likely to become a first-rate asset. They may act as the army's advance guards, and render such invaluable services as cutting communication lines, blowing up munition dumps, raiding enemy headquarters. A new Soviet retreat, on the contrary, would greatly reduce their rôle and probably lead to a gradual withering away of their activity. Even then, the guerillas would give trouble to the enemy and act for some time as an important drain on his policing forces.

THE BUSINESS WORLD

Manpower and the Stock Markets

THE Minister of Labour was recently asked in Parliament whether he had considered the possibility of closing the stock exchanges, and Mr Bevin replied that he had "the matter under review" with the Chancellor of the Exchequer. Perhaps Mr Bevin meant no more than that the possibility had not been overlooked, or that some plan of telescoping was being considered. But a good deal more has been read into his reply; and it may be opportune to point out that to close the stock markets is not the simple matter that some people appear to believe. It is, of course, true that other markets have been closed, or their functions reduced to a minimum. But, in these cases, the Government has taken over the whole business of purchase and distribution—and even so finds it worth while in some cases to maintain the market machinery in being. Those who suggest that the stock exchanges are redundant, seldom consider the question whether some alternative machinery would not have to be created.

It must be admitted at once that some of the important functions of the stock market have disappeared under the régime of closed economy, or have been rendered unnecessary by other developments of Government policy. Thus, the market no longer helps to adjust the balance of overseas payments—except through the sale of holdings to non-residents—or to secure new capital for industries. It is also true that virtually the only new investments available are the Government's own issues; and these are placed without the assistance of the market, except in the very humble capacity of agents for applications.

There remain, however, two important functions which the market still performs. The first of these functions is the need for disinvestment in certain circumstances. One of the arguments most frequently heard in favour of closing the markets is, of course, that people with capital use them to sell securities in order to maintain their standard of living in face of heavy taxation, designed to reduce expenditure; and, clearly, any expenditure which tends to weaken the war effort ought to be forbidden. But to block sales of securities would do nothing to differentiate between outlays which are desirable and those which are not. The sale of securities is necessary in war time to some individuals, as well as to some enterprises, just as disinvestment is to the country as a whole. The simplest way of checking undesirable expenditure is the direct method of limiting supplies, and restricting individual outlays on commodities and services.

In the context of wartime taxation and costs, there are obviously a number of occasions on which dissaving may be necessary. The payment of death duties is, perhaps, the most cogent case from the standpoint of the Exchequer, which would scarcely care to take over in payment a mixed packet of its own bonds, industrial equities, land mortgages, and house property. Sickness, unemployment, compulsory change of residence, war damage, or other essential repairs, are other examples. In the absence of a market, the State or the local authority would have to charge itself with the duty of providing relief for a whole new class of applicants; and it is not improbable that this duty alone might call for a labour force greater than the 7,000 to 9,000 who, it is estimated, are at present employed exclusively on Stock Exchange business.

In passing, it is perhaps as well to point out that a prohibition of dealings in any one substantial section of securities, while they continue to be permitted in other sections, is likely to defeat its own object, since it would simply concentrate realisations upon the sections in which business remained possible. Moreover, it would raise the fear that the prohibition might be extended to other sections, and so would drive those who set a high value on liquidity more and more into holding cash instead of Government securities. It is also very problematical whether there would be any considerable saving of labour under such a system of restrictions.

The second main function of the stock exchanges in

wartime is the provision of the best facilities possible for the adjustment of investment portfolios; and it has been estimated by one authority that as much as 90 per cent of all investment is undertaken by custodians of capital on behalf of others. Even if it is felt that the private investor acts in a capricious manner, and often against his best interests, it remains the fact that most investment is undertaken with a definite object in view, and the investment portfolio is arranged accordingly. The balance disturbed at any time by a great variety of events, ranging from a bad season or the outbreak of war. If it were a change of Government or the outbreak of war. If it were forbidden to make adjustments to meet these changes, the private investor would feel that it was a flagrant interference with his rights, while the custodian—trustee, finance director of an industrial concern, or investment department of a bank or insurance company—would be placed in a position in which he was unable to carry out his duties. If any doubt is felt about the call for these services, some answer is perhaps provided by the fact that throughout a large part of 1941 the number of bargains marked on the London exchange was substantially in excess of the number two years before, and that between end-July, 1939, and end-April, 1942, *The Actuaries' Investment Index* showed rises in value from 118.0 to 146.9 in 2½ per cent Consols, and from 119.1 to 141.8 in home corporations, against a two-point fall to 59.4 in industrial equities.

If the stock exchanges could have been persuaded to provide statistics of turnover under a few main sub-heads, it might have been possible to give still more substance to this argument. It is, however, evident that, after all professional operations have been excluded, there has remained a very general demand for opportunities to adjust portfolios, and it can scarcely be doubted that to have withheld this service would have caused both suffering and discontent. It is, of course, always the case that the bulk of the total business occurs in the Consol market, and it would probably not be an exaggeration to say that the turnover there has been of the order of £10 millions per working day. It would have been much higher but for the fact that, with a few minor exceptions, all issues of Government securities have been made without using the machinery of the market, while most of the securities are in a form which either does not permit of exchange, or offers little attraction to any but institutional investors. People do not pay for these facilities without believing that they extract a solid benefit from them, and it is scarcely possible to remove the marketability of securities, which is one of their great attractions, without providing alternative machinery.

There remains the question whether there is any truth in the contention that the exchanges employ unduly large numbers of men. Unfortunately, no figures are available for the Associated Stock Exchanges or for the PBSE. But there are recent statistics for London, which, judged by membership, is responsible for 73.5 per cent of the stock-broking and jobbing of the whole country—excluding a few small outside institutions. In December last, when the general call up for the services was still short of the forties, the total numbers, male and female, members and employees of all sorts, in London was 5,690 compared with 14,000 before the war. Of this total, almost one-quarter were replacements, presumably by less skilled people; there has been very considerable dilution. It included 4,557 men and 1,133 women. Of the former, 280 were of military age, and under 41, and had not been rejected for the Forces. Of the latter, 273 were between 20 and 30 years of age. There has since been a further review, in the light of later manpower requirements. Meanwhile, the employees of the Stock Exchange itself had fallen from some 400 to around 175, with considerable dilution. Further, out of 778 firms in August, 1939, 110 have been closed or taken over, while a further 116 are the subject of partial amalgamations. The latter constitute an ingenious method of saving over-

heads—not for the most part in personnel—while making it possible for the individual to retain something of his goodwill, even when he leaves his business to join the Forces or to assist the Government in other ways. There was, and is, no block reservation for stockbrokers or their clerks, and special reservations were comparatively few.

When it is considered that this contraction has been achieved in face of some expansion in business, of the substitution of daily for fortnightly settlements, of the absence from London of many companies, and of the plethora of Government forms, it is doubtful whether there is much room for any considerable telescoping. Further, with the price of the service rendered fixed, and competition keen, there is at all times every inducement to economise in labour, insofar as that is consistent with good service.

So far as figures are available, the members of the London

Exchange appear to have played their part at least as well as other professional and semi-professional bodies. It may be that the standard of service to clients will have to be further reduced, but this applies to other services too. What it is essential to recognise is that most of the services rendered are important, while the bulk of them could not be dispensed with for any considerable period without the provision of an alternative. In London, the total of boys and men, 46 and under, including 576 boys and rejects, was less than 2,000, and that of girls and women under 30 less than a quarter of that figure. A real saving in manpower would no doubt be achieved by abolishing financial transactions altogether for the duration, but that is not a practical proposition. Such speeding-up of dilution or further reduction in manpower as is desirable should be effected with the existing Government machinery, not by any special arbitrary action.

The Eastern Banks

THE recently issued reports and dividend declarations of British banks operating in the Far East reflect all too clearly the inroads which Japan's conquests have made on their current and prospective earning power. These banks have been among the brightest jewels in the crown of Imperial investments. Their published and distributed profits are but a partial and meagre measure of the contribution they have made to this country's balance of overseas payments. By tradition the Eastern banks have been managed and financed on exceptionally cautious lines. They have "ploughed back" a far greater proportion of their profits than they have distributed to shareholders; the greater part of this addition to their capital resources has found employment in sterling securities, and the conversion and investment operations involved have contributed as direct—and, probably, as substantial—an item to the national income from overseas investments as the dividends paid by them to British shareholders. A substantial part of the salaries paid by the Eastern banks and the bulk of their lavish pensions have been remitted to this country and spent in it.

The loss of the profits which have made these dividends, investments, and remittances possible is not merely threatened; it is taking place. With Japan in occupation of the treaty ports and concessions in China, of Hongkong, Malaya, the Dutch East Indies and Burma, the Far Eastern banks have been hustled out of the richest of their spheres of activity. The extent of the reduction in current earning power varies with each bank and may roughly be measured by the proportion of their respective branch offices now in enemy territory. The following table shows how the different banks have fared in this respect and gives the latest comparison of dividends.

	In		Dividends	
	Total	Enemy	1940	1941
	Offices	Territory	£	£2 10s.
Hongkong & Shanghai	42	36	15	7½%
Chartered	48	37	10%	7½%
Mercantile	25	12	12%	9%
National	30	2	16%	12%
Imperial	179	6	12%*	12%*
Eastern	13	1	6%	4½%

* Financial year to June 30.

The proportion of branches temporarily lost should not, of course, be used as a specific index of the loss of earning power. The events which began last December had to a large extent been foreseen, and the banks concerned had closed their commitments in the most obvious danger areas. This was particularly true of China, where the disappearance of silver arbitrage and the heavy expense of forward exchange operations had for some time past deprived the banks of their normal means of hedging open commitments; these commitments had, therefore, been gradually reduced and the resources liberated remitted to this country and invested here. It should be added that the reductions in dividends shown in the table were in each case dictated by prudence rather than by necessity. The means to maintain distributions were unquestionably available, even if measured by the profits actually earned during 1941. The events which led so rapidly to the loss of branches only began to unfold themselves during the last month of the year; and 1941 would, but for these events, have been one of the most prosperous in the history of these banks. The Chartered Bank, for example, excluded from its published 1941 profits, the second half year's earnings of all branches

in enemy occupation at the end of the year. Yet, it showed a net profit of £352,865, or only £47,000 down on the bumper 1940 total. That course has, in general, been followed by the other banks—if only because no other procedure could be followed because of the severance of communications with the offices concerned and the impossibility of getting information. In all cases, too, liberal provision has been made out of profits and hidden reserves to meet the contingencies arising out of recent events.

Although there may be lean times ahead for their shareholders, these banks retain their potential financial strength and earning power unimpaired. British prestige in the Far East has slumped, and with it the local prestige of British banks. But the remedy is a military, not a banking problem. When the military position in the Far East has been restored, the restoration of the general prestige of British banks should follow almost automatically. But the problem of reconstruction for, say, a bank such as the Hongkong and Shanghai, which is so largely represented in territories overrun by the enemy, will present technical problems of

Y.P. 3

considerable difficulty. The Japanese are now endeavouring to liquidate the business of its offices entirely; the task of unscrambling the results of their efforts will obviously call for much patience and ingenuity. The confusion of the immediate reconstruction period is, moreover, bound to be much increased by the changes which the invader is making in the currency arrangements of the occupied territories. In Malaya, for example, the country has been swamped by counterfeit Straits Settlements dollar notes.

There are, however, wider issues at stake. The Eastern banks must face a set of problems as fundamental as the military task of ousting the enemy. These problems come from the growing national consciousness of the countries which the banks serve; from the trend towards self sufficiency of certain of these territories, stimulated by the development of war industries; from the disappearance of the free exchange markets in which these banks earned such substantial profits. The purely "exchange" bank, designed essentially to serve the interests of external trade, and primarily of British trade, with the countries of the East, may be at a disadvantage. The Chartered Bank may well have been farsighted when, with its acquisition of the P. and O. Banking Corporation, it obtained an interest in the Allahabad Bank, an essentially domestic Indian bank; and

political foresight has been shown by those banks which have recruited an increasing proportion of their Eastern staffs in the countries in which they are employed. This policy has been applied with considerable success in India, principally by the Imperial Bank, which is largely concerned with domestic Indian banking, but also by the Chartered Bank.

All the banks, in short, will probably have to identify themselves far more, in future, with domestic banking developments in the countries where they operate. Even with a post-war relaxation of controls, it is probable that neither the financing of trade with the East, nor the attendant exchange operations will offer the glittering prizes that have been plucked from them in the past. This group of British banks should find it possible to adapt themselves successfully to the new conditions. They have acquired a knowledge of the areas they serve which no competing banks, local or foreign, can challenge. They may have sustained losses as a result of the war, but there are abundant reserves available to meet them. For all the problems and difficulties that beset them, the Eastern banks will have an important rôle to play as long as Britain continues to trade with, and invest in, the rich areas in which they have grown such deep roots.

Finance and Banking

South Africa's Sterling Bills

The latest weekly return of the South African Reserve Bank to reach this country, that dated April 2 last, shows an unusual movement, namely, a jump from £446,994 to £5,111,547 in "foreign bills discounted." It may be assumed that the bills so described are sterling Treasury bills. On this occasion the increase in the sterling bill holding is approximately balanced by a fall in "other assets" from £42,125,764 to £36,952,731. These "other assets" probably include longer term sterling securities, and have risen from about £16,000,000 since the outbreak of the war. It is, however, in the increase in the gold held by the Reserve Bank that the main evidence is to be seen of the improvement in the Union's balance of payments since the beginning of the war. Over this period, the gold reserve, which is still calculated at the former parity, has risen from £26,910,000 to £48,366,000, an increase which at current market prices represents about £42,500,000. It will be interesting to see whether the recent rise in the holding of British Treasury bills is an isolated operation, or whether it marks the beginning of a new policy regarding the use of South Africa's substantial creditor balance of international payments.

Notes Still Going Up

The position in the money market has become progressively easier this week. The banks have been more willing buyers of bills than for some time past, and though the market obtained a 41 per cent allotment at last week's tender for Treasury bills, against 37 per cent the week before, no difficulties have been experienced in taking up the additional bills to be paid for. The total bills taken up this week were £15 millions in excess of maturities. The banks' payments on TDR's were £25 millions against nominal maturities of £40 millions, but effective maturities are not believed to have been much in excess of the new TDR payments. The Bank return reflects the increased abundance of credit in a rise of £8,096,000 in bankers' deposits, carrying their total to £126,550,000. This movement gains added weight from the fact that bank cash was depleted to the extent of £3,227,000 during the week by a further withdrawal of notes. This carries the note circulation to the new record of £780,177,000. The expansion of the credit basis is in the main due to an increase of £10,485,000 in the banking department's holding of Government securities. The reconstitution of this item, recently depleted by £50 millions when the fiduciary issue was increased, is thus proceeding at a rather faster pace than would seem warranted by the expansion in the circulation.

Clearing Banks' April Returns

The clearing banks' returns for April disclose an exceptional dispersion of movements in assets, occurring within

a relatively stable volume of bank credit. Deposits were £9,594,000 higher on the month, and if allowance is made for a diminution of £12,622,000 in cheques being cleared and other items in transit, the true expansion in deposits appears to have been in the neighbourhood of £22,000,000. This movement reverses the seasonal contraction in deposits which occurred during the previous three months, when the customary deflationary impact of heavy tax payments was accentuated by the initial response to the offer of Tax Reserve Certificates and by the spurt in subscriptions to other Government issues during the Warships Weeks campaign. The outstanding movement among assets is a jump of £95,150,000 in bills discounted. In interpreting this movement it must be noted that the total outstanding of Treasury bills issued through the weekly tender increased by £15,000,000 over the period covered by the last two clearing banks' returns and that, during April, the discount market syndicate was obtaining fairly generous allotments at the tenders. It should also be noted that the official agents in the market had bought large lines of April maturities in order to keep money abundant during March. The excess of payments for new bills over maturities in the hands of the banks and the market must, therefore, have

	Apr. 1941	Dec. 1941	Jan. 1942	Feb. 1942	Mar. 1942	Apr. 1942

Loans and Advances	883.7	806.7	811.8	825.6	837.7	821.2
Investments in affiliated banks	23.8	23.8	23.8	23.8	23.8	23.8
Cover for acceptances, premises, etc.	149.4	154.6	150.2	144.8	145.3	141.1
Total assets	3,075.1	3,582.0	3,470.5	3,327.9	3,315.7	3,321.1

been much greater during April than the £15,000,000 excess of total payments over total maturities of Treasury bills issued through the tender.

The counterpart to the increase in bills is provided in main by a fall of £28,436,000 in cash and of £26,000,000 in Treasury deposit receipts. The nominal TDR maturities in the period March 28 to April 25 (approximately covered by the latest clearing bank returns) was £130,000,000. A large proportion of the nominal April maturities had been previously encashed, hence the comparatively small decline

in this item. Investments are down by £1,409,000, showing that the March return included the whole of the clearing banks' own participations in Warships Weeks subscriptions.

US and Silver Exports

The United States Treasury announced towards the end of last week that it had banned the export of silver to the following European countries: Portugal, Spain, Switzerland, Sweden, Vichy France and its colonial territories. There has hitherto been no lack of evidence that the silver programme has produced a one-way stream of the metal which has swollen the US Treasury's holdings of the metal to well over 3,000 million ounces. But this ban is the first indication that the outcome of that programme met with the full approval of the American authorities, and that they were prepared to resort to the strongest measures to protect their immense holdings of the metal. This was certainly not the attitude of US Treasury spokesmen a few months before the entry of America into the war, when they admitted that the silver legislation had proved a fiasco and might, for all they cared, be wiped from the Statute book. The change of opinion symbolised by last week's ban on exports is, in effect, a token of silver's elevation from the position of a useless precious metal to that of a very essential base metal. The ban is intended, first, to prevent silver leaking through the sieve of neutral Europe into enemy hands. Secondly, it is intended to preserve the strategic reserves of the metal in the United States which, colossal as they may have appeared in the guise of a useless currency backing, are none too large in terms of the industrial uses to which they must be put.

The latest figure of US Treasury holdings is 3,280 million ounces held at the end of 1941. Of this total just over

1,500 million ounces are held as reserve against silver certificates. The balance is free to be used in the various industrial directions opened up by recent research, notably in soldering alloys and steel plating where silver can be used as an effective substitute for tin. Even the silver held against the outstanding silver certificates could without much difficulty be freed for industrial uses. One method would be to withdraw the silver certificates and replace them by Federal Reserve notes. Another would be to use the silver in such a manner as to make it still technically available to the Treasury for purposes of currency cover. These considerations, and all they imply, are a far cry from the customary obloquy levelled in the past at the US silver programme. That programme may have been based on a mixture of log rolling and misbegotten economics. It may have created monetary confusion in the Far East and have done damage to the cause of silver which its originators little dreamed of. But it has, as a happy incidental, created a record-breaking reserve of silver, a metal whose strategic importance is of the first rank now that the supplies of tin available for the United Nations have been so sadly depleted.

Portugal's Balance of Payments

The only country in Europe which in this war has reaped the harvest of neutrality in terms comparable with the fortunate experience of all the neutrals in the last war is Portugal. It has benefited from the stream of refugee traffic between Europe and America, which has been canalised exclusively through it and which brought in its train a rich though short-lived boom in foreign exchange business. Of more permanent character has been the increased income derived from the export of certain strategic materials such as wolfram, for which the belligerents have been actively competing in Portugal, with the result that prices have soared to unheard-of levels. There have been offsets to these windfalls, and the war has inevitably

HONGKONG & SHANGHAI BANK (TRUSTEE) LIMITED
9 Gracechurch Street, E.C.3, a Company incorporated in England and an affiliate of The Hongkong and Shanghai Banking Corporation, is prepared to act as Executor and Trustee in approved cases. Full particulars may be had on application.

BANK OF NEW ZEALAND

Incorporated with Limited Liability in New Zealand by Act of General Assembly, 29th July, 1861.

Head Office: WELLINGTON, NEW ZEALAND
H. R. H. CHALMERS, General Manager.

★ Branches and Agencies at over 220 points in New Zealand and at Melbourne, Victoria; Sydney, New South Wales; Suva, Fiji; Apia, Samoa.

Authorised Capital £7,031,250
Paid-up Capital £6,328,125
Reserve Fund and Undivided Profits, 1941 £3,967,500

Aggregate Assets at 31st March, 1941 £55,616,460

★ Issues Drafts and Letters of Credit.
★ Makes Telegraphic Transfers.
★ Negotiates and Collects Bills of Exchange.

London Office: 1 QUEEN VICTORIA STREET, E.C.4
JOHN FORBES, Manager.

OVER 850 BRANCHES

A complete banking service is offered in every part of Australia, New Zealand and the Pacific Islands by Australia's oldest and largest bank.

BANK OF NEW SOUTH WALES

interfered with the normal outlets for Portuguese produce and in particular with the sale of its wines in the British market. But, by and large, the account balances appreciably in Portugal's favour, and as a result the country's balance of payments has been exceptionally favourable since the outbreak of the war. The Portuguese authorities have wisely taken this opportunity of reducing the country's external indebtedness. The report of the Portuguese National Debt Office for 1940 shows that during that year about two-thirds

of the external debt was extinguished. This was effected by the conversion in April, by which some £10,000,000 of the sealed bonds were converted. The respective repatriation of debt had in fact been taking place gradually by purchases of the sealed bonds in London, and this process has been persistently continued since 1940. Though these bonds are now outstanding to the amount of £26,317,000, it may confidently be assumed that only a small proportion of this total is outside Portuguese hands.

Investment

Consolidating the Ground

As was felt might prove to be the case, the rise in the shorts last week was the prelude to a further considerable recovery in medium dated gilt-edged stocks, and to a less extent, in the longs and irredeemables. By Tuesday last the movement had lost much of its impetus, but in general the rise was about $\frac{1}{8}$ to $\frac{1}{2}$ point. At the new level, none of the stocks had touched a fresh high, but there are cases in which prices exceed the best recorded this year, or last, but not in both periods together. The following table sets out the range of movement and the latest prices for a number of these stocks:—

	High 1941	Low 1941	High 1942	Low 1942	Close May 13
Consols 2½% at any time	82½	76½	83½	82½	82½
Consols 4% after 1957	113½	110	113½	111½	113½
Conversion 3½% after 1961	106½	102½	107½	105½	106½
War 3½% after 1952	106½	102½	106½	104½	104
Local 3½% at any time	96½	89½	97	95½	96½
Conversion 3% 1948-53	103½	101½	103	101½	102½
Funding 2½% 1958-61	95½	91½	95½	93½	94½
Funding 3% 1959-69	101½	96½	101½	99½	100½
Funding 4% 1960-90	116½	111½	116½	114½	114½
War 3% 1955-59	101½	100½	101½	100	100½

The improvement was accompanied by a considerable expansion in business in the Consol market, but, so far, most other sections have signally failed to participate either in the better prices or in the expansion of turnover. This is particularly true of British industrial equities, such business as called for any comment outside that in the Funds being in the more speculative sections. The general tone was, however, even firmer than of late and the general rise in the Funds further strengthens the basis for a more widespread increase in prices once there is any development to warrant optimism. While the ground is being consolidated for such an advance, it is not very easy to see whence there is to come the stimulus needed to set it in vigorous motion. There is no longer the prospect of important vesting orders, and a general rise will require to be backed by the normal expansion in investment demand. It seems not improbable that quiet conditions, with a firm tone, will continue until the shape of the spring offensive becomes visible.

A Doubtful Alberta Scheme

There does not appear to be much hope for the bondholder in a plan which is being advocated in some quarters for dealing with the defaulted bonds of the Province of Alberta. The idea is simply that a substantial cut in interest should be accepted in return for a guarantee of principal and interest by the Dominion Government, the interest rate named being 3 per cent. If this were done, the bonds would stand at a small discount, even if the new stock were long dated, and the bondholder would be well satisfied. There is, of course, nothing new in this plan. It has been mooted in connection with every Canadian default and it has always been shipwrecked on the rock of Provincial sovereignty, complicated by local politics. Alberta was one of the Provinces which refused to accept the terms under which it was proposed that the Dominion should assume responsibility for Provincial debts. There is no sign of any change of view by Mr Aberhart, and this line of approach to the problem seems the reverse of promising. There are, however, others, and, in view of the present prosperity of the Province of Alberta and the fact that it is advertising to the world at large, and Canada in

particular, its need of capital investment, there is some hope that its rulers will not always remain obdurate in the matter of reasonable treatment of its bondholders.

Coats' EPT Liability

Despite the many other factors at work, the decisive influence in reducing the revenue of J. & P. Coats from £1,998,699 to £1,744,637 in 1941 is shown by the chairman, Mr J. O. M. Clark, to have been the incidence of EPT. The company is particularly unfortunate in that it not only has a poor base period, but has also suffered a considerable decline in investment revenue from associated companies which is free from the tax. The year was a difficult one, owing to restrictions at home and the progressive loss of overseas markets, but it appears that, despite these troubles, the total profit exceeded £3,000,000, which must be something like a record for the recent years. The fact that the profit assessment for EPT is very different from that for normal profit calculations, precludes, however, all but the faintest hope that the company will earn enough to restore the dividend to 10 per cent, while the tax remains at 100 per cent. In these circumstances, the board is right to resist those who would like to see dividends maintained out of the equalisation account, since there can be no doubt that liquid resources will be required once a capital replacement is possible. The balance-sheet shows a rise from £3,802,368 to £4,461,755 in creditors, mainly a reflection of higher tax liabilities, while liquid assets are up from £3,775,918 to £4,341,148. This is accounted for by a jump in stock of some £700,000, of which only part is due to higher prices. Excluded from the above calculation are a rise of £340,000 in loans and advances to subsidiaries and a fall of some £200,000 in debit balances with these concerns. The increase in stock in trade has occurred despite the release of accumulated stocks to meet the Government's needs and relief granted to certain Lancashire spinners, whose holdings were exhausted. The good profit of the year is to be attributed in no small way to drastic limitation in the range of articles produced, and to simpler systems of selling, both administrative and operational. It is good to learn that some part of the consequent saving in distribution costs is likely to stick after the war is over. As to the outlook, the EPT cushion will presumably protect the proprietors from any further fall in dividend, but Mr Clark expressed the view that the company would have to rely on greater demands from the Americas to make up for its falling revenue in other areas, including this country. It is interesting to note, however, that he believes that clothes rationing may have the effect of increasing the demand for sewing cotton. The price of the £1 ordinary stock is 34s. 1½d., giving a yield of £5 4s. 1d. per cent, less tax, which suggests that no early recovery in distribution is expected.

Canadian Pacific Outlook

Holders of the ordinary capital in the Canadian Pacific Railway will find an explanation of the continued passing of the dividend, but very little to encourage them, in Mr D. C. Coleman's remarks at the annual meeting. The explanation is the large amount of stock falling in over the next few years, doubts about the future of operations and the conditions under which refunding will have to take place. Evidently, it is a matter of holding a fair balance between the present rights of the equity holders and their more distant prospects. It is difficult to escape the conclusion that, in this matter, the board of the company is more

conservative than the general run of concerns. Whether they are justified in their conservatism, only the future will reveal. Meanwhile, the immediate outlook is reasonably good. For the first quarter, there was an increase in net earnings from the railways of 17.2 per cent. Restriction on road transport will transfer a higher proportion of total traffic to the rails; the total traffic is likely to rise, but at a lower rate. Living bonus payments, tax accruals, and the higher cost of replacing stocks of materials will all raise costs, but a moderate increase in net railway revenue is expected for the whole year. Other revenue is largely dependent upon steamship earnings. The assumption is, presumably, that these will fall. Hotels are being closed in view of limitations on holiday travel, and, in the circumstances, Mr Coleman refuses to make a forecast of net revenue. About the more distant outlook, there is little definite statement, but the implication is that existing conditions are entirely abnormal, both in the character of traffic and in the restriction on competition by road and waterborne traffic. How far traffic after the war will return to its pre-war character is a matter of guesswork, but road and rail conditions will, presumably, return to something like their pre-war state. It is perhaps these considerations that have persuaded the board to preserve cash resources to the utmost.

Company Notes

Babcock and Wilcox Earnings

The preliminary statement of Babcock and Wilcox for 1941 shows a reduction in the balance on profit and loss account from £717,347 to £616,021. These figures are before taxation which, including tax on dividends, required £451,058 in the previous year—after war damage insurance and staff funds. The payment on ordinary capital is maintained at 11 per cent, including a 1 per cent bonus, for the third year in succession, though it is probable that the cover is lower than the 14.9 per cent earned in 1940. Total profits in that year, at £885,029, were more than £100,000 below the 1939 level, and it is likely that there was a further reduction of the same order in 1941. Although it is clear that the concern was fully occupied last year—it is a leading producer of steam boilers and other heavy heaters—rising costs and stricter contract terms may have reduced gross earnings, and it is probable that EPT has played a dominant part. The total of available income has been adversely affected in recent years by the necessity of writing off war losses in enemy occupied territory, and it is possible that the Japanese advance in the Far East may have forced the management to make further provisions in last year's accounts. The £1 ordinary shares at 43s. 6d. ex dividend offer a conservative yield of £5 1s. 1d. per cent.

Stewarts and Lloyds Lower Profits

The full accounts of Stewarts and Lloyds for 1941 show a decline in profits, after tax including tax on dividends, from £1,822,433 to £1,752,970. No doubt the necessity of meeting EPT at the full rate throughout the year is largely responsible for the fall. It is to be regretted that the form of the accounts is altered so as to conceal the provision for War Damage premium, which took £150,000 in the previous year. Depreciation is some £10,000 higher

at £581,279, but there is a transfer of £100,000 for special depreciation reserve. With other charges relatively unchanged, equity earnings are down from £884,930 to £785,481, falling below £1,000,000 for the first time since 1936. Deferred stock and Liaison shares receive the customary 12½ per cent covered by earnings of 16.6, against 20.7 per cent. By reducing the transfer to contingencies by £100,000 to £250,000, and crediting £85,754 from ARP reserve no longer required, it is possible to raise the carry forward from £182,689 to £192,875.

§ After debiting £90,000 to Pensions Reserve.
* Including £85,754 ARP reserve no longer required.

The chairman, Mr. A. C. Macdiarmid, is necessarily reticent with regard to the activities of the group. It is axiomatic that plant was employed to capacity last year, and the setback in profits is no doubt to be accounted for by the operation of cost factors and higher tax liability. The balance-sheet—the accounts unfortunately do not contain a consolidated statement—shows that, excluding inter-company items, current liabilities exceed liquid assets by £140,049. At the date of the previous accounts, there was a surplus of liquid assets amounting to £227,660. Against this, there is an increase of £339,997 in net advances to subsidiaries, and one of £206,401 in shares and advances on capital account in allied and other companies. Increased liabilities include a bank loan of £1,000,000, while stock-in-trade is up by some £775,000, and debtors by £400,000, against which cash is lower by some £213,000. The bank loan is probably due in part to the tempo of payment for work on Government account. The fact that the dividend is unchanged means that Tube Investments' receipts on the liaison shares are maintained. That company has just repeated its interim for 1941-42, but Stewarts and Lloyds receipts from it were 20 per cent in 1941, against 23½ per cent in 1940. The deferred shares of Stewarts and Lloyds stand at 45s. 3d., giving a yield of £5 10s. 6d. per cent, while Tube Investments ordinary at 81s. 6d. return £4 18s. 2d. per cent on the supposition that the 20 per cent dividend is unchanged.

Colvilles Report

Since final prices for some materials supplied to Colvilles have still to be determined, neither actual profit nor tax liability can be definitely ascertained. It is un-

J. G. SLEIGH, Managing Director.

fortunate that, in addition, the directors have decided to show estimated profits only after tax and war damage. In 1940 tax took £800,000, and the net figure appears to have risen, subject to the above qualifications, from £428,686 to £603,196. As in recent years, £250,000 is provided for ordinary depreciation; the £100,000 transferred as before for special depreciation is not treated as a charge against equity earnings. On this basis, the available surplus is up from £113,936 to £294,634, representing 15.3 against 5.5 per cent. The ordinary dividend is maintained at the 8 per cent, paid in the four previous years, and the carry forward raised from £119,858 to £157,710. These results are indisputably superior to the general run of heavy industrial earnings in 1941. The accounts do little to elucidate the position, but it must be supposed that the clue lies in the relatively better EPT standard which Colvilles possesses. The balance-sheet reveals the expected rises in creditors and debtors. Stocks are up from some £2,664,000 to £3,116,000, and there is a substantial rise in cash holdings from £171,000 to £507,676. The directors have repaid £100,000 during the year, reducing the Insurance Group loan to £900,000. The total of depreciation reserve now stands at £2,350,000. Clearly, the position of the company is very strong. The £1 ordinary stock, at 20s 9d, yields £7 18s per cent.

United Molasses Accounts

Full accounts of United Molasses for 1941 confirm the impression conveyed by the preliminary statement—discussed in *The Economist* of May 2, 1942—that the group suffered a considerable contraction of business last year, and this was aggravated by heavy losses on molasses in the Far East. Trading profits of the company dropped sharply from £799,116 to £151,809, and although the fall was in part due to the transfer of the tanker fleet to the wholly owned subsidiary, Athel Line, the company's share of earnings of subsidiaries and other revenue rose only from £271,185 to £323,448. Since current tax liability is reduced from £485,000, exclusive of £140,000 for arrears, to £75,000, equity earnings, although nearly £200,000 lower at £301,949, representing 30.8 against 48.1 per cent, still provide substantial cover for the ordinary dividend, maintained at 20 per cent. General reserve receives £100,000 against £150,000 to contingencies and the carry forward is raised from £66,582 to £73,081. The chairman, Mr. F. K. Kielberg, points out that although the group has suffered heavy losses in Japanese occupied territory, fixed assets were written off by the end of 1940 and full provision has been made since then for remaining investments in China, Java and India. It is good news that tonnage lost up to 31st December had been more than made good. This is due to the acquisition of an interest, exceeding 90 per cent, in Tankers, reflected, in the consolidated statement in a rise of about £404,600 in the value of the fleet before depreciation, and as part cause of an increase of £914,000 in holdings of gilt-edged stocks. The rise in the fleet valuation must be read in conjunction with an addition of almost £290,000 in ships rebuilding reserve, of which some £73,300 is due from the Government tonnage replacement account, and the remainder represents the excess of insured value of ships lost during the year over their written down book valuation. A decline in debtors from £2,059,133 to £1,167,024 is an indication of reduced activity, but the fall in stocks of molasses is exceeded by increases in other commodities. The excess of liquid assets over current liabilities is very slightly lower on the year. The purchase of Tankers is reflected in the company's balance sheet in a rise of some £1,080,000 in holdings in subsidiaries, and this, together with a jump of £372,000 in holdings of Government stocks, has been financed by additional loans from subsidiaries, there being modest declines in stocks and debtors. The difficulty of replacing tonnage is the supreme problem for the immediate future, even in the context of reduced overseas trading, and the board is to be congratulated on having reached a temporary solution. The 6s. 8d. Ordinary shares at 28s. 3d. ex dividend yield £5 17s. 11d. per cent, less tax, on the 20 per cent dividend and 2½ per cent tax free cash bonus.

BET Record Profits

The preliminary statement of British Electric Traction for the year to March 31, 1942, shows total profits which, at £767,588 against £748,552, have again reached a new

record level, and continue an upward trend unbroken since 1932-33. The statement completes the picture of the fortunes of the group in the latest financial year, and provides a summary indication of the progress of the wide section of the motor transport industry, in which BET is interested, besides its holdings in electric supply and gas undertakings. As was to be expected, liability for income-tax and EPT was higher last year, increasing from £81,661 to £105,750, and surpassing the previous highest provision of £104,709 in 1938-39. In the majority of cases, EPT has, probably, been met by the operating companies. The dividend on deferred stock is maintained at the 45 per cent, paid in the two previous years, and there is a surplus carried to undistributed profits of £8,434, bringing the total of this fund to £1,983,813. It is possible to estimate that equity earnings amount to £364,272, against £368,703, representing a rate of 47.1 against 48.3 per cent. The steady rise in total income, and the relative stability of surplus earnings achieved by BET, and the Tilling-BAT group of transport companies is outstanding among the general run of industrial enterprise. The welcome initiative in using producer gas, which permits operation on a commercial basis with considerable independence of the petrol ration, is on too small a scale to be of appreciable influence on profits until after the war. The £100 deferred ordinary stock, at £925, yields £4 18s. 11d. per cent.

Rio Tinto Reverse

Although the Rio Tinto Company is able to record a 45 per cent. increase in its net return on sales for 1941, receipts from interest and dividends are drastically reduced and only £175,316 of the peseta balance has been utilised against £441,776 in 1940. This balance must now be nearing exhaustion. The result is a decline in revenue of £275,764. Total expenses show little change, and although there is no special provision for taxes, against £200,000 last year, it is necessary, after meeting the preference dividend, to take away £14,795 of the £58,393 added to the carry forward last year. The table below summarises revenue and expenditure for the past three years:—

	Years to December 31st	1939	1940	1941
Revenue				
Sales net		224,194	86,213	126,397
Peseta balance used		64,611	441,776	175,316
Dividends and Interest		284,331	241,892	192,403
Total		573,136	769,881	494,117
Expenditure				
Administrative		273,346	269,653	267,136
Debt service		160,640	160,585	160,526
Special tax provision		—	200,000	81,250
Preference shares		81,250	81,250	—
Earned for ordinary		57,900	58,393	Dr. 14,795
Earned %		4.4	5.5	—
Carry forward		509,720	568,113	553,318

The continued decline in actual earnings is a reflection of the difficulties of the Spanish business, on the one side, and of the ill effect of EPT on the distributions of the Rhodesian copper interests. The directors are able to meet the preference dividend, but it is now over a decade since anything was paid on the equity capital. Of total assets of just over £7,750,000, some £3,700,000 are stated to be in Spain. The only substantial change in the balance sheet is a rise of some £109,500 in miscellaneous investments, which has been financed to the extent of £40,752 by reduction in cash and of £69,829 by a rise in creditors. The £5 Ordinary shares are quoted at 7½, a reflection mainly of the market's valuation of the Rhodesian interests.

De Beers Progress

A further instance of the ill-effects of arbitrary and unconsidered action by Government Departments is afforded by the partial holding up of the accounts of De Beers. So far as these were sent to individuals they passed without delay, but the bulk supplies were disclosed selectively and that most people are still without the full figures. On the basis of summarised statements which have filtered into the press, it is clear that a substantial improvement was realised last year. Total income, including sums released in respect of stores written off, if this item occurs in the later year, rose from £2,138,106 to £2,694,036. The total of mining and other expenditure was sharply reduced, but there was a heavy increase in tax liability, which jumped from £150,000 to £503,000. Thus, the sum available for dividends is increased from £1,279,534 to £1,753,894. The management have decided to bring payments on preference capital up to date, with a distribution requiring a gross sum of £1,200,000, covering the eighteen months ending December 31st last. This leaves £553,894 against nil, representing 17.4 per cent, for the deferred shares, which receive a payment of 20 per cent, the first since the 30 per cent distributed in 1937. The deficit of £82,500 is drawn from the carry forward, reducing it to £1,170,631. These results are very much better than could have been foreseen a year ago, when the elimination of preference arrears was generally regarded as the potential limit of distribution from 1941 earnings. The directors state that the sale of diamonds, both in the industrial market and as precious stones, has been extremely satisfactory. It has no doubt been assisted by hoarding purchases. The balance-sheet shows a decline in the surplus of liquid assets over current liabilities, inclusive of inter-company items, from £758,824 to £542,671. Among assets there is, however, a marked rise in loans at call from £260,000 to £740,564. As a result of the liquidation of Cape Coast Exploration, there is a net decline of £715,849 in investments in mining companies to £3,686,265. In order to purchase the *Diamond Corporation's* holding in the former concern, *De Beers* has disposed of some £371,000 of *Diamond Corporation* 4½ per cent debentures, leaving the total of unquoted securities at £1,113,000, while quoted securities are reduced by some £71,171 to £1,409,157 by the sale of the balance of the holding in the preference capital of *African Explosives*. It is satisfactory that there has been a corresponding improvement in the results of

Consolidated Diamond Mines, an associate, whose profits are up from £486,358 to £816,259. The ordinary shares receive 15 per cent against nil, the first dividend since 10 per cent was paid in 1937. The 50s. deferred shares of *De Beers*, at 162s. 6d., yield £6 7s. per cent, while the 10s. ordinary shares of *Consolidated Diamond Mines* at 11s. offer £14 12s. 8d. per cent.

Mining Finance Results

The 1941 results of *Central Mining and Anglo American Corporation* reveal a substantial improvement on the profits of recent years. The preliminary statement of *Central Mining* shows a jump in income from £368,017 to £712,143, before contingencies which receive £30,000 against £10,000. There is a considerable increase in tax liability from £55,000 to £175,000, but it is possible to estimate that equity earnings are up from £204,558 to £457,143, the highest level since 1936. There is 2½ per cent increase in the distribution on ordinary shares, bringing the total to 7½ per cent, less tax, at some 7s. 6d., while the cover is raised from 6.0 to 17.0 per cent. Investment reserve receives £100,000, against nil; reserve fund £100,000 against £25,000. The 1941 accounts of *Anglo American Corporation* indicate a rise in profits from £926,414 to £975,886. Since there is no provision for writing off shares and interests in other concerns, against £330,000 in the previous year, it has been possible to raise the ordinary dividend from 20 to 25 per cent. The provision for taxation, other than tax on dividends, is unchanged at £100,000. If the 1940 charge of £330,000 is treated as properly spread over a number of years, and so deducted from reserves, equity earnings, which are £597,130 against £633,331, represent a rate of 25.9 against 24.4 per cent grossed up for income tax at 10s. There is an increase in the carry forward from £107,317 to £128,148. The improvement in profits, despite the reduction in dividends from a number of mines in which the corporation is interested, notably Rhokana Corporation

THE IMPORTANCE OF SOUND MONEY

In these days of grave anxiety men of goodwill are seeking truth. Once they find a foundation for their beliefs which they regard as incontestable they are ready to act. Many of them are finding that the actions required are the reverse of those which they formerly thought to be right and in the interests of the mass of the people.

Many are now for the first time recognising that a large part of the prosperity and social services to which our people have become accustomed was founded on the services which our countrymen over a century and more have rendered to the world—services of banking, insurance, investment and the carrying of goods over the Seven Seas.

Those services brought in a valuable income which percolated throughout the length and breadth of the land. They were founded largely on the integrity of the British business man and on confidence in the value of our currency. That confidence continued so long as foreign peoples saw that our banking system, and consequently our currency, was being constantly buttressed by real savings.

The hazards of war temporarily suspend the income from many of those sources. We have now to maintain ourselves on what remains of the accumulations of the past and by the generosity of our friends.

If those services were to vanish entirely, the livelihood of large numbers of our people—several millions—would go too. In time, the population would fall to the low level desired by our enemies and our ability to maintain and defend ourselves would suffer accordingly.

How can we avert such a catastrophe, recover our ability to render valuable international services and thus increase the well-being of all our people?

The answer is that we can only do so by preparing the way for conditions under which the value of the currency can be stabilized and our paper money convertible into gold.

The primary requisite for the maintenance of a sound currency is an ability to pay our way in international trade. We have to provide goods and services, and not gold, in exchange for those things we desire and need to import, and we have to provide those goods and services at prices which overseas buyers can afford to pay for them.

This, in turn, requires a complete reversal of our national policy of recent times. That policy has been designed to

bring about internal stability at all costs. It has attempted to isolate internal trade from external affairs and to eliminate the influence of world price fluctuations on the Home Market. It has not succeeded and it cannot succeed. Indeed, it is undesirable that it should succeed, for it would deprive our people of the improvement in the standard of life which can only come from world abundance. The refusal to accept internal fluctuations in accordance with world fluctuations, undermines the competitive power of our industries and consequently undermines the stability of our currency—which it cannot be too frequently emphasized is a most valuable earning asset for the whole of the people.

Currency depreciation is of no assistance whatever for recovering markets. The uncertainty which a falling currency causes reduces the volume of trade.

A fair exchange of goods with overseas customers cannot be achieved by the internal rigidity and the consequent depreciating currency which we have seen in recent years, but by a constant willingness to adapt our price level to the fluctuations caused by international supply and demand for services and commodities and by a sound currency.

Those were the alternative policies with which we have been faced in recent times. There is no doubt now which is the right one. The re-adoption of the free internal economy which is essential to our survival as a great Nation will require a new outlook on the part of many sections of the community. Henceforth the larger industrial units, trade associations and trade unions must think in terms of the needs of the whole community rather than merely the interests of those sections with which they are most intimately concerned.

The situation requires the elimination of waste in every section of our national life and through those economies reductions in the rate of burdens of industry and individuals. It requires the acceptance of the principle that as much money as possible should be left in the hands of the business community to fructify and produce new goods and wealth. It requires that the right of all men to offer their services and productions freely in the common market place should be re-established: that private enterprise should be permitted to flourish and merit be rewarded.

This announcement is issued by The Sound Currency Association, 4, Dean's Yard, London, S.W.1

The Sound Currency Association holds its annual meeting on May 20th at The Abercorn Rooms, Great Eastern Hotel, Liverpool Street, E.C.2, at 2.30 p.m. ALL ARE WELCOME.

and Rhodesian Anglo-American, is no doubt due mainly to an improvement in finance business. The balance-sheet shows a decline in the total of cash holdings from £7,541,054 to £4,920,025 which is explained, partly by repayment of loans from affiliated companies and others of £1,760,426, leaving the total at £7,344,544, and partly by an increase in holdings of Government and other securities from £2,610,509 to £3,254,931. The value, at or under cost, of investments other than those in subsidiaries, is up from £7,203,674 to £7,793,570. It is clear that there has been, on balance, a definite improvement in market values during the year.

* * *

Anglo American Group

The milling tonnage of Brakpan was well maintained, but the reduced milling grade and higher costs resulted in a heavy fall in profits, and dividends were reduced to 2s. 6d., on which basis the yield at 28s. 9d. is 8.7 per cent. There was a heavy fall in the ore reserves, both in tonnage and in value, and this old mine will become increasingly dependent on its large holding in South African Lands, which had a most successful year. Tonnage milled, yield, costs and profits showed a very satisfactory increase; owing to higher taxation, the dividend was reduced slightly to 6s. 9d., on which basis at 4½ the yield is 8.1 per cent, which seems rather generous in view of the very good prospects of the mine. In spite of an increased milling tonnage, the yield, costs and profits of Springs were adversely affected. As a larger appropriation was made for stores, the dividend was reduced to 2s., on which basis the yield at 21s. is 9.5

per cent. A very severe fall in the ore reserve tonnage again occurred, and this fall is likely to continue. The upper or older portion of the mine is becoming exhausted, and the future will largely depend upon the opening up of the lower or Southern portion. A shaft to serve this part of the mine, jointly with the adjoining West Springs, is being sunk, but will take some years to complete. The position of the mine is not very satisfactory. The West Springs milling tonnage and grade were approximately maintained, but there was a substantial increase in costs, and, with a higher appropriation for stores, the dividend was reduced to 2s., to give a present yield at 33s. of 6.1 per cent. The ore reserves fell slightly. The large undeveloped area in depth will become available in due course, when the joint shaft with Springs is in commission, and the mine should have in prospect a long life. Daggafontein had a most successful year. Tonnage was increased, and whilst the sub-yield was slightly down, working costs showed a substantial fall, resulting in a larger profit. Owing to increased taxation, dividends were reduced slightly to 2s. 10½d., on which basis at 38s. the yield is 7.5 per cent. The ore reserves showed a satisfactory increase, and the mine is looking very well. East Daggafontein also shows a very satisfactory increase in tonnage, grade and profit, with also a factory increase in tonnage, grade and profit, and the dividends were raised to 2s. 6d., which at 37s. give a yield of 7 per cent. The ore reserves also show a satisfactory increase, and the mine clearly has a prosperous future in store. Western Reefs entered production, and a maiden dividend of 3d. was paid. Present tonnage, yield and costs are of little significance, being based on the first six months of crushing. The ore reserves show a very substantial increase, and the mine has a vast unexplored area.

Industry and Trade

Coal Consumption

The case for fuel rationing is incontrovertible. Consumption must be economised and cut down to a minimum compatible with the maintenance of the health of the people and the efficiency of essential industry. It is difficult to understand, however, why current discussion is centred almost entirely on the problem of economy in domestic consumption. The need for economy in industry is equally urgent. During the debate in the House of Commons on March 17th, Mr. Grenfell stated that the proportion of the national output taken for domestic purposes was about 20 per cent. Even if this is an underestimate, it indicates the importance of cutting out waste in industry. In fact, industry, like the domestic consumer, must be rationed on a much stricter and more effective basis than hitherto. For purposes of industrial consumption, crude and processed coal must be treated like steel and any other scarce commodity by the adoption of an efficient system of allocation, which not only eliminates all unessential uses, but also waste in essential industrial undertakings. Lord Leathers' statement on May 13th that there would be further careful pruning of passenger train services is to be welcomed. Together, domestic and industrial rationing should go a long way towards reducing the magnitude of the coal deficiency.

* * *

Insurance Against Nationalisation

After the outbreak of war, shipowners were required to obtain a licence from the Board of Trade (subsequently the Ministry of Shipping and later the Admiralty) for the completion of merchant ships then under construction and for the laying down of new ships. While licences have been issued for the construction of vessels on private account, a substantial proportion of the new ships have been, and are

being, built for the Government. In view of the heavy drain on the private fleets, the proportion of the total tonnage owned by the Government has been steadily increasing, a trend which was viewed with apprehension by the ship-owners. They feared that, if the war continued long enough, the greater part of the merchant fleet might be owned by the Government at its end and that there might be a demand for the nationalisation of the industry. Consequently, the General Council of British Shipping has approached the Ministry of War Transport with a view to being given an opportunity to buy these Government-owned ships. In other words, shipowners were anxious to stake a claim to the tonnage constructed on behalf of the Government. A scheme has now been devised, published as a White Paper on Friday, whereby shipowners who have lost tonnage, through marine or war risks, will be given the opportunity to purchase the ships built or to be built during the war on Government account. The price to be paid for these ships will be the cost of construction, less depreciation on the usual basis adopted by the Inland Revenue. Delivery will not be made until after the war, but the purchaser will be able to operate the ship to which he has acquired a title in consideration of a management fee. Ships will be offered on a rota basis in chronological order of losses, and vessels built for private account will be treated as an allocation from Government-owned tonnage. For the purpose of allocation, ships have been classified into types, comprising deep-sea liners, short-sea trade liners, deep-sea tramps, deep-sea tankers and coasting tankers. But not all the Government vessels will be made available to British shipowners; some of them will be assigned to the Allied Governments, and, in contrast to the deferred delivery scheme applicable to British shipowners, may be transferred immediately, on condition that they remain available to the Minister of War Transport.

Rejection of Wages Claims in Cotton Trade

The decision of the National Arbitration Tribunal to reject the claim for higher wage rates by the spinning operatives in the cotton industry, and the subsequent failure of the weaving operatives to secure an increase by arbitration, is of considerable interest. The application of the operatives was for an advance of 3s. 4d. in the £ on current wages in the spinning branch and for 8s. per week, on the basis of a 48-hour week, in the weaving section. Since the Ministry of Labour's cost of living index has remained comparatively stable for more than a year, the claim of the operatives was apparently made on the ground that their earnings are well below those of munition workers. In each case the arbitrators found that the claims had not been established. Operatives have already secured an increase of 35 per cent in wages since the outbreak of the war. Since the tendency of arbitration tribunals in their awards has hitherto been to compromise, the flat refusal of the National Arbitration Tribunal to concede even part of the claim of the spinning operatives in the cotton trade may indicate a determination to arrest the general upward movement in wage rates. Wage claims are under consideration in a number of other industries; it will be interesting to see whether the decision in the case of the cotton operatives will be regarded as a precedent.

* * *

Industrial Reconstruction

Last week the Executive Council of the Association of British Chambers of Commerce issued a report on the problem of industrial reconstruction. It is agreed that in order to secure full employment and a rising standard of living in world recovery, all aspects of industrial policy must be closely co-ordinated. The Executive Council suggests the establishment of a joint committee, comprising representatives of a council of industry, of an import and export council and of agricultural interests. The council of industry, consisting of representatives of industry, commerce and labour, is to be approved by the Board of Trade—which is simply the old and utterly false idea that corporate representation must imply competence and fair play. The council's task would be to ensure that the policy of each industry fits into the post-war scheme of reconstruction and, in collaboration with the Government, that trade and industry are "carried on for the benefit of the community as a whole." Within the general scheme of reconstruction, each industry should be responsible for the planning of its own policy and every encouragement should be given to the development of trade associations. It is admitted that steps must be taken to avoid the undue influence of organised producers; to enquire into existing monopolies, and trades and services which, by their nature, constitute monopolies; and to prevent the growth of monopolies in the future. Many of the aims outlined in the report are unexceptionable. But it is not difficult to discover a harking back to the old feudal and restrictive industrial self-government. While directions on industrial policy are to be given by the Government, the directions are to be based on the guidance of the council of industry.

* * *

Organisation of Building

One aspect of the unsolved problem of the relations between industry and the Government was strikingly revealed by the address of Mr R. Coppock, General Secretary of the National Federation of Building Trades Operatives and President of the Building Industries National Council, at the tenth annual meeting of the Council, held on April 30th. The burden of Mr Coppock's address was a plea for the recognition of BINC by the Minister of Works and Buildings as

the appropriate organisation representative of the interests in the building industry, competent to give him advice on matters relating to that industry.

He deplored the state of affairs whereby the policy of the industry is directed by persons "sitting in" with the Minister. The Ministry of Works and Buildings had set up an organisation under Sir James West, with seventeen sub-committees, all dealing with technical matters in relation to planning, and where the advice tendered by the outside organisations clashed with that given to the Minister by his own advisers, the independent advice has nearly always been rejected. If the implication of Mr Coppock's criticism is that the policy of the Ministry should be guided by BINC "on matters coming within the sphere of the building

industry generally," it raises the fundamental issue of the authority of the Government which is scarcely softened by the statement that

it was possible that in the post-war period we would find them [the vested interests in the industry] overridden by the compelling desire of the nation for decent homes and living conditions generally.

The national interest must prevail over the sectional interest, and any attempt by trade associations to undermine or to capture the authority of any Government Department is to be strongly condemned. The Ministry of Works and Buildings, as indeed any other Ministry, must be free in choosing its advisers, and any suggestion that trade associations should have a monopoly of advice is totally inadmissible.

* * *

"Closed Shop" in Coal Mining

On the outbreak of the war, an understanding was reached between the members of the Joint Standing Consultative Committee of the coal mining industry on the question of non-unionism. The owners' representatives assented to the principle that workpeople should be members of the trade unions which negotiated their collective agreements for them, and undertook to co-operate with miners' leaders in their efforts to secure a 100 per cent membership. The employers, however, were not in complete agreement on the question of making trade union membership a definite condition of employment, and under the security of the cost of living wage agreement and of the guaranteed pay week provision of the Essential Work Order, many workmen were behind-hand with their contributions, and there were threats of non-unionist stoppages in several coalfields, particularly in Yorkshire. These events led to a revival of the demand for a "closed shop," and it has now been virtually recognised in most of the coalfields of the country, though in various forms. In Yorkshire the employers have not only agreed "to use their influence to secure the individual membership of all workmen employed in and about the mines" but have also undertaken to refrain from paying the attendance bonus of 1s. per shift to non-unionists, subject, however, to an undertaking on the part of the miners' organisations to indemnify the owners in respect of any claim for wages or damages which may arise as a result of the operation of these arrangements. A very similar arrangement has been negotiated in Lancashire and Cheshire and Scotland, but in South Wales and Durham a solution of the problem has been found in the "closed shop" method. In the South Wales coalfield, the owners have agreed to make membership of the South Wales Miners' Federation a condition of employment, to deduct union contributions weekly from wages, and pay them over to the Federation's central office. These arrangements, from which clerks and officials are excluded, are to remain in operation so long only as the South Wales Miners' Federation retains complete authority to enter into and maintain agreements with the South Wales colliery owners, and "on the complete understanding that if the South Wales Miners' Federation should become subject to the overriding control of any other authority" they will become null and void. The contributions amount to 6d. per week, and the arrangements are to operate from May 22nd. The observance of these new arrangements will remove from the industry one of the most active normal peace-time causes of controversy and stoppage, and it is significant of a fundamentally changed attitude that in South Wales compulsory membership of the local trade union is to apply not merely, as in 1916, for the duration of the war, but for the full period of nearly four years ended February, 1946, covered by the new Conciliation Board Agreement. It is indicative of the harsh exigencies of wartime, and the bargaining strength of labour, that this dangerous, dubious and arbitrary principle of the closed shop should have been so readily and so widely conceded.

* * *

Retail Trade

Last week's issue of the *Board of Trade Journal* contained the retail trade returns for March and the Bank of England index numbers of retail sales. The higher level of the average daily value of sales compared with the early months of 1941 continued. In all departments, the value of sales was 6.4 per cent higher than a year ago. Central and west-end London again registered the biggest increase (25.8 per cent) and other regions showed rises ranging from nil to 8.7 per cent. The departments in which total sales have risen most markedly are household piece goods and furnishings, where the percentage changes from a year ago

were 45.3 and 35.2. Men's and boys' wear rose more than usual by 30.2 per cent, perhaps as a result of buying to avoid the restrictions on style. Women's wear sales rose only by 3.2 per cent compared with rises of 9.3 per cent in January and 5.0 per cent in February, which suggests that in March, 1941, women bought spring clothes despite the bombing (the percentage rise in March, 1941, over March, 1940, was one per cent). Sales of hardware and sports and travel goods decreased by 3.7 per cent and fancy goods sales by 2.3 per cent, while the miscellaneous departments showed an increase in turnover of 8.8 per cent. The figures of sales must be examined in conjunction with the figures of the value (at cost) of stocks. The figures of value are some indication of the size of stocks in the shops, but prices have risen unevenly over the departments. Values of stocks have fallen most in household piece goods (-28.1 per cent), miscellaneous (-23.4 per cent), sports and travel goods (-20.4 per cent), and furnishings (-16.5 per cent). The biggest rise in value is in women's wear (4.8 per cent), but normally there is a rise at this time of year, and this year it is lower than usual.

* * *

Second-Hand Furniture

The boom in the prices of second-hand furniture is not to go on. There is less new furniture, and the quality of wood and workmanship is generally not as good as in pre-war days. Good second-hand furniture has, as a result,

been obtainable only at a premium, but the rise has been evident in all grades of furniture. (For example, the average price of an ordinary deal kitchen table in a well-known second-hand furniture selling district of London, was recently as high as 35s., when the pre-war price would probably have been 5s.-10s. Furniture prices were frozen from May 11th at prices prevailing on May 1st. For second-hand goods, the Board of Trade has made an Order fixing their price on alternative bases. The price can be the one at which the same or comparable goods are being sold new, either on the day of sale or during the six months before May 1st. Or it can be the estimated reasonable price at which such goods would have been sold new during the six months before the war. An acute sense of value would be needed to compare two articles of furniture, one old and one new, which serve the same purpose, so that the price of the old could comply with the Order. So many factors affect the price of second-hand furniture that to lay down any more explicit price definitions would probably be impossible. The provisions of the Order are likely at least to act as a brake on prices, even if some further rise cannot be prevented. Antiques are exempt from the provisions of the Order, and the problem of what constitutes an antique has been solved simply. An antique is now any article made before January 1, 1900. Apart from the difficulty of proving when an article was made, this definition will raise many Victorian whatnots, among other things, to the dignified status of "antiques." Perhaps even a new fashion for horse-hair sofas will arise.

INSURANCE NOTES

PEARL ASSURANCE

THE first of the accompanying tables reproduces extracts from the life revenue accounts. The most striking feature is the very large increase in new business in the ordinary branch; the president and chairman (Sir George Tilley), in the statement circulated with the report and accounts, mentioned that one of the reasons was the introduction of a 3 per cent Savings Bonds policy which provides full war risk cover for civilians; this policy has produced a steady flow of business throughout the year. A strong advance is also revealed in the industrial branch, and here the chairman pointed out that the extension of income-tax to lower ranges of income had made a life policy more valuable to those who are subject to the tax for the first time, by reason of the rebate on premiums. Interest income in relation to the company's funds continues its downward trend, due largely to heavy investments in Government securities—since the beginning of the war over £18½ millions has been used to absorb Government issues—and also to some extent to the circumstance that securities requisitioned have been of high-yielding character. Death claims are lower in both branches, notwithstanding that payments in respect of deaths arising from enemy action have increased from £55,000 to £82,000 in the ordinary branch and from £102,000 to £158,000 in the industrial branch; one-half of the last-mentioned figure is in respect of men in the Services. Higher ratios of commission and expenses to premiums are the natural result of the expansion in new business, coupled with the increased cost of administration under war conditions and the rise in payments to members of the staff called for national service, who number over 4,000.

Premium income and underwriting results in the various branches are exhibited in the second table. The profits shown for the life branches are the surpluses earned during the year; these surpluses are much reduced—in the ordinary branch the result is actually a small minus figure—chiefly attributable to the strain imposed by a strengthening of the valuation bases. In the other branches the profits are the actual trading balances, excluding interest earnings, and not the transfers to profit and loss account. The fire premium income is higher, but the increase is not derived from the United States, where a policy of deliberate restriction of writings is being pursued; it is presumably the unsatisfactory results of the company's business in the American field which in substantial measure explain the loss on the year's operations. Trading in the various classes of accident business has been profitable, although the combined balance is insufficient to offset the loss on the fire account.

The underwriting profits set forth in the table are supplemented by interest earnings in the "other branches" and in profit and loss account totalling £57,000, making aggregate earnings for the year of £746,000. As was the case last year, no reversionary bonuses are being allowed, but modest bonuses are being granted on policies which become claims by death or maturity in 1942 in both the ordinary and industrial branches; these bonuses absorb £165,000 (£46,000 in the ordinary branch and £119,000 in the industrial branch). Allocations to staff pensions fund take £200,000 and the reserve for NDC costs £35,000. The dividend for the year is 7s. 6d., tax free, compared with 9s., tax free, for 1940, and the cost, including the preference dividend, is £468,000, against £558,000.

The balance-sheet position remains strong. The chairman stated that the market values of Stock Exchange securities is considerably in excess of the value at which they are shown in

the balance-sheet, leaving the investment reserve funds of £6,450,000 intact as an additional reserve. The surpluses carried forward in the ordinary and industrial life branches aggregate £2,382,000.

Note:—In calculating the underwriting profits for "other branches," additional reserves have been left out of accounts except in the case of capital redemption business, the underwriting profits for "other branches" do not include interest on departmental funds.

REFUGE ASSURANCE; BRITANNIC ASSURANCE

EXTRACTS from the life revenue accounts of these large industrial-cum-ordinary offices, with headquarters in Manchester and Birmingham respectively, are given in the table on page 700. The Refuge reported a substantial increase in new business in the ordinary branch, and a higher premium income in both ordinary and industrial branches, results which are remarkable bearing in mind that as many as 2,462 of the regular staff are

(Continued on page 699)

COMPANY MEETINGS

SCOTTISH UNION AND NATIONAL INSURANCE COMPANY

A YEAR OF EXPANDING BUSINESS

DIVIDEND MAINTAINED

SIR THOMAS WHITSON'S STATEMENT

The one hundred and seventeenth annual general meeting of the shareholders of the Scottish Union and National Insurance Company was held at Edinburgh on the 13th instant.

Sir Thomas B. Whitson, LLD, chairman, presided. The following statement by the chairman circulated with the annual report and accounts for the year ended December 31, 1941, was taken as read:—

During the year we have lost the valued services of Lord Selborne, who had been a director on the London board for a number of years. He will be greatly missed, and we regret his passing.

We have to welcome to the head office board the Right Hon. William Y. Darling, Lord Provost of Edinburgh, who joined us in October last.

It will be noticed in the statement before you that the accounts for the past year are in a slightly different form from those of previous years. This is a consequence of the request of the Government that we should all economise in the use of paper.

LIFE AND FIRE FIGURES

Life Department.—New business for the year, after deducting re-assurances, shows an advance in sums assured of £135,319 over the 1940 figure. While the new annual premiums increased by £9,187, single premiums showed a decrease of £2,750. Claims by death, with a reduction of £40,207, reflect a very favourable experience, despite the claims due to hostilities on policies issued before the war. The total claims since the outbreak of war due to hostilities amount to £64,675. Maturities decreased by £27,784. The gross rate of interest earned on the life funds in 1941 was 4.7s. 6d. per cent., and the net rate 3s. 2s. per cent.

In spite of war conditions, surrenders show a satisfactory decrease of £16,508. The amounts paid in annuities also showed a decrease. Commissions and expenses of management increased by £1,711.

The combined life and annuity funds have increased by £37,955 during the year.

Fire Department.—The total net premiums at £1,176,092 show an increase of £126,848 over the previous year. The total net losses, including fire brigade charges, were £531,839, which represents an increase of £19,489 over 1940. In view of the advance in net premium income, the loss ratio shows a welcome improvement. After allowing for the usual 50 per cent. reserve, the profit realised £74,452. During the year many factors, directly and indirectly connected with the war, exercised a considerable effect upon the fire department, both at home and abroad. A number of these factors were existent during 1940.

ACCIDENT AND MARINE RESULTS

Accident Department.—It will be noted that the accident, employers' liability, and miscellaneous accounts have been combined. The total net premiums in the combined accounts show an increase of £54,553, whilst the losses paid are £11,241 more than the previous year. After allowing for the usual 50 per cent. reserve for unexpired risks, and the necessary provision for outstanding claims, the transfer to profit and loss is £11,340. Each of the sections in this department with the exception of motor have shown a trading profit. Whilst the home experience has been generally satisfactory, this account has suffered by the continued unfavourable overseas motor experience.

Marine Department.—The trading of recent years in this department has enabled us to transfer to profit and loss a sum of £75,000. The spread of the war to the Pacific and other parts of the world has recently added so many problems and difficulties to those already borne by marine underwriters that our trading in the future will need to be kept under closer review than in the past.

ASSETS EXCEED £18,000,000

Profit and Loss.—I would draw your attention to the item for interest in this account. In the past it has been our practice to

place our interest earnings (other than life), less relative income-tax, to their respective revenue accounts. We are now placing the whole of such interest, less tax, to profit and loss account.

The directors are pleased to be able to maintain the same rate of dividend as last declared namely 4s. 6d. per "A" share and 16s. 10½d. per "B" share.

Balance-sheet.—The total assets of the company increased during the year by £456,734 to £18,347,051. We have contributed to the National War Effort the greater part of our available money, so that the amount in British Government Securities in our accounts is £3,674,800. The company's shareholdings in American subsidiary companies have been placed at the disposal of His Majesty's Government in accordance with the provisions of the Financial Powers (USA Securities) Act, 1941. The company's operations in the United States of America are being carried on under the same conditions as before.

TRIBUTE TO STAFF

It is with great regret that I have to report that a number of our staff have lost their lives whilst on active service, and I would wish to extend to their relatives our sincere sympathy. The continued demand by the Services for men and women has resulted in a further depletion of our staff at home and abroad. Thus those remaining are called upon to carry increasing responsibility and to work longer hours. To all of these we express our gratitude and thanks for the manner in which they are continuing to carry on.

I should like to refer also to the part which the staff have played in the War Savings Campaign and the considerable sums which they have contributed. To all members of the staff serving with His Majesty's Forces we send our best wishes and hope for their speedy return. To the other members of our organisation, our agents, branch managers, local directors and trustees, at home and overseas, we express our thanks for the work they have done during the year for the benefit of the company.

The report and accounts and dividend were approved.

THE LONDON ASSURANCE

A YEAR OF PROGRESS

The annual general court of The London Assurance will be held on the 20th instant in London.

The following are extracts from the statement by the governor, Mr R. Olaf Hambro, on the report of directors and balance-sheet for the year ended December 31, 1941:—

The net new life business for 1941 totalled £1,143,538. Premium income during the year amounted to £842,607 and the fund as at the end of the year at £11,318,486 shows an increase of £350,093.

The gross interest yield at 4.5s. per cent. shows a reduction of 2s. 6d. and the net at 3s. 9d. per cent. a reduction of 3s. Expenses of management show a further reduction during the year. Our mortality experience has been in every way satisfactory. The Stock Exchange investments of the life department fund show an appreciation over book value of £300,000. It is our continuing practice to invest all surplus money in new Government issues, and during the period of the war our new investments under this heading exceed £1,500,000.

The premium income of the fire department at £2,445,928 represents an increase over the previous year of £237,977. The profit transferred to profit and loss account is £18,698. The accident department premium income also shows an increase of £54,027. The amount transferred to profit and loss account is £215,015, representing 15.5 per cent. of the premium income, a highly satisfactory figure. The marine account premium income shows a continuing advance, the increase this year being £204,787, the total for the year being £1,463,853. After transferring £50,000 to profit and loss account, the marine fund stands at £2,057,179, or 142.6 per cent. of the premium income for the year.

The premium income of the corporation during the past year reached the total of £6,152,425 and our total assets as at the end of the year £23,990,327. The year has admittedly been a difficult one, but taking all the factors into consideration, progress has been recorded. Our total income has been more than maintained. There is, however, a probability that during the present year there will be some recession.

SPILLERS LIMITED

POSITION OF FLOUR MILLING INDUSTRY

AGREEMENT WITH FOOD MINISTRY

DIVIDEND MAINTAINED AT LAST YEAR'S FIGURE

SIR MALCOLM A. ROBERTSON'S REVIEW

The fifty-fifth annual general meeting of Spillers Limited was held at the Waldorf Hotel, London, W.C., on the 15th instant, the chairman of the company, the Rt. Hon. Sir Malcolm A. Robertson, PC, GCMG, KBE, MP, presiding.

The secretary, Mr P. Lloyd Tanner, FCIS, read the notice convening the meeting and the auditors' report.

The chairman submitted to the meeting his statement, which had been circulated to stockholders with the directors' report, as follows:—

I regret that once again it is not possible to lay the accounts of the company before the stockholders at the annual general meeting, and that at a later stage I shall have no alternative but to propose the adjournment of the meeting *sine die* for the future reception of these accounts. I am, however, glad to inform you that I hope this is the last occasion when it will be necessary to adopt this procedure.

A COMPLEX AGREEMENT

In the latter part of last year an agreement was concluded between the Minister of Food and the flour milling industry, and adopted by the company, prescribing the terms and conditions under which flour milling operations would be carried on for the three years following the outbreak of war. This agreement will accordingly govern the results of the flour milling side of the company's business from September 3, 1939, to August 31, 1942. As was foreshadowed in my statement last year, the accounting problems arising on this agreement are formidable and it will take some time to ascertain the company's precise position thereunder. This work is now in hand and it is the hope of your directors that on the occasion of the next annual general meeting it will be possible to place accounts before you.

GENERAL TERMS OF AGREEMENT

The agreement is one of some complexity and I shall not attempt to do more than convey its essential terms in broad outline. In essence it is provided that the reasonable costs of production of each flour milling undertaking shall be recouped and that there will be paid to the industry a profit per unit of output determined by reference to an overall average based on a pre-war period. There is, however, an important proviso to the effect that irrespective of the output during the period of the agreement the total profit is subject to a maximum determined by the average pre-war output. In these circumstances additional output attained during the period of the agreement does not carry any profit. Notwithstanding the imposition of this maximum upon earnings there is no minimum. If output falls below the pre-war standard the earnings decline accordingly.

DIVISION OF EARNINGS

As I have indicated, the earnings are payable to the industry as a whole and these are divisible in accordance with an agreed formula among the individual concerns. Since these comprise several hundred firms both large and small and many complications were involved, I think the reaching of agreement is a tribute to the broadminded manner in which the problem was considered by the industry. The administering of the agreement necessitated the formation of what may be termed a "trustee" company on the board of which your company is represented.

ANIMAL FEEDING STUFFS

No corresponding arrangement exists regarding the other major side of the company's activities—the manufacture of animal feeding stuffs. Output has been severely curtailed by restriction of supplies of raw material and the resultant decline in earnings has been accentuated by the absence of adequate adjustment of controlled prices. Negotiations are proceeding regarding concentration of manufacture in this industry, but have not reached a stage which allows me to make any useful comment.

TERMS NOT GENEROUS

Pending the preparation of accounts, it is difficult to comment with authority upon the financial effect upon the company of the various control regulations and arrangements. I can only indicate that on the flour milling side the terms are not regarded by your directors as generous in relation to the difficulties and scale of effort involved, while on the animal foods side the return is, by reason of reduced output, no longer commensurate with the extent of the undertaking.

In expressing these views I am looking beyond the narrower confines of current earnings and taking into consideration the necessity of maintaining essential industry in such manner as to enable it to emerge from the war period sufficiently strong to permit of its rehabilitation and rapid adjustment to competitive conditions. This has been recognised in the Finance Bill to the extent that the refund of 20 per cent. of the excess profits tax is given by statutory right. But this concession is of little or no value to an industry where the earnings are subject to control in such manner as substantially to eliminate the emergence of any liability which would be subject to refund.

WAR DAMAGE AND THE INLAND REVENUE

The incidence and effect of war damage enters prominently into the problem of post-war rehabilitation, and unhappily further damage was sustained by the company's properties during the past year. In this connection I feel compelled to direct attention to the added burden which arises from the present attitude of the Inland Revenue authorities who in effect seek to reduce the standard profit for the purposes of the excess profits tax by eliminating from capital employed the value of fixed assets rendered inoperative by enemy action even although the lost output is made good from other plants. I express the hope that inequity of this procedure will be immediately remedied so that those who have had the misfortune to suffer damage may be encouraged in their endeavours to minimise the effect of it upon the war effort.

DIVIDEND DECISION

I now come to the question of dividends for the year ended January 31st last. As in the previous year the lack of full information concerning the actual earnings and the other circumstances to which I have referred rendered the recommendation of dividends a difficult problem for your board. Having regard to the best estimates it was possible to make and to the strong liquid position and reserves built up in the past, the directors decided that they would be justified in recommending the declaration of dividends at the same rate as last year.

A resolution to this effect will be submitted at a later stage. It would, however, be wrong to suppose, as has been suggested in some quarters, that this level of distribution can now be regarded as established for the period of control. I have indicated to you a number of matters which cause anxiety to my colleagues and myself and there are all the other uncertainties inseparable from trading under war-time conditions. It will be necessary to make such reserves against the future as our resources permit and this is a matter which will be considered by the board as soon as accounts have been prepared for the three past years. This, together with future earnings, will govern the recommendation of subsequent distributions.

The preservation, so far as current conditions permit, of the basis of the company's trade in its various products continues to engage the attention of your directors. In these times our principal aim must be and is the production and distribution of essential foodstuffs, and the company's contribution in this respect is one of which I do not think we need be ashamed! I should, perhaps, remark upon the recent Order increasing the level of flour extraction for general purposes to 85 per cent. The change has been successfully accomplished at the various mills. This matter was

UNITED MOLASSES COMPANY, LIMITED

MR F. K. KIELBERG'S STATEMENT

The annual meeting of the United Molasses Company, Limited, will be held on the 29th instant in London.

The following is an extract from the statement by the chairman, Mr F. K. Kielberg, circulated to stockholders:—

There is, in existing conditions, little I can usefully add in explanation of the accounts or in elucidation of the company's activities during the year under review.

In the United Kingdom the company continues to act as agents for the Ministry of Supply, under the direction of the Controller of Molasses and Industrial Alcohol. The extension of the war to the Far East has still further curtailed the company's field of activities and has brought the company's business in that part of the world to a complete standstill. No news has been received from our subsidiary companies in China and Java since the Japanese occupation of Shanghai, Hongkong and the Netherlands East Indies.

The original cost of the company's assets in the areas now overrun or threatened by the Japanese amounted to over £1,250,000, but, as mentioned in the previous report of the directors, the fixed assets had already been written off by the end of 1940 and the remainder of the company's investments in China, Java and India has in the meantime also been fully provided for.

The company's fleet of tankers continues to operate under charter to the Ministry of War Transport. Losses suffered during the year were not severe and I am happy to be able to state that the tonnage acquired from the outbreak of war up to December 31, 1941, exceeded the total tonnage lost by the company during the same period. It is, however, getting more and more difficult for private owners to acquire tonnage at economic prices and for that reason, and in order to make provision for the anticipated high rebuilding cost of new tonnage, your directors have again this year placed the difference between insured values and written-down book values of vessels lost to a special ships rebuilding reserve account.

WILLIAM BEARDMORE AND COMPANY LIMITED

ORDINARY GENERAL MEETING

The ordinary general meeting of William Beardmore and Company, Limited, was held, on the 14th instant, at the offices of the company in Glasgow.

Sir James Lithgow, Bt., MC, DL, presided.

The secretary, Mr D. M. Cameron, CAC, read the notice convening the meeting, and the report of the auditors was read by Mr H. MacRobert, CA.

The chairman proposed the adoption of the report and accounts and the payment of the dividend on the ordinary stock as recommended.

The resolutions were carried unanimously.

The retiring directors, Mr J. B. Talbot-Crosbie, Mr T. M. Service, Mr Henry Lithgow and Captain Q. H. Paterson, DSC, RN, were re-elected, and the auditors, Messrs J. Wyllie Guild and Ballantine, reappointed.

A vote of thanks to the chairman concluded the proceedings.

TRIBUTE TO STAFF AND WORKPEOPLE

I would now express on behalf of the board our continued admiration of the manner in which the staff and workpeople of the company have performed their work under difficult—and often hazardous—conditions and with depleted numbers. Some have been decorated or commended by the authorities for their services in civil defence. All deserve our thanks and I am sure you will desire me to record on your behalf the high appreciation of their services. Many of the company's employees are now serving with the Armed Forces and to them I should like to convey our best wishes and hope for a speedy return to their former posts. Lastly I would record the company's sympathy with the relatives of those who have lost their lives through enemy action at home or overseas.

The report was unanimously adopted.

The retiring directors, Mr A. F. Forbes and Mr Wilfred D. Vernon, were re-elected, and the retiring auditors, Messrs Impey, Cudworth and Co. and Messrs Deloitte, Plender, Griffiths and Co., were reappointed.

After a vote of thanks to the chairman, the meeting stood adjourned.

JOHNSON AND PHILLIPS LIMITED

RECORD TRADING PROFIT

The twenty-seventh annual general meeting of Johnson and Phillips, Limited, was held, on the 14th instant, in London.

Mr G. Leslie Wates, JP, the chairman, in the course of his speech, said:—

The trading profit for the first time in the company's history has exceeded £500,000; this figure is arrived at before taxation. The largest allocation which has to be made from it is in respect of taxation, and on this head we make a reserve of £260,000, being the same figure as was reserved last year. We have made other reserves in connection with certain unascertained figures in relation to the company's trading which we consider reasonable and cautious.

The deductions from the trading profit in respect of directors' remuneration, auditors' and trustees' fees and the service of the debenture stock issue remain as last year.

We have written off by way of depreciation approximately the same sum as last year, and in this connection we have in mind the addition which we have made to the special reserve for contingencies, and also the post-war return of excess profits tax.

We have worked the great bulk of our plant and machinery to the maximum during the year. This has necessitated special care and a large extra cost in the repairs and maintenance undertaken, which accounts for the increase under this heading mentioned in the profit and loss account. Scientific development, which as always is most active in time of war, may quite possibly produce a change in the types of cable in use, which may by a stroke make redundant some parts of our plant.

The cost of the pensions and group life assurance scheme, and payments to men serving in HM Forces, are now reaching more substantial figures than we have been used to. These various allocations leave us £257,000 to deal with, which is within £4,000 of the figure available last year. We propose to pay the same dividend and to make the same allocations to research and development account, and to the special reserve for contingencies.

In conclusion he paid a tribute to the staff and workpeople for their loyal work.

The report and accounts were unanimously adopted.

(Continued from page 696)

now serving with the Forces or engaged in whole-time national service. The chairman (Mr J. Wilcock Holgate), in his annual address, indicated that the major concern at the present time is the continued reduction in the net rate of interest earned on the company's funds, and made the interesting suggestion that the one effect of this trend may be to bring to the forefront "the original conception of life assurance as a means of providing financial protection to a man's dependants in the event of his premature death, the investment element assuming a lesser importance than it has been possible to attach to it, quite fortuitously, in the past." Payments on account of death claims were lower, notwithstanding the incidence of war deaths, and

surrenders were much reduced, evidence of the policyholders' determination to keep their policies on foot. The expense ratio was higher in the industrial branch, but this feature must be considered in conjunction with the allowances which the company is making to members of the staff who have been called to the Forces.

The annual valuation was made on a strengthened basis in the ordinary branch, as regards life assurances being at least as stringent as a net premium valuation using the A 1924-29 Ultimate Table of Mortality, with interest at 2½ per cent; in the industrial branch additional provision has been embodied to meet prospective adverse mortality due to the war. The

(Continued on page 700)

GOVERNMENT RETURNS

For the week ended May 9, 1942, total ordinary revenue was £35,319,000, against ordinary expenditure of £78,762,000, and issues to sinking funds of £195,000. Thus, including sinking fund allocations of £638,155, the deficit accrued since April 1st is £322,189,000 against £330,613,000 for the corresponding period a year ago.

After decreasing Exchequer balances by £475,382 to £2,876,658, the other operations for the week (no longer shown separately) raised the gross National Debt by £43,508,460 to about £14,396 millions, after deducting sinking fund allocations in 1941-42, but before allowing for issues to sinking funds in 1942-43.

Shorter Comments

Production was called for, not only to achieve the efficient use of the nation's resources, but also to bring about action—to link output and strategy; to ensure that the right kind of weapons, as well as the right quantities, were produced; and to enforce the maximum of technical competence in manufacture, regardless of vested interests. A United Command is demanded for the same reason, to secure effective military action as the months of attack approach and to work out in deeds the conviction of the people that *il faut en finir*. At home, a plan for coal is called for to guarantee action before the ordeal of next winter, to impose, not only a fair and effective scheme of rationing, but also a reorganisation, under the State and in the interests of the community at war, of the entire process of production and distribution.

After Whitsuntide, the Government will produce a plan for coal. For two years the coal position has seen an inactivity which has been the reverse of masterly. Coal-getters were called up; pits were closed. The inevitable war demand for more and more coal was ignored; absenteeism among miners grew; the self-regarding attitude of owners impeded effective production, effective allocation of coal supplies according to war priorities and effective distribution; official timidity allowed ineffective control. There was a maintenance of peacetime practices by both workers and employers; their sole achievement has been, in combination, to impose the "closed" shop upon the coal industry. There is a demand for action in place of inactivity, for recognition of the common interest in place of sectional claims and for a single effective control. More coal is needed for the war, and less must be used by civilians. On the side of consumption there must be prompt, fair and effective rationing. On the side of output it is plain that the industry has proved itself inherently unable to solve its problems. It has set its face for a quarter of a century against all the plans for reorganisation, agreed by impartial investigators, to secure efficiency. The proper solution for the fuel crisis has already been canvassed in *The Economist*. It is to secure three things: the merging of entire districts into common productive units; the pooling of district resources of men and equipment under single responsible and competent district officers; and the pooling of financial claims so that the decisions taken for productive efficiency are matters of indifference to individual owners. If there is rationing of fuel without reorganisation of the coal industry, it will be a disaster, in fact and in principle. If there is no rationing, it will be a great surrender, as well as a disaster. If there is no reorganisation, it will be a betrayal of the nation's needs—and the need for an efficiently organised coal industry will not cease when the war ends.

A wartime government is always on trial. In the third year of war, when in place of war weariness, there is this militant and aggressive spirit, the trial is at its peak. The Government must prove, not only that it has the willingness and the wit to win the war beside its Allies, but also that it has the will, without reservation, to reshape the nation's economy wherever the needs of victory demand it. To use the pretext of war to "mutilate" the Services or to destroy the freedom of an industry would be political nonsense without excuse. But to refuse to take any steps required either to reorganise the Forces or to maximise war production would be political suicide. That is why these Whitsuntide debates are crucial.

It may be that the Government will return after Whitsuntide steeled against the 1922 Committee and armed with a three-point plan to ration fuel (on the lines laid down by Sir William Beveridge), to reorganise the coal industry as war and the common weal require and to focus communal control of fuel supplies in a single fuel department. But the omens are not good. The issue is too much confused by cries for and against "nationalisation." What appears to be a serious blow was recently struck against the war effort because of fear of nationalisation. Under the new shipping White Paper, State-built ships will be transferred to the ownership of the companies

whose ships have been sunk—which is quite reasonable. But they will apparently be managed, not by the most suitable companies in relation to their employment in the war effort, but by their prospective owners. The whole principle of the shipping pool is seemingly denied—for political reasons. Silently, what appears to be a scandal has gone through. The Labour Party, which has a Minister in the War Transport department, has raised no protest, just as, in the parallel case of coal, it is wedded to a doctrinaire and inefficient scheme of control by a representative body of workers and employers. It is not easy to look ahead when forces like these are in charge.

Just over 80 years ago, the Editor of *The Economist* set out the fundamental problem which now faces this country and its leaders:—

There are two kinds of statesmen [he said] to whom, at different times, representative government gives an opportunity and a career—dictators and administrators. There are certain men who are called in conjunctures of great danger to save the state. When national peril was imminent, all nations have found it needful to select the best man who could be found—for better, for worse; to put un- limited trust in him; . . . the qualities which are necessary for a dictator are two—a commanding character and an original intellect. All other qualities are secondary.

Words change their meaning. In the modern sense of dictator, Mr Churchill is its complete antithesis; in Bagehot's loftier sense, he is its very type. What is wanted now, in the third and decisive year of the war, is the "administrator" as well as "the dictator."

A really great administrator [says Bagehot] thinks not only of the day, but of the morrow; who is eager to extirpate every abuse and on the watch for every improvement; is on a level with the highest political thought of his time, and persuades his age to be ruled according to it in policy and in laws. . . . Administration in this large sense is concerned with the far-seeing regulation of future conduct, as well as with the limited management of the present. Great dictators are doubtless rare in political history; but they are not more so than great administrators. It is not easy to manage any age; it is not easy to be on a level with the highest thought of any age; but to manage that age according to that highest thought is among the most arduous tasks of the world.

The task now is to do precisely this, to solve these problems—of command, production and industrial organisation—according to "the highest political thought of the time" and by reference to "the far-seeing regulation of future conduct."

To say this is not to share in any intrigues against Mr Churchill and his Ministers. It is the right and duty of every responsible citizen and every worthwhile Member of Parliament to demand the best policy from the Government he supports. As Sir Edward Grigg has said:—

The House must face its own responsibility. It is no good saying simply, "Oh, the Government must know, trust the Government."

There are intriguers. On the Tory back bench, there is a surly resentment against the Prime Minister and his non-Tory advisers; on the Labour back bench, there is a petulant impatience with the Conservative connection. They shoot here and there and everywhere, but they mean to hit Mr Churchill. But these are only the petty complaints of little men, afraid of the darkness that is falling upon them and their puppetry. It is England that is at stake, not this flotsam and jetsam. The Government is not challenged by these factitious people, but by the facts. It is the privilege of Ministers to be held responsible. And the people must be given proof, not only of good intentions but of right methods, not only of laborious effort but of ruthless efficiency. Politicians live by their words, but they are known by their deeds. The present Ministers, who still command the support of an overwhelming majority of the people, must inevitably be judged, not by what they have done in the past, but by what they do now to strike at the enemy abroad and at the entrenched interests at home.

Myth of Empire

ALL is quiet in Madagascar and Martinique. In the one island military operations, in the other the negotiations between the American Government and Admiral Robert, are going smoothly. In France, too, although press comment has been very bitter, particularly over Madagascar, and the Paris collaborationists have called for positive reprisals, it does not look as though Laval will decide on military action—certainly not against the Americans.

This mixture of wordy violence and physical passivity reflects Vichy's basic attitude towards the French Empire. In its search to resurrect the ghosts of French history, the regime has not neglected Jules Ferry's attempt after 1870 to compensate the French for the loss of Alsace-Lorraine by a feverish plunge into colonising activity. One of the principal reasons put forward for the capitulation at Bordeaux in 1940 was "the preservation of the integrity of the French Empire," and ever since, the glories, the fidelity and the resources of the colonies have been a constant theme in French propaganda. The men of Vichy have tried to turn the eyes of the people—particularly the young people—away from their miseries at home to the land of promise overseas—*la France d'outremer*.

Their efforts have not been very successful. After 1870, Deroulade complained "I have lost two daughters [Alsace and Lorraine] and you offer me a crowd of domestics." To-day, two-thirds of France is lost; and at the same time the Empire, far from expanding vigorously as it did in the seventies and eighties, is undergoing a process of steady disintegration. The gap and contrast between Vichy's grandiloquent consciousness of Empire and its actual power to maintain its military and economic grip upon the colonies is yet another of those shams and deceptions actively practised by the regime which give to the structure of the Government its air of shabby unreality.

Vichy's difficulties in the Empire are not primarily political. Apart from a few dependencies—French Equatorial Africa and the Pacific islands—there has been little or no movement to break away from Vichy. The colonial officials and the colonial armies have maintained their loyalty to Marshal Pétain, not only because of their innate conservatism, but because the outlook for the Allied cause has hitherto looked black. If the choice lay between not fighting and being defeated under Pétain or fighting and being defeated all the same under Britain, there was no doubt where the balance of interest lay. Vichy's difficulties are difficulties of power, the impossibility of maintaining an effective system of defence, particularly in the outer fringe of colonies, the difficulty of

keeping up the particularly close and exclusive economic ties which, since the Customs Union of 1928, have bound the French colonies to the mother country.

There is little need to go into the military situation. In the Far East, Indo-China has been incorporated into the Japanese Empire without a shot being fired and with the active collaboration of Vichy's colonial officials. Syria has fallen to the British and the Free French. Madagascar has been occupied. Martinique and the other islands in the Antilles are passing under the effective military control of the United States. France's military position is secure—for the time being—only in French North and West Africa.

The economic picture is the same. The colonies of the outer fringe have been absorbed into other economic systems. Only with North and West Africa is effective contact maintained. Indo-China was granted a species of tariff autonomy at the beginning of 1941, which transferred it to "The Great Asiatic Co-Prosperity Sphere." In May, 1941, two economic agreements were signed with Japan, which rounded off Japan's "peaceful penetration" even before the establishment of military bases. Under these agreements, Japan secured Indo-China's rice supply, and was given the right to exploit industrial and commercial concessions. At the same time, the country was incorporated into the yen bloc. On the other side of the world, Martinique, which used to send France 99 per cent of its exports in return for 67 per cent of its imports, has become entirely dependent on supplies from the USA. Under an agreement signed in November, 1940, the US Government agreed to release certain sums from the blocked French accounts to enable Martinique to pay for its supplies. Syria and now Madagascar are part of the United Nations' world economy with its economic life blood of Lend-Lease.

The loss of the outer fringe of colonies has completely upset the balance of France's colonial economy. Not only was the system one of great interdependence between the metropolitan and the colonial countries; the dependencies also traded extensively with each other, and the loss of some of them has seriously compromised France's economic position, even in those African colonies where its political hold is still secure. From the Customs Union of 1928 until the outbreak of war, the volume of France's colonial trade and its ratio to the whole of the nation's foreign trade rose steadily. The table on page 708 shows the importance of the more distant colonies as sources of supply for France and the importance of France as a source of supply for the Mediterranean colonies. Now this relationship has been broken up. The olive oil, vegetables, fruit, tobacco, wool and

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

cotton of Syria and Lebanon, the maize, tea and rice of Indo-China, the palm kernels and palm oil of Equatorial Africa are lost. With them has gone the basis for a well integrated division of labour between the various parts of the colonial Empire. Algeria, for example, supplied two-fifths of the wine drunk in the colonies. North Africa imported large quantities of Indo-Chinese rice and tea.

France's economic relations with the nearest dependencies have been similarly upset. True, the vegetable, fruit and grain producers of North Africa no longer compete with French producers. The best agricultural land in France is under German occupation, and North Africa is now being squeezed dry to feed the mother country. In 1941, over 300,000 tons of fruit and vegetables were shipped from North Africa to Marseilles—the percentage of the Axis "rake off" has been put as high as 60 per cent. Iron ore and phosphates have also arrived in Marseilles from North Africa—the Axis percentage has probably been the same. The trouble is that France cannot satisfy North Africa's chief needs in return. French industry is working for the German war machine, and there is virtually no margin of export. The output of textiles, which are badly needed in North Africa, was cut drastically towards the end of 1941. There is no fuel surplus; on the contrary, France itself is running

Figures taken from the R.I.I.A. publication "French Colonial Possessions" (1940).

desperately short. A certain amount has been done in North Africa to turn wine into motor spirit, but it is impossible to make good the deficiencies. France cannot export machinery—particularly agricultural machinery—or spare parts, and the situation is developing into a vicious circle, with France demanding more and more food, and North Africa demanding more and more implements before extra food can be produced. General Weygand stated at a press interview, shortly before he was "retired," that it was not much good giving Algeria bank notes which bought nothing in return for all its exports. In these circumstances, the setting up of an economic office in Algeria and the holding of an Imperial Economic Conference in Vichy this February conformed to Vichy's general practice—"full of sound and fury, signifying nothing."

The same must be said of the two projects, the trans-

formation of West Africa into a "second Egypt," and the building of the Trans-Saharan railway. The irrigation of the Niger delta is to make possible a large scale production of rice, cotton and wheat in French West Africa. According to German sources, the irrigation scheme will make it possible to put 500,000 hectares under cotton, and some 450,000 hectares under rice. West Africa is to be merged into one economic unit with North Africa, and tied up as closely as, say, Algeria, with the metropolitan economy of France. The Trans-Saharan railway—"the route of cotton and coffee"—is designed to connect the Mediterranean with the Niger. Much pomp and advertisement accompanied the publication, in March, 1941, of a decree for the construction of the railway. But later on, enthusiasm died down. In December, 1941, the first section of the railway was opened, connecting Bon Arfa with Colomb Béchar in Northern Algeria. The distance still to be covered is about 2,000 kilometres, and it will take some eight years to complete the construction. There is no steel for rails, and no oil for Diesel electric engines. The section of the line opened so far has some importance in that it brings coal from Kenadra to meet the greater part of Algerian consumption. But, for the time being, the great enterprise of the Trans-Saharan line has faded away like a *jata morgana* in the Sahara desert.

Yet even if the two new schemes were successful beyond the dreams of Vichy, this whole attempt to find compensation for military defeat in colonial glory would still be a hollow sham. The only hope for a colonising future for the French is within the framework of an Allied victory. Otherwise they will simply find themselves working as the stewards and bailiwicks of their German overlords. Germany has been suspiciously kind to France's colonial day dreams. The men of Vichy have been encouraged to cling to their myth of unimpaired colonial greatness. The Germans have not yet backed Italy's colonial claims and, after dabbling rather half-heartedly in the dynastic troubles of Morocco, they have apparently decided that the French are as good as any local quislings at keeping the best colonial seats warm for the Germans. The Trans-Saharan and West African schemes have been loudly encouraged in the German press, and some raw materials have been placed at Vichy's disposal. This benevolence takes on a more sinister colour in the light of Germany's views on geopolitics. Geopolitically, it appears that Africa "belongs" to Europe. *Eurafrika* is a favourite concept of this German pseudoscience. Now that Germany is comfortably overlord of Europe, it must logically follow that the Nazis have the inheritance of Africa as well. If, in the meantime, French energy, French capital and French work improve the patrimony, the effort can be magnanimously encouraged. Then, when Germany is ready, the French will find that their status differs very little from their brothers in Senegal. *France Metropolitaine* and *France d'outremer* will share the same colonial servitude under the Teuton masters of *Eurafrika*.

Control of Production

MR LYTTLETON was appointed three months ago to carry out three tasks, until then only partially done. The first was to concert and supervise production programmes, so that industrial capacity and strategic needs would be kept always in line. The second was to watch over the progress of production, so that contracts could be kept continuously filled and industrial facilities kept fully and efficiently employed. His appointment came at a crucial moment when war production had entered a new phase. The process of transferring fresh resources from non-essential to war uses was very largely over; the gigantic task of industrial conversion upon which the United States is now embarking had been mostly completed. The new problem was not to bring in new facilities, but to make the maximum use of the

resources already mobilised, the mechanical equipment and the labour force alike. Programmes are a matter for centralisation in Mr Lyttelton's office. Progress is very largely a local matter; it is in the regions where there must be a single clearing house of all industrial resources, to dovetail capacity and requirements continually—always, of course, under the single central eye of a single Minister. There have been Regional Boards, representing the Supply Departments and local industry, in the eleven Civil Defence regions since January, 1940. In theory, their function has been to assist the Supply Ministries to make the fullest and most efficient use of the productive resources and manufacturing capacity of their regions in order to carry out central production programmes. In practice, their history is made up of "a melancholy list

of frustrations and disappointments." Nominal control over them has been bandied about from the Ministry of Supply to the Ministry of Labour, to the Ministry of Supply again, to the Industrial Capacity Committee, to the Production Executive and now to the Minister of Production. The Citrine Committee was set up by Lord Beaverbrook in February to examine their "present constitution and functions" and to make recommendations. Its finding is that, until now, the Boards have been

unable to secure rapid, effectual and continuous co-ordination of the efforts of all Government officials in the area in the production of essential stores.

The reason for this is that the Boards have lacked both status and authority. They have had no control over the officers of the Supply Departments stationed in their regions. There has been no "properly articulated system of devolution of executive policy." The Boards have lacked power to act; and they have been quite unable to secure the fullest use of local facilities by pooling orders, management, plant and labour.

The main cause of this weakness in the regions has been weakness at the centre. Until the appointment of Mr Lyttelton, there was no single Minister charged with the duty of concerting and supervising the activities of the Supply Ministries; it was impossible to devolve upon Regional Boards of Regional officers powers which did not exist. Now, in theory, these powers exist. Mr Lyttelton should be able to throw the mantle of his authority over the Regional Boards to secure a single focus of regional control and supervision. This is the main recommendation of the Citrine Committee.

Just as the Minister of Production is charged with the duty of concerting and supervising the activities of the Supply Ministries at the centre, so there should be in each region a representative of the Ministry whose duty it should be to concert and supervise the activities of the Regional Controllers of the Supply Departments.

The core of the Committee's own plan is these Regional Directors of Production, with the task of supervising the work of the Regional Controllers of the Supply Departments to ensure the maximum degree of co-ordination.

Unfortunately, there are to be no Regional Directors. The Government has decided that instead there shall be Regional Controllers (Ministry of Production). Apparently there has been a trial of strength between Mr Lyttelton and the Supply Ministries; and Mr Lyttelton has not won. His representative in each region will indeed be chairman of both the Regional Board and of its executive committee; and he will report direct to the Minister of Production. But, at most, he will be *primus inter pares*. It will still be impossible for regional facilities to be fully pooled and fully utilised. The Committee's suggestion that

the independent organisations established by Supply Ministries for capacity finding should be merged in the regional organisation

is in general accepted, but vital exceptions are made. The regional organisation of the Admiralty, even where it is concerned with non-shipyard work, is to be excluded. The regional organisation of the Controller General of Machine Tools is to be excluded. Because of the limitations imposed upon Mr Lyttelton himself in the matter of labour, the Regional Controller of Production will have no more than joint powers over the allocation of labour with the Regional Controller of the Ministry of Labour. The real job of the Regional Boards should be to control effectively the local allocation of resources, to marry capacity and requirements so that no capacity is unused and no requirements unfulfilled. But it is hard to see how this will be possible. The executive of the Boards will be unable to move a single tool except at the discretion of the Ministry of Supply.

This is not to say that the new system will be as bad as the old. Apart from these crucial exceptions, the Government has stated—in admittedly vague and general terms—that it accepts all the main recommendations of the Citrine Committee; and, in almost every detail, those recommendations were designed to secure local Boards headed by a strong executive, directly responsible to Mr Lyttelton and vested with the power to take decisions—with the representatives of the Supply and other departments collaborating at a lower level. But the exceptions take the heart out of the scheme. They put Mr Lyttelton's representative on the same level as the representatives of the other departments. They leave vital spheres of influence for the departments outside the regional system. It is hard to avoid the conclusion that they represent a remarkably successful rearguard action by the Supply Ministries against the threatened encroachment of Mr Lyttelton. It is probably right to be thankful for small mercies; to be gratified that, if Mr Lyttelton's representatives are to have one hand tied behind their backs, they will still have the other hand free; and, above all, to welcome gratefully the proposals for making the Regional Boards cognisant of all the contracts placed and all the work in progress in their areas, so that they can keep constant vigilance over the flow of orders and deliveries and over the use of capacity. It is a distinct gain, too, that most, if not all the most important, regional organisations for specific matters will now all be centralised, physically as well as administratively, under the Regional Boards. But it is hard to resist the comment, yet again, "too late and too little." Half a loaf may be better than no bread: but a half truth is more dangerous than a lie, and it would be mischievous and misleading to hail this new scheme as a notable step forward. The Citrine Committee has done a good job; but the Government has missed a great opportunity.

NOTES OF THE WEEK

The Debate

Feeling ran high at times in the debate on strategic planning which engaged the attention of the Commons on Tuesday and Wednesday. For the most part, speakers concentrated on the demand for a real Chief of Staffs, as distinct from the Minister of Defence, rather than on the proposed more fundamental need for a Great General Staff and for combined commands wherever the Services work together. As a result, the debate was, at bottom, about personalities. The main demand of most critics was that the same individual should not, to use the words of Sir Edward Grigg, both be taking advice, giving advice and acting upon that advice. One criticism was, though it was seldom openly stated, that Mr Churchill's direction of strategy had been wrong. Mr Stokes said quite frankly that his complaint was against the Prime Minister and that unless there was a change of strategic control, we should lose the war. Properly, the demand for a Chief of Staffs or for a Greater General Staff or for Combined Commands

has nothing to do with the question whether or not this or that person should be Prime Minister, nor has Lord Hankey's contention, reiterated in this debate by Colonel Oliver Stanley, that the Defence Committee of the Cabinet is a redundant body. These are questions of the machinery of command and administration. If they are confused with personal prejudice, they will not be settled, because every constructive suggestion will be treated as an attack on Mr Churchill—and, worse still, the opponents of reform will ride off on the excuse that the critics are merely using these suggestions to spike the Prime Minister's guns. This is largely what happened in this week's debate. The only effective answer which was given on Wednesday to the critics was Mr Attlee's indignant denial that the Prime Minister in fact dominated either the Chiefs of Staff Committee or the War Cabinet. The Government's defence of the present system was entirely concerned with the defence of Mr Churchill and had nothing to do with the real issues of organisation at stake. The upshot is that this question is

at the stage where so many other vital questions have found themselves in recent years; it is still being, to quote Sir Edward Grigg again, borne down and blanketed by the Government of the day, just as Mr Churchill's suggestions for re-armament were when he was in opposition. It cannot be too strongly urged, first, that this is not a demand to sack the Prime Minister; secondly, that it is not a demand for a fresh superman. It is not a question of personalities at all. The present Chiefs of Staff Committee is, by the terms of its warrant, a Chief of Staff-in-Commission. What is needed now is to take this appointment out of commission, and to insert into the system of strategic planning and command a man with that "cold, analytical professional" three-Service mind, which is needed; and then, under him, to constitute the General Staff and the Higher Commands as combined bodies, cutting right across the present tripartite and representative structure of Service organisation. It would be untrue, of course, to say that the Prime Minister is an irrelevancy in this matter. As Mr Attlee said, "It would be quite impossible to take away from the Prime Minister the major responsibility of advising the Cabinet on decisions of strategy." As Mr Churchill has often said, the responsibility is his. All that can be done is to urge the Prime Minister and the Cabinet to equip themselves with a machine for planning and command which will produce more positive planning, more positive action, and more successes in battle than seem possible with the present methods.

Combing Out

The scope for finding fresh workers for war employment is now very small indeed, but it is still necessary to comb over every activity and to see that no labour is redundant or wastefully used. A new step by the Ministry of Labour is aimed at this objective. In future, firms who are employing workers for less than fifty-two hours on manual work or less than forty-six hours on administrative or office work will be required to release for war employment a proportion of their workers equivalent to the short-fall in their working hours. The principle of this measure is sound. Its application will need great care. There are already signs that firms and institutions may attempt to protect their labour force simply by stepping up working hours when there is no need. If the measure of redundancy is to be working time, there must be some sanction to make certain that this does not lead to waste time. The fundamental task is to see that all labour, everywhere, in every kind of employment is efficiently used, that the minimum number of man-hours, not the maximum, is taken for every job. There are too many signs just now that the flow of labour from civilian industry to munitions is being, not speeded up, as it should be, but slowed down. The final act of standardising all civilian production, such as clothing, so as to release more workers for war employment is still being pertinaciously resisted. The proper use of working hours as a yardstick, at this stage in war economy, is to induce workers in necessary civilian industries to work just as hard and as long as workers in war factories, and to transfer the labour thus released into war work. The reservoir may be run almost dry, but every drop that can be scooped up is correspondingly more valuable.

Responsibility of Ministers

It was laid down in *The Economist* a fortnight ago that a first need of parliamentary rehabilitation in this country is that Ministers must be ready to resign. This is probably a requisite of wartime Government as well. It has become customary for ex-members of the Government, in the Lords or in the Commons, to express critical views about the Government's policy in the fields for which they themselves were formerly the responsible Ministers. There have been a number of instances this week. Sir Edward Grigg was until recently at the War Office. On Wednesday he spoke strongly about strategic miscalculations and deficiencies in strategic planning. Not unnaturally, the Labour speaker who followed Sir Edward Grigg protested against ex-Ministers criticising a policy about which they had kept silent when in office.

It is bitter to some of us [he said] that the men who take office never say anything until the time comes when they have to give up. They should have the courage to speak up when they are in and not wait until they are kicked out.

Mr Attlee made a similar point about Lord Hankey, who has been calling for a Chief of Staffs and for the end of the Defence Committee system, which by-passes major matters from the War Cabinet itself; he called Lord Hankey's attitude "a death-bed repentance." Obviously, there must be many cases of disagreement in Cabinets; obviously, it would be impossible for Ministers to resign every time they disagreed with their colleagues; that would amount to saying that Government by means of a Cabinet is impossible. Most Cabinet decisions are in some sense a compromise, and each Cabinet Minister sees something in the final decision which he approves and something which he disapproves. This is collective responsibility. But when the decisions concern matters for which the individual Minister whose wishes are over-riden has direct responsibility, and when they are also matters of vital national consequence, there is small doubt that it is the Minister's duty to have the courage of his convictions and resign. This simple piety has been too long lacking in British Cabinets. Men have preferred office to honesty. It is often hard for Ministers to decide where they should take a stand; but there are high moments in the conduct of every war when the decision should not be unduly difficult. The trouble is that the sense of Ministerial responsibility seems to be even more loose in wartime than in the sort of dead peace years which preceded this war. This is largely because so many Ministers have no responsibility. This is Lord Hankey's point; not long ago, he told the House of Lords that the way in which the Defence Committee and the Chiefs of Staff Committee were worked tended to leave Members of the Cabinet themselves entirely in the dark about matters of major policy. It has often been suggested in the Commons that the responsibility of the First Lord of the Admiralty is negligible, in the present system, beside that of the First Sea Lord sitting direct under the over-riding responsibility of the Prime Minister. Another Minister has declared that in all the months in which he was a member of the Government he saw but never spoke to Mr Churchill. Cohesion is lost. Responsibility is blurred. And so we get these curious episodes when men like Lord Hankey, Sir Edward Grigg and Colonel Oliver Stanley make quite startling comments about affairs in which it was popularly supposed they had no small hand.

Fighting in the South

The time of local action and limited objectives seems to be at an end in Russia. By a short head, the Germans won in the race to open large scale hostilities, but they confined their action to the geographically limited though strategically wide objective of recapturing the Kerch Peninsula. To re-establish their position there was an obvious preliminary to any attempt to encircle Rostov or begin operations in the Caucasus; and it looks now as though they have succeeded in this first step in the bigger operation. An encouraging feature of the fighting is the time it has taken the German forces to capture the town and reduce the remaining pockets of Russian resistance. The issues at stake to the north of the Kerch campaign, in the offensive launched by the Russians behind and below Kharkov, are not so clear cut, nor is the outcome so far as decisive. Marshal Timoshenko prefaced his attack by declaring it "the decisive offensive of the war." This statement demands careful consideration. It does not come from a press agency or a war correspondent or a military spokesman. It comes from the sober soldier who, more than any other, was responsible for Germany's reverses in the Donetz last autumn. It can only mean, therefore, that the Russians are putting very high hopes indeed upon the outcome of the offensive, and that it is designed at the least to disrupt Germany's offensive plans completely, at the most to clear the Eastern Ukraine. It is too early to estimate the fortunes of the attack. The Germans admit Russian progress south of Kharkov, but they have now launched a counter-attack between Izyum and Barvenkova, where the Kharkov-Rostov railway runs closest to the Donetz River. This is a narrow front, and it is not certain whether the counter-attack will develop into a full offensive. Should it do so, then clearly the Germans have chosen their point of attack shrewdly. The railway alone is of first-class strategic importance. A swing to military possibilities are even more significant. A swing to the north would bring the German columns into contact with Marshal Timoshenko's exposed left flank, at a time when his offensive is at full stretch. A swing to the right

could open up a new drive on Rostov. The Donetz fighting may well be crucial to the success or failure of the Russian attempt to seize the initiative in the south.

Profit Margins

The Ministry of Food has raised a storm in the grocery and provision trades. The latest scheme for control of wholesale and retail margins, due to come into force on August 24th, strikes a hard blow at multiple stores. The purpose of the scheme is to prevent organisations performing both wholesale and retail functions from retaining the two or three separate profit margins which accrue to them by the fact that the middlemen are eliminated. Since maximum retail prices, fixed by the Minister of Food, are operative for the majority of groceries and provisions, it has been possible for the multiple stores, which, organised in vertical combinations, are able to cut out the middleman, to make substantially higher profits than the small man who obtains his supplies at a later stage in the chain of distribution. The new measure is an attempt to hold the balance between the large concern and the small trader. The multiple stores are opposed to the scheme on grounds of public as well as of private interest. They claim that where, by eliminating certain stages in the chain of distribution, it is possible to retail goods to the public with greater efficiency, it is undesirable that costs should be artificially raised merely to keep small retailers in business, which is of course true. It is also true, as Sir George Schuster, chairman of the Home and Colonial group, points out in the course of his annual review, that where a concern performs the double service of distributing goods both wholesale and retail, it may claim to have earned a double profit. But the solution surely is not to maintain the swollen profits of the low cost distributor, but to pass them on to the public in lower prices; the difficulty about the case now being put up by the multiple stores is precisely that the greater efficiency they talk of, and the lower costs obtained by integration, have not been passed on. Maximum prices have tended to become minimum prices, and those offered by the large concerns are not substantially lower than those offered by the small man. Plainly, however, the matter is not simple. Lower prices by multiple stores, it is argued, would be an added threat to the existence of the small man, already imperilled by war conditions. Moreover, when supplies of all foods are relatively short, and when rationing has not yet become comprehensive, any general reduction in food prices on the part of the multiple stores might tend to cause queues, runs and shortage—though rationing is perhaps by now sufficiently wide to make this possibility not very significant.

The point emphasised by Sir George Schuster is that the multiple stores, if they were working to capacity, could deliver food to the public at prices substantially below existing maxima, and still earn adequate profits; and it is clear that the new move to eliminate the stores' relative advantage over the small tradesman which is represented by the double profit margin (and is in most cases passed on to the Exchequer in the form of EPT) is a political move, not an act of economic policy. It arises from the fact that no scheme has yet been made to help small men out of business and guarantee their post-war return. Hence, they have, mainly uneconomically, to be kept in being. It is, of course, arguable, on political or social grounds, that it would be impolitic to buy out and compensate small traders and to place the present reduced volume of food distribution in the hands of multiple stores. But it would surely be most politic, and desirable, on every ground, to enable the public to profit from distributive efficiency and to buy food correspondingly more cheaply. It is iniquitous that, for any reason, maximum food prices should be regarded as minima. There is every reason why the consumers should benefit from efficiency; and half-hearted attempts to "protect" the small shopkeeper (which are the result of a complete bankruptcy of policy with regard to compensation and wartime concentration) do no good either to the small shopkeeper or the public, and do definite harm to the war effort. Once again, a wartime policy for shops is a glaring need.

A Ministry of Fuel

Logic and symmetry have had as little part in the growth of Britain's public administration as in the development of its towns. This penchant for solving the problems as they arise, and by having recourse to expedients, has sometimes served the country well. There was no logic in the arrangement whereby Colonel Llewellyn, before he became Minister of Aircraft Production, combined the completely distinct offices of chairman of the Materials Priority Committee and Parliamentary Secretary to the Ministry of War Transport. But it could be justified on grounds of expediency and, on the whole, it worked fairly well. But there are times when such haphazard arrangements become an obstacle to efficient administration, especially in war. The time comes when, as in the case of the Ministries of Production and War Transport, the strands of administration, hitherto dispersed, must be gathered in a single department. Another sphere of administration where the need for centralisation has become urgent is fuel. True, coal, gas, electricity and oil are all administered from the Board of Trade. In actual practice, however, the Mines and Petroleum Departments enjoy a large measure of autonomy, and the Gas and Electricity Departments are independent of the Mines Department and of each other. If, as has been promised, the fuel problem is now to be dealt with as a single problem, it is difficult to see how this can be done efficiently without vesting the control over the various fuels in a separate and strong Ministry. The position has now been reached when the continued existence of separate departments for coal, gas, electricity and oil is a positive obstacle to policy.

A Personal Ration?

Another alternative to the Beveridge plan for rationing fuel is to be published in full in the next Bulletin of the Oxford Institute of Statistics. Its essential feature is the suggestion that the household fuel ration should be made up only of personal allowances, and that the household ration should be eliminated. To provide elasticity, babies and old persons would receive more than the flat *per caput* allowance, but recognition of the diminishing marginal requirements of a large household would be achieved by allowing school children only 50 per cent of the adult ration. The scheme admits the need for rationing all fuels on a point basis, and is thus an amendment rather than an alternative to the Beveridge plan. The objection to elimination of the household ration is that simplicity is bought at the expense of inevitable and unnecessary unfairness which might well breed a disproportionate crop of special appeals. For it is not always possible for the consumer to relate house space to inmates in the most economic fashion. There is still no doubt that the Beveridge scheme holds the field on merit.

End of a Campaign

The last of the British forces in Burma have reached the Assam frontier. There, among the wet woods and steep

bridle paths of the Naga and Patkoi Hills, the war dribbles rather than surges to the frontiers of India. It is possible that the coming of the monsoons will hold up campaigning for the time being. In any case, as General Alexander has pointed out, India has gained five months' breathing space, not only to improve its defences, and to introduce badly needed and somewhat neglected ARP arrangements, but also to grow accustomed psychologically to being in the front line of the war. This is an important item in the credit balance. Unhappily, it is the only one. Even though the enemy will not be able to exploit Burma's resources at once, its oil and rice are lost to the Allied cause. The occupation of Akyab and the Burmese coast down to Rangoon, has rendered the Gulf of Bengal, if not unusable, extremely dangerous to Allied traffic, which must throw a very heavy load upon India's land communications if any sizeable consignments of war supplies are to reach China by the new India Road. This is the most serious aspect of the Burma campaign—the isolation of Free China from its fighting Allies. It is perhaps possible now to question the wisdom of defending all the South Sea outposts instead of concentrating what were from the start very limited military resources on the key defence positions—Burma and Australia. It is, of course, easy to be wise after the event, and there are a host of reasons why Singapore and Java could not, in fact, have been left undefended. But the lesson of the dangers of dispersal must be learnt, until another year has brought with it the overwhelming striking power necessary to fight the enemy on any ground—of his own or of the United Nations' choosing.

Offensive Against China

There are some signs that the Japanese may launch a full scale offensive against China. Already, China is being made to fight on two fronts. During the past week, an important Japanese thrust has been initiated from Chekiang on the east coast. In this area, the enemy forces are said to be based on Hangchow and to be enjoying air support. On the Yunnan front, the enemy attack via the Burma Road has not, on balance, made much progress. The first successful Chinese counter-attack was forced to give way before Japanese reinforcements, which captured Tengyueh, on the section of the Burma Road between Bhamo and Paoshan. It is not clear whether subsequent Chinese counter attacks have succeeded in recapturing this town, but so far Paoshan, the next important clearing point on the Burma Road, is not directly threatened. The Chinese expeditionary force in Burma is still intact and carrying on guerrilla operations against the enemy. If a Japanese drive is to be concentrated against China in the next few weeks on two fronts, the supply question assumes first class importance. By some means, the urgent need for first line aircraft, both fighter and bomber, must be met by the Allies; and an efficient overland supply route must be reopened. There is no doubt that the only completely satisfactory solution lies in the recapture of Lashio and Mandalay, which can only be done in the near future by the Chinese. By remaining in Burma, the Chinese Expeditionary Force demonstrates that China has not acquiesced in the loss of the whole of this territory. The position is desperately serious. The whole future strategy of the Far Eastern war depends upon the maintenance of contact between China and the remainder of the Allied Powers. The Japanese appreciate this fact and may be relied on to exploit to the full any period of temporary isolation. It may well prove that this summer China, by sustaining a first class Japanese offensive, will play the same role in allied strategy in the Far East that Russia is playing in the west by engaging the German armies. And China must receive as substantial material assistance from the British Empire and the United States as has been carried to the support of the Russians.

The Balkan Scene

If the strategy of the Germans' summer offensive is to combine a drive on the Caucasus, a thrust towards Syria (either through or skirting Turkey), and a delaying action in the Libyan desert with the arrival of Japanese warships off Aden, then the week has brought some first moves in the complicated campaign—but not in the Balkans. It is possible that the uncertainty and disruption prevailing in the Balkans may prove a crucial obstacle to the larger plan

of conquest. Each Balkan state is providing the Germans with a special brand of headache. In Roumania, it is the Hungarian quarrel which is always on the point of boiling up into a minor war. Tension will not have been eased by the recent action of the Roumanian authorities in closing all the irrigation locks in the Danubian dam system, and thus causing widespread floods on the Hungarian side of the frontier. In Serbia, and even in Croatia, it is the Chetniks who are at the root of the mischief. The Germans hoped that disturbances in Croatia would die down after the capture of Colonel Dangic, the ringleader of the guerrillas, but he escaped within a few days. In Serbia, the holding of General Mihailovic's family as hostages has made no difference to the activities of the intrepid fighter. In Bulgaria, the obstinate pan-Slavism of the people gives the Government a lever against the German demand that they should enter the war against Russia. On May 1st, the country was plastered with illicit slogans, "Long Live the Red Army," and so forth; and railway sabotage and arson are widespread. The Germans cannot increase their garrison and cannot, therefore, exert further pressure. Moreover, the Bulgarians are useful to them for the policing of Serbia and as a whip to beat the Italians; the dispute over Macedonia—shall it go to "Greater Albania" or to Bulgaria?—is still unsettled. Finally, in Greece, which would become a major base for operations were the attack on Cyprus and Syria to be launched, the difficulty is not opposition but collapse—the first definite appearance of a spectre which waits in every occupied land. There is little resistance now in Greece; but neither is there any work or contribution to the Axis war effort. The people do not work; the fields are left uncultivated; there is a great deal of pilfering and black marketing; typhus has appeared; and starvation is everywhere. In the north, in Bulgarian-occupied Thrace, there are massacres, but not because of any active resistance on the part of the Greeks. They are part of a systematic policy of extermination such as has been pursued by the Croats against the Serbs in Croatia. The Balkan base for the summer's operations is treacherous ground, and the Nazis are too occupied elsewhere to be able to watch their every step.

Information Services

Mr Harold Butler is going to Washington to oversee Mr Britain's Information Services in the United States. Mr Butler will not stir the Americans. He is not an exciting figure. But he would seem to have many of the qualities needed for this vital but delicate mission. He has worked with Americans through the ILO; he knows America; he has that mixture of international idealism and practical experience that should commend a man to a country where enthusiasm and realism blend to give a rather incalculable edge to the general attitude towards foreign affairs. But his appointment will not, in itself, be enough to cause any important change in the direction of better understanding between Britain and the United States. Tempers and nerves are undoubtedly frayed; a good deal of skilful Axis propaganda has been going round in the form of stories whose origin everyone ignores but whose accuracy their tellers will vouch for; the isolationists have done their part; and the atmosphere is not as cordial as the present alliance and the future of world co-operation really demand. It is the whole scope, purpose and organisation of Britain's Information Services that really need reconsideration. The British "case" can not be put in the United States any more than it can be effectively put anywhere else because, so far, no case has been set out to put. The kind of questions Americans ask—sceptically, angrily or in a friendly way—often cannot be answered because nobody has thought out the answers in advance within a coherent framework of aims and ends. And since policy is still vague and undefined, there is no way of testing whether the people charged with explaining Britain to the United States are in reality the most suitable. The outsider gets the impression of a fierce struggle going on between the Foreign Office and the Ministry of Information over the question who shall say what to whom, which ends in nobody saying anything to anybody. The compromise reached over the Butler appointment—that Mr Butler should go out to replace Sir Gerald Campbell, but that Sir Gerald Campbell should continue to act in roughly the same capacity—is a typical example of the confusion of administration, and of mind, that still prevails.

The Cost of the War

The real cost of the war is not the money spent on it by the Government, but the goods that would have been made and the services that would have been rendered by the men and women and by the production facilities now engaged in war activities. Part of the real cost of the war is met currently by a reduction in civilian consumption and harder work; the remainder is met by the depletion or running down of existing capital assets. An attempt has been made by Mr. S. I. Schwartz in the April issue of the London and Cambridge Economic Service to estimate the real cost of the war in 1941 on the basis of the statistics given in the recent Government's White Paper on National Income and Expenditure (Cmd. 6347). The reduction in current consumption compared with and measured in terms of pre-war prices was of the order of £600 millions; and the legacy to posterity of actual and potential capital assets was diminished by £1,500 millions. The latter figure includes £800 millions for sales of gold and overseas investments, £250 millions for damage and destruction of property, and £500 millions for the net depletion of fixed equipment, stocks and working capital. In wartime, of course, new capital equipment is provided by Government expenditure; in 1941 Mr Schwartz values this increment at £400-£500 millions, and sets it off against the usual peacetime increment in the stock of capital goods, which was valued at £406 millions in 1938. On the basis of these figures, the real cost of the war has been met by a reduction in current consumption and by drafts on existing and potential capital assets in the ratio of 1 to 2½. Britain will undoubtedly be poorer than in 1939 to the extent that its productive power and other assets, including overseas investments, have been depleted. The burden that will have to be met by posterity is represented by the men, materials, and productive equipment that will be required for the rehabilitation of physical capital and for the repayment of overseas indebtedness; and, given reasonably free conditions of trade, there is no reason for believing that the burden will be a crushing one—unless the loss of skill and the depletion and destruction of capital very much exceed present expectations.

The Gyrations of Giraud

Several weeks have passed since General Giraud slid down a rope in Koenigstein in Saxony, travelled comfortably across Germany, discussing strategy in good German—with a rather French accent—with high German officials *en route*, crossed into Switzerland where, after a temporary arrest and an examination, he was permitted to travel on to Vichy. His doings in Vichy have been equally odd. He has had long colloquies with Pétain. He has seen Laval. He has travelled to Moulins to confer with the German High Command. Now reports are circulating that the Germans demand his return and that he, while giving a guarantee to Pétain not to support General de Gaulle, has refused to promise not to fight the Germans. Since France's future is not likely to be decided in Vichy, in any case, the devious doings of General Giraud are not perhaps of first importance. Any attempt of his to set up a rival Free French movement should be watched with suspicion, seeing how easily he slipped down the rope and out of Germany. But there is no evidence that this is his intention. Far more interesting are his contacts and connections with high German military authorities, with whom he appears to have discussed such delicate problems as the alternative to Hitlerism in the event of a German collapse, followed by "Communist anarchy." He and the German Generals no doubt see eye to eye on the undesirability of such an outcome. They may also agree on the pre-eminent claims of the German army to be the "saviours of order" in those chaotic hours. It is known that certain German Generals have been trying for some time past to send out feelers into Allied countries, notably through certain religious leaders in Switzerland. It is not impossible that General Giraud has been entrusted with this mission—yet another reason for following his activities with extreme caution.

Justice for Germany

Judged by his speech in the Lords debate last Tuesday, Lord Vansittart does not appear to differ fundamentally from Mr Morrison, whose recent appeal at Blackpool for "justice for the German people" was the occasion of the debate. The trouble is, as on so many occasions in the inter-

minable wrangle between the "Vansittartites" and the anti-Vansittartites, that they were not referring to the same aspect of the German problem. Mr Morrison appealed for "justice" for the Germans against the "butcher bird" school of thought which identifies Germans with Nazis and demands the same policy of extermination for both. Lord Vansittart has been at pains to dissociate himself from this radical reading of his pamphlets, and his speech in the Lords was only concerned with the other aspect of the German problem—the desire of Germans, good and bad, Godfearing and Hitler-crazed, rich and poor alike, to dominate Europe, if necessary by war. His plea, which no doubt Mr Morrison would accept, is that no sentimentalism and no subsequent regrets over stern measures shall in the future cloud the issue of preventing Germany, or any other nation, from dominating Europe. Here it is a question not of justice for the Germans, but of justice for the other peoples of Europe.

Industrial Assurance in New Zealand

The system and administration of working-class life insurance in New Zealand has certain similarities with those in force in Britain. In both countries industrial assurance is commercially efficient; in both countries, too, it has grievous social deficiencies. According to the latest official statistics, published in the New Zealand Year-Book for 1941, there are some 53,000 new industrial assurance policies issued per annum in the Dominion, which is a satisfactory result for a population of some 1½ millions. Unfortunately, against this there are lapses of existing policies amounting to about 22,000 a year. This conforms approximately with the estimate of the Cohen Committee on Industrial Assurance in Great Britain in 1933 that, against nearly ten million new policies issued per annum, 4½ millions were allowed to lapse. Another feature in common in the two countries is the extremely high expense ratio (commission and management). In 1939, in New Zealand, it was 30.08 per cent. In the ordinary branch, however, the expense ratio was only 13.95 per cent. The high ratio in the industrial branch is officially explained by the high cost of collecting premiums, "principally in the shape of renewed commission." This may be an adequate explanation, but it cannot defend a system which claims to be a stimulus to thrift. Moreover, the sums assured by lapsed policies amount to some £1½ millions per annum, and the premiums already paid on these policies by the insured are a total loss to them—though not to the insurance offices. The prosperity of such a wasteful system is the more surprising since there exists a State Life Assurance Office, created in 1869. Yet the official scheme has remained a failure compared with private industrial assurance, although its expense ratio is only 13.31 per cent. Apparently, people prefer the weekly calls of insurance agents for which they have to pay dearly, and do not care if they lose their benefits through lapsed policies.

Shorter Notes

The following table gives the number of civilian casualties in air-raids since September, 1940:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept.-Dec., 1940	21,669	30,556	52,225
1941:—			
January-June	18,698	20,451	39,149
July	501	447	948
August	169	136	305
September	217	269	486
October	262	361	623
November	89	155	244
December	34	55	89
1942:—			
January	112	61	173
February	22	21	43
March	21	13	34
April	938	998	1,936
Totals to date	42,732	53,523	96,255

Of those killed in last month's raids, which included all the Baedeker raids, 359 were men, 446 were women, 122 were children and 11 were unclassified.

AMERICAN SURVEY

Financing War Industry

FINANCE has not hitherto been a bottleneck in the United States' industrial war effort. The implied compliment to the agencies—private and official—responsible for the comparatively smooth response of the short and long-term capital markets to the demands made on them in recent months may be rated high, since the conversion of industry from peace to war in the United States has not been matched in its size and intensity by any other beligerent. A valuable description of the means by which this conversion of industry has been financed is given in a report by Roy A. Foulke, of the firm of Dun and Bradstreet, Inc., on "Credit Problems in a War Economy."

The problem falls into two distinct parts: first, the financing of new plants or extensions, and of their equipment; secondly, the provision of the additional working capital required by firms whose wage bill and work in progress have been multiplied several times since the defence and Lend-Lease programmes got into their full stride. The private resources of industry and the facilities which it would, in any case, have been able to obtain from the banking system have, of course, gone some way towards satisfying this demand for capital. The war found American banks underinvested, and American industry well endowed with liquid resources. There was thus considerable slack to be taken up. How rapidly this slack is being taken up is shown by the recent rise in member banks' loans and investments, and by the reduction in their excess reserve balances.

The traditions of American industry favoured the resort to private resources rather than the intrusion of State aid in any form. This was encouraged by official action, dating back to the Second Revenue Act of 1940, which allowed concerns expanding their facilities for defence work out of their own private resources to amortise the cost, for tax purposes, over a period of five years. Private resources were a great standby in the early months of the defence programme. But the calls made on them rapidly exceeded the available funds. The estimated cost of war industrial plant expansion approved up to the end of 1941 was \$7,366 millions; and of this total only \$1,326 millions represented expansions financed out of private resources.

The need for more direct official assistance in financing the long-term capital requirements of war industry became apparent. This assistance has been provided through two main channels. The first is the Emergency Plant Facilities Contract; the second the Defence Plant Corporation. The first method was approved in July, 1940; the contract provides for Government reimbursement of expenditure on emergency plant construction financed in the first instance by private resources, and the Government undertakes to repay such expenditure, including the cost of borrowed money, by monthly instalments spread over five years. The importance of this contract from the manufacturer's point of view is that, armed with it, he can approach his bankers and obtain from them the facilities required to finance his construction. Though the expenditure involved represents a long-term capital investment, and would not, in the normal course, be eligible for bank accommodation, the Government's undertaking to repay the cost over 5 years brings the operations safely within the scope of normal commercial banking. The contract provides that on completion of the repayment, the firm for which the plant has been built may purchase it "at a fair cost value," otherwise the title in the emergency plant passes to the Federal Government. The Government may then lease it or sell it, but must give the firm with which the contract was originally signed the opportunity to buy or lease on the same terms as those proposed to any other business enterprise. Some of the largest emergency plants now in construction in the United States—Ford's River Rouge plant, for example—are being financed under these terms.

Far more important is the direct Government financial assistance made available through the Defence Plant Corporation, which is a subsidiary of the Reconstruction

Finance Corporation. It has the power, not merely to build, purchase and lease plant and equipment, but also, if the President thinks it necessary, "to engage in the manufacture of arms, ammunition and implements of war." No such direct Government intrusion into the armament industry has yet taken place, and all plants erected and equipped by the Corporation have been leased to manufacturers. These leases usually have run for five years, and the manufacturer is given the option of acquiring the plant at the end of the emergency period on the basis of cost price less depreciation. The Defence Plant Corporation has become by far the most important unit in the construction of emergency plants. In January, 1941, its total commitments, including some plants already erected, amounted to \$350 millions; by November 15, 1941, the total had jumped to \$2,290 millions.

The problem of providing adequate working capital has raised serious difficulties only in the case of comparatively small firms whose own resources are exiguous and whose claims on normal banking facilities have proved quite inadequate to meet the abnormal demands made on them. The remedy has been provided in the main by the Assignment of Claims Act of 1940 and by a system of advance payments on Government contracts which bears some resemblance to the system of "progress payments" instituted in Great Britain by the Ministry of Supply. Payments due, or becoming due, under a Government contract may be assigned to a bank.

A more direct participation of Government agencies in the provision of short-term finance is represented by the advance payments on Army and Navy contracts which, since 1940, may be made up to an amount equal to 30 per cent of the total expenditure foreseen under such contracts. In addition, a system of "partial or progress" payments has been organised, under which manufacturers are paid certain percentages of the total value of work in progress, as each stage of construction is completed to the satisfaction of the Government inspectors. If, for some reason, special cases were to arise in which the working capital needs of a firm working on defence orders could not be satisfied from the firm's own resources or from the other channels already mentioned, it would be possible to have direct recourse to the Federal Reserve Bank of the district or to the Reconstruction Finance Corporation. By an Act of June 19, 1934, the Federal Reserve Banks were authorised to extend loans direct to established business enterprises for working capital purposes; the amount so lent has hitherto proved very small. Slightly larger, but still negligible in relation to the whole additional working capital put at the disposal of American war industry, are the loans made by the Reconstruction Finance Corporation. This ubiquitous organisation was, by a Congress amendment passed in June, 1940, authorised to grant loans to corporations engaged in the defence programme.

The steadily increasing intrusion of the Federal Government into the long and short-term finance of industry is a development not without political significance in the United States. There is some precedent for it in the earlier activities of the Reconstruction Finance Corporation and in the "New Deal" intrusion of the state into spheres of economic activity where it entered into direct competition with private enterprise. But these precedents shrink into insignificance beside the direct stake which the Government is now acquiring in American industry. Provision has been made in all the contracts for the orderly liquidation of those Government investments and for their transfer to the firms which have been operating the plant. But in the detailed application of these provisions, if not in the broader issues of economic organisation which they represent, it is clear that some scope for friction must exist. The Government's activities may, therefore, be storing up political dynamite—but with a time-fuse set for the "post emergency" period.

American Notes

Penalties and Priorities

The rumours that certain steel companies have been violating the priority regulations appear to be founded in fact. The War Production Board has made charges against Carnegie-Illinois, a subsidiary of US Steel, and Jones and Laughlin, and the Department of Justice is instituting suits to enjoin future violations. The accusations, which have been denied by the companies, are that both have been guilty of "repeated, deliberate violations of priority regulations" since June, 1941, by giving preference to their established customers and disregarding priorities for war orders. In particular, it is alleged that Jones and Laughlin, after having been ordered in February, 1942, to ship no steel pipe after March 14th, immediately recommenced pipe production, which by March 12th totalled 570,000 feet. Only 12 per cent of this was delivered to priority consumers; the rest went into civilian use. If the charges can be proved, the WPB can hardly be accused of exaggeration in calling it a "contribution to defeat." Carnegie-Illinois is the largest American steel producer, and Jones and Laughlin ranks fourth; together they produce more than 30 per cent of the entire American supply of steel. The feebleness of the penalty requested may be due to the fact that the violations occurred before the passage of the Second War Powers Act, which provided criminal penalties for such offences, but it is more likely that the Government is unwilling to take drastic action against key companies in the war effort. Nor can the kind of punishment which has been doled out to other offenders—orders restricting production, or depriving the company of priority ratings—be applied to big producers of essential war goods. A test case under the War Powers Act is expected shortly.

Congress Off the Ration

The introduction of petrol rationing in 19 states has been enlivened by a wholesale attack on Congress. Unlimited supplies of petrol for a few hundred Senators and Representatives have caused a fury of criticism which Congress's more serious faults never succeeded in provoking. True, petrol rationing touches Americans in a very tender spot, and the vision of Mrs Roosevelt, whose activity is legendary, attempting to fulfil her duties on bicycle and horseback, while Congressmen enjoyed unlimited mileage, did nothing to ease the hurt. Some Congressmen have been so alarmed that they are reported to have returned their "X" cards, which allowed them to buy any amount of petrol. The threat of severe penalties for fraud and the announcement that the lists of those securing more than the basic ration would be thrown open to the public has had a salutary effect on others as well; it is reported that in New York City alone over 2,500 motorists turned in "X" and "B1" cards and accepted others limiting their petrol more severely. Five classes of ration have been established: the "A" ration, which currently yields three gallons weekly for non-essential driving; B1, B2, B3, which entitle the holder to extra petrol up to a maximum of about nine gallons a week; and "X" cards which guarantee unlimited supplies to commercial vehicles and essential civilian services such as doctors and nurses. Though it is reported that some drivers have, in defiance of the law and the risk of fire, lined their garages with tins and barrels of petrol, most motorists are accepting the restrictions with good grace. In comparison with British rations they are not unduly severe; only about one-third of the 8,500,000 cars affected will be limited to the basic ration, which in any case makes possible 46-60 miles of driving a week. It is expected that the consumption of petrol will be reduced by about 50 per cent. Apart from the agitation over inequalities in the ration, criticism has seized on the confusion and fumbling with which rationing was introduced. Nor has the United States failed to produce the charge, by now so familiar to this rationed democracy, that the scheme will require 90,000 clerks to administer. A defect to be taken more seriously is the restriction of rationing to 19 states; the existence of "wet" and "dry" areas side by side will presumably lead to the same scandals that attended regional prohibition. Another argument for nation-wide rationing which is receiving attention is the rubber shortage and an extension of rationing seems inevitable.

Atlantic Sinkings

Losses of United Nations ships along the Atlantic coast of the United States and Canada continue to mount. Unofficial press reports this week have mentioned a figure of 190 sinkings in the past 18 weeks; last week a Navy Department statement put the total of 153 sunk or damaged, including tankers, merchantmen, and others, sunk along the Pacific and Atlantic coasts, in the Gulf of Mexico, the Caribbean, and African waters since Pearl Harbour. This included 92 US vessels sunk by submarines and 18 Norwegian. Which-ever figure is correct, ships are being sunk faster than they can be replaced. The record-breaking production of the American shipbuilding industry has only succeeded in delivering 120 ships between January 1st and May 10th. Claims filed against insurance companies since January 1st have almost completely wiped out all marine insurance profits of the last 22 years. Last week, sixteen ships were torpedoed, two of them in the St. Lawrence River and one off the mouth of the Mississippi. Other sinkings have occurred so close inshore that crowds on the beaches have been able to see them and have taken part in the rescue of the crews. The recent dim-out and black-out orders to coastal cities, including New York, are part of the attempt to reduce ship losses; the Navy has increased its sea and air patrols; and ships are urged to follow certain routes and to spend the night in harbour. These precautions, good in themselves, appear to be inadequate to deal with the menace, and it is surprising the United States has not instituted a convoy system along its coasts—unless the reason is that the escort vessels are not available.

Shorter Notes

The Federal Reserve Board has implemented one point of the President's anti-inflation programme by tightening the screw on instalment sales and bringing charge accounts under control. Goods bought on charge accounts must now be paid for within 40 days, those on instalment plans within 12 months. Practically all articles, for personal as well as household use, are included. The statement of the Price Administrator that these controls of consumer credit will be an important aid in keeping down the cost of living seems decidedly optimistic in view of the excess of cash purchasing power over supplies, which is estimated at about \$15 billions for 1942.

Three of the organisers of the Detroit race riot mentioned in a note last week have been indicted by the Federal Government on charges of seditious conspiracy. The demonstration, which included the wrecking of furniture of negroes moving into a Government housing project, appears to have been something more than a spontaneous flare-up of the white occupants; a check of licence plates of cars showed that some of the "indignant white neighbours" came from as far as 25 miles away, and two of the indicted men are said to be officers of an organisation responsible for pro-Axis propaganda.

The President has announced that total Lend-Lease aid in April to all countries amounted to \$677 millions. Total Lend-Lease aid to May 1st now amounts to \$3,835 millions. Since the start of the programme, the proportion of fighting weapons to food, drugs, raw materials and other industrial materials has steadily increased. To-day the major part of the aid supplied is in the form of finished munitions.

The President's action in releasing Earl Browder from prison has had a mixed reception. Browder was sentenced to four years in jail and a \$2,000 fine for perjury in connection with the issuance of a passport. The conservative press professes to see no reason why the relaxation of the sentence should make for greater unity, or what connection there is between his case and "aid to Russia." On the score of fair play, alone, however, Browder should have been released; his sentence was far heavier than that generally imposed for similar offences and was unquestionably due to his political views.

THE WORLD OVERSEAS

Far Eastern Neutrality

(By a Correspondent)

SINCE April, 1941, Soviet-Japanese relations have been based on the Neutrality Pact signed during Mr Matsuoka's visit to Moscow, and on the trade agreement concluded exactly ten days before the outbreak of Russo-German hostilities. The Russian war and later happenings in the Pacific have outwardly had no effect on the relations between Moscow and Tokyo; their neutrality has, in fact, become a sort of armed truce with both sides playing for time.

Trade between the two countries has probably been much reduced because of the war. No exact figures are available, as the publication of statistics on foreign trade has been discontinued in both countries for some time. But the hopes placed on the trade agreement—the first to be concluded after protracted negotiations which dragged on from 1925—do not seem to have been fulfilled, probably because the main items in Russo-Japanese foreign trade are vital war commodities which both countries are now eager to keep for themselves. More than half of Russia's total exports was usually made up of oil, coal and manganese ore; Japanese exports consisted mainly of electrical equipment needed for the new industries built up in the Far Eastern Soviet territory.

The concessions, too, have been modified. The Convention covering the lease of Kamchatka fisheries was reported in *The Economist* of April 4, 1942 (p. 470). At the auction, which took place towards the end of April of this year, only fourteen fishing districts were opened to the Japanese instead of the previous nineteen; Soviet fisheries took over twenty-nine districts. This reduction may have been due to the determination to keep the Japanese away from some districts of military importance. Tokyo raised no objections, for the time being preferring reduced traffic to an open conflict over the fisheries. The same applies to the concession of the North Sakhalin Petroleum Company. The Russians refused to grant a permit of entry to the number of technicians and workers proposed by Japan. No doubt the suspicion of Fifth Column activities under the guise of oil business was responsible for this refusal. But so far the normal work of the North Sakhalin Petroleum Company has not been impeded; and about one-fourth of Japan's domestic supply of petroleum has been flowing from Sakhalin.

During the past year, however, politics and strategy, not trade, have been the chief focus of interest. Soon after the outbreak of the Soviet-German war, Tokyo protested against the use of Vladivostok as a base for the delivery of supplies from the United States. The purpose of the protest went further than its immediate and obvious object. It was designed to test the Soviets' readiness to resist encroachments in the Far East at a time when they were fighting for their lives in the west. Moscow did not allow itself to be frightened into capitulation. The Soviet Foreign Office stated that any interference with the trade on the Vladivostok route would be considered an unfriendly act. The incident was followed by rumours about the lease of Siberian bases to the United States. These were officially denied by the Russians. In Tokyo, as well as in Moscow, it was stated that the Pact of Neutrality held good in spite of changed conditions.

"Friendly" Relations

There followed a period of almost aggressively "correct" neutrality. While Japan's ally was busily violating Russia's western frontier, the Imperial Government showed a curious anxiety to settle the vexed question of the Manchukuo boundary. A mixed commission went to work from May to August, 1941, to draw a demarcation line where up to 1940 frontier clashes had regularly disturbed the peace. In August, 1941, a joint conference at Chita declared the frontier conflict to be finally settled. For a time,

this game of neutrality was upset by the attack on Pearl Harbour. *Pravda* talked of "the perfidious assault of the Japanese"; and Litvinov spoke of "the common enemy," immediately on his arrival in America. Moscow seemed to expect a Japanese attack on Russia. But soon it became clear that Japan had chosen the southward direction for its expansion, and that the expected drive to the north had been postponed, at least for the time being. Re-affirmation of neutrality came from both capitals. Tension eased. Yet both countries concentrated large forces on their land frontiers; and Japan thus obtained what was most vital from the Axis point of view—the Far Eastern Soviet army was pinned down on the Amur, at a time when its services in the west might have been of the highest value.

The first anniversary of the Pact of Neutrality was marked in the Soviet Press by some acrimonious comments. *Pravda* did not mince its words in a warning to "the Japanese military cliques whose heads have been turned by military successes, and who prattle about Japanese expansion to the north." Yet the warning was supplemented by an expression of the hope that wiser counsels would prevail in Tokyo, and by a renewal of the neutrality pledge. As if to put its intentions beyond any doubt or suspicion, Moscow went so far as to publish a communiqué on the internment of American pilots who had landed on Russian soil after the bombardment of Japanese towns—a communiqué which is perhaps unique both as an instance of strict adherence to the letter of international law and as a paradoxical illustration of the "divisibility" of an alliance.

Mutual Restraint

What lies behind this strange rite of neutrality observed in a period when even the term itself has become utterly meaningless? The roots of Russo-Japanese antagonism have not disappeared. The record of hostility goes back to 1904; and it was in no way lessened by the October Revolution. The Japanese intervention in 1918-22, the occupation of Northern Sakhalin, the invasion of Manchuria, the enforced cession of the Far Eastern railway by the Russians, and the battles of Lake Khasan and on the river Khalikhin—these have been Japan's efforts to secure vital stepping-stones for an ultimate drive to the north. A Soviet victory in the west would, of course, endanger Japan's northern acquisitions. On the other hand, the establishment of a Great Asiatic Co-prosperity Sphere might mean that the hour of Russia, as an Asiatic power, had struck. But this basic antagonism has been overshadowed by short-term strategic considerations. Both countries are equally reluctant to disperse their forces in two wars. Soviet Russia could perhaps afford the dispersal of manpower, but not of equipment and weapons. Japan already has its land, naval and air forces stretched over enormous distances. The Soviets' Far Eastern fleet is an added deterrent. Its main strength consists, not in surface units, but in a considerable number of submarines and torpedo boats, which can hardly be put out of action by a surprise stroke on the Port Arthur or Pearl Harbour pattern. True, the seizure of Vladivostok and Khabarovsk may look like a tempting enterprise; but as Vladivostok has become a powerful base, protected by an "air umbrella," probably stronger than any of those the Japanese have so far encountered in the Pacific. And so long as Vladivostok remains intact, Japan's industrial and administrative centres are within the range of Soviet aircraft, whereas the vital centres of the Soviets lie far beyond Japanese reach.

All these risks have prompted caution. Japanese intervention is, therefore, likely and inevitable only in the case of an internal Russian collapse. But for the time being Tokyo is not counting on such a development. In fact, Japanese estimates of the Soviets' fighting capacity seem from the beginning to have been better informed, more

sober and more realistic than those of the Germans. The mysterious "clashes" on the Manchukuo frontier during 1938 and 1939 were in reality big modern battles, in which the Japanese were repeatedly beaten by Soviet tanks and aircraft. These experiences taught Japanese militarists not to look upon the Russian armies through the traditional minimising glasses of their victories of 1904 and 1905. It is also significant that immediately on his return to Tokyo Mr Tatekawa, former Ambassador to Moscow, warned his countrymen about Russia's military strength, and predicted a protracted Russo-German war.

A Waiting Game

In the meantime, both partners in neutrality watch each other with suspicion and keep their powder dry. Political trump cards, too, are held back in readiness. The Japanese have tried to organise the numerous colonies of "white" Russian monarchist emigrés in North China. Some detachments are reported to have been recruited and trained under the supervision of General Yanagita, head of the Japanese Military Mission in Northern China. But the Russian emigrés, torn between the hatred of the Soviet régime and their patriotic sentiments for Russia, failed to give the response expected. The Mongolian problem has been a sort of a Ukrainian question, though on a smaller scale, in the Far East. Outer Mongolia (the Mongolian People's Republic) is a kind of a Soviet protectorate, whereas Inner Mongolia belongs to the sphere of Japanese influence. Japanese agitators have tried to fan racial ambitions among the Mongolians, and to popularise the slogan of Mongolian unity.

The great trump card of the Soviets is the alliance with Free China. But since the outbreak of the war the Soviets have shown great caution in using it. Last May Day the traditional slogans of solidarity with the Chinese struggle for independence disappeared from the posters and banners displayed in Moscow for the first time since 1925. The storm over Asia has not reached the Sea of Japan and the river Amur. But it can hardly be said that their surface is unruffled or that the barometer is set fair.

Latin America and the Axis

[BY OUR CORRESPONDENT FORMERLY IN BUENOS AIRES]

May 1941

IN April, 1917, the sinking of a Brazilian merchantman by a U-boat caused Brazil to sever relations with Germany. Six months later, further sinkings provoked the Brazilian Government into declaring war. To-day none of the many submarine attacks on Latin American shipping has so far become a *casus belli*, although Germany has rejected the diplomatic protests of Brazil, Chile, Uruguay and Venezuela against the torpedoing of their merchant ships, mostly in American waters. Prompt reprisals for these attacks have, however, followed in the case of Brazil, Uruguay and Venezuela. Brazil confiscated 96,325 tons of Axis shipping, and a presidential decree providing for "the recovery of damages for acts involving loss to Brazilian lives or property" imposes a levy on the assets in Brazil of German, Italian and Japanese nationals; this amounted to 10 per cent on funds up to 20 contos (about £360), 20 per cent up to 100 contos (£1,800) and 30 per cent on larger sums.

This measure produced the first of a series of warnings in the Tokyo official press to the effect that Brazil could not always hope to bank on geographical isolation in settling accounts with the Axis. Uruguay replied to the sinking of the merchant vessel, the *Montevideo*, in March by confiscating the German tanker *Tacoma* which had refuelled the *Graf Spee* in Montevideo harbour. Venezuela confiscated seven Axis vessels as reprisals for shipping losses in the Caribbean. Of the ships confiscated, two had been scuttled at the mouth of Lake Maracaibo in an effort to obstruct petroleum exports from Venezuela. The loss of the Chilean ship *Tolten*, with one survivor, provoked great indignation in Chile, which still maintains diplomatic relations with the Axis. In reply to Chile's protest, Germany is reported to have promised satisfaction "if it can be proved that the vessel was sunk by a German submarine." The Argentine steamer *Uruguay* was one of the earliest victims of U-boat action in European waters. Germany's reply to Argentina's protest over this incident has never been disclosed, but the demand for Government efforts to secure satisfaction is revived periodically.

odically, in the Argentine press and Congress. Axis vessels formerly laid up in Argentine ports and now sailing under the flag of Argentina's State Mercantile Marine were purchased, not confiscated.

A Convoy System?

The Rio de Janeiro newspaper, *A Noite*, recently reported that arrangements were being made to form a joint American shipping control board including representatives of those Latin American States which have severed relations with the Axis powers (that is, all except Argentina and Chile). The board would arrange and co-ordinate itineraries and measures of protection for the ships of these states. Brazil has begun to use the convoy system and Uruguay, with characteristic alacrity in matters affecting continental solidarity, has proclaimed the intention of collaborating in any scheme for inter-American convoys. The Argentine Ministry of Marine has announced that Argentine ships will not for the present sail in convoy.

In their relations with the Axis, the Latin American republics fall into three categories. Ten are at war with the Axis, eight have severed diplomatic relations and two maintain diplomatic relations. While these differences exist within the framework of continental solidarity, the organisation of an effective convoy system affording protection to all American shipping and involving the pooling of the Americas' naval resources for escort work is a delicate problem.

Mexico's Strong Protest

The first Mexican U-boat victim in the present war is the tanker *Portero del Llano*, torpedoed last week off Florida in circumstances which leave no room for doubt that the assailant was aware of its nationality before the attack. Mexico's prompt representations to the Axis powers, with whom diplomatic relations were severed before the Rio Conference, introduce a more challenging note into the steadily mounting demand for Axis respect for neutral Latin

THE STANDARD BANK OF SOUTH AFRICA LIMITED

Bankers to the Imperial Government in South Africa and to the Governments of Southern Rhodesia, Northern Rhodesia, Nyasaland and Tanganyika.

American shipping. The protest demands "complete satisfaction and guarantee of reparation by 28th May," failing which "the Government will immediately take the measures demanded by national honour."

In Mexico City the protest is interpreted by some observers as tantamount to an ultimatum. There have been recent indications that Mexico's mobilisation of war resources, in manpower and material, is proceeding rapidly. The Confederation of Mexican Workers (CTM), the most virile and politically powerful labour union in Latin America, with 450,000 members, has organised compulsory pre-military training for 200,000 workers. And the far-reaching agreement between the United States and Mexico announced last month in a joint statement by Mr Sumner Welles and Sr Padilla, Mexico's Foreign Minister, presages a speeding up of Mexican industry, which, in the words of the statement, will "not only develop the economic life of Mexico and the United States, but will greatly speed the war effort of the United States." The two countries undertake:

1. To negotiate reciprocal trade agreements.
2. To collaborate in establishing in Mexico a series of basic industries with credit supplied by the United States Export and Import Bank (steel and tinplate rolling mills are the principal developments planned).
3. To establish the procedure to be followed in handling priorities and allocations. (A survey of the Mexican railway system to this end has been made by United States experts.)
4. To study the feasibility of constructing small cargo vessels using Mexican facilities and material supplied by the United States.
5. To construct in Mexico a high octane petrol refinery with equipment from the United States.

Since the two countries agreed in March, 1941, on mutual assistance in defence, steps have been taken to improve Mexico's Pacific coast defences with aid from the United States.

Co-operation with the United States

Collaboration between the two countries in the economic and military fields is complete. Politically, relations have never been so cordial—a tribute to President Roosevelt's Good Neighbour policy. The contrast between mutual relations during this war and the last is profound. Mexico is not now, as she was then, a potential springboard for a German invasion of the United States. Instead of a pro-German President and an unstable administration deeply resentful of interference by the United States, there is to-day a stable and progressive government, friendly to the United States, which has suspended internal political dissensions in support of its vigorous policy of continental solidarity and the extermination of disruptive Axis influences. In its handling of foreign affairs the Government of President Avila Camacho represents the country's general opinion. Cordiality towards the United States and naval support for the democracies is not the policy of any one political faction but the consensus of national opinion. All the countries contiguous to Mexico are at war with the Axis. Whether or not the republic joins them, its full collaboration in continental defence has been assured.

The Danish Krone

[BY A CORRESPONDENT]

May 1st

TOWARDS the end of January, the Danish currency was appreciated by about 8 per cent, and was thus brought to its pre-war level again. Large sections of the Danish public, including the representatives of both the industrialists and the workers, have for some time clamoured for this partial reversal of a ten-year-old policy of currency depreciation; their argument ran that the krone was in fact undervalued in comparison with other Continental currencies, and that it is more important to reduce import prices than to maintain the high incomes of agrarian exporters. Farmers have indeed done comparatively well during the last two years—though they could only do so by exhausting their soil—while the price level of raw materials on which Danish industry depends has risen by 100 per cent or more. The cost of living has probably only risen by about half this amount, but the public has been warned that the gradual exhaustion of pre-war stocks of raw materials may soon involve a new pressure on prices. Furthermore, the workers are particularly interested in a more stabilised cost

of living, as they have been unable so far to secure a commensurate increase in their money income.

The agriculturists and their mouthpiece, the Farmers' Party, have fiercely opposed the new proposals and have only given in after the announcement of what is described as a generous gesture on the part of Germany. The Germans are, in theory, prepared to take over the costs of the new arrangement by paying higher prices for Danish products, while the Reichsmark prices of their own exports to Denmark remain unchanged. Denmark, it is true, is trading with twelve other European countries as well, but all of them together account only for one-fifth of her imports and a similar proportion of her exports; Germany's attitude is, therefore, decisive for Danish trade.

It has, however, since been announced that new trade negotiations between the two countries are forthcoming and that the prices of all merchandise may be reviewed on this occasion; it is quite possible, therefore, that the present price level will only be maintained for a limited period. The value of the German "concession" is further limited by the Nazis' practice of buying Danish goods on almost unlimited credit. The German clearing account debt at the Danish National Bank increased by 437 million kroner during 1941, while Denmark's total exports (including those to countries other than Germany) were only 1,277 million kroner. At least 40 per cent of Germany's imports apparently remain unpaid, though the farmers receive advance payments from the National Bank, and the burden of higher import prices is thus largely borne by the whole Danish community instead of by the German customers.

Some small price decreases, e.g. for coke and cement, have recently been announced in consequence of the new exchange rate of the krone. But there are, as well, indications of obstacles standing in the way of a more general lowering of the price level. An appreciable rise in the price of cycles has been foreshadowed in view of the growing shortage of synthetic rubber and other materials; the Government could recently only avoid an increase in the price of flour by granting special subsidies to the millers, and the hoped-for price reductions in other agricultural goods have been postponed pending a clearer development of the prices of fertilisers and other imported products. A recent, though belated and rather small, grant of higher wages by the Wages Arbitration Court may also be used to justify further price increases. Even the more optimistic publicists when commenting on the new rate of exchange forecast only a stabilisation of the general price level.

A less desirable consequence of the appreciation of the krone will be that the remittances of Danish workers in the Reich to their families will automatically be lowered in value by about 8 per cent.

German Europe

Banks in 1941

THE total assets of Germany's five leading banks increased by 22.5 per cent during 1941. Compared with the beginning of 1939, they had been nearly doubled by the end of 1941. The total of the most important items of the *Deutsche Bank*, *Dresdner Bank*, *Commerzbank*, *Reichskredit A.G.* and *Berliner Handelsgesellschaft* were as follows:

(In Million Reichsmark)			
	1939	1940	1941
Total Assets	10,143	13,007	15,927
Bills, Cheques and Treasury Bonds	4,766	7,569	9,423
Advances	3,416	2,715	3,065
Investments	867	1,699	2,270
Deposits	8,802	11,699	14,923
Taxes	75	109	127
Net Profits	37	36.7	41

(In per cent. of Total Assets)			
	1939	1940	1941
Cash	2.7	3.6	3.7
Treasury Bonds	21.9	40.3	44.3
Reich Loans	3.4	9.1	11.2
Advances	33.7	20.9	19.2

The table reveals the interesting fact that the increase of deposits during 1941, which was Rm. 3,224 millions, exceeded the rise in 1940, which was Rm. 2,897 millions. During 1940, the discrepancy between growing deposits and decreasing advances continued. In 1941, however, advances showed a marked increase, although their fall in relation to total assets continued—from 20.9 per cent to 19.2 per cent. Various explanations have been found by the German Press. The general conditions of Germany's war economy in 1941 certainly stopped one source of greater liquidity, that is to say the liquidation of stocks, whose replacement ended at the beginning of the war. At the same time, German industries were flooded with new orders arising out of the prolonged fighting in the Soviet Union. The Government, on the other hand, were trying to reduce direct financing by bills, and forced firms to some extent to demand credits from the banks. The banks were engaged in a big competition for debtors. Detailed figures show that the average amount of advances grew considerably, which reflected the concentration of orders on big factories. The general tightening of financial policy—increased taxation, fixed armament prices and the Excess Profit Tax—may also have forced companies and firms to use banking credits to finance new armament orders. It is expected that advances will again increase during 1942, though there is no doubt that the movement will still remain small compared with the inevitable increase in wartime liquidity.

The main feature of the bank reports is the growing importance of the banks in financing State expenditure. Treasury Bonds and Reich Loans in 1939 amounted to 28.3 per cent of the banks' total assets; at the end of 1941 the percentage was 55.5 per cent, and the percentage is even greater if Treasury Bills were included. At the shareholders' meeting of the *Commerzbank*, it was announced that this percentage had increased from 43 per cent in 1939 to 70 per cent of the total assets in 1941.

The concentration of banks in Germany and the expansion of German banks into occupied countries continued during 1941. The *Deutsche Bank* acquired a clear majority in the *Creditanstalt-Bankverein* in Vienna. This leading Austrian bank, whose collapse in 1931 heralded the financial crisis in Central Europe, holds leading interests in south-eastern countries, and the *Deutsche Bank* will now be able to dominate this part of Europe. New interests were acquired in Hungary, Roumania, Bulgaria, Yugoslavia and Slovakia. The *Dresdner Bank* expanded not only into the south-east but also into western countries. The *Continental Bank* in Brussels and the *Handels-Trust* in Amsterdam are dominated by the *Dresdner Bank*. The *Commerzbank* founded the *Rijnsche Handelsbank* in Holland, the *Banque Hanséatique* in Brussels, and the *Hensa Bank* in Riga and in Tallinn. These three banks also acquired important interests in Yugoslavia and Bulgaria, and concluded agreements with leading banks in Greece and Turkey. The *Bank der Deutschen Luftfahrt A.G.*, of Berlin, which specialises in financing the aircraft industry in Germany and elsewhere on the Continent, took over the entire capital of N.V.

Hollandsche Buitenlandbank at The Hague. Some time ago the bank had founded the *Aero-Bank, S.A.*, in Paris. This indicates greater activity in the French and Dutch aircraft industries.

Banking activities in the occupied provinces of the Soviet Union presented difficulties for German banks. The greater part of the occupied territory is served by *Reichskreditkassen*. In the district called Ostland a public bank, the *Gemeinschaftsbank-Ostland* was founded. In the western part of the Ukraine the *Creditanstalt*, Vienna, opened branches, and in Rovno a new *Central Bank* was established. The new currency is named *Karbowanetz*. Its cover is the value of the land. At the same time, so-called Economic Banks are to be founded. It is admitted that there is hardly any business at present for these banks; financial reorganisation was attempted before agriculture and industry had been restored.

In France the total deposits of four leading banks (*Crédit Lyonnais*, *Société Générale*, *Comptoir National* and *Crédit Industriel et Commercial*) rose during 1941 from 60,300 million francs to 75,900 million francs, or by 26 per cent; the increase in 1940 was 45 per cent. At the end of the year, the most important items of these four banks were as follows:

(In Million Francs)			
	1939	1940	1941
Bills and Treasury Bonds	29,300	46,100	61,600
Loans and Advances	7,100	7,700	7,500
Cash and Money on Call	8,700	9,700	9,600

The large increase in bills and Treasury bonds is entirely owing to the increase in the latter. It is doubtful whether the banks will be able to continue this policy. Two-thirds of the increase in deposits were registered during the first six months of the year. The funds derived by firms from the sale of stocks can no longer be expected to grow, for stocks are almost exhausted. The continued rise in prices, the disappearance of money into black markets and widespread hoarding among the peasants are likely to prevent any further spectacular accumulation of banking deposits.

The banking situation in Belgium, Holland, Denmark and Norway shows the same trend. Everywhere deposits continued to rise, whereas advances fell. The banks' private business is rapidly declining. Investments in state loans and the discount of Treasury bills and Treasury bonds have become almost the sole activity. German influence is also responsible for a cheap money policy, and the intention is obviously to establish a uniform rate of interest of 3½ per cent.

In Central and South-East Europe, conditions are different. In the "new" countries, Bohemia and Moravia, Slovakia, Croatia and Serbia, German banks are in absolute control; in Croatia control is shared with Italy. In Hungary, Roumania and Bulgaria, changes in territory have influenced the general banking trend only imperceptibly. The discrepancy between increasing deposits and declining advances is almost as great as in Germany.

The most interesting difference in the situation in Germany and occupied or dependent countries is the steady rise in small savings in Germany, which compares with an almost general standstill or even decline in the occupied countries. Germany's system of rationing and price control is still effective. Elsewhere the system of rationing is defective.

Books.—The *Frankfurter Zeitung* estimates that sales of books increased in 1940 by 15 per cent compared with 1939 and assumes that the increase continued during 1941. The *Wehrmacht* and hospitals demanded considerable supplies. Exports into occupied countries, particularly where German troops were stationed, increased at the same time. Supplies grew short during 1941. One of the biggest firms had sold out roughly three-tenths of all the listed books at the end of 1941. The issue of new books is now considerably below the pre-war figure, which was from 18,000 to 20,000 each year. Firms tried to increase supplies by re-printing books in greater numbers. Restrictions on the allocation of paper were introduced in the autumn of 1941. But bookbinding is probably the real bottleneck in book production.

THE BUSINESS WORLD

Profits—A New Series I

WAR is so destructive and suppressive that the search for new economic truth in wartime can only be a discouraging business. Researchers have watched their records burn, and have seen their statistical sources suppressed on grounds of security. Yet there is one field at least—the synthesis of statistics of national income and its distribution—in which vital wartime progress has been made. As a critical yardstick of the war effort, this was a job which had to be done; and *The Economist* has the satisfaction of having contributed a small part of the raw material on which these national income estimates, presented with the Budget White Paper, were based, in the shape of a computation of profits drawn upon a more satisfactory, though much more laborious, basis than the series which have been familiar, quarter by quarter, to readers of this journal.

Hitherto *The Economist* has been able to present only a two-year record of profits as they appeared in the companies' accounts. Two major defects were accordingly present in the figures. The first shortcoming was a lack of continuity in the data. This it was attempted to overcome, as far as possible, by resort to a chain index—*The Economist* Profits Index—the purpose of which was not so much to measure the precise rate of change in industrial earning power, as to give a general indication of the direction and rough extent of its movement. The weakness of the index, however, was not primarily in the linking of disparate groups in each succeeding year—there is sufficient stability in the composition and publication of industrial profits

to make the chain index method statistically respectable. But, while one year's companies are sufficiently alike those of preceding years to be comparable, there is an overriding factor, common to all companies, which has threatened increasingly to distort all profits figures during the past five years. This second defect is taxation. No summation of profits can pretend to accuracy which takes no account of the incidence of taxation, and makes no attempt to correct its basis. This arises from the unfortunate fact that different companies treat standard income tax in their published profits in different ways: they may disclose their profits (nowadays, usually, after EPT) before making any provision for standard taxation; or they may deduct only that part of their tax liability which relates to the profits which they have decided to retain in the business; or they may deduct the whole of their tax liability before disclosing their profits. Company and professional accountants have made scarcely any progress towards a standard practice in treating taxation in company accounts.

The immense difficulties which follow for those who wish to study profits seriously can be illustrated by a simple example. For instance, the case may be taken of a company which has earned £100,000 before income tax (i.e. "gross") and decides to distribute this sum up to the hilt to its shareholders. These profits will be shown in this company's accounts at £100,000, and the cost of the dividend will appear at the same amount. But the company will have an income tax liability under present conditions of £50,000, which it will recoup from the shareholders' dividend warrants, though nothing will be shown in the accounts regarding this sum. Suppose now that the company changes its practice, as many companies do from time to time, and decides to present to its shareholders a profits figure after providing for all income tax (i.e. "net"). Its basic earnings before tax may remain the same, yet its accounts will reveal profits of only £50,000 under the new system, and the cost of the dividend will represent the actual net sum which shareholders receive. The trouble is that these two sums, £100,000 and £50,000, represent the same fact from an economic point of view. It is high time that accountants realised this point and ceased to stand on legal niceties about "shareholders' money" and "company's money."

Until accountants develop a uniform practice, therefore, no aggregation of published profits can have any meaning. It follows that the old *Economist* index was unsatisfactory, because it lumped together the profits of all companies, some before tax, some after tax, and some "half and half," over a series of years in which income-tax was changing so rapidly as to distort the figures beyond recognition. The index was an unsatisfactory measure, both of the total profits earned by industry and of the net profits available for shareholders. To get over this latter weakness, *The Economist's* quarterly reviews have for some time past included a table showing the distribution of gross profits (i.e. before any deduction for income tax) between preference and ordinary shareholders and free reserves, and also the gross rates of payment on debenture and share capital, together with gross rates of earnings on ordinary shares. To obtain these figures, it was necessary to examine the accounts of each company in turn, to discover whether profits were struck on a gross or a net basis, and to make adjustments to net figures to convert them to a common gross basis.

This laborious process has now been applied retrospectively to the published accounts of the past four years. The detailed method of deriving homogeneous figures from the heterogeneous mass of data which companies pour out each year need not be described. Its object is simply to bring all the published results on to one common basis, before deducting any allowance for standard income tax, and to set out the figures as gross percentages on capital, comparable with the usual gross dividend declarations which are familiar to shareholders. The results, which are given in the table opposite, show the successive steps involved. The figures relate to 412 companies

whose reports were published during the first quarter of this year, and are presented with a four-year comparison. For the sake of convenience, the latest year's results may be regarded as applying to 1942, and "year 1 preceding" as 1941, etc. But this raises another difficulty in reporting industrial profits—the distinction between the date of the publication of profits, and the date of the financial year in which they were earned. This factor will be discussed in greater detail in a succeeding article, and is only mentioned here in order to emphasise that the figures at present under consideration are presented according to date of publication, and not according to the various dates of the financial years to which they refer.

It will be seen that the analysis covers five sub-divisions of total gross profits. The first is *gross interest*; then follows *gross preference and ordinary dividends*. The two final divisions deserve some slight explanation. *Free reserves and additions (+ or -) to profits carried forward* are plainly allocations from net profits. *Provisions for capital redemption funds and deferred repairs*, however, are, at first sight, specific charges against profits. But closer consideration shows that to charge such sums against the profits of companies which happen to have such capital charges extant would artificially depress their actual earning power, merely to achieve a formal consistency of financial treatment. Two minor points may also be mentioned. First, profits before tax are underestimated to the extent that the figures are shown after deduction of War Damage premiums, and losses written off investments. Secondly, it may be arguable whether the rate of tax applicable to 1940 ("year 2 preceding") should be 7s., and not 7s. 6d., in which case the total would be reduced to £77,302,000.

The four-year comparison of the gross profits of these 412 companies shows some remarkable features. Taking, first, the course of total profits, it will be seen how efficacious is the present regime of 100 per cent EPT. Using the year "1939" as base, these companies showed a 4 per cent increase in profits in 1940, but in the two succeeding years their gross profits were slightly below the 1939 level. This comparison—it may again be emphasised—is a true comparison of the results of the same companies over the four years, after the profits have been adjusted (in an upward direction, be it remarked) to take account of the ever-increasing incidence of standard income tax.

That is the first point, and it comes as valuable confirmation of the inferences which have been drawn in the past from the less satisfactory figures compiled on the old basis. The second point is no less arresting. For each of the four years, there is shown the apportionment of profits under the five sub-divisions as percentages of the yearly totals.

These percentages show an astonishing stability in distribution policy, together with a slight, but persistent, tendency for equity capital to be paid less in dividends, and for reserves to receive proportionately more, out of a smaller total of distributable profits. In "1939," for example, ordinary capital received 63.5 per cent of total profits, and free reserves and redemption funds together 13.1 per cent. These three categories in 1942 together received an almost

412. FIRST QUARTER, COMPANIES GROSS PROFITS—NEW BASIS (IN £'000)

	Year 3 Preceding	Year 2 Preceding	Year 1 Preceding	Latest Year
All interest gross...	5,695	7-6	5,631	7-2
Preference div. gross...	11,867	15-8	11,855	15-3
Equity div. gross...	47,573	63-5	46,524	59-8
Sub-total...	65,135	86-9	64,010	82-3
Free reserves and carry fwd., gross...	8,999	12-0	11,794	15-1
Deb. or pref. redemption deferred, repairs, etc., gross...	775	1-1	2,030	2-6
Profits before tax...	74,909	100	77,834	100
Year 3 preceding ("1939")	100	104	99	98
Rate of tax applied in grossing up...	5/6	7/6	8/6	10/-

* Including war contingencies.

identical proportion of available profits, but the equity share was reduced to 59.0 per cent and the reserves jointly received 17.2 per cent.

These figures surely dispose of any suggestion that equity capital as a whole has benefited from the war. In terms of net dividend payments, of course, it is very substantially poorer. In 1939, the net sum paid to ordinary shareholders in respect of their gross dividends of £47,573,000 was £36,868,000, with income tax at 5s. 6d. in the £. In 1940, the net amount remaining out of the smaller gross dividends of £43,188,000, with tax at 10s. in the £, was no more than £21,594,000. These calculations represent the most useful confirmation of the value of these new basis figures in setting out the facts regarding industrial profits. In a succeeding article, it is intended to examine the course of total profits, assessed on this new basis, for a larger number of companies during the past four years, and to compare them with the results shown by the old basis figures.

Finance and Banking

More Notes in Circulation

The position in the money market has been influenced this week by window-dressing operations, some of the clearing banks having been engaged in making up for their May returns. The volume of credit available has at all times proved adequate for the immediate needs of the market and no special assistance appears to have been needed. But the margin of cash has been sufficiently narrow to make the daily task of balancing positions rather more eventful than is now customary. The discount market had to take up a fair volume of new Treasury bills this week. The syndicate's allotment at the last tender rose from 41 to 44 per cent, and the bills issued amounted to £75,000,000, against this week's maturities of £65,000,000. The Treasury Deposit Receipts required from the banks this week amounted to £30,000,000, which compares with nominal maturities of £50,000,000. Owing to prior encashments, however, it is probable that the last figure must be reduced to about £40,000,000 to arrive at the true maturities. It follows that little was on balance raised by way of floating debt borrowing during the week. This week's Bank return shows the customary expansion in the circulation, the increase in the latest weekly period amounting to £2,293,000. This is balanced by an increase of £2,605,000 in Government securities, a movement which leaves the credit basis unaffected by the continued outflow of notes into circulation. The latest increase in the circulation leaves the reserve of unissued notes at £47,772,000, and the process of using up the recent £50,000,000 increase in the fiduciary issue has thus begun.

Burmese Currency Problems

The currency problems created by the Japanese invasion of Burma differ in some respects from the comparable problems that have arisen in other countries occupied by Japan. This is because Burma shares a common currency with India. The Indian rupee is the monetary unit in Burma and the Reserve Bank of India is the issuing authority. It is true that the Reserve Bank had issued some distinctive notes for circulation in Burma and that these notes were not legal tender in India, but up to the Japanese invasion Indian notes enjoyed legal tender rights in Burma and constituted an appreciable part of the circulation. A notification providing for the withdrawal of these legal tender attributes of Indian bank notes had been given, and the required notice expired some weeks after the Japanese invasion of Burma had begun. In the prevailing confusion, the proposed changes in the currency position and the conversion of all Indian bank notes into distinctive Burmese notes could not be carried out. The metallic currency in both countries was identical, and so were the one-rupee notes which were issued, not as Reserve Bank notes, but as Government paper representing silver rupee coins. This community of currency must create certain difficulties. It is inevitable that substantial amounts of a currency which is legal tender in India will have fallen into Japanese hands, and the authorities in India will no doubt be considering steps to prevent the encashment of such notes. Another difficulty concerns the position of rupee bank accounts opened with a Burmese branch of one of the banks operating in the East. Holders of such rupee balances now residing out of Burma are

Central Bank Loans to Governments

The League of Nations economic and statistical ser-
 vices have compiled a useful table, in their Monthly Bulletin
 of Statistics for March, showing the growth of central bank
 advances to their Governments and of holdings of Govern-
 ment securities since the beginning of the war. As a measure
 of inflation such figures have lost much of the trustworthi-
 ness that could once be attributed to them. Nevertheless,
 they are a guide to the purest form of deficit-induced infla-
 tion, and certainly deserve closer and more consistent
 scrutiny than they receive in these days of increasing in-
 sensibility to financial heterodoxy. The data for the most
 important of the belligerent powers (where it is available),
 and for some of the occupied countries, giving the position
 at the outbreak of the war, in June, 1941, and at the latest
 available date are given below:

Country	In Million	Sept., 1939	June, 1940	Latest date
U.S.A.	\$	2,804	2,466	2,436 May
		(100)	(88)	(87)
U.K.	£	402	766	955 May
		(100)	(191)	(238)
Germany	Rm.	13,425	15,071	22,838 Feb.
		(100)	(112)	(170)

* 1941

The feature of this table is its indication of the compara-
 tive freedom of the belligerent nations from this crudest
 form of inflation, and, on the other hand, the lengths to
 which it has gone in the countries occupied by Germany.

Investment

No Change on Balance

There is still no certainty among investors that the
 spring offensives on either side have taken shape. The news
 from Kerch and from Kharkov and indeed from the Far
 East, where the end of the retreat from Burma appears to
 be dragging on, is received with reserve. There is an impres-
 sion that all the belligerents are at present skirmishing for
 position; and until the next chapter is definitely opened and
 its trend observable, it is probable that the markets will
 continue to exhibit a restricted turnover at prices which
 indicate a sober optimism. Meanwhile, the various
 items of home news which might be expected to sway
 sentiment have had curiously little effect. The further relaxa-
 tion of the ban on conversions has no doubt been partially
 responsible for continued support for gilt edged issues, but
 it has not markedly increased that support. Among equities,
 there is, as ever, a selective demand for high class issues
 which, coupled with shortage of stock, has served to keep
 prices up. There has been little reaction to the Ministry of
 Food's decision to control more strictly the profit margins
 of multiple stores, no doubt in part because the implica-
 tions of the new order are not yet completely clear, and in
 part because the margins affected were in many cases the
 subject of EPT at 100 per cent already. The announcement
 of the levy on bricks caused a temporary recession for
 London Brick, but the setback was short-lived. In the pre-
 vailing mood, sentiment is scarcely affected by minor mili-
 tary operations or refinements of economic policy. It is
 concerned to estimate the next big moves at home and
 abroad, the moves which will give the latest clues as to
 the length of the war and the measures still necessary to win
 it. In the meanwhile, prices are firm, but business somewhat
 stagnant.

Conversions Ban Relaxed

The announcement of a further relaxation of the ban
 on optional conversions, for which a plea was advanced in
The Economist of May 2nd, is welcome. The ban had
 already been lifted by steps to permit conversion of muni-
 cipal, Dominion, public utility and TFA issues. The Chan-
 cellor's announcement of last week removes it altogether
 so far as securities bearing interest at more than 4 per
 cent are concerned. It remains the case that Treasury
 approval has to be obtained in every instance, but this is
 intended only to secure some sort of uniformity in the
 terms offered, and, to make sure that the date of the offers
 is such as to harmonise with the plans of the Exchequer.
 The permission, of course, applies only to conversions made
 within the terms of the original prospectus. According to
The Actuaries' Investment Index, the average yield on in-
 dustrial debentures was just over 4 per cent at the end of
 last month. In certain cases, it is well below this. Probably,
 it is necessary for a company to see a saving of something
 like $\frac{1}{2}$ per cent per annum in the rate, for conversion to be
 worth while, so that, in a general way, debentures bearing
 less than $4\frac{1}{2}$ per cent will not be converted. The bulk of
 those to benefit from the lifting of the ban will, however,
 bear a higher rate than that. There is a large amount of
 these, mostly issued between 1918 and 1931, but many of
 them are, of course, not convertible at present. None the
 less, it is not difficult to compile a list, running into some
 tens of millions of pounds, which are likely to be dealt
 with. There is so far no indication as to whether the
 Treasury will attempt to concentrate a number of issues at
 a given time, or how far it may be feasible to assimilate
 the terms of the different issues. Evidently, complete
 assimilation is not desirable. Consent in principle has

already been given to certain issues, and these will be allowed precedence. The effect of the relaxation can only be to intensify the search for stock giving a relatively high yield, and so to drive up the whole fixed interest list.

Tin Companies and EPT

Two recent announcements should bring consolation to those with investments in Far Eastern tin companies, namely, the new definition of their EPT standards, and the decision to distribute the cash holding of the Buffer Pool. The former also affects rubber plantation concerns. It had already been established that a company which has lost its assets to the enemy will be considered by the Inland Revenue as still carrying on business, provided it intends to resume activity after the war. There will presumably be cases in which it will not pay to re-equip tin properties which are nearing exhaustion. It is now made clear that, wherever capital is withdrawn from a continuing business, the EPT standard will merely be reduced by 6 per cent of the withdrawn amount. On the assumption that the whole capital is lost, this appears to mean that, if the old EPT standard was 50 per cent of the capital, it will now be 44 per cent, and where it was 25 it will be 19. Companies which have lost their all will thus be entitled to substantial refunds of tax, varying according to the relation of the old EPT standard to capital. Further, if refunds due exceed actual payments made, they will rank as an offset against subsequent profits, should these be subject to this tax. In the changed circumstances, it has been decided to distribute the cash held by the Buffer Pool, which is estimated at £2,500,000. Some of this is due to companies outside the Far Eastern area, and some of the Malayan companies borrowed to make their contributions; but the net receipts should constitute a welcome nest egg to strengthen the cash position of many concerns. It is not to be supposed that the refunds will make it possible to resume dividend payments. For the moment, there are heavy income-tax liabilities to be met, and it will be soon enough to decide what the position will be after these have been liquidated.

Gaumont-British Affairs

The circular issued by the Committee, representing those shareholders of the Gaumont-British Picture Corporation, who asked for a Board of Trade inspection at the end of 1938, sets out a great deal of the relevant material, but, inevitably, contains little that is new. The investigation was suspended by the Board of Trade in June, 1940, and there appears little hope that it will be renewed until after the war. It is doubtful whether it will then serve any very useful purpose. The group, as a whole, provides excellent examples of the evils of pyramiding, and of holding companies in general. While the capital structure and voting control remain what they are, the independent investors have no chance of making their wishes felt. Hence, no doubt, the demand for the inspection. And while the law remains what it is, there is no means of altering the position. The disappointed shareholders are advised to press for a more detailed statement of the position than has so far been provided, and to seek to obtain from the new board, what the old would not allow, namely the appointment of a director, or directors, to represent them. This would not, however, get rid of the principal objections to the present set-up, namely, that control of the whole group resides in 5,100, £1 shares of Metropolis and Bradford Trust, and that the group includes concerns with conflicting interests whose shareholders are different. Since it appears impossible to separate out the various interests, the best solution would be to form one holding concern to take over the whole group, winding up subsidiaries where possible, and to ensure that the only return to any of those interested came through a holding of one class of shares in the holding company.

Company Notes

ICI Group Earnings

The profits of Imperial Chemical Industries, and their distribution, were dealt with fully in *The Economist* of April 18th. It will be recalled that they showed a decline, and that the earnings on the ordinary capital fell from

10.2 to 9.1—owing to a misprint this figure appeared as 9.9—while the dividend was maintained at 8 per cent. The full accounts show the income of the group on a different basis, in that it is now given before any deductions for pensions. A straight three-year comparison is, therefore, not possible, but, comparing like with like, total income rose in 1941 by less than £500,000, against an increase of over £3,000,000 in 1940. Lord McGowan states that the rise in 1941 was some £940,000, but this seems to compare the 1940 income, after charging £466,000 of ARP expenditure with the 1941 income before the corresponding charge. Meanwhile, the rise in taxation last year was some £1,376,000, apart from tax on ICI dividends, and, in order to maintain the ordinary payment, it was necessary to charge that part of ARP outlays of a capital nature, amounting to £488,000, against capital and not against revenue, as in the previous years. Details of the appropriation of profit over the past three years are set out in Table 1. The figures of income for 1940 are obtained by adding the increase in

pensions charge to those originally published. The amount of ARP expenditure on capital account for that year was £414,693. In his comments on the year's operations, Lord McGowan indicates that at home there has been a net increase in demand, and that prices have only been raised when an increase was dictated by the emergence of factors likely to be permanent, or by the price structure of related products. In some cases, prices have been surprisingly successful in maintaining exports, in which it has received valuable co-operation from the United Kingdom Commercial Corporation. Overseas subsidiaries and connections have, like the corresponding companies at home, continued to expand as much as possible within the limitations of shipping, exchange resources, and locally available materials. In the absence of any detailed information about the rise in prices relative to costs, it is impossible to say how far the expansion of output slowed down last year, but it is clear that the fall in net profit is due solely to the full rigours of EPT.

Writing Down Subsidiaries

The consolidated statement of the group contains accounts of 105 subsidiaries, against 111 a year before. The fluctuation in the number of accounts covered detracts somewhat from the value of the comparison, but Lord McGowan states that, of 14 companies not reporting, three are known to have made profits while 10, situated in areas under enemy control, have been written down to £11. This writing down calls for £625,000, and, together with other charges against capital, explains the fact that the rise in obsolescence and depreciation fund on the year is only £1,474,478, despite appropriations from profits of £3,045,116. The surplus, disclosed in the statement, is lower by £288,488, largely as a result of contributions under the War Damage Act exceeding the allocation from profits for War Contingency Reserve by £250,000. Despite the substantial amount written off, there is a rise of some £2,630,000 in fixed assets of the group. This rise, partially

offset by the increase in obsolescence reserve, finds its counterpart in a fall of some £1,360,000 in net current assets. The details, set out in Table II, show that cash and debtors are down, but that an increase of some £2,450,000 has been secured in stocks of raw material and finished goods. Unfortunately there is no indication as to how far this is due to higher prices, but it is improbable that the whole of an expansion of over 10 per cent can be attributed to this factor. The provision to write down assets of subsidiaries does not represent the whole of the original value of the companies concerned, for substantial provision had been made in earlier years. On the entry of Japan into the war, the main interest of the group in that country was in frozen

balances. In China and Malaya, business was carried on until the last moment, but again provision had been made in advance of the event. Any further success in the Japanese attack upon India and Australia will intensify the threat to the very large interests of both revenue and capital nature which the group has in those areas. It is difficult to believe that the closing of a substantial part of the Pacific to Allied traffic has not already had adverse effects on these interests. No indication is given about the possible effects upon policy of a further expansion of Japanese influence, but it is very probable that any further substantial advance would make an even more drastic conservation of resources desirable. The £1 ordinary shares of ICI at 33s. 9d. ex dividend give a yield of £4 14s. 10d. per cent.

Dunlop Rubber

The preliminary statement of Dunlop Rubber for 1941 shows a rise in net profits from £3,001,855 to £3,186,269. As in 1940, £650,000 is provided for tax liability in the following year in addition to the current transfer which absorbs £1,924,620, against £1,741,880. If the transfers to tax reserve are in each case charged against current earnings, there is a rise in the free surplus from £417,788 to £424,149, representing 10.2 against 10.0 per cent. The omission of the 2 per cent bonus, leaving the total payment on ordinary stock at 8 against 10 per cent, is, therefore, dictated by prudence—and no doubt by necessity. The directors are transferring £100,000, against nil in 1940 and £200,000 in 1939, to contingencies, leaving the carry forward some £10,000 lower at £622,839. These results are highly satisfactory, but they do not, of course, take account of the Malayan losses which occurred since the close of the financial year. The consequent shortage of raw material

must seriously prejudice current production, and it is possible that the guarantee of the Dunlop Plantations preference may need to be honoured. How far direct losses in manufacturing and trading companies in territory now occupied by the Japanese, or closely threatened, have been written off is uncertain, but no doubt some light will be thrown on this vital aspect of the position by the chairman's speech. In the circumstances, there can be nothing but commendation for the decision to reduce the total ordinary payment. At the current price of 26s. 4½d., ex dividend, the £1 ordinary stock yields £6 1s. 4d. per cent.

Home and Colonial Group Outlook

The full accounts of *Home and Colonial* for the year to January 3, 1942, show a decline in income after EPT from £257,010 to £232,157. Charges against profits are somewhat lower, income-tax reserve requiring £22,000 against £35,000, and total depreciation £59,091 against £59,873. The payment of service on prior charges, however, necessitates a draft on the carry forward of £50,185, against £39,114 a year ago, reducing the total to £119,623. Equity shares have received no payment since the 6 per cent distributed in 1939-40, and under present conditions are not within sight of a further distribution. Trading profits of *Home and Colonial*, and its wholly owned subsidiaries, *Meadow Dairy* and *Lipton*, before EPT, have risen from £1,002,506 in 1939, and £859,169 in 1940 to £1,259,249 last year. Total tax liability, including tax on dividends, jumped from £585,310 in 1939 to £1,123,413. This enormous liability is, as the chairman, Sir George Schuster, points out in his statement, the result of assessment for EPT either on an unfortunate profits standard or on a capital standard which makes no allowance for the goodwill included in the purchase price of the shares of the wholly owned subsidiaries. It is understood that the EPT position is still the subject of negotiation, but that the sums provided by the group will cover any conceivable

* Equity earnings shown after £10,000 yearly to statutory reserve.

liability. The consolidated balance-sheet shows a slight decline in the surplus of current assets, excluding inter-company items, from £1,944,210 to £1,941,930. There is an increase in the total invested in Government securities, and tax reserve certificates, from £19,451 to £214,998, in cash of some £320,000 to £1,458,844, and in stock from £3,416,610 to £3,444,782. The main change on the liabilities side is a rise of nearly £730,000 in tax reserve to £1,831,616. The immediate future of the group, as Sir George Schuster points out, is governed by two factors, the possibility of obtaining an adjustment of EPT liability and the course of Government food and price policy. The implications of the new scheme for the control of profit margins of multiple stores, which is discussed in a note on page 711, vitally affects the scope of future trading. There is frankly little possibility that the facilities of the group can be used to capacity under war conditions as long as legislation is designed to keep the high cost distributor in business. Nor is there any likelihood that the higher gross profits which result from sale at official maximum prices by a low cost distributor can be paid out to the equity holder while EPT operates as it does at present. It is, perhaps, unfortunate that the existing organisation of the provision trade offers so little incentive to efficiency. The *Home and Colonial* 4s. ordinary shares now stand at 3s. 1½d.

The Clothing Ration

The end of the first year of clothes rationing is approaching. The ration in the current period has released a quarter of a million tons of shipping, and nearly 400,000 clothing workers have been transferred to the fighting forces and to industries directly engaged on war production. Rationing has proved its worth, and, on the whole, the Board of Trade has learned the lessons taught by experience. The new coupons, which are now being distributed, have been printed in what it is hoped is a forge-proof form. New measures have been taken, which, among other advantages, will make racketeering more difficult. One of these is the coupon banking scheme, under which traders are now applying for accounts to be opened. The banking of coupons will save labour, trouble and time. Utility clothing has been launched, and supplies of all kinds of clothing are coming on to the market. In general, these clothes are sufficiently well made and designed for popularity, but durability is a factor which deserves greater consideration. Specifications to simplify clothing have been laid down. The ration itself is, inevitably, to be smaller in the period beginning on June 1st. But a principle which has been applied for other commodities in short supply is to hold good for clothes; the basic ration of 60 coupons for fourteen months is available to all, and above this, certain classes of people, such as children and industrial workers, will receive supplements. Several million workers, such as shipbuilders, chimney sweeps, quarrymen and chemical workers, have received a supplement, and more classes of workers are to benefit in the coming period.

Controlled Diamonds

In accordance with expectations, control over gem diamonds has been strengthened. Mr F. A. Mathias, Government Director on the Board of the Sierra Leone Selection Trust, and until recently Diamond Adviser to the Board of Trade, has been appointed Controller of Gem Diamonds. The first Order issued by the new control prohibits the manufacture of gem diamonds from June 1, 1942, except under licence. Although no detailed official statement has been made about the reasons for the new appointment, it is obvious that the Government's object is the adjustment of the diamond cutting industry to the needs of war. The facilities available outside Amsterdam and Antwerp, though improved since 1940 by the influx of refugee workers, are not sufficient to meet the demands of both the industrial and gem diamond trades. As cutters and polishers engaged in the preparation of valuable gem stones receive far higher wages than those engaged solely in the preparation of industrial diamonds, there has been a shortage of skilled diamond workers for war work for some time past. Last autumn the Board of Trade had to intervene to prevent excessive poaching of workers by luxury diamond firms. The licensing of the manufacture of gem diamonds will ensure that essential needs for industrial diamonds are met before any workers are released for other work. The export trade in gem diamonds will probably receive attention after the war demand has been satisfied, while the manufacture of gem diamonds for the home market will probably cease. Owing to the rapidly increasing Allied demand for industrial diamonds, the shortage of skilled diamond workers will, no doubt, force a reduction in the manufacture of gem stones. As prices of industrial diamonds, unlike those of luxury diamonds, have not risen since the outbreak of war, and their sale has never been particularly profitable, the decline in the manufacture of gem stones is bound to lead to a reduction in profits of diamond mining companies. The appointment of the new Controller of Gem Diamonds completes the British Government's ring of diamond control. On November 9, 1939, exports of diamonds from this country were controlled (by licence) by the Board of Trade. Diamond tools have been controlled since the same date by the Controller of Diamond Dies and Tools (Ministry of Supply), and on March 25, 1942, control of rough diamonds was undertaken by the Diamond Controller (Ministry of Supply). The new control closes the last gap in the chain of controls by taking charge of the diamond cutting trade. In this connection it is perhaps interesting that the offices of the new Gem Diamond Controller are at the same address as the Rough Diamond Controller's.

Veterinary Insurance for Cows

As long ago as last August 23rd *The Economist* published a note (on page 244) describing a scheme which was

to begin "shortly," prepared by the National Veterinary Medical Association and designed to protect the health of dairy herds. Discussions have no doubt been proceeding for the last nine months between the NVMA, the National Farmers' Union and the Ministry of Agriculture. At any rate, it is now at last announced that the scheme will begin to operate on June 1st. Farmers can voluntarily enter into agreement with a veterinary surgeon of their own choice, and pay premiums varying from 10s. to 12s. 6d. a year for each dairy cow. In return, each herd will be examined at least four times a year and additional visits made if necessary to treat mastitis, contagious abortion, sterility and Johne's disease. The Ministry of Agriculture is to provide free laboratory services, vaccine and expensive drugs free in some cases, and in others, such as sulphanilamide for mastitis, at reduced cost. It is to be hoped that all farmers will co-operate in the scheme, although it is believed that many will hold aloof on the score of expense. At the time the proposals were first mooted, expense may have been a potent factor, but the prices paid to farmers are now higher—probably high enough to pay for the economy of preventing disease. The four main diseases to which the cow is heir, and which are covered by the premiums, are estimated to reduce annual milk yields by at least 50 million gallons, and large quantities of meat are also lost. It is a pity that some compulsory scheme could not have been evolved which, apart from the advantage that every cow would be examined, would also have the effect of reducing the cost to individual farmers. There is no suggestion yet that the scheme is to be extended to sheep and pigs, as was hoped last August.

Tin Supplies and Requirements

Despite the lack of statistics since the Japanese attack on Pearl Harbour, there are indications that the Governments of the United Nations are successfully tackling their tin problem at both the production and the consumption ends. From all extra-Pacific tin mining areas an intensified production drive for tin has been reported. Bolivia, now the largest supplier of both the United States and Great Britain, produced nearly 43,000 tons of tin in 1941, and is expected to reach the 1929 record of over 46,000 tons this year. The Belgian-Congo may produce as much as 20,000 tons this year, against 12,400 tons in 1940. Nigeria is expected to produce 17,000 tons, or one-10,300 tons in 1940, and Cornwall about 2,000 tons, or third more than in 1940. In other parts of the world, with Australia ranking first, steps have also been taken to expand production, but even if these steps do not produce any sizeable results, the United States and Great Britain may count on about 85,000 tons of new tin this year.

Last year the United States is believed to have used about 95,000 tons of tin, while consumption in this country equalled approximately the 1940 total of just over 29,000 tons. New supplies this year will be about 40,000 tons, or roughly one third smaller than last year's consumption in the two countries. Both the British and United States Governments have been successful in the past five months in reducing tin consumption without adverse effects on the war effort. Their technical research departments are collaborating closely with representative consumers, as well as with the research institutes normally engaged in the development of new uses for tin. The pooling of this extensive experience and skill has been the basis of a substantial number of economy orders or economy recommendations, among which the extensive replacement of tinplate by lacquered blackplate, the grouping of bearing metals on the basis of their tin content, the replacement of tin solder by lead and silver-based solders, the replacement of tin in alloys, as well as the elimination of tin foil and collapsible tubes, are the most important. Although the results of the economies cannot be estimated, it is likely that they will bring United States and British consumption this year into line with new supplies. Withdrawals from stocks may, therefore, not be necessary except to replace tin lost in transit and for any necessary shipments to Russia. Shipments to Russia should remain small for the time being, for China, which used to ship the bulk of its tin to the United States, has now only one outlet through Mongolia to Russia. According to a recent official Chinese report, current output is at the annual rate of 17,000 metric tons, a figure which roughly equals Russian requirements.

COMPANY MEETINGS

THE STANDARD LIFE ASSURANCE COMPANY

STRINGENT VALUATION OF ASSETS

LARGE INVESTMENTS IN GOVERNMENT SECURITIES

The one hundred and sixteenth annual general meeting of the Standard Life Assurance Company was held, on the 19th instant, in Edinburgh. Mr E. M. Beilby was in the chair.

The manager and secretary having read the auditor's report, the chairman said:—

Gentlemen, I regret that, owing to his illness, Mr Jamieson, chairman of the company in the past three difficult years, is not able to be here to-day. We hope for his complete recovery. As vice-chairman I take Mr Jamieson's place at this meeting.

May I take it to be your wish that the directors' report, which is in your hands, be held as read?

Before reviewing the results of the past year, I must refer to the loss of two members of the board since our last annual meeting. Mr George Wm. Blackwood, who served as a director for the long period of twenty-five years, died on 26th April, 1942. Mr Blackwood, as chairman, vice-chairman and director, was interested in all that concerned the company—more particularly in the staff and in the careful development of our business. His wise advice based upon wide experience was greatly appreciated by his colleagues on the board, with each of whom his personal relations were always most happy. His guidance and encouragement will be greatly missed by the officials and staff.

Lieut. J. R. Gifford, R.N.V.R., W.S., who became a director in June, 1939, went on service in the Navy shortly after the outbreak of war; after performing various duties he was posted to H.M.S. Repulse and lost his life on December 10, 1941, when that ship was sunk in the Far East. It is a matter of great regret that our association with him should have been ended after such a short time. Already his keen intellect and sympathetic understanding had forecast a service of marked usefulness to the company which it was hoped would endure for many years.

During the year the directors were fortunate in being able to appoint Mr William Watson, C.A., and Mr J. B. Crawford to the board and later at this meeting you will be asked to confirm the appointments in the usual ways by re-electing them. Further, on his return from a distinguished tour of duty as Governor of Burma, the directors invited Sir Archibald Cochrane to resume the seat upon the board which he had held for some time previous to proceeding to the East. I am glad to say that Sir Archibald accepted this invitation and his re-election also will be submitted to you to-day.

NEW BUSINESS

In spite of the difficult times through which we are passing I am pleased to be able to submit to you what I think you will all agree is a satisfactory report. The new business during the year under review reached a total of £2,004,632 after deducting re-assurances. This represents 90 per cent of the total completed during the previous year and is, I think, a reasonable amount for war time, when it is borne in mind that practically all our outdoor staff is away on service. A substantial total of deferred annuities has been completed in the year although the total is somewhat less than the amount granted last year. There has also been a reduction in the immediate annuities completed during the year.

NET RATE OF INTEREST

Turning to the revenue account of the life assurance annuity fund we find that the premium income at £2,488,000 shows a decrease of over £80,000; this decrease is largely accounted for by the practical cessation of single premium business. It was decided during the year that it was inadvisable that the Company should accept large sums by way of single premium—a decision taken by many other life offices. Naturally this has had a marked effect on the amount of the premium income. The interest revenue after deduction of tax is £1,304,000, being practically the same as the corresponding figure of last year. This represents a net rate of interest on the life assurance and annuity fund during the year of £4 3s. 6d. per cent, which although lower than that earned last year will in present circumstances, I am sure, give satisfaction

to members. Again a sum of over £40,000 was transferred to the revenue of the life assurance and annuity fund from the guarantee fund.

On the other side of the account you will see that the total of the claims by death is £775,000, an increase of over £80,000 upon the figure of last year. The total this year includes a substantial amount due directly to enemy action. The claims by maturity call for no comment and are some £9,000 less than the corresponding amount last year.

RESERVES INCREASED

Owing largely to the restriction of our efforts during the war, commission and expenses of management show a decrease on last year of £20,000, and I am pleased to be able to report that the expense ratio (i.e. the ratio of commission and expenses to premium income) shows a further reduction and now stands at only 10 per cent. It will be seen that the sum of £100,000 has been transferred to inner reserve and that £50,000 has been transferred to the staff pension fund.

The total assets as shown in the balance sheet are now £35,255,000, representing an increase of £893,000 over last year's total. The increase on this occasion is not so large as during recent years; but this is mainly accounted for by one maturity claim of exceptionally large amount which has reduced the capital redemption fund during the year from over £1,000,000 to just over £400,000. As in previous years members will be glad to know that the directors have been able to state that in their belief the value of the assets was in excess of the balance sheet figure. It is a difficult matter in these days to place a proper value upon each of the company's assets; but I can assure members that a very thorough and careful examination of the assets has been carried out and that, after making such provisions as in the opinion of the directors were advisable and, in the case of Stock Exchange securities, making use of the lowest quotations in the official list after deducting accrued interest and dividends, the directors were satisfied that the excess value of the assets over the figure shown in the balance sheet was of considerable amount.

INVESTMENTS IN NEW WAR LOANS

The policy, referred to last year, of subscribing largely to British Government loans has been continued and it will be seen from the balance sheet that the total holding in British Government securities as at November 15 last was £9,570,000, an increase during the year of £1,744,000. From the outbreak of war to the present time the company has increased its investments in British Government securities by £5,308,000, of which total £4,142,000 represents investment in New War Loans. In accordance with the wishes of the Government all excess income over outgo in this country, in addition to a substantial proportion of other funds available for investment, is being invested in New War Loans so that members have the satisfaction of knowing that the company is assisting materially in the National Savings movement, which forms such an important part of the country's war effort.

STAFF

In these days the efforts of the company's officials and staff must be directed almost entirely to endeavouring to give efficient service to those persons who are already members of the company. Our staff has been greatly depleted, as, after the departure of those members who are expecting to leave very shortly, over two-thirds of the pre-war male staff in this country will have left on national service. Many members of our overseas staffs have also joined the forces and as a result of the demand by the authorities for female labour, we expect to lose a considerable proportion of our female staff before long. The reduction in our male staff has been heaviest among our outside men and in the circumstances we are forced to rely upon our members and upon our agents to bring new business to the company, because we have

not the staff to give the same full service to the public which we were accustomed to give in pre-war years. It is difficult in these days to overestimate the value of life assurance and any enquiries which are addressed to the head office or branches by our members or agents will, of course, receive the fullest possible attention. The foresight of those persons who in the past have assured with the Standard is amply demonstrated when one looks at the accounts and sees the large sums which have been paid out by way of claims, many of them arising from the war.

It is with deep regret that I report that two further members of our staff have given their lives in the service of their country. Both of these young men were lost in air operations over enemy territory.

To the many members of our staff who are absent on service I send from this meeting our warmest greetings and best wishes. They are continually in our thoughts and they can be assured of a hearty welcome back to the service of the company when the time comes. The staff who are left at home to carry the heavy burden of the work have responded with admirable loyalty to the calls made upon them. Members will appreciate the debt they owe to the staff and I know I shall be carrying out their wishes in recording our sincere gratitude for their efforts.

MANAGER'S RETIREMENT

I am very sorry to have to report that our manager and secretary, Mr Mascall, has decided to retire on September 15th next. We are greatly indebted to Mr Mascall; at a time when he might well have sought rest in retirement he willingly undertook the heavy burden of the managership of the company in war time and during the whole period of the war he has guided the affairs of the company with wisdom and success. Mr Mascall, when he retires in September, will have served the Standard for 52 years—a record of which I think he and we may be justly proud. During all that time he has done good and loyal work for our company at home and abroad. We give him our warm wishes for health and happiness in well-earned retirement.

The directors have appointed Mr Davidson manager and actuary as from the date of Mr Mascall's retirement and they have every confidence that under his leadership the company will fully maintain its high position. Other appointments have been made at head office—in particular Mr A. R. Reid as secretary, Mr P. C. Reynolds as deputy secretary, Mr J. B. Dow as joint actuary and Mr W. M. Wishart as assistant secretary. In London, consequent upon the retirement of Mr A. B. Drayton after 48 years' loyal and devoted service with the company in various parts of the world, the directors have decided to combine the City and West End branch offices under Mr E. V. Goodall as manager for London, who will be assisted by Mr A. E. Bromfield as secretary for London. I may say that it was with gratification that the directors were able to give these appointments to men already in our service.

I now move the formal adoption of the report, revenue accounts and balance sheet submitted.

The resolution was carried unanimously.

THE LIVERPOOL AND LONDON AND GLOBE INSURANCE COMPANY, LIMITED

THE CHAIRMAN'S STATEMENT

In a statement circulated with the 106th annual report of the Liverpool and London and Globe Insurance Company, Limited, the chairman, Mr A. Kentish Barnes, indicated total fire, accident and marine premiums of £10,009,347, being £690,448 higher than in 1940. Underwriting profit was £750,784.

New life business, at £1,331,199, was some £60,000 lower.

Fire premiums, at £3,964,216, were well maintained. Sums insured were not generally keeping pace with rising values and policyholders were urged to re-examine their insurances.

Accident department trading was again satisfactory, premiums, at £4,928,422, showing a substantial increase.

Marine premiums rose by £230,000, or 26 per cent.

Interest to profit and loss account was £323,858, and balance carried forward was £1,526,905.

The directors recommend a final dividend of 13s. 6d., making 27s. per share, less tax, for 1941.

ALLIANCE ASSURANCE COMPANY, LIMITED

MR. R. D. TROTTER'S REVIEW

The annual general court of the Alliance Assurance Company, Limited, will be held on May 27th.

The following is an extract from the statement of the chairman, Mr R. D. Trotter, which has been issued to shareholders:—

On January 28th our late and much-revered chairman, Mr Lionel N. de Rothschild, died. We have lost in him a great personality and one who devoted a large measure of his energies to looking after the interests of the company and of the shareholders.

The net new business completed during the year in the life department amounted to £1,118,485. This is slightly lower than the corresponding figure for 1940, and is about one-third of the amount of business which we used to complete in the pre-war periods. The claims experience was satisfactory. The claims by death were only £573,104, and this figure included £50,496 for war claims, as against £826,027 in 1940, which was admittedly a bad year from that point of view. At the close of the year the Alliance life and annuity funds amounted to £23,141,164, an increase of £318,429 for the year.

FIRE AND ACCIDENT DEPARTMENTS

In the fire department the net premiums amounted to £2,129,372, which is £46,247 less than the premiums in 1940, and this is not surprising, owing to the fact that we have naturally lost business in foreign countries now occupied by the enemy. The claims experience was again more satisfactory than in 1940, and, after having put by £25,000 for bad and doubtful debts, after adjustment of reserves for unexpired risks and the inclusion of interest, less tax, amounting to £95,595, there is a balance of £529,552 carried to profit and loss account. I feel that you will agree with me that this is a very satisfactory year's result in these difficult times.

In the accident department there was a net increase in premium income of £22,573, the comparative figures being £1,227,778 in 1941, as against £1,205,205 in 1940. The principal increase is in respect of the employers' liability account. Our motor account shows a good profit. The premium income is lower than in 1940. This is not to be wondered at in view of the shortage of petrol and the consequent laying up of cars, and we must look for a considerable contraction in the premium income during the current year for the same reasons. The profit of the department, £198,867, has been transferred to profit and loss account, and is slightly in excess of the amount transferred in the previous year's account.

SATISFACTORY MARINE BALANCE

The marine underwriting account for 1939 has been closed with the very satisfactory balance of £143,348, which is £59,514 higher than the balance of the 1938 account. The surplus, after setting aside £9,168 for further claims in respect of 1939, is therefore £134,180, which, together with interest (less tax) on the marine fund £28,820, making a total of £163,000, has been carried to profit and loss. This is an exceptionally good result and one we can hardly hope to repeat next year.

In the trustee department the funds now being administered total approximately £16,000,000, excluding debenture trusteeships and the like. The number of trusts now being administered is 246. With regard to our Stock Exchange securities, I am glad to be able to report a considerable recovery in market value. As was reported last year, there was a favourable margin over the book value in the case of the members' accounts. This margin has further increased, in spite of considerable sums written off during the last two or three years in respect of deposits in enemy-occupied territories.

As was to be expected, the rate of interest earned on the company's funds has suffered further from the requisitioning of relatively high-yielding securities and the investment of the major part of the proceeds, as well as all new money, in Government War Loans. The policy of the company has been from the outset to invest the maximum amount in such loans in order to assist the Government in the prosecution of the war, and I feel sure that it will be gratifying to the shareholders to know that the total subscriptions to such loans by the "Alliance" group of companies during 1941 amounted to over £1,000,000. The holding of British Government securities at December 31st last represented fully 40 per cent. of the company's Stock Exchange investments.

COMMERCIAL UNION ASSURANCE COMPANY, LIMITED

SIR BERTRAM HORNSBY'S STATEMENT

The annual general meeting of the Commercial Union Assurance Company, Limited, will be held on May 26 at the registered office of the company, 24, Cornhill, London, E.C.

The following are extracts from the review by the Chairman, Sir Bertram Hornsby, C.B.E., on the report and accounts and balance-sheet for the year 1941: Perhaps the most gratifying feature is the increase in the volume of our business despite the extension of hostilities to the Far East, where, as you will be aware, our interests were extensive and of long standing.

FIRE DEPARTMENT

The premium income amounts to £5,813,593, being an increase of £259,175 over that of the year 1940. The ratio of claims paid and outstanding is 43.98 per cent., while commission and expenses of management account for 46.71 per cent., and there is a net underwriting profit of 7.52 per cent. £500,000 is transferred to profit and loss account, and the fire fund now amounts to £7,192,869, or 123.73 per cent. of the premium income. As to our home business, the results during 1941 show a noteworthy improvement in comparison with our experience for 1940.

LIFE DEPARTMENT

The outstanding features of the year are (1) the substantial increase of £905,040 in the amount of new sums assured, the total of which, after deduction of reassurances, was £3,806,938; (2) the increase of the year's premium income to £2,004,203, thus for the first time passing the two-million mark; and (3) the increase in the life fund of £1,085,614, which brought it up to £29,917,664. These three features are closely connected and played their part in enabling us to increase our holdings of war issues by nearly £2,500,000. This, coupled with the heavier taxation, brought down the net rate of interest obtained on the life fund to £3 2s. 9d. per cent., against £3 5s. 8d. per cent., which has obliged us to introduce a new and somewhat higher scale of premiums at the beginning of this year for many of our contracts.

Our current bonus period ends on December 31, 1942. At present we are allowing an interim bonus on "with profit" policies which in the old series is equivalent to a minimum cash bonus of 16 per cent. of the premiums due and paid since December 31, 1937, and in the new series to a reversionary bonus of £1 per cent. on the sums assured for each year's premium paid.

MARINE DEPARTMENT

The net premiums of the marine department amounted to £1,476,655, showing an increase of £138,939. Claims paid and outstanding amounted to £698,820, and £250,000 has been transferred to profit and loss account. The marine fund now stands at £2,099,109, or 142.15 per cent. of the premium income.

ACCIDENT DEPARTMENT

The premium income at £8,342,178 shows an increase of £808,307, arising principally in the United Kingdom and the United States of America and, as one might expect, mainly in the employers' liability section of this department due to the increase in industrial activity through the expanding war effort.

PROFIT AND LOSS

Gross interest, dividends and rents at £1,016,323 show an increase of £29,132, and reflect the result of the increase in the funds during the year. The weight of taxation falls upon us again with increased force, United Kingdom taxes taking £1,045,517 and Dominion, Colonial and foreign taxes £207,067, increases of £310,512 and £87,429 respectively. Part of the increase in the United Kingdom taxes arises from a provision of £250,000 which we have thought it prudent to make this year on account of prospective liability on the year's trading results.

A transfer of £379,902 is made to general reserve fund, raising that fund to £5,000,000, or over 140 per cent. of the issued capital of the company. The balance remaining will meet the cost of the final dividend recommended by the directors of 3s. 6d. per £1 stock and leave a balance to be carried forward of £197,498.

Bearing in mind the increasing difficulties arising out of war-time conditions the results will be regarded as satisfactory.

NORWICH UNION LIFE INSURANCE SOCIETY

CONTINUED PROGRESS

The one hundred and thirty-fourth annual general meeting of the Norwich Union Life Insurance Society was held, on the 19th instant, at Norwich.

Mr Ernest Hicks (the president) said that during the past year they invested over £950,000 in British Government securities, which now stood at £6,758,785, and they were continuing to invest all available moneys in this way. In addition, under their special Savings Bonds schemes they had bought approximately £400,000 of National War Bonds for individual policyholders, and these purchases were shown under the heading of loans on stocks and shares.

In these days of anxiety and distress the value of life insurance to the community and the relief it could give in so many ways was even more evident than in normal times. They paid out in claims during the year £1,267,287, of which £208,625 was directly due to war deaths. In addition, they had paid out £2,057,918 in maturities.

The net new business was £6,683,408, being 57 per cent. of the production of the last pre-war year of 1938. The expense ratio was 13.34 per cent. and the net rate of interest £3 7s. 9d. per cent.

There was a considerable increase in the market value of their securities. The shares of the Norwich Union Fire purchased in 1925 had always appeared at the figure of £6,088,174. At the time of purchase the total assets of the Fire Office were £5,700,000 and the shares carried an uncalled liability of £493,000, which had since been entirely discharged out of the profits of the Fire Society, and the total assets now amounted to £7,600,000. They had received throughout a gross dividend of £4 6s. 8d. per cent., and in these days of low interest rates a first-class permanent investment of this magnitude showing such a satisfactory return was extremely valuable. The close co-operation of the work of the two societies throughout the world became every year of greater worth to both. By this alliance the combined societies were able to offer comprehensive insurance service covering practically all insurable risks.

The report was unanimously adopted.

NORWICH UNION FIRE INSURANCE SOCIETY LIMITED

SATISFACTORY UNDERWRITING RESULTS

The annual general meeting of Norwich Union Fire Insurance Society, Limited, was held, on the 18th instant, at Norwich.

Mr Ernest Hicks (the chairman), dealing with the underwriting results, said that in the fire account there was a very satisfactory increase of £160,872 in premium income, and he was glad to report that the resulting profit of £90,358 was a considerable improvement on last year.

The share certificates representing the society's holdings in its subsidiary insurance companies in the U.S.A. had been deposited with H.M. Government, their position being protected by the provisions of the Financial Powers (U.S.A. Securities) Act. This arrangement was satisfactory to all concerned.

The accident account had again been very satisfactory, the premium income having increased by £168,050, a full recovery from the temporary set-back in 1940. The result of the underwriting produced a profit of £162,459. In these excellent figures he was glad to say the overseas section had again contributed.

The marine premium income at £707,838 showed an increase of £75,425 and the account, so far as they could judge, was progressing satisfactorily. It was necessary, however, to maintain a cautious outlook. The 1939 account, now closed, showed a profit of £48,677, which they were transferring to the profit and loss account, in the knowledge that a full reserve strength was maintained to meet all liabilities.

In addition to the trading profit above referred to, the profit and loss account had a credit of £111,241 for net interest, leaving with the amount brought forward a sum of £738,736 at their disposal. The dividend, after deduction of income tax, took £137,324, and the large sum of £168,139 was now necessary as home taxation provision. The balance remaining to be carried forward amounted to £335,196 as against £325,995 last year.

The total assets were now £7,604,085—£546,627 more than in the previous year.

The report and accounts were unanimously adopted.

ROYAL INSURANCE COMPANY, LIMITED

97TH ANNUAL REPORT

THE CHAIRMAN'S STATEMENT

In a statement circulated with the 97th annual report of the Royal Insurance Company, Limited, the chairman, Mr A. Kentish Barnes, indicated that fire premiums totalled £5,754,087, and losses £2,625,849, the underwriting profit being £413,649, or 7.19 per cent. Home fire premiums had increased slightly as a consequence of advancing values, but losses, though less than in 1940, were still abnormally heavy.

Premiums in the United States had expanded with the growth of industrial activity and increased commodity prices, but losses were higher, several fires of exceptional severity having occurred.

In Canada, losses showed an increase, but a gratifying expansion of premium income helped to produce a moderate profit.

Results in Australia and New Zealand again made highly satisfactory showing. In the general foreign field, fire business was well maintained and underwriting experience was on the whole satisfactory.

ACCIDENT AND GENERAL RESULTS

Accident and general premium income was higher at £6,579,577; losses were £3,022,603; and a profit of £528,295, or 8.03 per cent., resulted. Motor business showed no falling off during the year but the further restrictions on motoring must cause contraction in this account. Workmen's compensation business again increased, reflecting industrial activity and higher wage rolls, and a modest surplus emerged.

In the United States, satisfactory results were produced, coupled with a considerable rise in premiums. In the Dominions and the general foreign field business showed gratifying development and contributed substantially to the aggregate results.

New life business, at £3,195,000, showed a slight improvement. War death claims were £74,000 out of total death claims of £902,000.

MARINE DEPARTMENT

In the marine department, the 1940 account closed with a profit of £249,685. There had been an increase of marine losses which was inevitable having regard to the greatly increased hazards of navigation due to necessary wartime measures.

Total underwriting profit (including £46,000 on account of shareholders' proportion of life profits) was £1,237,629.

New investment in this country had been confined to Government War Loans, the Royal and its associated companies now holding over £8,000,000 of British issues.

The staff had now subscribed for over 100,000 National Savings Certificates without taking into account individual subscriptions to 3 per cent. Defence Bonds.

COMPANY'S AMERICAN SHAREHOLDINGS

Reference was made to its shareholdings in associated American companies which the Royal had placed at the disposal of the Government. The dollars accruing to the company in the United States, both from its branch and subsidiary companies, had been made available in America to the British Government and the sterling equivalent was paid to the company here. This arrangement was satisfactory to all concerned, and the directors had been glad to assist the Government in this way.

ASSISTANCE TO THE GOVERNMENT

In many important directions the company was affording help to the Government. Since the commencement of the war the Royal and allied companies had issued on behalf of the Government approximately one million policies or certificates of insurance under the various war risks insurance schemes. During 1941, a scheme was formulated for the handling by insurance companies of all claims on the Government under commodity insurance and business war damage policies. For this purpose, committees had been formed throughout the country and the Royal and its allied companies were bearing a full share of this work. In addition, the Royal, together with other companies, placed at the disposal of the Government the services of technical staffs for inspection purposes with the object of fire prevention.

Activities were not limited to this country. Similar assistance was rendered in Canada, India and the other Dominions, while, in the United States, the technical organisations controlled by the companies generally had been active in fire prevention service in factories and plants vital to the war effort.

THE DEMAND FOR INSURANCE

War conditions had presented insurance companies with many problems, not the least of which was adaptation to changing conditions. Competition between companies had to all intents and purposes ceased, but the demand for insurance had in no way lessened. Nor was it to be expected that it should. Insurance was not a commodity that could be rationed, and the needs of the community expanding in many directions under war conditions required to be adequately met. Much had been done to help the position by a drastic curtailment of routine operations, and further possibilities were under constant examination. It must, however, be borne in mind that each insurance was a separate individual contract and no ingenuity could avoid the need for separate individual handling.

A considerable curtailment of the service so far offered to the public in this country must be faced—or perhaps, more correctly, an alteration in its character. This was made necessary by the depletion of the staff.

There were now over 560 of the home staff serving with His Majesty's Forces. Casualties had fortunately been few, but the loss of a further six who had given their lives since the meeting a year ago was deplored; also three more were reported missing and nine as prisoners of war. Deepest sympathy was extended to those who had been bereaved.

The chairman concluded his statement with the following words:—

I make no forecast for the present year; it is only to be expected that, in the conditions created by the world upheaval, we shall feel its adverse effects. Nevertheless, we face the future with a sober confidence and, above all, with the knowledge that, to the limit of our capacity, we are playing a useful part in sustaining the economic welfare of the nation and the community.

INDUSTRIAL AND GENERAL TRUST, LIMITED

DIVIDENDS MAINTAINED

The 54th annual general meeting of The Industrial and General Trust, Limited, was held, on the 21st instant, in London.

Mr W. Sandford Poole (the chairman) said that the impact of events in the Far East did not, to any extent, affect their gross revenue in the past year, and it was gratifying to be able to present accounts showing an increase of £16,306 in the gross income compared with a year ago. Net receipts amounted to £275,637. Deducting debenture stock interest and all working expenses and adding £137,395 brought forward, their net revenue available for appropriation was £333,659. They recommended the declaration of a final dividend on the ordinary stock of 8 per cent., making a total dividend of 12 per cent. for the fifth successive year. The increase in the rate of Dominion tax relief which they were able to pass on to stockholders on payment of these dividends was an indication of rising taxation in the British Dominions. The carry-forward was raised by £20,809 to £158,204.

Market quotations of investments were still fitful and afforded no true index to intrinsic values. Events in the Far East in recent months had caused a considerable setback in the quotations for plantation and other Far Eastern stocks and shares. The Trust's investments in enemy and enemy-occupied countries were estimated to represent at book cost less than one-eighth of their total investments. They had thought it might be interesting to have an unofficial valuation made of their investments portfolio based on quotations on March 31st last, so far as they were available. The valuation showed an overall depreciation of less than 3 per cent. on the total of £8,000,000 at which the investments stood in the balance-sheet but, as against that, their reserves and undivided revenue, after providing for the dividends to be declared, amounted to nearly 25 per cent. of the £8,000,000 invested. Their total investment in British Government securities was now £335,000.

He was hopeful that they might be able to repeat this year's rate of dividend again next year.

The report was unanimously adopted

IMPERIAL CHEMICAL INDUSTRIES, LIMITED

FACTORIES AT FULL CAPACITY

LORD MCGOWAN'S STATEMENT

The fifteenth ordinary general meeting of Imperial Chemical Industries, Limited, will be held on the 28th instant in London.

In a statement circulated with the report and accounts, the chairman (the Right Hon. Lord McGowan, K.B.E., D.C.L., LL.D.) writes:—

As a result of the pressure of the war for more production, our factories have been worked to capacity throughout the year. The performance of the various plants, maintained at a high level, testifies to the excellence of the equipment, the standard of maintenance which it is our practice to keep, and the technical control. The volume of output to meet demands has for a number of products touched new peaks. Our task is to provide supplies to meet industrial, agricultural and civilian requirements. The shrinkage in civilian needs under the national policy of rationing and limitation of supplies, is outweighed by the enlargement of industrial and agricultural activity.

We have continued our basic price policy. It is to approach every case with a reluctance to advance the price and not move unless we are convinced of the need for a change by the emergence of factors which are likely to be permanent, or unless a change is called for by the general symmetry of the price structure for related products. Where the expansion of demand and growth of efficiency have made it possible, we have made price reductions, notwithstanding all the conditions of war.

OVERSEAS ACTIVITY

When we look back on the numerous and growing difficulties with which our efforts to promote our export trade have been surrounded, we are surprised by the degree in which volume has been maintained. But with patience, persistence and a willing co-operation of all those with whom we must work in this sphere of activity, and above all with the indomitable courage of the merchant sailors and the high degree of protection afforded by the Royal Navy, and, during much of the year, by the silent vigil of the United States Navy, goods have moved to their distant destinations.

Our main manufacturing subsidiary or associated companies in the British Empire—Imperial Chemical Industries of Australia and New Zealand, Canadian Industries, and African Explosives and Industries—have continued their successful progress. Within the limitations of shipping, exchange resources and locally available materials, they have continued to expand their own activities, which like ours have grown with the intensity of the war effort.

The unprovoked attack by Japan upon the United States and the embroilment of the whole of the Far East by the declaration of war on the United Nations, has vitally affected our companies in Japan, China and Malaya. We had, however, not been unmindful of the risks of carrying on business in these areas, and had from time to time in preceding years made ample provisions against contingent losses in the territories now occupied by the enemy in the Far East. I must, however, warn you, now Japan is at the gates of Australia and India, that we have very large interests, both of revenue and capital nature, in those countries, through Imperial Chemical Industries of Australia and New Zealand and I.C.I. (India).

RESEARCH AND DEVELOPMENT

Our research activities during 1941 have again covered a wide field. They have embraced problems arising out of new plant conditions brought about by war circumstances, such as the substitution of novel raw materials for normal ones now unobtainable, and the development of entirely new products of both present national and possible future commercial importance. Our research staffs in this task have shown much original and ingenious thinking, while our readiness to assist have been highly appreciated.

War conditions call for the development of research ideas through the semi-technical stage to full scale operation much more rapidly than for peace time, and particular attention has been given to the development of new projects. Important materials are now being supplied by processes which not long since were in the hands of the laboratory staffs. The company is collaborating

with other concerns in this country where exchange of technical information appears to be in the national interest, and in some instances is voluntarily supplying its technique to industry.

The number of the company's employees in Great Britain at the end of 1941 showed a further substantial increase on the previous year, while changes have continued to come about through additional calls to H.M. Forces. We have also carried further the process of dilution of staff and workers in our own factories in order that the services of those released may be at the disposal of the Government. New entrants have proved very adaptable, and under the skilled guidance of the older workers have rapidly shown themselves capable of efficient production. Large numbers of women have been introduced and taken their places both on day and shift process work.

I wish again on your behalf to thank the servants of the company, in whatever capacity they work, for all they have contributed during the past year, first to the national interest and secondly to the company. Work was carried on during the first six months under the continued severity of air attack, and though this was greatly diminished during the second half of the year, other conditions of difficulty, whether of transport, of hours worked in the factory, or otherwise, still affected them. Yet our men and women carried on with unflinching courage and a dauntless spirit, and displayed that toleration and patience which solves all problems. Their loyalty and efficiency have maintained the high name of the company. Your board is proud to work with them.

FINANCIAL RESULTS

The total gross income shown in the consolidated income statement is £19,956,000, compared with £19,016,000 for 1940. This increase of £940,000 is largely to be ascribed to the expansion of our activities. The net consolidated income, however, has declined from £6,576,000 to £6,243,000, a fall of £333,000. Once again the conversion of an increase of £940,000 in gross income into a reduction of £333,000 in net income is due to taxation. The net burden from this cause to be borne by the company, and its subsidiaries, after allowing for income-tax recoverable from dividends to stockholders, is £8,762,000, compared with £7,385,000 last year, or an increase of £1,377,000. The difficulties which flow from high taxation, and the drain on cash resources from this and other special war time measures unfortunately still remain. For instance, the restriction of our financial resources has not permitted us this year, like last year, to write off capital expenditure on air raid precautions against revenue. The cumulative cost of all air raid precaution expenditure, both capital and revenue, to December 31, 1941, was over £3,400,000.

The surplus of combined assets over combined liabilities and share capital fell from £16,204,000 to £15,916,000 during the year. This fall is largely to be ascribed to the capital charge on the company for liabilities under the War Damage Act, 1941, the provision for which exceeded the amount we were able to appropriate out of the balance of available profits for 1941 by £250,000.

The charge for obsolescence and depreciation in the accounts of Imperial Chemical Industries, Limited, was £2,000,000, the same as in 1940, and in addition subsidiary companies provided in their own accounts £1,045,000.

In the legal profit and loss account of Imperial Chemical Industries, Limited, itself, the net income shown declined by £256,000 to £6,162,000 by reason of the heavier income-tax and excess profits tax. The appropriations made by your board and its recommendation of the final dividend on the ordinary stock are set out fully in the report of the directors.

Just as I have abstained from giving you any review of our production activities during last year, so I shall refrain from recording any opinion of the future. Our interests are indissolubly tied up with those of the nation and we have special responsibilities by reason of the magnitude of our interests, the national need for the products we make, and their vital importance in war. We shall endeavour fully to discharge them, and I am confident that every man and woman associated with the company will spare no effort to contribute his or her part.

ARMY AND NAVY STORES, LIMITED

DIVIDEND MAINTAINED

The annual general meeting of the Army and Navy Stores, Limited, was held on the 19th instant in London.

Brig.-General Sir Frederick Gascoigne, K.C.V.O., C.M.G., D.S.O. (the chairman and joint managing director), presided.

The chairman, in the course of his speech, said: At the last general meeting I warned you that our path in the following months would be beset with many difficulties, and that our earning powers would be drastically reduced and profits would suffer. The first part of that forecast was fully realised, but the second part was not, as we not only propose to maintain the dividend of 7½ per cent., but have actually increased our profits.

TRADING DIFFICULTIES

As regards the difficulties to which I referred, these continued to mount up. Further restrictions were imposed by the Government on the production of goods not necessary for the prosecution of the war, and replenishment of nearly all our stocks was in consequence difficult, and in many cases impossible. Many of our experienced staff were called to the Forces or to do work of other national importance, and we had to carry on with a sadly depleted staff. Petrol was severely cut, and the frequency and area of our delivery service had to be drastically curtailed.

We have borne these restrictions with patience, for we realised they were imposed on us in the national interests, and I know that the vast majority of our customers have accepted them with the same understanding and not blamed us when we have failed to produce all the goods for which they have asked; where the service has not been up to pre-war standard; or when we have been forced to curtail our deliveries.

Despite all these drawbacks, we have been besieged by people who wished to become new customers and by others who wished to make fuller use of the Stores than they did in pre-war days, especially in such commodities as wines, spirits and tobacco.

Ever since the supply shortage began—I refer, of course, to unrationed goods—it has been the policy of your board to look first after those people—whether they be shareholders or not—who relied on the Stores in pre-war days for their supplies. This does not mean that even our pre-war customers got anything like they were accustomed to order in the old days, but their needs were the first to be met, and to the full extent of our available stocks. This has been a little difficult to regulate in the case of goods which are being received spasmodically and in fluctuating quantities, but in the case of wines and spirits—where we knew precisely where we stood—we decided to issue ration cards to our old and regular customers for these commodities and to confine supplies to them.

Turning to the profit and loss account, our gross profit—that is the balance from trading account, miscellaneous revenue and the interest on investment account—amounted to £547,307, which is £19,524 more than in the previous year. As our expenses at £435,266 showed a reduction of £7,778, the net profit is £112,040, or £27,302 higher than in the previous year. In view of my warning last year and the difficulties about which I have told you, this excellent result must surprise you. The explanation is that our branches in India, Bombay, Calcutta, Delhi, etc., have done extremely well and our factories also made a very useful contribution to the result.

ALLOCATION OF PROFIT

The directors recommend that a dividend of 7½ per cent. the same as last year, be paid, that £2,000 be allotted to the Indian good service fund, which is the same allocation as last year; that £12,249 be placed to the credit of the pensions redemption fund; and that £35,000 be reserved for N.D.C. and Indian excess profits tax. Together these appropriations account for £110,749, leaving £1,292 to be carried to the surplus to carry forward, which will then stand at £104,375. I hope you will consider these to be satisfactory results, and I am sure we have a very sound balance-sheet.

As regards the future, we can only do our best by eking out our existing stocks and supplementing them as far as possible, so that our customers can continue to get, at any rate, a modicum of what they require until the days of greater plenty return.

The report and accounts were unanimously adopted.

INCORPORATED ACCOUNTANTS

FUNCTIONS OF FINANCE IN WARTIME

The annual general meeting of the Society of Incorporated Accountants and Auditors was held on the 21st instant in London.

Mr Percy Toothill, F.S.A. (the president), expressed undiminished confidence in the inspiring leadership of the Prime Minister and ultimate victory. The duties of the accountancy profession were, he said, almost entirely devoted to work of national importance connected with the war. Men and women had been released for duty with the Services, and the strain on the profession due to increased professional work and the severe depletion of personnel was acute. By a system of individual deferment something had been done to ease the claims which the Ministry of Labour and National Service was forced to make on the profession.

AUDITORS AND E.P.T. CREDITS

There would be regret in the accountancy profession that the Finance Bill had done nothing to remove the serious anomalies associated with the assessment of E.P.T. The Chancellor of the Exchequer had reminded them that the 100 per cent. rate was introduced to take the profit out of war. That was generally recognised, but the adjustment of inconsistencies would not conflict with that sound principle and the rectification of anomalies would stimulate war production. These criticisms were not a specious cloak to avoid the burden of taxation which industry, as well as all classes of the community, must sustain for the prosecution of the war. It was satisfactory, however, that the Finance Bill appeared to clarify the conditions relating to the 20 per cent. repayment.

From the viewpoint of accountants, however, the suggested new provisions were still obscure, and it might be felt that it would be unwise to include amongst the assets of companies sums which might later be repayable under these provisions. For these reasons it would probably be preferred to insert a note on the balance-sheet in general terms, with a specific reference to this future right to repayment, the application of which still remained to be laid down by Statute, except that the amount would clearly not be distributable either as dividend or bonus shares. Some companies were precluded, for security reasons, from disclosing their profits before taxation, and it would probably not be desirable in many cases to insert any definite estimate of the E.P.T. repayable. The omission of such vital information from the accounts was to be regretted, but there appeared to be no other available course.

The past twelve months had witnessed extensions of the two main functions of wartime finance: the restriction of unnecessary personal expenditure and the provision of means for the maximum war production. On the whole, the first function by means of ever-increasing taxation and stricter rationing, had worked fairly well, although further restriction on personal expenditure was necessary. But the second function had been less successfully explored, and it was probable that our financial resources were not yet fully deployed. It was a strange anomaly that the ability of a company to expand its vital war production depended not entirely on the need for that production but on the accidental factor of the amount of its profits for the years 1935-37, in relation to E.P.T.

FUTURE WORK OF PROFESSION

He hoped that the future work of the accountancy profession might be increasingly concerned with the practical application of accountancy experience and methods in the solution of business and social problems. Accountants could usefully participate in evolving new methods of price fixing and costing and the simplification of industrial and commercial administration. Government accounting and costing methods might have developed under pressure to meet immediate requirements and reform by way of simplification and standardisation should be pursued. Incorporated accountants were in a position to obtain a unique knowledge of the whole field of industry, commerce and agriculture and their professional work provided scope for diverse talents which should be fully and effectively employed in attempting to solve the economic problems of the present time and those which would present themselves with the coming of peace. Whilst everyone had accepted the controls and rationing which were essential for the successful prosecution of the war, he trusted it would be an early purpose of Government policy, when peace was secured, to eliminate gradually but none the less certainly the controls which were imposed by wartime necessity.

CENTRAL MINING AND INVESTMENT CORPORATION, LIMITED

IMPROVED RESULTS

STATEMENT BY MR F. R. PHILLIPS

The annual general meeting of the Central Mining and Investment Corporation, Limited, will be held, on the 27th instant, at 1 London Wall Buildings, London, E.C.

The following is an extract from the statement of the chairman (Mr F. R. Phillips) issued to shareholders:—

The profit for the year 1941 amounts to £682,143, compared with £309,557 for 1940. The improvement is substantial and gratifying. Before arriving at the profit of £682,143, the sum of £30,000 has been appropriated for contingencies account.

THE DIVIDEND

The amount available on the appropriation account, including the amount brought forward from 1940, is £862,019. A final dividend of 8s. per share will be paid on the ordinary shares, which, with the interim dividend of 4s. per share paid last December, will make a total distribution on the ordinary shares of £255,000. The total paid to both classes of shareholders is thus £305,000. In pursuance of the policy mentioned at our last meeting of gradually building up again our reserve fund, the sum of £100,000 has been appropriated, raising that fund to £1,300,000. Provision for taxation, at £175,000, is naturally higher than that of the previous year. The amount to be carried forward is increased by £2,143, to £182,019.

MINING RESULTS

During the year 1941 new records in several directions were established by the Witwatersrand gold mining industry. For instance, the ore milled reached a total of 67,255,450 tons, or 2,740,100 tons more than in the previous year, the average grade of ore milled further decreased by 0.069 dwt. per ton to 4.127 dwt., and the number of ounces of fine gold produced increased by 356,494 to 14,039,912, with a currency value of £117,935,261, which was £2,994,550 in excess of the year 1940. On the other hand, the working profit earned amounted to £45,845,043, or £1,680,144 less than in the previous year, due mainly to a rise in working costs of 6d. per ton.

On the property of the Blyvooruitzicht Gold Mining Company, Limited, from the initiation of development operations in April, 1941, to the end of March, 1942, 5,160 feet had been sampled, all of which proved payable, with the exceptionally high average value of 836 inch-dwt. Those of you who have followed the history of this new company must have been struck by the remarkable development results obtained to date.

In the case of Consolidated Main Reef Mines and Estate, Limited, the tonnage milled for the year 1941 was 5 per cent. greater at 2,525,000 tons. Lower grade and higher costs resulted in a drop of £194,500 in profits, with the result that dividends totalling 25 per cent. were paid, compared with 30 per cent.

At Crown Mines, Limited, the available ore reserve as at December 31, 1941, was 688,400 tons lower at 19,518,500 tons, but the value was unchanged at 4.8 dwt. The ore reserve is, however, quite adequate for current requirements.

Development at Durban Roodepoort Deep, Limited, reached the record total of 106,447 feet and of the footage sampled 70 per cent. was payable, compared with 62 per cent. for 1940. Payable ore developed increased by over 800,000 tons to 3,118,300 tons, and the available ore reserve at the end of December, 1941, amounted to 7,881,800 tons, valued at 4.4 dwt. per ton, compared with 6,799,300 tons of the same value for the previous year. Considerable progress was made with winding plant installations. The ore crushed totalled 2,393,000 tons, a record, and an increase of 169,000 tons compared with the previous year. Working profits rose £76,600 to £1,225,309, and dividends from 32½ per cent. to 35 per cent.

The decrease in profit earned by East Rand Proprietary Mines, Limited, was due almost entirely to the lower grade of ore mined. Dividends were maintained at 35 per cent.

THE FUTURE OF GOLD

From time to time over the past few years the question of the future of gold has been raised, but nothing which has been said

has in any way shaken our belief in the essential part which gold must continue to play in the economic structure of the world, and consequently we have no misgivings as to the wisdom of the policy we have consistently followed over many years past of having a large commitment in the South African gold mining industry.

STEWARTS AND LLOYDS, LIMITED

MR A. C. MACDIARMID'S STATEMENT

The fifty-second ordinary general meeting of Stewarts and Lloyds, Limited, was held, on the 19th instant, at the registered office of the company in Glasgow. Mr William Forbes presided in the absence of Mr A. C. Macdiarmid, the chairman of the company, who was slightly indisposed.

The notice calling the meeting was held as read, and the secretary (Mr William Stewart) read the auditors' report.

The chairman said: A copy of the directors' report has been sent to each stockholder, and I presume that, in accordance with your usual custom, you will agree to hold it as read.

I am not at liberty to make at this meeting a speech on the usual lines. I shall, however, read to you Mr. Macdiarmid's statement circulated with the report and accounts:

"For the second year I am circulating with the report and accounts a statement in place of the speech which, under normal circumstances, I should have delivered at the annual general meeting to be held in Glasgow on the 19th instant. Cards of admission to the meeting, which will be formal, are not being issued. A quorum has been arranged, but any stockholder who wishes to be present will be welcome.

"Stockholders will appreciate that it is not possible for me to make the usual detailed review of the company's activities. The accounts submitted show that the company's affairs are in a sound condition. You will observe that the directors have transferred the sum of £100,000 to reserve for special depreciation and that they have added a further sum of £250,000 to reserve for contingencies.

"The directors again wish to express their appreciation of the services rendered by the whole body of staff and employees of the company under most difficult and trying conditions."

I move that the report and accounts for the year 1941 as submitted to this meeting be hereby received and adopted.

Mr J. C. Lloyd seconded, and the resolution was adopted. The chairman: I move that the dividends as detailed in the directors' report to the stockholders dated May 11, 1942, be paid—these dividends to be paid on or after May 23, 1942, to the stockholders whose names are on the register at the date of this meeting, and that £192,875 be carried to the accounts for the year 1942.

Mr J. C. Lloyd seconded, and the resolution was adopted. The retiring directors were re-elected and the auditors were re-appointed.

BRITISH MATCH CORPORATION, LIMITED

SATISFACTORY TRADING RESULTS

The 15th ordinary general meeting of British Match Corporation, Limited, was held on the 20th instant at 66A, Fenchurch Street, London.

Sir Clarence E. Bartholomew, O.B.E. (chairman and managing director), presided.

The chairman submitted the report of the directors, which states: The net revenue for the year ended April 30, 1942, amounted to £340,881, to which has to be added the balance brought forward, £89,922, and after allowing for the dividends already paid, which absorbed £92,297, there is a balance of £338,506 available for distribution.

The directors recommend placing to dividend equalisation reserve £60,000, the payment of dividend on the preference stock for the half-year to April 30, 1942, and a final dividend on the ordinary stock of 5½ per cent., making a total of 8 per cent. for the year, leaving £94,524 to be carried forward.

The trading results of subsidiary and associated companies at home and overseas have been satisfactory, though considerably affected by heavy taxation.

The chairman moved the adoption of the report and accounts and the recommendations contained therein, which were unanimously approved.

BRITISH ENKA LIMITED

PROFIT MAINTAINED

The seventeenth ordinary general meeting of British Enka Limited was held on the 20th instant at Winchester House, Old Broad Street, E.C., Mr A. D. Carmichael presiding.

The chairman, in the course of his statement, said: The working profit amounts to £122,438. Although this appears a larger amount than in the accounts published last year, the actual working profit is almost the same. The previous year's figures included a reserve for excess profits tax which is now believed to be higher than the actual liability. The 1941 Finance Act gives the company a more favourable standard, and no reserve is thought necessary for the current year.

In the first half of the year we suffered very considerably from interruptions due to war conditions, but later our working conditions were somewhat easier. We have been able to maintain a good standard of quality. In solving our many problems, we miss at times the technical advice and assistance which we used to receive from the A.K.U. in the years before the war.

Relations with our competitors in the trade have been happy and collaboration has been close and always very helpful. The organisation set up before the war by the rayon producers has proved a great benefit, and in particular it has enabled the industry to deal collectively with the Government on many matters forced upon us by war conditions. The introduction of the Clothing Rationing Scheme has meant still closer control upon our output, and a Rayon Allocation Committee has been set up by the rayon producers to collaborate with the various controls and to ensure compliance with the Government's instructions. All rayon yarn produced is now directed into the various channels of consumption, as decided from time to time by the Government.

The report and accounts were unanimously adopted.

JOHNSON AND PHILLIPS

We regret that the meeting of this company on page 699 of our issue of May 16th was stated to be the twenty-seventh annual general meeting instead of the thirty-seventh.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

THE strength of the Russian counter offensive at Kharkov and the various speeches by members of the Government served to maintain sentiment, but the small price improvements throughout the markets were a reflection of increased enquiry and shortage of stock rather than any real expansion in turnover. The gilt-edged market continued to provide the major interest; demand for 3 per cent issues being reflected in numerous small advances, while among dated stocks, 2½ per cent Funding was raised ½ at the reopening. Among irredeemable stocks, turnover was slight and barely affected prices. Apart from steady support for South American issues, the foreign bond market was quiet. Light buying and a general shortage of stock occasioned many small advances among Brazilian stocks, while Chilean bonds rose ½ point on Tuesday. Interest in the home rail market was at a low ebb and prices tended to weaken in the absence of support. Junior issues were generally steady, but small declines were common for the prior charges both before and after the week-end. Some slight improvement in Argentine rails in the foreign rail market was not continued after the week-end, when interest was transferred to Brazilian rail stocks, but, apart from a point rise for San Paulo at the reopening, improvements were small. Elsewhere, Canadian Pacific issues were persistently weak. Further buying of the Funds in midweek occasioned widespread gains, while a stronger tendency was apparent in the home rail market.

Conditions in the industrial market were quiet, but even light enquiry for leading issues was sufficient to reveal a considerable shortage of stock at current prices. With several small advances on Tuesday, brewery shares reversed their pre-week-end dullness when H. & G. Simonds lost 1s. 6d. There was a steady demand for tobacco shares, and after gains of ½ each on the previous Friday, BAT advanced ½ and Imps ½ at the reopening. The following day Gallaher rose ½ while Tobacco Securities jumped ½. Several small gains for leading issues were registered in the motor and aircraft group, Morris gaining 6d. on Monday among other smaller advances. The heavy industrial section reflected the generally improved sentiment in slight gains, but the reduced dividend of Pease & Partners, on which the shares fell 1s. 4½d., introduced some irregularity.

Turnover in shipping shares was light and prices showed little movement. Active dealing in British Celanese Second preference was the feature of the textile section, while Courtaulds rose 6d. at the reopening. Stores issues were generally unaffected by the new Ministry of Food Order, but the announcement of the levy on producing brick companies occasioned some dullness for London Brick. Later, conditions remained unchanged, and among many small advances Harrods rose 1s. 9d.

With little buying from the Cape, the kaffir market remained generally quiet, prices of both dividend payers and developing mines remaining firm. Central Mining rose ½ before the week-end, while on Tuesday West Wit. Areas repeated the previous day's gain of ½ and Grootvlei and Government Areas gained the same amount. A little more interest was apparent in the rubber market, but apart from a gain of ½ for Sungei Krian at the close of last week, prices scarcely moved on balance. In the tea market, Ceylon issues were in favour and shortage of stock resulted in persistent improvement. The small volume of business in the oil market was concentrated almost solely on the leading issues. Thus, Shell Transport rose ½ on Friday, as did Burmah Oil, while in the early part of the current week Anglo-Iranian, Shell and Burmah all showed further improvement. Activity continued on a reduced scale in midweek, but the undertone remained firm.

New York

THE uncertainty of war developments, together with fears regarding the possible effect of taxation on profits, kept turnover at a low level throughout the week on Wall Street. Despite rather slow dealing, small gains were well spread before the week-end, but on Tuesday support slackened, and several falls up to two points were registered among leading issues. Despite increased activity in midweek, most issues were slightly easier.

BY TENDER

Glasgow Corporation Bills.—Glasgow Corporation has issued £325,000 bills, maturing September 30th, 1942, at an average rate of £1 os. 3.59d. per cent and £425,000 bills maturing October 31st, 1942, at an average rate of £1 os. 4.05d. per cent. The total amount of bills outstanding is now £750,000.

COMMODITY AND INDUSTRY NEWS

Rubber Gloves.—The Rubber Gloves order (S.R. & O. 918) has been made by the Board of Trade, whereby the purchase of rubber gloves for other than essential use is prohibited. Rubber gloves will be obtainable only on production of a certificate signed on behalf of either H.M. Inspector of Factories, the Board of Trade, the Ministers of Health, War Transport and Agriculture or the relevant Ministers for Scotland and Ireland, and endorsed by the person to be supplied. Certificates will be given only where the industrial need is considered essential and where there is no substitute for rubber gloves. Traders will obtain replacements on production of certificates. Supplies to Government departments and for direct export are exempt, as are gloves which contain rubber only as elastic in the wrist.

Soft Drinks.—Manufacturers of soft drinks decided on May 12th to form a war-time association to represent the industry in all negotiations with the Ministry of Food and to carry out the reorganisation and regulation of production and distribution which is necessary during the war. A provisional executive committee representative of the various groups was set up to organise, in conjunction with the Ministry of Food, the formation of the Association.

Smaller Cotton Exports.—The recent decline in exports of cotton goods is shown by the statistics just published by the Board of Trade, the shipments of cloth for the first quarter of this year being given as 142,622,000 square yards, against 227,023,000 square yards in the fourth quarter of 1941 and 185,109,000 square

yards in the first quarter of last year. Shipments of cotton yarn during the three months ended March 31st were 4,294,000 lb., against 5,807,000 lb. in the fourth quarter of last year and 8,114,000 lb. in the first quarter of 1941. These figures are not surprising in view of the recent cut in export allocations made by the Cotton Board. For comparison purposes it may be mentioned that in the first quarter of 1940 shipments of cotton cloth were 322,508,000 square yards and of cotton yarn, 26,712,000 lb.

Soap Rationing.—The effect of the new arrangements for the supply of soap to catering establishments and institutions, which come into force on June 1st, will be to reduce their consumption by 20 per cent. They will no longer be restricted to buying the particular types of soap which they previously used. Part of the allowance may be taken in loose coupons at the rate of not more than 1½ in a four-weekly period for each resident, to enable such residents to buy their own soap. The cut of 20 per cent, is the average reduction which rationing has made in the supplies of soap for the domestic consumer.

Finance

GOVERNMENT RETURNS

For the week ended May 16, 1942, total ordinary revenue was £43,211,000, against ordinary expenditure of £79,364,000, and issues to sinking funds of £195,000. Thus, including sinking fund allocations of £833,155, the deficit accrued since April 1st is £358,537,609 against £375,636,000 for the corresponding period a year ago.

the weakening and frustrating of Japan through five long years of war, but also for China's part in the Burma campaign. Of all the fighting Allies, the Chinese are least able to equip themselves. Bombs, grenades and small arms of various kinds are produced, sometimes fabricated by guerilla bands behind the enemy lines. But no more complicated weapons are made. For all the armament of modern war the Chinese are dependent upon outside supplies. In a country and in a climate where heavy panzer equipment is out of place, the lack of equipment has not reduced the Chinese to the impotence it must have done on other fronts. But on every front, from Pearl Harbour to the Straits of Dover, air power is decisive. It was air power that was most lacking in Burma. It is air power that is China's most urgent need in Yunnan and Chekiang.

Finally, the defence of China is in the overwhelming interests of the United Nations. It is estimated that China's resistance is holding down over 30 Japanese divisions. Some 800,000 men are immobilised. If they could be thrown into the campaign against India, against Australia, against Siberia, their intervention might be decisive. Just as the maintenance of Russian resistance is the first principle of successful action in the West, the maintenance of Chinese resistance is the first necessity in the East. Both Russia and China provide the resistance on land which the war effort of Britain and the United States, still primarily maritime, must maintain and complete. If either goes or, worse, if the resistance of both is smashed, there can be no further talk of a second front. It is very doubtful, indeed, whether the reinvasion of Eurasia can be accomplished from the sea alone.

What can be done? No one can question the imperative need to give all aid with all speed to both Russia and China. The problem is, how? From the Chinese end some proposals were put forward a month ago. The situation of China has grown worse since, but it is just possible that it can still be made good. The first require-

ment is effective unity of action in what is left of the Burma front. General Stilwell has been to India and held consultations with General Wavell. Perhaps a joint plan of action will emerge from these joint discussions. The most effective way of defending India is to defend it in Burma. If General Alexander's men can be reinforced, then an offensive launched before the Japanese have had time to dig in at Bhamo and Myitkyina might restore the link with the Chinese and ensure that the new India Road will be able, when it is opened, to function without savage interference from Japanese aircraft. Any such attempt requires strong reinforcements in the air. Bombers and fighters are China's first need. It is useless to underestimate the technical difficulties of getting fighters to this front or into China in a fit state for use on arrival. But both the Germans and the Russians, as well as the Japanese, have improvised their way through similar difficulties.

Finally, the Chinese need more aid from Russia. The problem is difficult. The Russian armies are so heavily engaged in the West that any diversion of effort may well be out of the question. But if China is first overwhelmed, the Soviet Far Eastern Army will face an army augmented by anything from 15 to 30 divisions. Once again it is a problem of synchronisation, in the East as in the West.

Some phrases recur in this war with dogged and dreary persistence. "One at a time" is one. "Too late and too little" is another. Their melancholy echo is the reason why Russia must be aided in the West with all the arms and by every means her allies can provide. But to-day these phrases are running with the speed of bad news all through the Far East. If the concept of the United Nations is to mean anything in the war, and later in the peace when the formidable task begins of giving an ordered framework to the lives of the millions of people of East Asia, then China, too, must be helped until it hurts; and helped now.

The Parties and the People

THERE was no revolt at this week's assembly of the Labour party, though it was only by a hair's-breadth vote that the Executive secured the party's agreement that the political truce should go on. Independents will continue to capture Tory constituencies which, in Labour's view, might well have gone Labour. Conservative seats of the 1935 vintage will continue to be protected against the swing of the pendulum. More than that, there will be no demand from Labour's official platform for Socialism in Our Time. "It is of vast importance to proceed on a basis of co-operation," said, not Mr Attlee or Mr Morrison, but Mr Shinwell.

The basis of co-operation looks pretty broad. At the conference, the National Executive of the Labour Party moved and carried a resolution on reconstruction which, in many of its essentials, might be endorsed by majorities in all the other parties. There must be no return to an unplanned society, which produces economic insecurity, industrial inefficiency and social inequality; measures of Government control, needed for mobilising national resources in war, are no less necessary for securing their best use in peace; the planning of production for community consumption is the only lasting foundation for a just and prosperous economic order, in which political democracy and personal liberty can be combined with a reasonable standard of living for all citizens. These arguments were the gist of the resolution and they have been heard before in recent months from almost every other point of the political compass. On the face of it, they do not clash too greatly with the report on reconstruction put out on Friday by the Federation of British Industries.

For the first time for many years the leaders of the Labour party have sought to draw up a viable pro-

gramme; and it is, perhaps, a doubly welcome development that the Labour party is trying to bring its policy into line with political realities. In the first place, it is obviously important during the war that broad agreements should be sought by the politicians who are in coalition. In the second place, the Labour party was far too content before the war to remain permanently in Opposition with a programme which had no chance of popular acceptance or practical realisation. But there is also a serious danger in this façade of agreement. It is misleading. Up to a point, it is true that all parties are agreed upon the need for a measure of planning to remove insecurity, inefficiency and inequality. But the verbal agreement hides vast differences in interpretation. The vital question is who are to be the controllers? An amendment "to remove from power the commercial vested interests which at present dominate the system of Government control of industry" was shelved at the Labour Conference; but the FBI make it plain in their report that, in one form or another, they intend this régime to continue.

At bottom, the issue is one of power even more than of policy. In one sense, it is true that there is at present a vacuum in British politics. Ever since the last war, the parties have proved themselves incapable either of furnishing democratic leadership or of working a Parliamentary system in a democratic way. In another sense, however, there has been, and is, no vacuum. The Baldwin-MacDonald-Chamberlain era may be said to have started in 1922; and ever since then effective political power has remained with the Tory back-benchers who still form the 1922 Committee. They decided the course of British politics twenty years ago, and it was their decision in May, 1940, when they saw the red light,

which finally made Mr Chamberlain make way for Mr Churchill. It was their conception of industrial self-government which made this country's economy into a producers' ring before the war, and it is their notion of political economy which underlies the system of wartime controllers. They may agree verbally about the need for post-war planning, the planning of production and the planning of overseas trade. But they expect the planning to be done, not by the community in any sense, but by organised industrialists and traders; and they are much surer of what they want than the planners who find it so hard to decide between representative boards, public utility bodies and Government departments as the method of communal control. Where the planners are most certain, as in the case of the Labour plan for a National Board for the mining industry, including both miners and employers, they come closest to the Conservative industrialists; in this respect, the miner and the mine-owner belong to the same producers' club.

It would be disastrous if this fundamental conflict were to be completely hidden by the fog of war. Parliamentary democracy in this country will never be fresh and alive again unless the real issues of policy are made plain and openly debated. The people must decide. It is they who will be most affected by what is done. At present, they stand on the side lines. They are outside politics. In their millions, they are in the Forces, and the war factories. Most of them have no chance to cast a vote in wartime. Many of them have no votes to cast. The most fundamental question of all is what they want, and they cannot say until they are shown the real choices and asked for a decision. Too many politicians and reformers who are planning for the people hardly ever think of the people at all. It is much easier to work out an employment programme or an investment policy or a trade plan than it is to bear in mind all the human implications. Under any plan which is not totalitarian, for instance, will working people be prepared when the war is over to give up their right to choose their own job, their own place of work and their own place to live? Will not the desire of ordinary people for the ordinary freedoms of ordinary life be as much a limiting factor to any plan as their desire for security of employment and pay?

It is hard to know what the popular view is. It is certain that most people do passionately desire security for themselves and their families; that is why there must be these plans for full employment, equal opportunity, and fair distribution. But, just as much, they want what the Labour resolution called "personal liberty." Indeed, if the question is put to them, that is what they believe they are fighting for now; and in the long run it will be they, by what they want and what they will stomach, who will decide the boundaries between state control and free enterprise. The only sure thing is that they will want no more control by vested interests. But at present they are not being asked. There

are no elections. Their so-called representatives are mostly relics from another and shabbier era. The gap between reform and reality has scarcely ever been wider.

Mr Churchill has said, rightly, that there is no war weariness. This is perfectly true in the sense that there is no defeatism, no call at all for peace at any price. But there is a weariness with politicians, with blind leaders who have not led. Mr Churchill stands unique and unchallenged among politicians because he does lead. But Mr Duff Cooper, say, is more typical. He emerges from the security in which he has dwelt since he left Singapore. He hastens breathlessly to the microphone. He looks backwards at the British Empire. In the words of a popular comedian, he says "You lucky people!" But the people who are lucky enough to hear him are not impressed. They want, first, to get on with the war and, secondly, to get back to their jobs, their families and their homes when the war is over; and the proceedings at this week's Labour Conference were sometimes as much out of touch with both these sentiments as Mr Duff Cooper. The entire Conference tended to talk as if the war was all over bar the shouting—at a moment of acute crisis in the war when good counsel about the economic war effort was never more needed.

The fact is that the real battle, the battle for political power, is going on behind the scenes. At present, it is raging round the coal industry. It is never far from the doors of the "business men's" Ministries. Mr Churchill is the only leader the people know and trust; they look to him to win the war. The battle for power, therefore, is a battle at the highest level, for Mr Churchill. Professor Laski calls upon him to proclaim a people's peace; the Conservatives look to him to remember that he leads a party as well as a nation.

All this is too much out of sight. Mr Attlee and Mr Morrison are impeccably right when they force an overwhelming Labour vote of wartime solidarity in support of the War Cabinet. But they are sadly wrong if they believe that the struggle against old political abuses, any more than the war against Germany itself, can be won without further grim fighting. Reform cannot ride to glory on an old Tory band wagon, however plain the name of Churchill on its side. There is no virtue, admittedly, in party strife. But the division between the interests of the corporations and the interests of the community is as deep as history. The time cannot be indefinitely delayed when this issue will be stated in public and to the people, when Ministers will choose their side and be ready to resign. The gap between Parliament and the people is so wide that a wartime General Election, which may be impossible now, cannot be ruled out for the duration. When it comes, it must on no account be a coupon election with all the rivals stubbornly on the same side as Mr Churchill. The lion and the unicorn must fight it out, and the people must acclaim the victor.

EQUITY & LAW
LIFE ASSURANCE SOCIETY
Established 1844

PROTECTION IN WARTIME

● Civilian War Risk Cover **without additional charge** is normally granted under new Whole Life and Endowment Assurances — whether With-Profit or Without-Profit.

● A Guaranteed Bonus each year until 1946 inclusive is provided under all new With-Profit Policies — thereafter Bonuses are dependent upon Profits.

The Coupon Age

IT has frequently been remarked in recent years that the age of finance is over. It died in 1931. Since then, money has been recognised, not as the dominant element in the national economy, but as the handmaiden of more tangible realities. These arguments have been reinforced in wartime. The handmaiden has been conscribed; finance is now the camp follower of production. The war effort of the country is planned and executed in physical terms, and there is a widespread belief that, whatever else happens after the war, there must be no return to the dominance of money. So the financial age is dead. It is less widely recognised that what has taken its place is the coupon age.

The coupon, properly speaking, was an invention of the last war. But so long as it was restricted to the purchase of one commodity in one shop, its wings were clipped. The decisive stage in the development of the coupon—a step as important as the invention of paper money—came with the points rationing scheme last year. The points coupon can be spent on different things at different shops. In this sense, we have points for some foodstuffs and for clothes. We are to have points for sweets and, if the Government shows a little firmness of purpose, for fuel. There is every expectation that there will be more points schemes. There was a rumour that tobacco and cosmetics were to be included with sweets. There is no reason in principle why there should not be a points scheme for travel, cinemas and gramophone records.

With the invention of points, the coupon takes on many more of the attributes of money. In districts where there are many munition factories, and where the majority of the population have more money than they know what to do with, it is the surrender of the coupons, rather than the payment of money, that constitutes the real consideration for the acquisition of goods. Moreover, coupons begin to respond to demand and supply. For example, the British public (for reasons which lie deep in the psychology of a very peculiar people) has a pronounced liking for tinned salmon, and when the points scheme was first introduced, there was a run on this particular item. Demand exceeded supply. But did the price rise? Certainly not; that would have been unforgivably mid-Victorian. Even worse, it would have been ineffective. It was the points-value, not the money-price, that was put up.

Clearly, here is a very potent new social weapon. Hitherto, rationing and coupons have been associated only with restriction and scarcity. But there is no reason why they should not equally be associated with plenty. It is not the coupons that create the scarcity of butter. The amount of butter that can be consumed is, in any case, fixed by the amount that can be imported. The coupons achieve equality of distribution. "Equality of distribution"—the phrase has a peacetime ring. Why not secure an equality of distribution of butter in peacetime by issuing coupons and selling butter, against coupons, at a very low cost, covering the loss by selling the remainder at exorbitant prices? Why not extend the principle until every mortal thing is included in some points scheme or other? "Come ye, buy and eat; yea, come, buy wine and milk without money and without price."

The prospect opens up a planner's paradise. By this means a revolution could be achieved of a peculiarly English character. This great people can rarely be induced to take any action at all by direct arguments of a logical kind. But give them a run around the mulberry bush and pretend you are really doing something else, and they will acclaim you as a pillar of church and state. For example, early in the war, Mr J. M. Keynes put out a scheme for what he called compulsory savings. He was roundly denounced by every perorator in the country who could lay his tongue to such phrases as "the voluntary system" or "the basis of self-respect." Mr Keynes tried again, this time calling his scheme "deferred pay." The opposition was less indignant but still enough to kill the proposal. Mr Keynes entered the Treasury as an adviser, and the

Chancellor of the Exchequer produced the same basic idea under the description of "post-war tax credits." The scheme went through the House of Commons with universal assent. The same endearing national trait could be illustrated by many other examples. Blood would run in England's streets if it were proposed to limit incomes to £5,000 a year—but the same result achieved by an increase of the rates of income tax and surtax is regarded as being in the soundest tradition of Conservative finance. Why then struggle fruitlessly for anything so dangerous and revolutionary as an equalisation of incomes, why interfere with incomes at all, when an equalisation of the standard of living can be achieved by universal coupons? The English genius consists in raising the euphemism to a political dogma. Let other countries have their revolutions; in England the new social order will seize power by *coupon d'état*.

There is something in this for the academic economist too. Points rationing, as has been mentioned, takes the place of the invention of paper money in the development of the coupon. We are already on the verge of the next stage of the invention of bank credit. Coupon banking accounts already exist, in which deposits and payments are made, not in money but in coupons, the retail hosiery drawing on his account to pay, say, 10,000 coupons to his wholesaler. The chairman of Lloyds Bank, in announcing this scheme last January, remarked that "of course" no overdrafts would be permitted on these coupon accounts. The "of course" is in the historical tradition. In the early days of banking, banks "of course" permitted no notes to be outstanding to a greater amount than the cash in the till, and contemporary opinion attributed the failure of the Bank of Amsterdam to its transgression of this obvious rule. But gradually it was discovered that the average note-holder was content to hold his notes and not ask for cash, and modern banking is founded on the axiom that only a small percentage of a bank's creditors will ask for hard cash. What is to prevent the banks learning from experience that there are some people who do not use all their clothes coupons? What is to prevent them, over the years, evolving the doctrine that it is safe to permit small overdrafts on coupon accounts, since, if the proper ratios are preserved, if confidence is maintained and if the balance sheet is suitably ambiguous, there is no risk of default—that is, of any coupon failing to be converted into clothes. Eminent and painfully respectable bank directors will be outraged by the suggestion that there is any dishonesty in such a proceeding.

They will also be outraged when, as will inevitably happen, some ingenious professor writes a book to prove that banks can create coupons. They will deny it. That banks can create coupons. They will say, are not clothes any more than Coupons, they will say, are not clothes any more than credit is money. The banks' only function, they will assert with their traditional felicity of metaphor, is to serve as a cloak-room. But the theorists will still preach their pernicious doctrine; and the parlance of the markets will also play its part in confusing the issue. The Clothes Market which will grow up in Lombard Street will no more resemble Petticoat Lane than the Money Market looks like a casino. When *The Economist* of the future reports that "clothes are tight in Lombard Street, overnight clothes are in great demand, and the running brokers are embarrassed" the meaning will be other than might appear at first sight.

Only one stage in the development of the coupon will then remain. Some professor, even more ingenious than his fellows, will propound the thesis that if only the banks would create more coupons, we could all be better clothed. Why go naked when every fourth row of cotton is being ploughed under? If only the natural flow of commerce were not impeded, for their selfish ends, by a conspiracy of international couponers, a new era would dawn. The wheel will have come full circle. The radicals will be proclaiming that the age of coupons is over and that some more scientific device must be invented. They might try

Reform of the Foreign Office

TO say that the world of diplomacy has been revolutionised in the last hundred years is a truism. But it has to be said for the reason that Britain's diplomatic practice did not, until recently, appear to recognise that this truism was true. The age of dynasties had gone, the age of mass democracy had come. Every kind of issue and interest—trade, wage and labour questions, standards of living—had thrust itself up to the level of international relations. Yet, to an almost incredible extent, the old limited dynastic world lingered on behind the closed doors of the Foreign Office, the embassies and the legations. In the years before the war, a few concessions were made. A commercial councillor was appointed here, a press attaché there. The BBC began some foreign broadcasting. The British Council was brought into existence and given a small grant. But there was nothing approaching the really revolutionary changes which were necessary to make British diplomacy even reasonably effective, let alone successful.

The onslaught of total war made glaringly explicit the conditions under which modern diplomacy must work—so explicit that very widespread changes were in fact introduced. Now that morale on the enemy's home front was a war-winning factor, the people—as opposed to their governments or ruling classes—could no longer be ignored. Now that contacts hitherto private and unofficial—say, between traders, bankers, businessmen and trade unionists—could affect the course of the war, they had to come under Government control. Britain began to build up a range of institutions which the dictator states had been using for years. There was now a Ministry of Economic Warfare and a Ministry of Information; the BBC vastly extended its propaganda services; finally a Political Warfare Executive was set up. These new institutions were linked with the Foreign Office, but enjoyed a degree of autonomy depending largely on the vigour with which they resisted outside control. This is still, roughly speaking, the position today, in the third year of total war.

It is obvious that the multiplication of agencies, although it met a very genuine need, has not solved the problem of the efficient conduct of foreign relations. Looking on at the workings of this strange machine, with all its ancillary but quasi-independent parts, is like standing outside a room in which a conference of deadly urgency and deathly secrecy is being carried on. Occasionally the door swings wide and a burst of high altercation is heard; occasionally the door bursts open and out flies the convulsed form of a Minister of Information or a BBC executive or a PWE official. Time and time again, the developing fortunes of the war have shown that the dispute raging inside—the grand dispute of war and peace aims—is still undecided and that, as a result, a proper control of the various agencies and an efficient division of labour between them is impossible.

The fault of the Foreign Office is, surely, its inability to formulate policy and its consequent inability to foresee problems before they arise and to have an answer ready. The other organisations are left to make good the lack of policy as best they can, partly by pushing up the bright ideas of individuals or departments as far as they can go in the executive hierarchy (seeing them lose brilliance, polish and effectiveness as they pass from departmental thumb to departmental thumb), partly by attempting to secure a snap decision on some question of policy, in the hope that the "higher-ups" will be either too lazy or too occupied to notice and that a precedent will thus be established. A great deal of Britain's foreign policy at this moment is being settled on a completely *ad hoc* basis, according to the individual whims, prejudices or deep convictions of relatively junior officials who, from the very nature of their work, are

unable to see the problems they deal with as a coherent whole.

Such a situation is intolerable. It is not incurable. Indeed, a magnificent opportunity awaits the Foreign Secretary to create order out of chaos and to transform the energetic but frustrated machine that is heaving and humping and throwing up jets of steam below him into a smoothly running, well geared and speedy instrument of foreign policy. Mr Eden's speeches have gone some way towards fulfilling the first principle of effective foreign policy—that is to say, having a policy at all. There is nothing in his speeches, particularly in his most recent Edinburgh speech, which, if properly developed and the implications worked out, could not form a framework within which long term diplomatic activity, short term decisions and day to day propaganda could not be integrated. The difficulty is that no adequate machinery exists for dealing with his general pronouncements in this fashion.

The reform of the Foreign Office does not differ in character from the reforms which are needed in general in Britain's machinery of government. Here, again, the two basic principles of the Haldane Report hold good: the integration of the field of work and the separation of planning from administration by the appointment of a Minister with general oversight and a competent planning staff. The difference lies in the urgency of the need and in the fact that here not even a first embryonic attempt has been made to deal with the structural problem on new lines. At present the only factors pointing in the right direction are the presence of Mr Eden in the War Cabinet, at one level, and the various rather chaotic attempts to secure Foreign Office control in the Ministry of Information, PWE and the foreign services of the BBC, at another. The integration of the field of work should present no difficulties of principle since the sphere is very clearly defined by the term "foreign relations." Such a reorganisation would mean the disappearance of the old narrow concept of traditional diplomacy and the substitution for it of a conception of the totality of the nation's public actions, contacts, responsibilities *vis à vis* the outside world.

Over this new unified structure Mr Eden would exercise general direction as War Cabinet Minister charged with the oversight of foreign affairs. The Foreign Office, the various agencies set up under the pressure of total war (the Ministry of Information, PWE and MEW) and other old established institutions (the BBC, the British Council, the Department of Overseas Trade) can be brought together as a single field of administration, with their work of necessity rationalised and re-allotted. The conduct of political business with other governments, diplomacy in the strict sense, would still be the province of the Foreign Office itself. The conduct of economic affairs would be the work of a new amalgam of MEW, the Department of Overseas Trade and the Consular Service. Propaganda, that is direct contact with the peoples of other countries, would be the task of a new Department of Information devoted to foreign publicity and controlling the foreign services of the BBC.

To secure effective supervision and guidance, Mr Eden would need the assistance of a skilled staff comparable to the production executive with which Mr Lyttelton has been provided or the experts who work on home affairs for the Lord President of the Council. This staff would not be composed of "experts" on foreign policy in the old sense. What is needed here is not a man who knows all about Patagonia, but rather one who sees how the particular problems, claims and possibilities of Patagonia fit into the general pattern of Britain's foreign policy. The instinct of the Foreign Office to recruit those who have benefited most from the best kind of general education is undoubtedly sound. Unhappily, the results of this

education are then largely nullified by a decade of soul-destroying dragooning along the exclusive paths of traditional diplomacy. The youth who is caught at twenty-three or twenty-four, and compelled thereafter to limit his social contacts and the horizons of his work to ambassadorial coteries and to diplomatic problems viewed in the narrowest traditional sense, is seldom capable by the time he is thirty of understanding the broad movements, popular passions and social upheavals by which the modern community is tossed along. Those Foreign Office officials who have survived the routine with vigour and freshness and those who have been brought into the Foreign Office and its allied agencies during the war as temporary civil servants are probably the men from whom Mr Eden could pick his general staff. They possess

the width of vision; they have gained some specialised knowledge; they have worked in the machine; they still have energy and enthusiasm and ideas.

A body of this sort would not only provide the essential link between the Secretary of State for Foreign Affairs—the title is already remarkably apt—and the various departments. They would also provide the machinery without which British foreign policy cannot hope to be either comprehensive or forward looking or even abreast of the times. The urgencies of war have pressed this problem upon the nation. The urgencies of peace will be even more pressing. An efficient army and navy and air force can perhaps win victory, a timid and inefficient foreign policy notwithstanding. But only the efficient and vigorous conduct of foreign affairs can win the peace.

Bars to Freer Trade

THE principle of free trade is simple and, in theory, generally accepted, even by those who in practice oppose it. A country should concentrate on producing commodities more cheaply than other countries, and on the production of commodities which it can produce more cheaply than other commodities. In practice, the objections which Adam Smith himself saw to the application of this principle remain the chief impediments to freer trade. In words now hackneyed, he explained that the impediments were two: the need to bring new native industries to a position where they can compete with established foreign ones; and the fear of exposing established native industries to the competition of new foreign ones.

To-day the problem tends to be over-simplified. The Atlantic Charter has promised greater freedom of trade after the war and equal access to trade and materials for every nation. But international commercial reconstruction will not be achieved simply by stating objectives. Adam Smith's impediments remain. The discrepancies in the costs of agricultural and industrial production between one country and another remain the crux of the problem; and after-war periods have never been favourable to their adjustment. Wars always mean more production in every belligerent country; nowadays they also mean a great expansion in the production of costly substitutes. When wars end, there are new industries and new armies of workers. New countries, brought into being or back into being by war, strive to become economically self-sufficient at whatever cost. These are lessons of history, and suggest that the real impediments to freer trade tend to be biggest at the close of wars. After 1815, industrial tariffs were raised up on the Continent of Europe in order to prevent invasion by Napoleon's troops from being followed by invasion by British goods. After 1871, the barrier of protection was used to fortify the competitive position of the new German Empire, threatened by American grain and British iron and textiles. The course of events after 1918 is only too familiar—growing tariffs, drastic measures against the migration of labour and the creation of artificially bolstered industries. The fact that post-war periods are poor springboards for freer trade should be recognised.

Leading statesmen of the Allies have followed the Atlantic Charter in urging that every country should have free and equal access to raw materials. In fact, such access has never been denied. By and large, no country has prevented another country from buying raw materials at a single world price. The real problem is whether countries can be allowed—if there is to be freer trade—to develop, in their own industrial hothouses, high-cost manufactures to convert these materials into highly protected goods. There is a similar problem in the case of food. The present plans to feed the starving populations of Europe immediately after the war are necessary and desirable. But they will not touch the fundamental food problem of Europe. The countries of Europe have had, and will have, free access to the cheapest food in the world, if they

want to buy it. But the free importation of grain, meat, butter, fruit, eggs and other products would bring ruin, not only to the big landlords of Prussia, but no less to the legion of small proprietors in Austria, Bavaria and other parts of central and eastern Europe. A flood of cheap food from overseas would cause serious economic disturbances in the receiving countries; and it would be politically resisted. There will be similar problems outside Europe. The new industrial countries overseas are making industrial headway more rapidly than ever because of the war. Will they be prepared after the war to abandon their high-cost manufactures in order to introduce freer trade? If they are not, how are the older industrial countries to pay for the raw materials to which they will have "freer and equal access?" These are the real dilemmas.

What can be done? Some guide can probably be gained from the practice of private undertakings when they are forced by circumstances to adjust their business to new conditions. They work out, according to comparative cost of production, what lines they can keep going, and they give up the rest. One suggestion is that this should be done nationally and internationally, on the basis of some kind of world census of costs of production. A comparison of grain costs in the New World and in Europe would reveal what proportion of European agriculture would reveal what proportion of European agriculture would carry on under competitive conditions; and for those unable to compete, compensation would have to be found by employment in other activities. In agriculture, the net effect of placing European farming on a paying basis would reduce it to a very much more limited size. The same process is proposed for the international readjustment of industry. High-cost manufactures which cannot exist without high tariffs should be placed on a list of industries to be slimmed, reduced and transferred to other activities. It is a problem of economic adjustment, to be done by agreement or competition.

It will be answered to this argument that no conceivable international body, and no national Governments, could impose readjustments of this kind upon agriculture and industry. Nor, it will be argued, could they adopt the simpler and much more direct course of exposing all national economic activities, high-cost and low-cost, equally to the winds of international competition—which, classically, is the free trade solution. The point is that, if this is so, it is idle to speak in general terms of an all-round application of freer trade after the war. Adam Smith once said that "to expect freedom of trade to be entirely restored is as absurd as to expect that an Oceania or Utopia should ever be established." He might say this again now with added feeling. He knew that the barrier to free trade is the desire to maintain high-cost production; and he would have said now that the only way to freer trade is, not by good will, but by the elimination of uncompetitive enterprises and the transfer of their resources to other work. If the national and international framework of the post-war world cannot include such a process of adjustment, freer trade will remain a slogan.

NOTES OF THE WEEK

The Sixth Campaign

An atmosphere of expectancy, with its inevitable accompaniment of rumours and reports from the usual well informed sources, has hung over the Mediterranean for some weeks past. The heavy bombing of Malta was obviously a screen for the passage of large Axis convoys through to Libya and their slackening suggested that the supplies and reinforcements had arrived and that the offensive might be expected to begin. Three weeks ago, a first feint did in fact occur. Rommel brought up three mechanised columns, but later withdrew, presumably after testing the strength of the British defences. Now it seems that the real battle has begun. Heavy German forces are being engaged by the British south of Tobruk and the attack shows signs of developing into a major offensive. On the right flank of the British forces, the first enemy attacks were repulsed; but on the left, further south, very severe fighting was joined. The weather is unfavourable; if the Libyan position alone had been in question, then Rommel would probably not have chosen this time of year. But it is most unlikely that Libya alone is in question. The attack is probably one move in the long awaited three-pronged attack upon the Middle East, of which the fighting at Kerch and Kharkov is the other extremity.

The Kharkov Front

It does not look now as though the Russians are likely to attain any of their major objectives in the first bout of the summer fighting. The three-week attack has brought them nearer to Kharkov, but the Germans hold the city. The drive on Lzovo has not succeeded in developing into a threat to Dnepropetrovsk. Meanwhile, the German counter-attacks on the Izyum sector are gathering strength and the centre of the fighting has shifted southwards. It is, however, possible that Marshal Timoshenko's offensive was not launched primarily with the purpose of recapturing territory. The most urgent task may well have seemed to disrupt von Bock's plans for an offensive on Rostov by securing the initiative. At best, the German winter defence line might be pierced. At the least—and it is not yet certain that it is only the least—van Bock would be compelled to that it is only the least—van Bock would be compelled to reorganise his plans and call up reserves designed for other purposes. The achievement of the major objective—a definite break through—appears to have been hampered by the Germans' success at Kerch. At what may well have been a turning point in the Kharkov fighting, aircraft have been available from the Kerch front and von Bock could throw them into the counter-attacks. Bitter fighting goes on all over the southern front, but it looks as though the advantage has swung—if only temporarily—to the Germans.

Full Mobilisation

It is not true that this country is yet fully mobilised. There is still need for constant combing-out of civilian industry and government service. The new Kennet Committee will not find much surplus labour in the service of finance but its appointment is a step in the prudent direction. The old Kennet Committee, which has the Civil Service under review, has not done a completely successful job; the Departments have been left too much to decide for themselves on the labour they need. In civilian employment at large, the new Order fixing minimum hours, if rightly applied, is an important advance. It has long been plain that civilian industries should be expected to work as long hours and as efficiently as the war factories, and to use no more labour than absolutely necessary. The standardisation of civilian manufacture, too, which is proceeding, means an important gain in manpower. The trouble is that it may still be blocked, in its final stages, by the desire of manufacturers to retain their identity and the identity of their products. The bar here is not simply the self-interest of manufacturers. It is, as in the case of shopkeeping, the disinclination of the Government to prepare a policy for compensating squeezed out firms and proprietors.

But, when all this is said, it remains true that this country, if not fully mobilised, is mobilised to an astonishingly high degree. Mr Bevin claimed last week that it was

mobilised more highly than any other country in the world. He said that two-thirds of the men and women between the ages of fourteen and sixty-five were in the Forces, in Civil Defence or in industry; and many of the rest are doing essential domestic duties or important part-time work. The time when fresh labour can be found to push up output has very nearly gone. The problem in Britain, as in Germany, is now a problem of efficiency. Mr Bevin said that the test between now and the end of the war will be between British and German managerial ability. In Germany, the reservoir of manpower has been run dry by casualties as well as by mobilisation. The shortage of men for the Forces as well as for industry is acute throughout German Europe. In addition, there is a shortage of plant, materials, equipment and transport facilities. Britain is better placed. The door to the outside world is open and supplies and finished products can come in. The bottleneck here is shipping. But the bottleneck of manpower at home is hardly less serious; and it is still true to say that no measure should be neglected, however small, either to find a few fresh recruits for war work or to raise the output of those already brought in. Germany's greater difficulties will tell if they fail in this summer's fighting. For this summer, they have thrown everything into the scales, and nothing less is needed from this country.

French Monkey Puzzle

The situation in France is more confused than ever. In the ring of rival pressure groups and interests, only one policy is clear and consistent—that of Italy. The Duce wants Corsica, Tunis and Nice. He has wanted them for years, but he wants them now with a new urgency to offset the uniformly bleak record of Italy in the war. At the same time, the general situation has shifted slightly in his favour. In 1940 or 1941 it was possible to disregard Italy's claims, for the Italian contribution to the Axis victories was negligible. Since the first failure in Russia, however, the German war effort has been running on a much narrower margin. Italy's foodships, Italy's navy, even Italy's men in Libya bulk larger now than Germany's own reserves are so much reduced. At Salzburg, Hitler put on the screws for a greater contribution. The troops massed on the Italian-French frontier and the Blackshirts gathered noisily at San Remo opposite Corsica, suggest that the Duce demanded, and possibly received, the promise of an adequate *quid pro quo*. This fact introduces the first element of uncertainty into Germany's policy towards France. The Nazis are, of course, only concerned to squeeze equally the two Latin sisters, but to squeeze Italy successfully now involves making demands on France—demands which, if fulfilled, would almost certainly mean the breakdown of any policy of collaboration. Hitler's attitude towards collaboration also shows the uncertainty of touch which follows from a failure to decide on a definite course of action. The Germans could have put an end to the farce of Vichy's "independence"—they could have occupied all France, set up a quisling administration in Paris and ruled by terrorism. Such a step would have led almost surely to their losing the chance of obtaining the French Empire and Navy. Alternatively, the Nazis could have backed a collaborationist, Laval or some other, and by relaxing their pressure attempted to make the Quisling regime popular. But, just as Hitler is hesitating between Italy and France, so he hesitated between reprisals and collaboration. Heydrich visited Paris; at the same time, Laval was brought in. But this background of uncertainty makes Laval's position impossible. He cannot placate both the Axis and the people of France, any more than he can conciliate both the United States and Germany. While ready to give away on a number of points, including, apparently, the use of bases and the transfer of the French Fleet, he is standing firm against Italy's demands. At the same time, he is refusing to take drastic action over Madagascar and Martinique. It begins to look as though Hitler's last experiment in collaboration is so obvious a failure that only the alternative of total occupation remains.

French Resistance: The Implications

A factor which recurs in every estimate of the French situation is the steady growth of internal opposition. This movement, gathering in strength and purpose, is, or ought to

be, represented by the Free French, since they from the first have raised the torch of resistance à l'outrance. Now that the fires are beginning to break out and burn on occupied soil, it should be possible for all the phases and types of French resistance to be fused into one great effort of liberation. Clearly, however, this is not coming about. The basis of the Free French movement is not broadening as a result of France's less passive rôle. Since the disappearance of Admiral Muselier and the high naval officers who went with him, it must be said quite definitely to have been further restricted. This potential insufficiency has been underlined by the events in Madagascar and Martinique. General De Gaulle himself recognises that the present situation is unsatisfactory, and at Free French Headquarters on Wednesday expressed his desire "to broaden the basis of the Free French movement from which no Frenchmen would be excluded who would work for France against the Axis." General De Gaulle's statement bears out the persistent rumours circulating both in Washington and London. It is all to the good that not only the logic of the situation should press in that direction, but that a definite lead should come from the Foreign Office and the State Department. Much of the uncertainty of touch in the Free French handling of delicate political problems can be traced back to an even greater uncertainty of touch in Allied diplomacy. In no connection is it more important that the broad outlines of the United Nations' future policy towards Europe should be clearly known in advance. France is in many ways the key to the new Europe; but the lock must be understood if the right key is to be forged in the hour of victory.

Miners' Wages

On Friday last week the national executive of the Mineworkers' Federation placed before the coalowners a request for an immediate general increase in wages and for a uniform national minimum wage of £4 5s. per week. The application was considered on Thursday by the Joint Consultative Committee of owners and miners. As is shown in a Note on page 765, wages in the coal-mining industry have already been raised by 3s. 8d. per shift, or 36 per cent, since the outbreak of war. The average increase involved in the new claim is 4s. per shift, which would raise the price of coal by something like 5s. a ton. Coal-mining is an arduous and unpleasant occupation. There is a shortage of mining labour; and the remuneration of miners must be adequate to ensure a sufficient inflow of young labour as well as reasonable contentment among the existing labour force. In the view of the mining unions, current wages do not fulfil these conditions, and, in spite of the increase since the outbreak of war, often compare unfavourably with the remuneration paid for less taxing work in the munition industries. The case does not lack substance. The White Paper on Price Stabilisation and Industrial Policy (Cmd. 6294) specifically provided that—

There may be proper grounds for adjustment of wages in certain cases, particularly among comparatively low-paid grades and categories of workers; but it emphasised that

The maintenance of wages and employers' remuneration at a reasonable level should be achieved as far as possible by efficiency of production by the joint efforts of employers and workpeople.

The great need of the moment is to increase the output of coal. The rationing of domestic and industrial consumers is essential but it will not be enough. If an increase in wages will ensure the wholehearted collaboration of miners in a scheme of technical and administrative reorganisation designed to improve the efficiency of the industry as a whole, the price may not be too high—even though it will mean a substantial subsidy from the Treasury, at least to begin with, in order to prevent retail prices from rising. But the demand for a National Coal Board, endorsed by the Labour Party Conference, provides no guarantee of increased efficiency. An improvement in labour relations is necessary and urgent; but a pact between miners and owners at the expense of the consumer is unlikely to solve the coal crisis.

Essential Work

A new element has come into discussions about social security. In the past, there have been two wings to the movement to secure minimum standards of life and work. On the one hand, there was the demand for a minimum

wage, stressed at this week's Labour conference by the vehement opponents of family allowances; on the other, there have been the attempts by means of social insurance and assistance payments to ensure that no individual or family fell into avoidable destitution. The main bogey is unemployment—insecurity of work. In war conditions, the guaranteed pay week has been introduced into many industries. Several millions of workers are employed under the Essential Work Order; in return for the loss of liberty to leave their work, they are guaranteed wages whether there is work for them or not. Notoriously difficult problems like the problem of casual labour at docks have been solved for the duration by the pooling of labour in areas and the guaranteeing of work and payment. This is the minimum wage with an added dimension—security of employment—and it is plain from Mr Bevin's recent speeches that he and some see in this an important contribution to the problem of security in more normal times. It is obvious, however, that the guaranteed pay week is part and parcel of a situation of full employment. It is obvious also that it involves a limitation of the worker's freedom to choose his job. It could not possibly be part of peacetime policy unless, by successful planning, full employment could be ensured; and it remains doubtful whether most workers will be willing, even for security, to sacrifice their fundamental freedom of choice.

Mexico at War

Why Germany thought fit to precipitate a declaration of war against the Axis by Mexico, by first sinking a Mexican tanker and then marking its rejection of Mexico's Note of protest by sinking another, remains something of a mystery. President Camacho asked Congress for a declaration of war and for the grant of extraordinary powers for national defence. There was every reason to suppose that Congress would agree. Relations with the United States, based on a genuine belief in the sincerity of the "Good Neighbour Policy" and in the value to both countries of close economic co-operation, have become increasingly close and cordial since the outbreak of the European war. Relations with Great Britain, break of the European war. Relations with Great Britain, at one time strained to breaking point on account of the oil dispute, have improved in recent months, and particularly since the exchange of diplomatic representatives was resumed. Mexico, both at Havana and at Rio, showed itself to be in the van of opinion which grasped the necessity of a hemisphere defence. The advantages to the Allies of a belligerent Mexico will be many, but perhaps the most important is that it will be possible to deal radically with the Nazi fifth column, a serious potential danger which has been sedulously cultivated from Berlin. Economic co-operation is already very close—some eighty per cent of Mexican exports find a market in the United States—but it will be possible to push to the limit the interchange of Mexican raw materials and minerals for American arms and finished products. Equally important will be the fact that defence of the vulnerable Mexican Pacific coast line can be undertaken jointly. Agreement for the reciprocal use of air bases was made as long ago as April 3, 1941. The announcement by the Mexican Navy Minister that all Mexican vessels will in future be conveyed is no doubt a portent of goodwill by the Mexican attitude, pause to contrast it with the very real threat which Mexican hostility to the United States presented in the last war, they can draw little comfort from the supposition that a further and unwelcome obligation may have been imposed on the defensive preparations of Washington. It has always been clear to the Roosevelt administration that security could only be based on hemisphere defence. The removal of any obstacle to that end is of great advantage to the Allied cause.

The Art of Price Fixing

If it is true that the military development of the war is teaching the world a grim geography lesson, it is no less true that the total war effort is driving home a number of hard facts of economic science. In the sphere of price control, almost all the conceivable mistakes have by now been made. Unhappily, they have not yet all been remedied. The basic condition of successful price fixing, that control should be complete—that it should extend not only to the article itself but to the retail and wholesale prices of all goods

which could possibly be used as substitutes, at all stages of production and distribution, and must be accompanied by measures to ensure maintenance of supply—is still very partially applied. This week sees the introduction of two orders designed to fill important gaps in the structure: the Second Hand Goods Order and the Sales by Auction Order. The details of the Orders of this week illustrate the considerable difficulty of relating the prices of second hand and new goods; but the principle, that second hand articles made later than January 1, 1900, must not be offered for sale at prices exceeding those of equivalent new goods, is clear and should be enforceable. The task is still not complete. The price of cobbling is now to be controlled, but the price of many services, and particularly of domestic service, is still determined by the law of a market which is anything but free. The prices of vegetables are becoming something of a scandal in a country where reliance on a vegetarian diet is every day more necessary. And where control has been ventured, there has been an obvious failure to see that production for the market is maintained. The prices of household linen and of many sorts of household equipment, including cookery, are soaring. It is to be hoped that the Government will press forward with the task of completing, and making coherent, the piecemeal controls which represent so important a bulwark against inflation. Partial control actively exaggerates the evil in all sectors of the economy to which it is not applied.

The End of the Militia

The Military Training Act, 1939, which marked Great Britain's first adoption of conscription in time of peace, was originally to remain in force for three years. It was then to expire unless, after an Address by each House of Parliament, an Order in Council was made continuing its operation for a year at a time. The first three years have now come to an end, and since the body of the Act has been swallowed up in the various National Service Acts of the war, the Government is allowing it to lapse. The rights, however, guaranteed to the original militia, including the right of reinstatement in employment, are carried on in the National Service (Armed Forces) Act of 1939. The chief interest in Mr Bevin's announcement, however, lies in his hint that a similar Act to the one now lapsed will be passed after the war. He said that the expiration of the Act would "leave a clear field for the enactment, at a later date, of such legislation as circumstances may show to be desirable." In 1939 there was far less opposition to peacetime military conscription than might have been expected. After this war, even the trade unions are likely to approve of some form of military training for all young men. But the principle should not be confined to military training or to a certain age-group. The legislation that circumstances already show to be desirable should provide for compulsory service for the community by all citizens. The principle that they should be willing to work for democracy as well as fight for it is one that commands ready acceptance.

Old England

The memorandum on population trends, submitted to the Royal Commission on the Geographical Distribution of the Industrial Population in 1939, has now been published as a White Paper (Cmd 6358). Its appearance at the present time, when there is considerable public interest in population problems, is welcome, because it gives a full factual background to discussion and also a sober estimate of the likely trend of Great Britain's population until 1970, farther than which the Registrars-General will not commit themselves. It can be said at once that the wildly alarmist prophecies about "the possible extinction of the nation" after a hundred years have no foundation, because it is quite impossible to predict the future birthrate on which the size of the population will then depend. What is almost certain, however, because the estimate is based on the actual birthrate in the past and at present, as well as on the actual decline in mortality, is that there will be far more old people. In the second half of the nineteenth century the annual number of births rose from about 600,000 to a million, with a peak of 1,082,000 in 1903; since 1914 there has been a decline to about 700,000, which is the present level. Therefore, the population now in the middle years of life consists of survivors of births which were considerably

in excess of those that have produced the existing youngest and oldest sections of the community; and it is this large group of middle-aged who will more than double the over 65 age-group in thirty years' time, compared with the actual numbers in 1937. The following table, condensed from one given in the White Paper, shows the effect of current trends on the age distribution of the population:

	Actual Population 1937	Forecast Population			
		1941	1951	1961	1971
Total (thousands)	46,008	46,565	47,501	47,192	45,980
Age-Groups (thousands) :—					
0—15	10,179	9,573	9,054	8,433	7,600
15—30	11,305	11,080	9,882	8,762	8,421
30—45	10,351	10,897	10,993	10,168	8,764
45—65	10,303	10,689	12,061	13,339	13,332
Over 65	3,870	4,326	5,511	6,490	7,863
Distribution of Age-Groups per thousand of the population :—					
0—15	221	205	191	179	165
15—30	246	238	208	186	183
30—45	225	234	231	215	191
45—65	224	230	254	282	290
Over 65	84	93	116	138	171

The probabilities revealed in this table are clearly of great social importance. In thirty years' time the total population will be very little smaller than in 1937; but the old will outnumber the young, and will not be very much less than the numbers in the two most productive age-groups—the 15-45's. Old-age pensions, therefore, may be expected to be as burning a social topic of the day as children's allowances are at the present time, although, as the White Paper wisely points out, with lowered mortality goes increased vitality and an increase in the age up to which economic productivity can be maintained. The ratio between the age-groups does not necessarily give the ratio of potential producers to dependants. A large body of healthy old men and women need not be a national liability, but it is a factor which economic and social planning must take into account.

The Birth Rate

The population forecasts of the Registrars-General, given in the previous Note, are based on the assumption that the birth rate will follow the natural course postulated by its present low level. Thus, the smallness of the younger ages in the existing population will mean a serious decline in the numbers of women in the child-bearing ages (15-45) in the future; compared with the actual number of 11,129 in 1937, it is estimated that the total of potential child-bearers was 11,176 in 1941 and will fall to 10,464 in 1951, to 9,388 in 1961 and to 8,498 in 1971. It is consequently calculated that, assuming a fixed fertility curve, the number of births per annum will fall from its present level of 700,000 to 570,000 by 1961. If, however, the number of births could be kept constant at 700,000 a year, the present population would be maintained in perpetuity at not much below its present figure, with a possible increase to 47½ millions in the likely event of a further improvement in mortality. But to maintain the number of births at 700,000, there would have to be a rise in fertility in order to counteract the fall in the number of reproductive women which, as has been explained, is bound to take place in the next two or three decades. The Registrar-General's report for England and Wales in 1938—which is not for general sale owing to the paper shortage—is therefore opportune. The "gross reproduction rate" in 1938 was 0.897, that is, each 100 women produced nearly 90 female children; thus each

100 women of child-bearing age in this generation would be replaced by 90 women of child-bearing age in the next generation, if all the children survived. But all the children will not survive. The "net reproduction rate," after allowing for the mortality rate current in 1938, was 0.805; and, after a further allowance was made for the likely improvement in mortality, the "adjusted net reproduction rate" was 0.84. Each 100 women of child-bearing age, therefore, were likely to be replaced by 84 in the next generation; and to maintain the annual number of births at 700,000 the reproduction rate must be raised by about 19 per cent above the 1938 level. This conclusion lends considerable interest to the new section of the Registrar-General's report for 1938, which contains the first analysis of the age of mothers and of married fertility obtained under the Population (Statistics) Act of that year. This section will be a gold mine to the sociologist; and even to the layman it is full of interesting items. For the present discussion one of the most significant facts is that the rate of child-bearing at any given age decreases progressively as the interval since marriage increases. Thus, in 1938, wives in their eighth year of marriage were only bearing children at about half the rate of wives of the same age in their second or third year of marriage. This is in strong contrast to 1911—the last previous year for which fertility statistics are available—and must have been due to an increase in the desire for family limitation and in the means for attaining it.

The conclusions of the White Paper and those based on the Registrar-General's 1938 report may, of course, be completely invalidated by the war. Nevertheless, there are indications that the effect of the war is not likely to be so serious as might have been expected. First, the mortality directly due to the war is so far much less than was feared. Secondly, the fall in the birth rate has so far only been 10 per cent.; in the first quarter of this year the rate was higher than in any other first quarter since 1931, in spite of the adverse circumstances, that is, air raids, in which conception took place. This not unfavourable birth rate is partly due to the large number of marriages of young women in the first year of the war, which itself may be partly due to the financial incentive of marriage allowances for Service wives. How far child-bearing itself is determined by economic factors cannot be estimated, but whether the determining factors are economic or psychological, there can be no doubt that at the present time a declaration of Government policy on the subject would be most opportune. On the psychological side, women should be told that child-bearing is of greater importance to the community than working in a factory; on the economic side, every restraining factor should be removed. Half the increase in births required to maintain the existing population could be secured, according to the Ministry of Health, if women who would normally have married at ages between 24 and 30 were to marry three years younger, and the other half could be provided by an increase in the fertility of married women by 10 per cent. These are concrete remedies, and the Government must neglect no means to see them put into effect.

The Small Shopkeeper

On the motion for the Whitsuntide adjournment, the House of Commons debated the thorny problems which govern the future of the small retailer. The debate was singularly disappointing. Although grievances were aired, the House came no nearer to formulating a policy for the retail trade. Possibly, from the Government standpoint, this was due to an unwillingness to anticipate the findings of the third interim report of the Committee on Retail Trade which is shortly to be published. The debate did, however, serve to illustrate how the present lack of policy displeases the protagonists on both sides. For, almost simultaneously with the announcement of the order controlling profit margins of multiple shops, which the large retailers consider designed to favour the small man, numerous speakers in last week's debate continued to assert that official policy, wittingly or unwittingly, discriminates against the one-man business. The truth of the matter is that in very many, though not all, cases, the multiple store is a more efficient unit of distribution under wartime conditions than the small shop. The special features of the small shop, individual attention and the display of particular lines of goods, are at a discount under war conditions. Rationing and the points system has made distribution more suitable for

stereotyped mass methods. There can be no doubt that efficient conduct of the war does require the temporary closure of many small shops. It is also true that many shops which are closed under the pressure of war conditions will never be reopened. The small retailer has been losing ground to the multiple shop and the department store for some decades, though probably far less than is generally claimed. The war will, and must, accelerate the process. But the small shopkeeper has a serious cause for complaint in the absence of any system of compensation. It should not be impossible to introduce some form of levy into the retail trade through which firms which profit at the expense of competitors will automatically contribute compensation. The problem is not unique. It is a special case of the concentration of industry as a whole. The Board of Trade knows the solution. It must permit neither the existence of superfluous distributive units nor the injustice of enforced, but uncompensated, liquidation.

Walter Darré

Germany's Minister for Agriculture, Walter Darré, has been sent on long leave for reasons of ill-health. Secretary of State Backe takes over his office. This change comes after many weeks of makeshift arrangements in Germany's agricultural industry, all designed to husband food stocks and to repair winter damage to the crops. After a third and unusually cold war winter, the prospects for the harvest in 1942 are very poor. Germany's agriculture is extremely short of labour. The supply of fertilisers is low, the lack of feeding-stuffs is making it impossible to maintain the number of livestock. This is particularly serious where pigs are concerned, for they are the most important source of meat and provide roughly one-third of the country's fats. Substantial imports from the Balkan countries or from Denmark and Holland cannot be expected. In short, a dwindling home production caused by poor harvests in 1940 and 1941 is not sufficient to feed Germany's armies as well as the population at home. Walter Darré, who succeeded the old conservative Hugenberg as Minister for Agriculture in June, 1933, provided the Nazi Party with an agricultural policy on the basis of racial principles. "Blood and soil," the "hereditary farm," and the importance of the pig in the history of the Nordic races were some of the subjects on which Darré published confused treatises. The application of the "hereditary farm" principle to Germany's peasant agriculture nearly wrecked it as an industry and the famous *Reichsnährstand* and the compulsory marketing organisations which were thought out by a number of Secretaries of State in the Ministry had to be introduced in 1933-34. Self-sufficiency was never reached. But this system which favoured the big land owners worked so smoothly that it could be carried over into the war without any changes. In Greater Germany 2.8 per cent of the total number of farms comprise 46.2 per cent of the land under cultivation. The peasant farms lack machinery, although they are the main livestock breeders. From 1933 to 1938, 400,000 persons, among them many independent peasants, left the land for work in industries, and the total shortage of farm workers at the beginning of the war was put at 700,000 by Darré. At present, cereal and root crop cultivation can only be maintained by the ruthless concentration of small farms, a process which makes possible the use of large-scale machinery. The great herds of pigs must be drastically reduced because of the loss of potato stocks during the winter and because of the general lack of feeding-stuffs. A "pig-slaughter" similar to that of 1916, which was followed by the winter starvation of 1916-17, seems unavoidable. This would mean tremendous losses for the peasants, and a definite shortage of meat and fats after a few months of fair supplies. Darré, who failed to reorganise Europe's agriculture on German lines, may have opposed this ruthless emergency measure, which would ruin German peasants in return for only temporary relief.

Goering's Appeal

Goering's speech on May 20, 1942, marked the climax of an intensive propaganda campaign for more work. The setting of the ceremony was Hitler's Chancellery, and the audience was composed of armament workers and peasants. A new order, the Knight's Cross of the civilian War Merit

Cross, was conferred for the first time on a foreman in a big armament works. The ceremony, which culminated in the decorated foreman inspecting a guard of honour, is more important than Goering's speech. Goering himself is a poor orator, and is unable to make much impression on an audience. The full text of the speech contains hardly anything that goes beyond the gruesome details given by Hitler himself about the fighting in Russia. The difference is that Hitler addressed the Nazi Party and the German people as a whole, whereas Goering appealed to workers and peasants, the working home front. Goering, the poor orator, did the one thing that was likely to create an impression on the audience as well as on the workers and peasants who happened to listen on the radio. He painted the gruesome details given by Hitler even blacker, glorified Hitler as a superhuman, chosen by providence, and in describing the economic difficulties, used language which is known in Nazi propaganda as "the frank speech of a soldier." The substance of what he said can be summed up in the appeal for extra work in the factories and in the fields, and the apology for the hardships imposed on the German people—the wartime restrictions, the separation of families, rising prices, higher rents and smaller rations. From a political point of view, the most significant parts of the speech were the references to the few who still exclude themselves from the community, to foreign propaganda and to internal whispering campaigns. The apathetic German workers and peasants who have become war-weary were asked by Goering not to believe in foreign propaganda, but to harden themselves like the soldiers on the front. Apparently an inarticulate opposition to the war is growing up among workers and peasants. Slowly the masses are learning to associate the war and its aims with the ambitions of the Nazi Party. The Nazis have managed to keep their armies intact, but the home front has begun to weaken. Hitler's task was to rally the Nazi Party; Goering is called in to explain to workers and peasants must accept any discipline. A new decoration for workers is created. A State ceremony is designed to win their favour. At the same time, the keynote was discipline and sacrifice. These, combined with the appeal to honour, have not proved ineffective in the past.

Help from the Colonies

It is a welcome sign of the wider interest being taken in colonial affairs that two debates on the colonies have taken place in the House of Lords within a fortnight. The second, last week, dealt with the subject from the new viewpoint which the campaigns in Malaya and Burma have opened up. There was less emphasis, that is, on what Britain must do to help the colonies in the war, and ought to do in the way of long-term political and economic development, and more on the best way of directly associating the colonies in the Empire's war effort—in other words, how the colonies can best help Britain. Obviously, these two aspects of colonial policy are closely interrelated. There is not, of course, any suggestion of bargaining on either side. Even in the politically conscious West Indies, where claims for more self-government are being strongly pressed, there is not the slightest hint of an offer to help Britain on condition that self-government is granted. On the contrary, with that self-government is granted, go murmurs that enough advantage is not being taken of the wish to render service. Great Britain cannot afford to be less generous, and, in accepting help from the colonies, will do much towards promoting a feeling of responsibility in them which itself will help their political progress. Specifically, the well-founded suspicion that non-Europeans are barred from commissioned rank in local military units because of their colour must be dispelled. It is no answer to state, as Lord Cranborne did in the debate, that the number of African commissioned officers is extremely small because of the lack of suitable candidates. Suitable candidates do not enlist because they feel that their chances of promotion are negligible. On the wider issue, the problem was well put by Lord Hailey. He emphasised the difficulties of framing a detailed definition of colonial policy for dependencies at such varying stages of development, and also the dissatisfaction which colonial peoples feel with vague generalisations. But he considers it not impossible to frame a declaration giving "a more concrete and more informative statement of our intentions," both political and economic. Here again, there is no question of a *quid pro quo*. In war or peace, the colonies have a right to know what they may expect from British rule.

Rations and Manpower

It is far too often taken for granted that any kind of rationing must involve the employment of an inordinately large staff. Sometimes it is even said that more manpower is wasted by rationing than is saved. This is, of course, complete nonsense, and some figures which were recently given in the Commons make this plain. The staff employed at the Board of Trade in operating the coupon rationing scheme for clothing is about 900. The staff engaged full-time on rationing at the Petroleum Department is 2,250. The headquarters, divisional and local staffs of the Ministry of Food responsible for rationing number just under 30,000. If the number of people saved in the production and distribution of clothes, petrol and food are set against the size of these staffs, the saving, which runs into hundreds of thousands, is so obvious as to need no further comment. A more pertinent criticism is that more still might be saved. For one thing, the rationing of standard necessities should involve the elimination of more middlemen and market agents than have been released. Largely, their functions have gone. Again, the remarkably small staff employed on clothes rationing is due to the fact that the clothes ration is comprehensive and uniform. Relatively more are employed by the Petroleum Department because their main work is the investigation of individual cases. The personnel of the Ministry of Food is swollen because, until the latest developments in the points system, foodstuffs have been rationed one by one and separate rations occupy separate staffs. The more comprehensive rationing is, the smaller the staff needed to work it. The ideal scheme, a points system for all necessities in a single scheme, is impracticable; but it could almost be run by the proverbial man and a boy.

Shorter Notes

In answer to a parliamentary question, there has been printed in Hansard a table giving the size of the staffs engaged on public relations and Press work for the different Government departments and their annual cost. Excluding the National Savings Committee, which has a publicity staff of 89 costing £34,291, the Service Departments, somewhat surprisingly since their attitude is one of withhold rather than tell, head the list. The War Office has a publicity staff of 356, costing £112,370 a year; the Air Ministry's is 199, costing £97,574; and the Admiralty's is 72, costing £39,960. Of the civil departments, the Ministry of Food is quite naturally first, with a publicity staff of 65, costing £23,083, followed by the Ministry of Agriculture with 56, costing £15,813. The Board of Trade, on the other hand, which has a great deal of information to tell the public, has a publicity staff of only 12, costing £5,321. The total for all departments, excluding the publicity department itself—the Ministry of Information—is 1,086, and the annual cost is £437,211.

At the Labour party conference, a resolution in favour of a scheme of social security, including family allowances, was adopted. Opinion, however, was far from unanimous on family allowances, because an amendment of the Locomotive Engineers and Firemen, excluding a scheme of family allowances from the resolution, was only defeated by a majority of 1,718,000 votes to 690,000.

The Government has decided not to accept the suggestion of the Select Committee on Offices or Places of Profit under the Crown that the number of Parliamentary Private Secretaries should be limited, on the grounds that as these members perform valuable services to the House as a whole, as well as to the departments, the step suggested would not serve the best interests of Parliament.

According to an answer given by Major Lloyd George in Parliament, the estimated weekly consumption of chocolate and sugar confectionery in 1938 was 6½ ounces, divided almost equally between the two.

The number of cases notified as tuberculosis in the first four months of this year was 16,718 in England and Wales, compared with 16,364 in the corresponding period of 1939.

AMERICAN SURVEY

The Pressure on Prices

(From Our Washington Correspondent)

May 15th

THE housewife who went to the nearest schoolhouse last week and obtained Ration Book One (for sugar) obtained the first concrete evidence that something is being done on a national scale about the problem of price and supply. That was last week. This week, after a week-end which resembled a Mardi Gras of the highways, car owners in the seventeen states of the eastern seaboard and the District of Columbia are being rationed again for gasoline. Next week, a comprehensive series of price-ceilings will become effective on retail outputs of most categories of goods.

Preliminaries to these moves date back some months. National income payments moved from \$70,000 millions in 1939 to \$76,500 millions in 1940 to \$92,100 millions in 1942. and are currently estimated at \$117,000 millions for 1942. This increase in income becomes graphic in terms of consumer pressures if one considers that the income of America's 6.9 million farm families rose from \$9,100 millions in 1939 to \$11,700 millions in 1941, and an estimated \$14,000 millions in 1942, and that income from wages and salaries rose from \$45,800 millions in 1939 to \$61,800 millions in 1941; at the same time as non-agricultural employment was stepped up from 35 million to 39.4 million, exclusive of recruitment to the armed forces. And much of the new income went to families whose income level had previously put them in the group that the Treasury euphemistically classes as "non-habitual savers."

This income resulted from the first phases of a war programme that currently totals \$164,000 millions—\$64,000 millions authorised in the 18 months before Pearl Harbour, and \$100,000 millions authorised in the five months after Pearl Harbour. Actual expenditures were \$23,000 millions up to May, 1942. Because of industrial and consumer pressures, prices of raw materials went up 66 per cent, wholesale prices 31 per cent, retail prices 25 per cent between September, 1939, and March of this year. The cost of living, based on the average prices of necessities, has gone up about 15 per cent.

Specific Shortages

The rise in prices was compounded of a general broad pressure of increased purchasing power and specific acute pressures caused by sudden shortages. Most graphic among the latter are the shortages occasioned by Japanese conquests, the loss of Philippine sugar, which amounted to 16 per cent of our pre-war consumption, and the loss of Far Eastern rubber, which was formerly 98 per cent of our total supply. (Rubber is, of course, only one among a series of losses from this area, ranging from tin to tea.) In the general field of metals and chemicals, domestic shortages of a comparatively acute nature have occurred as the war programme has expanded beyond existing capacities. (The limitations on capacities, incidentally, have frequently reflected niceties of cartel management.) In some cases the problem is not one of shortage, but of location; the shortage is in means of transportation, not goods. (The East Coast petrol situation is a case in point.)

On the specific shortages, action was begun over a year ago with the establishment of priorities among uses, giving graded preferences to work on the defence programme in order of its urgency. As a temporary measure, this gave results. At present, however, about 60 per cent of the war programme is already in Class A-1-a.

On the consumers' side, rationing of metal-consuming durables, from cars to ice-boxes, has been completely accomplished by halting their production; all heating and plumbing apparatus has been frozen. (Why pick that particular word?) Clothing has been restricted in respect of styles—no patch pockets on women's suits, no full sleeves

or skirts, narrow hems, two-inch width limit on belts, men's trousers to be cuffless (in spite of a pained release by Department of Agriculture experts that trousers with cuffs could be refurbished six times), vests to disappear, and the salesman's ancient standby, the two-pants suit, to be halved in its lower regions. (This debagging process caused a start even among those who had thought that the war was going to take our shirts.)

But the main job is obviously still ahead. The Emergency Price Control Act of 1942, approved on January 30th, empowered the Price Administrator to set ceilings on the prices of commodities and on rents in defence-housing areas. The Act omitted any reference to wages, and included a section on agricultural commodities which prevents the setting of ceilings on those products lower than a level approximating 110 per cent of parity; intergroup bargaining was thereby continued. On April 27th the President, in a message to Congress, followed by a radio address to the nation, emphasised the need to keep the cost of living from spiralling upward, and announced his seven-point programme.

The Limitations of Price Control

Parallel with the President's speech, Price Administrator Leon Henderson issued the General Maximum Price Regulation, putting ceilings (effective on May 11th for wholesalers, May 18th for retailers and July 1st for services) on practically all goods, except the unprocessed foods exempted (at current price levels) by the Act under whose authority the Regulation is issued. Under this order, each firm will have its own ceiling—the highest price charged for a given commodity in March, 1942. Prices may fall below this, but not go above it. Retail stores must display publicly their ceiling prices for selected commodities in the "cost-of-living" group.

Services connected with commodities are included in the order effective July 1st. Other services are not: excepted are services of an employee to his employer, professional services, entertainments, services of a common carrier or public utility, advertising, including radio, insurance and underwriting, press association and feature services, services related to real property. Rents are restricted in 302 areas.

Forecasts of the effect of this Regulation are warily phrased. Will the cost of living go down? OPA administrators anticipate some reductions in what they term the "roll-back"—under ceilings, retailers will have a strong incentive to put pressure on wholesalers and manufacturers to reduce the prices on their replacement orders so as to keep the retailers in business. Costs of distribution will be cut as services are diminished—the rubber situation figures here too. On the other hand, 30-40 per cent of the food budget is without a ceiling, either because the commodities are exempted by the Act or because they are too seasonal for a March price to be fixed, and food accounts for 30 per cent of consumer expenditures. And the enforcement of rent reduction, with housing as scarce as it is in many areas, presents serious difficulties.

If pressure from interest groups on the various elements in costs is continued, the present price pegs cannot be made to stay in place. Even if these highly political situations are adequately handled, the problem of closing the gap between the currently available quantity of goods and the currently available quantity of purchasing power remains.

Closing the Gap

One current set of very conservative estimates shows the size of the problem. Assuming full adoption of the present tax and social security programmes of the Administration, the fiscal year, 1943, will still leave the American people an

May 30, 1942

income of about \$93,000 millions, to be divided between saving and spending. The amount they would set aside for saving might run to \$17,000 millions. (A 1,000 million a month has been set as a voluntary goal for purchases of war bonds.) That would leave \$76,000 millions to be spent on goods, or about \$8,000 millions more than the value of available goods at January 1942 prices. This amount might be absorbed either by taxation or by forced savings. The conservative character of this estimate can be judged from the fact that OPA estimates place the gap not at \$8,000 millions but at \$17,000 millions.

Faced with such a prospect in an election year, it is no wonder that Congressmen are toying with proposals for less showy tax measures. Arguments for the sales tax are advanced to the effect that the usual case against such measures—their disproportionate cut into the incomes of the lower income groups—becomes a merit when the object is to restrict consumption.

The less thorough the job done through taxation or forced and voluntary savings, the sooner we shall turn to further rationing. At present, the number of scarce articles is limited to those containing various critical materials and imports. But as various phases of armament production approach their peaks, our primary shortage is going to be manpower. Then the same type of shift from civilian supply to war industry will take place in labour as has already been effected in raw materials. Plant making non-essentials will shut down for want of workers. The gap between purchasing power and available goods will be widened further. At that point, further specific rationing will be required for equitable distribution of the scarcest articles, and general rationing will be necessary to equate purchasing power and goods.

The Century of the Common Man

Two remarkable addresses, those of Vice-President Wallace and of Mr Milo Perkins, executive director of the Board of Economic Warfare, have directed attention to the unprecedented amount of thought Americans are devoting to the question of the post-war world. These speeches were not unique. Both Mr Hull and Mr Willkie and a host of less well-known figures, including most of America's prominent columnists, have made their contribution to the discussion. Both Mr Wallace and Mr Willkie emphasised the failure of American policy after the last war. Mr Wallace said plainly

We failed in our job after World War I. We did not know how to go about it to build an enduring world-wide peace. We did not have the nerve to follow through and prevent Germany from rearming. . . . We did not strive wholeheartedly to create a world where there could be freedom from want for all the peoples. But by our very errors we learned much . . .

This is a reversal of the long-established American attitude of disclaiming responsibility for the welfare of the rest of the world; and as a prerequisite to any constructive policy, it is an immense gain to the United Nations.

Mr Wallace characterised the present struggle as a continuation of a centuries-old "people's revolution" towards a society based on President Roosevelt's four freedoms—with emphasis on a better standard of living for the common man in the Axis countries as well as in the United Nations. There can be little quarrel with the specific points of Mr Wallace's programme: that military and economic imperialism must go; that international cartels must be controlled, and inventions made to serve all men rather than the few; and that the common man must learn to increase his productivity. Nor is there much that is debatable in Mr Hull's plea for better international economic relations based on fair treatment and mutual benefit, along the lines already indicated by the Lend-Lease Act. Mr Perkins characteristically concentrated upon the necessity of reforming a society "commodity rich, consumption poor," and the need for creating mass consumption capable of absorbing the products of the mass production industrial equipment which the United States will possess at the end of the war, through the "bold and daring use of long-term credits by every enlightened government."

Neither Mr Perkins nor Vice-President Wallace neglected the price of an enduring peace; Mr Perkins spoke of the war as—

toughening us for the greatest conquest men have ever

faced—the conquest of backwardness and unnecessary poverty. Mr Wallace argued that the return of peace would give the citizen the supreme duty of sacrificing a lesser interest for the greater interest of general welfare. There can be no privileged peoples. We ourselves in the United States are no more a master race than the Nazis.

This was well said and will bear repetition, for the Americans, who in many respects have enjoyed more privileges than the other nations, may find the building of a better order both more costly and more controversial than they realise. The question has already been raised whether after the war the United States will really be willing to relax its immigration laws and reduce its tariffs substantially. A recent *Fortune* booklet has argued that, after the war, the centre of economic and military power will rest in the United States, although it lays stress on the necessity of Anglo-American co-operation. It puts forward as a primary peace aim the safeguarding of the system of free enterprise against any assaults of collectivism, in contrast to Mr Perkins' belief in increased Government intervention and the necessity for retaining war-time controls at least for a period. The inevitable profound disagreements on particular programmes are, perhaps, less important at this stage than the welcome news that the American people are moving toward a realisation of their own power and a recognition of the responsibilities which that power must entail.

American Notes

Rose-coloured Spectacles

The optimists had a short-lived spree last week before the deluge of official warnings against undue cheerfulness. The gloom of the stock market lifted slightly; bonds of the occupied countries spurted; and rumours that the war would be over by Christmas enjoyed a brief revival. The wave of "wishful thinking" appears to have been due to a number of unrelated factors: exaggeration of the importance of the announcement that no new construction of war plant will be undertaken which cannot be completed by July, 1943; the reports of gloom and food difficulties from the Axis, which have been given wide publicity; the Russian drive towards Kharkov; continued speculation about the likelihood of a second front; and the vein of optimism in Mr Churchill's speech and the recent Army and Navy reports. The American press has an amiable weakness for headlining good news and tucking away uncomfortable items on inside pages. Official Washington responded quickly; the commentators followed suit; and, if the news over the next few months turns black, the public cannot claim that it has not been warned. Mr Roosevelt, Mr Hull, the Under-Secretary of State for War and Mr Wallace, all expressed uneasiness and cautioned the public that the war is bound to be long and hard; it was even suggested that the wave of optimism was German-inspired, to sap the war effort. Unfounded ups and downs in public opinion in wartime are hard to control, but in view of the vigilance of the Administration there seems to be no ground for thinking the American people will be allowed to stray very far from sober reality. Anxious solicitude over American morale will probably become less and less necessary as the United States becomes more deeply involved in the war.

Priorities for Labour

The War Manpower Commission has taken the first steps toward establishing a system of priorities for skilled labour. The United States Employment Service is directed to draw up a list of critical war occupations—skilled occupations necessary to the war effort, in which a national shortage of labour exists—and the War Production Board is to classify war plants and products in the order of their urgency, as a guide to the distribution of labour. The Employment Service is to refer workers to employers in the order of their priority, and will immediately begin to analyse and classify the occupational questionnaires distributed by the Selective Service System. The Employment Service is evidently to be the central organisation in the distribution of manpower, for all Selective Service local boards must secure the advice of the local employment office before classifying or reclassifying individuals skilled in a critical war occupation. This should end the disturbing loss of skilled workers to the Forces. The need for agricultural labour is reflected in the request to the Farm Security Administration for more mobile labour camps for migrant farm workers, and for adequate transportation facilities for them. In a recent address, Mr McNutt, Chairman of the

Manpower Commission, estimated that, by the end of 1943, an additional 4,500,000 men would be drawn into the armed Forces, and that war industry would have absorbed 18 million additional workers. Some labour is also expected to be drawn from the Latin American countries. This gigantic conversion of manpower will nearly halve the civilian labour force; and to distribute it effectively, much more will be required than the creation of priorities. Labour will have to follow the example of materials, where priorities proved inadequate and specific allocations are being substituted. The Commission hopes to avoid compulsion, but it is difficult to see how voluntary co-operation, or even what Mr McNutt gently referred to as "compulsion from time to time," can take the place of a comprehensive system of controls. Nor is it by any means certain that the Employment Service has sufficient trained staff or the organisation to deal adequately with the transfer and training of 18 million new workers within the next fifteen months.

Growing Pains

The President's April Order recognising and defining the vastly increased powers of the Board of Economic Warfare over imports and exports has had to be followed in quick succession by another clarifying its relations to the State Department. The Board, which was established in the summer of 1941 under the Chairmanship of Vice-President Wallace with Milo Perkins as its executive director, was given broad but vague powers to co-ordinate policies relating to economic defence. Its powers were largely advisory, its members the hard-pressed heads of various agencies. It is reported to have been hampered both by Jesse Jones' "go slow" policy and by the caution of the State Department. In April, the President issued an Executive Order giving the Board the control, under directives from the War Production Board, of imports other than arms necessary to military and civilian production and power to create and finance corporations to obtain supplies from foreign sources, as well as control over the benefits received from other countries under Lend-Lease and their distribution. The Order was interpreted as placing the Board above Jones in the purchase of critical materials and freeing it from the State Department. Mr Hull, however, was on holiday at the time, and since his return, a new Order has been issued pointing out that, while the Board's responsibility is pre-eminent in "matters of business judgment," the Board must recognise that it is the function of the State Department to conduct or authorise all negotiations with foreign governments. Where no clear-cut distinction is possible matters are to be settled by amicable discussion and if necessary, by reference to the President. The Board's place in the President's inner War Cabinet is assured, but it is not to be at the expense of the State Department. It can only be hoped that the necessary centralisation of authority in vigorous hands which seemed to have been accomplished is not, in fact, to be dissipated once more.

Taxes in the Melting Pot

While estimates of war expenditure during the fiscal year 1943 have soared from \$56,000 to 70,000 millions. Congress is making only slow progress toward formulating a new tax programme designed to restrict spending and finance the war. Since the Secretary of the Treasury presented Congress with a programme to secure an additional \$7,600 millions of revenue, including \$3,200 millions of additional income-tax, a number of other proposals and counter-proposals have been made. Mr Morgenthau has requested reductions in the personal exemptions for income-tax purposes, lowering the exemption for a single person to \$600, that for married couples to \$1,200, and that for dependants to \$300. This, it was estimated, would bring in \$1,100 millions, of which only \$100 millions would come from nearly 7 million new taxpayers. This would bring the total income-tax increases suggested by the Treasury to \$4,300 millions. The Joint Congressional Committee rejected the scheme for lower exemptions in a counter-proposal which would have increased income taxes only by \$1,900 millions, and cut the Treasury's plan for corporation taxes by \$500 millions. Recently the shadow of the November elections, which has hung heavily over the tax deliberations, appears to have lightened somewhat. The House Ways and Means Committee has voted to reduce exemptions slightly more drastically than the Treasury had

suggested, and to increase both the normal and the surtax rates. The Treasury has recommended that 10 per cent of taxable income be withheld at the source to hasten collection. The President has announced reduced appropriations for the Works Progress Administration. Despite the Treasury's giving ground on lower exemptions, and their acceptance by the House Ways and Means Committee, feeling for a general sales tax remains strong, both inside and outside Congress, on the grounds that it is the only method of restricting consumption and expenditure in the lower income brackets, where increases in purchasing power have been most striking; the Administration may not be able to head it off. There is a growing understanding of the need for cutting purchasing power, but the measures adopted might well be more drastic, and if Congress succumbs to the temptation to delay until after November, the anti-inflation campaign will be seriously, perhaps fatally, crippled.

The Savings Campaign

The Treasury has announced that it hopes to establish a rate of voluntary saving equal to 10 per cent of income by July. Since May, 1941, when the current Savings Bond programme started, over \$4,000 millions has been received including \$3,000 millions in 1942, although some of this did not represent new savings, but merely the shifting of funds from other investments. Investments in Federal securities, which in the last quarter of 1940 represented only 1 per cent of all individual savings, jumped to 27 per cent in the last quarter of 1941, a much greater increase than could have been financed out of current income. Sales of savings bonds in April amounted to \$530 millions; the quotas for May, June, and July have been set at \$600, \$800, and \$1,000 millions respectively. The recent increases are largely the result of voluntary pay roll deductions, of which even greater results are expected. Over 70,000 firms, including most of the larger ones, have adopted schemes for voluntary deductions, and the Treasury estimates that about 13 million workers participate weekly. These firms employ about 66 per cent of all industrial workers. The Treasury's insistence on saving out of current income is the only line to adopt, although there is some question whether a flat rate of 10 per cent should be applied to all incomes, particularly when it is a question of "shaming" individuals into saving. Reports that some savings banks have sent out letters declaring that "hoarding cash is sabotage" suggest, however, that even informed persons are not entirely clear either about the advantages of different forms of abstinence or about the fundamental point that the real need is to cut spending and consumption. There has been considerable discussion of a system of compulsion, which would relate savings to the amount of income, and if the Treasury is dissatisfied with the results of the voluntary campaign, a scheme on the British model would probably be well received.

Shorter Notes

Secretary Knox has announced that negroes, who, up to the present have only been allowed to serve in the Navy as messmen, will now be admitted to reserve components of the navy, marine corps, and coast guard. Ten manufacturers in the Middle West have been ordered to admit Jews and negroes to work on war contracts.

The War Production Board has announced that it is prepared to set over-all dollar limitations on inventories in the hands of retailers and manufacturers to assure equitable distribution of goods among dealers. Excesses in one line would prevent purchases in others.

Four farm organisations have announced their opposition to the President's request that legislation should be passed providing that ceilings for farm prices can be set at 100 per cent of parity, rather than at 110 per cent as is now the case.

A committee of State Governors is meeting Federal officials in Washington to establish uniform regulations for lorries and remove other interstate trade barriers hampering the war effort.

THE WORLD OVERSEAS

Balkan Agriculture

(By a Correspondent)

May 18th

WHATEVER Germany's ultimate designs on the economy of South-Eastern Europe, the immediate agricultural policy with regard to that part of the *Grossraum* is plain enough. It may be summed up as maximum production with a change-over to the crops most needed by the German war machine. An article published some time ago in one of the Balkan countries, and bearing the unmistakable stamp of Berlin, is highly revealing and perhaps worth quoting at some length.

Published on the occasion of the new cuts in the German civilian food rations, the article begins by setting forth the supply difficulties with which Germany has to contend at present. These difficulties, the article says, are attributable to two main reasons. First, Germany has to cater for an additional 8.5 million consumers inside the Reich; 2.5 million foreign workers, 2.5 million prisoners of war, one million German colonists, a natural population increase of 1.5 million and one million double rations. Secondly, the difficulties are due to German generosity in the feeding of occupied territories and countries affiliated to the New Order, "although Germany is in no way bound to do so under international law." Rather disingenuously, none other than Finland is cited as a recipient of such generosity.

After this stirring introduction, South-Eastern Europe is urged to increase its agricultural production to the utmost. Europe is not yet self-sufficient in foodstuffs, says the article; its present self-sufficiency is calculated at 91 per cent of total consumption. On the other hand, South-Eastern Europe was a surplus region already before the war, producing 107 per cent of requirements. According to German calculations, this could be increased to 177 per cent by raising the present low production yields. But even an all-round increase of 10 per cent, the writer of the article contends, would remove all grain shortages in Europe.

However, mobilisation of this potential is only part of the German plan. The more urgent and less advertised part is to fill some of the specific supply gaps, which are considerably larger than the 9 per cent average. One case in point, with special application to South-Eastern Europe, is the shortage of oilseeds. This is well known to be Europe's main agricultural deficiency; before the war more than 60 per cent of European requirements were covered by overseas imports. The main task assigned to South-Eastern Europe at the moment is to make good the greatest possible part of this shortage.

The different degree of urgency of the two points is borne out also by the difference in the methods used for each. The increase of general productivity is left to the care of the satellite Governments. The Reich contents itself with using pressure through them, although this pressure may go to the extent of having unaccommodating Ministers dismissed, or the whole land tenure system reconsidered for the sake of higher productivity. The agricultural plans, introduced in one after the other of the Balkan countries, also suggest a common source of inspiration.

German Supervision

When it comes, however, to the question of oilseeds, the Germans do not stop at such indirect measures as "agricultural offensives" conducted by the respective Governments. German firms are given monopolies over the heads of the Governments; they supervise the execution of plans from the distribution of seeds to the final stage of loading the railway trucks for Germany. Areas to be sown with the different kinds of oil-bearing seeds are exactly prescribed; this year Roumania is to sow a total area of 600,000 hectares, more than treble the pre-war acreage. Bulgaria has increased its area under soya beans from 30,000 to 70,000 hectares.

Hungary, whose acreage under oilseeds in 1941 was 45,000 hectares, is to treble this area by the compulsory sowing recently decreed for medium and large estates. Serbia and Croatia are to increase their respective acreages, but these are relatively insignificant, as these countries, together with Slovakia, have other rôles to perform. All told, this acreage would provide, in terms of vegetable oil, a total of some 250,000 tons, of which four-fifths should be available for export after satisfying irreducible home requirements. The figure does not include olive oil production, which in Greece alone was 130,000 tons before the war.

Taken at their face value, these plans look formidable. The reality is vastly different. Even the Germans must realise that the low yields per hectare in the agriculture of South Eastern Europe, which they would like to see raised, are not just a whim of the Balkan producer. They have deep-rooted causes, foremost among them the under-capitalisation of Balkan agriculture. Propaganda, organisation and even coercion cannot remove these causes, and certainly not from one day to another. Indeed, such figures as are available show that, apart from isolated instances, agricultural yields since the war have fallen, in some cases by 25 per cent and more. This is due, to a large extent, to the unsuitability of the soil and climate for some of the new crops. Some countries in south-east Europe have been made to grow cotton, which has proved a complete failure. Nor are conditions congenial, apart from certain regions, for the growing of soya beans, and this applies to some extent also to other oilseeds.

Since last summer there have been new difficulties. The military mobilisation of most Balkan countries has resulted in an increasing shortage of farm labour, accentuated by a simultaneous decrease in draught animals. Germany has sent some tractors to relieve the situation, but in very inadequate numbers.

Another factor of growing importance is peasant resistance—a combination of conservatism, hatred of the Germans and sound economic instinct.

The Severe Winter

The most recent and perhaps most serious addition to this array of adverse factors has been the severe winter of 1941-42. Coming on top of one poor and one medium war harvest, it has thrown all the agriculture of south-east Europe out of gear. In the first place, the early arrival of the winter resulted in an extremely poor maize harvest. (South-Eastern Europe is the main consumer and only exporter of maize in Europe.) Wheat sowing, which in normal years go on well into December, had to be stopped at the end of October. To give but one example, in Roumania, out of a planned 2,300,000 hectares, 1,000,000 remained unsown. During the winter the abnormally severe frost must have destroyed a considerable part of the reduced sowings. Of this no figures have been given, but the extent of the damage may be gauged from Denmark's experience, where between 50 and 60 per cent of the wheat-fields have been destroyed by frost. When the thaw set in, after an exceptionally long winter, large areas were completely under water, and further rains and spells of cold weather delayed work in the fields. Even the revised plans went by the board and had to be replaced by haphazard improvisations. It now looks as if little of the coming harvest will be left for consumption, in view of the seed requirements for the autumn sowing. Indeed, a shortage of seeds is already making itself felt, and is openly admitted as one reason for the insufficient spring sowings.

These developments, taking place in Europe's only surplus region, may prove a factor of considerable importance in the months to come. Washington's announcement about the grain stocks held in readiness for liberated Europe could not have been better timed.

Fuel Rationing on the Continent

[BY A CORRESPONDENT]

IN spite of Germany's natural wealth of coal and lignite, the Nazis found it necessary, in the interest of the war industries, to ration solid fuel for domestic use from the very beginning of the war. Details of the methods used were given in *The Economist* of May 16th (page 684), and it is only necessary here to emphasise that in practice there is no national scheme; the "just distribution" to the consumer is left to the coal traders to carry out.

As much fuel as possible is distributed in Germany during the summer months, and in recent years much pressure has been exercised on all consumers to take their coal at an early date; if no better space is available, the coal is to be stored in the living-rooms or in premises belonging to neighbours, while the traders are supposed to keep in their stores a reserve of only 5 per cent of their quotas. Banks, savings banks, welfare institutions, and employers have been urged to give special credit facilities to the poorer population to enable them to pay for the coal on delivery. At the same time, a big propaganda drive has been started to induce the population to a more economical method of heating. Other measures taken in the Reich include a general ban on temperatures above 18 Centigrade in heated rooms, and an order which forbids the provision of hot water in blocks of flats on more than two days a week; rents have, however, to be lowered if a hot water service had been stipulated in the agreement.

All these ration schemes are only concerned with solid fuel, but neither oil nor gas nor electricity is used to any large extent for heating in Germany. Furthermore, oil is practically unobtainable now, and an extension of gas and electric heating has been prevented by the limitations on the manufacture and sale of the necessary appliances. Gas and electricity have now also been curtailed by restricting consumption to the amount used in a given period; in some districts the gas supply has even been restricted to certain hours each day.

The basic ration of coal and briquettes in Italy amounts to 30 per cent of normal pre-war consumption. People in northern Italy were asked last winter not to start heating before December 1st, and in the south the heating period started correspondingly later; central heating was not allowed to operate longer than nine hours every day. In Italy, too, every attempt has been made in the last two years to deliver a large proportion of the coal before the season for heating actually started, but only one-fifth of the ordinary ration had been delivered early in December, 1940, and last year the proportion seems to have been considerably smaller. The use of electricity and gas is also severely restricted in Italy, though no comprehensive rationing scheme has so far been developed. During February, March and April this year, the maximum amount of electric current to be consumed by every customer (except those using 18kwh or less per month) was 80 per cent of what had been used in the corresponding period of 1941. Large gas consumers, of over 2,000 cubic metres per month, have to pay a surtax of 8 lire for every cubic metre in excess of what was used in April, 1940. All public offices in Italy were closed after 3 a.m. during the winter months in order to save fuel and light.

Consumption in France

Some interesting figures have been published concerning fuel consumption in France during 1941. French households were reported to have used during that year a total of 721,000 tons of coal, that is, 43 per cent of their 1938 consumption. It seems likely, however, from the available evidence that during the winter of 1941-42 a still smaller proportion of the necessary household fuel was actually available. The method of rationing is, moreover, exceedingly crude. As in Germany, there is no comprehensive rationing scheme for all sorts of fuel, even though the cuts in the use of gas and electricity are much more severe in France. The coal ration coupons are almost exclusively based on the number of people belonging to each household; extra allowances are provided for small children, and for families which are not supplied with gas, but neither the number of rooms nor the former requirements are taken into consideration. In unoccupied France, an ordinary family of one to three persons usually received

coupons for 8 cwt of coal for the whole of last winter, and a further 4 cwt were provided for every two additional persons; in Paris, a small family only received 4 cwt throughout the winter. The actual deliveries may have been even smaller than the official rations; according to a German newspaper correspondent, heated rooms were practically non-existent in Lyons in the winter of 1941-42. Wood is largely used, as far as it is available, to supplement the rations, and French newspapers have occasionally complained that French forests are being pillaged for firewood. During the current year, ration books have been provided in unoccupied France only for households in districts with a population of over 5,000 inhabitants; even in larger areas the authorities may refrain from issuing ration books provided that there are plenty of local fuel substitutes. The maximum amount of electric current has been cut down by 10 to 30 per cent of normal consumption.

The position in the various smaller European countries is rather obscure, but enough is known to show that the supplies are utterly inadequate. In Belgium, where the position is probably better, in this respect, than in most other occupied territories, the average amount available for a small family was 4 cwt per winter month. The position is particularly severe in the Scandinavian countries, where the population had mainly to rely on wood to protect itself from the severe cold of last winter. The differences in the supply of household fuel between the various countries of the Continent are probably still greater than in the supply of foodstuffs, but even the most fortunate of these countries are inadequately provided with fuel.

The Irish Budget

[FROM OUR DUBLIN CORRESPONDENT]

May 11th

THE Irish Budget was both surprising and unsensational. Indeed, the reason why it was surprising was that it was so completely devoid of anything new or original. The announcement that no increases of taxation were to be imposed was received with a sigh of relief by the public, who had been expecting the worst. The deficit in the year ended March 31, 1942, amounted to £2,679,000, which was substantially less than the estimated deficit of £3,908,000 because of increases over the estimates in the yield of income-tax and customs. The cost of the Army was £8,155,000, compared with £1,766,000 in the last year of peace. The recurrence of annual deficits has resulted in an increase of the deadweight debt by £3,356,000. Savings Certificates increased by £500,000, and deposits in the Post Office Savings Bank by £2,600,000. The State also incurred large contingent liabilities by guaranteeing the capital of bodies concerned with shipping and importation. The year closed with a balance in the Exchequer of £2,394,000.

The estimated tax revenue for the present year is £32,395,000, compared with actual receipts last year of £30,992,000. Customs are estimated to yield £616,000 less than last year because of reduced imports of tobacco, sugar, oils, motors and clothing. Income-tax, which is 7s. 6d. in the £, is estimated to yield £9,226,000, compared with £8,760,000 received last year. The yield of surtax will be reduced because of the departure of a number of rich residents. The biggest increase is in Corporation profits tax, which is estimated to yield £2,570,000, against £910,000 last year. A few minor concessions to the business community are made in this unpopular tax, which are calculated to cost the Exchequer £100,000. Non-tax revenue is estimated at £5,970,000, making the total estimated revenue £38,365,000. Total expenditure is estimated at £44,146,000, of which £1,347,000 is for capital expenditure to be defrayed by borrowing. The net expenditure is therefore £42,923,000. The net deficit, allowing for some minor adjustments, is £4,558,000.

The Minister for Finance stated that he had no hope of reducing this deficit by economies in expenditure. Indeed, he devoted a large part of his Budget statement to a denial of the existence of wasteful practices in the Civil Service. He also stated that additional taxation is out of the question. There has been no expansion of incomes such as has occurred in the belligerent countries. The national income is stagnant or falling, export prices are unsatisfactory, and the cost of living is high. Emigration and unemployment are on the increase. Any addition to the burden of taxation would cause further unemployment, and would neutralise the efforts of the Government to provide employment by its programme of public expenditure. Between normal and emergency employment schemes, capital expenditure and

advances to the Local Loans Fund, over £6,000,000 is provided in the Budget for the relief of unemployment. Much of the unemployment is caused by the suspension of imports of coal, petrol and raw materials, and these difficulties will be relaxed when the gathering of this year's harvest relieves shipping space now required for wheat.

Reasons for Borrowing

The decision to borrow for the deficit appears to have been dictated by the hard necessities of the situation. But even if an increased revenue were attainable, it would not be desirable to increase taxation at the present time. The National Security Loan of £8,000,000, floated last year, was oversubscribed by the general public without any resort to the banks, and there is no doubt that a similar issue can be successfully made this year. The balance of payments has become very favourable, and large sterling balances are accumulating. Bank deposits are growing on account of the impossibility of purchasing stocks. Both the public and the banks are eager to secure a suitable outlet for their idle resources. Any addition to the deadweight public debt is, of course, to be deprecated, and should be kept within the narrowest possible limits. It can be justified this year by two considerations. In the first place, much of the expenditure is in its very nature non-recurrent, and, in the second place, additional debt is a lesser evil than increased taxation which would break the back of the long-suffering taxpayers.

Italy's Foreign Trade

[BY A CORRESPONDENT]

April 28th

ITALY, as a result of the loss of overseas supplies, is now looking beyond the Brenner for its most needed industrial raw materials, has given up struggling for national autarky and is trying instead, according to the present Governor of the Banca d'Italia, to achieve what he calls a European autarky, in community with the German nation. The total volume of trade between the two countries has grown remarkably during the war; the combined totals for their export and import trade with one another have been as follows:—

	(Rm. millions)
1938	547
1939	659
1940	1,232
1941	just over 2,000

This increase was, to a large extent, due to higher commodity prices. The German periodical, *Das Reich*, estimates that Italian import prices rose by about one-third between 1939 and 1940, and a similar rise probably took place in 1941; the price level of Italian export goods, owing to rising prices in Italy herself, may well have increased still more steeply than those of imported goods. Even so, the increase in the physical volume of trade must have produced a severe strain on the trans-Alpine railway system, especially since purely military transport is also taking place on a large scale. The Germans claim that they succeeded in delivering all the goods promised in the agreement for last year; this involved, in particular, a 100 per cent increase in their steel exports and the dispatch of 12 million tons of coal during 1941. In view, however, of the severe shortages in Italian industry, some of these claims may well be exaggerated. For instance, Italy has had to ration all sorts of fuel in the most stringent manner, although the imports of German coal are supposed to make good for the loss of English and other deliveries, and although the manufacture of electricity from water-power has been increased by over 3,500 million units between 1938 and 1941. For the current year, some further increase in coal deliveries, and in German exports in general, have been contemplated.

The Italians provide the German war machine with those few raw materials which are available in their country—namely sulphur and pyrites, mercury, hemp, flax and raw silk for parachute production. Valuable as they are, these products will not suffice to offset German exports to Italy, and the Italians have been compelled to send increasing quantities of agricultural products to the Reich; this situation is partly reflected in the extension of rationing over almost the whole range of foodstuffs in Italy. The main agricultural products which are being sent to Germany are vegetables and fruit, and, to a lesser extent, rice, olive oil

medicinal herbs, wines, etc.; many of these goods are not in themselves vital for feeding the Italian population, but they could be exchanged for Balkan grain and Danish dairy products if the Germans were less persistent in their claims on Italy. All the recent German-Italian agreements provide for an increasing adaptation of Italy's agriculture and horticulture to Germany's special needs, and the agricultural exports to the Reich, which are already stated to comprise more than 50 per cent of Italy's total agricultural exports at the beginning of 1941, are supposed to increase during the next few years.

Italy's trade balance with Germany is still passive, but the export deficit has been considerably narrowed, according to a recent German report. During 1934 to 1938, imports from Germany exceeded exports by about one half; in 1941, this excess is said to have been only between 10 and 15 per cent. (As the total volume of trade was just over Rm.2,000 millions, Germany's imports may have been in the neighbourhood of Rm.950 millions, while German exports were rather more than Rm.1,050 millions). This reduction may be partly due to the particularly steep rise in Italian prices; but, even so, there appears to have been an actual increase in Italian goods going to the Reich under strong German pressure. As for the price factor, the Germans have now made an attempt to introduce the price-stop principle in their trade relations with Italy; special agreements to that effect were made last October, and extended in connection with the new economic agreement of March, 1942.

Nevertheless, Italy's trade balance with Germany will probably remain passive during 1942. However, the remittances of Italian workers in the Reich will enable Italy to make up for any discrepancy; it was stated in the semi-official German announcement of the March agreement that the wages sent home by these workers now exceed the sum of Rm. one million daily, and that these accounts are going to play an important part in the German-Italian clearing system. They may eventually be used to balance Italy's 1941 clearing account, especially as Signor Gayda urges his countrymen to go to the Reich in still larger numbers and to assist "the mighty German industry."

Non-German Trade

Italy's trade with overseas countries has been crippled by the blockade, and the structure of its trade makes it difficult to find new European trading partners outside Germany. Its non-European exports consisted very largely of textile goods and other manufactured products which cannot easily find a market in industrial Europe, especially in wartime and in face of powerful German competition. In most of the countries which are under German occupation to-day, trade agreements have to be made with the Reich itself. It might be easier to find markets for Italy's agricultural products—if these were not so largely reserved for the Reich. Moreover, it has been stipulated in the latest German-Italian agreement that exports to third parties should only be envisaged when the requirements of the two contracting States have been complied with. Furthermore, as the railway system between Italy and the rest of Continental Europe is used to such an extent for German deliveries, the possibility of increasing trade with other countries is obviously limited; no seaborne trade of any consequence is possible except perhaps where it is directed through the narrow waters of the Adriatic Sea.

The list of Italy's non-German Continental trading partners was formerly headed by Switzerland and France. Switzerland's transit trade through Italy has been greatly increased, since most of her remaining overseas trade is done through Italian ports, but otherwise no increase has taken place in the volume of Swiss-Italian trade. Italy's trade with France has suffered greatly during the war, though a "timid revival" of trade with the unoccupied zone has recently been announced; much of the former

trade with France was in colonial produce, and a great deal of it was carried by sea. As for South-Eastern Europe, only the less fertile countries near the Adriatic coast have been allotted to Italy as protectorates or spheres of interest. These comprise the "States" of Croatia, Montenegro and Albania; Italy, according to Senator Giannini, also bears the burden of supplying Greece with the greater part of its necessities. Trade relations with Hungary and Slovakia have shown a noticeable but not a spectacular improvement, and those with Roumania have also improved, though Germany has monopolised the most valuable products of that country—oil and grain. Italy's trade with Bulgaria is about normal, while the Italian share in Turkey's trade has considerably declined, owing mainly to transport difficulties.

The Financial Front

[BY A CORRESPONDENT]

April 30th

By occupying the Continent, Germany has been able to use some important financial bridgeheads, for instance, the Paris and Amsterdam Bourses, in the infiltration of concerns with world-wide interests. It is impossible, of course, to obtain an up-to-date and complete picture of these activities. Apart from gaps in the information available, the requisitioning and forced sales of concerns in incorporated territories blurred the picture for some time. Already, in their own country, German official institutions had frequently acquired majority, or at least minority, interests in numerous companies by confiscating the property of Jews or enemies of the state. Later, Polish iron and steel concerns, for example, and the textile industry in Lodz, Czech banks and various Yugoslav companies became German property. Collaboration with French industry is frequently strengthened by the acquisition of capital interests.

The legal position would be relatively simple if the confiscated property remained in the ownership of the state. But it becomes complicated when confiscated property is sold by the state either by auction or on the bourses. It might be advisable, therefore, for the Allied Governments to follow the example of inter-Allied conferences on the punishment of crimes and atrocities committed in the occupied territories, and to publish a declaration that all the transactions effected under these conditions are invalid. This would be a useful contribution to reconstruction in the post-war chaos.

At the same time, measures would have to be contemplated for dealing with those changes in ownership which are legal, and affect companies important to Britain or the whole world. Numerous international concerns are domiciled in France, Holland and Belgium, with their capital dispersed over the whole world. Shares of the most important colonial, raw material, and shipping concerns have been bought and sold on the bourses of these countries. It is easy to use political power for business ends in the acquisition of important capital interests. Capital is doubtless available for this purpose, especially as Germany pursues not only profits, but also commanding positions in world markets and international cartels. This process has entered on a more dangerous phase since the beginning of the war in the Far East, for the restoration of the original capital and control will be doubly difficult if Japanese acquisitions of tin, oil, rubber, and shipping companies in the Dutch East Indies are backed by friendly groups of shareholders on the Continent. So far as the Malay companies are concerned, there is an unmistakable hostility between the Japanese conquerors and the British owners.

The problem has assumed different forms. No anxiety need be felt over the group of concerns whose capital is for the most part held in German-occupied countries, but where actual possession of the concern itself is in Allied hands—as, for example, the Suez Canal Company. Yet certain changes were necessary in order to forestall the effects of German buying of shares on the Paris Bourse. It seems that there are intricate movements on foot to enable the Germans to buy Suez Canal shares as cheaply as possible. German papers published reports saying that the company had declared its insolvency, whereas, in fact, only the payment of dividends had been suspended, for the transfer of canal dues to Paris has naturally ceased. At the same time, too, German papers reported that the Paris office of the company, like the Alexandria office, had fulfilled all its obligations. Another example is the Pen-

natoya concern, which owns lead mines in Spain, metal refineries, and chemical works in Marseilles and northern France, and capital interests in numerous companies in Turkey, Italy, Morocco, Indo-China and Paris, as well as interests in other French concerns, for instance, Kuhlmann. Most of the plant, machinery and other real capital of these concerns is, therefore, not in German hands. In February, the shares of these companies began to slump, and German reports explained it by stating that French investors were no longer interested in Spanish properties. It is known, however, that there is no lack of interest on Germany's part, and there have recently been attempts for a greater penetration into Spanish industry.

Unfortunately, the more usual case is that shareholders are British or Allied nationals, whose plants and factories are situated on the Continent under German occupation. This is, of course, no new war problem. There are grave doubts, however, whether Allied interests in the occupied countries are guarded with the same objectivity as the custodians of German properties guard German interests in this country. The difference lies, not only in Nazi methods, but also in the intricacy of the whole problem. British interests in Germany are enemy property. But what is the ruling in France, which is not at war with Great Britain? What is, moreover, the position in Holland or in the Dutch colonies? At present, no doubt, power decides. It will be difficult to prevent the use of force in the opposite direction, in a post-war restoration, if there is not a speedy agreement on general principles—which should be made known to the European public in order to prevent *bona fide* acquisition of foreign property. In several cases, Allied governments in agreement with Britain have found an interim solution, which may be used if the companies in question have shareholders outside the occupied territories. In such cases, a free board of directors has been formed with a separate administration. The most important example is the Unilever concern.

The Real Aim

Though important private interests are at stake, in the foreground of this problem is Germany's attempt to gain positions of economic importance in the world. Long before the war, all shares of foreign-owned companies had to be banned from the German bourses. There was, in Germany, no financial bridge to international concerns; there was only the road of buying and selling commodities. Suddenly, the German financial and economic policy was offered the chance of acquiring interests in numerous foreign concerns; by this, it is hoped, permanent influence in the international economy will be won—however the war may end. The United States of America made such transactions impossible by the freezing of capital assets. If, for example, certificates only of American Bemberg are now quoted on the Amsterdam Bourse a transfer of shares may later be called in question. But German private capital is at present securing interests in the Belgian Congo, North Africa, Indo-China and in the Dutch East Indies, in international electric, shipping and oil concerns. At a time when the decisions of the Rio de Janeiro Conference are being put into practice, South American interests are falling into German hands. If this should be a legal gap in the blockade, it should be closed as soon as possible.

Russia at War

Workers' Supplies

THE war has entailed a reorientation of Soviet food policy in industrial centres. The rôle of the street shop in food distribution has been reduced to a minimum; and the supply of provisions to workers has been entrusted to the management of industrial establishments. There have been various reasons for this development. There is the employment of all available female labour, which has rendered private feeding more and more difficult. Housewives who have gone to armament industries have little time left for queuing up at shops or for doing their private cooking. On the other hand, shortages of foodstuffs can more easily be overcome by communal feeding in factories than by individual catering. A decree of May 6, 1942, provides for the setting up of so-called Workers' Supply Departments in all the enterprises in the main industries, with the task of

producing and supplying foodstuffs to the workers and employees of industrial establishments as well as to their families.

The interesting thing is that the Supply Departments have not only to supply, but also to produce, the food. The decree speaks of the establishment of "auxiliary farms" attached to factories, mines, etc., and managed by the Workers' Supply Departments. Nothing has been said about the size of these "auxiliary farms"; but it has been indicated that cattle rearing, besides cultivation of grain and vegetables, should come within the scope of their activities. It is, of course, difficult to say how the scheme will work; but it is certainly intended to make industrial establishments as little dependent on outside supplies as possible. *Pravda* emphasises that the Workers' Supply Departments should in all respects be treated as a normal productive branch of any particular industrial establishment. They have also to see to the timely collection of foodstuffs from the central supply stores, a task which the normal network of distribution seems to have been unable to discharge.

The work of the Supply Departments will come under the double control of the trade unions and the factory committees. The Central Council of Trade Unions has issued an appeal to local branches, stressing the importance of the reform for the improvement of the food position and asking the local organisations to take the most active interest in the work of the Departments. The rôle of the factory committees is to control the correct distribution of food and ration books; they also have a say in employing and dismissing the personnel of the Departments. This double control is meant as a safeguard against abuses and speculation in food.

A situation has been brought about in many respects similar to that which prevailed during the first years of industrialisation, before the abolition of the rationing system in 1935. During that period, too, the distribution of foodstuffs was based on the factory rather than on the retail shop. This had the one important effect that, at a time of food scarcity, the Government was able to direct supplies of food into the channels which suited its industrial policy most. During the first Five-Year Plan the workers in heavy industries were incomparably better supplied and fed than those employed in light industries. The general policy was aimed at the development of heavy industries; and the food policy was adapted to this end. Under such conditions, money wages meant very little. A worker of a Moscow textile factory who earned twice as many roubles as his colleague of the Kharkov Tractor Works, was actually much worse off; the shop and the dining-room of his workshop could offer him much less than was available at a tractor plant. The Workers' Supply Departments now provide channels for directing food supplies into the most vital defence industries; the normal trading network was hardly suitable for that purpose. And money wages have once again lost something of their meaning.

There is one significant point in the instructions given to the managers of the Workers' Supply Departments. They are asked to keep in close touch with the life of the factory, so as to know who are its best workers and Stakhanovites. "Those who work best—it is said—have the right to better supplies"; and the manager of the Supply Department should regularly inform himself about those workers who

exceed their productive quotas, and keep for them additional foodstuffs. Thus, equal money wages may buy unequal quantities of goods, even within one factory.

The Supply Departments may play a great rôle in Soviet war economy. In reducing non-essential consumption and directing food supplies to the workers in defence industries, they can perhaps do a part of what war taxation and savings accomplish in other belligerent countries. Not only can they supply foodstuffs; they can also withhold the supplies.

* * *

Spring Sowing.—Spring sowing is reported to have given good results in most of the Eastern Asiatic territories. Tadzhikistan has completed its cotton sowing in the first days of May. Siberian grain farms, too, have fulfilled their plans in time. The Volga region is lagging behind, perhaps because of the unusually cold spring weather. The main difficulties have been labour and tractors. The shortage of labour still seems to be acute, in spite of the "agricultural mobilisation." This applies particularly to tractor and lorry drivers, who are being asked to work very long hours. A decree of May 10, 1942, has introduced a new system of bonus payments intended to induce the staffs of the Machine Tractor Stations to more intensive work. Under the decree, members of tractor brigades will receive—besides the normal wages paid by the MTS—additional bonuses from the collective farms. These will amount to 13-20 per cent of the value of crops raised in excess of the plan. The trouble seems to consist in a high proportion of breakdowns caused by newly skilled drivers. In the Volga region a large number of tractors have been idle; and the farmers have been urged to use draught animals instead of waiting for tractor repairs.

The following figures illustrate the development of the "Eastern granary" (Siberia and Eastern Kazakhstan). During the second Five-Year Plan, 17.5 million acres of new land were put under cultivation. A further five million acres have been sown in the course of the last three years. Sowing of winter crops in Siberia started for the first time only three years ago; but it is claimed that the area under winter crops is now 3,400,000 acres larger than a year ago.

*

Industrial Competition.—A drive for "Socialist emulation" has been started in the most important defence industries. The initiative was taken by the metal workers of Kuznetsk; and soon the rivalry spread to tank and aircraft factories. Pledges to increase production and to reduce waste—these are the customary forms of "emulation." One of the gun factories, for instance, undertook to produce, beyond the plan, tank cannon in numbers sufficient to equip three tank brigades. Another big metal plant in Stalingrad pledged itself to produce, also above the plan, 2,500 tons of steel and 1,500 tons of rolled steel during May. Other typical "challenges to emulation" envisage the lowering of costs of production by 10 per cent, the economising of fuel and electric power by 3-5 per cent and so on.

Commenting on the drive for higher production *Pravda* stated:—

Spring and summer are seasons of tank and aeroplane activity. It is now that the Red Army needs increased help. One tank built to-day in excess of the plan is worth more to us than many tanks built later on.

M. Joreglyad, the deputy commissar of the tank industry, has published a very optimistic statement:—

The output of Soviet tanks—he said—has been considerably increased, and the present tank industry is several times more powerful than it was in the early days of the war. It can supply the Red Army with as many tanks as it will need to defeat the enemy in 1942.

Yet, in spite of this optimistic account, much emphasis is still being laid on the need to speed up tank production. The Stalingrad Tractor Works decided to shorten the time allotted for the final construction processes of a tank by 15 hours. It is said that the time required for these processes is now 26 hours less than the accepted time standards. It is not clear which "time standards"—foreign or Russian—are meant.

THE BUSINESS WORLD

War Damage

A LITTLE more than a year ago, the Government, after much deliberation and careful drafting, produced the War Damage Bill, which became in due course the War Damage Act, 1941. It was a very long document, running itself to 102 sections, and followed by trailing clouds of schedules, standard policies, rules and orders. These addenda covered more than 40 pages of small type, and provided the Government and the responsible draftsmen with opportunity enough to express their meaning and qualify the liability of the Treasury in any manner that was considered desirable. If there is any ambiguity or misdescription in this law, it is not to be attributed to the shortage of paper.

The draftsman begins by explaining that Part I of the Act provides indemnity for war damage sustained by land. Part II starts with a declaration that the Board of Trade is undertaking liability for war damage to goods, and continues with a statement that it also insures chattels against war damage. The second schedule opens with a *pro forma* policy agreeing that if the insured property sustains war damage, the Board will indemnify the owner. It goes on to indemnities for war damage to farms, war damage to inland craft, war damage to hire-purchase goods, war damage to churches, libraries and museums. A later schedule contains another *pro forma* policy, underwritten by the Board of Trade, and covering private effects—once more against war damage. This dominant *motif* permeates the whole vast document, as insistent as the cry of a huckster in the market place. "War damage. War damage. This way for indemnity against war damage."

But what is meant by the words war damage? On that point the Act is commendably clear, for in Section 80 it provides the following definition:

In this Act the expression war damage means damage occurring (whether accidentally or not) as the direct result of action taken by the enemy or action taken in combating the enemy or repelling an imagined attack by the enemy.

Action taken in combating the enemy. The verb to combat is defined in the Oxford Dictionary as "opposing or striving against," so that when the Board of Trade issues a policy against action taken in combating the enemy, it is clearly contracting to make good damage done to the insured property by steps taken to oppose and to struggle against an invading army. If the Germans were to land in Kent, and British soldiers should blow up a village to prevent the Germans from using it, that would be war damage within the clear and indisputable meaning of the War Damage Act; and as such it would, logically, be covered by the Board of Trade's policies.

But is the matter quite so plain? A question put recently in the House of Commons to Mr Dalton, President of the Board of Trade, and the answer that he gave to it, suggest doubts. This was the question:

Whether in the event of invasion of this country, compensation for loss through the application of the scorched earth policy, or in consequence of seizure by the enemy, is covered by the War Risks Insurance and War Damage Acts, or whether the Government propose to accept liability for losses which may be caused to citizens under these heads?

And this was Mr Dalton's answer:—

The Acts were designed to deal with damage resulting from such risks as air raids or coastal bombardment. In general, these would not cover the risks mentioned. It is not possible to lay down in advance the financial arrangements which might have to be adopted in the circumstances described in the question.

Difficult as it may be to believe in the light of Mr Dalton's reply, it is nevertheless a fact that there is not, from one end to the other of this most elaborate law, a single reference to air raids or coastal bombardment, a single section in which any damage but war damage is mentioned, a single place where the definition "action taken in combating the

enemy," is (except in a reference to the black-out) either qualified or conditioned. After millions of pounds have been extracted by compulsion from house owners and business firms, and other millions have been accepted voluntarily from householders as premiums on their furniture, the Board of Trade denies its liability for the risks that it has insured, and airily informs the public that its policy was designed to cover such risks as air raids or coastal bombardment, and does not in general (whatever that may mean) insure the policy-holder against action taken in combating the enemy. If Mr Dalton's declaration is not a flagrant repudiation of contract, it would be interesting to know what is.

The Board of Trade, if put to it, would probably set up as a defence that, if the country was invaded, and if the authorities destroyed property to prevent its falling into enemy hands, the expense might be so enormous as to strain the assets of the insurance fund. That is a defence that some unsuccessful underwriters and insurance companies would have been glad before now to adopt. They would have liked to be able to tell their policy-holders that, when they gave cover, they had underestimated the risk, and that consequently the bargain was off. It would have been very satisfactory if they could have said, "We're sorry, but we drafted this policy too generously; we ought to have excluded this risk and that risk, and if we had thought of it, we would have excluded them; but as we overlooked them when we gave you cover, you will naturally agree now to our inserting fresh conditions while we retain the old premium. The alternative would be that claims might exceed premiums, and we should lose money. You will kindly read the policy as we would prefer it to be, not as it is." That is not done by private insurers, but it is exactly what the Board of Trade is doing to its clients.

"The socialisation of all services of insurance would make its benefits more available, and at a far lower cost than is the case in the present competitive system." That sentence comes from the Labour Party's manifesto on post-war reconstruction: life, fire, accident and, presumably, marine insurance would be taken from untrustworthy private capitalists. It is not necessary to recall here the successful history of British insurance, its reputation for standing by its bond, and paying more, not less, than its legal liability. The international pre-eminence of British insurance offices for over a hundred years is proof enough. But suppose that things were different, and that the British companies managed their business as the Board of Trade under Mr Dalton proposes to manage the War Damage Act. Suppose, too, that typhus was raging across the Continent, and an English working man who had been paying premiums for years on a clean life policy, wrote to his company and asked whether death from a typhus plague was covered. And suppose the general manager of the life company sent him a letter on these lines:

Dear Sir,

Your policy is designed to deal with such diseases as rheumatoid arthritis or senile decay. In general, it would not cover the disease you mention. It is not possible to lay down in advance the financial arrangements which might have to be adopted in the circumstances described in your question.

Yours faithfully,

That would be a reproduction of Mr Dalton's answer in the House of Commons, and what would the Labour Party have to say about it? One may reasonably guess that they would be critical, and ask questions of the President of the Board of Trade, and stimulate him to deal vigorously with this fraudulent private enterprise, and point out how impossible such a swindle would be if all the services of insurance were socialised, and ask indignantly how long this bare-faced exploitation of the working man by wasteful and unscrupulous insurance companies was to be allowed to continue. There seems to have been no such angry outcry from the Labour Party when Mr Dalton announced the Government's breach of contract in the House last week.

Finance and Banking

Window Dressing

Most of the clearing banks have been busy this week in making up for their May returns. Though this has involved a modest amount of calling in of loans and the temporary cessation of bill purchases by the banks concerned, the net effect of these window dressing operations has hardly been felt on the money market. On each day of the week, there has been some outlet for July and August bills with one or more of the clearing banks, and though cheap money from non-clearing lenders has not been much in evidence, there has always been enough credit to go round. By Thursday, conditions in the short loan market had become exceptionally easy again, despite the fairly large amounts of Treasury bills being taken up by the market. For three consecutive weeks, the market's allotments of bills at the weekly tenders have ranged over 40 per cent, which represents an exceptionally large turnover. Treasury deposit receipt payments this week amounted to £15,000,000, thus equalling the nominal maturities. Prior encashments had probably reduced the nominal maturities to under £10,000,000, but as Treasury bill payments to equalled maturities during the week, it will be seen that the net borrowing from the market on short term account was kept within exceptionally small dimensions. The Bank return reflects the end-month making-up in a rise of £20,834,000 in bankers' deposits, which have thus expanded to the comparatively high level of £146,635,000. This increase in bank cash has occurred despite a further rise of £6,169,000 in the note circulation—a movement which leaves only £41,603,000 of unissued notes in reserve. The main counterpart to these changes is provided by an increase of £19,550,000 in the holding of Government securities and by a fall of £9,957,000 in public deposits.

Silver Output and Consumption

The annual review of Messrs Handy and Harman, the New York firm of bullion dealers, contains its customary wealth of factual information on the silver market—information which is particularly welcome in this country now that the sources of much of the former data on the silver position are so effectively blocked. The feature of the year 1941 in the silver market was the increasing isolation of the three main centres, New York, Bombay and London. As long as shipping, exchange and export restrictions remain what they are to-day, this isolation must continue. In New York, the sole price movement of the year was the increase of the market quotation from 34½ to 35½ cents per ounce. This occurred on November 28th, and followed the agreement between the USA and Mexico providing for the direct purchase of Mexican silver by the US Treasury. As the Treasury bought the whole of the newly mined American silver at 71.11 cents per ounce and has been acquiring a substantial amount of the Canadian production at its official price of 35 cents, less than half the world's 1941 silver production was available to industry in the USA and Canada. As this industry increased its requirements considerably owing to the war, the diversion of the Mexican silver to the US Treasury would have created a serious situation and the natural solution was for the open market to fix its price for silver slightly above the Treasury's buying price of 35 cents. Western hemisphere production of silver in 1941 is estimated at 203,500,000 ounces, or some 10,000,000 ounces short of the 1940 figure. Data for the rest of the world have not been available and the estimate has remained at 64,000,000 ounces, the same figure as for 1940.

Little information is available about other sources of supply, but it is estimated that London received about 5,000,000 ounces of melted coin from Hongkong while some 2,500,000 ounces were exported from China during the first eleven months of the year—the bulk going to British India. It is interesting to note that imports of silver from Japan into the United States from the beginning of

the year until July, when they were stopped, amounted to 7,832,000 ounces, a figure which exceeds current Japanese production by some 1,500,000 ounces, the excess representing metal which must have been filched from China.

Silver in Industry

The main feature of the silver year, however, was the inordinate increase in the industrial demand for the metal. For the United States and Canada this is estimated to have totalled 80,000,000 ounces, an increase of nearly 95 per cent over 1940. One factor in this was the increased sales of silverware resulting from the exceptional crop of marriages in the United States which followed the enlistments and the Selective Service Act. But the main influence at work was the immense increase in the real industrial uses of silver. Some of these are listed by Messrs Handy and Harman. They are: silver alloys replacing brass and nickel alloys; pure silver wire replacing copper wire in certain electrical appliances; silver used as corrosion resisting material for plating; silver used with lead instead of tin-lead solders; silver used in making brazing alloys and in the manufacture of electrical contacts; pure silver used for making aeroplane bearings and in photographic films and surgical materials. The result of this record extension in the industrial uses of silver has been to bring the US Treasury purchases of silver down to 139,000,000 ounces for the year, the smallest annual total since the inauguration of the silver buying programme. Messrs Handy and Harman conclude their report by referring to the possibility of an advance in the market price of silver in view of the increased use of the metal which may raise consumption to a point where a shortage would occur.

Cater, Brightwen's Expansion

After the publication of Cater, Brightwen and Co's balance sheet as at April 30th last, the time has come to talk of the "big four" and no longer of the "big three" of the discount market. In the total of its balance sheet, namely £36,694,000, and more particularly in its net bill holding of £25,304,000, this firm now challenges comparison with the three public companies which have hitherto dominated the market. The latest balance sheet is the first to reflect the changes in the stature of the firm following the absorption of Roger Cunliffe in July, 1941. The effect of this operation and of the subsequent development in the activities of the firm is a 50 per cent expansion in the main balance sheet items, bills having risen from £16,053,000 to £25,304,000 and investments from £7,307,000 to £10,421,000. The ratio between bills and investments is unusually conservative for these times, and the "austerity" of the position is emphasised by the fact that the bill portfolio is not swollen by dubious items which should more properly be included among investments. The longest security to be ranked among bills are short-term notes which have less than twelve months to run to maturity. The investments are given in detail and the longest of them are 2½ per cent National War Bonds of the 1946/48 series. The firms which have merged to constitute this unit in the discount market have brought with them a strong tradition of genuine commercial discount business. Despite the inevitable supremacy of the Treasury bill in this as in every bill portfolio, this tradition still lives. This may be seen from the increase of the contingent liability in respect of bills rediscounted from £1,202,000 to £3,686,000. Such liability is only indicated in the balance sheet in respect of commercial paper and is excluded where Treasury and Corporation bills have been sold. The balance sheet, therefore, not only reveals a business conservatively run, but reveals it with exemplary clarity.

Port of London Bills

Tenders have been invited this week by the Port of London Authority for £2,000,000 of six months bills. The bills are dated June 1st and will mature on December 1st.

In conformity with the official regulations on short term borrowing by public authorities, the Port of London Authority has been clear since March 14th last of any bill indebtedness and has thus slightly exceeded the prescribed two months' abstention from bill borrowing. The last issue was also for £2,000,000 in six months bills and these were placed at an average rate of £1 os. 7d. per cent.

Capital Movements in USA

The US Treasury Department's statistics of capital movements to and from the United States are now complete for the year 1941. In their totals, they show smaller movements than for the two previous years, but the geographical distribution of the changes is of exceptional interest. The net grand total of capital movements shows an efflux of foreign capital to the amount of \$496,900,000. compared with an influx of \$706,400,000 in 1940. Foreign

short term banking funds in the United States were reduced by \$286,600,000, sales of US securities by foreigners exceeded purchases by \$262,000,000, while on the other hand purchases of foreign dollar securities by foreigners exceeded sales of such securities by \$51,700,000. The main contributor to these capital movements was the United Kingdom. During the year Britain sold US securities to the amount of \$227,300,000. On the other hand, its holding of short-term banking funds increased by \$37,300,000. An exceptionally large movement was the reduction of \$169,600,000 in the short-term banking funds held by Switzerland in the USA during the year. This movement may be read in conjunction with the substantial increase in the Swiss gold reserve during the year, and represents the private dollar holdings sold by Swiss nationals to the National Bank of Switzerland in anticipation of the freezing orders applied during the year to all European assets in the US. The National Bank, in pursuit of its traditional policy, has decided to convert the greater part of these dollar assets into gold earmarked for its account in the United States.

Investment

Manpower and the City

The appointment of the Kennet Committee gives form to the statement made by Mr. Bevin rather over a fortnight ago, which was, in part, the occasion of an article in *The Economist* of May 16th. As was then suspected might be the case, the object is to save manpower "by way of some form of concentration or otherwise"; but the scope of action is the whole of the City's financial operations—banking, insurance, investment trusts, and finance and discount houses, as well as stock exchange businesses, presumably including those outside London. The position of the London Stock Exchange was fully discussed a fortnight ago. It only remains to add that the normal process of combing out employees continues, and that some slight saving of manpower might possibly be effected by the more extensive adoption of Saturday working—but not, of course, by opening the exchange on that day. So far, no up-to-date figures are available for either the banks or the insurance companies. The former have been continuously under fire, and it is doubtful whether any very substantial saving is possible. In the absence of figures, it is impossible to venture an opinion about insurance companies, while the position of the other elements is even more uncertain. It is well known that considerable pressure has been put upon the discount houses, for other reasons, to amalgamate, but without the results which were at one time anticipated. But whatever results might be expected from telescoping in this section, it is difficult to believe that they would include the release of any very large labour force. This would seem to apply also to investment trusts and finance companies, subject to the possibility that in these cases the management are not the owners, and may, therefore, hold a rather different view on the expediency of maintaining staff, even under war conditions. There is, of course, no reason at all to object to a thorough investigation, provided that the results warrant the time spent. It is part of a sound and necessary policy of combing-out; and it may even serve to dispel some illusions as to the contribution of financial institutions.

Two further points of some interest must be mentioned. The panel chosen to deal with the banks and stock exchange consists of Mr. E. H. Lever, once of the Prudential and now of Richard Thomas; Sir Robert Witt, solicitor; and Sir William Wood, formerly accountant, *inter alia*, and now president of the LMS. These will sit under Lord Kennet. The choice suggests that the sound principle is being followed of appointing those with least connection with the sections of finance they are called upon to investigate. The City is somewhat concerned about the interpretation to be placed upon the final sentence of the Chancellor's statement. Is his hope that the Committee will remain in being "in case it can continue to be of further assistance—in the same sphere" an indication of similar investigations elsewhere, or—as it seems to read—a portent of repeated investigations into financial institutions?

American Form Certificates

A new set of regulations, drawn up by the Stock Exchange Committee, appears, at first sight, to introduce fresh complications for holders of securities which are in American form. This applies now mainly to Canadian securities such as Canadian Pacific, International Nickel and Brazilian Trac-tion. The distinction between the American form and the normal British practice is that once the share certificate is signed by the person or firm in whose name it is registered it passes by delivery as a bearer security. As a result, the registered holder may be different from the actual owner, and this fact has led to a certain amount of evasion of the regulations designed to prevent the enemy from realising such holdings. It has also meant that, in the past, infinite trouble has been caused, after a sale, by the need to trace out the past ownership. Without going into the complexities of the matter, the effect of the new regulations is that two prices will in future be quoted for all the securities in question. Arrangements have already been made for the double quotation in the case of the three stocks named above. The higher of these will be for certificates registered in the name of a firm which the market recognises as "good." The lower for those registered in the name of the actual owner. The purchaser should, therefore, have stock transferred into one of these market names. Having done so he will have to lodge the stock with his bank for the collection of dividends and other "rights," since the company will have no knowledge of his existence. The difference between the two quoted prices will presumably amount to the cost of effecting the transfer, plus an allowance for insurance, and other charges, in those cases where there is no London register. A further complication arises from the fact that much of the stock in question is already lodged in the United Kingdom Security Deposit in Montreal. In this case, the owner has nothing but a Call Ticket, issued by the Bank of England. Owners of these tickets who wish to sell will, in future, be required to furnish sufficient information to enable the buyer to trace the registered holder. Unfortunately, until this is done it will still be impossible to tell whether the stock in question is a good delivery or not. Further, in order to limit the amount of stock in existence which is not known to be a good delivery, all stock will, after September 1st, be a bad delivery which is not registered either in the name of the actual holder or in that of a recognised firm. Holders of any such securities will, therefore, be well advised to consult their brokers at once as to what action should be taken.

New Dealings and the Treasury

So far as can be seen at present, there is no reason to question the wisdom of the Treasury in deciding to reinforce the control of permission to deal, exercised by the special sub-committee of the Stock Exchange, by requiring that its own permission must also be obtained. There is something anomalous in the fact that, while a company may

not raise money to forward its contribution to the war effort by the issue of shares without obtaining the permission of the Capital Issues Committee and of the Treasury, a group which holds the shares of a company may dispose of them by obtaining permission to deal. In addition, the solicitors of a financier, whose name was some years ago much before the public, have found a perfectly legal way of driving a coach and horses through the regulations. The sub-committee, to whom the application came, considered the issue against the public interest, but could not legitimately object to it. It will not be surprising if, when all is known, it proves that there has been some co-operation between Treasury and Stock Exchange in this matter. This is, however, no more than a possibility. In normal times, it would be a reflection on the efficiency of the new issues sub-committee to suggest that Treasury intervention was needed in the public interest. In war, when the rights of the investor have been so drastically interfered with by the Government in the national interest, it would show a lack of proportion to complain of this further intervention. The new step remains, however, one of potential importance.

Fine Spinners Developments

The results of Fine Cotton Spinners, for the year to March 31st last, show a fall in a total revenue after all management charges from £823,861 to £635,228. Interest, depreciation and directors' fees are virtually unchanged, but War Damage Contribution is halved at £50,000 and tax provision reduced to one-third, at the same figure. As tax on dividends alone amounts to more than three times that figure, it is evident that either there has been over-provision earlier or that the latest profit is after some tax. After these appropriations, and after meeting the preference dividend, the net amount available is £225,676, compared with £272,242 a year before. This year, it is necessary to provide for part redemption of the new funding certificates—but not for interest on them. The provision of £50,000 is rather in excess of the minimum required, in view of the decision to pay a 3 per cent dividend on the ordinary capital. Some 37 per cent of the dividend goes to holders of old preferred ordinary capital, converted under the scheme of January last. This leaves a total of £95,426, of which £80,000 is used to write down cost of replacing basic stock. It should be borne in mind that in this and succeeding years there will be a charge of £15,000 for interest on the funding certificates. Provided this can be found, and the 3 per cent dividend on the equity capital maintained for a further five years, the certificates would be paid off and an annual sum of £65,000 released for the equity capital, either as dividends or as additions to reserves. It is not intended to infer that such earnings are in any way assured.

The question has, however, a particular relevance in view of the offer which has been obtained by Mr Austin Kavanagh, secretary and advisory accountant to the preference shareholders' committee, to purchase the funding certificates for cash. The price offered is 18s. 6d. per £1, free of all costs, for certificates of £50 and over, and three-pence less for those of smaller amounts. For those who want cash now, the offer will have considerable attraction. For those who can afford to wait, it is a matter of assessing how soon the certificates will, in fact, be paid off. If the whole could be redeemed five years from now, acceptance of the offer would entail abandoning a capital profit of rather over 8 per cent over that period—the profit to the undisclosed buyer would appreciably be less, as he pays all costs, which raise the gross price to some 19s. odd. Those who believe that, whether the certificates are paid off or not, the future profits will show an improvement over those of the period after 1933 sufficient to ensure the regular payment of the preference dividend, might accept the offer and secure a slightly larger income by buying the preference shares, which, even after the offer, still stood at some 17s. 6d.

Company Notes

Pease and Partners Setback

The drop in total income of Pease and Partners from £617,446 to £406,338 for the year to March 31, 1942 came as something of a shock. Nor are the accounts sufficiently informative to give any clue to the reason. Totals are before taxation, which required £70,000 last year against

£200,000 in 1940-41. Depreciation receives £70,000 as before, but there is a reduction of £20,000 to £40,000 in the transfer to renewals and contingencies. After prior charges, £144,089 against £176,476 is available for equity earnings representing 8.5 against 10.2 per cent. Thus, the ordinary dividend which is reduced from 10 to 8 per cent is covered by current earnings and the small surplus goes to raise the carry forward from £300,194 to £304,692. The setback may be attributed to rising costs, which have affected all aspects of the business of the group from colliery and quarry to the output of finished iron and steel products. There may also have been some shortage of labour, although the concern is scheduled under the Essential Works Order. The consolidated balance sheet shows a rise in surplus liquid assets only from £2,353,187 to £2,355,069. There is the normal increase in creditors and debtors, but the secured loan is moderately lower at £266,678 against £286,763. The fall in cash from £1,056,823 to £849,375 finances a rise in investments from £240,478 to £377,306 and in consumable stores from £434,145 to £511,158. Despite the rise in the price level, stocks of coal, coke and iron, however, are reduced from £190,540 to £154,253. Total reserves are reduced from £1,371,635 to £1,250,366. The 10s. ordinary shares, at 10s. 3d. ex dividend, yield £7 16s. 1d. per cent.

"Slubbers" and English Sewing Cotton

The full accounts of *British Cotton and Wool Dyers* for the year to March 31st suggest that there was a contraction in turnover last year. No strict comparison is possible between the total disclosed profits of the two latest years, since, before repairs and renewals in both cases, those for 1940-41 amount to £247,113 after EPT, while those for 1941-42 amount to £205,857, including an unspecified transfer from taxation reserve. There is no specific mention of EPT in the latest year. On this basis, the apparent increase in equity earnings from £42,903 to £47,004, representing 7.1 against 6.1 per cent, has little meaning. The ordinary stock receives 5 per cent as before, and, after transferring £10,000 against nil to contingencies, it is necessary to reduce the carry forward from £55,116 to £53,412. The balance sheet suggests a very definite contraction in business. Thus, debtors are reduced from £251,396 to £135,678, net loans to subsidiaries from £27,572 to £13,445, and creditors have dropped sharply from £463,481 to £120,755. There is a fall in cash from £212,563 to £71,943, and stock is some £41,000 lower at £212,611. The full accounts of *English Sewing Cotton* for 1941 show a substantial rise in gross earnings. Total profits are up from £253,421 to £261,243, and after doubling the transfer to staff funds at £10,000, equity earnings amount to £151,071, against £150,812, representing 7.6 per cent as before. The ordinary stock again receives 7½ per cent, leaving the carry forward £1,071 higher at £121,745. The balance sheet shows a fall in stocks of £154,000, of which £100,000 has been placed in Tax Reserve Certificates. The total of cash and debtors is little changed, while creditors are some £87,000 lower. It seems probable that the experience of *English Sewing Cotton* was more satisfactory than that of *British Cotton and Wool Dyers*. If this is the case, the contrast is most probably due to the fact that rationing and restriction of civilian consumption must have interfered less with domestic demand for the products of the former concern. The *English Sewing Cotton* £1 ordinary stock, at 26s. 6d., offer a yield of £5 9s. 1d. per cent; the "Slubbers" 5s. ordinary stock at 4s. 3d. yield £5 17s. 8d. per cent.

Whitbread's Good Year

The full accounts of Whitbread for 1941 show a striking improvement in profits, after fees, tax and depreciation, from £249,605 to £313,046. It is clear that the rise in the gross figure, which is not disclosed, must be much greater. After meeting prior charges, equity earnings are up from £150,708 to £213,291, representing 23.6 against 15.4 per cent. The directors have restored the total payment on ordinary shares from 14 per cent to the 18 per cent, which was distributed for the five years ending in 1938. There is again no transfer to reserve, the whole of the surplus being devoted to raising the carry forward from £287,497 to £316,395. These results may well prove a pointer to the trend of brewery profits as a whole. These results represent a recovery from the sharp fall in the preceding year, when the company appears to have suffered more from the various effects of enemy action than some of its competitors. Increasing purchasing power

The Baltimore and Ohio Railroad Company

SUMMARY OF ANNUAL REPORT FOR THE YEAR 1941
The annual report of the President and Directors of the operations of the Company for the year 1941 is being mailed to its shareholders. The report shows that the gross earnings for the year were the largest for any year since 1929.

RESULTS OF OPERATIONS

The audited income account of the Company in comparison with 1940 is summarised as follows:—

	1941	1940	1941 Increase Over 1940
Railway Operating Revenues	\$227,503,021.56	\$179,173,161.63	\$48,329,859.93
Railway Operating Expenses	160,918,417.51	132,600,798.97	28,317,618.54
Net Rly. Operating Revenue	\$ 66,584,604.05	\$ 46,571,665.66	\$20,009,938.39
Rly. Tax Accruals	15,780,105.71	11,645,694.99	4,134,410.72
Railway Operating Income	\$50,804,498.34	\$ 34,928,970.67	\$15,875,527.67
Equipment and Joint Facility Rents			
Net Debit	4,507,373.81	4,310,439.38	196,934.43
Net Rly. Operating Income	\$ 46,297,124.53	\$ 30,618,531.29	\$15,678,593.24
Other Income	8,306,748.91	8,244,714.20	62,033.81
Total Income	\$54,603,872.51	\$ 38,863,245.49	\$15,740,627.05
Miscellaneous Deductions	2,004,180.92	1,688,203.37	315,977.55
Income Available for Interest and Other Charges	\$ 52,599,691.62	\$ 37,175,042.12	\$15,424,649.50
Fixed Interest and Other Fixed Charges	20,141,033.67	20,265,210.33	124,176.66
Income Available for Other Purposes	\$ 32,458,657.95	\$ 16,909,831.79	\$15,548,826.16
Contingent Interest Charges	11,366,775.00	11,360,335.00	6,440.00
Net Audited Income	\$ 21,091,882.95	\$ 5,549,496.79	\$15,542,386.16

In this statement there are included as deductions before arriving at net audited income, the full amount of fixed and contingent interest on the total interest bearing indebtedness of the Company accruing within the periods shown.

AVAILABLE INCOME AND APPLICATION UNDER MODIFICATION PLAN

The statement shows that for the year 1941 there was \$52,599,691.62 of audited income available for the payment of interest and other charges. Under the Plan for Modification of Interest Charges and Maturities of August 15, 1938, as incorporated in the supplemental indentures of January 1, 1940, and the supplemental indentures, an adjustment is made in this amount for cash transactions pertaining to the income of former years. This increased the amount of income available for the payment of interest and other charges to \$52,644,114.86. From this is first deducted \$1,057,688.32 for rent for leased roads and equipment and \$19,083,345.35 for interest remaining fixed under the Plan, or a total of \$20,141,033.67, leaving remaining available net income of \$32,503,081.19. From this available net income the Board of Directors in the exercise of their delegated discretion appropriated \$5,690,337.39 for capital fund to be applied to or to reimburse the Company's treasury for capital expenditures. They further appropriated \$22,073,407.69 providing for the payment of all accumulated and unpaid contingent interest accrued to December 31, 1941. From the then remaining available net income, 75 per cent, or \$33,554,502.04, was appropriated for sinking fund, leaving available balance of \$1,184,834.03 for other corporate purposes. (The Plan provides that from 1939 to 1943, 75 per cent, and thereafter 50 per cent, of the Available Net income remaining after the payment of all contingent interest charges, is to be set aside in the Sinking Fund until \$100,000,000 par value of secured obligations of the Company is retired.)

The payment of contingent interest authorized by the Board of Directors will be made against the surrender of contingent interest coupons of May 1, 1942, appurtenant to all bond issues affected by the Plan, and the supplemental indentures relating thereto and to facilitate collection the coupons of May 1, 1942, may be presented for payment on or after April 10, 1942.

There was a net increase of \$3,788,010.17 in outstanding interest bearing obligations incurred during the year, due principally to the issue of equipment trust obligations.

The total expenditures during the year for additions and betterments to road property aggregated \$3,773,277.77.

During the year four new and additional Diesel passenger locomotives were acquired and placed in service, and to provide adequately for the transportation of material so vital to National Defense, 4,763 new and additional freight cars were acquired, consisting of 1,563 steel box cars, 2,050 steel gondolas and 1,150 steel hopper cars.

The Company also acquired and placed in service four passenger-train cars, eight baggage and scow, twenty-five units of automotive equipment and four units of work equipment. The Company built in its own shops fifty new caboose cars and rebuilt and modernized five locomotives, two passenger-train cars, thirty-six freight-train cars, one unit of floating equipment, and one unit of work equipment. The total cost of the equipment acquired, together with additions and betterments to existing equipment, aggregated \$17,080,694.55. During the same period there were retired for obsolescence and other causes, eleven steam locomotives, three passenger-train cars, 205 freight-train cars, and thirty-six units of miscellaneous equipment, having a total book value of \$1,085,851.44, which deducted from the total cost of equipment installed during the year makes a net increase in capital account of equipment of \$16,015,347.11.

In addition to the cars delivered and placed in service during the year, 687 additional cars were under contract and have since been delivered. The Company has authorized the acquisition of the following new and additional equipment for 1942 delivery, viz.: two multiple-unit Diesel passenger locomotives, six multiple-unit Diesel freight locomotives, 1,000 steel box cars and 1,000 steel hopper cars at an aggregate cost of approximately \$9,500,000.

Based on 1941 volume of traffic, it is estimated that on an annual basis the increases in rates, fares and charges authorized by the Interstate Commerce Commission will produce \$10,500,000 additional revenues, as compared with the increase recommended by the Modulation Board appointed by the President of the United States, of \$14,250,000 in wages and taxes incidental thereto, and nothing for increases in cost of materials and supplies and other taxes.

Railway tax accruals in 1941 aggregated \$15,780,105.71, to which

(Continued at foot of next column)

has stimulated the demand for beer in recent months. While restricted supplies must continue to present a limiting factor, there is, at present, no prospect of any acute shortage being allowed to develop. The balance sheet shows an increase in stocks from £489,227 to £584,454, for which higher prices are no doubt largely responsible. There is a moderate reduction in debtors from £807,417 to £760,915, while the rise in cash and Government securities from £985,547 to £1,420,516 reflects an expansion in current liabilities from £1,186,397 to £1,543,116. General reserve remains unchanged at £1,000,000. The ordinary shares are privately held; the £100 4½ per cent preferred ordinary shares at £106 yield £4 6s. 9d. per cent.

* * *

Colliery Results

The fortunes of colliery companies are of immediate topical interest, but unfortunately the latest results provide little indication as to the trend of profits in the industry as a whole. *Yorkshire Amalgamated Collieries* show a decline in profits, after tax including tax on dividends, from £168,521 to £112,776. Equity earnings are reduced from £129,636 to £77,046, and there is a further cut in the ordinary dividend from 6½ to 5 per cent. In the absence of a transfer to general reserve, which received £25,000 in the previous year, the carry forward is raised from £124,750 to £129,496 after crediting £581 against £1,090 for refund of income tax. The decline is attributed by the directors to the rising weight of taxation. The incidence of EPT has not yet been agreed, but it is stated that ample provision has been made. The consolidated balance sheet shows a modest rise in coal stocks from £346,969 to £364,568. Government securities of £74,360 have been sold to help finance the purchase of £75,000 tax reserve certificates. Cash holdings are some £100,000 higher at £394,935, so that, excluding investments, there is a rise in surplus liquid assets from £360,038 to £412,297. The preliminary statement of *Carlton Main Colliery* for the year to March 31st last suggests more satisfactory results. Net profits are up from £115,278 to £116,975, and the ordinary dividend is maintained at 10 per cent. It is possible to estimate that equity earnings have risen from £109,278 to £110,975, representing 10.2 against 10.1 per cent. On the other hand, no clue to profits is provided by the announcement that *Horden Collieries* are to resume the payment of interim dividends with the distribution of the customary 2½ per cent for the year to September 30, 1942. Last year, no interim payment was made, but the ordinary stock received a total of 7½ per cent, as in 1939-40. No doubt colliery earnings have been predominantly influenced by local labour and transport conditions. There is as yet no evidence of any substantial recovery in pre-tax earnings.

"Johnnies" Group

The rich Main Reef Leader has been the chief source of ore supply to *Government Areas* during its prosperity, but owing to the gradual exhaustion of the ore body it was decided some time ago to prospect and develop, where payable, the low-grade Black Reef and Upper Leaders. As a result, and in order to try to maintain dividends on lower-grade ore, the plant was increased and is now running to its new, full capacity. Last year, yield and costs were adversely affected and dividends reduced to 70 per cent, to give a present yield, at 35s., of 10 per cent. Ore reserve tonnage was almost unchanged, but there was a fall in grade. A new shaft is being sunk in the middle of the property to accelerate exploitation of the Black Reef, while borehole prospecting will continue in other less favourable areas. Milling tonnage of *New State Areas* was unchanged, but yield and costs were badly affected, so that dividends showed a fall of 3½ per cent to 23½ per cent, which at 35s. gave a yield of 13½ per cent. Development shows a heavy fall in percentage of payability and in value, owing to in-

Continued from preceding column
should be added miscellaneous tax accruals of \$433,577.45, making total taxes for the year \$16,213,683.16, an increase over 1940 of \$4,432,316.04, or 37.62%. Of railway tax accruals, \$6,471,098 was levied by States and local taxing agencies, and the remainder, \$9,309,008, was taxes due the United States, of which \$6,194,708 were pay-roll taxes for unemployment insurance and retirement, and \$2,809,102 income taxes, the remainder being miscellaneous charges. Railway tax accruals in 1941 absorbed approximately seven cents of each dollar of total operating revenues and approximately twenty-four cents of every dollar of net operating revenue against which these taxes are a first charge.

R. B. WHITE, President.

creased development in blocks previously ignored. Ore reserves are maintained in tonnage, but with a further fall in grade. Drilling to prospect for Black Reef and Kimberley Reefs was unsuccessful, but will be continued. Operating results of *Randfontein* were similar to those of the previous year and dividends were maintained at 22½ per cent, to give at 37s. a present yield of 12.2 per cent. Ore reserves show another heavy fall and a decline in value. The regular fall in ore reserves has been in progress for some years and must cause anxiety. The *Van Ryn Deep* report shows a heavy fall in profits due to reduced yield and increased costs. Dividends are reduced to 11½ per cent, to give a present yield of 23.75 per cent at 10s. In spite of increased development in the newly-acquired Benoni Outcrop Section, the ore reserves show a fall both in tonnage and in grade; and this tendency is likely to continue during

the remaining life of the mine. Despite a reduced yield and substantially smaller profit, *Langlaagte* maintained the 5 per cent dividend. Ore reserves were unchanged, but a large amount of development is required in the small remaining blocks of ore in order to hold the reserves. The margin between yield and costs is now extremely small, and, with its very weak ore reserve position, the mine must be very near the end of its life. Whilst *Witwatersrand (Knights)* almost maintained its profits, despite increased taxation and anticipated capital expenditure on the reduction plant, the dividend was reduced to 23½ per cent, to give a yield of 9.5 per cent at 50s. Development tonnage was reduced, but reserves were almost maintained as only a comparatively small proportion of the tonnage mined was derived from ore reserves. The outlook for this old mine is for a comparatively short life.

Industry and Trade

Levy on Bricks

In its first report, submitted to the Ministry of Works and Buildings last December, the committee on the brick industry envisaged a progressive decline in the demand for bricks during the war period. It therefore recommended an immediate cut in output of 12½ per cent, to bring production into line with estimated requirements, and a further 4 per cent cut to reduce stocks to the equivalent of one month's output, except in the south-eastern area. The latest available output statistics relate to the five months ended May, 1941, when production averaged 380 million bricks a month. In considering how to secure the necessary adjustment in output, the committee decided that of the two possible methods—the spreading of the cut over the existing works, and the closing down of entire plants—the latter was preferable on grounds of expediency. But, expecting a rapid increase in the demand for bricks after the war, the committee felt that the closed works should be capable of resuming production at short notice, and that they should be put on a care and maintenance basis. Since the Government has decided against the use of public funds for this purpose in connection with last year's concentration of industry scheme, the committee suggested that the cost of maintaining the closed works in working order should be met by a levy on the sales of undertakings which continue in production. This recommendation has been accepted, and a levy at the rate of 3s. per 1,000 bricks has been imposed in respect of deliveries since May 18th. The price of bricks varies considerably, according to type and place of delivery; according to *The Builder*, the minimum prices at works for full lorry loads, Sittingbourne district, vary from £2 10s. per 1,000 for "third common stocks" to £4 5s. 6d. per 1,000 for "first hard stocks." It is hardly necessary to add that the levy will be paid by the consumer.

* * *

Milk Production

The hope expressed last April by the Minister of Agriculture that there was a good chance of a larger milk production this year than in the previous war years, has been fulfilled. Production at present is well in excess of the output at this time last year. Output depends on many unpredictable factors, and it is possible that more milk has been produced than was expected. Manufacturers have been working to capacity, but during the peak production period there will be a surplus after providing for the maximum quantity that it is possible to store in the form of butter, cheese, condensed milk and milk powder. The surplus is being distributed to non-priority domestic con-

sumers, without restriction of dairyman, during the five weeks ending June 27th. The Milk Supply Scheme remains in force in all respects, and the prescribed requirements of priority consumers are being met in full before supplies to other consumers are raised above three pints a week. Milk producers are to be congratulated on their achievement in raising production. It is hoped that the increase will be progressive (subject, of course, to the normal seasonal variations), and that reasonably adequate supplies of milk will be available for all consumers.

* * *

Earnings in Coal Mining

The application of the Executive Committee of the Mineworkers' Federation for an immediate substantial advance in wages, and for a national minimum wage of £4 5s. per week, is discussed on page 748. Since the outbreak of war the successive increases accruing from the automatic operation of the war-period cost of living sliding scale wage agreement have amounted to 2s. 8d. per shift. From June 1, 1941, another 1s. per shift was added in the form of an attendance bonus, thus securing for the miners a total advance to date of 3s. 8d. per shift of 7½ working hours. Compared with the average level of cash earnings in the first half of 1939, these war-period additions represent a gain of 36 per cent, which compares with a rise in the cost of living index of just under 30 per cent, and under the Essential Work Order the workmen are guaranteed these advances as well as their pre-war normal wages. The intervention of other factors makes it impossible to estimate accurately how far the higher wage level has influenced attendance and application; on March 19th the Secretary for Mines said in the House of Commons that the rate of absenteeism (presumably unavoidable as well as avoidable) during the year ended March, 1942, was 9.46 per cent, as compared with 6.43 per cent for the corresponding period ended March, 1939; and on May 6th he gave the average output per person as just over 21 cwt. per shift, which compares with 23.5 cwt. in the March quarter of 1939. Under the influence of these higher wages and reduced output per person employed, the labour cost of production has risen from about 3s. per ton where the normal output per person is highest to about 5s. per ton where it is lowest; partly because of the reduced rate of production, other costs have increased by 1s. 6d.-2s. 6d. per ton. The actual amount of the further war addition being asked for is 4s. per shift, which would mean that consumers would be faced with the possibility of an average rise in the cost of coal of something like 5s. per ton.

Wartime Canning

An Order of the Ministry of Supply, issued on May 19th, which restricted the use of tinsplate for the canning of edible oils, appears to have given rise to mistaken reports about an Order limiting the canning of vegetables. While nothing in the nature of a no-canning Order has been issued by the Ministry of Food, it is true that both materials and labour are in short supply, and that some limitation of canning may have to be imposed. Existing resources are said to be adequate for the canning of meat, milk and beans likely to be available for this purpose. But while efforts will be made to prevent food from going bad, and to can substantial quantities of vegetables and part of the crop of plums, loganberries, blackberries and apples, the possibility of some restriction in this field must be envisaged. Statements that lacquered steel is already replacing tinsplate on a large scale as a canning material for perishable food are premature. Lacquering has long been used on tinsplate as a means of conserving certain foods, but the problem of soldering cans of untinned sheet, whether lacquered or not, is still under investigation. Hot rolled sheet, known as blackplate, can, however, be used for certain foods, such as dried biscuits.

Transport and Regional Self-Sufficiency

The Ministry of War Transport has the task constantly before it of seeking means to economise transport. A number of schemes have been worked out under its aegis, affecting other Departments and covering many sections of the community, among which are the Road Haulage Scheme and retailers' pooled deliveries. Last October the Minister of War Transport announced that plans were being made to limit the distance covered by goods in their travels from wholesaler to retailer. Cross hauls were to be eliminated and the nearest sources of supply drawn upon. The announcement was discussed on page 543 of *The Economist* of November 1, 1941. So far as food is concerned, where the machinery of control is of necessity most highly developed, plans have recently been announced. A regional scheme for wholesale distribution of groceries and provisions has been worked out, under which the country has been divided into nine areas, known as sectors. Retailers (and catering establishments and institutions) will be prohibited from obtaining any of the goods to which the scheme applies from premises not situated in the same sector. The saving of transport is the objective of all such schemes, but this stone thrown into the pool will cause ripples reaching and influencing other spheres. Within certain limits, Great Britain may find itself divided into small areas, each relatively self-sufficient economically. Any danger that such division is likely to be more than purely economic is obviated by the fact that, for the most part, the goods concerned are now or about to be standardised.

Labour Problems in Cotton Trade

The pressure for an improvement in labour conditions in the Lancashire cotton textile industry continues. As recorded in *The Economist* of May 16th, the spinning operatives' demand for higher wage rates was rejected early this month by the National Arbitration Tribunal, and the claim of the weavers met a similar fate. But the United Textile Factory Workers' Association, which includes all the trade unions in the industry, has now applied for the payment of wages in respect of the full holidays customary in the cotton trade. At present operatives receive payment for a week's holiday each year; but as the aggregate holidays of operatives average about a fortnight, the claim involves another week's pay without work. At a meeting with the employers at the end of last week, it was agreed to defer consideration of the new claim until September, when it is to be discussed as part of the wider problems facing the industry. Opinion among employers is reported to be against further concessions to the operatives, except in consideration of the assistance of the trade unions in the reorganisation of the industry.

Wool Textiles Exports

Exports of woven wool textiles have been rationed and controlled by licence since last February. Heavy shipments in the first few weeks of the year, however, account for the

substantial total exported during the first quarter of the year. The Board of Trade export figures for the last five quarters are as follows:—

	'000 Square Yards		Total
Three Months	Woolens	Worsted	
January-March, 1941	8,907	6,406	15,313
April-June, 1941	10,472	4,457	14,929
July-September, 1941	15,468	7,407	22,875
October-December, 1941	23,348	9,874	33,222
January-March, 1942	18,393	8,763	27,156

The allocations which have been made to export houses for the various markets from February 1st may be expected to cause a sharp decline in the totals for future quarters. The quarterly worsted yarns ration is understood to be approximately two million lb, and the tops (combed wool) ration is almost three and a half million lb. The total of more than 98 million square yards of woollen and worsted tissues exported during the year ended March 31, 1942, compares with 93 million square yards in 1939, and 90 million square yards in 1938.

Increased Wool Buying Prices

Last Saturday the Dominions Office announced that as a result of discussions between Dr. Evatt, the Australian Foreign Minister, and the Chancellor of the Exchequer, the price paid by the British Government for Australian wool is to be increased by 15 per cent. The increase takes effect with the beginning of the new clip. It was added that corresponding adjustments will be made to the prices paid for New Zealand and South African wool. This decision did not come entirely unexpectedly. Early in April the South African National Wool Growers' Association discussed the necessity for an increase in wool prices "owing to the rise in costs of farming essentials," and towards the end of that month the Australian wool growers' organisations asked the Dominion Minister of Commerce to press in London for an increase in wool prices for the same reason. The actual increase appears to meet the most extreme demands of the Dominion growers. When the British Government in the first weeks of the war agreed to buy the entire Australian and New Zealand wool clips for the duration of the war and one year thereafter, prices were fixed at the pre-war levels of 13.44d. per lb. for Australian wool and 12.25d. per lb. for shorn New Zealand wool. Prices for Cape wool were adjusted to these levels—the average is 10.75d. per lb.—when following the fall of France, the British Government arranged to become also the main buyer in South Africa.

Reports from the three wool Dominions indicate that wool growers there have seldom had a more prosperous time than since the outbreak of this war, for the agreements with the British Government, besides granting a remunerative price, secured a guaranteed market for the whole clips, although shipping shortage forced the buying Government to accumulate huge stocks in the producing territories. In Australia, the wool cheque totalled £A65,246,000 in 1930-40 and £60,937,000 in 1940-41. In New Zealand, it amounted to £NZ15,740,000 and £NZ17,273,000 in the same periods to £NZ15,740,000 and £NZ17,273,000 respectively. For South Africa comparable figures are not available. It is likely, however, that British Government payments to South African wool growers reached £SA10,000,000 per season. A 15 per cent increase may cost the British Government as much as £15,000,000. In the United Kingdom wool issue prices will not be immediately affected by the increase, as the Wool Control has just extended its existing price schedule for raw wool and tops until the end of October next. As the recent reduction in the British raw cotton price despite rising quotations in other countries indicated, the Government is anxious to stabilise prices for textile products. As part of this wider plan the present raw wool issue prices in this country may well be maintained for a longer period than the limit now fixed. On the other hand, the increase in the wool buying prices is likely to lead to higher dollar receipts from exports of Empire wool to the United States. These exports are known to be very large, and according to a recent statement in the House of Lords, they have not been interrupted by military events in the Pacific area. While the British Government retains the dollar equivalent for any Empire wool sold at the price it has itself paid in sterling, any possible profits made from re-sales outside the United Kingdom are to be shared equally between the British and Dominion Governments concerned.

THE EMPLOYERS' LIABILITY ASSURANCE CORPORATION, LIMITED

BUSINESS MAINTAINED IN ALL SECTIONS

The sixty-first ordinary general meeting of The Employers' Liability Assurance Corporation, Limited, was held, on the 27th inst., in London, Sir Courtauld Thomson, K.B.E., C.B. (the chairman), presiding.

The following is an extract from the chairman's address which had been circulated with the report and accounts:

The main features of our results in 1941 may be summarised as follows: Our premium income amounted to £6,716,000. The total amount taken to the credit of profit and loss account was £396,000. This includes the underwriting profit, which, at £84,000, is considerably below our average of recent years, and gross interest income of £312,000. After providing for British taxation, totalling £260,000, and for other charges, and after declaring dividends at the same rates as a year ago, we carry forward £523,000, slightly less than the amount we brought in at the beginning of 1941. This £523,000 is additional to our general reserve of £2,500,000; the two combined form a substantial reserve fund of over £3,000,000.

There was a considerable appreciation over book values shown by the market values at December 31, 1941, of our investments in stocks and shares. Their market value at that date at current rates of exchange amounted to £9,203,000.

FIRE AND ACCIDENT ACCOUNTS

The underwriting experience in the fire account for 1941 shows an improvement over 1940, and the profit is £21,000, or 4.9 per cent.

The increase of £435,000 in the premium income of our accident and general account relates both to our home and our overseas business. Although our standards in the selection of business have been maintained throughout the year, there is a considerable reduction in underwriting profit, due to the heavier incidence of claims in the United States. Our Workmen's Compensation experience in the United States was much less favourable than in the previous year, and the results of our motor business in that country were also less satisfactory. Our results in other classes were generally profitable.

The year 1941 was again one of many difficulties, and it is probable that 1942 will prove at least equally trying. Our operations in Canada, Australia, South Africa and India, as well as those at home, were generally profitable in 1941, and to our managers and agents in those territories I should like to express here our appreciation of their care and skill.

EFFECTS OF THE WAR

In the United States, as in Canada and the Dominions, the deepened impact of the war is bound to be reflected in our experience. The consequences are likely to be similar in character to those with which our experience at home here has made us familiar since September, 1939. We shall doubtless be faced with reduction of income in motor business as the result of restrictions on the use of petrol and rubber, and in the United Kingdom that reduction will, of course, be much more pronounced in 1942.

The support given by our associated life office, the Clerical, Medical and General, to new British Government issues from the outbreak of war to date amounts to over £2,000,000. The corporation itself, by its investment policy at home, in the Dominions and in the United States, has contributed to the financial effort of the Empire and its Allies.

In expressing thanks to our managers, staff and agents in all parts of the world for their work during the year 1941, I bear in mind particularly the dislocation and pressure brought about by the war. As you will readily understand, the absence on military service of an increasing number of our staff, including those in the United States, places much additional strain on the remainder.

The report was unanimously adopted.

FRIENDS' PROVIDENT AND CENTURY LIFE OFFICE

THE CHAIRMAN'S STATEMENT

The annual general meeting of the Friends' Provident and Century Life Office will be held on June 3rd in London.

The following is an extract from the statement by the chairman, Hugh E. Seebohm, J.P.:—

Since the close of 1941 two of our directors have decided to retire because of advancing years, to whose services it is appropriate that I should make reference.

Robert H. Marsh had been a member of the Friends' Provident board for 37 years, and had taken a leading part in the successful developments of the past 25 years. He had been for many years deputy chairman, and chairman of the general purposes committee. Sir Harold J. Stiles, F.R.C.S., was of valued assistance on the Century board.

SIMPLIFYING CONTROL

During the past year your directors have been considering means of simplifying the control of the many classes of insurance carried on by the Friends' Provident and Century Life Office and its wholly-owned associated undertaking, The Century Insurance Company, Limited. Technically there must continue to be two boards of directors, but by making the membership of the boards identical, or nearly so, a unity of purpose and a greater ease in efficient administration can be established.

Accordingly resolutions will be proposed, which if adopted by the members, will add to the board of the Friends' Provident four members of the board of the Century who are not at present directors of the Friends' Provident. The shareholders' meeting of the Century added to the Century's directorate the members of the Friends' Provident board who were not directors of the Century.

In the presentation of the report and accounts of the Century this year, we have consolidated the accounts in respect of the fire, accident and marine business of the Century with those of the subsidiary undertakings, thus revealing more fully the volume and the fortunes of our operations.

During 1941 we have endeavoured to continue to conduct our business in a manner most conducive to the national interests by the investment of our funds in the new issues of Government bonds, and by issuing policies payable in these bonds.

NEW LIFE ASSURANCES

Life assurance plays its part in the encouragement of thrift, not only for a short space of time but as a continuing effort. We include under new assurances cover for civilian war risks in the United Kingdom, and have found the experience more favourable than we could have ventured to hope. The volume of new life assurances (£1,956,000) is still below the pre-war volume, but the quality is excellent, and we enjoyed a welcome increase of £562,000 over 1940.

In 1941 we invested, in the group, in new issues of the British Government £952,000. Our gross rate of interest recovered from £4 9s. 5d. to £4 13s. per cent. The rise in our net rate of £3 19s. 10d. compared with £3 4s. 1d. per cent. is accounted for mainly by the change adopted in our method of calculation to accord with the practice usually adopted by other offices.

The premiums in each of the fire, accident and marine departments increased moderately, and in the aggregate amounted to £1,633,000. Each department earned a profit.

The total profits of the Century Insurance Company, including interest, after full provision for taxation and all other outgoings, including war damage contribution and staff superannuation fund, amounted to £73,550. The sum of £30,000 net has been utilised for a dividend on Century shares, and the balance of £43,550 has been added to the sum carried forward.

The capital and free reserves of the Century at the close of 1941 exceeded £1,500,000 and were in addition to full provision in all departments for all known liabilities.

I desire to pay a special tribute to the cheerful, skilful and untiring service which we have received from our staff at home and abroad. Now that a large proportion of the male staff has taken up national duties, the women have most efficiently filled the gap with a sense of responsibility and a determination to do their part, of which it would be impossible to speak too highly.

DAILY MIRROR NEWSPAPERS, LIMITED

DIVIDEND OF 10 PER CENT

MR. JOHN COWLEY'S REVIEW

The ordinary general meeting of stockholders of the Daily Mirror Newspapers, Limited, was held, on the 27th instant, at the Memorial Hall, London, E.C.

The following is the statement by the Chairman, Mr John Cowley, circulated with the report and accounts:—

During the year we lost a valued friend in Mr Wallace D. Roome, one of our colleagues. He had been engaged on the paper from its first issue—a period approaching 40 years—and throughout the time had a wholehearted care for the *Daily Mirror* and those who worked for it. He was a wise counsellor, and his passing is regretted far beyond the confines of our own business.

RESULT OF YEAR'S OPERATIONS

A year ago in my statement I remarked, "Our accounts for the year to February 28th last do not make altogether satisfactory reading. The reason can be summed up in the word 'taxation.'" The position to-day is not different, and although we have had a very good trading year and recommend the payment of a final dividend of 5 per cent. on the ordinary stock, again making a total of 10 per cent. for the year, you will notice from the appropriation account that after making the usual provision for pensions and reserve our carry-forward is reduced by the sum of £31,196. However, the balance of profit and loss is the substantial sum of £85,931. It will be seen from the accounts that the main change on the liabilities side of the balance-sheet is an increase of £138,962 in the creditors, &c., item, reflecting chiefly the provision made for taxation.

On the assets side investments are up by roughly £60,000, of which amount £50,000 is covered by our subscription to an issue of Government Savings Bonds. Loans have been reduced by £75,000 through the repayment of this sum by Anglo-Canadian Pulp and Paper Mills, Limited. Debtors and cash together are around last year's figure, and there is a new item, tax reserve certificates, £150,000. We have not received during the year any return by way of dividend on our very large investment in Anglo-Canadian Pulp and Paper Mills, Limited. That company has, since its capital reorganisation, improved its financial position considerably. You will realise that the entry of the United States into the war has brought fresh problems for the Canadian newsprint industry.

An overdue adjustment in the price of newsprint has been temporarily suspended by Government order in spite of increased costs of production.

SUPPLIES OF NEWSPRINT

Over here the supply of paper is still one of our anxieties. The Newsprint Supply Company, which handles the whole of the supplies for the newspaper Press, has again worked to great advantage, but it has been necessary to reduce the quantities available for use for reasons which are obvious, as either paper or the materials to make it have to be imported, and there is a likelihood, or at least the possibility, of a further reduction. We have made the best use of the quantity available for our use. We have reduced the number of pages in our paper, and, in addition, have reduced also the number of copies printed. The price of newsprint, which is controlled, has recently been increased by £2 a ton to consumers.

The *Daily Mirror* is very firmly established in the public favour and enjoys great popularity. The demand for it is such that we could sell every day hundreds of thousands more copies. Of course, in most industries to-day similar conditions prevail—demand is greater than supply.

The newspaper Press in peace-time in a democratic country is of the greatest value and importance. In war-time its importance and value are not in any way lessened. There are many reasons why diverse views and opinions should be freely and widely circulated by our newspapers, and it is to be hoped that sufficient newsprint and other materials will be available so that the service of the Press to the nation will be maintained as nearly as is at present possible.

EXHIBITION OF WAR PICTURES

Last month we held an exhibition of photographs at the Dorland Hall. It was a thrilling and impressive collection of pictures depict-

ing our people and our Allies in every phase of war action and effort. These magnificent pictures, every one having a real news value, will later, with the help of the Ministry, be sent for exhibition in the United States of America. During the short time it was open it was visited by over 50,000 people and service charities have benefited by more than £2,500 (all the admission money being devoted to this purpose).

SUNDAY PICTORIAL NEWSPAPERS (1920), LIMITED

SALES MAINTAINED

The ordinary general meeting of stockholders of Sunday Pictorial Newspapers (1920), Limited, was held, on the 27th inst., at the Memorial Hall, London, E.C.

The following is the statement by the chairman, Mr John Cowley, circulated with the report and accounts:—

The accounts for the year ended February 28th last show a profit of £192,497, which is £16,211 less than the profit of the previous year. This figure is arrived at after providing for taxation, working, office and other expenses, contingencies, etc. The report shows the appropriation of £20,000 to reserve account, £25,000 to taxation reserve and £5,000 for pensions. An interim dividend of 5 per cent. was paid last December, and the final dividend of 7½ per cent. proposed will make a total of 12½ per cent. for the year on the ordinary capital.

Although the total payment of 2½ per cent. more on the ordinary capital for the year entails a reduction of the profit and loss balance, there will remain the substantial sum of £119,496 to be carried forward. The accounts are presented in the usual form. The changes on the liabilities side show the effect of the reserve additions. The item Creditors, Surplus on Sale of Investments and Reserve for Contingencies, higher at £580,341 by some £51,217, reflects the provision made for Excess Profits Tax, etc.

SUBSCRIPTIONS TO GOVERNMENT ISSUES

In our "Investments at Cost or Under" there is a net increase of £69,780. During the year we took an opportunity of increasing our holding in one of our associated companies, and subscribed £50,000 to a Government issue of Savings Bonds. From the outbreak of war to the date of our balance-sheet we subscribed £125,000 to new Government issues, and during the recent Warships Week took up a further £50,000 of Three per Cent. Savings Bonds. I have no doubt you will approve our policy in this direction and our intention, as far as our funds permit, to continue to subscribe to new Government issues which may be made from time to time. The War Savings Groups at our offices and works receive our encouragement, and they have helped to forward the good work of the National Savings Movement, which is such an important factor on the financial side of the war effort. The voluntary work performed by those in our employ who give their time and labour in this direction is very praiseworthy.

This year again you will notice on our balance-sheet the following footnote:—

"The book value of the investments exceeds the total of the market value of the quoted shares and the value of the unquoted shares as estimated by the directors. The difference is covered by the reserve account, surplus on sale of investments and reserve for contingencies."

I indicated last year faith in a recovery in the value of our investments when we reach more settled times, and cannot now usefully make further comment.

TRIBUTE TO EDITORIAL STAFF

I am pleased to be able to tell you that the net sale of the *Sunday Pictorial* was fully maintained, and that the advertisement revenue was very satisfactory. As you know, the quantity of newsprint we are allowed to use each week is strictly limited and is considerably less than at this time last year. We have been compelled to issue papers of smaller size, and it is a real tribute to our editorial people to be able to say that they have continued to turn out an attractive paper each week with such restricted space at their disposal.

It is my duty, and my pleasure, to again commend my fellow-directors and members of the staff for their good work during the year, willingly carried out at all times.

HOME AND COLONIAL STORES LIMITED

GOOD TRADING RESULTS

TAXATION PRECLUDES DIVIDEND PAYMENT

EFFECT OF WAR CONDITIONS ON DISTRIBUTIVE SERVICES

SIR GEORGE SCHUSTER ON BOARD'S POLICY

The annual general meeting of the Home and Colonial Stores, Limited, was held in London on the 29th instant.

The following annual review by the Chairman (Sir George Schuster, K.C.S.I., K.C.M.G., C.B.E., M.C., M.P.) has been circulated with the report and accounts:—

The course of trading results for the company and its subsidiaries over the last four years has been shown very clearly in the summaries given in the directors' report. Perhaps the most striking feature is that, after making provision for taxation, the amount available for distribution was: For 1938 £462,596 out of a trading profit of £558,520; for 1939 £549,457 out of a trading profit of £1,002,506; and for 1941 £274,919 out of a trading profit of £1,259,249.

From the sums thus available for distribution there have to be provided allocations to staff benevolent funds, and about £286,000 for preferential charges (£105,000 to outside holders of securities in subsidiary companies and £181,000 for the Home and Colonial in subsidiary companies) and £181,000 for the Home and Colonial in subsidiary companies. The net result is that, whereas in 1938—a year in which the company was still carrying out its reorganisation programme and working at an unduly low margin of profit—it was possible to pay 3 per cent. on the Home and Colonial Ordinary shares and to increase the total reserves and carry-forward of the group by £76,102 (equivalent to a further 5 per cent. on the Home and Colonial Ordinary shares), in 1941, with a trading profit £700,000 higher, the Ordinary shares get nothing and it has only been possible to meet preferential charges by drawing on reserves to the extent of £38,074.

Before enlarging further on this position I must make it clear that the results for 1941 to which I have just called attention are dependent on the provision for taxation made in the accounts, which itself is based on calculations as to payments that may have to be made if the company is assessed for excess profits tax on a "profit standard" basis. Discussion is still going on with the Revenue authorities, and it is not yet clear what the exact "profit standard" will be, or what the "capital standard" will amount to, if the company succeeds in its application for assessment on a capital standard. We still hope to be able to satisfy the Revenue authorities that a more favourable basis should be allowed; but, in the meanwhile, it is necessary to provide in the accounts for the less favourable alternative.

Shareholders will naturally want to have some explanation of these results. So far as concerns taxation I dealt with the position very fully in my statement of last year; but in view of the importance of the matter I feel it necessary to review the situation again.

COMPUTATION OF E.P.T.

It is, of course, well known that the methods for assessing excess profits tax were so framed as to work out very hardly in the special circumstances of this company. The standard years (1935, 1936 and 1937) for calculating the datum line on which this tax is levied were years of the company's reorganisation and profits were abnormally low. In fact, as I explained last year, the average annual group profits for those years were about £470,000 less than the average for the preceding four years and £500,000 less than the average for the three subsequent years. The Finance Act recognised the situation for giving some relief in such cases, by allowing a justification for giving some relief in such cases, by allowing a company so placed to apply for an alternative standard based on a prescribed rate of interest on its capital. But here again this company may be placed in a specially unfortunate position. In compiling the statement of assets required for establishing the amount of capital employed, a holding company such as the Home and Colonial Stores is not allowed to include its investments in and the shares of its wholly owned subsidiaries (such as Lipton and Meadow Dairy Company), but has, instead, to bring in the actual net trading assets of these subsidiaries. The result of this method in our case may be the exclusion in the capital computation of the whole or a substantial portion of the price paid for the goodwill of these subsidiaries.

The element of goodwill, however, largely affected the price at which the Lipton and Meadow undertakings were acquired. If that acquisition had been carried out by a direct purchase of the undertakings from the shareholders the goodwill would have been valued separately as part of the assets to be acquired, and would have had to be thus shown in the Home and Colonial balance sheet. Actually, however, the acquisition was carried out by the more normal method of purchasing the shares of the two companies, and the goodwill was paid for by paying a premium on the shares. This was done in order to preserve the identity and thereby protect the goodwill of the businesses acquired. We are pressing on the authorities the justice of the view, that our capital assets should include this goodwill which would represent a substantial improvement on the taxation provision that has been made in the accounts, though it would still leave the company with a standard considerably below what can fairly be regarded as the normal earning power which it had established before the beginning of the war.

INCOME TAX PROVISIONS

Apart from excess profits tax, the income tax provisions as at present interpreted seriously affect the immediate financial position. As I explained last year, the main cause for this is that the revenue authorities refuse to treat as expenditure chargeable against profits a number of items for which, in the opinion of the directors, it is necessary to provide before arriving at what can properly be regarded as distributable profits. In the year 1941, for example, apart from income tax levied from debenture holders and share holders in the group on the amounts distributed to them, the company has had to provide a sum of £137,870 for income tax, chiefly in respect of "disallowed items" which the directors consider ought commercially to be treated as deductions from profits but which the revenue authorities still calculate as profits. The effect of these disallowed items, as I explained last year, is much more serious with income tax at its present high rate of 10s. in the £. If, for example, the disallowed items are £150,000 and the rate of income tax is 5s. in the £, then it is necessary to earn profits of £200,000 to provide the net sum of £150,000. But if the tax is raised to 10s., then a gross sum of £300,000 has to be earned in order to provide the same net sum of £150,000. In other words, an additional profit of £100,000 has to be earned, but with excess profits tax at 100 per cent there is no chance of earning any additional profit.

I have again referred fully to these matters because I think it is important that the public should understand what is happening. It would be totally wrong to complain either against the principle of a full tax on extra profits earned from war conditions or against bearing a fair share of any burden necessary to fulfil the double purpose of mobilising the maximum war effort and maintaining a sound system of national finance—which means ruthlessly restricting private expenditure and meeting as much as possible of the war cost from taxation.

INJUSTICE OF PRESENT SYSTEM

The only points that I want to make are, first, that injustice should not be done in distributing the burden as between one class of investor or business and another, and, secondly, that taxes should not be levied in such a way as to undermine the financial structure of the country's business as a whole. The present system of calculating "excess profits" is definitely creating injustice. In our own case we can freely admit that, since the war began, some of our profits have been due to war conditions; but that applies equally to other companies doing the same kind of business, and it is patently unjust for our company to be forced to surrender so much of its profits that not even a small ordinary dividend can be paid, while other companies trading in exactly the same way can pay handsome dividends merely because, for special reasons quite unconnected with the war, they were doing better than

MAYPOLE DAIRY COMPANY, LIMITED

SALES AFFECTED BY RATIONING

DIVIDEND MAINTAINED AT 4 PER CENT.

SIR GEORGE SCHUSTER'S REVIEW

The annual general meeting of the Maypole Dairy Company, Limited, was held, on the 29th instant, in London.

The following annual review by the chairman (Sir George Schuster, K.C.S.I., K.C.M.G., C.B.E., M.C., M.P.) has been circulated with the report and accounts:—

As shown in the report, the trading profits for 1941, after charging depreciation, but before providing for maintenance, repairs and taxation, amounted to £380,431, or approximately £55,000 less than for 1940. In my statement of last year I made it clear that, owing to war conditions, we were likely to experience considerably greater difficulties in 1941 than in 1940. In the event this forecast proved correct, but it is fair to say that, due to special efforts made by the management and staff, the actual result is better than we felt entitled to expect at the beginning of the year.

This company has always been largely dependent on its business in margarine, and the full effect of rationing that article was only felt during the latter half of 1940. Our trade in other specialities has also been seriously affected, partly by rationing and partly by diminution in supplies. This last condition particularly affected canned fruit. Every effort has been made to offset these results by developing the sale of what were formerly subsidiary lines. A good deal has been achieved in this direction, but the restriction of supplies puts a very definite limit on what is possible.

RATIONING AND REGISTRATION

The Maypole Company, which has always been essentially a specialist company, has been particularly liable to suffer from conditions prevailing in the present war. We have not dealt, like many of our competitors, in a full range of general grocery lines, nor in the many articles the sale of which is often associated with groceries. The commodities in which we specialised were among the first to be rationed, and rationing was in their case linked with registration. Simultaneously general grocery goods were increasingly in short supply, and retailers in many instances adopted the practice of refusing to sell these goods except to customers who were registered with them for the rationed articles. This practice was actually encouraged by the Ministry of Food, and, indeed, was not unreasonable, since it helped shopkeepers to control distribution of these unrationed goods.

The effect, however, on our company was that a number of our customers who used to come to us specially for butter, margarine, eggs, &c., found themselves forced to register for these articles with general grocers in order to get other goods. The introduction of the "points" rationing system for a large range of the previously unrationed articles removed to a large extent the difficulties in which our customers were placed and has contributed to the development of our trade in the articles affected. We therefore welcomed this new feature in the rationing methods employed by the Ministry of Food, and we think it is generally agreed that it has done much to ensure a fairer distribution of unrationed goods.

EGG DEPOTS

The company's egg collecting stations at provincial centres have in the past proved of great benefit to ourselves in ensuring supplies of home-produced eggs, as also, we believe, to the producers by providing them with a convenient and favourable market. These stations have now, in common with all other packing stations throughout the country, been linked up with a nationally controlled scheme of distribution, the Government having called on the industry generally to pool its resources so as to effect economy of working as well as to secure an equitable distribution of eggs to the large centres of population. We cannot quarrel with this move, but, in effect, we thereby lose an advantageous position which we had built up for ourselves.

UPKEEP OF PREMISES

In present conditions, all work on repair and maintenance of premises has, of course, to be restricted to a minimum. This, however, cannot be regarded as more than a postponement of expenditure which must be ultimately incurred. Special provision

has accordingly been made for "Deferred repairs and renewals" by setting aside a sum of £60,000 for this purpose out of last year's profits. This sum, with the £25,000 provided in the previous year, will, it is anticipated, be sufficient to cover the eventual cost of such renovation work as would normally by now have fallen due.

A certain number of our branches were damaged by enemy action during the early months of last year, but all cases of minor damage have been repaired and business has been carried on almost without interruption. Where more than minor repairs were required we have, in several instances, been able to secure alternative accommodation, with the result that very little of our trade and goodwill has been forfeited, even temporarily. Apart from the few badly damaged shops, no other branches have had to be closed down during 1941—a tribute to the sustained demand everywhere for Maypole service.

TRIBUTE TO STAFF

The thanks of directors and shareholders are due to head office staff, inspectors, branch managers and assistants who have, throughout the year, been working in difficult and exacting conditions. Despite the extra calls imposed on them the work of our serving staffs at the branches has been carried on with keen enthusiasm and efficiency.

In all, about 2,200 members of the company's head office and branch staffs (not including subsidiaries) are now serving in the armed or auxiliary forces. Many more will probably be called up during the coming months and the problem of securing replacement is now becoming one of extreme difficulty. It is hoped that the Government authorities will recognise that businesses like ours need to retain a certain proportion of their experienced staff if the essential work of food distribution is to be carried on efficiently.

Measures are being taken to introduce every possible economy in labour by cutting down some of our normal peace-time activities, such, for instance, as our van delivery service. The readiness with which customers have accepted these restrictions and the consideration shown by them to some of our less experienced staffs at the branches have been very greatly appreciated.

Our system of bonus payments to the branch staffs has been continued and will, we hope, be maintained so far as future trading conditions and profits permit.

The company continues to give special consideration to the circumstances of men called up for service in H.M. Forces. Grants or allowances to supplement Service pay are being made to dependants in all cases where the families of the men have to be provided for. Employees who, at the time of enlistment, were members of the company's pension fund continue to retain their full rights and benefits of membership.

TAXATION AND FINANCIAL RESULTS

In the statement last year I dealt very fully with the manner in which the war system of taxation was affecting the amount of profits available for distribution and the general financial position of the company. For the current year it is not necessary to go into the matter at such length.

The decrease in the company's trading profits, combined with the concession made by the Revenue Authorities which, as noted in the directors' report, has enabled us to have our liability to excess profits tax suspended in respect of the sum set aside for deferred repairs, has meant in effect that our profits have fallen below the level at which they attract excess profits tax. No reservation is called for in respect of national defence contribution as the provision for excess profits tax already made in 1939 and 1940 more than covers any sum which alternatively would be required for national defence contribution.

The final result is that, as shown in the report, the net profit available for appropriation, is about £12,000 higher than in 1940. As against this it has been necessary to provide £10,000 more (£85,000 instead of £75,000) for income tax. Allowing for this, the amount available for distribution is practically the same as for

the previous year. We have accordingly recommended that the same dividend should be paid—that is, at the rate of 4 per cent. on the deferred ordinary shares, which will, after making the usual allotment to the company's provident fund, leave a balance of £1,281 to be added to the amount carried forward, bringing this to the figure of £302,337 1s. 2d.

I propose, therefore, at the annual general meeting formally to move:

"That the report of the directors, together with the audited accounts for the financial year ended January 3, 1942, be received and adopted; that a dividend for the year of 4 per cent., less income tax, be paid on June 1st to the holders of the deferred ordinary shares on the registers of the company on May 1, 1942; that the sum of £10,000 be allocated to the provident fund, and that the balance of £302,337 1s. 2d. be carried forward."

It is a satisfaction to the directors that, in spite of the great difficulties, it has been possible to recommend the maintenance of the ordinary dividend at 4 per cent. As I said last year, the future may bring greater difficulties, but we feel that the most important point of all is to maintain the organisation and goodwill of the company. So far, thanks largely to our management and branch staff, it has been possible to do this, and in these circumstances, despite the present uncertainty of outlook, we feel that we can ask the shareholders to look forward with confidence to the ultimate future.

CROWN MINES, LIMITED

SATISFACTORY RESULTS OF A DIFFICULT YEAR

Mr W. H. A. Lawrence presided at the annual meeting of Crown Mines, Limited, held in Johannesburg on the 21st instant.

After reviewing operations, the chairman said the total profit had been £3,507,687. Dividends had absorbed £1,461,747, and provision for taxation had amounted to £1,970,692. Further provision made in respect of miners' phthisis outstanding liability had been £53,374.

The net amount expended on capital account during the year, namely, £42,170 had been lower than would have been the case had not deliveries of plant from overseas been held up as a result of wartime conditions. The principal items of expenditure had been for alterations and additions to the "C" reduction plant.

DEVELOPMENT RESULTS

Development results on the main reef leader had continued to be satisfactory, but disclosures on the south reef, development of which had been mainly confined to the western section of the mine, had been disappointing. The total ore developed during the year had amounted to 3,128,800 tons, of an average value of 4.9 dwt. That had been an increase of 127,600 tons, compared with the total ore developed in 1940, the average value being 0.1 dwt. higher.

The available ore reserve as re-estimated at December 31, 1941, had totalled 19,518,500 tons of an average value of 4.8 dwts. over a stoping width of 44.3 inches. The available ore reserve showed a decrease of 688,400 tons compared with the previous year, value and width being unchanged.

The price received for gold and the rate at which normal income-tax was payable by the company had remained unchanged throughout the year. There had been, however, an increase in special contribution which was based on taxable income before deduction of redemption allowance and any tax loss brought forward from a previous year. As from January 1, 1941, the percentage payable had been raised from 11 per cent. to 16 per cent., while as from the beginning of the current year there had been a further increase to 20 per cent.

The problem of obtaining supplies of materials essential to the maintenance of mining operations had become increasingly difficult throughout the year. Every effort was being made by the mining industry as a whole to reduce consumption of imported materials to the lowest point compatible with the safety and maintenance of operations at the normal level.

CURTAILMENT OF DEVELOPMENT

Since the close of the year under review it had been agreed to conserve existing stocks by curtailment of the development pro-

grammes to such an extent as was feasible and appropriate, and your company had adopted that policy in conjunction with other mines of the Witwatersrand. In order to comply with the general policy of conserving essential materials it had been decided not to circulate to shareholders the usual quarterly reports nor a report of the proceedings at meetings. Copies of these reports could be obtained, however, on application to the head office in Johannesburg or to the London office.

In common with the rest of the industry, the company had continued to undertake the manufacture of munitions and had fulfilled satisfactorily all work of that nature entrusted to it. The number of European employees of the mine who were absent on military service had increased during the year.

The report and accounts were adopted.

CITY DEEP, LIMITED

PROBLEM OF SUPPLIES

Dr Hans Pirow, the chairman, presided at the annual meeting of City Deep, Limited, in Johannesburg, on the 21st instant.

After giving a review of the operations for 1941, the chairman said that the total profit had been £835,117. Dividends had absorbed £408,750 and provision for taxation had amounted to £410,516. Further provision in respect of miners' phthisis outstanding liability had been £15,294.

The capital expenditure on equipment had amounted to £41,683, the principal item being air cooling plant at No. 4 shaft. Preparations for the installation of that plant were well advanced, but its erection had been delayed pending the delivery of equipment from overseas. At the end of the year there had been a balance of working capital in hand of £56,318.

DEVELOPMENT RESULTS

Development accomplished during the year had been 63,274 feet—an increase of 3,334 feet compared with the previous year's figure. 26,600 feet had been on reef and sampled, 11,960 feet being classed as payable with an average value of 23.9 dwt. per ton over the average reef width of 15 inches. Of that payable development 10,130 feet had been on the main reef leader and 1,830 feet had been on the south reef.

The available ore reserve as re-estimated on December 31, 1941, had been 4,113,900 tons, of an average value of 5.2 dwt. over a stoping width of 43.3 inches. The available ore reserve showed an increase of 98,300 tons compared with the previous year's figure, the value being 0.1 dwt. lower and the stoping width 0.1 inch lower.

The price received for gold and the rate at which normal income-tax was payable by the company had remained unchanged throughout the year. There had been, however, an increase in the special contribution which was based on taxable income before deduction of redemption allowance and any tax loss brought forward from a previous year. As from January 1, 1941, the percentage payable had been raised from 11 per cent. to 16 per cent., while as from the beginning of the current year there had been a further increase to 20 per cent.

CONSERVATION OF STOCKS

In view of the difficulties which were experienced in obtaining adequate supplies of essential materials every effort was being made by the gold mining industry as a whole to reduce consumption and to conserve existing stocks.

The development programme generally had been curtailed since the beginning of the current year. In order to conserve essential materials it had been decided not to circulate to shareholders the usual quarterly reports nor a report of the proceedings at meetings. Copies of these reports could be obtained, however, on application to the head office in Johannesburg, or to the London office.

A large number of the company's European employees was absent on military service. The mine had undertaken its share of munitions production and had satisfactorily fulfilled all work of that nature entrusted to it.

The report and accounts were adopted.

RAND MINES, LIMITED

SATISFACTORY POSITION

Mr W. H. A. Lawrence presided at the Annual Meeting of Rand Mines, Limited, in Johannesburg on the 22nd instant.

In moving the adoption of the report and accounts, the Chairman said it would be agreed that the position disclosed was satisfactory. Profit earned had been £965,357, a decrease of £92,359 compared with the figures for 1940; that profit had been derived exclusively from dividends, interest and sundry revenue. Although the Investment Reserve account had been reduced by a net amount of £67,447, nevertheless at the end of the year it had stood at the substantial total of £3,437,033. The balance of the appropriation account had increased by £193,649 to £1,375,908, represented by cash and cash assets after allowing for all liabilities except those of a contingent nature.

The company's contingent and option liabilities to subscribe for shares in and to finance certain undertakings had been further reduced during the year, and ample cash resources were available to meet all such commitments as and when they matured. Investments in shares and debentures had been brought into account at a book value of £3,955,284, which was a decrease of £56,740 compared with the total at the end of 1940. All investments for which share market quotations were available appeared in the books at or under cost, but in no case above the market price at December 31, 1941. Unquoted securities had been entered in accordance with conservative values placed upon them by the Board, and in no instance at a valuation exceeding cost. The market value of the gold mining interests of the company at the end of the year had represented 77.4 per cent. of the market value of all investments, and of those gold mining investments 94.4 per cent. had been dividend producing.

STEADY PROGRESS OF GOLD MINING INDUSTRY

The Gold Mining Industry had maintained steady progress of recent years despite the difficulties of the times, and since the Company's last annual meeting two new mines had been brought to the producing stage, while a third, Blyvooruitzicht, had commenced to mill development rock and to recover gold therefrom. The output of gold by the mines of the Witwatersrand area and extensions together with miscellaneous production had been 14,039,912 ounces fine, an increase of 356,494 ounces, but as a result of the general increase in working costs the working profit earned had fallen by £1,680,144 to £45,845,043. As from January 1, 1941, the special war contribution, which was based on taxable income before reduction of redemption allowance and any tax loss brought forward from a previous year, had been increased from 11 per cent. to 16 per cent. Since January 1, 1942, that contribution had been further increased to 20 per cent. The taxation of the gold mines in the Transvaal, including the share of profits paid to Government by leased mines, had amounted to approximately £27,000,000 in respect of 1941.

The Government has referred repeatedly to the importance of the gold mining industry to the national economy, and has laid stress on the part which the mines are playing in the Union's war effort, both by the maintenance of gold production and the manufacture of munitions. Furthermore, at December 31st last some 6,000 employees were absent on full-time military service, and approximately 6,000 other employees had volunteered for part-time service in the Mines Engineering Brigade, the National Volunteer Brigade and other units.

PROBLEM OF ESSENTIAL SUPPLIES

One of the most difficult problems which has to be faced is that of the supply of essential materials from overseas. Every effort is being made by the industry to effect economies in the use of such materials and to conserve existing stocks to the greatest possible extent. With this object in view development programmes generally have been curtailed since the beginning of the year. Furthermore, a system has been introduced of pooling stocks of materials such as steel, rubber and non-ferrous metals which are held by the mines. These pooling arrangements may be extended from time to time to include other essential supplies.

In order to effect a very necessary economy in the use of paper, it had been decided not to circulate to shareholders the reports of the proceedings at the annual general meetings. Shareholders could, however, obtain copies of the reports of the pro-

ceedings at that meeting on application to the Corner House or to the London Secretaries of the company, Messrs A. Moir and Company.

The tonnage of ore milled by the Witwatersrand Mines of the group during 1941 had been 21,068,500, an increase of 453,200 tons compared with 1940 and a fresh record. The average yield of gold per ton milled at 3.690 dwt. had been a further reduction of 0.132 dwt., or 3.45 per cent. There has been a fall of £122,268 in the total working profit of £11,088,828. The total amount distributed as dividends had been £4,709,713, which had been £572,776 less than in 1940. The amount provided for the payment of direct taxation to the Government had decreased by £212,246 to £5,760,924.

POSITION AT BLYVOORUITZICHT MINE

At the Blyvooruitzicht mine sinking of No. 1 Shaft had been stopped at a depth of 5,042 feet and reef development had commenced, the footage accomplished during the year amounting to 7,970 feet. In the restricted area covered by that development high values had been disclosed, and as a result it had been decided to erect a small crushing plant capable of treating 8,000 tons of development rock per month. It was not intended that the revenue derived from that source should be utilised for dividend purposes, but that it should provide a portion of the finances required to meet the heavy expenditure on development which must be incurred before the mine could go to production on a normal milling scale. The average number of Europeans employed by the eleven Witwatersrand Mines of the group during the year had been 14,695, including those on active service. The average number of Non-European employees had been 114,274, which had been an increase of 3,683 compared with 1940. At April 30th last the total number of Non-Europeans employed by the eleven mines had been 112,967.

The health record of native employees had continued to show very satisfactory results. The mortality rate from phthisis had fallen from 0.07 per thousand to 0.06, while deaths from mining accidents had fallen from 1.75 per thousand to a new low record of 1.67 per thousand. Compared with 1940, the shifts lost per native per annum from disease and accidents had risen slightly from 4.78 to 5.21. The present valuation of the outstanding phthisis liability of the mines of the group was £5,848,830, an increase of £667,172. The eleven mines affected had provided, with accrued interest up to the end of 1941, £3,372,213 towards meeting that liability.

The report and accounts were adopted.

F. FRANCIS AND SONS, LIMITED

DIVIDEND OF 14 PER CENT. MAINTAINED

The forty-first ordinary general meeting of F. Francis and Sons, Limited, was held, on the 28th instant, in London. Mr John Ismay, the chairman, said: "The net profit for 1941 at £63,778 shows a reduction of £7,585. In arriving at this figure, however, I would point out that the whole of the company's liability for War Damage Contribution and War Risks Insurance has been charged against profits."

I draw your attention to this fact because no doubt you will have observed from the various company reports, which have appeared during the past few months, that this procedure is not always adopted.

This year has had to bear the full 10 per cent. E.P.T. against 90 per cent. for the previous year, and whilst we are proposing a final dividend of 10 per cent., making 14 per cent., the same as the previous year, the increase in taxation together with the Government insurance liabilities previously referred to has resulted in our carry forward being only increased from £20,549 to £21,702. If, however, you will refer to our consolidated statement you will see that the balance of current liabilities over current assets is increased by £2,246 to £112,723.

You will see, therefore, from these figures that there is no prospect of any increase in dividend so long as E.P.T. remains at 100 per cent.

You will observe from the balance-sheet there has been a slight increase in freehold properties, and an increase on shareholdings in subsidiary companies. The latter item is, in fact, actually represented by buildings and appears as such in the consolidated state-

ment. Adequate provision has been made for depreciation, and assets remain very conservatively valued.

With regard to the future, whilst it is quite impossible to forecast under existing conditions, I can only say that your board views the future with confidence.

The chairman concluded by moving the adoption of the report and accounts, which was seconded by Mr S. W. Francis (managing director), and carried unanimously.

JAMES W. COOK AND COMPANY, LIMITED

DIVIDEND AND BONUS MAINTAINED

The forty-fifth annual general meeting of James W. Cook and Co., Limited, was held, on the 22nd instant, in London, Mr W. J. Clarke (chairman and managing director) presiding.

The chairman said: "Our subsidiary companies have once again helped very greatly to secure the results that we now present to

you; they have been very active during the year, and are continuing so now.

In the profit and loss account the repairs item stands at £21,344. The high cost of repairs is altogether due to money expended as a result of war damage, and whatever benefit we are to receive will relieve future accounts. Our ordinary overhaul has suffered, and for that reason we require to transfer to "deferred repairs" a further sum of £10,000.

The item in the balance-sheet "Due to subsidiary companies," £32,625, is a new item and requires a little explanation. We lost property at sea and the amount received in compensation has been used to purchase haulage concerns. That accounts for the increased amount invested in subsidiary companies on the credit side. Our debtors are all good, and the item of £76,149 creditors and credit balances includes that of taxation reserve, to which we are adding another £10,000. The contingent liability figure, £61,172, is a reduction on last year. We are able to recommend the same dividend and bonus as last year, and carry forward a substantial sum to next year's account.

The report and accounts, together with the dividend of 10 per cent. and bonus of 2½ per cent., were unanimously adopted.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

THE upward trend of prices engendered by the initial Russian successes on the Kharkov front on the eve of the Whitsun holiday was not resumed when the markets reopened on Tuesday. Earlier optimism was replaced by a marked disposition to await events, and a turnover remained low, although prices throughout most sections were steady to firm. Turnover in the gilt-edged market was light, prices in consequence showing little movement. Some demand for the dated 3 per cent stocks was reflected in gains of ¼ before the holiday, although irredeemable and long-dated issues were generally unchanged. At the reopening, however, both Local Loans and Old Consols eased ¼, but other changes were few. Some speculative activity in the foreign bond market at the end of last week occasioned a firm tone, with Brazilian and Chilean issues prominent, advances of 2 points being registered by the 5 per cent issues of 1896 and 1911 among the latter. Among European issues, both Greek and German Potash bonds advanced on some enquiry. Continued support for Brazilian issues occasioned further improvements in mid-week. In common with other sections, the earlier activity of the home rail market, in which gains of ¼ for LMS 4 per cent preference, and ¼ for both the 4 per cent Guaranteed and First preference Berwick issues were registered, was replaced by more subdued conditions in the early part of the current week, when LNE preferred lost ¼ at the reopening. The firmness of Brazilian stocks provided the feature of the foreign rail market, San Paulo advancing 1½ points on Tuesday among smaller gains for Leopoldina issues. Quiet dealing in mid-week left the Funds largely unchanged, while among home rail equities G.W. ordinary rose ½.

The numerous small improvements in the industrial market prior to the holiday were a reflection of the continued shortage of stock rather than any real expansion in turnover, but in the current week movements were both fewer and smaller. Quiet demand for some leading brewery issues occasioned several small gains, Guinness rising 6d. at the week-end, while South African Breweries advanced 2s. 6d. on Tuesday. After jumping ½ the previous day, BAT lost ½ on Friday, as did Imps, but among other tobacco shares Gallaher improved slightly at the reopening. Numerous advances in the motor and aircraft group

reflected the general firmness of leading issues, Triplex, Leyland and AEC all advancing after the holiday. The heavy industrial section, however, was rather irregular, but changes either way were restricted to a few pence. Shipping shares were quiet although several small improvements were registered. Steady buying of textile shares occasioned a small but general advance, Patons & Baldwins being prominent with a gain of ½ last Friday. Among many small rises in the miscellaneous section Boots rose 1s. and United Molasses 6d. at the reopening, but International Nickel fell ½. Reduced activity in midweek was sufficient to maintain prices in most sections.

Some demand from the Cape at the end of last week occasioned a fairly general improvement in the kaffir market, in which Central Mining rose ¼ and Rand Mines ½, but at the reopening conditions were quieter, West Wit Areas falling ¼. Both the tea and rubber markets improved on the news from the fronts, Malayalam and Grand Central in the former rising 9d. and 1s. respectively, while in the latter market, Eastern Produce was outstanding with an advance of 1s. 10½d. Later, however, conditions in the rubber market became quieter, although tea issues continued firm. Turnover in the oil market was light, but gains were rather widespread, Burmah, Shell and Anglo-Iranian all rising ¼ on Friday. Later, light selling occasioned falls of ¼ for Shell and Anglo-Iranian, but other sections were generally steady.

New York

PENDING the outcome of the struggle in the Ukraine, Wall Street has witnessed no resumption of the previous Thursday's activity, when optimistic rumours occasioned widespread gains of 2 points. Meanwhile buyers are holding off, and with very little selling in progress prices have generally been maintained.

Shorter Comments

Baltimore and Ohio Railroad Co. (\$000s).—Gross earnings from operations in the year ended Dec. 31st at \$227,503 were the

best since 1929, and \$48,328 higher than 1940. Net railway income is \$15,679 higher at \$46,297, which with other receipts gives a total income of \$54,604, a rise of \$15,741. Interest charges are little changed at \$31,508, giving a net income of \$21,092 which compares with \$5,549 earned last year. The average train load at 984.02 tons was 41.86 higher, and transportation costs 32.87 cts per dollar earned, a reduction of 1.78 cts per dollar. The advance in rates and charges yielded \$10,500 against the

\$14,250 required to meet increased wage and tax schedules.

Brazilian Traction, Light and Power Ltd. (Shares).—Gross operating income in April \$3,768 (\$3,429), net earnings before depn. \$2,006 (\$1,861). Agg. gross earnings Jan. 1st-April 30th \$14,754 (\$13,240), agg. net earnings \$7,774 (\$7,017).

Society of Incorporated Accountants and Auditors.—During 1941, 122 (249) new members were admitted, while 34 (57)

Associates were advanced to Fellows. The total membership on December 31st was 7,881 (7,879), of which number 6,324 (6,323) were Associates and 1,555 (1,553) Fellows.

Cities Service (Shares).—Cons. gross operating revenue year ended Decem-ber 31st \$260,947 (\$238,690), net income \$14,284 (\$9,928). Company's gross income \$16,769 (\$18,222), net income \$4,900 (\$6,780), surplus \$20,956 (\$19,631).

COMMODITY AND INDUSTRY NEWS

Sir Cecil Weir.—The Board of Trade has released Sir Cecil Weir from his appointment as Controller-General of Factory and Storage Premises, to take up the Director-Generalship of Equipment and Stores in the Ministry of Supply, in succession to the late Sir William T. Wilson. Mr A. P. Watter, deputy Controller-General, succeeds Sir Cecil Weir as Controller-General of Factory and Storage Premises.

Producer-Gas Vehicles.—The Minister of War Transport has appointed Lord Ridley to be Director of Producer-Gas Vehicles. Lord Ridley will take up his appointment when certain work he is doing for the Air Ministry has been completed.

Tyre Requisitioning.—The Ministry of Supply is considering plans for the requisitioning of tyres on cars which have been laid up. The approximate number of tyres is known, and they will be called for as they are required. The Ministry announces that the fact that requisitioning is not immediately undertaken does not mean that the utmost stringency in the use of rubber is not to be exercised.

Export Control.—Under the Export of Goods (Control) (No. 24) Order (SR and O No. 929) which comes into force on June 9th, export control is extended to cover certain kinds of furniture, mainly beds (including parts and fittings); manufactures wholly or partly of kapok; cotton stockin-

ette sacks, bags, or wrappers; upholsterers' skewers and pins, and parts of office machinery.

Cobalt Control.—The Control of Non-Ferrous Metals (No. 10) (Cobalt) Order made by the Ministry of Supply came into force on May 26th. Licences are now required by importers or manufacturers to dispose of cobalt and certain specified materials containing cobalt imported into or produced in the United Kingdom. The material cannot be acquired from the importer or manufacturer unless he has a licence or unless the acquirer is authorised by licence.

Utility Clothing Alterations.—Provisions have been made by the Board of Trade in an Order (SR and O No. 886) governing the maximum charges which may be made for alterations to utility garments carried out, or contracted for, within a month of purchase. These charges are limited to the actual cost, whether the alterations are done by the retailer or contracted out, and in no case may they exceed 10 per cent of the selling price before the alterations were made. The Order came into force on May 28th.

Quilts Maximum Prices.—The Board of Trade has made an Order (SR and O No. 887), which came into force on May 28th, controlling the maximum prices to be charged by manufacturers, wholesalers and retailers of quilts and quilt covers manu-

factured under licences issued under the Consumer Rationing (No. 8) Order. All such quilts and covers must bear a special mark. Manufacturers' prices for quilts and covers of their own manufacture are determined by conditions attached to the licences. Margins have been fixed whereby the total mark-up between manufacturer's selling price and the retail buying price may not exceed 17.65 per cent (equivalent to 15 per cent on returns) of the former. Retailers may add a margin of 42.86 per cent to the price, exclusive of purchase tax (equivalent to 30 per cent on returns). Overriding maxima are laid down in the Order.

Finance

GOVERNMENT RETURNS

For the week ended May 23, 1942, total ordinary revenue was £40,119,000, against ordinary expenditure of £93,020,000, and issues to sinking funds of £150,000. Thus, including sinking fund allocations of £983,155, the deficit accrued since April 1st is £411,588,000 against £430,996,000 for the corresponding period a year ago.

Commercial and Circular Letters of Credit, and Travellers' cheques issued. Bills are purchased or sent for Collection. Deposits are received for fixed periods on terms which may be ascertained on application.

LLOYDS BANK

LIMITED

EXECUTORS AND TRUSTEES

The appointment of individuals as Executors and Trustees imposes on them heavy burdens and duties which they are not always in a position to fulfil. Especially is this the case in wartime, when life is so uncertain and so many difficulties arise in the administration of estates.

When the Bank is appointed, continuity is assured and a Testator can count on his estate having the benefit of skilled and experienced management in the disposal of securities, the payment of duties and taxes and in the many other matters incidental to its administration.

A pamphlet giving terms and particulars will be sent free of charge on application to any Branch.

Head Office: 71 Lombard Street, London, E.C.3

THE ENGLISH, SCOTTISH & AUSTRALIAN BANK, LTD.

Head Office: 5 Gracechurch Street, E.C.3

Restraint of Trade

THREE reports by business bodies on reconstruction have just appeared. Together they represent the views and interests of a deep cross-section of trade and industry. The Association of British Chambers of Commerce represents over a hundred chambers; the London Chamber of Commerce has a direct membership of 9,000 firms and companies; the Federation of British Industries includes 182 trade associations covering most of the main industries. The reports are at once encouraging and depressing, encouraging because their writers show a longing to look forward, depressing because in fact they show a standing inability to look any way but backward. When they call for new methods and positive policies, for international co-operation between Britain and the United States and between primary and industrial producers, for a fuller flow of international lending to develop the backward regions of Asia, Africa and America, and for the payment of world debts in goods, they show a courage and a faith which, unhappily, their actual proposals belie. When they plead that "the theories and practices of the past can no longer be taken for granted," when they recognise the rôle of monetary policy and of state investment in securing full employment in the future, and surrender entirely the old idea that retrenchment is the only remedy for idle factories and idle men, they suggest an enlightenment which the programme they lay down unfortunately

does not bear out. If these are really their convictions, then they have not the courage of them.

In both trade policy and industrial policy, it is precisely the theories and practices of the past that these business men tend to go back to, not the best theories and practices of an enterprising past, but the worst theories and practices of a restrictive past. The only solution the Federation of British Industries seriously entertain for the solution of Britain's overseas trade problems is a system of bilateral barter. At home, the Federation, after proclaiming that individual effort and private enterprise are the keystones of business, goes on to ask for authorised trade associations to regulate trading, to control sales, to demark territory, to control materials, to coerce interlopers and, no doubt, to fix prices. The Association of British Chambers of Commerce, too, having announced that a system of private enterprise provides the greatest of all motive powers to progress and prosperity, lays down that every industry, organised on trade association lines, should be its own planner; that Government policy should be inspired and directed by a Council of Industry; and that overseas trade should be regulated and made orderly by an Import and Export Council of traders and industrialists.

There is the paradox. On the one hand, these documents make a notable plea for freedom and expansion.

On the other hand, they paint a picture of control, restraint and restriction, both at home and abroad, a picture of national and industrial autarky and of self-rule by vested interests. They ask for a brave new world, and they advise the retention of a corporative and monopolistic system. This is economic defeatism of the same kind as the political defeatism which is prepared, in too many quarters, to abandon the parliamentary system because of the shortcomings of particular parliaments. They are part and parcel of the same tired, disillusioned, frustrated attitude which has ushered in Fascism in other countries. People of good faith and ill faith alike, slogan-sated planners and self-regarding industrial barons, are combining with loud cries to throw out the baby with the dirty bath water.

It is necessary, of course, to face facts. Neither in principle nor in practice is any return to the uncontrolled trade of past generations possible. Counsels of perfection are no answer to counsels of despair. Neither nationally nor internationally is the community ready any longer to allow demand and supply to work without control in the distribution of the necessities of life. The Atlantic Charter itself lays down that every people in every country is entitled to minimum standards of living, and it must be the responsibility of governments to secure these standards on principles other than those of the free market. Moreover, as the Federation of British Industries make plain in their report, there will be one major practical obstacle after the war to the free operation of British trade. The sterling area will be short of dollars. Some form of exchange control, some retention of imperial preference, some bilateral correlation between imports and exports—in the last resort all these may be needed to balance accounts in the new conditions. The trouble is that these expedients are not to be accepted, as they should be, one by one, as necessary evils, with the closest scrutiny of each and the most earnest search for freer alternatives. They are apparently to be hailed as a system of trade. The fact that there are alternatives to controlled barter, better for Britain and for the world, is brushed aside. The fact that collaboration with the United States can provide a better way out is looked at only with apprehension. Indeed, one main conclusion which emerges from these proposals is that British industry is afraid of the United States. Collaboration is called for; but, in the report of the FBI, the principles of the Atlantic Charter and of the freer trade movement which has found its spokesmen in the United States are flatly repudiated. There is no real attention to the fact that the crucial factor in the field of world trade is the future willingness of the United States to buy goods and the future readiness of the United States to invest abroad without demanding that its debtors shall buy only American goods. These are the real alternatives to be striven for. It is American tariffs, not American free traders, that are in the way.

The point is that these business men seem to have lost hope. They have thrown up the sponge. They see the world economy, as the physicists see the world, running down. The background of the FBI's proposals is a tragic picture of Britain in decline—a debtor country ousted by overseas industrialists, with dwindling assets, a declining, ageing population and war-damaged equipment.

The best system would be one which gave us the best trading facilities all over the world, says the FBI.

The true function of international trade is nothing more nor less than the exchange of goods and services of a mutually advantageous character,

says the London Chamber of Commerce. These are brave words. But, at bottom, they believe that the time for all this has gone. They wish to save from the wreckage the controls and restraints by which particular groups of producers enjoy particular advantages.

It would be a pity if this despair went on record as the voice of Britain. The consequences of the war, for instance, are vastly exaggerated. To take only one example, there will admittedly be a reduction, compared

with before the war, of something like £250 million in British income from "invisibles"; but a successful policy of full employment after the war, by employing a million people who formerly were out of work, would, at any rate, restore the lost real income. There is no evidence in the past that wars cast nations, victors or vanquished, back into destitution. Indeed, the reverse is the case. Every index of economic growth shows a steady and predictable rate of advance which, up to now, has been only slightly and temporarily disturbed even by the greatest of wars and depressions. Britain is not ripe to be pensioned off, now or after the war. There is, and will be, no nation in the world whose interest in the maximum growth and freeing of international commerce is so great as this country's. It may indeed be necessary to adopt *ad hoc* this restriction or that. But the aim should remain always plain—to secure

as large a volume of international commerce under conditions as free of restrictions and by methods as free of discrimination as possible.

Britain's greatest asset is still her buying power. These reports speak a lot about lack of purchasing power, at home and in the world at large. Usually, what they seem to mean, when they are not simply paraphrasing Major Douglas, is the lack of willingness on the part of one nation to buy from others or the low productivity of countries like China, which have only to be developed by world investment to become buyers and consumers on a great scale to the benefit of every country. Hardly once do these reports from British industry mention the need for greater technical efficiency, either in Britain or abroad, the need for more output per head, or the development of new techniques and industries. They assume the worst. They forecast a Britain brooding like an aged miser in the twilight over a dwindling treasure.

This is surely false. Very few economists will be ready to accept all the characteristic calculations of Mr Colin Clark. But, by contrast with these jeremiads, Mr Clark's new book, "The Economics of 1960" (published by Macmillan), has at least the merit of being based, ostensibly, upon facts and figures. It tells a very different story. From the world's statistical trends of population, industrial development, primary production, prices, capital movements and interest rates, Mr Clark forecasts a new turn in world economy, a steady upward movement in world trade, in world investment and in world employment. Within two decades, he suggests, the industrialisation of Japan and China can bring about a new industrial revolution in all the producing countries of the world. Output will grow, he calculates, in Asia, in Africa, in Latin America and in the Balkans. The United States and Russia will become substantial importers. A new period of expansion and opportunity is round the corner.

It is perhaps not hard to pick holes in Mr Clark's neat statistical structure. But it is impossible to argue with thesis away. The world has a future as pregnant with economic possibilities as its past. The point is that there are certain conditions without which the general implications of Mr Clark's figures, even if they are well founded, cannot become fact. They assume that world trade is as free as possible, that the problem of the freest possible transfer of goods and capital will be solved by international collaboration, that the goods produced by the developing countries of Asia will be bought. To strive for these conditions is surely the plain interest of this country. The need now is not to work out the weapons of economic defence in a frustrated world, but to find rather the technique of economic progress. After the last war, the high tariffs of the United States (to use Mr Sumner Welles' phrase) brought poverty and despair to many communities; it would be a crime if, after this war, the quotas and preferences of Britain brought similar distress to many more. And it would be fatal for Britain. The answer to each and every question, if the high opportunity of this and the next generation is to be seized, is collaboration with the United States, not to restrict trade but to free it, not to stake out vested claims, but to raise the world's stock of goods and services in every place and by every means.

Technique of Subjection

IN recent months, the German Government has made a determined attempt to reverse its policy of extermination in Poland. This development is a remarkable commentary on the lack of success which has attended the rule of the General Government. It also throws light on the pre-conditions of any peace settlement in eastern Europe.

The change of policy must be assessed against the background of rather more than two years' deliberate and avowed effort to exterminate the Polish nation. Since the end of the Polish campaign, the methods of the German occupation authorities have consisted in an experiment in the large scale application of terror which has become notorious, even in the setting of Nazi-occupied Europe. It would be untrue to suggest that throughout this period until the close of 1941 there was no attempt to find and make use of a Polish quisling. But none of the earlier attempts appears to have been supported by a pledge that co-operation would be rewarded by an improvement in Polish conditions.

Some months ago, the German authorities offered to confer a quasi-autonomous constitution on the part of Poland under the authority of the General Government. A draft agreement suggested, in return for the pledge that was sought from the Polish nation, certain very considerable advantages: the provision of an "independent Polish political organism," with defined political liberties; economic autonomy, with the right to retain Polish crops for domestic consumption and an amnesty for all inmates of concentration camps. Taken at its face value, the German offer amounted to a pledge to re-create Poland as a puppet state with a standing not far inferior to that of Vichy France. Apparently, it was not intended to apply the proposals to the whole territory of pre-war Poland. The western districts which, in the form of the *Warthegau*, have been incorporated as an integral part of the Reich were not to be returned. In compensation, it would not be surprising if Poland had been offered some extension of her territories to the east at the expense of the Soviet Union.

The most interesting aspect of these proposals is the reasoning which induced the German authorities to think, quite erroneously, that they would be acceptable. Long policy of extermination was not difficult to explain. Long knowledge of the Polish national temper provided good reason for believing that no compromise would be possible between aggressor and victim. The hundred and fifty years during which Poland, divided between Russia, Prussia and Austria, possessed no national entity served to breed a tradition of fighting resistance throughout the nation. The national consciousness of the Poles is acutely, fiercely alive. The Germans were faced, and still are, not only with resistance à l'outrance, but with virtually

complete solidarity. In these circumstances, mass executions, torture, imprisonment, deportation and the stifling of all intellectual leadership, with the avowed aim of extermination, were the reply of Teutonic logic. The reversal of this policy is much harder to explain. But it is most likely that it was the outbreak of the war with the Soviet Union which made inevitable the search for some more effective form of pacification. Lying immediately behind the eastern front, a Poland seething with patriot disturbances, which two years of terror had not been able to quell, became an acute danger to the German transport system, as well as an important drain upon police and bureaucracy.

Thus the outbreak of the Soviet campaign exposed the failure of the extermination policy and drew attention to its dangers. It also seemed to provide a potential starting point for negotiating with Polish leaders. Situated between two larger nations, Polish nationalism has historically had to contend with a dual danger of aggression. When the Soviet Union entered into an alliance with Great Britain, there arose automatically among some Poles the fear that an Allied victory might mean for Poland neither full territorial restitution on the eastern front nor a secure outlet to the Baltic. There can be little doubt that the renewed German search for Polish quislings, supported by the novel bait of quasi-independence, was rendered plausible, just as it was rendered necessary, by the outbreak of war between Germany and Russia. Since that date, German propaganda has dwelt at extravagant lengths on the danger to Poland of a Russian, that is of an Allied, victory. It has busily spread rumours of secret negotiations and conclusion of secret agreements, the contents of which were alleged to be highly detrimental to Polish independence.

The whole aim of this latest campaign to break the Polish spirit has been to confuse the issue. Events have proved that downright disloyalty purchased by a pledge of personal safety and promotion has no attraction for Poles. But to arouse a conflict of loyalties is more subtle. To present a superficially reasonable case for believing that adherence to the Allied cause may leave Poland less well off in the event of an Allied victory than she would be as an accepted member of Nazi Europe is to place a great strain on good faith and good sense. And it was possible to complicate the issue still further by pointing to the contrast between the treatment which has hitherto been meted out to Czechs and Poles. If Germany is defeated, the argument of the tempter runs, both Poland and Czecho-Slovakia enjoy the prospect of a return to national independence, but the Czechs will have "suffered less"; more of their national leaders will be alive to re-create the state; fewer irretrievable disasters will have occurred; Poland could have little to

were able to prevent the Russians from pressing home their attack decisively, but equally the Germans do not seem to have completed their much-advertised encircling movement and to have trapped the main Russian armies on the right bank of the river Donetz. The fighting has ended in stalemate, with the Russians at Krasnograd and Lozovo still hanging perilously on von Bock's left flank—and until this position is cleared up, the Germans cannot hope to advance successfully on Rostov. The rest of the front is quiet, and it looks as though the Germans were anxious to concentrate their forces on securing their position in the south. Meanwhile the days are passing, the weather is improving, the summer has come—and each hour lost brings the German armies nearer to a second winter war.

Food Distribution

Competition can work in curious ways. The retail trade (said Lord Woolton in the Lords on Wednesday) is one of the most expensive and luxurious factors in the national life because, he added—oddly at first hearing—"in no trade does the force of competition work so keenly." The competitors bid up prices by providing a wide variety of goods to choose from and extra delivery and other services. Well-to-do buyers are willing to stand the racket, and poorer people have no option. Even in peacetime this position is very far indeed from satisfactory. In wartime it is not tolerable; transport and manpower are needed for more essential purposes, and the public, rich and poor, must be provided with an adequate ration of necessities at reasonable prices. Thus the war has seen a rationalisation of distribution. The selection of goods has been narrowed. The distributive methods of food industries have been remodelled. Wholesale buyers of margarine must buy at the nearest factory. Bakers must take flour from the nearest mill. Twelve million ton-miles annually have been saved by these means in the cake and biscuit trades, and ten million ton-miles each in the sugar and sweet trades. The latest important step is in the milk trade. After September 30th the Milk Marketing Board will become the sole buyer. Milk will be bought, sold and delivered at the places decided by the Ministry of Food. In urban areas, with populations over 10,000, retail sales will be rationalised; dairymen will be required to form associations to cut out overlapping in deliveries; each dairyman will either take his proportionate share of the trade, or be recompensed by the association. All this is to save transport and manpower. It should also at least hold prices down—the compensation must not be levied from consumers. In the compensation scheme there is a lesson for the whole problem of retailing in wartime. In the trend towards rationalisation there is a lesson for peacetime, when competition must either bid prices down instead of up or be replaced by the direct state distribution of necessities.

Fighting France

As opposition in France grows, "Gaullisme" is becoming more and more the symbol of total resistance. It is essential that it should mean the same in London, and some observers have felt in recent months that the Free French movement had become too personalised in General de Gaulle. This is the substance of a number of suggestions: that the movement should be purely military or that its basis ought to be widened; that it must not prejudice the political future of France. General de Gaulle did well to bring these issues into the open at a recent press conference. The General laid it down that

the Fighting French belong to no party; they are made up of men of every party and shade of opinion who are united on one single question: the liberation of France.

This is an absolutely unequivocal contradiction of the basic criticism that narrower loyalties have been substituted for the general issue of resistance. The General also dealt with the particular points raised by critics. The movement cannot be purely military; the Free French are responsible for the administration of Equatorial Africa and the Syrian Mandate. The suggestion, however, is not really that the movement should be non-political, but that it should not represent any single order of political ideas. Here there is some confusion of thought, for the more purely military the movement is, the more it cannot fail to have a personalist and authoritarian stamp. It is by making the movement more political in a broad sense, by developing the civilian side of its affairs and administration, that all hint of "personalism" can be removed.

In the first hours of collapse, the movement was inevitably "personalised" in one man, the man who was ready to carry on resistance. The growth of resistance and the acquisition of more territory makes this element of personalisation less necessary. The setting up last September of a National Council, containing such distinguished civilians as M. Pleven and Professeur Cassin, was a step towards the development of the purely political side. That the process should go further the General himself recognised when, at the press conference, he expressed his wish to broaden the basis of the movement. Some names were mentioned, for example, M. Pierre Cot and General Odic. There are other names which seem obvious to the outside observer—M. Maritain, M. Monnet and M. Leger in the United States; M. Cambon or M. Commère in this country; or, if it were possible, men of the stature of a Mandel or a Herriot in France. Many Free French difficulties have not been of their choosing or creation. From the first, the decision of the United States Government to maintain relations with Vichy has complicated the problem of Free French representation in Washington. It is also true that British policy with regard to the status of the Free French has not always been very clear. Any reorganisation of the movement on the lines forecast by General de Gaulle must be accompanied by a strengthening of its position in the counsels of the United Nations and by closer collaboration in the work of preparing for a new and ordered Europe, in which a restored and reinvigorated France will take its honoured place.

Mr Lyttelton Goes to Washington

The effective development and allocation of Anglo-American striking power requires the closest collaboration between the two countries. President Roosevelt and Mr Churchill laid down the broad principles of collaboration five months ago. The allocation of raw materials was entrusted to the Raw Materials Board; the distribution of equipment was vested in the Munitions Assignment Board; and the task of pooling the shipping of the two countries was given to the Shipping Adjustment Board. These Boards have been in operation for some time and there have been frequent consultations between their British and American sections. The task of dove-tailing the supply of raw materials and the manufacturing facilities of the two countries is immense, and Mr Lyttelton's visit to Washington will mark a further step towards its accomplishment. The Minister of Production, who is also chairman of the London Committees of the Raw Materials Board and of the Munitions Assignment Board, will confer with Mr Donald Nelson, who, as chairman of the United States War Production Board, holds a position in some respects analogous to Mr Lyttelton's in this country. Although collaboration in the production of munitions of war has already reached an advanced stage, there is much that remains to be done. During the short time Mr Lyttelton has held his present position, he has worked to bring Britain's production plans into closer line with strategic requirements; Mr Donald Nelson and his colleagues have no doubt pursued the same objective in the United States. But the time has now come when the British and American production facilities, as well as their products, must be regarded as a single equipment, and when detailed arrangements must be made for the allocation of this equipment in order to secure the best possible distribution of work and the maximum output of finished war material in the proportions dictated by Allied strategy. It is this need which has given rise to reports of the formation of a Joint Production Board. The resources of the two countries are in many respects complementary. There are many items whose production has reached a more advanced stage here than in the United States and which this country can supply to the United States. That Britain is already furnishing the United States forces with British products under Lend-Lease—that is, that Lend-Lease works both ways—was recently acknowledged by Mr Stettinius, United States Lend-Lease administrator.

Food and Strategy

Allied strategy has undergone changes, Mr Hudson announces, and food and farming policy must accordingly be somewhat revised. Plainly the key to the change is

shipping, now needed more than ever to carry war supplies and expeditions. An alteration, for this reason, in food and farming policy is overdue. But the actual alteration announced by Mr Hudson is not really, by itself, a change in policy at all. More land is to be ploughed up and, it is hoped, more food produced at home. There are reasons for supposing that, in many areas, there is not the labour, the fertilisers or the equipment to do more than maintain present output, even with the chance of fresh acres. But, even if the effort can be made with some success, by co-operative or similar means, which should be encouraged, something more ingenious and more immediate in its effects is due from the Ministers of Agriculture and Food. Lord Woolton is at present content to proclaim—to the Master Bakers, it should be noticed—that

we shall have plenty of bread all through this year. Your supplies of raw materials are assured.

He should rather be in conclave with Mr Hudson to cut down food imports at once—to switch every possible crop from animal to human use; to concentrate still more in production on food rather than on feeding stuffs; to give dairy cattle an absolute priority in all forms of feed; and to cause beef cattle to give way, not only to dairy cattle, but also to human consumption by surrendering their pastures. Certainly every crop produced on any newly ploughed-up acres should be for direct human consumption; and every pasture possible should be used for milk. Lord Woolton, on his own side, will be best engaged, meanwhile, in saving every ship possible either by reducing rations, wherever practicable (the scope is not wide), or by eating into stocks.

A Welcome Ally

Mexico is now formally at war with all the Axis Powers. While promising that troops will not be sent outside the continent, President Camacho has pledged full co-operation in hemisphere defence. This latest addition to the company of the United Nations has been warmly acclaimed in London and Washington. So, too, has the news that a zone 62 miles wide along the Mexican coasts and frontiers has already been cleared of Axis nationals. This is an important security measure, and the ability of the Mexican Government to take it so promptly emphasises the immediate practical advantages of the declaration of war (the implications are further discussed in a special survey of Latin America on page 789). Perhaps the most satisfactory aspect of the Mexican decision is the proof that the declaration rests on wide popular support. Pro-Axis sentiment in Mexico was always essentially foreign inspired. The attempt of the Spanish Falange to confuse Roman Catholic opinion and to foment ill-will between Church and State has been effectively countered by the important pronouncement of the Archbishop of Mexico, Mgr. Luis M. Martinez. This dignitary has made a forthright statement that it is the duty of all Roman Catholics to support the civil authority "even against their consciences." In the secular sphere, there is a general understanding that the fruits of the Mexican Revolution, and of the agrarian and social reforms carried out by President Cardenas, could not survive in a world dominated by the Axis. Satisfaction with the recent land reform and with the policy of eliminating foreign exploitation of Mexican resources is widespread, and there is solid determination to see that the clock is not put back. That Mexico is able to regard the United Nations as the champions of national independence and the supporters of the Mexican programme of social reform is due in no small measure to the wisdom with which Washington handled the oil dispute.

Priorities for Manpower

Yet another stage has been reached in manpower policy. Broadly, the task now is to make the best possible use of the men and women already mobilised. This is not completely so, of course. The effort to find and release extra workers for war employment cannot be relaxed for an instant. It remains true that this country's greatest shortage is of labour. Combing out and the standardisation of civilian production must go on unchecked. Nevertheless, the broad fact remains that the vast majority of war workers are already at their stations. The aim now is to see that they are at the right stations, that there is no shortage of workers for the kinds of war production that count most at the moment. Accordingly, a redistribution

is planned within the war industries to meet changed demands. There is a sharp need for extra workers in the production of tanks, aircraft and ships, in cotton and coal-mining. The Ministry of Labour plans to move workers from jobs in which stocks have piled up or from jobs, the products of which are not so immediately important, to do this more urgent work. No details are given of how the individuals will be chosen for transfer, at what stage they will be moved, how they will be transported and what plans are made for their housing. No doubt these difficulties will be kept at a minimum. It has been stated that the amount of disturbance and actual migration will be as small as possible. It is altogether good news that this redistribution is contemplated. The composition of war output is as important as its total size; and only by flexibility is it possible to move workers from jobs which have been urgent to work which is now more urgent still.

Arms for China

The fighting in Chekiang is still proceeding on a considerable scale. Forced out of Kihwa, the Chinese have left the town a heap of ruins and have already started guerrilla operations in the rear of the successful Japanese force. The news from the Yunnan front is good. The Chinese appear to retain the initiative and to have isolated Tengyeh and Lungling. The centre of interest remains, however, the question of supplies rather than the course of the actual fighting. China's need for heavy equipment of all sorts and particularly of bombers and fighters was restated in broadcasts to America by the Generalissimo and by Madame Chiang Kai-shek. These appeals serve to convey a sense of extreme urgency. The Chinese needs must be met. They also carry a pledge that equipment sent to China will be used to the utmost against the enemy. Madame Chiang Kai-shek pointed out that enemy propaganda is attempting to spread the wishful and malicious rumour that China, whose supply line is cut by the loss of Burma, might be forced to abandon the struggle and that consequently to deliver equipment would be a bad investment. The motive of such a tale is too transparent for it to carry any conviction. The Chinese are determined to fight to the end, but they must be given the arms. The news that the Lend Lease negotiations in Washington have been concluded by an interview between Mr T. V. Soong and President Roosevelt provides evidence that the economic and political future of China and the United Nations is being further integrated.

Australia Waits

Bombing and counter-bombing go on round the coasts of Australia. No doubt there is ceaseless activity at sea. But in the eyes of the world there is a lull. Australia waits for the attack; and there are probably many people in this and other countries who, simply because there is a lull, have decided that Australia's concern for its safety has been overstated. It is for this reason that the visit of Dr Evatt

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

first to the United States and then to this country has been so opportune. He has backed his views about the importance of the Pacific Front and about the dangers concerning Australia by hard facts—and frank speech. He has persuaded many people in this country of the baselessness of the idea that Australians, in pressing for help from the United States, were anti-British. He may even have convinced a small stubborn and unintelligent section of British opinion that it is not a disadvantage for Australia to have a Labour Government at this crisis. Obviously, Dr Evatt has done good work. Precisely how good the layman cannot say. Plainly, Dr Evatt came both to the United States and to Britain to state strong Australian views about Allied strategy and about the allocation, distribution and deployment of Allied war material. What he asked for is, of course, a secret. Whether he got it is a secret too. It can only be said that this bid to balance one end of the Allied war front against the other is a striking illustration of the complex strategic requirements which the output and the transport of the United Nations have to meet. And it must be added that Australia must be defended to the limits imposed by distance. The loss of Australia would be a shattering blow to the Americas and to Britain, whatever the course of the fighting elsewhere.

The Right Place

The announcement that plans have been made for the more efficient use of labour by transferring it where it is currently most needed coincides with the publication of details of the scheme for making the most efficient use of Army recruits. It is further evidence of the slowness with which the army machine works that the scheme is apparently only now coming into force, although it is nine months since the Beveridge Committee handed to the War Office its interim report on the use, or rather misuse, of skilled men in the Forces and since the Select Committee on National Expenditure recommended much the same sort of scheme as has now been adopted. All recruits will henceforward serve first with a General Service Corps for six weeks, during which time they will be subjected to interviews and the various tests for finding special aptitudes that have been worked out by psychologists. The aim is to find out, not only into what categories—skilled or unskilled, sedentary or manual, combatant or administrative, and so on—the recruits best fit, and into which branch of the Army they should accordingly be posted, but also which of them are potential officers. Obviously, a great deal will depend on the interviewing officer, because the mechanical and intelligence tests are by no means infallible. It is also to be hoped that, during his term with the General Service Corps, a recruit will not be subject to full military discipline, for an overdose of this, immediately after he has been called up, would not be conducive to success in the tests—it is for this reason that it might have been better to place these primary training centres under the Ministry of Labour. But provided that a good deal of latitude and discretion is allowed to those in charge at the centres, they should secure more efficient posting in future. It is a pity that they have only been generally established at a time when most of the Army has already been mobilised. But men now being called up include, besides the 19's who are more readily adaptable to any service, those who have hitherto been reserved under the Schedule of Reserved Occupations and who, consequently, may be expected to possess special skill and qualifications. For these the new training centre will provide a much needed sifting machine.

Minister of Production ?

While Mr Lyttelton is in the United States the new regional production boards will be in abeyance. This is a pity. It is true that the Minister of Production did not succeed in winning effective powers of direction over regional production for his new local representatives, still unappointed. It is true, too, that there is no magic in regional machinery to revolutionise output. The most important need on the Government side of production is effective central control over programmes and progress. But this is precisely the importance of the question of the regional boards at the present stage. It is a test case, not so much locally as centrally. It is a test of Mr Lyttelton's own authority. Is he Minister of Production in the sense that was hoped when he was appointed? The compromise reached with the Supply Departments over the Citrine Committee's report on

regional organisation gave no assurance, to say the least, that he is. If he is not, if he lacks the final voice in production matters which the Citrine Committee proposed he should vest locally in his regional directors, then the work of his office becomes mainly co-ordination and planning, rather than direction and, if necessary, interference to secure high, steady and efficient output. The course of events, in Whitehall and in the regions, will tell.

Strikes

The bulk of public opinion is disposed to look kindly upon the claim of the coal miners for higher wages, which is excluded from the Government's new coal plan. There are special disadvantages about their work, special dangers and special unpleasantnesses, which entitle them to a hearing in the front line of war workers. It is for this very reason that the many thousands of miners who have lately gone on strike have probably acted most unwisely—as well as, in most cases, illegally. Coinciding as the strikes do with the hard bargaining which has been going on in the last few weeks between the different sections of the coal industry and the Government about the industry's future, these strikes, taken together, give an unfortunate appearance of intimidation. Obviously, they were not intended in this way. Most of them were not sanctioned by the Mineworkers' Federation. The majority were about matters of purely local dispute. Nevertheless, they were blunders, from both the national and local standpoint. Public opinion in wartime is as disposed to react harshly against strikers as it is to support genuine claims of war workers who are not well used.

The Daily Worker

By 1,244,000 to 1,231,000, the Labour Party decided at last week's Conference in favour of lifting the ban on the *Daily Worker*. The decision was a commonsense one. There is no reason at all why the *Daily Worker* should not be given a chance to show its loyalty and willingness to abide by the laws of the land. The refusal to lift the ban has not been backed by any good reasons. On the other hand, as the vote at the Labour Conference showed, there is quite strong opposition to its removal. Probably the chief reason for this is the extraordinary claims made by the *Daily Worker* spokesmen for their organ. Obviously, the paper it has a right to that much freedom. But the spokesmen go very much further. They give the *Daily Worker* a special quality. They say that one of the main reasons why output is not so high as it might be is the absence of the *Daily Worker* from the working man's breakfast table. In fact, in their arguments, the *Daily Worker* ceases to be a newspaper and becomes something much more mystic. This is presumably what the large minority at the Labour Conference could not stomach. "What are they really after?" they ask. They are made suspicious; and they cast their votes accordingly—a point which ought to be borne in mind by the extravagant publicists who claim that every worker and every trade union in the country is pining for self-expression in the form of the *Daily Worker*.

Shorter Notes

Much satisfaction will be felt at the statement in the report of London University for the past year that, in view of the new era in colonial development which will open after the war, the senate has set up a special advisory board in colonial studies. To the British people's lamentable ignorance of colonial affairs can be attributed many of the present failures in British colonial rule, and any attempt to inform the public on colonial problems is welcome. The board has already prepared a survey of the University's resources relative to colonial affairs, which is to be presented to the Colonial Office with a request for official guidance on how these resources can best be applied.

During March, detention orders were made under Regulation 18B against three persons, all of them British subjects. In the same month, 16 persons were released and 3 ceased to be detained under the regulation and are detained instead under the Prerogative as enemy aliens. At the end of March, the total number of persons detained under the regulation was 583.

AMERICAN SURVEY

War and Latin America

THE American Survey is usually devoted, week by week, to the affairs of the United States. But there can be no hard division between the Americas, North, Central and South. The defence of the Western Hemisphere is a single problem. The American spotlight this week is on Mexico, which has declared war on the Axis, and on Argentina, which has still to take its final decision. The following three articles have been written in London, to paint the Latin American background, and to bring the main issues into relief, by the Buenos Aires Correspondent of THE ECONOMIST, who has come home to join the RAF.

1. Defence and Politics

ONE HUNDRED AND FIFTEEN years ago, Simon Bolivar convened at Havana the first Pan-American Congress. Last January, the twenty-one American republics agreed at Rio de Janeiro on the cardinal points of a hemisphere policy. In the interim, the Latin American states have consolidated their independence. For all of them the present conflict has made Pan-Americanism practical politics. Addressing the Cuban Chamber of Commerce in New York recently, Mr Sumner Welles said:

There has now commenced a new period of world history, in which inter-American solidarity has become a real, living and vital truth.

In September, 1939, the geographical isolation of the Americas, and the freedom of inter-American trade, made Latin American neutrality tenable. But in 1940 a potential Axis threat from Dakar, less than half as far as New York from the bulge of Brazil, emphasised that country's strategic importance in the defence of the United States. After Pearl Harbour, the isolation of 20 independent states, militarily weak, but rich in raw materials, was no longer real. In the face of an Axis drive towards America, the realisation grew that unarmed neutrality could no longer be considered a sufficient bulwark. The fate of Europe's neutrals, the growing attacks on Latin American shipping and the accumulating evidence of Axis intrigues in Latin America were significant portents.

With the wartime strangulation of overseas trade, inter-American trade assumed a new importance. The Pan-American ideal of Bolivar, invigorated by President Roosevelt's "Good Neighbour" policy and its practical developments in the form of inter-American trade treaties, became an economic panacea south of the Rio Grande. With North America at war in two oceans, the time had come to implement the 1940 Havana pledge of continental solidarity in defence. At Rio de Janeiro, the Americas faced the task of mobilising their joint resources to this end. The first step was a unanimous resolution recommending the rupture of diplomatic relations with the Axis. Ten of the Central American and Caribbean republics were by then at war. Colombia, Mexico and Venezuela had already severed Axis relations. During the conference, Bolivia, Brazil, Ecuador, Paraguay and Peru did likewise. Each of the 20 states has taken measures to repress Axis activities, commercial as well as subversive, within its frontiers. Only the Argentine and Chilean legislatures have so far failed to ratify the recommended rupture.

The Non-Belligerents

These two states are the southernmost neighbours of the continent. But the reasons for their aloofness from the continental plan are very different. In Argentina, they reflect the long domestic struggle between the isolationist Conservative oligarchy and the Radical opposition, which today represents the country's vastly preponderant anti-Axis sentiment. The opposition's resentment against electoral malpractice has entrenched the oligarchy's political power by provoking a legislative stalemate, giving the Government the opportunity to govern by decree, a procedure of which it has taken full advantage to throttle public opinion on the issue of hemisphere defence. After a recess since October, Congress reopened last week. Events during the recess did nothing to allay popular unrest about subversive Axis activities in Argentina.

But acting-President Castillo has pursued his policy of cautious neutrality with no concessions to the popular demand for a break with the Axis. After Japan's entry into the war, he suspended constitutional guarantees in the face of a growing agitation for the convocation of Congress. This step enabled him to suppress the agitation by prohibiting press comment. *Acción Argentina*, a virile non-party movement embracing anti-totalitarian opinion of all shades, fell under the ban. A public outcry against the electoral abuses which had just won for the Government the important province of Buenos Aires was smothered in its early stages. Re-opening Congress, Dr Castillo began by saying: "Argentina maintains friendly relations with all countries," and added:

The Government considers that Argentina's attitude in recognising the United States as a non-belligerent is more useful and opportune than any other measure. This does not mean that Argentina holds herself aloof from that country, which is fighting for the defence of principles that are also Argentina's principles. But foreign policy is not the whole problem of a country, and each country must carefully take account of its own internal situation.

His speech gives no hint of the positive measures for which the authoritative Argentine press has been campaigning. *La Prensa*, which had previously accused the Government of "sibylline phrases and enigmatic attitudes," attacked his policy on the eve of Pearl Harbour as "the negation of Pan-Americanism," and *La Nación* claimed it had "failed to satisfy the country in its transcendental aspects."

The feud between Right and Left is as bitter in Chile as in Argentina, and even more complex in its aspects. But while Argentina's Government is isolationist and Conservative, Chile's is Popular Front, representing a Leftish anti-Nazi bloc whose leader, President Rios, was elected last January after the death of President Aguirre Cerda, also a Popular Front candidate. Chile has promised full collaboration in continental defence, and was, in fact, the first country to press for a Rio de Janeiro conference. Her concern is the vulnerability of her 3,000-mile coastline to Axis attack. This concern offers a key to her postponement of a break with the Axis. She has called up her reserves, mobilised her fleet, and drawn up ARP plans. Immediately after his election, President Rios said to the press:

Regarding continental defence, it should not be forgotten that the greater aid of the great nations to the small, the more efficient will be the collaboration of the small with the great.

His statement summarises Chile's hopes and fears. Her capital, Santiago, is as far distant as Tokyo from San Francisco.

Pan-American Defence

There are abundant signs that the United States appreciates the nature of Chilean defence problems. The suggestion that the United States had refused to supply Argentina's defence requirements in retaliation for her attitude was denied by a Washington spokesman, who said that the needs of the eighteen republics which had broken with the Axis were more urgent, but that there was a basis of equality for all. President Roosevelt intimated that, in considering Argentine and Chilean wants, special attention was being paid to those of Chile in view of her exposed position. The exchange of military missions is now a regular feature of United States-Latin American relations.

Under the stimulus of Lend-Lease a continental defence system is rapidly taking shape. Caribbean outposts shielding the vitally important Panama Canal have long been secured. The Caribbean republics at war, who have formed a defence bloc, and Venezuela, strategically important because of her oil as well as her accessibility to the Canal, fall beneath their protection. So does the east coast of Mexico. The construction and use by the United States of bases on Mexico's more vulnerable west coast are expected to follow from the joint defence policy established

by the two countries before their military alliance took place. Besides providing useful striking points for Pacific operations and reinforcing a gap of some 1,500 miles between North and South America, these Mexican bases would protect the inter-oceanic bridge (only less important than the Canal) formed by the Isthmus of Tehuantepec.

Mexico at War

Mexico is the largest as well as the latest of the Latin American countries to declare war on the Axis. Her decision will hearten the smaller militant states co-operating in the Caribbean and Central American defence scheme, of which she now becomes the backbone. Germany recently claimed to have sunk over 125,000 tons of "enemy" shipping in the Gulf of Mexico, the Caribbean and to the east of the Antilles. This claim indicates the nature of the war likely to be waged on Mexico's Atlantic doorstep—and its problems. They are acute problems, not only to Mexico but to all the hemisphere powers engaged in a great and growing inter-American traffic with limited and at present unco-ordinated shipping resources. Unrestricted submarine warfare has struck at the hemisphere's lifelines in the domestic waters where they converge. And there is no Burma Road from North to South America except by sea. The United States has just announced the appointment of Rear-Admiral Kauffman to the command of the Gulf Sea Frontier.

In Colombia, geographically dominating both ends of the Canal, the last remaining German-operated air service has disappeared. In their vast expansion since 1939, the United States-owned Pan-American Airways have acquired the States-owned Pan-American Airways have acquired the States-owned lines in Colombia and Brazil, where the Axis had gone to great pains to develop and control "commercial" services. United States-Brazilian plans for strong naval bases near the mouths of the Amazon are completed. In Ecuador, the United States have acquired a naval base from which patrols can cover the Colombian and Ecuadorean Pacific coasts as well as the Canal approaches from the south. Uruguay, strategically more important than Argentina in the defence of the River Plate, is an outstanding exponent of collaboration. She recently received the first instalment of material under a \$17 millions Lend-Lease plan, which will provide aircraft, coastal guns and several destroyers; and two naval bases are being completed on her coast. Argentine-Chilean co-operation involves the protection of the Magellan Straits. The British base at the Falkland Islands controls the Atlantic approaches to this southernmost channel of the continent.

Much remains to be done to co-ordinate hemisphere defence against dangers from without. But an impressive experiment in continental unity is under way, based on mutual respect for the sovereign rights of each participating nation, whose territory and resources are at the service of the others in the interests of all.

2. Axis Influence

In his recent speech to the Free World Association, Mr Wallace, Vice-President of the United States, said:

We may be sure that Hitler and Japan will co-operate to do the unexpected—perhaps an attack by Japan against Alaska and our north-west coast at a time when German transport planes will be shuttled across from Dakar to furnish leadership and stiffening to a German uprising in Latin America. . . . We must expect the offensive against us on the military, propaganda and sabotage fronts, both in the United States and Latin America, to reach its apex some time during the next few months.

Germany has long sought Latin America's support for the New Order. In the days when Hitler was assuring the United States that he had no designs on the New World, pro-Axis newspapers were being assiduously established throughout Latin America by elements controlled from Berlin. They varied in tone from the scurrilous to the pedantic. Common to them all was the use of the German *Transocean* news service, which had established a vast Latin American network supplying material, usually free, to the press. They all exploited domestic political schisms in support of a benevolent neutrality towards the Axis. Two instances of their efforts to embarrass relations between South American Republics were an ostensibly "Nationalist" Argentine journal, which had to be banned, in Uruguay, and a campaign in pro-German newspapers calculated to arouse mutual distrust between neighbouring states, which

was denounced by the Bolivian Government to the representatives of Argentina, Brazil, Chile, Paraguay and Peru. The methods of the German propaganda machine have brought it into conflict with authority in each of the Latin American countries at various times since the beginning of the war. But although its subversive activities have been subjected to checks, it has not lacked active co-operation from social and political factors within the continent.

The Trojan Horse

The spiritual and racial bonds between Latin America and Spain have had a profound influence on the social development of most of the Republics. Although the political power of the Roman Catholic Church has receded since colonial days, it is still influential, and in some States politically prominent. Where clerical politics are in evidence, they are sometimes Rightist and favour the Franco regime. The connection between Church and Falange in Latin America is occasionally close. In using the Falangist propaganda organisation (which insists on "the motherhood of Spain" and denounces Pan-Americanism) Germany has found the connection between Church and Falange profitable to the extent that the clergy contain some apostles of the New Order. In fact, the influence of the Falange has been almost entirely as an instrument of German propaganda. Mexican clerical reactionaries, through their *Sinarquista* movement, have supported Mexican irredentists. In the words of a recent manifesto, they hold that collaboration with the Axis would provide

a magnificent opportunity to reclaim the territory lost in 1847 to the United States.

Professional admiration of Germany's military ability among Latin American—and particularly South American—army castes, whose tutorship has been largely German, has provided more Axis propagandists.

Germany has used these separate currents without fusing them. But the rising tide of Pan-Americanism has carried with it, not only organised labour, for whom the issues have been clarified since Russia joined the democracies, but also active political groups formerly antagonistic to the United States, such as the Peruvian *Aprista* movement. In recent months the many arrests and deportations of Axis propaganda agents and the magnitude of the operations disclosed have revealed the store which Germany set on her propaganda system in Latin America.

Axis Immigrants

In the fields of sabotage and espionage the potentialities of Axis communities in Latin America have been recognised by the American Governments as a common danger. Of the German, Italian and Japanese nationals and their descendants living in Latin America, the last are by far the fewest. A broad and virile stream of Italian immigrants has influenced the social development of, principally, Argentina, Brazil and Peru. More than a fifth of Argentina's population has Italian blood, and in the three countries Italian strain is much more prevalent than the German. The allegiance of Italian "colonists" to the Axis pattern in general, and Fascist Italy in particular, is, however, conspicuously less than that of the closely-knit German and Japanese communities. Italians have been assimilated quickly; their voice is substantially that of the man in the street, that is, anti-totalitarian.

There are probably 1,200,000 first and second generation Germans in South America, and two-thirds of these are in Brazil. Investigations by the South American Governments have revealed the sinister ramifications among them of the Nazi *Auslanddeutsch* organisation. The possibility of an armed uprising in the German-speaking districts of southern Brazil and north-eastern Argentina was popularly envisaged early in the war; a remark then prevalent in both Argentina and Uruguay was that the Axis could take these countries "by telephone."

In recent years, Japan's closest economic bonds have been with Peru, of whose exports she took 16.6 per cent in 1941. There are 240,000 Japanese, mostly first generation, in Brazil (with its total population of 44 millions against Peru's 6½ millions). But the impact of the unassimilable Japanese community has been most felt in Peru, where, although the last official census gave the Japanese population as about 25,000, it is actually estimated to number 50,000. In 1931 the help of 30,000 armed Japanese was promised to the Peruvian Government to suppress a revolt. The infiltration of Japanese settlers in the Peruvian headwaters of the Amazon, in north-eastern Brazil and in Sao Paulo, and the concen-

tration of Japanese interests in these areas, have, in the past been held to indicate Japan's aim to develop transcontinental trade routes which would eventually avoid the need to use either the Panama Canal or the Magellan Straits.

In March, the Brazilian Government published the text of a letter it had received from a Brazilian of Japanese extraction denouncing the complicity of the Japanese community in Axis plans. Briefly, he stated that Japanese naval officers, working as fishermen, had made plans to obstruct the arrival of sea reinforcements on the Sao Paulo coast; that the railways from Brazil to Bolivia and Paraguay had been mined; that Japanese plotters owned key properties, through which passed water and electricity supplies to the army barracks in Sao Paulo; that they had tunnelled national munitions factories; and that an army of 25,000 Japanese, armed with machine guns, grenades and anti-tank weapons imported as agricultural machinery, was ready to rise in the State of Sao Paulo, as soon as it had been cut off from outside help. The Japanese Consulate in Sao Paulo, where Axis communities are perhaps more concentrated than in any other district in the continent, was indicated as the headquarters of the movement. According to the informer, it was planned to use as aerodromes lands appropriately "cultivated" by Japanese settlers. The Government has not revealed its reaction except to arrest several Japanese found to hold Japanese military ranks up to that of general. (A single illustration of Axis espionage is the fact that, some time ago, less than an hour after the *Queen Mary* had entered a Brazilian bay, and when port officials were ignorant of her arrival, Berlin radio announced the news to the world. The Brazilian police recently confiscated 30 short-wave transmitters belonging to Axis nationals: Rio de Janeiro.)

Defence Measures

Attention to these internal fronts is now playing a large part in the collaboration of the Latin American States in hemisphere defence. Brazil has cancelled Japanese land concessions, intensified army recruitment, undertaken a census of civil aviators and reserve officers, removed military recruits of Axis descent to regions free from Axis influence, and appointed technical directors to Axis-controlled industries valuable to national defence. Peru has repressed pro-Axis newspapers controlled by Italian, Japanese and Spanish interests, and prohibited home and foreign travel by Axis nationals, as well as their use of wireless or long-distance telephones and their occupation of coastal properties. Among those recently arrested under Peruvian security measures are Spaniards and Germans with German Jewish passports found to have been acting as agents for the Reich, although they entered the country as refugees.

Thanks to the efforts of a Parliamentary Commission, whose reports are among the most thorough indictments of Axis intrigues in Latin America published to date, the Argentine Government is now actively collaborating in suppressing Axis influences. It has decreed the deportation of Enrique Volberg, Germany's financial agent in Argentina for propaganda activities. A Pan-American Committee is now sitting in Buenos Aires to discuss and co-ordinate security measures. The experience of the Dies Committee and the Federal Investigation Bureau of the United States has been largely drawn on by most of the Republics.

3. Economic Portents

PRESIDENT ROOSEVELT'S "Good Neighbour" policy, with its insistence on mutual respect of sovereign rights, has been a powerful unifying influence on the political relations of Latin American countries, not only with the United States, but also between themselves. Their growing appreciation of its sincerity has been a mainspring of their progress through successive Pan-American conferences to the reality of a hemisphere defence programme. Applied to the needs of this programme, Lend-Lease is the logical culmination of the "Good Neighbour" policy.

The pre-war trend towards industrialisation was well forward in several Latin American republics, notably Argentina, Brazil, Chile and Mexico. Hemisphere defence is speeding this development by stimulating the interchange of raw materials between productive centres. Since the beginning of the war, and parallel with the curtailment of extra-continental markets, the United States has concluded "Reciprocal Trade Treaties" with most of her neighbours,

who have in turn signed bilateral trade agreements among themselves. Monetary problems arising from trade dislocation and the adjustment of Latin American economies to an intensification of inter-American trade were among the first to be solved by the aid of Lend-Lease, either directly between Government and Government, or through Washington's Import-Export Bank, which is playing an increasing part in financing public works projects in more backward states. In the economic sphere, as distinct from that of military expediency, it is, however, through the development of Latin America's potentially vast extractive industries that Lend-Lease is likely to make its biggest contribution to the sub-continent's welfare. Backing the work of 75 United States technical experts now in Latin America, and financing the schemes of numerous inter-governmental committees, its potentialities are remarkable; and in the urgency of war needs they are being rapidly exploited.

Rediscovery of the Amazon

An outstanding example is Brazilian-United States collaboration in developing the Amazon basin. Extending over 3½ million square miles, with a population of only two millions, it is one of the least-known regions of the world. But it is the original home of rubber, and contains the world's largest hardwood reserves. President Vargas brought nearer his dream of its rediscovery by inaugurating, at Manaus in October, 1940, a vast sanitation scheme financed by Federal and State taxation, in the development of which he envisaged the co-operation of neighbouring republics.

Collaboration with the United States has broadened and accelerated the project. The Import-Export Bank is lending 100 million dollars in exchange for the whole Brazilian rubber output for the next five years. The rubber industry, which in its peak year, 1912, produced 45,000 tons, collapsed under the competition of the East Indies and Malaya, and in recent years has yielded only 1 per cent of world output. Experts predict that, with its present intensive reorganisation, it should be yielding 100,000 tons annually in ten years' time. With the assistance of United States

research chemists, who are exploring substitutes for Asian oils, and have already proved the value of *carnauba* wax as a substitute for beeswax, Dr. Souza Costa, the Brazilian Finance Minister, has organised the Amazon Development Company. The Amazon is navigable throughout its length, and an important feature of the scheme, which Lend-Lease is financing, is the construction of a railway from its headwaters to Bolivia, offering Bolivia access to the Atlantic. There is no transcontinental road; but Pan-American Airways connect Bolivia's capital with Belem, at the mouth of the Amazon, which it is estimated will become one of South America's principal ports. The scheme is expected to be self-financing before it is finished. Manaus, the inland centre of Amazonas, and once the rubber capital, will be the focal point for agricultural development. From Peru, which has no pipe lines to the Pacific, Brazil will eventually obtain, under a recent treaty, sufficient refined oil to meet the needs of the whole Amazon region.

United States Collaboration

Brazil is larger than Europe, and United States collaboration is not confined to the Amazon basin. A year ago, the United States obtained by agreement the exclusive right for two years to purchase Brazil's strategic materials, including manganese, bauxite, nickel, diamonds, and rubber. The rich Itabirito iron ore deposits in the state of Minas Geraes, formerly owned by British interests, have been acquired by Brazil, which has been loaned \$14 millions for their development, repayable from ore purchases by the British Government and the United States Metals Reserve Company. The deposits are calculated to contain 111 million tons of high-grade hematite, the largest known. In the colonisation necessary for the post-war development of these vast projects, Brazil has indicated that she will welcome immigrants, but intends to avoid the formation of "Sudetenlands."

Neighbouring republics are undertaking similar schemes. The development of Peru's vast iron ore deposits is being planned; and the United States is absorbing her cotton surplus, formerly exported to Japan, as well as her rubber output, which, though small, is being developed by the newly-formed Peruvian Amazon Corporation, backed by the United States Rubber Reserve Company. The latter has lent Peru \$1,125,000 to encourage rubber production. Bolivia has obtained from the United States a loan of \$25 millions, and the Metals Reserve Company will acquire her whole copper output, expected to reach 6,500 tons yearly. She has also been lent \$5½ millions for petroleum works. Under Lend-Lease plans, the United States is to obtain Chile's total output of copper, gold and mercury, and Argentina's production of tungsten.

Argentina's Paraná river system and the northward development of her railways have in the past given Argentina a virtual monopoly of Paraguayan trade, and an increasing share of Bolivia's exports, notably of petroleum. Argentine press criticisms of the Government's isolationist policy have not failed to point out the benefits that Brazil derives from her development of communications with these inland republics and Peru, by offering them new outlets. In this and other instances, it seems likely that domestic politics will eventually attune themselves to the new economic interdependence which is spreading throughout the sub-continent.

A "New Constellation"

Spurred by present exigencies, the natural growth of manufacturing, as well as extractive, industries will give the Latin American states a greatly increased capacity to turn their swords of defence into plough-shares. When that time comes, politics outside, as well as inside, the continent will be forced to recognise the realities of what a Washington observer has called "a new post-war economic constellation." Before the eyes of Latin American statesmen and industrialists, many of them men of acute vision, it is emerging now, as a positive sign of Latin America's readiness and ability to take her place in what Mr Wallace has called "the century of the common man." In the post-war world, to quote Mr Wallace—

perhaps it will be America's opportunity to suggest the freedoms and duties by which the common man must live... older nations will have the privilege to help younger nations get started on the path to industrialisation, but there must be neither military nor economic imperialism.

His words are for Latin America a significant endorsement of the Atlantic Charter.

American Notes

Work or Fight

The famous "work or fight" order of the last war has reappeared in the United States as the first sanction against recalcitrant workers. The War Manpower Commission has announced that, if workers refuse to accept suitable employment in war industries without reasonable cause, they will be reported to the Selective Service System, which makes decisions on occupational deferment. Presumably this is a stop-gap measure until other penalties are established; it would not be applicable in all cases, and in some would defeat its own purpose. Further controls over the hiring of skilled workers are expected shortly. All employers and employees in war industries will soon be directed that, in future, changes in employment must be handled exclusively through the United States Employment Service. This clause will be embodied in future war contracts, but voluntary compliance is expected to begin at once. Employers who already have contracts will probably be asked not to hire any new workers except through the public employment exchanges. A more drastic step which is expected is an order designed to prevent employers from retaining a skilled worker who could be used to better advantage elsewhere. The speed with which the Commission is moving is a reflection of the chaotic conditions in the market for skilled labour, particularly in the aircraft industry, where "pirating" has become increasingly common.

Housing War Workers

President Roosevelt has sent a message to Congress requesting an increase of \$600 millions in the appropriation for housing under the Lanham Act. In his message, the President underlined the need for more housing for war workers. The Government hopes to keep down the volume of workers migrating to war production centres to 1,600,000 between June, 1942-June, 1943. But in spite of reliance on private industry and more use of existing buildings, there remains a considerable demand for accommodation which can only be satisfied by public construction. So far, the funds appropriated by Congress total \$1,020 millions. In view of the large-scale migration which has already taken place—estimated at about two million people—these sums appear far from adequate. The cautious phrasing of the President's message suggests that he anticipates a hostile reception by Congress. He was at great pains to make it clear that much of the housing would be temporary in nature, and that a large portion of the funds would be returned to the Government in the form of rents and later through sales. It is unfortunate that the housing shortage, which has been becoming increasingly acute, is only being taken in hand at a time when both materials and labour are growing shorter every day. It now seems unavoidable that there will be a repetition of the shoddy building which disfigured American cities during the last war and which added to the problem of slum-clearance. The immediate need, however, is the provision of minimum accommodation for war workers; and even on the minimum estimate of 1.6 million migrants, which is likely to be exceeded, the measure seems to fall far short of what is required, particularly if the strain on public services in defence centres is taken into account.

Bridges and Browder

The order for the deportation of Harry Bridges, Australian leader of the Pacific Coast dock workers, is nothing new; his case has been banded backwards and forwards between Congress, the Department of Labour, the Supreme Court, and the Attorney-General's Office for years. What is remarkable is the renewal of the pressure to deport him a week after President Roosevelt's release of Earl Browder, secretary of the Communist Party, and at a time when aid to Russia is one of America's chief aims. The explanation lies in the split between the policy and powers of the Executive, and those of Congress. Attorney-General Biddle was forced to take action against Bridges under a law which orders the deportation of any alien who has been a member of a group planning the overthrow of the United States Government by force. Originally the law was directed only against present members, but when it was proved that Bridges was no longer a member of the Communist Party,

the law was amended specifically to include him. Because of radical leadership of dockers' strikes in the thirties, Bridges has aroused the implacable enmity of West Coast employers. But, since the entry of the United States into the war, he has made an active and valuable contribution to industrial peace, and the Administration is not likely, voluntarily, to have taken action calculated to cancel the good effect of Browder's release. The reputation and earlier activities of the American Communist Party are admittedly an obstacle to all-out aid to Russia in the minds of many Americans. But, in this case, the driving force derives from Bridges' union record, rather than his political affiliations. An appeal is to be made to the Supreme Court, which may find unconstitutional a law that might easily be used as a threat to a number of aliens now solidly behind the war effort. The criterion which the Attorney-General has followed in cases involving the abrogation of civil liberties has been whether, in the words of Chief Justice Holmes, there was a "clear and imminent danger" to the Government. It might well be applied to Bridges.

Fourth Estate

The liveliness of current press feuds probably overstates the divisions in American public opinion. But the way in which the liberal and internationally minded newspapers are going into battle against the America Firsters and the obstinate isolationism of the Patterson-Hearst-McCormick press chains is heart-warming. *PM*, the experimental New York evening tabloid, backed by Marshall Field, has made an instructive feature of its daily comparison of the German propaganda line and quotations from the Hearst press and Patterson's *New York News*. It is the *News* which called the rationing of bicycles "totalitarian stuff" on a par with such "unnecessary" hardships as tyre-rationing and petrol cards. It is the *News*, too, which sees the coming dictatorship in every Washington directive or order, and which has been ominously suggesting for months that "that man" would cancel the November elections because he was afraid of a Republican landslide. The *News*, which favours the tag "Wanna Bet?" at the end of its more polemical leaders, was smartly taken up by the *New York Post*, which offered \$10,000 to \$5,000 that the elections would take place. "Put up or shut up" the *Post* advised rudely. The *News* appears to have done neither, though the suspicion that the elections might after all be held as usual has been creeping into its columns, along with the prophecy that it would be fought over such "petty tyrannies" as bicycle-freezing. The two *Tribunes*—Chicago and New York, no relation—are waging long-distance hostilities. McCormick's Chicago paper, which was only temporarily submerged by Pearl Harbour, continues its anti-British, anti-Roosevelt campaign under a blur of patriotism, sneering at the *Herald-Tribune* as a "hyphenated anglophile journal," with no interest in the Far East because there are no titled people out there. More stir has been made recently by an advertisement published by the "Friends of Democracy," which charges Hearst, Patterson, and McCormick with "aiding the enemy" by their constant attacks on America's allies, the Administration and the direction of the war. A number of papers considered the advertisement too hot to handle, but it was finally printed by the *San Francisco Chronicle* and reprinted by *PM*. The belated offer of the *News* to print the advertisement—at advertising rates—has been accepted with alacrity by the authors, on condition that they can find the cash. The venom of the Isolationist press is all the greater because it must realise it is fighting a losing battle; but this does not diminish the public service of the journals which are helping to arrange the funeral.

Testimony on Rubber

A joint statement by Mr Nelson, Mr Henderson and Mr Eastman has made it clear that there will be no rubber for civilian use in the United States for at least two years. This should help to end the confusion which has been caused by conflicting statements by representatives of the seven agencies concerned with the rubber shortage, and has led to a certain slackening in public enthusiasm for conserving rubber. The Truman Committee of the Senate has meanwhile been conducting a post-mortem into the reasons for the failure to accumulate stocks of natural rubber and to build up a synthetic rubber industry. Its foremost witness has been Jesse Jones, who controlled the

Rubber Reserves Corporation and supervised the financing of new plant under the Defence Plant Corporation. The most sensational parts of his testimony related to the responsibility of Dutch and British interests, who, he alleged, were unwilling to sell the Government adequate supplies of raw rubber because of fear of price declines after the war if production were expanded. There was no opportunity for the British or Dutch to present their own side of the case, and the Truman Committee appears to have accepted Jones's interpretation. According to the witness, he was also frustrated in attempts to produce synthetic rubber by the President's veto, based on the high cost of synthetic as opposed to natural rubber. Lack of foresight in this essential matter was evidently not restricted to Jones alone; but it is difficult to acquit him of the major responsibility. The formation of Jesse Jones Walking Clubs will probably continue.

* * *

Soldiers' Dependants

Bills before Congress increasing pay for men in the Forces, and establishing a system of allowances for dependants, are expected to remove the main cause for deferment of service—the support of dependants. The Bill providing increased pay is being held up in the House, which insists on a minimum of \$50 a month, as opposed to the \$42 a month incorporated in the Bill, but it should be passed shortly. The Johnson-Edmiston Bill embodies War Department policy on allowances, which has the backing of the Administration—as well as a more controversial section which would direct the Federal Security Agency to make additional allowances to cases providing hardship. The scale of allowances established is, as might be expected, more generous than that in existence in other countries; out of a private soldier's pay \$20 is allotted for his family, and the Government will contribute \$20 for a dependent wife, and \$10 a month for each child. A quick passage is expected for this part of the Bill, and the Army and Navy will administer its provisions in an attempt to avoid the delays and scandals of the last war. The cases of men deferred on account of their dependants are already being reviewed by Selective Service, and it is expected that by the end of the year dependency will be discarded as a reason for deferment, and essential war work will constitute the main bar to Service.

Bauxite Supplies and Requirements

The United States aluminium expansion programme is making rapid headway, and it seems now more than likely that before the end of this year production will approach the scheduled rate of 450,000 tons per annum, that is to say, about three times the 1939 output. Naturally such a huge rate of production requires extensive preparations in the field of raw material supplies for the aluminium industry. Supplies of cryolite, needed as flux in the electrolytic process of splitting alumina into aluminium metal and oxygen, have been fully assured since the occupation of Greenland, the world's only source of natural cryolite. The problem of securing adequate supplies of bauxite has been more difficult, and has required extensive development both in the United States and the Guianas. The latest information, however, shows that these programmes have not only been kept in line with the rate of expansion of the United States aluminium industry, but even pushed ahead of it. In order to produce 450,000 tons of aluminium metal about 1,800,000 tons of raw bauxite are required. In addition to these quantities the United States is likely this year to absorb 600,000 tons of bauxite for abrasive, refractory and chemical purposes. By producing the record quantity of 899,500 long tons of bauxite last year, United States mines in Arkansas, Alabama, Georgia and Virginia supplied more than one-half of the country's total requirements in 1941. This year domestic supplies, despite further extensive development work in recent months, are unlikely to retain this high share, although they are expected to rise to 1,100,000 tons in 1942. The quantity to be covered by imports can thus be taken at roughly 1,300,000 tons, or about one-third more than estimated imports in 1941. For some years Dutch Guiana, where the Aluminum Company of America owns extensive bauxite deposits, has supplied well over 80 per cent of United States imports. In order to cope with the growing demand, the Surinaamsche Bauxite Maatschappij, a subsidiary of the Aluminum Company of America, started a new bauxite

crushing plant near Paramaribo, in February, 1941, which, according to an official Dutch source, has an annual capacity of 900,000 tons. The company's former plant at Moengo, on the de Cottica River, which supplied 615,000 tons of bauxite in 1940, remained in full operation, so that the annual capacity of the Surinaamsche Bauxite Maatschappij alone is now about 1,500,000 tons per annum. In addition, the independent Dutch Billiton concern commenced the construction of a modern bauxite crushing plant near the Surinam River last year, which will start operations this year. Dutch Guiana alone, which supplies the United States exclusively, could, therefore, meet the huge import requirements of the United States aluminium industry. At the same time, however, British Guiana has developed its bauxite production well beyond the limits set by Canada's import requirements, and could, if necessary, maintain its share in United States bauxite imports, which reached 10 per cent of the country's total imports in 1941.

* * *

Labour's House

The growing estrangement and enmity between John L. Lewis and the rest of the American labour movement is partly responsible for new efforts to end the division between the CIO and the AFL. The unity which Lewis failed to achieve in January is being spurred on by his continuous sniping at both the co-operating organisations, which are coming closer in self-defence. Hostilities between Lewis and Philip Murray were carried one step further when Lewis removed the president of the CIO from the vice-presidency of the United Mine Workers last week, ostensibly because Mr Murray had accepted the leadership of the Steelworkers' Union. Lewis's quickness to exploit any sacrifices agreed to by the other unions has been noticeable in the automobile workers' union, where an attempt is being made to stir up resentment against the abandonment of premium pay for Saturday and Sunday work. Organisation of dairy farmers is continuing, and the United Construction Workers, under Lewis's control, is recruiting florists, laundrymen, and restaurant workers. Lewis sticks to the Isolationist line on war strategy, arguing that every ship should be withdrawn from the Atlantic to concentrate on a descent on the Japanese mainland. Even within his own union, opposition is not lacking; at its convention in Trenton, 200,000 miners voted to secede because of his "anti-war policy," for "running counter to labour in general in his opposition to President Roosevelt's foreign policy" and for his "flagrantly undemocratic procedure."

* * *

Shorter Notes

A new shipyard to be constructed on the East Coast will be supervised and staffed entirely by negroes. It is estimated that 9,000 workers will be employed.

Hard liquor production will be reduced by 90 per cent by the end of the year to meet demands for alcohol, to be used in the manufacture of synthetic rubber and other vital war products. Already 50 per cent of the industry's capacity has been converted. No liquor shortage is anticipated as there is at least 550 million gallons of whisky in storage, sufficient for four years.

President Roosevelt has expressed surprise at the large number of men rejected by the U.S. Army on account of illiteracy. Education is a function of the 48 states, and there are wide differences in standards, mainly related to the wealth of each state. The southern states in particular have been characterised by very low appropriations for schools.

War bond sales for May totalled \$634 millions, passing the Treasury's quota of \$600 millions by a substantial margin.

The result of the negotiations on shipbuilding wages has been to increase the wages of 550,000 workers by 8 cents an hour, which is less than the 13 per cent increase due to the workers under their cost-of-living wage stabilisation contract. A new feature is the provision that all wage increases will be invested in war bonds, to be cashed only in cases of "extreme emergency."

THE WORLD OVERSEAS

The Conscription Plebiscite

(From Our Ottawa Correspondent)

May 8th
A WIDER cleavage than most Canadians thought existed in their country was disclosed by the results of the national plebiscite on manpower policy. It had few ameliorating features and it promised and produced an immediate political crisis. To repair it became the immediate task of Canadian leadership, a task to be taken up under the most unfavourable circumstances. The cleavage exists between English-speaking citizens and those of French stock who voted "No" to the Government's request for a free hand in conscribing manpower if and as the need arises. It also exists in provinces, especially in the west, where the population is of mixed ancestry.

Since Quebec voted 72 per cent negative, its position attracted the most attention when the plebiscite results were being analysed. But figures for the prairie provinces showed a substantial negative sentiment in communities predominantly German, Ukrainian, Polish and of other origin. The plebiscite laid bare dramatically the sources of tension in a population in which many racial strains mingle. It provided clues to the potential dangers that lurk in a sprawling federation of provinces in which the process of assimilation has not yet been completed. It delivered a shattering blow to Canadian complacency, which has taken national unity for granted, offering a clear and definite turning point from which to measure the progress of cohesive forces that are undoubtedly strong though largely latent, or from which to reckon the advance of dividing factors if they are not to be halted short of destruction.

Nearly complete figures, in advance of official returns, showed a two-to-one vote for the affirmative. By provinces the vote was:—

	Yes	No
Prince Edward Island	23,568	4,860
Nova Scotia	120,763	35,840
New Brunswick	105,629	45,743
Quebec	375,650	971,925
Ontario	1,201,953	229,947
Manitoba	218,093	53,651
Saskatchewan	183,617	67,654
Alberta	186,624	75,880
British Columbia	253,344	62,033
Yukon	847	291
Civilian Total	2,670,088	1,547,724
Armed Services	251,118	60,885
Total	2,921,206	1,608,609

The figures exercised a sobering influence—on one side of the conscriptionist controversy that has raged in Canada for several months, as well as on the other. The plebiscite result led logically to the repeal of Section 3 of the National Resources Mobilisation Act, which prohibited the despatch of troops called up under the Act to service outside Canada. But the gap between the easy enactment of an amending measure and the effective introduction of conscription could not be bridged at once.

On the debit side, the extent of minority opinion regarding conscription was greater than most Canadians believed. The vote reflected the popular conviction on that issue, though the Government refrained from making any commitments one way or the other in the campaign preceding the vote. Mr Mackenzie King has become the target of the criticism that the plebiscite produced the cleavage. It merely uncovered the basic fact that 1,600,000 Canadians at this late date possess a mental reservation on the necessity of devoting the entire resources of the nation to winning the war. But the Government and its leader cannot escape criticism on the ground that such a mental reservation does exist, owing to a failure of information among the public regarding the issues at stake.

Great Divergences

Instead of a great demonstration of national unity, the plebiscite disclosed great divergences. It disappointed those

who had hoped for a greater affirmative vote in Quebec. But it proved the point that has been basic in the policies of the King Government, that the issue of conscription endangers national unity. The chorus of conscriptionist agitation had blurred that fact, and it is now as clear as daylight. The yawning gulf is there for all Canadians to see. Success so far in maintaining unity and in mobilising the national effort will not count against failure to avoid the abyss now.

On the credit side, the cleavage in Canadian opinion can be seen in its true light as a difference over means rather than ends. There is no issue over the war itself—the discordances refer to policies for waging war. The mandate for total war is decisive in spite of the strength of the Noes. Conscription is the symbol of total war to nearly 3,000,000 Canadians. It is a pity perhaps that the symbol required to mobilise the emotions of the people could not have been some more urgent issue, such as army reform.

Conscription has no immediate significance as military policy. The voluntary recruiting system has produced more than enough men, and this fact has been under the closest scrutiny from time to time, because of recurring charges that enlistments had broken down. On December 31, 1941, aggregate enlistments were:—

	Enlistments	Requirements in 1942
Navy	27,000	13,000
Army	295,000	100,000
Air Force	100,000	80,000
	422,000	193,000
Prospective by March, 1943	615,000	

Recruiting has been steadily on the upswing for several months. The army requirement through 1941 was 6,500 a month, and this figure has been doubled in several months of this year. The conscription law, in addition, is being used to call up 7,000 men a month at present, so that more than 20,000 men are donning the uniform of the Canadian army each month. There has been no diminution in enlistment applications for the air force and navy. The day after the monetary reformer, W. D. Herridge, made a speech in Ottawa decrying the failure of the voluntary system and calling for conscription for overseas service, 609 men enlisted in the Canadian army. This was a record day's total to date.

The Meaning of Heydrich

[BY A CORRESPONDENT]

THE attempt on the life of Heydrich is a significant symptom of the new stage which the underground struggle of the subjugated European nations has entered. The notion that Heydrich fell a victim to some obscure family feud among the higher circles of the Nazis can be dismissed. The gangsters of the Gestapo know more discreet and less costly methods of settling an internal quarrel than the staging of a spectacular attempt in broad daylight in the suburb of a central European capital. Such an attempt is a heavy blow to German prestige. It brings on the tense atmosphere of mass reprisals. It must be taken abroad, and throughout the occupied countries, as a demonstration of the vitality of the underground movement. It seems clear, too, that the attempt was not carried out by any of the clandestine organisations which take their political cue from responsible Czech circles in Allied countries. There the prevailing opinion appears to be that other, perhaps less spectacular but more systematic, methods of resistance are more useful under the present conditions—slow work in factories, widespread and well concealed

THE BUSINESS WORLD

Profits—A New Series—II

AN article under this title in *The Economist* a fortnight ago reviewed the need for making substantial improvements in the computation of industrial profits. It introduced an instalment of the improved figures, based on the results of public companies published in the first quarter of this year. In this second article, the aim is to examine the course of gross profits for the past four years, and compare them with the old basis figures which have been available hitherto. The difference between the two series, it will be recalled, is fundamentally this: the old basis figures have made only partial adjustment for the distorting effect of changes in the standard rate of income-tax; the new basis figures attempt to eliminate this bias entirely, and to give, as far as possible, an estimate of industrial profits before any deduction for standard income-tax.

One of the most obvious advantages of the new basis figures is that they are closely comparable over a period of years, and it would be a simple matter to construct an index number based, as the old *Economist* index has been based, on the period in which the results were published. In revising the figures, however, the opportunity has been taken to introduce a further improvement in their presentation, namely, to analyse the results, not by reference to the arbitrary periods in which the accounts were published, but instead by reference to the financial periods in which the profits were earned. From the economist's point of view (as distinct from that of financial journalist), the weakness of profits arranged by date of publication is that they are post-dated by an appreciable time-lag. The attempt is made instead to set estimates of gross profits in the actual financial periods to which they refer. The gross profits estimates published a fortnight ago referred to companies whose accounts were published in the first quarter of this year. To obtain a series of figures grouped under financial periods since 1938, it has been necessary to re-allocate the figures for each company published in this and earlier quarters

according to the date of its financial year. This again is a laborious process, but one well justified by the results. The figures are set out in the following table:—

TABLE I.
GROSS PROFITS BEFORE TAX ANALYSED BY FINANCIAL YEARS

Accounting Date Falling In	No. of Cos.	1938	1939	1940	1941
		(£000)	(£000)	(£000)	(£000)
1st Quarter.....	500 487	62,414	57,875	60,962	54,128
2nd Quarter.....	386 360	38,859	38,629	36,773	35,928
3rd Quarter.....	324 253*	41,692	39,854	41,011	34,633*
4th Quarter.....	863 860 303*	147,253	149,547 149,050	143,117 60,588*	59,328*
Whole Year.....	2,073 1,403*	290,218	285,905 285,408	281,883 191,432*	184,008*

* Results not yet complete.

Two general remarks may be made regarding this table. First, the results for recent quarters are naturally not yet complete, owing to the time-lag in publication. Secondly, the sample of companies changes from year to year, but on the assumption that the sample is fair—which is most reasonable—some interesting conclusions emerge. The gross profits of 2,073 companies, before standard income-tax, declined by 1.4 per cent, from £290,218,000 to £285,905,000, between 1938 and 1939. A slightly smaller sample of 2,070 companies showed a decline of 1.3 per cent in gross profits between 1939 and 1940, and an incomplete sample of 1,403

TABLE III.
Economist INDEX OF NET REPORTED PROFITS, BY PUBLICATION DATE

companies showed a reduction of 3.8 per cent in 1941. These are comparisons of gross profits; they are accordingly an indication of the thorough effectiveness of 100 per cent EPT, in preventing any rise in gross profits. Even if the standard rate of income-tax had remained unchanged since the first quarter of 1938, the net earnings available for capital would have been some 6 per cent lower. In fact, net earnings, after standard income-tax, have been more than halved, as a result of the doubling of the standard rate between the first quarter of 1938 and the second quarter of 1941.

To overcome the discontinuity in the sample of companies, a new index of gross profits has been constructed from the quarterly figures by the link method. This is a simple geometric average based on the four quarters ended December, 1938, and its course during the past three years is shown below:—

TABLE II.
INDEX OF GROSS PROFITS, BY ACCOUNTING PERIODS
Four Quarters ended December, 1938=100

	Accounting Periods Ended In			
	1st Quarter	2nd Quarter	3rd Quarter	4th Quarter
1938.....	98.13	98.06	97.95	98.24
1939.....	101.7	100.3	101.2	99.74
1940.....	96.14*	98.72*	96.20*	96.68*

* Provisional.

The record of the index during the past three years confirms, in general, the conclusions suggested by the annual figures, though with one interesting supplementary point. It will be seen that there was a tendency in the late part of 1939 and the early part of 1940 for gross profits to show a slight rise, which EPT has subsequently checked. It could hardly be said from the evidence that an incipient break-away in profits was then about to occur, but if it was, EPT checked it immediately.

In the course of time, it is hoped that this new index will provide a useful addition to economic statistics. Meanwhile, it is proposed to publish it in conjunction with the familiar *Economist* index of published net profits, based on periods of publication and not of account. It has been decided, however, to make this index statistically more respectable, by adopting a geometric mean, rather than the somewhat crude weighted arithmetic average which has hitherto been employed. The difference between the two indices is surprisingly small, though the new method has the advantage of giving a slightly more sensitive impression of the course of net reported profits at the peak and trough of their cyclical swing. The original base (four quarters ended June, 1936) has been retained for the index, of which the recent record is given in Table III. The trough of this index was touched in the third quarter of 1933, with a

THE ECONOMIST NEW PROFITS SERIES.

The notes below may assist readers to follow the improvements in our profits figures.

The new figures are presented throughout on a gross basis, and represent the closest estimate that can be made of industrial profits, before deducting any charge for standard income tax.

The gross profits are shown (a) under periods in which they were published and (b) under the periods in which they were earned.

(a) A four-year comparison of gross profits of companies whose accounts were published in the first quarter of this year was given in the first article of this series on page 720 of *The Economist* of May 23rd.

(b) A four-year linked comparison of gross profits arranged by accounting periods is given in Table I, and this is expressed as a quarterly geometric index number of gross profits (four quarters 1938 = 100) in Table II.

The *Economist* index of net reported profits (i.e., net profits taken from the companies' accounts without adjustment for taxation) has been converted from an arithmetic to a geometric basis (July, 1935, to June, 1936 = 100) and is given in Table III.

It is intended at a later stage to transpose the reported profits given in Tables IV to VI to a gross basis.

"low" of 64.1, compared with a "low" of 66.3 recorded by the old index for the first quarter of the same year. The "high" were respectively 133.4 for the new index in the third quarter of 1938, compared with 131.7 for the old index in the second quarter of that year. No substantial changes, therefore, are involved in the adoption of the geometric method in preference to the old arithmetic index. The results are, however, more satisfactory from a statistical point of view.

It is hoped that these new features will constitute a permanent improvement in the quantitative expression of industrial profit-earning capacity—at least until the accounting millennium arrives. The accounting changes involved are far from revolutionary, but they would enable consistent profits figures to be prepared with a tithe of the labour which is now required for the presentation of the new gross figures. If it be objected that the changes are not worth making, then the answer must be that one of the key elements in economic data—the profit incentive—would then remain a matter of careful but makeshift estimate instead of a quantitative measurement, which is a state of affairs which should only be countenanced in a juvenile, or senile, economic society.

There remains, finally, the familiar series of tables which have appeared regularly each quarter in *The Economist* and have evolved over a period of thirty-four years. It is intended to continue these tables for the moment in their old form, despite their admitted defects, in order to preserve continuity. Table IV (page 798) shows that the total profits of 426 companies, as revealed to shareholders, in the first quarter of this year, were reduced from £91.1 millions to £86.4 millions, while net reported profits fell by nearly 10 per cent from £47.5 millions to £43.0 millions. (It will be recalled that these imperfect net figures are used in *The Economist* index which is set out in Table III.) The gross equivalent of the net reported profits figure (shown in column 3 of Table V) is £68.5 millions, and the percentage breakdown of this figure between preference and ordinary capital is given in the last line of Table VI. It seems probable that the higher gross rate of ordinary dividend paid by the first quarter companies this year is due to changes in the sample, and does not reflect any material change in distribution policy. Lastly, Table IV presents first quarter profits by industrial groups, as revealed in the companies' accounts, without adjustment, for taxation. So far as it is profitable at all to comment on this crude mixture of profits struck at every stage known to the accountant, there is ground for misgiving in the fact that the consumption trades—breweries, stores, food and drink and tobacco—have stood up better to the brunt of war than several basic industrial groups, including iron, coal and steel and textiles.

One dominant feature, however, emerges from all the figures discussed in these two articles. Crude or refined, presented by the accountant or adjusted by the economist, they all point to the completeness of wartime control of profits. One of the advantages of the new series of gross profits figures is that it gives proof of what had been only reasonable inference—that EPT is completely effective, and that net profits have been more than halved since 1938. The ranks of labour should recognise this plain fact. The ranks of capital should ask themselves if anything less would be appropriate in a context of total war.

TERRITORY OF SOUTHERN RHODESIA

SALISBURY MUNICIPAL LOAN.

ISSUE OF £100,000 FOUR AND A HALF PER CENT. BONDS TO BEARER OF £100 EACH.

NOTICE IS HEREBY GIVEN that in accordance with the conditions on which the above Loan was issued the following BONDS were on the 2nd June, 1942, DRAWN for redemption at par on the 30th June, 1942:—

Bonds numbered 272 768 624 505 644 345 432 483 507 407 473 625 422 898 341 907 30 930 38 595. Viz.: 20 Bonds of £100 each.

Present, Kenneth L. Steward, Notary Public representing the firm of Cheeswright, Casey, Duff, Watts and Co., Notaries, 23, Lime Street, London, E.C.3.

The Bonds and all Interest Coupons not then due must be left at the office of the Standard Bank of South Africa, Limited, 10, Clements Lane, E.C.4, three clear days for examination. Payment of principal will be made on and after the 30th June, 1942, from which date the Bonds will cease to bear interest.

In addition to the above, Bonds amounting to £95,200 have previously been purchased and drawn.

For the Standard Bank of South Africa, Limited,
LEWIS L. BAKER, Sub Manager.

2nd June, 1942.

Finance and Banking

Financing the War Loan Dividend

Even though public deposits had been allowed to fall as low as £7.6 millions on the eve of the War Loan dividend, this week's TDR call on the banks was fixed no higher than £50 millions, the equivalent of nominal maturities. It was therefore evident that the authorities were relying upon a substantial surplus of receipts from other sources, and the current Bank return shows this expectation to have been fully justified. In spite of the dividend disbursement of some £31 millions, public deposits have recovered to £16 millions. In addition, Government securities have been reduced by £12.9 millions, suggesting a partial repayment of last week's ways and means advances, though the explanation may equally well have been the running off of short bills. Prior encashments have probably reduced effective TDR maturities to about half the nominal level, while some of the nominally maturing Treasury bills may also have been taken off the market. It is known, too, that the banks transferred the bulk, if not the whole, of their current TDR subscriptions on the early days of the week, a process which tended to damp down their demand for bills in the market. Even so, the very moderate level of floating debt borrowing remains somewhat mysterious, since the current deficit has lately been running at fairly high levels.

* * *

Debt Movements in May

Though the May debt return is the second to distinguish between Treasury deposit maturities and prior encashments, it is the first which permits any inferences to be drawn from this information, since the April return covered a split period. In the five weeks to May 30th, TDR redemptions totalled £113.5 millions, of which £12.5 millions were paid off before maturity to cover subscriptions to new issues. Such encashments, of course, may include deposits falling due within the period. Since nominal maturities in these five weeks amounted to £160 millions, however, it can be said that a minimum of £46.5 millions and a maximum of £59 millions of these deposits had been encashed before April 27th. For the first time in five months, new borrowing against Treasury deposits exceeded repayments, the outstanding total rising by £31.5 millions to £518.5 millions. The weekly demand on the banks has been considered small in relation to the current deficit for the period of £263.8 millions, but it must be remembered that the tender Treasury bill issue was rising by £55 millions. Bank deposits and discounts portfolios, therefore, are likely both to show an appreciable expansion. Of the apparent deficit, too, some proportion did not require domestic finance, since it may be assumed that the £22,934,000 raised against "other debt" must chiefly represent a further instalment of the RFC loan. The Canadian Government contribution is, of course, treated as revenue. As much as £36 millions has been brought in under this head in the past five weeks, indicating that the \$1,000 millions gift has now been drawn upon to the extent of \$180 millions. Over the period, the floating debt shows a net rise of £120.7 millions, which will be almost exactly negated by the further issue, announced after the turn of the month, of £120 millions of 3 per cent Funding Loan, 1959-69, to the National Debt Commissioners.

* * *

Notes and Savings

This week's further rise of £4.3 millions raises the note circulation £41.2 millions above the Christmas peak, compared with an expansion of only £18.5 millions over the corresponding period a year ago. Perhaps the chief point of this comparison is that, from early June to the December peak last year, withdrawals amounted to as much as £116.3 millions. In other words, given a continuance of the recent trend, at least two further increases of £50 millions in the fiduciary issue are likely to be needed before the end of the year. Hitherto the increased demand for

notes seems to have been a perfectly natural corollary of a rising national wages bill. At the same time, it is clearly not unrelated to the disappointing level of small savings, which in the past eight weeks have averaged rather less than £12 millions, compared with more than £15 millions in the first quarter. This, however, does not necessarily indicate a decline in savings taken as a whole. According to the Budget White Paper, "net personal savings" in the second half of 1941 were £81 millions higher than in the corresponding months of 1940, although small savings (sales savings accounts) were £3 millions lower. In the second quarter, on the other hand, the "Kindersley items" were as much as £72 millions higher than in 1940, whereas total net personal savings were £60 millions higher. For the first six months of that year as a whole, the corresponding figures were a rise of £179 millions in personal savings and of £137 millions in the "Kindersley items." It was, of course, in the latter part of 1941 that the unseasonal rise in the note circulation became pronounced.

Turkish Exchange Policy

Drastic changes in Turkish exchange policy have recently been announced. They are designed to achieve two main objectives: first, to correct the payments balance between Turkey and three countries which have since the beginning of the war accumulated appreciable credits against Turkey—the USA, Switzerland and Sweden; and, secondly, to arrest the steep rise in the Turkish price level. For some time past Turkey has bridged the gulf between the official rates for the piastre and the rates measuring its true depreciation by paying premiums to exporters and exacting them from importers. For example, importers from the United Kingdom have paid for their sterling, not merely the official rate of 520 piastres to the £, but a premium of 48 per cent bringing the effective rate up to 770. Out of this premium a substantial but smaller subsidy has been paid by the official exchange office to exporters from Turkey. The exporter to the United Kingdom, for example, has been receiving the official rate plus 40 per cent for his sterling. An appreciable margin has thus been kept by the exchange office. These premiums have, of course, been equivalent to a depreciation of the piastre, and their effect has been to stimulate the upward trend of prices in Turkey. The Turkish authorities have now decided to abolish the premiums applicable to the US dollar, the Swiss franc, and the Swedish crown. The import premium in all these cases is to disappear at once, but exporters from Turkey to these countries will continue to receive the export premium as long as the clearing accounts with these countries continue to show a balance against Turkey. The premiums applied to Switzerland and Sweden were 48 per cent for imports and 40 per cent for exports. In the case of US dollars they were 38 and 25 per cent respectively.

Apparently, this attack on exchange premiums is not being co-ordinated, but is taking place piecemeal wherever the clearing account between Turkey and a foreign country requires adjustment. It remains to be seen whether this highly unorthodox tampering with exchange rates will not do more harm than good. Even in these days of exchange and foreign trade control, the structure of a country's exchange rates is an organic whole, and should follow a co-ordinated pattern. To change some exchange rates artificially without touching the others must create a great deal of disequilibrium. The trade with the United Kingdom and the sterling area, which is now conducted through the Anglo-Turkish clearing and through special accounts in London, and is largely handled by the United Kingdom Commercial Corporation, is not intended to be affected by the change in exchange policy.

* * *

Motor Insurance Rates

The decision of the member companies of the Accident Offices' Association—the tariff companies—to reduce by 20 per cent the rates on private car policies covering road risks reflects the downward tendency in claims ratios for this class of vehicle. The improvement is due to the smaller "exposure" resulting from petrol rationing, coupled with lower traffic density. There have been important offsetting factors, notably the large number of serious accidents arising during the blackout and the increasing cost of effecting repairs; but in the case of private cars these factors, happily, have only partially arrested the improvement making possible the present reduction in rates. With insurances on commercial vehicles, on the other hand, mileages have increased rather than otherwise, and the claims trend has been clearly adverse. The lower premiums for private cars operate from July 1st, and current policies will rank *pro rata* for the remainder of the policy term. Non-tariff companies and Lloyd's underwriters have not yet made announcements, but are understood to have the subject under consideration.

Investment

Falling Equity Yields

An article on page 798 carries a step further the story of the falling return to industry under a regime of total war, EPT at 100 per cent, and a stringent revision of contract conditions. Despite this downward trend and the uncertainties of the past month, May saw a further

FIXED INTEREST AND EQUITY SECURITY MOVEMENTS (July 1, 1935=100)
Financial News indices of 20 fixed-interest securities (converted to new base) and 30 ordinary shares

modest improvement in equities. As reflected in the index of *The Financial News*, set out in the attached chart, the rise is some 2.8 per cent on the month, and the new level is approximately that of February. The less sensitive and more comprehensive figures of *The Actuaries' Investment*

Irish Banks' Returns

The returns for the banks operating in Eire for the March quarter, published by the Currency Commission, are as follows:—

Excess of Assets outside Eire over Liabilities outside Eire	73,994	83,753	...	...	87,936

The trends that have been visible since the beginning of the war continue. The great increase of deposits reflects the accumulation of idle balances by businesses which are unable to obtain stocks. Many of these deposits are in their nature temporary, and the banks have wisely increased their liquid assets. The extreme liquidity, together with the reduction of loans and advances, has had an adverse effect on the banks' profits. It is noteworthy that all the bills held by the banks are commercial bills; no Government bills are held in Eire, Northern Ireland or Great Britain. The net sterling assets continue to expand, but this expansion would be quickly reversed if imports of many essential commodities again became available. The financial situation in Eire appears to be singularly suitable for the borrowing operations of the Government which must soon take place.

* * *

A Good Start

The very modest recoveries of May, detailed above, were accompanied by more considerable rises in South American securities and by a further substantial advance in the securities of companies operating on the fringe of the Pacific conflict. This movement has now reached a point, in some sections, where about half the fall since the entry of Japan into the war has been made good. Prices are, in consequence, around levels at which a great deal more caution is called for. The volume of business showed a slight expansion, and it was continuously reported that it was easier to sell a large parcel than to buy even a small one. This paucity of stock suggested that it would be much easier to secure a further rise than a resumption of the fall, and the favourable interpretation placed upon events in Russia and Libya, coupled with the news of the four-figure raid on Cologne, caused a sharp advance in

equities on Monday. Any lingering doubts about the possibility that the Cologne expedition was merely a *tour de force* were dispelled by repetition of the performance, on an almost equal scale, two nights later; and Tuesday saw an even more substantial advance, which hoisted the industrial ordinary index of *The Financial News* to the highest since the end of the first third of February. At the same time, there was a modest recession in fixed interest stocks which must have occurred altogether outside the Funds, since these were considerably firmer. It is still too

early to draw any definite conclusions as to the summer offensive; but the first brush has had effects characterised as more than satisfactory by the Prime Minister as regards Libya, and which seem to have been similar on the Kharkov front. In addition, the heavier bomber raids seem to indicate a very definite development towards establishing a real second front, which, when supplemented by the American effort, should assume a very considerable importance. In these circumstances, it is not impossible that the summer may bring some revival in Stock Exchange business, with a corresponding rise in equity prices, based on the estimated effect of hostilities on the duration of the war.

Unified Stockbroking

Attention was called in *The Economist* of April 25th to the creation of a joint advisory committee to study problems of interest to London and the twenty-two provincial exchanges who are members of the Associated. At the same time, it was deplored that the Provincial Brokers Stock Exchange remained outside the scope of this new development, since they were still unable to accept the new regulations put forward rather over a year ago, and designed to form the basis for unified practice among members of the profession. The disadvantages of being excluded from the opportunities, which this new body would present, of ventilating grievances and participating in the remodelling of the profession, were so great that it seemed that they must outweigh those arising from the necessity of abandoning certain special practices, doubtless well adapted to the peculiar circumstances of individual members of the PBSE. It is highly satisfactory that, within a fortnight of the announcement, the PBSE had passed, by a very substantial majority, resolutions adopting the regulations of June, 1941, and so placed themselves in a position to participate in the deliberations of the new committee. Both London and the Associated exchanges have, rightly, attached great importance to the adhesion of the PBSE, which represents the large areas where no trading centre exists, and the projected meetings of the committee were deferred until Tuesday and Wednesday of this week, in order that all three parties could participate in its opera-

tions from their inception. Thus, the creation of the first piece of machinery for carrying out the agreement between the two major groups has been the occasion of bringing in the third, and so crowning the efforts of more than a decade of hard work.

Another Step Forward

The advisory committee, in its augmented form, is to consist of ten members, four from London, four from the Associated exchanges, and two representing the PBSE. On the basis of membership, the three groups are weighted very roughly eleven, three and one. Having regard to the decreasing degree of cohesion, the representation is probably as just as could be achieved in a body of manageable proportions. The first members are the chairmen of the London, Liverpool, Glasgow and Manchester exchanges; a representative of Leeds—in the absence of the Bristol chairman—three other members of the London Committee and the Chairman of the PBSE and his Deputy. This body will elect its own Chairman annually after a broken period of 19 months to January 1, 1944, and the first to hold that office is Mr R. B. Pearson, the Chairman of the London Committee. Members are elected by the committees of their groups and hold office for one year, but there are arrangements for sending substitutes. Meetings may be convened at any time by the Chairman on his own initiative or on the request of a majority of the representatives of any of the three constituents. It should, thus, be possible for a matter of importance to any of these to be discussed by all three with the briefest delay. The formation of such a committee has been envisaged by those principally interested for some years past, but, until agreement had been secured on certain essentials, no progress could be made. The new regulations last year provide the necessary basis. The joint advisory committee is the machinery by which further progress is to be achieved. There is no dearth of ideas as to the changes necessary. Some of them were conceived long ago, others arise directly out of the war or will be presented even more acutely by post-war conditions. The committee has thus a long job ahead, which will call for imagination and a great deal of persuasion. Both in its constitution and in its membership there is, however, promise that it is not ill equipped for the task.

Company Notes

Dunlop Rubber Earnings

The full accounts of the Dunlop Rubber Company do not greatly alter the story told by the preliminary statement, discussed in *The Economist* of May 23rd. The rise in the parent company's tax provision is largely counteracted by a fall in the amounts found by subsidiaries and the total is still, in round figures, £4,000,000. This includes EPT, and the report is remarkable in that it states the estimated amount of the refund coming to the parent, at £564,000, subject to tax. No credit is taken for this in the accounts. Details for the past three years are set out below. In this comparison, the provision of the parent towards tax liability for the ensuing year has been deducted from the profits of the year in which it is charged. If instead, the net addition to tax reserve had been treated as part of the sum "earned for ordinary," the earned percentages would have been 30.7, 13.6, and 10.2. The consolidated balance-sheet shows important changes, mostly associated with the extension of the war to the Pacific. Dunlop Malayan Plantations, previously valued at £3,662,634, disappears from the account, and instead is included under investments and advances. These show a rise of £1,880,667, while in the balance sheet of the parent company advances and current accounts with subsidiaries show a reduction of £798,000, caused by the shrinking of trade. Consolidated current assets are up by some £2,970,000 to £22,176,000 odd, almost £2,500,000 of the rise being in cash and interest free loans to the Government. There is an increase in net liquid assets from £11,215,000 to £13,710,000, while net surplus and reserves have increased from £6,931,124 to £7,321,418. These figures exclude the contingent liability on £2,500,000 Dunlop Plantations preference capital, nor is this included in Sir George Beharrell's statement that the whole balance-sheet value of assets under enemy control is more than covered by the specific reserve of £3,250,000. As to the current year, Sir George finds it impossible to give much

guidance. It will evidently be full of difficulties, both as to supplies and because trade relations have been cut to ribbons. But, from the shareholders' standpoint, the effect will be cushioned to a considerable extent by a sharp fall

in EPT liability, which must in the past three years have absorbed a very large part of total profit, possibly something of the order of £1,250,000 to £1,500,000 in 1941, for the parent company, and a similar amount for the subsidiaries.

Marks and Spencer Economies

The full accounts of Marks and Spencer, for the year to March 31st, throw some light on points raised by the preliminary statement, dealt with in *The Economist* of May 9th. As was then suggested, the very sharp fall in tax liability was due to a refund from the earlier year, while it is now made clear that the almost equally heavy drop in profits was, in part, caused by a transfer, whose amount is not disclosed, to stock contingency reserve. The statutory balance-sheet—regrettably, no consolidated statement is provided—shows a drop in stock in trade of £720,000 to £1,279,000, while cash and debtors are down by £862,000, and creditors by £1,188,000. This is eloquent testimony to the falling off in trade, which, according to the chairman's statement, has reduced counter footage and staff by almost one-half. The funds thus released have been invested in gilt-edged securities to the extent of £500,000, while £397,000 has gone in additional advances to subsidiaries. There is no hint as to the use to which these are put. Excluding the last item, there is an increase of some £107,000 in net liquid assets, and this, together with the advances in question, have been financed by a net reduction in fixed assets of £36,000, after depreciation, and a rise in reserves and carry forward of some £92,000. There is no mention of a stock contingency reserve. The profit has owed something to the export corporation, which has done good work in America, but, from now, exports will be on a limited scale. The company has concentrated upon the provision of utility goods, which would seem to suit its pre-war disposition, and, at the same time, the raising of the price range has made possible improvements in quality, style and taste of the goods offered. It seems probable that this year must bring a further reduction in earnings, while it is far from clear what the tax provision will be. It is very doubtful, however, whether equity earnings can be maintained. The "A" ordinary shares of 5s. yield, at 36s. 6d. ex-dividend, some £4 16s. per cent.

Smithfield and Argentine Meat

The accounts of Smithfield and Argentine Meat for 1941 show a striking recovery in profits, based on a very considerable expansion in business. Total income is up from £64,394 to £151,901, the best since 1934. There is, however, a provision of £51,000 against nil for taxation, while depreciation receives the customary £25,000. Consequently, equity earnings amount to £19,884, against a

deficit of £15,644, representing a rate of 3.9 per cent against nil. The dividend on ordinary stock, which received no distribution in 1940, is restored to the 2½ per cent paid in the two previous years, and it is possible to raise the carry forward from £42,671 to £46,930. The improvement is the result of two main factors which are discussed fully in the statement of the chairman, Sir James Caird. There has been a marked increase in slaughtering and in the output of the canning department. There has also been an important technical development which has succeeded in cheapening transport costs. The discovery of a new quick-freezing process for boneless meat makes possible a saving of some 35 per cent of transport and storage space. There is every probability, as the chairman points out, that this process will come into general use. There have, of course, been adverse factors, in particular the difficulty of obtaining tin-plate, stores and fuel. Moreover, the considerable capital expenditure during the year on equipment and buildings—which does not include expenditure on the new freezing plant, due to be charged against the expenditure of the current year—together with delays in tonnage unloading and the weight of taxation, have imposed a considerable strain on liquid resources. The strain would have been greater but for pre-war purchases in anticipation of such a need. That it was still large is evident from the balance sheet, which shows an increase in the bank overdraft from £19,455 to £53,859, and a fall in cash holdings from £47,329 to £29,642. The scope of the expansion in business is reflected in the rise in debtors from £63,919 to £188,388 and in creditors from £372,380 to £545,425. Stocks have risen from £336,152 to £504,094, but the increase in general stores from £235,700 to £295,039 is, allowing for the higher price level, extremely moderate. The expansion in business last year is, of course, the direct result of the development of wartime food policy. It is the improvement in the process of quick-freezing which is the most encouraging pointer to the maintenance of larger profits. The £1 ordinary stock at 12s. 6d. offer a yield of £4 1s. 7d. per cent.

Fine Spinners Accounts

The full accounts of Fine Cotton Spinners, whose preliminary statement and the cash offer for the Funding Certificates were discussed in *The Economist* of May 30th, show total profits of £632,100 against £823,861. Depreciation receives £120,000 as before. After meeting the preference dividend, equity earnings amount to £92,548, if the provision for redemption of funding certificates and of £80,000 for writing down basic stock, are treated as charges against profits. On this basis the 3 per cent ordinary dividend, the first since 6 per cent was paid for 1939-40, is covered by earnings of 3.4 per cent. There is no transfer to war contingencies against £200,000, and after crediting £3,128 profit on sale of investments, the carry forward is raised from £178,599 to £194,025. The balance-sheet shows an important reduction in surplus liquid assets, for which the part payment of preference arrears in cash, provision for redemption of funding certificates, and the payment of an ordinary dividend, are responsible, from £2,430,959 to £2,020,901. There is a decline in both debtors, from £1,120,487 to £743,465 and creditors, from £970,120 to £825,088, which argues some contraction in business last year. Stocks are significantly reduced from £2,142,866 to £1,666,752, a decline which explains the rise in cash holdings from £489,204 to £667,881, and a considerable increase in net advances to subsidiaries. The advantage which shareholders can hope to draw from the reconstruction depends, of course, on the trend of business, and the extent to which war, and still more post-war, conditions make it possible to maintain profits at around the present level. No doubt the supply of raw material is the most vital consideration for the immediate future. The £1 ordinary shares, at 9s., yield £6 17s. per cent.

The urgent necessity of recovering waste paper from every possible source has been recognised by the formation of the Waste Paper Recovery Association, under the auspices of the Newspaper Proprietors' Association and other newspaper societies. In a very large number of cases, books, vouchers, documents, etc., are held for a longer period than is legally necessary. The Association are anxious that secretaries and accountants of companies should get into touch with them for advice on these points, as well as information as to the collection and disposal of waste paper (Central 1345).

CITY OF PORT ARTHUR

FIVE PER CENT DEBENTURES

The City of Port Arthur announces that the INTEREST COUPONS of the above-mentioned Debentures maturing 1st July, 1942, may be PRESENTED on and after the 17th June, 1942, between the hours of 10 and 2 o'clock (Saturdays excepted) at the Bank of Montreal, 47 Threadneedle Street, E.C.2.

Three clear days required for examination.
 Lists may be obtained on application at the Bank.

MIDLAND ELECTRIC CORPORATION FOR POWER DISTRIBUTION LIMITED

NOTICE IS HEREBY GIVEN that the TRANSFER BOOKS of the 3½ per cent First Mortgage Debenture Stock, 1965-73, of the Company will be CLOSED from the 16th to 30th June, 1942, both dates inclusive, for the preparation of Interest Warrants.

Warrants will be posted on the 29th June, 1942.

By Order of the Board,

C. HEATHCOCK, Managing Director.

Toll End Road, Tipton. 30th May, 1942.

AVELING-BARFORD, LIMITED

At a Meeting of the Board of Directors held on Tuesday, the 2nd June, 1942, the following Resolutions were passed:—
 It was resolved that dividend be paid on the 1st July, 1942, on the 175,000 Cumulative Preference Shares of £1 each at the rate of 5½ per cent. per annum for the six months from the 1st January, 1942, to the 30th June, 1942.

It was resolved that the Preference Share Transfer books of the Company be closed from the 17th June to the 30th June, 1942, inclusive.

By Order of the Board,

E. ODDS, Secretary.

Grantham, 2nd June, 1942.

Industry and Trade

Aircraft Production

Before the two devastating raids on German industrial centres, there was a tendency to belittle the efficiency of the bomber as an instrument of economic warfare. The size of the bomber fleet was considered inadequate, and its employment has been spasmodic and subject to prolonged interruption by unfavourable weather in the winter, and by short nights in the summer. Moreover, the view had been expressed that while the deficiency in numbers could be rectified in time, the defence against the night bomber would become efficient to the point of rendering large-scale operations increasingly unprofitable. The significance of the two raids lies not only in their destructive effect, but also in the proof they provide of the increased striking power of the RAF, and of its ability to strike hard into Germany's industrial vitals without an unduly high proportion of loss, during a short summer night. In fact, the results of the two raids are highly encouraging, especially as the balance of aircraft production has now swung decisively to the side of the United Nations. But the bombing of Germany's industrial centres can only become decisive when sorties of upwards of 1,000 can be made with a measure of regularity. This, as Mr Churchill pointed out in the House of Commons on Tuesday, is not yet possible. The very fact that impressive results can be achieved by large-scale and regular sorties emphasises the need for yet greater efforts in production. Moreover, the bomber is not the only type needed in ever-growing numbers. Great strides have been made in the production of aircraft, and in the training of crews, in securing the right types in the right proportions, in securing "balance" between numbers and quality, and in Anglo-American collaboration. Across the Atlantic, production is rising by leaps and bounds. But further improvement is possible under all these headings. Indeed, there are still many shortcomings in the balance of types and in the organisation of production that can and must be rectified. Certain specialised types of proved value in air warfare are still not available at all, while others are seriously deficient in numbers, or of inferior quality, and there are still indications in this country of lack of synchronisation in the production of parts, and in their flow to the assembly shops.

Regional Production Boards

It is a setback that the reorganisation of the regional boards has been delayed by Mr Lyttelton's visit to the United States. Moreover, since the publication of the report of the Citrine Committee, together with the Government's proposals of action, criticism has been directed by employers' federations and trade unions against the decision of the Government to ask for the resignation of the industrial members of the boards. These consisted of three representatives of employers and three representatives of labour in each region, and they have hitherto provided both the chairman and the vice-chairman of the boards. The point at issue apparently is whether or not employers and workpeople should be represented on the executive committees of the boards. The Citrine Committee suggested that the committees should be composed of the regional controller, two vice-chairmen (one representing employers and the other labour), and representatives of the three Supply Departments and of the Ministry of Labour. But the Government is understood to hold the view that, at least to begin with, they should consist only of officials. There is much to be said, admittedly, for the need for "preserving an independent point of view in the work of the boards," which was emphasised by the Citrine Committee and is now being echoed by industrialists. But it is very questionable indeed whether the only way to secure "independence" is by bringing industrial members into the executive committees, straight away. Indeed it is an odd vocabulary which regards Government officials as "dependent" in contrast to the "independence" of "representative industrialists."

Fuel Rationing in Abeyance

While the Government has accepted in principle the substance of the Beveridge plan as the most practical and effective method of rationing the consumption of domestic fuel, it has unfortunately decided to hold it in reserve, pending the outcome of a publicity campaign, in which

Mr Churchill is to be one of the speakers, designed to secure an equivalent voluntary reduction in consumption. The scheme adopted for introduction, if this "should at any stage become necessary," is a points rationing scheme; one cwt. of coal or coke equals 5 therms of gas, 100 units of electricity or 2 gallons of paraffin. There is to be a household ration and a personal ration. The personal ration is 7½ cwt. a year for all persons, and supplementary rations may be given for special needs. The household ration varies with the number of habitable rooms and with locality, to allow for climatic variations. The scale is given below:—

HOUSEHOLD RATION PER YEAR
(In terms of Coal)

No. of Rooms	Scotland and North of England cwt.	Midlands cwt.	South of England cwt.
1	40	30	25
2	45	35	30
3	55	45	35
4	60	50	40
5	70	55	45
6	75	60	50
7	85	70	55

In the case of houses with more than seven habitable rooms—these amount to only 15 per cent of the total—the household ration will be based on the number of residents, but no extra allowances will be given unless there are at least four residents. It is expected that the ration will involve no reduction for about a quarter of the existing households. But it is difficult to reconcile the ration scales with paragraph 16 of the scheme, which provides that

if any householder satisfies the local fuel overseer that his previous consumption was not unduly high, it will not be cut by more than 33½ per cent.

This overriding provision is clearly a special concession to the larger households, to those who have consumed expansively in the past, and is therefore to be condemned, especially as there is already provision for the granting of supplementary rations for special needs. Presumably, in order to prevent a switch-over from coal and gas to electricity beyond the capacity of the electricity supply industry, consumption in any household during a half-year must not exceed that in the corresponding period of the previous year. All administrative preparations will be made to enable the scheme to be introduced at short notice; meanwhile the restrictions on the delivery of solid fuels are to be maintained.

Black Market Prosecutions

With the April statistics of prosecutions under the Food Control Order, the Ministry of Food has published figures showing the general incidence of penalties. This step is timely, indeed, overdue. The actual figures are heartening in that they show the majority of the penalties inflicted to be of relatively small intensity, and, presumably, the punishment fits the crime. Of the 2,323 successful cases in April, 184 were dismissed under the Probation of Offenders Act; fines of £1 and under were inflicted in 797 cases; fines between £1 and £5 in 826 cases; fines between £5 and £10 in 246 cases; fines between £10 and £20 in 106 cases; and fines exceeding £20 in 108 cases, while in 56 cases sentences of imprisonment were imposed. The 2,487 prosecutions were undertaken against 278 wholesalers, 989 retailers, and 1,056 "other offenders." Offences against the Maximum Prices Orders, and of supplying or obtaining foodstuffs without proper authority, are the types of offence most common. The Ministry of Food now appears to be adept at catching the small fry swimming in the black market pool, but the Board of Trade has announced the intention, through ex-Superintendent Yandell, who became Chief Enforcement Officer this week, to catch the "big fish." Mr Yandell's interest in the petty type of offence is small, but he is determined to stamp out large-scale black marketing. The Ministry of Food and the Board of Trade each can teach the other. Morally, it is as important to stamp out the smallest transgression as the largest. But since the largest transgression causes most disruption, the greatest effort should be concentrated in its detection. It would be of interest if the Board of Trade were to publish figures of prosecutions as the Ministry of Food does.

Bakers' Subsidy

It is the policy of the Ministry of Food to keep down prices of certain essential foods by means of subsidies. One of the most important of these foods is bread, and the price has been reduced from an average of 8½d. per quartern loaf immediately before the war, to 8d. The price of flour to bakers was controlled on September 3, 1939, at 22s. per sack of 280 lbs., and increased in May, 1940, to 25s. 6d. The first subsidy to bakers was granted in December 1940, at the rate of ½d. for each quartern loaf baked and sold at 8d. In October last year the price of flour was raised to 33s. 3d. per 280 lb. sack, the price of bread was stabilised at 8d., and bakers were subsidised at the rate of 7s. 9d. per sack of flour—the whole extent of the rise in price. This subsidy, however, took the place of the original one of ½d. per quartern loaf. At the same time an additional temporary subsidy at the rate of ½d. per loaf was granted to bakers for a limited period pending evidence on the cost of baking and distributing bread, in support of their claim for this additional subsidy. An investigation was made and figures agreed between a firm of accountants appointed by the National Association of Master Bakers and the Director of Costings in the Ministry of Food. As a result, the Ministry has come to the conclusion that no justification exists for the extra subsidy of ½d. per loaf, and it believes that prices could be maintained without the ½d. grant. The bakers, on the other hand, insist that the costings are based on averages and that some bakers could not produce and sell bread at the present price without subsidisation. In view of the results of the investigation it would be a pity if the Minister were persuaded by bakers to continue the subsidy.

* * *

Pencils Controlled

A Board of Trade Order has decreed that from June 1, 1942, pencils are to be manufactured in a limited number of degrees and colours and unpolished. Few will regret the passing of the fancy pencil of "novelty" shape and colour; the advertisers' gift pencil of low quality lead and high quality paint and polish will be a small loss even to a drab war time world. The small ornate pencil which used to dangle by a piece of bright cord from our ball programmes has been lost to us these many months and the pencil is coming into its own as a tool of a trade or perhaps of several trades. The more recent development of the pencil cannot be regarded as progress in either a utilitarian or an aesthetic sense. The pencil with the rubber top which always fell off and was lost, the inefficient, propelling pencil for which refills were often not obtainable and the empty cases of which clutter up all our desks, the bridge pencil, the point of which seldom survived the rubber, will all pass unwept. If the raw materials of pencils are to be limited, the needs of the accredited pencil users must be safeguarded. The draughtsman must have his hard pencil to draw the lines of infinitesimal marking. The staff officer must have the coloured pencils to mark his map in such a way that he knows at a glance the course of the battle. The censorial and editorial blue pencil must not be crowded off the market by the free distribution pencil advertising Buggin's Beer. If the interest of legitimate pencil users is fully safeguarded the control of pencils is both timely and welcome.

* * *

Mexico's Raw Materials

Mexico is potentially one of the world's richest sources of raw materials. Hitherto development has been hampered in agriculture, controlled mainly by Mexicans, by the lack of capital and transport facilities, and in the production of minerals, controlled almost exclusively by foreign capital, by political instability. Mexico's entry into the war is likely to usher in a period of rapid economic expansion. Discussions between the American and Mexican Governments,

aiming at an immediate increase of Mexico's raw material production with the help of United States' capital, have already reached an advanced stage.

*

There are two agricultural products which Mexico will be able to supply without delay. They are henequen, a hard hemp fibre, and guayule, a cabbage-like rubber plant. The production of henequen, which can be used as a substitute for Manila hemp and sisal, has fluctuated between 80,000 and 125,000 long tons per annum in recent years, a quantity which roughly equals the combined sisal output of East Africa. Guayule production reached about 4,500 long tons in 1941, a figure which is expected to be doubled from existing cultivations within the next year or so. A silk industry could be established without difficulty; soil and climate are unusually favourable, wild mulberry trees are abundant, and Allied supplies are short. Mexico's chief contribution to the raw material pool of the United Nations, however, will consist of minerals. In recent years, production has been below capacity, largely because of political instability. For several centuries, Mexico has been the world's largest silver producer; in 1941, output was 80 million ounces, against 105 millions in 1930. Mineral oils and non-ferrous metals are produced in large quantities. Oil production has been depressed since 1938 as a result of the expropriation of the foreign companies in that year. In 1941, output amounted to 43,837,000 barrels, compared with nearly 47 million barrels in 1937. Among metals, lead and zinc are by far the most important. Lead production fell from 248,000 metric tons in 1929 to 155,000 tons last year, zinc from 174,000 to 155,000 tons, and copper from 86,600 to 49,000 tons. In addition, Mexico supplies substantial quantities of other metals such as antimony, quicksilver, molybdenum and cadmium, as well as small quantities of tungsten, chrome and tin, all of which are essential raw materials of the munitions industries. With assistance from the United States, the output of many materials can rapidly be increased. Since July, 1941, the whole surplus of Mexico's strategic minerals supplies has been acquired by the United States Metals Reserve Company under an agreement which runs until the end of this year. Although this agreement only provides for the payment of "current market prices," it has had a marked effect on production. Arrangements which bring Mexico within the Allied sphere of active development will greatly intensify the rising trend of production.

* * *

Domestic Pottery

The quantities of household pottery on sale in recent months have been extremely small, and prices have risen inordinately. Kitchen cups and saucers, which before the war fetched 6d., were recently selling at three and four times that price. An attempt had been made to deal with the problem of supplies by permitting the supply, outside the quota, of plain undecorated pottery. The Domestic Pottery (Manufacture and Supply) Order (S. R. and O. No. 1038), which came into force on June 1st, prohibits the manufacture of domestic pottery except under Board of Trade licence, and manufacturers and suppliers must comply with such directions as the Board may issue regarding the manufacture, supply and acquisition of these articles. On June 1st the Limitation of Supplies Order ceased to apply to pottery, and manufacture is now limited to a list of relatively essential articles such as cups, saucers, plates and teapots. These articles will be manufactured only in plain white or light ivory, undecorated and unembossed, and will be in three grades, "A," "B," and "C," for which prices have been fixed. For example, cups and saucers will be 11½d., 10½d., and 10d., according to category. The Order will fulfil the twofold function of releasing pottery decorators for other work, and of bringing pottery prices back to within the reach of the average consumer. It is estimated that 90,000,000 cups are broken annually in household use, while the percentage of breakages is highest in catering establishments. It is hoped that by a further 20 per cent cut in exports in August it will be possible to put 80,000,000 pieces of utility crockery on the home market, to which it is expected that the plastics trade will be able to add another 10,000,000 pieces. An appeal is being made to the public to economise in their purchases of crockery, and particularly to buy piece by piece as need arises, and not to buy whole sets. The utility pottery is not expected to be in full supply until August, but control of similar goods will apply from June 10th on a class "A" basis.

COMPANY MEETING

SMITH'S POTATO CRISPS (1929) LIMITED

SIR HERBERT MORGAN'S SPEECH

The thirteenth ordinary general meeting of Smith's Potato Crisps (1929), Limited, was held, on the 3rd instant, in London.

Sir Herbert Morgan, K.B.E. (the chairman), in the course of his speech said: After making handsome provision for taxation of £132,203 we have left a net profit for the year of £80,065 as against the corresponding figure of £78,519 for the previous year. We are proposing the same dividend as last year and also the same cash bonus. This fact I have no doubt you will accept as the best proof that can be offered of the continued success of your company, which yearly grows from strength to strength. The strength of our position is very conclusive proof of the value of our company to the community.

While we have been subject to limitations I should like to place on record that because of the essential and highly concentrated food value of our product, the many Government departments we are concerned with have treated us with fairness and justice. They are helpful to those deserving help. Your board—and we feel the shareholders as well—are proud of a company which has created a national article of diet, the value of which is such that it plays a more important part in these critical times than ever before, in assisting to feed the people.

It must be remembered that Smith's Crisps, compared to the ordinary potato, are more nutritious and produce more heat and energy. Smith's Potato Crisps are 92 per cent. solid food—the ordinary boiled potato 18 per cent. Crisps contain 33 per cent. of fats owing to the fine oil in which they are cooked. All the mineral salts are preserved, encased in oil—and remember, our Crisps do not fatten. Not only are they supreme in value as food, but their nature is such that they exactly suit the lives of millions of people living under war conditions.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

THE generally cheerful conditions at the end of last week were fully maintained in the early part of the current week on the news of the latest air offensive against Germany and the reports from Libya and Russia. Small improvements were general throughout the markets, but turnover failed to expand, although there was rather more activity in South American bonds. Fair business in the gilt-edged market occasioned several improvements among the medium dated stocks, among which 3 per cent Savings Bonds 1955/65 gained ¼ on Tuesday. Among irredeemable issues 3½ per cent Conversion was particularly firm, but Old Consols and Local Loans after easing ¼ on Friday remained steady. Interest in the foreign bond market was centred on South American securities, buying of stock in short supply raising prices sharply. The news of increased copper output occasioned a spurt in Chilean issues on Tuesday, most issues rising 2 points, while Brazilian loans were firm throughout on steady support. Mexico's declaration of war led to some buying of the 5 per cent loan of 1899, which after earlier gains rose 1½ points on Tuesday, while the 6 per cent Treasury bonds also showed marked improvement. The home rail market was inactive, and apart from a gain of ¼ for GW ordinary at the reopening and ½ for Southern deferred, prices were generally unaltered. Brazilian rail issues provided the chief interest in the foreign rail market, the 4 per

cent Leopoldina debenture rising 4 points before the week-end, while the 5½ per cent preference stock advanced 2 points at the reopening, and San Paulo ordinary a point on Tuesday. There was little of interest in Argentine rails, but among Canadian Pacific stocks the 4 per cent preference rose 1½ on Tuesday. Some enquiry for short-dated funds raised prices slightly, while Peruvian bonds were particularly strong in midweek.

*

There was a little more activity in the industrial market than of late, where the upward trend of prices is a reflection of the marked shortage of stock rather than continued buying. Among brewery shares Courage advanced 1s. at the reopening, while Distillers were slightly easier, but prices in general showed little change. Tobacco issues, however, were firm throughout, BAT advancing ½ on Tuesday after earlier gains, and Carreras "A" ¼, while on Friday Imps rose ½. A gain of 1½ for Leyland was the largest movement in a quiet motor and aircraft section where Morris was a little better. Tilling and Dennis Bros., however, weakened slightly before the week-end. In the heavy industrial group colliery issues were neglected, Bolsover and Stavelly both weakening slightly, but prices generally moved within narrow limits where changed. In midweek, however, Shipley Colliery lost 1s. 3d. Shipping issues enjoyed several small improvements, but business was quiet throughout. Textile shares were firm on steady provincial support, and gains, while small, were widespread and persistent, British Celanese Second preference reaching its highest level for several years. In the miscellaneous section, Emmies and

UNIVERSAL DEMAND

Our consumers represent every section of the public, particularly His Majesty's Forces and the British workers. The Army, Navy, Air Force and the British workers deserve very special consideration in everything concerning their food. They represent the energy, skill and determination of the nation. If I may express a very personal view, I believe that the mass of the workers of this country, while welcoming direction and a reasoned presentation of the necessity for their own individual output, are sometimes over-preached to. Most of the urges which have been applied to the stimulation of greater output are accepted by the vast majority of men and women with enthusiasm. They must not be deadened and confused by too many exhortations from too many sources for too many purposes.

So far as our own staff is concerned, the full knowledge of the purpose they serve in producing our particular form of food for those engaged in the war effort, gives them all the incentive they need. They like to feel they are serving—and believe they are serving—a useful, necessary and national cause. In this difficult year they have continued to put all they know into their work.

A HOME-GROWN PRODUCT

To us, it is cause for pride that the potato which we produce as Smith's Potato Crisps not only is a home-grown product, but is largely grown by ourselves in the wonderfully fertile soil of the Eastern Counties. As you know, not only have we our own farms of upwards of 10,000 acres, which make an important contribution to our particular product, but we are also growing under contract potatoes on large areas of the finest farming land in England. Naturally, it will be understood that our estate, which is administered under the most scientific principles, is not limited to the growing of potatoes. It also makes a very substantial contribution to the country's food supplies in wheat, barley, oats, sugar beet and live stock—pigs, sheep, and cattle.

In the history of the company we have always had full support from the hundreds of thousands of distributors who supply our Crisps, and we again thank them. Our old allies, the Licensed Trade, carry on in face of increasing difficulties, but maintain their position as valuable servants of the public.

The report was unanimously adopted.

*

Apart from some buying from the Cape at the reopening the *kaffir* market was rather quiet. Changes were few, Crown Mines rising ½ on Monday when Rand Mines recovered Friday's loss of the same amount, while West Wit. Areas advanced ½. Despite the lack of enquiry the *rubber* market was steady, a number of small gains being registered. The shortage of stock restricted business in the *tea* market, prices remaining strong on steady demand. Activity in the oil market was restricted to the leading issues, Anglo-Iranian advancing ½, Shell and Burmah each ¼ at the reopening. The next day Anglo-Iranian jumped ¾ and Shell ½, while other issues were also marked up slightly. The maintenance of the Shell dividend left prices largely unaltered, but in the *tea* and *rubber* markets prices continued to improve in midweek.

FAMOUS SINCE 1795

OTARD'S

COGNAC BRANDY

New York

AFTER the dull conditions which had prevailed on Wall Street before the Memorial Day holiday, there was a sharp improvement on Monday. Gains of a point and more were spread over many industrial issues, Chrysler and Montgomery Ward both reaching new high levels for the year. The following day, however, the failure of the market to respond more strongly to the war news led to some lightening of speculative commitments, but despite small losses no weakness was apparent. Better war news in midweek failed to produce any appreciable recovery.

COMMODITY AND INDUSTRY NEWS

Paper Control.—The Control of Paper No. 46) Order, which came into force on May 31st, consolidates previous Orders relating to the maximum prices chargeable for waste paper-making materials. A few minor adjustments have been made of certain categories of waste paper, and old manilla and sisal ropes. Provision has been made for fixing maximum prices by direction for any new categories of waste paper which are not included in the schedule to the Order.

Export Control.—By the Export of Goods (Control) (No. 25) Order, which comes into force on June 16th, licences will be required to export trunks and suitcases wholly or mainly of metal; buffalo pickers; and clocks and clock movements. The existing control in respect of knitted, netted or crocheted goods wholly or mainly of wool is extended to cover similar goods made wholly or mainly of wool and cotton.

Argentina's Grain.—The final official estimates of Argentina's grain and linseed crops were published recently. The figures are given below with the final estimates for 1939-40 and 1940-41, for comparison:—

	Final Estimates 1939-40	Final Estimates 1940-41	Final Estimates 1941-42
Wheat—			
Qrs. 480 lbs.	14,928	33,948	28,009
Oats—			
Qrs. 320 lbs.	6,023	3,719	3,242
Barley—			
Qrs. 400 lbs.	4,680	4,332	2,106
Rye—			
Qrs. 480 lbs.	1,587	975	723
Linseed—			
Metric tons.	1,014	1,460	1,600

Fruit and Vegetables.—The Minister of Food has made the Fresh Fruit and Vegetables (Restriction on Dealing) Order, which will come into force on a day appointed by the Minister. The Order requires that wholesalers, selling agents and buying agents are to be licensed on that day; prescribes the wholesale channels through which controlled and uncontrolled produce may be marketed; and prescribes

the records of transactions in fresh fruit and vegetables, which are to be kept by growers and distributors. The Order applies only to dealings otherwise than by retail in all fresh fruit and vegetables, except potatoes and carrots.

Knitted Goods Exports.—Two committees have been appointed by the Board of Trade to advise on the release for export of knitted woollen goods. One committee, under the chairmanship of Mr. Thow Munro, will act for Scotland, and the other, with Mr. L. R. Allen as chairman, will act for all other exporters of knitted goods.

Lace Concentration.—A scheme for concentrating the production of the lace manufacturing industry has been approved by the Board of Trade. The 60 or so firms are to be concentrated into one corporation, known as British Lace Furnishings, Ltd. Closed firms will receive a share of the profits and a care and maintenance grant.

Industrial Caterers.—Firms engaged in organising and operating canteens in war

factories under the Factories (Canteens) Order, 1940, have formed the National Society of Caterers to Industry. Mr. H. J. R. Stent, of Barker's (Contractors), Ltd., is president of the Society, and Mr. Arthur Lawson, formerly of the Board of Trade, has been appointed secretary. A national joint industrial council has been set up to provide the machinery for joint action between the employers and employees in the industry.

Your Guide to War Savings

Issued for your information by the National Savings Committee.

3% Savings Bonds (1960-70)

A full Trustee Security (no limit to holdings). Available in units of £50 or any higher multiple of £50 through any Bank or Stockbroker. Interest (subject to Income Tax) accrues from date of purchase, and is payable half-yearly. There are separate issues (max. subscription £1,000) for the Post Office and Trustee Savings Banks—minimum first subscription £10 and subsequent minimum £5.

Post Office and Trustee Savings Banks.

Interest at the rate of 2½% per annum. You can open a Savings Bank account in the Post Office Savings Bank or in a Trustee Savings Bank with a deposit of 1/- and upwards. Your money will be safe. It will be readily available if needed. It will earn good interest and will be helping the war effort so long as it remains on deposit.

3% Defence Bonds.

Can be bought in units of £5 from any Bank, Stockbroker, Post Office or Trustee Savings Bank. Interest paid half-yearly, and Income Tax not deducted from it at source. Repayable in ten years with a bonus of 1/- for every £5 invested. Individual holdings limited to £1,000. Can be cashed at par at six months' notice.

2½% National War Bonds (1949-51)

An ideal short-term security. Price of Issue £100 per cent. Subscriptions of £100 or any higher multiple of £50. Interest is payable half-yearly. Interest accrues from date of purchase. Obtainable from all Banks and Stockbrokers. There are Post Office and Trustee Savings Bank Issues for this Security.

National Savings Certificates.

Cost 15/- each and become worth 20/6 in ten years. Increase in value free of Income Tax. Can be bought at any Post Office, Bank, Trustee Savings Bank, through National Savings Groups or through Honorary Official Agents. Individual holdings limited to 500 Certificates. Can be cashed at any time by giving a few days' notice.

On to Fortune

THERE have been few times since the war started when the war news has sounded better, even to the soberest observers, than in recent weeks. The new Treaty with Russia is discussed on another page. It is a landmark in the war—and in history. In the Eastern Pacific it seems that, if the Alaskan pincer can be broken, a limit may have been set to the advance of Japan. On land, in the Ukraine, the Germans were forestalled and battered. Before Sebastopol and Tobruk, they have been battered and so far held. In the air, a heavy threat hangs over their Western cities and arsenals.

There is, however, another side to the medal. China is reeling from heavy blows at its vitals. Germany is still immensely powerful in arms. The battle in Libya hangs in the balance; the biggest battles in Russia have still to come; a new attack in the Kharkov area has already started. Japan is strongly entrenched in East Asia and the South Seas. Over-optimism now would be as fatal as complacency was two and a-half years ago. This is not the end. The end is not even in sight. Those people who speculate on a quick finale to the war in the next few months are wasting energy. This could only happen by a negotiated peace with the Nazis, which is not possible, or by the internal collapse of Germany, which, though by no means impossible, certainly ought never to be taken for granted.

But, although this is not the end, it can be the beginning of the end. The elements of victory are now at hand. In every battlefield, the enemy is meeting his match. In his captive countries, organised resistance is ready and waiting. Taken as a whole, British war production has doubled in the past twelve months; aircraft output has doubled since the last quarter of 1940. Across the Atlantic, the massive industrial power of the United States is pouring out the products that will decide the issue. American output has overtaken British output already; soon, Mr Lyttelton has announced, it will be "far ahead." Anglo-American aircraft production is half as big again as the production of all the Axis powers. The Germans can have no hope now of an outright victory. What they are still working for, with their military strength and their guile in propaganda, is a stalemate victory. Their hope is that the democratic peoples of Britain and the United States will not be willing to see the struggle through to the final act. The longer the day of reckoning can be put off, the Germans argue, the less likely is it to come. Peace without defeat is their opportunity. They are in possession of great spoils to bargain with. This, above all, is the reason why British and American hopes should not be fastened upon a quick end to the fighting. Total victory must be the Allies' goal. The end may indeed be quicker than has seemed likely at any time since the war broke

out. But the speed of its coming will be in direct ratio to the extent to which the United Nations work and act and think as if every ounce of effort and sacrifice were required for an indefinite time to come.

The truth is that a new stage of the war has begun. Until lately, the task was to hold the aggressor and to build up productive capacity and stocks of weapons. Now the task is, not only to make more weapons, but to use them in attack. The new stage really started when the Russians broke the German assault last autumn. It was the Russian armies which set the door of opportunity ajar, and they have held it open. In December, when the United States went to war, still another door was opened—in the West. In January, Mr Churchill came back from Washington with plans to pool the munitions, the ships and the raw materials of this country and the United States. This week another stride forward has been taken. Plans have been announced to complete the organisation for the most effective use of the combined resources of the two countries. Two new bodies are to be set up: the Combined Production and Resources Board, headed by Mr Donald Nelson, the Chairman of the War Production Board, and Mr Oliver Lyttelton, Minister of Production; and the Combined Food Board, headed by Mr Wickard, Secretary of Agriculture, and Mr R. H. Brand, chief of the British Food Mission in the United States. The function of the Production Board will be to combine the production programmes of the United States and the United Kingdom into a single integrated programme, which will be adjusted continuously to strategic and military requirements, as indicated by the Combined Chiefs of Staff Committee. Thus, what has been attempted in this country by the appointment of Mr Lyttelton, to bring output and strategy into line in all plans and programmes, is to be carried into the wider sphere of Anglo-American co-operation. Production will still remain the responsibility of its directors in each country. The new Board will be responsible for the maximum utilisation of productive resources in a common plan. By the concentration and standardisation of war production, each nation's facilities will be used to the utmost, overall demands on shipping will be cut down to a minimum and the essential needs of the civilian populations will be safeguarded. These are the goals. In fact, there are still too many loose ends in the organisation of production and the mobilisation of facilities in the United States for them to be realised at once. There are ragged edges in Anglo-American co-operation. The joint shipping pool is still not in practice a complete pool. But, in intention and in organisation, munition resources, raw materials, shipping, productive facilities and food, all these have been pooled between the two Governments. It is an impressive spectacle.

War economy has become international. The kind of planning and central production which each separate belligerent has found necessary is to be applied now astride the Atlantic. The concentrated methods of industrial production which each country has found necessary to employ its capacity to the full for war purposes are to cut across frontiers. The process which began with Lend-Lease is to be carried into its final stages. There is an augury in this, not only for the war, but also for the peace. It has been plain ever since 1939, when the war potential of Britain and the United States was little more than a column of statistics, that if the industrial strength of these two countries could be mobilised for battle, the war could only end in one way—the defeat of Germany. The entry of Japan and the Far Eastern disasters that followed did nothing to alter the ultimate balance. The significant point now is that this balance is being struck, not on paper or in speeches, but in workshops and factories and in the field. When the goods and services of the two western democracies have aided the manpower of all the United Nations to end the fighting, a new chapter will start in which their goods and services, and their willingness to buy the goods and services of other countries, can again determine the future of the world. The Russian Treaty, which provides for co-operation between Britain and Russia in the defence and development of Europe, is an essential precondition of peace and

progress. Lend-Lease and the Combined War Boards of Britain and the United States are fore-shadows of the chance that the two democracies will have in peacetime to make real the aspirations towards a better, freer, more spacious, more prosperous, more expansive and more just world which have been voiced so notably in recent weeks by American statesmen. By their skill and sense of responsibility in freeing the channels of world trade, spreading the benefits of world investment and raising the yield of the world's labour, Britain and the United States will have a joint task no less important than the joint assault that they are now concerting against the world's enemies. If they will, they can free and unfetter the resources of the earth—and, if they choose otherwise, they can bind and cripple them.

It should not be supposed that this emphasis upon the combined role of Britain and the United States in war or in peace implies any derogation of the part that must be played by the other great countries. The Russian Treaty is clear proof to the contrary. The United States and Britain are the core of the war effort because they are the exporters. Russia and China, the importers, are the crust. If they had not held, the war would have been lost. If they were not given full aid now, and their rightful place in the peace effort, disaster would follow. There is and must be no discrimination between the nations. In strategy, there is none. British tanks are passing to the Russian front in a steady stream. American and British aircraft have reached Free China. Nor is there any discrimination in war economy. The new Combined Food Board will not only draw up common plans for the supply, transport and distribution of British and American foodstuffs, agricultural materials and equipment; it will also co-operate with all the United Nations in the use of food resources and, in addition, collaborate with all the other interested nations in the world in the development, expansion, purchase and use of their foodstuffs. Russia, China and the countries of Latin America, all have their place in the pattern of combined action. Lend-Lease, in its various ways, now embraces them all. It would be idle to deny, of course, that there are dangers in the power which can now be wielded in London and Washington. It is vastly important that every step should be taken in time with the wishes and interests of other countries. It is certain that this can only be done on a basis of all-round trust. One element that could disrupt the bonds of union that are now being forged would be petty nationalism on the part of any single country or any single group in any country. While the war lasts, it is imperative that every industrial interest, of whatever nationality, should realise that the main aim is to maximise war output and not to maintain national claims. When the peace comes, it will be no less important that the nations who stand in the strongest and most favourable position should realise that, only by the adjustment of their ways and policies in political and economic matters, regardless of sectional stakes, will it be possible to win the peace as well as the war.

At the moment hopes are high, both for the near and far futures. Collective security is being translated into world fact by deeds. A habit of co-operation is being formed. But the road between now and peacetime has still to be travelled and it will be grim and hard. No war is won until the last bugles have sounded. The Germans and Japanese can still strike massive blows. The only course is to assume that they will go down fighting in the greatest holocaust in history. There will be heavy losses and grievous casualties—the price of victory. The bond of the world alliance is shipping; and shipping is still an Achilles heel. Allied ships and Allied cargoes are being sunk in great numbers on all the oceans. The need for ships to strike the final blows against the enemy will be enormous. What is called for now, when the sky is brightening, is a new dedication by all the free peoples at war to the straitened ways of a siege existence, which will use for the needs of civilians not a ton of shipping that can be spared for more urgent duties. The tide is rising to the flood. It must not be missed.

Treaty with Russia

MR EDEN surprised and delighted the Commons and the nation when, on Thursday afternoon, he gave them the news of Mr Molotov's visit to this country and to the United States, and laid on the table of the House a White Paper containing the text of a Treaty between Britain and Russia, together with certain speeches and exchanges of congratulations made on the occasion of its signature. The surprise was a natural reaction to a very well-kept secret. Few people have had an inkling of what was going on and considering the hazards attendant upon Mr Molotov's return to Russia—whether by sea or by air—it is good that the secret was so well kept. The delight was equally natural for, without exaggeration, it can be said that a diplomatic instrument has been jointly forged which may have as much significance for the future of world order as victory itself. After the debacle of the inter-war years, no one can have escaped the haunting fear that, in this war as in the last, victory will again be achieved only to be thrown away. The new Anglo-Russian Treaty is plain evidence that better things may be in store.

It is not a hastily negotiated pact. Many months and long deliberations have been spent in drawing it up. It is the culmination of a process which began nearly a year ago when, on July 12, 1941, the British and the Soviet Governments first entered into formal treaty relations to give each other full assistance for the duration of the war. This alliance formed the starting-point for a broader approach. The next step was taken on the high seas when, on August 15th, President Roosevelt and Mr Churchill announced the Atlantic Charter, to whose principles Russia subsequently adhered and under whose terms it was agreed—after the second Allied Conference at St James's Palace—to set up an Allied bureau for research and the co-ordination of reconstruction plans. In December, Mr Eden paid a visit to Moscow, a secret at that time almost as closely guarded as Mr Molotov's visit here, and, on December 29th, a joint communiqué appeared, referring to an exchange of views between the two Governments on questions relating to the prosecution of the war and to post-war reconstruction. The conversations were continued after Mr Eden's return. The United States was brought into them. So were the Dominions and the Allied Governments in Europe. At every turn the widest range of advice and support was solicited, and it can be said that the Treaty which has emerged, though it is the concern of only two of the United Nations, springs in a sense from the collaboration of all of them. As such, it has, of course, a far greater significance for the post-war world. By the end of May the exchange of views had brought agreement.

It only remained for Mr Molotov to undertake the journey across the enemy's lines and for the Treaty to be signed in London.

In it the broad outlines and general principles of the Atlantic Charter begin to take positive shape. Here they are applied to the special problems of a particular area. The area is Europe, the cauldron out of which the first two world wars have boiled up. In all its military clauses the Treaty refers to "Germany and its European associates" only—the question of Japan's aggression and the plight of Free China fall outside the scope of the agreement, though no doubt they were very fully discussed both in London and Washington. The first concern of the world is that Europe should not boil over a third time. The Treaty establishes the principle that the two great border Powers—Britain and Russia—both of whom have a somewhat similar relationship to Europe, that of belonging to it yet of having vital interests in other continents, shall collaborate after the war, for twenty years at least, to maintain the peace and to work for general prosperity. Clearly this does create a broad structure of security into which more detailed agreements can be fitted later on. The most significant political development of the twentieth century lies in the emergence of five centres of world power whose military and economic resources are so much stronger than those of smaller or poorer or less fully developed states that on their decision the great problem of peace or war finally hangs. Their number is, of course, not static. Free China is destined to emerge as a new power centre. If India can overcome internal disunity, the future may rank that country, too, among the great of the earth. But at present there are five effective power centres—Washington, London, Berlin, Moscow and Tokyo. Three are peace-loving, two are not. The peace of the world depends obviously upon the defeat of the two aggressors. Equally obviously, it depends on the continued collaboration of the peaceful Great Powers after the war. If Britain and Russia cannot work together to secure a Europe that will not go to war, the cauldron is certain to boil up again. Their decision to collaborate is therefore a pre-condition of security.

Although the Treaty does not go much beyond general terms, it contains more than just a statement of the Powers' determination to collaborate. It gives an outline of the form the collaboration shall take. The two articles of Part I refer to the war situation only. Each country will continue to give the other full assistance of every kind. Neither will open negotiations with Hitlerite Germany or any other German Government that has not satisfied them of its non-aggressive intentions. There

EQUITY & LAW
LIFE ASSURANCE SOCIETY
Established 1844

PROTECTION IN WARTIME

● Civilian War Risk Cover without additional charge is normally granted under new Whole Life and Endowment Assurances—whether With-Profit or Without-Profit.

● A Guaranteed Bonus each year until 1946 inclusive is provided under all new With-Profit Policies—thereafter Bonuses are dependent upon Profits.

City Office: 30, COLEMAN STREET, E.C.2

will be no separate armistice without previous agreement. Part II is devoted to the post-war period. Article 3 expresses the desire of the High Contracting Parties to join with other powers in setting up a system of security and states their determination to take all the steps necessary to prevent a repetition of German aggression before this system comes into being. In Article 4, each guarantees the other full assistance in the event of an attack on one or the other by a European Power, until such time as this bilateral guarantee has been superseded by a multi-lateral security system. The two Powers bind themselves in Article 5 to co-operate for the prosperity of Europe in accordance with the interests of the United Nations and, in the course of this co-operation, to base their action upon two principles of the Atlantic Charter—no territorial aggrandisement and no interference in the internal affairs of other states. Article 6 contains a promise of economic assistance for the work of reconstruction; Article 7 includes a provision against joining alliances or coalitions directed against the other; Article 8 fixes the duration of the Pact at 20 years.

The pivots of the new system are thus collective defence against aggression and economic collaboration in raising the standards of prosperity. The co-operation envisaged is in both cases, rightly and necessarily, European, indeed worldwide. It is in the military and economic sphere that the basic insufficiency of the sovereign nation state has been most obviously demonstrated. The exclusive and uncoordinated economies of a score of nation states contributed most to the economic depression and decline of inter-war Europe. Nor were these economies sufficient when the day of reckoning came to support a defence system capable of withstanding Hitlerism. The military ineptitude of the European defence system was even more obvious. Under modern conditions of centralised industrial power, the only sure defence of national independence open to smaller States is to work inside a super-national scheme of economic co-operation and defence. Now even if the lead for establishing such a system were to come from the smaller States, it remains true that they have neither the resources nor the influence to carry it through. They look to the three great peaceful power centres to create the framework of collaboration, to back the enthusiastic, to encourage the doubtful, and to deal firmly with the plainly obstructive. Nothing is more wearing, both for men and for nations, than to live without standards and without the sense of fitting into a constructive and expanding scheme of things. Britain, Russia and the United States have still to prove their leadership. And the time may be running short.

It is because the material assistance and the agreed standards can only come from the Great Powers that the two principles of Article 5—no territorial aggrandisement and no interference—are of such vital importance. Collaboration and leadership can easily degenerate into flat imperialism and the Nazis have not been slow

to make this point in their propaganda. The United States is accused of "taking over" the British Empire; Britain in turn is accused of colonising the French Empire and of offering France "dominion status"; Finland, Poland and Turkey have been subjected to a war of nerves on the question of Russia's "expansionism." The undertaking of no territorial aggrandisement is a guarantee against the success of this propaganda. It would be folly to underestimate the power of mischief these innuendoes represent. The principle of non-interference is in one sense an extension of this. The ways of expansion in the modern world are devious. If a Nazi community living abroad works to overthrow a democratic government and to set up a regime committed to collaboration with Germany, is this "aggrandisement"? The results can be the same. There is an imperialism of ideas as deadly as the imperialism of arms.

There is another sense, however, in which the no interference principle is a false and retrograde step. It suggests that the nations of Europe have no interest in the presence of a law-breaker in their midst until the law is actually broken at their expense. This contradicts every lesson of the last nine years. Peace may not be indivisible. Law certainly is and a Government that begins by violating the basic rights of the human person will probably end by violating those of the international community. Concentration camps are an act of aggression against Europe, and there can be no hope of collaboration for economic prosperity or joint defence to uphold the rule of law, unless the rights of the citizen are solemnly recognised to be the concern of Europe. There can be different forms of Government. Russia will not seek to impose universal sovietism nor Britain world-wide parliamentary democracy; but there can be no two attitudes towards the police state with its spy system, its arbitrary arrests and its condemnations without due process of law. Nor are the citizens of Europe—both non-German and German—likely to feel a sense of wider loyalties if the new community does not guarantee their personal rights.

The framework has been established. As far as it goes, it is an extremely satisfactory framework. But just as the Atlantic Charter called for this greater degree of precision, the Anglo-Russian Treaty in its turn calls for a far more concrete working out of its general commitments. The conversations must continue. The Inter-Allied bureau must produce some evidence that its work is making serious progress. Europe must get, through the Allied propaganda sources, a clearer picture of the world the United Nations mean to build. All this calls for a degree of foresight and precision which has not, unhappily, been a marked characteristic of recent British diplomacy. Now Mr Eden's great opportunity has come, perhaps the greatest opportunity with which a statesman has ever been faced. The future of Europe, the future of the world, and quite especially the future of Britain, depend upon the way in which he goes to work.

Regional Economics

THE machinery of British local government has long been in need of overhaul. Before the war, the most familiar criticism was that the quality of the services provided and the cost of administering them varied too much from area to area. Despite the minimum performance insisted upon by Whitehall, education would be good in one place and bad in another; hospital facilities would be duplicated here and non-existent there; trading services might or might not be efficiently run. Even more productive of complaint was the variation in rates and the absence of uniformity in the basis of assessment.

The war has aggravated these shortcomings, particularly in the sphere of local finance. The widespread exodus of ratepayers from evacuation areas has meant that the revenue of the local authorities in these areas has declined far more rapidly than their expenditure. The

loss of rates on empty properties might, theoretically, have been met by increasing the burden of those who have stayed behind. But this course, even if practicable, would have been wholly inequitable, particularly as most of those who had left probably meant to return when the war was over. In the event, most of the deficiency in revenue has been met from the usual source in times of need—the Exchequer. A larger part of the cost of maintaining essential services in a number of evacuation areas has thus been laid upon the general taxpayer. In the circumstances, it is clear that no other course could have been taken. No local authority could be left to face its exceptional wartime burdens unaided, any more than the "blitzed" property-owner could be left to rebuild his own house. The effects of war on particular localities, just as in earlier years the effects of economic depression,

had to be borne by the community as a whole. But there is another side to this increasing dependence upon State subventions. It means that to an ever-growing extent local authorities are being relegated to the position of being merely agents for the central Government. It is not good in practice or in theory that the function of spending money should be divorced from the responsibility for raising it. The indications are that many of these problems will be aggravated, rather than eased, after the war. Reconstruction and the expansion of social services are among the foremost peace aims; and it is clear that the local authorities will have an important part to play in these activities. This will mean larger local expenditure and a re-emergence of the old complaints about variability of service and the inequity of rating.

Fortunately the war itself, by bringing these difficulties to a head, has indicated part of the solution. There is nothing new in the demand for regional government. It has often been observed that the way in which the British prefer tradition to convenience is strikingly illustrated by the survival of a quaint system of local boundaries whose delineation has long ceased to accord with modern needs. The novelty of war has been the actual introduction of the region as an administrative area for certain purposes. It can provide continuity of administration if the centre of affairs should be cut off from the rest of the country. Its usefulness in civil defence pointed the way to its development in other fields of activity. Through the Regional Boards it now provides the indispensable link in production between local industry and Whitehall.

The interposition of the region between the smaller local areas and Whitehall has been a proved wartime success in the spheres in which it has been employed. Does it offer any lessons for the post-war development of local government? Lord Reith, when head of the then Ministry of Works and Buildings, regarded the region as an indispensable part of the machinery of reconstruction. Many progressive local government officials favour the development of regional government. Others are frankly distrustful. The principal impediment to any objective consideration of the merits of the proposal is the vested interest which so many people have in the maintenance of present boundaries, though the term "vested interest" is perhaps unduly sinister, since the motive for opposition in many cases is sincere belief on the part of local councillors and officials that the efficiency of the services they administer will be impaired by association with neighbouring areas.

The case for regional government can be simply stated. Existing local government areas are too small to administer certain services with efficiency. Areas of water supply are still too small in many cases to be economic, and co-operation between neighbouring authorities is only rarely achieved in the face of opposition. Local boundaries are perhaps more appropriate for the purpose of gas supply; but here again there are considerable productive economies to be obtained from the use of larger gas plants. Areas for the distribution of electricity are particularly anomalous, and the report of the McGowan Committee has made it clear that the main need is for larger areas. Finally, local transport areas are far from being co-terminous with "natural" traffic areas. Admittedly the problem of enlarging the area of trading services is immensely complicated by two factors. In the first place, the ground is shared by municipal undertakings and private companies, which cannot easily co-operate. In the second, the optimum technical area for one service is not necessarily the optimum for another. If efficiency were the only criterion, the solution would clearly be the establishment of "ad hoc" authorities with overlapping boundaries for the administration of each service. But an equally important requirement is the maintenance of the democratic control which provides municipal trading services with their *raison d'être*. Regional administration would make it possible to get nearer the technical optimum without sacrificing the virtue of consumer control. Apart from the trading services, there is certainly ground for arguing that such services as education, public health and highways could be more efficiently administered in regional areas. In all of them the quality of performance now varies

unjustifiably from area to area, and none of them can be regarded as a purely local concern. Finally, a further advantage would flow from the regionalisation of suitable services; there would be important economies in the overall cost of local administration per head of population; duplication of premises, staff and equipment would be avoided; and the larger authorities might be expected to attract more competent personnel.

But even if regional government achieved the greater efficiency expected of it, there would remain the basic problem of revenue to be settled. The rating system is generally recognised to be thoroughly unsatisfactory, because it transgresses the cardinal principle of ability to pay. Its area of operation was considerably limited by the Derating Act of 1929, and during the war it has partially broken down. What is to be done after the war? The importance of rates in local revenue can be diminished by increasing the share of expenditure borne by state subventions and "other receipts." But the danger of increasing the reliance of local authorities upon the state is real; and the scope for raising "other receipts" is clearly limited, despite the ingenious suggestions which have been propounded for financing such services as hospital treatment on an insurance basis. There remains the possibility of introducing a new form of local taxation on income. This is a highly controversial subject, which cannot be adequately treated in brief. It is evident, however, that if the idea were acceptable, it would be infinitely easier to put into practice in regional areas than in the existing areas. The main advantage of the larger area would be that it would usually overcome the difficulty of whether to tax a person at his place of residence or place of work. With the present boundaries, a well-nigh insuperable problem would arise from the fact that so many people sleep in a different local government area from that in which they work.

Other problems would remain, even under regional administration. How should investment income, particularly from overseas, be treated? How should the tax be levied on commercial undertakings with a nation-wide network of branches? Should the regions establish their own tax collection machinery, or rely on the existing machinery of the state? How should the revenue collected by the regions be distributed among the smaller constituent authorities? All these difficulties, and no doubt many others, would have to be settled, but they should not be insuperable. It would be misleading to condemn local income taxation out of hand on the ground that sharing in income tax by state and Federal Governments has not proved satisfactory in wartime in Canada and Australia. In these instances the root of the trouble has been the federal system itself. This difficulty could hardly arise in Great Britain, where the sovereignty of Parliament would not be impaired by the granting of new powers of local taxation.

There is considerable difference of opinion about the methods of local government reform discussed above. And it is hard for any layman to be positive about his suggestions. But there is no disagreement at all about the ends to be achieved. If democracy is to be healthy at the centre, it must be active in the localities. Local government must be at once more democratic and more efficient. It is here that the dilemma arises. The present areas of local government may be small enough for something approaching a real parish-pump democracy, but they are too small for efficiency. The latter can be obtained, perhaps, by more central direction, but only at the expense of the former. The appropriate compromise, it is suggested, is to be found in the establishment of regions. They should be the right size for technical efficiency, and neither too remote from local affairs to be undemocratic nor too close to Whitehall to suffer from over-centralisation. To make them still more appropriate to their ends, they should have the responsibility for raising the greater part of the money which they spend; and it is difficult to see how this could be achieved without the substitution of some fairer method of revenue collection in place of the present rating system. The planners of post-war reconstruction will need to ponder long and deeply on these issues.

Necessary Evil

In the April issue of the Oxford Economic Papers, Mr C. J. Hitch, by nationality an American but British by academic adoption, has some very sound words to say about post-war policy. He is concerned primarily with the question of post-war controls. He lays down two overriding principles. The first is that this country's economic future

depends on the extent to which we combat self-interested restrictionism; the representatives of the trade concerned are not the obvious commanders of this campaign.

The second is that

the freest possible multilateral trade is so obviously in the long-run interest of a nation of forty-seven millions living in a small area that this should be clearly formulated as the aim of British commercial policy.

Mr Hitch is no Utopian. He realises that, in the transition period after the war, controls will be necessary. At home, there will be, on the one hand, pent-up demand and arrears of work, together with a new positive urge to set about reconstruction in an orderly fashion; and, on the other hand, there will be a relative scarcity of materials, and for a time possibly of shipping facilities, with a consequent need to direct economic activity into the most urgent channels by some system of priority and allocation. Mr Hitch would spread this accumulated investment demand over a period, and guide it in the right way, not by means of interest rates—there must be no repetition of the old-style disastrous remedy of deflation—but by controlling the rate and direction of the use of investment materials. He would maintain some system for allocating such materials as steel and timber, and continue the licensing of civil building.

In foreign economic relations, there will be a pressure of circumstances calling for control. On the one hand, Britain's ability to buy abroad will be 80 per cent or less of its pre-war ability; on the other hand, the demand for imports will be greater than before the war, to carry out reconstruction, to secure full employment, and to satisfy pent-up demand. The supply of sterling is likely to be half as much again as the demand for sterling; by the end of the war, accumulated sterling balances on overseas account will be very large; capital exports will worsen the position, while speculative capital movements will be very dangerous. Mr Hitch believes firmly that controls and restrictions are undesirable. But he also sees that they will be necessary, in part and for a time. He examines the choice of evils. Depreciation he rejects because it will worsen the terms of trade. Bilateralism he rejects because it will sacrifice the gains of triangular and multilateral trading, and precipitate trade war. Borrowing he rules out because its benefits will be short-lived, and its longer-term effect will merely make the situation worse. Finally, and reluctantly, he elects for nondiscriminating restrictions on unnecessary imports and on capital exports. He proposes a three-point programme: exchange control to prevent the flight of capital, which must not be restrictive except in the case of capital transfers; import licensing for manufactured and semi-manufactured goods, which must be restrictive in the first instance in order to give priority to necessary imports of raw materials and foodstuffs; and bulk buying of necessary materials and foodstuffs on Government account, in order that the Government may be able to control centrally the disposition, use and price of these commodities. Thus the programme accepts the fact that

the cost of imports must be cut to fit the cloth of foreign exchange accruing on current account.

But, in the conditions which he lays down, Mr Hitch shows his real objective. Import restrictions must be combined with measures to increase exports to the point which will render these restrictions unnecessary.

All controls must be of the type which will permit the gradual relaxation and abandonment of restrictions as quickly as this becomes possible.

There may be disagreement with the details of Mr Hitch's proposals. There should be none about the rightness of the emphasis which he places upon its purely expedient character. The real need will be not the restraint of trade, but its expansion.

Minister in West Africa

Lord Swinton's appointment as Minister Resident of Cabinet rank in West Africa is a logical sequel to the

appointment of a Minister of State in Cairo. In both cases, the advent of the military has produced problems which affect the civil administration but which are outside its normal scope. In both cases, consequently, it has been found necessary to appoint a person to be responsible for the territory where the military and civil spheres overlap, thereby confining the soldiers and the administrators to their separate functions. But there are two important differences between Lord Swinton's position and Mr Casey's. Mr Casey, like Mr Lyttelton before him, is a member of the War Cabinet. Except on matters of high policy, he can take decisions which otherwise would have to be referred back to London; except in the conduct of

military operations and diplomacy, he has the authority of his status. Lord Swinton will be more of a co-ordinator; since he is not to be a member of the War Cabinet, it is not clear whether his decision will be final in the event, say, of a dispute over labour policy in Freetown. The other big difference is in the nature of the territories under their command. The Middle East territories form a vast, but single, bloc. Lord Swinton's jurisdiction comprises four stepping stones, of ascending magnitude, which are separated by Vichy territory. Yet it is this geographical independence which makes the presence of a resident Minister, who can oversee all four colonies, the more necessary. Strategically, the importance of British West Africa is immense. Not only is it the central link in the air route between America and the Near East; but with the closing of the Mediterranean, Freetown acquired an importance on the Empire's ocean life lines which is second possibly to that of no other port, now that Singapore has fallen. The economic importance of the colonies is discussed below. Apparently, Lord Swinton will not encroach on the ordinary administration of the territories. But presumably he will be concerned in such matters as import policy, and in any case his appointment will be a step towards closer co-operation between the colonies if not to federation. As an ex-Colonial Secretary, Lord Swinton should have a reasonably good knowledge of West Africa. But in the public mind he is chiefly remembered as the Minister who did not deliver the aeroplanes—though Mr Churchill himself once pointed out that Lord Swinton was "much less blameworthy" in this matter than several other persons. It is also difficult to see why he is retaining his chairmanship of the United Kingdom Commercial Corporation when he will not be able to exercise its functions. There is also the investigation into Communist (and other) activities through a deputy as well?

West African Resources

West Africa is by far the most densely populated part of the British Colonial Empire. Nigeria alone has a population of 20,200,000, four times as many as the population

of Ceylon. All four West African colonies put together are populated by close on 26,000,000 inhabitants, out of just over 55,000,000 inhabitants in all the areas under the administration of the Colonial Office. All four colonies are important producers of oilseeds. In the year before the war they exported 425,000 tons of palm kernels, three-fifths of the world shipments of this product which is the raw material of margarine and soap. Nigeria and Gambia together shipped in the same year 375,000 tons of groundnuts, or one-sixth of world shipments. The Gold Coast and Nigeria are the world's largest and third largest cocoa producing countries respectively, and together supply 400,000 tons per year or nearly two-thirds of the world crop. Sierra Leone has an important reserve of hematite iron ore. Although in an early stage of development, shipments of this ore from the colony were nearly one million tons per annum in the years before the war. The Gold Coast, moreover, is one of the largest known sources of manganese ore and has an annual productive capacity of 700,000 tons of particularly rich ore, which is needed urgently both in this country and the United States. Nigeria is one of the three major tin-mining areas still free from enemy control, and is expected to supply 17,000 tons, which is not much less than the prospective total consumption of the United Kingdom this year. The Gold Coast and Sierra Leone produced together 2,500,000 metric carats of industrial diamonds in 1937 (or 25 per cent of world production in that year) and could by an all-out effort not only repeat but exceed that performance. All four West African colonies are also potential producers of rubber, and their wild rubber trees are being at present developed with the help of Malayan specialists. In securing maximum production of the materials needed by the Allies, the new Resident Minister can perform a valuable task, which alone would justify his appointment.

Miners' Wages

In formulating its coal plan the Government decided that, while it was desirable to create special machinery to deal with questions of wages and conditions of employment in mining on a national basis, it was undesirable to associate it with the proposed National Coal Board which will advise the new Ministry of Fuel on production problems. Consequently, a special board of investigation was set up last week to deliberate on the machinery that will be required by the proposed national wages board and, urgently and specifically, to examine the miners' claim for a minimum weekly wage of £4 5s. 0d. and for an increase of 4s. a shift in the wages of adults and 2s. a shift in those of boys. The chairman of the investigation board, which has already held a number of meetings, is Lord Greene, Master of the Rolls. The adoption of national machinery for dealing with wages means the fulfilment of a long-standing demand by the miners, which has hitherto been strenuously resisted by the owners. If it is the prelude to the smoothing out of existing wage differentials—the adoption of a national minimum wage would involve a step in this direction—the balance of the industry's cost structure would naturally be affected, giving rise to a whole new set of problems. So far as the demand for higher wages is concerned, it is difficult not to sympathise with the miners, and they are openly uneasy because their claim, still unanswered, has been passed on to the new board. Wage rates in coal mining have risen more than in other industries; but if the comparison is based on actual earnings, tries; but if the comparison is based on actual earnings, and the miners, whose occupation is more strenuous and more perilous than those of most other workers, and who cannot easily make up their wages by overtime, have not done as well as many other workers. The owners have suggested that an increase should take the form of a bonus on additional output. Whatever decision is made, it is plain that more coal must be a condition of any substantial increase in coalmining wages.

Matters of Finance

The discussions on the Finance Bill tended to be a curious chorus of mutual praise. The Chancellor of the Exchequer is praised from the Labour Benches on his courage. The public are praised time and again for their endurance in face of wartime taxation. Only infrequently, in this atmosphere of bonhomie, do the real issues of wartime finance emerge. It is not far from a scandal that the two questions of wages policy and compensation, for in-

stance, have not been discussed in these debates. The fact is that, under wartime Parliamentary procedure and conventions, the Commons are given practically no opportunity of discussing the state of the nation's finances as they should be discussed. It will not be denied that the orthodox British system of public finance has proved itself astonishingly adaptable and expandable in face of the enormous task of mobilisation for total war. But this means that it is all the more necessary that the deep-rooted economic implications of what is going on with the aid of finance should be fully canvassed in the grand inquest of the nation. Quite rightly, Sir Kingsley Wood points to the need for genuine savings to avert inflation, now or at a later, equally dangerous, date. Quite wrongly, he refuses to go deeper into the subject. With one hand, purchasing power is painfully mopped up by taxes and savings. On the other hand, in the form of earnings of all kinds, salaries no less than wages, purchasing power is swollen to new dimensions; but this is not allowed to have any place in these financial discussions. The Chancellor, and presumably the Government, rather tends to let well alone. Labour members have been convinced that rationing is a sufficient weapon by itself against inflationary dangers; and they are only too happy to see earnings mount. All this is understandable enough. But there will be a day of reckoning; and it will have done no harm, to say the least, if Parliament had spent a good deal of its time during the discussions on the Finance Bill in examining precisely this point.

The Finns' Dilemma

It is too early to guess at Hitler's plans for the northern front during the summer campaign in Russia. There would be much to be gained by making it the scene of a major offensive designed to capture Leningrad, cut both the Murmansk and the Archangel supply routes and threaten Moscow's communications with the Ural region by a vast encircling movement from the north. Yet this development is unlikely. The Germans are not in a position to attack equally strongly all along their immense Russian front, and in world strategy, the only large-scale offensive that really makes sense is the attack from Moscow southwards to open up the Middle East. An offensive on this scale in the south would probably mean denuding the other fronts, and this would leave the Finns to bear the brunt of the campaign in the northern sectors. The Finnish people have buoyed themselves up throughout the long, desperate winter with the belief that the Germans meant to send strong reinforcements in the spring to complete once and for all the consolidation of the Karelian front. This, they believed, would give them the respite they very badly need. But if Hitler's plans are concentrated on the south, then there is no hope of relief for Finland and the question must arise whether, under these circumstances, it would not be possible to put an end to the fighting. Hitler's need for continued Finnish resistance and his realisation that all is not well were probably the reasons that sent him and his staff on a visit to Marshal Mannerheim. It is unlikely that he went to persuade Finland to take a more active part in the war. It is much more likely that Hitler went to plead with the Finns to stand firm. It is unfortunately almost certain that he was successful.

The reason for this is political. From the economic point of view, the Finns could hardly be worse off than they are now. Nearly all foodstuffs are rationed, and only one food is fairly plentiful—fish. There is a disastrous

THE BRITISH LINEN BANK

shortage of potatoes, which is part of the Finn's staple diet, and this year's harvest will be very poor; the winter started too soon for all last year's potatoes to be lifted; only 40 per cent of the normal acreage was ploughed up; 2,000 tractors are out of use because of the shortage of petrol; fertilisers are running out; and the war is making a very heavy drain on agricultural manpower. The Swedes have done a certain amount to make good the big deficits. A trade agreement signed on May 11th arranged that iron and steel and machinery and implements to the value of 35 million Kroner should be sent to Finland in return for whatever Finland felt able to export. At the same time the Swedes lent the Finns a 5-year credit of 35 million Kroner to buy food in Denmark. But Sweden's surpluses are not great, and Germany's promised help has fallen far behind schedule. The outlook for next winter is very black. There is not a Finn that does not hope for peace by the autumn. But here the political difficulty comes into operation—Nazi propaganda has succeeded in convincing the Finns that only a German victory can preserve their independence. From Left to Right they are united in believing that an Allied victory would mean incorporation in the Soviet Union, and against that danger they will fight on.

Appointment of Mr Bruce

With the conclusion of Dr Evatt's visit to London, Mr S. M. Bruce has been appointed accredited representative of the Commonwealth Government and member of the Pacific War Council. This decision is welcome in London. Mr Bruce, who held the appointment of High Commissioner since 1933, is known and liked. His appointment implies—to be frank—an improvement in understanding between London and Canberra, and, in outlook, between Mr Bruce and the present Australian Government. It is obvious, as Mr Curtin himself suggested in the House of Representatives, when announcing the appointment, that any apparent disagreement was the fruit of an attempt to reconcile a difference of emphasis at a distance of 12,000 miles. The outstanding success of Dr Evatt's mission is that this difference is now seen in perspective as a necessary and complementary corrective for geographical bias. "There never was any real cause for doubt or misunderstanding, but I am happy to say," said Mr Curtin, "that any trace of either has completely disappeared"; and again in his speech at Melbourne, when opening the Liberty War Loan, "... the organisation of the associated nations is more concerted than it was." There are signs, too, that the success with which Australia has repelled air and naval attacks on the Commonwealth has fostered self-confidence and resolution. That more powerful attacks are bound to come is understood, but the carping anxiety that Australian needs would be underestimated by the United Nations has been substantially dispelled. The fundamental problem of Dominion representation in the British Cabinet remains. Decisions taken by Mr Bruce cannot bind Mr Curtin. Co-operation between the Commonwealth Government and its London representative must be very close if the arrangement is to be worth while. But the centre of decision, as Mr Curtin has always argued, is in Washington, in the Pacific Council there and the Combined Chiefs of Staff Committee. Mr Bruce's appointment is important, but—in the larger context—a side-issue.

The Imperial Parliament

A remarkable statement on the possible future of Parliament was made by Lord Selborne in a debate in the House of Lords last week on post-war world settlement. Nobody will quarrel with his assertion that the fall of Singapore had shown the need for combined Imperial study of defence problems. But, apparently to realise this, Lord Selborne went on to say that

"the effective and democratic solution of the problem would be to disband this Parliament in the United Kingdom, and to have separate Parliaments in England, Scotland, Wales and Northern Ireland, and one Imperial Federated Parliament, representing all the Parliaments of the Empire, sitting not in this country at all but in some much more central spot, such as Capetown, and being responsible for Imperial, Dominion and foreign policy."

It is difficult to believe that any responsible person, much less a member of the Government, could seriously make such a preposterous suggestion, which would not only grant separate legislatures, and presumably executives, to England, Scotland and Wales, but would also set up an Imperial Parliament, whose decisions on foreign policy and

defence would be binding on the whole Empire, in the capital of a Dominion which is divided on whether it wants to remain a member of the Empire or not. It is quite true that no satisfactory solution has been found to the problem of enabling the Dominions to take an effective part in Imperial decisions while preserving their independence and separate legislatures and executives. But to suggest that this could be achieved by the artificial creation of a solely Imperial Parliament is fantastic. Without good-will, the new Parliament could come to no decisions at all; with good-will, the present system is as workable and effective as the illogicality of the structure of the British Empire allows. The Mother of Parliaments must be having a hearty laugh at the thought of the bastards to be foisted on her in the name of what Lord Selborne called "organic development."

Empire Air Training

A new agreement for training Empire pilots in Canada has been signed. There is little basic difference between the new agreement and the old, which was due to expire on March 31st next. Canada's share—the lion's share—in making the scheme a success deserves grateful recognition, but it is the most obvious commonsense that sends pilots from the small island of Great Britain to be trained in the open spaces of North America. Where difficulties might have arisen is in the question of control—are RAF pilots to be under the control of the Royal Canadian Air Force while they are being trained, and similarly are RCAF pilots to be under the control of the RAF when they are posted to the United Kingdom? Apparently they will—in both cases—but the existing, though not new, RAF units in Canada will retain their identity, and in this country a Canadian Bomber Group, to consist of RCAF bomber squadrons, will be formed under the command of RCAF officers, and there is to be a much closer liaison on all questions affecting the employment of Canadian personnel. It is also interesting to note that Canadian pilots will in future be trained for operational work to a much greater extent than hitherto. It would clearly be an advantage if this could apply to British pilots trained in Canada, so that airfields in this country could be left as free as possible for operations themselves. Australia and New Zealand are to participate in the scheme to the same extent as before, but their domestic air training has increased owing to the Pacific war. The chief limitation to the scheme, however, is that it is for Empire air training. British pilots are being trained in the United States as well, and it would have been an advantage if the new agreement could have been extended to become the Air Training of the United Nations.

War Supplies for India

On the recommendation of the American Technical Commission, a "War Resources Committee" is to be set up under the Viceroy to direct India's economic war effort. This must, of course, be dovetailed into the supplies which can be despatched from Britain and the United States. The largest convoy ever despatched from Britain has arrived in India. The problem now is to ensure that this great mass of men and material, as well as the growing supplies produced in India, do not share the fate of the large force that was landed in Singapore shortly before it fell. Much has been learned since that tragic campaign. First perhaps in importance is the method of dealing with Japan's infiltration tactics. The coasts of India are long. Landings there will be, and some will be successful. They must not be countered as they were in Malaya and Burma—by linear defence and retreat after encirclement. Next in importance is perhaps to re-think the British soldier's equipment. The British Army in India is, of course, fighting on known ground. Presumably the weapons and the kit of the soldiers will be well adapted to local conditions. Yet it was not so in Malaya and Burma, where Empire troops sweated under packs and in heavy boots while the Japanese fought in shorts and sandals, with a Tommy gun swung in their sarong. In the air, the defenders should have things their own way, for the Japanese are thousands of miles from their supply bases. The question is, of course, whether enough planes have arrived. Finally, the lesson of Burma is the lesson of every front: at all costs the enemy must not be allowed to divide the Allied and split their common front. India is still being defended best in China. It is good news that reinforcements of British and American aircraft have reached Free China. The arrival of the giant convoy may presage the despatch of still more.

The most vital front is still North Burma, and, however urgent the priorities elsewhere in India, it would be folly to neglect any chance of restoring the Sino-British link.

Regional Production

While Mr. Lyttelton is in the United States, his office is indignantly countering the suggestion that the regional production boards are being left in abeyance. The Citrine Committee suggested that a central co-ordinating committee made up from the Supply Departments, the Ministry of Labour and the machine tool control, should be established. This committee has already been set up and has been in session. In addition, it is stated, preparatory work is going on in the regions. Officers are being reshuffled. Discussions about the full use of machine tool capacity are going on. The regional controllers of production will be appointed soon and announced as soon as Mr Lyttelton returns. All this is welcome news. But the fact remains that there have been regional boards for nearly two and a half years, and that both the Ministry of Production (in its first abortive stage) and the Citrine Committee go back to early February. Some impatience to see the boards working without the "melancholy list of frustrations and disappointments" which the Citrine Committee finally found is surely understandable.

Contributions and Compensation

The War Damage Act was rightly hailed as the outstanding example of a measure designed to spread the indiscriminate loss to property caused by air raids over all property-holders and, by the state's contribution, over the community. It undoubtedly set at rest widespread anxiety. On the whole, it has not worked badly. But in so far as it relates to buildings it remains full of anomalies and inconsistencies which, unfortunately, have not been removed by the War Damage (Amendment) Bill now under discussion in Parliament. For example, the contributions in respect of property are not shared equally among the various interests in property according to their respective stakes. The fact that the principle has found partial application, under the clause by which mortgagees have to meet a proportion of the contribution (though not on the precise basis of their financial stake in the property) if the annual value of the house does not exceed £150, only throws into relief the inconsistency of the scheme. Sir Kingsley Wood has steadfastly refused to accept the principle of all-round and proportionate contributions. The technical difficulties involved in its extension are no doubt considerable. The Chancellor contends that the burden upon large property owners has been relieved by an improvement in rents, and that a great deal of mischief would be done by interfering with small mortgages which would undermine confidence in this form of investment—both of which replies beg the question. There are other and even more disturbing anomalies. A landlord or owner-occupier whose property is destroyed not only loses the rent, but, if there is a mortgage on his house, he must continue to pay interest, usually at the rate of about 5 per cent. True, the Government allows interest to accumulate on the sum ultimately due to him at the rate of 2½ per cent, but this is not payable until compensation is paid after the war, and the prospective payments cannot be set off against the current liabilities which he may not be able to meet. If the landlord cannot meet these interest payments, he must prove inability to do so and then take advantage of the War-time Liabilities (Adjustment) Act in order to avoid formal bankruptcy. The equity of the arrangement whereby the stricken landlord has to exhaust his savings before he can secure relief is surely questionable and can hardly be dismissed by reference to the undesirability of releasing purchasing power. Fundamentally, the anomalies of the War Damage Act provide a reflection of the Government's failure to accept the principle of deferred compensation, subject to immediate relief in necessitous cases and to arrangements providing for the avoidance of disturbances in debtor-creditor relationships, in the case of all losses of income or capital due to the war.

Imperial Preference

While endorsing, in principle, the Anglo-American agreement of February 23rd on future trade policy, the National Union of Manufacturers, an organisation similar

to the Federation of British Industries, but much smaller takes strong exception to the part of Article 7 which calls for—

the elimination of all forms of discriminatory treatment in international commerce and the reduction of tariffs and other trade barriers.

In so far as the apprehensions of the NUM, expressed in memorandum on post-war trade, are due to its belief that other countries are unlikely to apply this principle, they are understandable. They simply reveal a desire not to forgo certain privileges without a *quid pro quo*. But the revival of international trade will be impossible in an atmosphere of defeatism and mutual distrust. The NUM admits that the motive powers of trade, far from being impaired after the war, will be more powerful than before. Moreover, the leading statesmen of the United States, the country whose policy will influence the future course and organisation of world trade much more powerfully than that of any other have repeatedly stated their intention of working to free the intercourse between nations from the shackles of restriction. If the United States is willing to translate this theory into American practice, Britain can only gain by playing a wholehearted and unreserved part in the process; and the defensive and pessimistic attitude reflected in the recent reports of the NUM and other business organisations in this country is anything but helpful.

Medical Manpower

Superficially, the allocation of the country's medical manpower among the civilian population, the hospitals and the Services should be simple. Doctors and dentists are the only persons who are called up to follow their own professions exclusively; they need no special training. Conditions in the Services are perhaps more conducive to illness than civilian life; but there has been a remarkable absence of illness in the country as a whole since the beginning of the war, and casualties, that is, wounded, among the armed forces of the whole Empire were only 46,363 in the first two years of war. And yet there is a shortage of doctors. At a recent meeting of the local medical war committees, the Minister of Health stated that there is to be an acceleration of the withdrawal of civilian practitioners for the Services in the next few months. On the advice of the Medical Personnel (Priority) Committee, which was set up some time ago under the chairmanship of Mr Geoffrey Shakespeare, he has suggested to the General Medical Council that the training of medical students should be curtailed, and this suggestion has been adopted by reducing the clinical period of a doctor's training by six months. Mr Brown also referred to other economies in medical manpower. The most important of these is a scheme to eliminate overlapping in the work of general practitioners. Local medical war committees will apparently divide their districts into areas inside which doctors outside the area will not visit patients. This will prevent doctors from towns visiting patients in villages where a doctor is already in practice and will prevent two or more doctors from covering the same area. Clearly, this will mean much heart-searching and it will abolish the ancient right of a patient to choose his own doctor. It is true that this concentration of general practitioners is only for the war, and doctors whose patients are transferred will receive half fees as though they had been called up or the patients evacuated. But if the financial side of it could be equitably settled, there is in the scheme, together with the rationalisation of hospital work to which Mr Brown also referred, the germ of the State medical service which many are looking forward to after the war.

Part-time Employment

In a paper read before the Royal Society of Arts this week, Mr F. C. Hooper, joint managing director of Lewis's, Ltd., described the scheme whereby his firm has replaced its young mobile staff by part-time workers. An appeal was made last August to married women aged 35 and over to apply for employment in the stores, the hours varying from 5½ to 6 a day in a six-day week to five full days; it was emphasised that the job was a regular one and that normal business standards of punctuality and attendance would apply. Mr Hooper claimed that the scheme was a success, and his firm is certainly to be congratulated on having faced the necessity of giving up the greater part of its normal staff and on having solved the management and other problems arising from an influx of older, sometimes elderly, women, many of whom might not have taken kindly to the rigours of business life. But the firm's emphasis on the patriotic nature of the work, when it launched its appeal, was not altogether justified, for the scheme was framed in the interests of Messrs Lewis's, Ltd., rather than in the nation's. Mr Hooper stated frankly that if it had not been devised, the firm would not have been able to continue in business; it seems to have been too readily assumed that it was necessary for the firm to continue in business. Obviously, no firm can be expected to allow itself to be bled to death, but Messrs Lewis's enterprise would win more general approval if there had been more signs of an attempt to cut down the "luxury" departments. For instance, the "patriotic" wives and mothers were given the option of working in the "luncheonette, soda fountain and snack bar." It is quite true that the blessing of the Ministry of Labour was obtained before the appeal was launched, and most of the women newly taken on, being married and over 35, would not be subject to calling-up or direction. But if they can give 30-36 hours a week to Messrs Lewis's in Birmingham, Glasgow and Manchester, they can also give them to real war work in the same towns whose need of labour must be acute. Part-time employment should pass the same test of essentiality as whole-time; it must not be allowed to maintain business as usual.

Shorter Notice

Mr J. M. Keynes has the distinction of being the only new peer in the Birthday Honours. When he takes his seat in the House of Lords he will be the only economist in

Parliament. So long as he is a member of the Chancellor of the Exchequer's Consultative Council, he will presumably be precluded from taking a completely independent line, but there can be no doubt that his elevation will be as much a future gain to the nation as it is a reward for the services he has rendered in the past.

The Marquess of Dufferin and Ava, whose appointment as Acting Director of the Empire Division of the Ministry of Information caused a slight stir in Parliament because he was released from the army to take it up, recently resigned the post. No new director has been appointed, but Mr L. W. Brockington, K.C., the well-known Canadian broadcaster, has agreed to act as adviser to the Empire Division for the time being. Lord Dufferin and Ava has also resigned his chairmanship of the Colonial Development and Welfare Advisory Committee, which examines applications from the colonies for assistance under the Colonial Development and Welfare Act. His successor to this post has not yet been appointed.

In spite of strong opposition in the States, the Commonwealth Parliament has passed the Bill imposing a uniform income-tax for the whole of Australia. In the two houses only 28 out of a total Parliamentary membership of 110 voted against the Bill, and a serious obstacle to Mr Curtin's plans for extracting the utmost war effort from the Australian people has been removed.

The Governors of Harrow School have appointed Mr R. W. Moore as headmaster, to take office after the end of the present term. The appointment is significant, partly because Mr Moore is a young man—he was born in 1906—and also because he was educated at Wolverhampton Grammar School and will go to Harrow from the headmastership of Bristol Grammar School, though he has had previous experience of public school teaching. It is a welcome sign of the times that the governors of one of the largest public schools have appointed as headmaster a man who is not steeped in the public school tradition.

AMERICAN SURVEY

The New Frontier

TWO distinguished Americans have carried further the note of confidence and enthusiasm about post-war opportunities. In Durham, Mr Winant spoke very movingly of the social courage, vigour and imagination of the free peoples.

The world of tomorrow and today demands courage. What I have seen of your people and what I know of mine and of people elsewhere has convinced me that our supply of courage will never fail. We have the courage to defeat poverty as we are defeating Fascism; and we must translate it into action with the same urgency and unity of purpose that we have won from our comradeship in this war.

Mr Sumner Welles, Under-Secretary of State, spoke in the same vein when he referred to the great task before us

which in every sense of the term is a new frontier—a frontier of limitless expense—the frontier of human welfare.

The use of the word frontier has a peculiar magic in the United States. The existence of free land in the West until the end of the nineteenth century is believed to have been responsible for America's economic advance. It spelled unlimited opportunity and the possibility of escape from the cramped and over-developed and static East. It was held to have prevented the creation of rigid classes, because the depressed and unemployed could always move on to free or cheap land beyond the frontier. Recent re-

search has thrown some doubt on the thesis that it always provided a cheap and easy escape for the dispossessed, but the phrase, "the new frontier" remains one to conjure with.

Mr Welles has the reputation of being a realist, and his speech has been applauded for its concrete ideas about the course of events immediately after the war is won. These included, beside punishment of those responsible for the war, the proposal of a lengthy armistice before the drawing up of the final terms of peace. During this period, there would be disarmament of the aggressors and the creation of an international police force

to insure freedom from fear to peace-loving peoples until there is established that permanent system of general security promised by the Atlantic Charter.

Mr Welles did not fail to drive home once more the failure of American policy after the last war. No representative of the Government has denounced with such force and candour "the material selfishness," "blindness" and "provincial policies" of the United States in the 1920's, as well as the lack of statesmanship evidenced by other countries responsible for the conduct of the vociferous affairs. In particular, Mr Welles dwelt upon the selfish and privileged minorities in every country—but particularly in the United States—who had destroyed international trade to conserve and increase their own profits, bringing

ruin on their fellow-citizens and paving the way for militarism and dictatorship.

He referred to the steps the United States is already taking to obtain the co-operation of others of the United Nations on post-war policy. Pre-eminent among these are the drafts of permanent Lend-Lease agreements offered in the past weeks to China, Russia, Norway, Holland, Belgium, Poland and Greece, which are modelled on that signed by Great Britain on February 23rd. Besides placing the supply of materials to the various fighting fronts on a uniform basis, these agreements sketch the outlines of post-war policies which have found general acceptance in their provision for joint action

directed to the expansion by appropriate international and domestic measures, of production, employment, and the exchange and consumption of goods, which are the material foundations of the liberty and welfare of all peoples; to the elimination of all forms of discriminatory treatment in international commerce and to the reduction of tariffs and other trade barriers.

It is also expressly stated that reciprocal benefits under Lend-Lease should not create burdens upon international commerce, but should further improve economic relations. The administration of Lend-Lease will unquestionably play a decisive part in shaping post-war economic policies.

A more specific application of the principles of Lend-Lease to the post-war period appears in an article by Mr Herbert Feis, of the State Department, in the current issue of the American quarterly *Foreign Affairs*. The ideas are his own and are not to be attributed to the State Department. Mr Feis's proposal is that, at the beginning of each year, the American Government should make available credits to other countries for certain purposes, and that, as these credits were drawn upon, the debtor countries should provide corresponding credits for the United States in their own currency at a fixed rate of exchange. If at the end of the period chosen these credits had not been exhausted, they would all be cancelled. Thus there would be a constant stimulus to countries to accept imports, a stimulus which would be most operative and most necessary in the United States, and no permanent debt or pressure on the exchanges would develop.

Work in Progress

There is, in fact, a vast amount of research and thought on the conditions of the peace being undertaken in the United States of which very little is known in this country. A publication of the Twentieth Century Fund, *Postwar Planning in the United States*, by George Galloway, lists and briefly describes the activities of over 100 public and private organisations which are concerned with various aspects of post-war society. They include 35 Government agencies which have been directed to devote attention to problems which will arise after the war. The number of projects upon which work is going forward is formidable; they cover almost every conceivable aspect of the peace.

In his preface, Mr Galloway points out that much of the discussion is "vague, general, thin, and evanescent"; that the projects are frequently historical and comparative rather than policy-making; and that there is an urgent need for more co-ordination and co-operation to develop common objectives and avoid overlapping. He is able, however, to make a few interesting generalisations. There is a growing recognition of the indivisibility of wartime and post-war planning. There are a considerable number of business groups formed to lobby for a return to free enterprise as untrammelled and as quickly as possible. The desirability of maintaining the system of private enterprise is widely taken for granted both by private and Government bodies, although

there is some question whether private enterprise, alone and unaided, can create full employment and produce security and abundance for the masses.

Full employment both of men and resources is the main preoccupation of most groups. Mr Lewis Lorwin, a consultant to the Board of Economic Warfare, has described the aim as the establishment of

a socially responsible system of private enterprise tempered and sustained by public management when and where necessary... providing private enterprise with a social purpose and establishing minimum social standards on the basis of which private enterprise is to be conducted. Its emphasis is on democratic procedure to achieve social-economic ends... and on reconciliation of individual opportunity with social guidance.

The American Outlook

There are some grounds for thinking that the high note of confidence in Administration speeches is not yet entirely shared by the common man. A recent Gallup poll posed the question: What do you think the US will have for the first two or three years after the war—prosperity or depression? Those who expected depression totalled 43 per cent against 45 per cent for prosperity, with 12 per cent undecided. Analysis of the answers shows that pessimism was most characteristic of farmers and the lower wage groups, with some reason if the post-war slump in agriculture and the crisis of 1921 is taken into account.

Professor Slichter of Harvard, writing in *Dun's Review* for April, to an audience of businessmen, attacks this

indiscriminate pessimism which has been rampant during recent years, and which I suspect most people enjoy. Indeed, there seems to be a competition in pessimism about the country's economic future, with one person trying to make a blacker forecast than another.

Professor Slichter, on the future of private enterprise, warns business that its retention will depend upon the kind of economic future it offers America, with first place going to full employment. The business man of the past must give way to the executive more closely in touch with community needs; labour must be given increasing participation in management; and business must rehabilitate itself in the eyes of the public. With these steps, he believes firmly in the possibility of creating a higher standard of living than ever before, through new and improved products and methods, and scoffs at the idea of the inevitability of a post-war slump or a lower standard of living after the war. He points to the rapid growth of productivity in American industry in the last twenty years; in 1940 it was nearly double the man-hour output of 1920 in non-agricultural industries. The development of cheap and attractive housing alone, he feels, would solve the problem of employment for a generation. In another field, the cheapness of aluminium resulting from war-expanded production, will make obsolescent a large part of railway equipment, lorries, and all private cars, creating a tremendous new demand.

It is essential that the process of education and leadership which has been so ably begun by Mr Welles, Vice-President Wallace, and others, should be continued and made increasingly definite. The unity of war-time provides an unrepeatable opportunity for securing agreement on the fundamentals of reconstruction; it may not survive the victory. The action which is being taken now will determine what is possible after the war; and it may have a very considerable influence on the effort thrown into war production, particularly by those who are still dubious and suspicious about their welfare in the post-war period. Beside the promise and the performance of Lend-Lease, other developments in the United States are shaping the new society. Labour-management production committees have proved a success; business is being thoroughly trained in co-operation for a social end. In this respect more might, perhaps, be done to secure the co-operation of American industry. The idealism of an international New Deal will have to be implemented by the unrivalled technical achievements of American business men. The new frontier will then become a reality.

American Notes

The Supply of Ships

An article in the American magazine *Fortune* throws a new and harsh light on the American shipbuilding programme. The pool of ocean-going ships available to the United Nations at the end of 1941 is estimated at about 25 million gross tons; assuming the losses during 1942 and 1943 equal to those of 1941, that is, 4 million tons, and the building of 18 million tons, it is calculated that there will be a pool of 35 million gross tons at the end of 1943, the efficiency of which is considerably reduced by the need of conveying and longer hauls. But it is the achievement of the scheduled 18 million gross tons which is in question. Production of ships during the first quarter of 1942 totalled only 730,000 deadweight tons, 28 per cent below the minimum promise of 1 million for the period, and Admiral Land is said to have admitted that only 7½ million deadweight tons or about 5 million gross were in prospect for 1942. The delay, according to Admiral Land, is due to

three shortages: steel, labour, and shipbuilding brains. *Fortune* raises the question whether it is not due rather to the refusal to build new yards and "invent" shipbuilders, and to the piling up of orders in yards which were already filled to capacity for months to come. The Admiral points to the failure of some new yards to deliver ships and insists that he has resisted only "fool expansion." On the other hand, there is the brilliant record of the Kaiser yards on the Pacific Coast, which are only one year old, and have progressively reduced the time needed for construction from the time the keel was laid from 78 to 60 days, and finally to 48 days. How much truth there is in the accusations of the "super-expansionists" it is impossible to tell. But the shipping shortage is the gravest danger facing the United Nations, and it is hard not to agree with *Fortune* that the most drastic measures are necessary if the building programmes—which themselves create none too comfortable a margin when the shipping needs of victory are considered—are to be realised.

The Use of Ships

Nothing is more urgent than to make the best possible use of available shipping tonnage. Yet there are still complaints in the United States of the waste of carrying capacity, due to the lack of an authority able to override the demands of the various Government departments which use shipping—such as the Board of Economic Warfare, the Lend-Lease Administration, and others. Movements in ballast are larger than they should be. The Service Departments are still accused of withholding ships from the general pool and using them wastefully. The Army is particularly criticised for its refusal to co-operate with other urgent demands for shipping accommodation and for inefficiency in operation. Recently Mr Lewis Douglas has been made Deputy Administrator of the War Shipping Administration, in charge of operations. The powers granted to Admiral Land over the requisitioning and operation of ships and the fixing of priorities appeared at the time to be complete. The divorce of operations, under Mr Douglas, from shipbuilding, which is now under the control of Admiral Vickers, may bring more order into the allocation of shipping space and economy in operation. If not, there will be pressure to increase Admiral Land's powers in practice by bringing him into the Cabinet. Of all commodities of which there is a shortage, shipping is the shortest, and chaotic scrambling for carrying capacity is the more unforgivable when a system of orderly allocations is being developed for critical raw materials and a system of priorities for labour.

Manpower Delay

The brave words of the President's Order establishing the War Manpower Commission at the end of April have yet to produce any substantial result. Priorities for skilled labour have been forecast but no list of critical skills has yet been completed, and Selective officers are still trusting to individual judgment to decide whether a man should be deferred on the grounds of essential skill. There are stories that the delay is due, not to the fact that work is in progress, but to friction over the personnel of the new Board, and over policy and procedure. The difficulty of finding able administrators acceptable to labour is manifest. Early in May, it was reported that Mr McNutt had attempted to appoint General McSherry as the Commission's executive director, but this was being discouraged because of opposition to him by John L. Lewis and the Department of Labour. It was only last week that the appointment of General McSherry was announced, not as executive director, but as chief of operations, presumably a compromise appointment. There is keen competition for labour experts, not only from the Department of Labour, but from the labour section of the WPB and the Services of Supply; and there seems to be some danger that the War Manpower Commission may have to be content with less than the best. Should this happen, effective control of the allocation and training of labour may be divided among a number of agencies, and the very reason for the existence of the Commission—over-all direction of labour supply—will vanish.

Rubber and Petrol

Confusion about the need for nation-wide petrol rationing, in order to conserve rubber as well as to save petrol, continues even in high places. The Price Administrator, who is in charge of rationing, has stated that it is urgent. President Roosevelt, in his press conference, was less definite, and merely said that he was getting the facts on the rubber situation, particularly in regard to scrap rubber supplies. The President pointed out that, except along the Eastern Seaboard, there is plenty of gasoline. Plans are, however, going ahead for a nation-wide scheme of rationing likely to take effect during the summer, and the rationing scheme already in operation in the East has been overhauled to effect further economies and make it fraud-proof. "X" cards, allowing unlimited supplies of petrol, are being abolished. "C" books, which provide a substantial supplementary ration, are to be issued only to persons directly concerned with the war effort or essential civilian services. To make the supply of petrol water-tight, service stations will be required to turn in coupons collected from motorists in order to obtain supplies from distributors, and they, in turn, will have to present coupons to suppliers. A certain amount of fumbling was, perhaps, inevitable; but, in view of the experience of other countries with rationing, which is available to the United States, it is surprising that provisions of such an elementary nature were not part of the original plan. Much is being said about the need for lower speeds in order to save tyres, but it appears to have had little success, except in the East, where the fact of rationing has driven home the existence of an emergency, and 35 mph is becoming the rule. In the West, where greater distances and magnificent straight, level roads have made high speeds a habit, 60-70 mph driving continues to be common. Legal limitation on speeds, as well as rationing, will probably be needed.

Labour and Management

The labour-management production committees sponsored by the War Production Board to stimulate labour's interest in efficiency have worked much better than at first seemed likely. Business was inclined to be suspicious of the committees, because of their resemblance to the Philip Murray plan for union participation in management, and its suspicions were not allayed by the wholehearted CIO approval of the plan. An independent survey of management opinion made by the editors of *Mill and Factory*, a trade publication, shows, however, that the results have been good, and that there have been few difficulties. Of those questioned, 87 per cent said that labour had not used the committees as a means of encroaching on management functions; 95 per cent said labour had not tried to introduce collective bargaining problems into meetings; and 74 per cent said that labour had made a sincere effort to use the committees for the purpose of increasing production. Reports that managements are being "swamped with ingenuity" should perhaps be taken with a grain of salt. But there seems no doubt that efficiency is being substantially increased. So far, committees have been set up in about 2,000 prime-contracting plants, and work is going forward to spread them to sub-contractors.

Shorter Notes

The War Production Board has announced the reduction of certain non-essential imports, such as corned beef, coffee, and bananas, in order to conserve shipping. The amount of food which is imported into the United States is not large, and great savings cannot be expected; but in view of the shipping shortage, these restrictions were overdue. The cut in imports of corned beef will be particularly serious to Argentina. This is perhaps not entirely a coincidence.

The Senate and House conferees have formally agreed on legislation establishing \$50 monthly as the base pay for the lowest ranks in the Armed Services. The Senate has passed and sent to the House legislation authorising the Government to pay \$28 monthly to dependants of soldiers. An additional 22 may be withheld from a soldier's pay for his dependants, making a total allowance of 50.

THE WORLD OVERSEAS

Professional Manpower in Germany

(By a Correspondent)

May 20th

THERE were nearly 150,000 undergraduates in Germany in the years preceding the Nazi revolution, but in the summer term of 1939 only about 60,000 students were taking courses in German and Austrian universities and university colleges. The number of those taking degrees in engineering fell from an annual average of 2,700 between 1929 and 1935 to about 1,000 in each of the years 1938 and 1939; there was already a shortage of approximately 18,000 engineers, technicians and draughtsmen at the outbreak of war; and, according to Herr Rust, Reich Minister for Education, the continued shortage of engineers is a serious handicap to the war effort. The shortage in some other professions will be still more alarming in the long run; it has been calculated, for instance, that in 1950 the number of lawyers will be too few by 40 to 50 per cent, and the number of teachers by 60 to 65 per cent, unless swift emergency measures are taken. It is interesting to note that, according to a recent decree, students, teachers and apprentices are exempted from being called up for other labour duties.

The declining birth-rate in pre-Nazi Germany would in itself have hardly caused a fall of more than 20 per cent in the number of students. Certainly, the exclusion of Jews from the professions and from the universities has contributed to the shortage of lawyers, but there was never a high percentage of Jews among the German teachers and engineers, and the shortage of doctors is so far the least serious, even though the Jews formerly formed an important part of the medical profession. The main reason for the present difficulties is the lack of incentive for German boys and girls to choose a professional career. Professional categories, were never well paid in Germany, and there are much better chances to get a good post without such a long qualifying period. There are now, for instance, 50 per cent more industrial and commercial apprenticeship openings than applicants, whereas in 1934 only every third youth who wanted to become an apprentice was able to find a post. Moreover, the attitude of the Nazi Party and the Hitler Youth Movement towards "the intellectuals" has destroyed the traditional German esteem for intellectual work.

The number of children attending secondary schools has been appreciably lowered, and 40 per cent of all secondary school pupils leave school before taking their final examination. Moreover, almost half of those who took their final examinations in recent years have applied to become Serjeants of arms—it indicates the present demand for Army vice officers—that despite the large number of applicants, a shortage seems now to have arisen even in this profession and, according to a recent decree, all suitable NCOs are to be given quick promotion. By contrast, it has been announced that, of those taking their final school examination in 1941, only about 25 per cent were willing to study science, medicine or engineering, and less than 2 per cent wanted to register in the faculties of arts, law or divinity; in any case, most of them have, of course, to wait until after the end of the war.

The Remedies Adopted

The higher birth-rate between 1934 and 1939 cannot have any effect on the supply of professional labour until late in the 1950s. An obvious remedy for the shortage of professional people has been to shorten the courses of professional and general instruction. For instance, the three upper forms of the secondary schools have been concentrated to two forms only. The course for an engineering degree has been shortened from four to three years; the so-called technical medium colleges educate their students in two instead of two and a half years; and an ordinary practical apprenticeship in an engineering factory, which

formerly took four years, has also been shortened by six months. The education of teachers has been even more reorganised; the total training of secondary school teachers, formerly six years, now takes only four years. The effect of the measures has, however, been partly offset by the long terms of compulsory military and labour service which have been introduced in recent years.

These measures have contributed to lowering the standard of knowledge and skill among the younger generation of German students. That a serious deterioration has taken place is not disguised in the more responsible educational and general newspapers in Germany, and it is sometimes even admitted that the frequent preoccupation of young people with Hitler Youth and Party services takes much of their time from ordinary studies. Elementary schoolteachers are generally taken on by recommendation of the Hitler Youth rather than of the school authorities. It is interesting to note that even military observers have pointed out that "it is impossible to wage a modern war with uneducated people."

Owing to these difficulties, the Nazis have modified, to a small extent, their attitude to the "inferior races." Some Jewish doctors are known to have been ordered to resume their professional activities. Since 1941, small numbers of Czech students have been re-admitted to medicine and engineering courses in German universities. The Polish universities remain closed, and all education given to Polish pupils must be either elementary or purely technical; technical education now comprises special colleges—always run by German administrators—in which courses are given in medicine, pharmacy, veterinary science, agriculture, engineering, etc., and vocational training has recently been made compulsory for all Polish boys. In occupied Russia, some university colleges, in Kiev, Odessa, and Shitomir, have been re-opened under the auspices of the occupation authorities to educate the Russians and Ukrainians in an anti-Bolshevik spirit.

The position is different in the occupied countries of western and northern Europe. In countries like Norway, Belgium and Holland, the Nazis are prepared, in principle, to admit institutions of higher education, provided that they co-operate with the Reich. An increasing number of students have actually registered in the universities of all these countries since the invasion, in many cases obviously in order to escape the necessity of doing slave work for the Nazis. Everywhere, however, this education has met with increasing difficulties since neither teachers nor pupils are prepared to submit to the Nazi New Order. The position was recently most critical in Norway, where the vast majority of the teachers, including university, secondary school and elementary schoolteachers, have been dismissed or sent to concentration camps for not joining the Nazified teachers' organisations. Two famous universities of the Low Countries, in Brussels and Leyden, have also been closed because of their resistance to Nazism.

Neutral Austerity

[FROM OUR DUBLIN CORRESPONDENT]

June 1st

THE inconvenience caused by the war is growing daily in spite of neutrality. Supplies of many essential commodities are running short. The bread situation has so far not been too serious. One hundred per cent extraction has been resorted to, and the existing supplies will probably last until July, when imports will be necessary to tide over until the harvest. The condition of the wheat crop is giving rise to some anxiety caused by weather conditions, but the acreage has been greatly extended, and if the yield is round about the average, the volume of the harvest should prove very abundant. A temporary shortage of butter has come to an end owing to the resumption of summer dairying. The price has, however, had to be raised in order to increase the price of milk payable by the creameries; this thereby keeps the farmers from cutting down production. Other fats—such as margarine, lard and dripping—are in very short supply. The main danger in respect of the sugar supply is that it may be impossible to replace machinery in the sugar factories in case of a breakdown. Tea continues to be strictly rationed, and there is also a shortage of cigarettes, matches and other conventional necessities.

The most acute difficulty is in respect of the fuel supply. Imports of petrol have been reduced to one-fourth of normal, with the result that private motoring has come to a complete end, and even commercial motoring has been greatly reduced. Bus services in Dublin are being reasonably well maintained, but it is feared that the shortage of rubber and the impossibility of replacing tyres may lead to further reductions. The shortage of coal is even greater than that of petrol. The English mishandling of coal production is having repercussions on Irish economic life. The Great Southern Railway's passenger services, apart from those in the Dublin suburbs, are practically at a standstill. There is an acute shortage of gas, which is rationed in such a manner as to cause the greatest inconvenience to consumers. Even the supply of electricity is now diminished owing to the reduction of coal imports. The capacity of the Shannon Scheme has been long exhausted by the growing demand, and the Liffey Scheme has not yet come into operation. The prospect for lighting and heating in the coming winter is alarming.

Apart from very small supplies of coal the only home-produced fuels are turf and wood. While these can replace coal for domestic heating to a large extent, they are less suitable for industrial uses. A great drive is being made to increase the output of turf, with some success. The unemployed in Dublin have been deprived of unemployment assistance if they are able to assist in turf production, and the supply of labour employed on the bogs has been considerably augmented. The most serious problem in relation to turf will be that of transport. If supplies of petrol and coal still further diminish, there is a danger that neither the turf cut during the summer nor the produce of the harvest will reach the urban consumer.

The Price of Neutrality

These shortages and inconveniences are the price of neutrality. Belligerent countries are willing to pay a considerable price for victory, and neutrals must be prepared to pay a price for keeping out of the conflict. The suggestion that the continued pressure and want of food and fuel will drive Eire to alter its attitude towards neutrality in return for supplies is entirely without foundation. There are rumours of a general election in the autumn, and it is almost certain that, in the event of such an election, the present Government would be returned with an increased majority. In spite of dissatisfaction with certain details of the agricultural and rationing policy, the Government would undoubtedly receive a fresh mandate on the issue of neutrality. The losses caused by the war are not without some compensating gains. At least, the country has been spared the capital destruction caused by bombing and will not have to incur the cost of restoring houses and factories after the war. Moreover, the reduction of imports has turned the balance of payments strongly in our favour, and we are accumulating large sterling assets which will prove useful when the period of restocking begins.

Prices and Wages in France

[BY A FRENCH CORRESPONDENT]

May 31st

THE Vichy Government is at present engaged in readjusting wages which are abnormally low. This operation is the more necessary since, despite the very reduced quantity of the food rations, large sections of the population are unable to buy them on account of the high price level. Hourly wages of Frs 1.75, Frs 2.0, and Frs 2.50 are still paid in the country; they correspond to a monthly income of less than Frs 500. In a statement made at Paris in January, the former Minister of Labour, M. Belin, quoted a number of typical cases in which hourly rates did not exceed Frs 1.0-Frs 1.50.

The *Petit Journal* of December 30, 1941, wrote: "An enquiry has been carried out in a number of departments in the occupied zone, particularly in the Nord, a district with a dense working-class population. It appears from this enquiry that the 'shopping basket' of the working-class family has trebled in price since 1939, while its calorific value has sensibly diminished." The same paper continues: "Wages are manifestly too low. It is only necessary to take a look at the average wages paid in the departments. What can a worker do with Frs 1,200 to Frs 1,500 a month? How can he feed, clothe and house himself? The view that in the present state of affairs the minimum monthly wage should be Frs 2,000 is gaining ground."

According to existing information, the minimum wage on which life can be supported in France to-day is between Frs 1,500 and Frs 2,000 a month for a childless household. The majority of workers employed at time rates continue to draw between Frs 1,300 and Frs 1,500 a month. Unskilled workers and women, even if fully employed, have difficulty in earning Frs 1,000. Workers who do only thirty hours a week—which is the usual position in the consumption goods industries—earn only from Frs 600 to Frs 700 a month. As for the unemployed, they receive from Frs 7 to Fr 14 a day, together with certain allowances.

The Labour Charter

Since Laval came to power the application of the Labour Charter appears to have been slowed down. It is understood that Laval is the representative of certain Paris circles which are hostile to this new professional organisation, and attempt to direct against it the discontent of the working classes. Moreover, the Minister, Henri Moysset, who was most actively working for the reform, and was an intimate collaborator of Darlan, lost his post in the latest Government crisis, as did the Minister of Labour, Belin.

The nature of the Charter was described in *The Economist* of April 4th (page 468), and the extent to which it has been applied was set out in an official communiqué published on April 20th. A Supreme Labour Council was set up to work out the general principles of the new organisation. A certain number of the factory social committees, which comprise the nucleus of the system, have been provisionally established. The social committees include representatives of the employers, the workers and other categories of employees. Their number amounted to 1,500 in April. The twenty-nine professional groups (*familles professionnelles*), into which the industrial and commercial population is to be divided, have been or are on the point of being defined. The provisional committees, charged with the organisation of the professional groups, are in process of being set up.

The hostility of working-class circles to the Labour Charter has not evaporated. They see in it an instrument destined to violate their traditional liberties. Numerous sources of friction arose in the course of the creation of the factory social committees. It is understood that the legal status of the labour delegates has not been decided. Many employers have profited by this fact, in order to nominate the delegates themselves. "Election by the workers, pure and simple, is the only way," wrote the *Petit Journal* of March 8th.

In an attempt to conciliate syndicalist circles, the Government announced the publication in the near future of a decree which "will improve the conditions in which syndicates which are already in existence will be able to continue their activities, and will announce the methods by which they will be integrated in the new organisation." The attempt was made in vain. In the face of this setback, it is not impossible that the new Government will abandon the legislation or completely refashion it.

Russia at War

Building Industry

THE construction of factory buildings and sheds is still expanding in the eastern territories of the Soviet Union. Workers in construction industries have been urged to join the "socialist emulation" (referred to in *The Economist* of May 30th), which is taking place in all the defence industries; and towards the end of May, the press published urgent appeals for the speeding up of construction work. In the allocation of building materials, the metal industries have been given priority; and, among these, factories producing arms and munitions have first claim before those producing machines and tools. As to the speed of production, the papers publish the following examples: in one factory, a department covering an area of more than 14,000 square yards was built in thirty-five days; another department, covering an area of nearly 17,000 square yards, was built in twenty-seven days; a new aircraft factory is said to have been assembled in thirty-five days. As is usual in such cases, no indication is given of the average speed of construction, and only record results are published.

The difficulties experienced by the building industries spring from the shortage of materials and labour. A very high proportion of brick and cement was produced in territories now under German occupation. The lack of building materials puts construction managers in a rather awkward position. They are simply advised to discover materials "on the spot," or to "use local resources." The following appeal of *Pravda* gives some idea about the job in front of a construction manager:

It is necessary to see that there is not the slightest delay on the job because of a non-delivery of materials. In this respect, serious responsibility must be borne by the local Soviet and party organisations, which must pay more attention than hitherto to the development of the building materials industry. At the same time, the construction manager must also personally seek out local materials. If you are a good building manager, then display your initiative, find local materials, open up quarries, organise local transport, do not invent excuses and do not hide behind the cloak of wartime difficulties.

The search for quarries has indeed been very intensive, and the question whether any "local resources" of building materials are available at a given place must have affected the location of factories.

The shortage of labour is the other limiting factor. Workers in the building industries have been urged to learn various trades, so that they may be used for various jobs. Masons have to work—according to need—as concrete layers, plasterers or fitters. The press complains about competition between central and local authorities for building labour. A case, for instance, has been reported in which a local committee of the party refused to allow its workers to take up jobs on a construction undertaken by the People's Commissariat of Building. The quarrel between Moscow and the provincial town was discussed in a leading article of *Pravda*, which gives some idea about the acute-ness of the problem.

Expansion of building is usually the most direct index of the expansion of the productive capacity of a country. Whether this is actually so in Russia is difficult to say, since it is not known what is the proportion of building designed to accommodate evacuated works, and what is apportioned to entirely new factories. In the first case, there can only be saving of previously existing productive capacity; in the second case, actual expansion takes place. There are, however, some reasons to assume that the construction of buildings for evacuated works is playing a minor part in the present campaign.

The Kolkhoz in Wartime.—The most striking wartime feature of the collective farm seems to be the widespread replacement of the tractor by the horse. The war has to a large extent immobilised the machine, on which the whole structure of collective farming was based. Tractor drivers are short; the staff of the repair workshops has been depleted, and fuel shortages have also affected the position. Collective farms have been urged to get their tractors repaired by the workers of neighbouring factories; the managers of those factories, in

their turn, are short of workers, and show a natural reluctance to send them out to the countryside.

Izvestia summed up the position, stating that "a great part of this year's agricultural work has to be carried out with draught animals." But this—the paper says—entails a return to the use of horse-drawn ploughs and sowing machines; and the peasants have been urged to take out of the *Kolkhoz* (collective) stores old and primitive agricultural implements.

It is difficult to judge the scale of this switch-over from tractor to horse. But the attention given to it in the press, and in various speeches, seems to indicate that it has been large enough to create an important economic and political problem. The economic question is how the use of a more primitive technique will affect this year's harvest. The political implication bears on the "individualist" tendency of the farmers. The tractor has provided the technical basis for collective farming, whereas the horse is the classical traction force of private farming. The switch-over from tractor to horse—if it takes place on a large scale, as it seems to be doing—is likely to loosen the collectivist coherence of Soviet agriculture, and to strengthen those "individualist" tendencies which have by no means disappeared during recent years. *Izvestia* says that horses and agricultural implements have been allotted to individual farmers, and that the individual *Kolkhoznik* has to take care of the animals allotted to him. This changes to a large extent the accepted division of labour within the collective farm. The collective stable is being at least partly redistributed among the peasants. To gauge the significance of this fact it should be remembered that it was precisely the collectivisation of cattle which caused the great slaughter of horses by peasants more than a decade ago.

Another interesting feature is the development of the so-called *Kolkhoz* trade. The supply of foodstuffs to the country has during recent years been secured through three channels: deliveries to the state, sales of foodstuffs by the farms and individual sales by members of the *Kolkhoz*. The independent trade by farms and farmers accounted for a comparatively small fraction of the food supplies. But its share was growing in recent years, and the war has accelerated the process. Transport shortages have impelled the Government to adopt the principle of decentralisation. The *Kolkhoz* trade, and, even more so, the trade by individual *Kolkhozniki*, is the most decentralised form of supply. It has been carried out on local markets in neighbouring towns. In recent months, much stress has been laid upon the need to encourage this kind of trade. But here again it is the trade by the individual *Kolkhoznik* that is placed in a better position than the trade by the *Kolkhoz*. Press reports complain of the difficulties the collective farms find in transporting their goods to local markets. The individual *Kolkhoznik*, who has to carry smaller quantities of commodities, can reach the market and sell his produce more easily.

an indemnity from each and every customer paying in hybrid documents; and all other considerations apart, that is hardly a promising approach to the saving of paper.

A Non-Transferable Cheque?

Any solution along these lines must be deemed impracticable, the more so as banking opinion is unanimously and very reasonably opposed to any *ad hoc* amendment of the Bills of Exchange Act which has so well withstood the test of time. That, however, is not necessarily the end of the matter. It may be asked whether, from the viewpoint of the payer, the simple cheque voucher is not itself as good as a receipt. In the United States, though there is no overriding Federal law on the subject, a cheque is universally accepted as *prima facie* evidence of payment and separate receipts are seldom given. In this country, on the other hand, possession of a receipt is deemed to give the holder a superior legal position, and it is not certain that the accountancy profession would welcome, for example, an Order in Council suspending the right to demand receipts

in wartime. A possible compromise might be to require that receipts, where demanded, should be given on the cheque. Provided payment were clearly left unconditional, no amendment would be needed in existing legislation, but the public would have to grow used to putting two signatures on the back of cheques. The remaining, and probably the most promising, alternative would be the substitution of a non-transferable instrument for the normal cheque payable to order. It is now widely recognised that a bill of exchange, with its negotiable character, is an inefficient means of payment under modern conditions, when the vast bulk of cheques drawn never circulate but are paid in for collection by the original payee. Opportunities for conversion of a non-transferable instrument would be fewer, while no question of forgery could arise. The repeated examination of endorsements which is at present necessary could, therefore, be dispensed with, a point which might be worth the consideration of the new Kennet Committee. One difficulty, of course, would be the possible inconvenience to payees having no banking accounts, though bankers would be free to collect at their own risk after suitable inquiries.

Credit Expansion Resumed

As was foreshadowed by the floating debt movements, the clearing bank returns for May show an expansion of £49.6 millions in deposits to £3,131.1 millions. While this represents an expansion of £307.1 millions on the year, there has been little rise on balance over the past eight months. The present level is still £198.1 millions below the peak of December, 1941, whereas in the corresponding period last year there was a net expansion of £24 millions—clear testimony to the efficacy of the War Weapons Week campaign, and even more of the new Tax Reserve certificates, in draining off surplus deposits in recent months. It

(In £ millions)

may be noted that the outstanding amount of Tax Reserve certificates is nearly £250 millions. On the assets side, the rise in deposits has its chief counterpart in a further recovery of £32.6 millions in discounts and of £21.0 millions in TDR holdings. Investments, on the other hand, are practically unchanged, even though advances have declined by a further £10.5 millions, confirming that the downward trend has not yet been arrested. In consequence, the ratio to deposits of the four liquid assets has risen on the month from 37.7 per cent to 39.0 per cent, while that of the higher earning assets has declined from 60.7 per cent to 59.4 per cent, against 61.0 per cent a year ago.

Motor Insurance Rates

In last week's issue of *The Economist*, mention was made of the decision of the member companies of the Accident Officers' Association—the tariff companies—to reduce by 20 per cent the rates on private cars covering road risks, with effect from July 1st. Similar announcements have now been made by leading non-tariff companies and also by Lloyd's underwriters, with the proviso that Lloyd's policies which are already subject to special rates will be considered on merit, the wartime discount in no circumstances to exceed 20 per cent.

The Interest Factor

The more rapid recovery in market prices, which owed its inception to success on the battle fronts, has continued up to date, but with a gradually changing emphasis. There is a tendency for South American stocks to settle down, at or near their recent highs, after a short bout of profit taking, and the attention of the public has been, in considerable measure, transferred to British industrial equities, and to some extent to the Funds. The movement has been accompanied by a further recovery in the volume of business, and in the ordinary share index of *The Financial News*, to virtually the highest of the year, but this is still well below that ruling prior to December 6th in both cases. The market remains short of stock in almost every section, and the immediate prospect is for further rises so long as all goes well in the theatres of war. The market's explanation of the rise, based in part on the type of orders received,

The French Banques d'Affaires

Under the dual influence of inflation and German occupation, the French banking system is undergoing a remarkable change. The traditional distinction between commercial banks and *banques d'affaires* is gradually disappearing. In the past, the latter specialised in financing the promotion of new enterprise, and retained an active interest in the industries created or reorganised under their auspices. In the changed circumstances, however, the *banques d'affaires* have to confine their activities, like the commercial banks, largely to reinvesting their deposits in bills. The balance-sheet figures of the leading *banque d'affaires*, the Banque de Paris et des Pays Bas, duly indicate this trend. In 1938, bills represented only 35 per cent of the bank's total assets; this figure increased to 52 per cent by the end of 1940 and to 73 per cent by the end of 1941. On the other hand, participations declined from 15 per cent in 1938 to 10 per cent in 1941, while advances to customers declined during the same period from 19 per cent to 6 per cent. The explanation lies in part in the plethora of liquid funds which places industry in a better position to finance itself, and in part in the increasing German control over French industries. German interests have acquired participations in a number of leading French firms, and now look after their financing. Only too many French firms, moreover, are engaged in manufacturing arms for Germany, and these, too, are looked after by German interests. In face of the loss of its normal business, the Banque de Paris et des Pays Bas has sought to increase its deposits. The opening of a number of branches has been under consideration, but until now the only branch—apart from the pre-war branches in Geneva, Amsterdam and Brussels—that has actually been opened is in Marseilles, having been established after the Armistice in order to secure a footing in unoccupied France.

Financial Self-Sufficiency of Crown Colonies

As is well known, the accumulation of large sterling balances on account of the Dominions has materially changed their financial relations with this country. It is less generally known that the situation regarding many Crown colonies is somewhat similar. They, too, have accumulated sterling balances, and in consequence are now able to finance themselves to a high degree. To give an example, in the past the sugar campaign of Mauritius had been financed in London. This year, however, no credits are required for that purpose, as the colony is well in a position to cover its own financial requirements. The same is true to a large extent also concerning the British Crown colonies in Africa. This state of affairs is obviously purely temporary. It is due to the fact that Great Britain is not at present in a position to supply the colonies with manufactures to an extent comparable with her purchases in them. Nor are the colonies able to spend their sterling elsewhere, but are compelled to save a large part of the proceeds of their exports. With the return of normal conditions, however, the replenishment of depleted stocks and the execution of deferred capital expenditure will make heavy demands on colonial sterling balances, and the colonies will look once more towards London for credit facilities.

Investment

is that there is a swing of opinion among investors towards the view that the war will be over this year. This is coupled with a considerable growth in the belief that the Treasury will not be able to maintain a low rate of interest for any lengthy period after the end of the war, although it is admitted that some further fall in the rate paid on short term bonds may be secured. On the former point, there would seem to be very little justification in the present state of the two parties to the conflict, or in the prospective expansion in the power of the United Nations, particularly in the matter of shipping, for so optimistic a view. On the latter, the discussion is likely to continue until the answer is provided by events. It is, however, interesting that views are changing, and that some sections of the market should look for the event to be discounted years in advance. A conservative estimate of the duration of hostilities would seem to be a minimum of almost eighteen months. After that, it is probable that

control of the new issue market will be retained, without revolutionary amendments, for a period of years rather than months. It is, perhaps, not too early to begin to discount the post-war relaxation of EPT and other hindrances to company earnings, but it would seem too early to expect any substantial switch from fixed into variable dividend securities based on the belief that the rate of interest is likely to rise.

Limitation of Dividends

It is a curious commentary on the attitude towards the investor that, at this stage of the war, questions should still be asked in the "House," as happened last week, suggesting the desirability of further limitation of dividends. The reply of the Chancellor of the Exchequer, that he thought the cases of increases were few, but that the need for limiting shareholders' spending power and increasing company subscriptions to war loans remains, is not less curious. Even if it is admitted that, while the reward of labour may be increased during war, it is undesirable that savings should reap an increased reward as a result of it, it is still possible to distinguish between increases in profits caused by the war and those which arise from other causes, and merely happen to coincide with it. The figures published in *The Economist* last week and a fortnight before show that, in general, the effects of EPT have far exceeded the limitation of distributions, and, where earnings have risen, the principle of dividend limitation has usually been observed. Most of the few cases where dividends have increased represent either recovery from acute depression or else the first fruits of nursing a new concern to the profit-earning stage. In the latter case, it would be hard to justify a claim that savings should go without reward for the duration of the war, just because the company happened to be formed in, say, 1938, instead of five years earlier. Unfortunately, in too many cases, this is just what happens, and companies, which had pumped back profits in the early stages of the war to increase their contribution to the war effort, find themselves on the verge of bankruptcy owing to the demands of EPT at 100 per cent. In this matter of the reward of risk-taking, as in so many others, there is great need of clear thinking. It is clearly not desirable that anyone should make profits out of war, but a very large section, who are not investors, do so in money terms. It may even be expedient to apply a differential tax to those who, by abstaining from consumption in the past, have provided the present capital equipment. But it is more than a little anomalous that legislators should appear to find it both natural and desirable that all rewards to shareholders should be kept down to, or even below, their pre-war level.

Bradford Dyers Outlook

The decision of the board of Bradford Dyers once more to postpone consideration of a preference dividend, until the trading results of the year are available, will have caused little surprise. After the marked recovery of 1940, when five years' arrears of preference dividend were liquidated, there was a sharp fall in profits last year. When the full accounts were available, earnings sufficed to cover a further two and a half years' arrears, leaving a balance of £7,500 to be added to the carry forward. The year brought every sort of problem. Not only was there a sharp reduction in total output, for home and overseas markets, but requirements were constantly varying, and the group suffered from shortage both of labour and materials. The current year has certainly brought further limitations on the civilian demand in the home market, and although, for the cotton textile trade in general, this may be more than offset by service requirements, it is doubtful whether the latter will yield any considerable profit to Bradford Dyers. There is, however, another side to the picture. If quantities are reduced, the variety is likely to be curtailed at least as drastically, and the company may be able to reap definite advantage from the increased standardisation and a more regular flow of demand for any specific product. It seems doubtful whether these advantages can fully outweigh the loss of trade, and the quotation for the £1. 5 per cent. cumulative preference stock units which will carry two years' arrears at the end of this month, is only 155. The longer term outlook for this group seems even less favourable than that for some of the other large horizontal combines in the industry, but it should be possible to provide

something for preference shareholders during the war years and the period of post-war re-stocking.

J. Lyons Accounts

The full accounts of J. Lyons for the year to March 31, 1942, contain the customary paucity of information. Profits after tax, except tax on dividends, and all expenses, except directors' fees, have risen from £896,710 to £909,585. This increase is responsible for higher equity earnings at £406,147 against £393,247, representing 23.8 against 22.4 per cent on ordinary and "A" ordinary capital. Ordinary and "A" ordinary shares receive 20 per cent, as in the two previous years, and the surplus goes to raise the carry forward from £320,990 to £355,882. This outline of the profits position permits only one inference, that gross income last year rose ahead of costs and taxation, despite every difficulty presented by war time catering.

	Years ended March 31,		
	1940	1941	1942
Profit	1,024,623	896,710	909,585
Directors' fees	13,171	13,110	13,085
Prof. dividends	462,353	462,353	462,353
Prof. ord. dividend	28,000	28,000	28,000
Ord. "A" ord. and proportional profit shares:			
Earned	521,099	393,247	406,147
Paid	371,255	371,255	371,255
Earned %	33.0	22.4	23.8
Paid %	20	20	20
Carry forward	298,998	320,990	355,882

* On ordinary and "A" ordinary: each proportional share ranks for one-fifth of dividend on an ordinary share.

The reduction in debtors, from £1,377,289 to £928,923, and in creditors, from £2,644,945 to £2,496,987, suggests some contraction in business, while the rise in the value of stock from £3,049,375 to £3,259,214 may conceal a fall in real terms. The only other significant change is the investment of £125,000 in 2½ per cent National War Bonds. In view of the relative stability of retail prices, and such adverse factors as the jump in the cost of crockery replacement, it is most probable that last year's improvement is due mainly to the introduction of new labour-saving methods, such as the replacement of "nippies" by self-service. Whether there remains much scope for further cost reduction is doubtful. With turnover inevitably limited by the shortage of supplies, the maintenance of net profits appears to depend, in the long run, on the ability to raise prices to the consumer. Here, of course, the concern has to meet a new competition from British restaurants. The £1 "A" ordinary shares, at 100s. ex dividend, yield 44 per cent.

Cable and Wireless Payment Maintained

The news that the operating and holding companies of the Cable and Wireless group are both maintaining their total distributions for last year at 4 per cent can scarcely have come as a disappointment to the investor, despite the fact that the market marked the price down 1½ points on the news. As a matter of history, the whole of this rise, and a good deal more had occurred in the past few days, and a considerable proportion of it in the few hours, preceding the announcement. After the fall the quotation is 61, compared with approximately 64 just after the declaration of a year ago. In the meantime, the general level of security of prices has risen very appreciably, but the group is, of course, involved in the Pacific area. The extension of Japanese occupation there will not have affected the results of 1941 materially, but it may well be that the board will have given some weight to the current position in deciding how much to distribute. Prior to the entry of Japan into the war, the ordinary stock had exceeded 70, against a high of 66 in 1940, a fact which suggests that the public had no very grave doubts as to the immediate outlook. In fact, it was anticipated that the increased business in the telecommunications field, coupled with at least the maintenance of earnings in the Marconi group, would more than offset any further decline in revenue from investments, caused by vesting orders and the general limitation of dividends. This year, the price has been down to 47 and, recently at high

as 62½. It will be necessary to wait some days, at least, for the full accounts, which will answer doubts as to last year's results, and the chairman's comments, which, it may be hoped, will throw some light on prospects. At the moment, they appear less bright than they were a year ago, partly because enemy occupation restricts the field of operation as well as depriving the group of physical assets. In general, it is by no means certain that, under conditions of peace, profits will exceed those earned in the immediate past. These doubts are reflected in the yield, which, at the current price of 61 cum dividend, is a little over 6½ per cent.

Forestral Land

Despite an improvement in the balance on profit and loss account from £512,882 to £593,683, shown in the preliminary statement of Forestral Land for 1941, there is a marked decline in the cover for the ordinary dividend. This is accounted for by a jump in the transfer to taxation reserve from £15,543 to £250,000. If, in the previous year, the sum of £20,809 required for redemption of ten-year registered notes is not treated as a charge against profits, equity earnings can be estimated to have declined from £406,197 to £231,732, representing only 12.4 against 20.9 per cent. The total distribution on ordinary capital is maintained at 9 per cent, but there is no transfer to dividend equalisation, against £100,000 in the previous year, while general reserve receives £50,000 against £150,000. A sum of £5,000 has been subscribed to war charities since the date of the last accounts, so that the carry forward is increased from £134,475 to £149,309. Comment on the result must be deferred until the full accounts are available, but in view of all the difficulties, both of transport and of rising costs in Argentina, the results appear not unsatisfactory. Dividend equalisation reserve remains at the adequate total of £500,000, while general reserve is raised to £1,500,000 after the latest transfer. The ordinary payment is still sufficiently covered, and there is no evidence that the situation will deteriorate in the current year. The £1 ordinary stock and shares, at 27s. 3d. ex dividend offer £6 12s. 1d. per cent.

Lead Industries

Full accounts of Goodlass Wall and Lead Industries, the important lead and paint manufacturers, show a rise in disclosed profits for 1941 from £266,425 to £305,346. The increase is, however, more than absorbed by higher taxation, which requires £199,507, against £155,945. As these appropriations include tax on dividends, the preference payment calls for less and equity earnings have increased from £36,434 to £37,150, representing 6.1, against 6.0 per cent. The ordinary shares against receive 6 per cent, and the carry forward is raised from £79,615 to £80,023. This uneventful stability has been achieved despite a further contraction in the export trade, and in the demand for lead exercised by the building trade, and despite the interruption of paint production by enemy action. There was, however, expansion of business in the metallurgical department, and the chairman, Mr Clive Cookson, points out that the relative plenty of lead was favourable to the concern. There has been a severe labour shortage affecting the operation of the Greenside Mine, in which Goodlass Wall is interested, and the Calcutta lead and zinc companies have suffered from the incidence of Indian taxation. In all the circumstances, the results are satisfactory, but the chairman sounds a cautious note in respect of the outlook for the coming year. The consolidated balance-sheet shows some running down of stocks, valued at the customary basic price, which is below market price, from £1,324,408 to £1,072,358. This has partially financed an increase in the cash holdings of £337,050 to £468,845, including the transfer of £150,000 to deposit account. Debtors and creditors are both some £226,000 higher. The directors point out that no adjustment to the balance-sheet total of land and buildings has been made on account of damage by enemy action. General reserve is unchanged at £288,937. The 10s. ordinary shares, at par, offer £6 per cent.

Newspaper Earnings

Accounts for the latest calendar year of a selection of leading newspaper concerns are analysed in the following table. It must be emphasised that the figures are not

comparable between different companies, but only as between the successive annual results of each particular company. The lack of uniformity of presentation of accounts, and in particular in the important matter of showing taxation with or without including tax on dividends, prohibits comparison of the actual sums earned by different concerns in any one year. With this proviso, however, the table indicates a very striking improvement in the earnings of the Press as a whole. In only one case, that of the *Sunday Pictorial*, is there a decline in total disclosed earnings. The remarkable feature of this company's accounts is the decision to raise the ordinary dividend from 10 to 12½ per cent, despite a decline in equity earnings from 16.4 to 11.7 per cent and the fact that there is a consequent draft on the carry forward. The decline in total profits is, of course, partly explained by the fact that they are shown after tax, except £25,000, as usual, transferred to tax reserve, and except tax on dividends. In no other case, however, is there a setback even in equity earnings. *Illustrated Newspapers*, whose sale has been particularly hard hit by paper rationing, again show no earnings on ordinary capital, but six months' preference arrears to April 30, 1941, have been distributed. The remainder, *Allied and Associated Newspapers* and the *Daily Mirror*, have improved their position despite paper rationing and taxation, and the two former have raised equity payments from 6 to 8 per cent and from 12 to 15 per cent respectively. An indication that the present

position is not considered discouraging is afforded by market opinion, which is responsible for an improvement in the range of yields on the same five concerns from between £7 5s. 5d. and £13 6s. 8d. a year ago to between £5 and £8 18s. 7d. on June 10, 1942. The explanation is no doubt that reduction in the size of newspapers, coupled with approximate maintenance of circulation and advertising revenue, has actually increased potential profits. The balance-sheets of all five companies show little change. Debtors tend to be moderately reduced, and some investment in tax reserve certificates is common. Stocks are little changed in money terms, there being presumably a certain reduction in real terms.

Consolidated Gold Fields Results

The milling grade of *Robinson Deep* was lowered, and as costs rose, profits fell, and dividends were reduced to 50 per cent to give a present yield of 34s. 4½d. of 10.9 per cent. Development was satisfactory and ore reserves almost maintained. The additional air-cooling plant should shortly be in commission. The mine is very deep, and, although it has clearly passed its prime, has a long life in store. *Simmer and Jack* suffered a series of reverses, the most important being widespread caving in the upper (older) portions of the mine. Milling grade fell severely as the number of available stope faces became inadequate to control the grade of ore to the mill: moreover, owing to the caving, ventilation difficulties arose in the western portion of the mine, so that mining of good grade ore from this large area was restricted. Since costs also rose, profits showed a heavy fall and dividends

were reduced to 36.6 per cent, to give a present yield, at 12s., of 7.6 per cent. The heavy fall in the ore reserves is mainly due to the necessity of eliminating certain blocks rendered inaccessible by the caving. Development footage was increased, and intensive development will be required to improve the ore reserve position, which now represents less than two years' supply. It is solely due to the troubles mentioned above that capacity of 180,000 tons a month was not reached last year. Present disappointments, however, should not be allowed to detract from the great possibilities of the mine. The *Vlakfontein* plant with a capacity of 20,000 tons a month, started up after the end of the financial year. Development results continued good. The last two quarterly development reports show a highly satisfactory improvement both in payability and values. The mine carries the continuation in depth of *Sub Nigel* pay shoots. It starts production with the high issued capital of £3,000,000, to give a

capitalisation of £6,000,000 at the present price of £1. An interesting comparison is the old *Sub Nigel*, with an issued capital of £886,000, which gives a capitalisation of about £11,300,000 at the present price of 6½. The operating results of *Vogelstruisbult* were very similar to the previous year, and dividends were increased to 17½ per cent to give a yield of 6.9 per cent at 25s. 6d. Development results, especially in the north and north-east portion, towards *Daggafontein* and *East Daggafontein*, were excellent, and the ore reserves show a substantial increase in tonnage. After certain initial disappointments the mine is now well into its stride. But it is subject to full taxation and to the Government's share of profits. Consequently, there may be a slight reduction in the current year's dividends. The dividend position after the war should, however, be more than re-established, especially as the mine is ready to increase the plant by 8,000 tons a month when conditions are propitious.

Industry and Trade

Synthetic for Crude Rubber

Even if shipments from Ceylon continue and production in other countries still accessible is increased, it is doubtful whether the United Nations will be able to meet more than one-fifth to one-sixth of their essential rubber requirements from current supplies of natural rubber. True, they hold large stocks of natural rubber, and efforts are being made to reclaim a larger proportion of rubber from discarded articles. But, quite apart from the fact that reclaimed rubber is not equivalent to new rubber, there still remains a big gap between supplies and requirements which can only be bridged by the large-scale manufacture of synthetic rubber. Plans have been made, months ago, for an enormous expansion of production in the United States from oil instead of from coal as in Germany. If these plans can be carried out, the United States will produce 25,000 tons this year, 300,000 tons in 1943 and 600,000 tons in 1944. But there appears to be some doubt about the ability of the United States to adhere to this ambitious schedule; it is now three months since Mr Leon Henderson, United States Price Administrator, said that it would require a miracle to secure 300,000 tons of synthetic rubber in 1943 and 600,000 tons in 1944. True, American industry has already performed many "miracles" of production. But the technical problems involved in a large-scale expansion of the output of synthetic rubber are very considerable and quite different from those involved in, say, the conversion of the motor industry into an arsenal.

In order to carry out a programme of such magnitude, it will be necessary to increase the annual output of the most commonly used basic materials, namely, butadiene and styrene, from a few thousand tons to several hundred thousand tons. In practice this involves the rapid transformation of small pilot or semi-commercial plants into large-scale industries. The production of styrene is dependent upon the supply of benzole, which is already far from plentiful in the United States. Similarly, reports from America suggest that a bottleneck is developing in butadiene, which is at present produced from the so-called C4's. These are hydrocarbon compounds containing four carbon atoms only, and occurring in natural gases and petroleum cracking gases. But C4's are also needed in the manufacture of aviation fuel. While the volume of C4's

calculated to be available may be sufficient to meet all requirements, it is unlikely to be collected in full from tens of thousands of wells, and many hundreds of refineries, few of which possess adequate separation facilities. Discussions before the United States Senate Committee on synthetic rubber indicate that the difficulties are clearly recognised. For example, attempts are now being made to tap new sources of C4's by the fermentation of agricultural products. In view of the doubts about America's ability to meet the essential needs of the United Nations, it has been suggested that the production of synthetic rubber should also be started or increased in other countries, including Great Britain, on the basis of oil supplies from sources other than the United States, and that in view of the time required to provide production facilities, arrangements should be made now. They were scarcely set at rest by Sir Andrew Duncan, who stated in the House of Commons, on Wednesday last week, that the import of the raw materials for the large-scale production of synthetic rubber in this country would impose a heavy additional burden on shipping, and that large quantities were being made in the United States, where the necessary raw materials were readily available.

Welded Ships

Reference was made in *The Economist* of April 11th last to the use of welding in shipbuilding. In America the standardised "Liberty" cargo ships are almost entirely welded; the process is also widely used in the established yards engaged on cargo liner or naval construction. For technical reasons, the introduction of welding in Great Britain has been slow, but, under Admiralty guidance, welding facilities are to be increased until this method of fabrication is used in every case where, with existing layout, it will show a saving in time over riveting. This depends on available labour as well as on the type of joint to be made. It is generally more economical to train welders than riveters, but certain types of joints, hull plates for instance, can be riveted more quickly than hand-welded. One reason why the shipbuilding industry in America decided to adopt welding on such a vast scale was the fact that it had to recruit large numbers of workers with no previous experience in shipbuilding. Another was the progress in that country of welding by automatic machines, which is not only more reliable than the process of manual welding but also more productive; automatic welding largely eliminates the need for special skill which is essential in operations

by hand. Automatic welding plant is seen to the greatest advantage where a large amount of pre-fabrication off the building berths is possible, which is not the case in the majority of British yards. However, efforts are now being made by the Admiralty to introduce these machines into British merchant shipbuilding. They employ a special process known as "Union-Melt" which has been used successfully in American shipbuilding since 1937-8 and in other industries longer than that. The welding plant, supported on a small trolley, is run along the two edges of steel, the weld metal being fed automatically from a large spool; the actual fusion takes place underneath a cover of granulated material poured through a small hopper. These machines are to be imported from America, which suggests that the process has considerable technical merit. This raises the interesting question why the process has made so late an appearance in British industry. The extent to which it will be possible to employ it in British shipbuilding will presumably depend on the suitability of individual yards, the availability of the fairly extensive electrical equipment involved, and the number of machines that can be imported or manufactured here. It appears, however, that at present automatic welding is to be regarded as an aid to production rather than as a departure from existing practice.

Unemployment in May

A drop of 9,515 was recorded between April 13th and May 11th in the number of unemployed persons registered at employment exchanges in Great Britain. The distribution of the total of 117,984 unemployed is given in the accompanying table. The main contribution to the fall came from boys and girls, presumably absorbed into employment after leaving school. The numbers of men wholly unemployed barely changed, but fewer were temporarily stopped and fewer men normally in casual employment were out of work on the day of the count. The number of women

	Wholly Unemployed	Temporarily Stopped	Persons Normally in Casual Employment
April 13, 1942			
Men	55,365	3,217	3,725
Boys	14,178	64	...
Women	34,509	3,000	245
Girls	12,996	200	...
Total	117,048	6,481	3,970
May 11, 1942			
Men	55,060	2,579	2,945
Boys	10,711	20	6
Women	32,902	3,084	281
Girls	10,290	106	...
Total	108,963	5,789	3,232

wholly unemployed showed a decrease of 1,607, but there were slight increases in the other categories. Men classified as unsuitable for ordinary industrial employment numbered 25,628; 1,505 women were classified as unsuitable for normal full-time employment. These persons are no longer included in the unemployment returns. All the regions except the Eastern and Wales showed decreases in unemployment. The process of eliminating unemployment is slow, but the numbers now involved are small. Nevertheless, further falls can be looked for. The unemployment figures are in a sense a measure of the efficiency with which the Ministry of Labour is transferring workers from one job to another.

Regional Self-Sufficiency in Food

In accordance with the Ministry of War Transport's policy of securing the elimination of cross-hauls and the curtailment of long-distance traffic wherever alternative goods can be secured from nearer sources of supply, the Ministry of Food has worked out a scheme designed to secure economies in the wholesale distribution of groceries and provisions. An outline of the plan, known as the sector scheme, whereby the country has been divided into nine areas within which the highest possible degree of self-sufficiency is to be sought, was published on page 766 of *The Economist* of May 30th. Since then the scheme has been amended in certain respects and its introduction has been postponed from June 29th to August 24th. In general the amendments have been designed to give the scheme

a great measure of flexibility. For example, the scale of limitation of the total number of suppliers on which retailers can draw within their area, issued on May 8th, has been withdrawn. There will be no limitation in the number of suppliers for points goods which retailers, caterers and institutions may nominate. In the case of many provisions, however, the number of suppliers allowed is only one, in some the number is two and in others three. The Ministry of Food is investigating the possibility of securing further economies in transport by extending the scheme to manufactured goods and by reducing cross-hauls within sectors.

Retail Trade

The *Board of Trade Journal* for June 6th contains the retail trade report for April and the Bank of England index numbers of retail sales in that month. The Bank's index number of the average value of retail sales (1937=100) for April was 113, which compares with 112 for March and 112 for April, 1941. The percentage rises for the total sales are shown in the accompanying table. At Easter the index for food usually rises because buying is concentrated into fewer days owing to the Easter holiday, but this April there was a decline from 118 in March to 117. In April, 1941, the index stood at 116, a rise of three points from the previous month. The index of sales of non-food merchandise rose by six points from March to April, to 110, mainly owing to a rise in the clothing component. The rise

PERCENTAGE CHANGE IN VALUE OF RETAIL SALES FROM CORRESPONDING MONTH A YEAR AGO		
	Food and Perishables %	Other Merchandise %
1941 April	+ 0.9	+ 2.9
May	- 4.3	- 2.4
June	- 3.1	+ 6.8
July	- 6.7	- 15.9
August	- 1.9	- 10.8
September	- 0.8	- 8.2
October	+ 0.2	- 23.5
November	- 0.4	- 2.3
December	- 1.9	- 7.4
1942 January	- 1.1	+ 12.0
February	+ 1.8	+ 11.3
March	+ 4.3	+ 5.3
April	+ 0.9	+ 0.8

was smaller than it was in 1941, possibly owing to the approaching end of the clothing ration period. In the various departments the changes in the value of sales compared with the corresponding month a year earlier were generally smaller than in March. They are shown in a table on page 845. The most notable is the decline in sales of men's and boys' wear. The value of stocks at cost showed a tendency to decline. The President of the Board of Trade stated this week that he had asked the Retail Trade Committee to expedite their report. Meanwhile, some voluntary concentration has been achieved. Branch stores have closed some of their premises, and one large chain store firm has reduced its counter footage by nearly one half. Concentration by large firms is a simple matter compared with the difficulties facing the one-man business. It is greatly to be hoped that the Retail Trade Committee has tackled the problem with courage and will produce some solution satisfactory to both shopkeeper and customer.

Apparel and Textiles Control

The Limitation of Supplies (Cloth and Apparel) Orders, 1940, introduced production quotas for textiles and apparel in order to restrict the volume of production for civilian needs and to release labour, raw materials and factory space for war purposes. Since that time the nature of this restriction has undergone considerable change; for example, by the introduction of the utility scheme. The replacement of the provisions of the Limitation of Supplies (Cloth and Apparel) Orders by a new control system embodied in the Apparel and Textiles Order, 1942, which controls, in addition, goods previously controlled in classes 4 and 6 of the Limitation of Supplies (Miscellaneous) (No. 13) Order and the Felt Hat Hoods Order, 1941, merely extends a principle already adopted, of regulating the nature as well as the volume of production. By the Order much more precise regulations have been laid down concerning the goods

to be produced, with a view to obtaining the maximum production of the most essential goods from the resources still available. To this end, the Board's powers of legal control at the raw material and manufacturing stages, rather than at the point of supply, have been more strongly emphasised. A separate direction has been made for each of the main industries controlled by the Order. Directions have been made to cover the production of woven wool cloth, woven non-wool cloth, knitted goods, corsets, footwear, gloves, fur apparel, made-up garments, felt hat hoods, lace, mattresses and quilts. The directions differ from industry

to industry; in general, the tendency is towards the production of more utility goods and the supply of materials to designated firms. Thus under the Woven Wool Cloth Direction (S.R. and O. 1001) there is no quota restriction on supplies by registered manufacturers either of utility or non-utility woven wool cloth. Manufacturers will, however, receive cloth sub-certificates from designated makers-up or indirectly through merchants, and the Wool Control requires that contracts made accordingly will be met in proportion to the raw material released to the manufacturers by the Wool Supply.

INSURANCE NOTES

SUN LIFE; SCOTTISH WIDOWS'; UNITED KINGDOM PROVIDENT; EQUITY AND LAW

CHIEF interest in the Sun Life accounts centres in report on the quinquennial valuation. For without-profits assurances the basis employed was the OM table of mortality with interest at 3½ per cent in calculating the present value of the sums assured and the present value of the net premiums, the net premiums themselves, however, being those derived from the OM table with 3½ per cent interest. The chairman (Sir William H. Goschen, KBE) explained at the annual meeting that, had circumstances permitted, the society would have valued these contracts by using the more up-to-date A (1924-29) mortality table, but that the resulting liability, with 3 per cent interest, would have been less than that emerging from the basis actually adopted. For with-profits assurances the basis of valuation remains unchanged, the OM mortality table being employed, with interest at 3 per cent. On all the society's contracts the liability of £45,927,000 resulting from the valuation is approximately £995,000 greater than it would have been if the bases adopted five years ago had also been used on this occasion. Nevertheless, the margins between the assumed rates of interest and the average net rates of interest actually earned on the funds are tending to narrow, and the decision to postpone any general distribution of bonus, and to carry forward unappropriated surplus of £3,771,000 seems, therefore, to be fully warranted. Interim bonuses are being maintained on a modified basis. In the balance-sheet British Government securities at £15,351,000 show an increase during the year of £1,900,000, and the chairman indicated that the assets, which in the aggregate now exceed £50 millions, stand at less than their market value at the close of the year. Half-yearly dividends of 2s. 9d. per share (unchanged), less tax, were paid on July 1, 1941, and January 1, 1942, respectively.

The reduction in the new business transacted by the Scottish Widows' must be considered moderate, having in mind that about 60 per cent of the male staff are now away on full-time national service, compared with a little over 40 per cent a year ago; a factor aiding production has doubtless been the society's decision to cover civilian war risks under most with-profits policies. Death claims include £126,000 resulting directly from war operations, but the chairman (Mr Kenneth Murray, WS) stated at the annual meeting that the total was below the average of recent years, and that so far the war has not brought any marked increase in the total deaths, although inevitably the proportion of young men among those who have died has risen. In the balance-sheet British Government securities at £10,161,000, representing 27 per cent of the total assets, are higher by £1,284,000. The chairman records that the general

rise in prices over the year has increased the already large margin between the market value of securities and the values at which they appear, and that, as regards house property, which consists almost entirely of the society's branch premises, damage by enemy action has been relatively light.

In the case of the United Kingdom Provident the reduction in new business is more marked, as would be expected in view of the institution's policy of excluding civilian war risks from the cover provided by new policies; in the always interesting review cover provided by new policies; in the always interesting review of the chairman (Sir Ernest J. P. Benn, Bt.) it is stated that these risks are regarded as "a speculation out of keeping with the spirit and practice of mutual life assurance." The triennial valuation was made on the same bases as three years ago—that is to say, with interest at 2½ per cent and using the A 1924-29 ultimate table of mortality—except that for with-profit contracts, which comprise the bulk of the business, the rate of interest has been reduced to the very stringent figure of 2½ per cent; the institution has thus very materially strengthened its reserve position. Assets are carried at the same values as in 1938, there being a substantial hidden reserve so far as Stock Exchange securities are concerned. No general distribution of bonus is being made in respect of the profits of the triennium, but modest interim bonuses are being allowed on policies becoming claims. The valuation surplus carried forward amounts to £1,011,000 and there is an investment contingency reserve of £1,000,000.

There has been some improvement in the position of the Equity and Law in comparison with that disclosed by the triennial valuation a year ago. The chairman (Sir Geoffrey Ellis, Bt., MP) pointed out at the meeting that the recovery in Stock Exchange values during the year was equal to a very substantial proportion of the sum which, by a modification of the reserve basis, it was necessary to release last year in order to write down securities to market values; he indicated that the society would apply any improvement in asset values first to increasing the stringency of the actuarial valuation basis. The composition of the investment portfolio reflects a policy of augmenting the holdings of British Government securities, which are higher by £700,000, although Stock Exchange securities in the aggregate are less by £300,000. No interim bonuses are being allowed. Concerning the figures in the table, the reduction in new business is more than accounted for by the virtual cessation of single-premium business. The net rate of interest earned remains at a level which the society, in pursuing a more conservative investment policy, cannot expect to maintain. Expenses show a marked reduction, although the ratio to premium income is still high. The fees paid to directors, including those paid to them by subsidiary companies, amount to nearly £14,000. The dividend is unchanged at 1s. per share, costing £10,000, less tax.

COMPANY MEETINGS

DUNLOP RUBBER COMPANY

CO-OPERATIVE WAR EFFORT

SIR GEORGE BEHARRELL'S SPEECH

EXTENDED USE OF RECLAIMED RUBBER

We ourselves are doing all we can to ease the position by the extended use of reclaimed rubber, and we are benefiting by the foresight of your board in having established early last year additional plant for the retreading of tyres. It seems, however, that we must be prepared for a substantial reduction of sales, both in the home and overseas markets, and our overseas manufacturing companies will be similarly affected, some more, some less, than ourselves. This situation we are endeavouring to relieve by finding useful forms of manufacture to occupy the floor space which is likely to be left empty and by economising expenditure in every possible way.

There are, I am glad to say, various factors which should assist us in our efforts to meet the difficulties that confront us. According to the provisions of the Excess Profits Tax reduced profits will result in considerable relief from taxation, especially having regard to the fact that our liability is computed on the basis of the results of the entire group of Dunlop companies. In collaboration with the technical heads of the industry we are working in close contact with various departments of the Government, with which relations are excellent.

THANKS TO THE STAFF

We can rely wholeheartedly on the loyalty and good will of our employees, who, you may be sure, appreciate the progressive policy which the company has adopted with regard to pensions, service allowances, and other matters affecting their status, security, and welfare. I would like here to offer them, on your behalf, a sincere expression of thanks for the way in which they stood up to the strain of 1941 and are facing the difficulties of 1942.

We shall be assisted by the improved organisation of the rubber manufacturing industry. In times of national emergency industrial co-operation becomes a vital necessity, and I would like here to pay tribute to the tyre manufacturers' conference which has successfully carried through much co-ordination within the tyre industry and is giving useful assistance in various matters arising out of the control of tyre distribution. The conference is also collaborating with other branches of the rubber manufacturing industry to form a much-needed federation covering all branches.

CONTROL OF TYRE DISTRIBUTION

Our relations with our customers have been gravely affected by recent developments. In particular, the control of tyre distribution has unfortunately resulted in the severance of our company's contact with thousands of traders, many of whom must for the time being suffer a complete loss of their tyre business. This is a situation that we deeply regret, and we deplore no less keenly the interruption of our friendly relations with customers in other important lines of business which we shall have to cut down or, it may be, abandon altogether for the duration of the war. Our only consolation is our confidence that the interruption cannot be more than temporary and that the good will existing between your company and its customers is far too strong to be injured by such a disturbance. We look forward to the time when we shall resume a very pleasant business relationship. Meanwhile, I offer to all our customers a word of thanks for their generous help and sympathy in our difficulties.

We do not know how great these difficulties may be in 1942, though we do know that they must be considerable. The company is, however, well supported by liquid resources and reserves. Its organisation, despite the shocks of the last few months and the absence of over 5,000 of its employees on war service, is strong and efficient. We are a year nearer to the turn of the tide than when I sent out my statement 12 months ago, and your board has every confidence that the company will weather the storm and continue to uphold the great position which it has won for itself in the trade of the world.

The report and accounts were adopted.

The forty-third ordinary general meeting of Dunlop Rubber Company, Limited, was held, on the 10th instant, at the Piccadilly Hotel, London.

The following is an extract from the statement by the chairman, Sir J. George Beharrell, D.S.O., circulated with the report and accounts:—

The year 1941 saw the steadily increasing adaptation of British manufacturing industry to meet the needs of the nation's war effort. Government regulations for the limitation of supplies reduced the volume of our business in certain lines, but the demands for others were considerably expanded. The company's factories were satisfactorily occupied until the end of the year and total turnover increased, though profit margins were lower. In spite of the closing of practically all the company's European markets and steadily increasing difficulties in regard to export licences and transport, our overseas trade resulted in a fair profit. The overseas Dunlop factories outside enemy control showed satisfactory results, the Indian and South African companies and the Dunlop Tire and Rubber Corporation, of America, having record sales and trading profits.

Unfortunately, the extension of the war in the Far East at the end of the year changed the situation and the immediate outlook for your company. This new factor must be borne in mind in considering the accounts and the directors' recommendations, to which I will now briefly refer.

The net profit for the year amounted to £3,186,000, compared with £3,002,000 for 1940. The provision for taxation this year amounts to £1,925,000 for the Dunlop Rubber Company, the increase over last year being mainly due to increased rates for Excess Profits Tax and income-tax. Your board has maintained the policy of providing £650,000 towards the income-tax liability for 1942-43. As regards the subsidiary companies, the rates of taxation have increased considerably overseas as well as at home, and the provisions in the accounts of these companies amount to £1,510,000, making a total of £4,085,000 for the group as a whole.

Last year I told you that for the first time in many years the board had not been able to make any allocation to increase the company's reserves, with the exception of the special income-tax reserve. In view of the changed circumstances, the board feels that a policy of conserving and strengthening the company's financial position is necessary, and has therefore allocated to contingencies reserve the sum of £100,000. A dividend on the Ordinary stock of 8 per cent. is recommended, and, if approved, will be paid on June 22, 1942.

THE OUTLOOK

It is difficult to comment usefully on the outlook, but stockholders must have realised that recent events in the Far East have materially affected the company's position for the immediate future. The Japanese factory, which has earned substantial profits in the past, is, like the Dunlop factories in France and Germany, lost to us for the duration of the war, and our trading companies in China, Singapore, and the Netherlands East Indies have followed certain of our European companies into inactivity. The rubber plantations, which Dunlop Plantations, Limited, and, late, Dunlop Malayan Estates, Limited, had brought to such a pitch of efficiency, are in enemy hands. We cannot look for any profit from any of these properties till after the war. Nor do we know in what condition the assets will be when we recover them, nor what compensation we may recover for any damage suffered.

The rubber manufacturing industry in this country is strictly controlled, and the amount of business which we are able to do will depend on the amount of rubber available. In regard to this, I cannot give any details. Every possible step is being taken by Great Britain and her allies to stimulate the production of reclaim, synthetic rubber, and rubber substitutes, and I am confident that the Dunlop company will be allotted its fair share of whatever may be available.

ASSOCIATED NEWSPAPERS LIMITED

LORD ROTHERMERE'S SPEECH

The thirty-seventh annual ordinary general meeting of Associated Newspapers, Limited (proprietors of the *Daily Mail*, the *London Evening News* and the *Sunday Dispatch*), was held, on the 9th instant, in the Memorial Hall, Farringdon Street, London, E.C.

The Viscount Rothermere, the chairman, presided.

The following is the statement by the chairman, which was circulated with the report and accounts, and was taken as read:—

The trading year which ended on March 31st last presented many difficulties to the newspaper industry; nevertheless, we are pleased to be able to show such satisfactory results and such strong financial resources as are reflected in the year's accounts.

After providing for interest on notes, depreciation and taxation, the accounts show a net profit of £535,424, which is £65,882 more than last year.

BALANCE-SHEET ITEMS

The dividends on the 5 per cent. preference shares and 7 per cent. ordinary shares and an interim dividend of 5 per cent. on the deferred shares have been paid. The directors recommend the payment of a final dividend of 10 per cent. on the deferred shares, payable on July 15th. This will make a total of 15 per cent. for the year, compared with 12 per cent. for last year.

There is very little change in the items on the balance-sheet, as will be seen from the comparison with last year's figures.

On the assets side the principal change is under the heading of investments, and you will notice that debentures in a subsidiary company have been reduced to £200,000. This is, in fact, little more than a book-keeping transaction in connection with a subsidiary company entirely owned by us. The debentures are reduced by the deduction of an investment reserve and the "shares in subsidiary companies" are increased by a similar amount in the balance-sheet.

During the past year we have continued our policy of investing as much as possible in Government loans, and our investments in Government securities now stand at £1,000,000. In addition, we have purchased during the year £250,000 of Tax Reserve Certificates to meet future tax liabilities.

I mentioned last year that full reserves have been made in the accounts in connection with income-tax, newsprint, investments, etc., and this year we have transferred in the appropriation account a further sum of £50,000 to reserve for contingencies.

PROBLEM OF ADVERTISEMENT SPACE

The growing confidence vested in the *Daily Mail* by the responsible public and its unrivalled goodwill in the business world have made still more acute the problem of advertisement space.

Actually, in the small war-time *Daily Mail* the proportion of space for advertisement purposes in relation to space for news has been reduced considerably.

Our policy is to allocate that space on the fairest possible basis, and to this end the *Daily Mail* was the first to introduce the rationing of space as well as the narrower column measure. This lead has since become the general practice.

An all-round smaller size of advertisement space was instituted, thus enabling us to accommodate the largest possible number of our regular advertisers.

The *Evening News* continues its great lead with the largest sale of any evening newspaper in the world. True to its slogan of "First with the News," even in the worst period of the intensive air bombardment, it stands today higher than ever in the esteem of the London public and advertisers who value the London market.

The *Sunday Dispatch* maintains its unique position in Sunday journalism. It has strengthened its position with the public and with advertisers in a manner which promises well for the day when restrictions as to numbers of copies and sizes of newspapers are finally removed.

The *Overseas Daily Mail*, playing its big part every week in the spreading of British news and trade reports to every Allied and friendly country in the world, may be regarded as one of the finest pieces of British propaganda now being sent abroad.

PROVINCIAL EVENING PAPERS

Our provincial evening papers have all maintained a high standard, both in regard to sales and financial results, during the year.

In addition, these provincial offices afford a most valuable stand-by for the *Daily Mail* and *Sunday Dispatch* in the event of interference with our London plants.

During the past year our main problem was, as before, our supplies of raw material—newsprint. Further reduction in consumption by all newspapers was necessitated by the difficulties of importing both paper and pulp, but once again we have all benefited by the arrangements made by the Newsprint Supply Company, which has ensured a fair and equitable distribution to all papers of the raw material available. In this connection I would like to express our appreciation of the part played by the Home Mills in the provision of our paper supplies. The newspapers of the country are at the present time consuming less than 20 per cent. of the amount of newsprint they consumed before the war.

BOARD'S POLICY

The sales of our three newspapers have been well maintained during the year, subject, of course, to paper restrictions, and their popularity and prestige have never been higher. We have continued our policy of presenting the war news as accurately as possible, and of telling the public the truth as fearlessly as possible with one object in view: the speedy, successful and victorious prosecution of the war.

Our volume of correspondence from our millions of readers proves beyond doubt the justification of this policy.

We now have over 1,200 members of our staff serving with the Forces, and it is with satisfaction that I record that since the beginning of the war all of them on joining up have continued to receive a substantial percentage of their salaries from the company.

Newspaper business could not be other than difficult during war-time, and the past year has been no exception. I wish to express a grateful word of thanks to my colleagues on the board, to the staff, and to all those associated with us for their untiring and devoted work for our newspapers.

The report and accounts were adopted, the retiring directors were re-elected, and the auditors, Messrs Lever, Honeyman and Company, were reappointed.

LISBON ELECTRIC TRAMWAYS LIMITED

INCREASED COST OF MATERIALS

The forty-fourth ordinary general meeting of the Lisbon Electric Tramways, Limited, will be held on the 17th instant at No. 4, London Wall Buildings, London, E.C. The following are extracts from the statement of the chairman of the company, Mr A. N. Rye, M.I.E.E., which was circulated with the report and accounts:—

The traffic shows a small increase over the record number of passengers carried last year, the numbers being 144,358,627, as compared with 144,148,222.

The revenue shows an increase of £7,049, on the other hand expenditure has risen by £28,849. The profit as shown at £140,221 is £18,790 less than the previous year. The increase in the expenditure is again caused by the much higher cost of coal and all other materials necessary for the operation of the tramways.

The board now recommends the payment of a final dividend of 2½ per cent. net on the ordinary shares, which, with the interim dividend already paid, will make 5 per cent. net for the year.

Capital expenditure on additional rolling stock and electrical equipment amounts to £8,659. The stock of stores and materials has increased by £19,189 owing to the much higher prices, and sundry debtors by £10,255. The investments are £34,021 less, due to the sale of securities to meet the purchase of the company's debentures. The market value of investments was in excess of the book value as at December 31st last, and they consist principally of British and Dominion Government stocks. The remittances in transit and cash are increased by £40,546. Creditors and credit balances have increased by £51,952. A further £52,900 of the company's debentures were purchased and since the end of the year the directors have given notice to redeem the outstanding debentures on September 30th next.

Up to the present we have been able to maintain a normal service notwithstanding the great difficulty of obtaining imported coal. It should, however, be appreciated that it may be impossible to maintain a full service throughout the current year and any reduction in our service must seriously affect our profits.

EVER READY

REGD TRADE MARK

MANUFACTURERS OF DRY BATTERIES

CELLS, ACCUMULATORS, RADIO EQUIPMENT, MOTOR CAR ACCESSORIES, PORTABLE ELECTRIC LAMPS.

Net trading profit for year to 31st March, 1942 £571,934

Total reserves and carry forward £1,300,547

Dividends on Ordinary Stock 35% plus 5% Bonus

Points from the speech of Mr. Magnus Goodfellow (Chairman) at the Annual General Meeting of The Ever Ready Co. (Great Britain) Limited on June 4th, 1942.

TRADING CONDITIONS

During the past year for the most part the heavy demands for our productions were promptly met, but, although we worked throughout the year to full capacity, there were unavoidable temporary shortages in supply to some of the general consumers. Our production plans for the current year, if all goes well, should enable us to continue to meet the bulk of the requirements of the general trade. The fatigue engendered by the conditions, and the continuous drive for increase in production over a period of two and a half years, has been well sustained by our Managers, Staff and workpeople, and I again, on your behalf, thank them for their efforts. The increase in the total cost of the year's production was not covered by the profit on increased sales, and as a consequence there was a fall in net profit, as shown in the accounts. No provision has been necessary either for Excess Profits Tax and/or National Defence Contribution, as the total of reserves previously created is more than sufficient to meet all tax liabilities to date.

STRONG FINANCIAL POSITION

You will observe that our expenditure on plant during the year was £187,000, the continually increasing demand having made necessary this large expenditure. The financial stability of your Company is more than maintained, the balance of Current Assets over Current Liabilities having risen during the year from £788,000 to £863,000.

GUARDIAN

Assurance Company Ltd.

ANNUAL GENERAL MEETING—8th JUNE, 1942

Extracts from Statement made by the Chairman COLONEL LIONEL H. HANBURY, C.M.G.

LIFE DEPARTMENT.

New Life Assurances were completed during 1941 for a net amount of £809,000, being £15,000 less than the figure for the previous year. Claims by death have been heavier than was "expected" according to the A 1924-9 Tables of Mortality. This loss from mortality on life assurance contracts was largely attributable to the war and has been partly offset by a profit on annuity contracts.

FIRE DEPARTMENT.

There has been an increase of £116,000 in the premium income in this account. The balance transferred to profit and loss is £76,000, representing nearly 8 per cent. of the premium income.

ACCIDENT AND GENERAL DEPARTMENT.

In this account also there has been an increase of £23,000 in premium income. The transfer to profit and loss is over £104,000.

MARINE DEPARTMENT.

The premium income for the year amounted to £452,000, as compared with £393,000 in the previous year. After writing off £550 for loss on exchange and providing £72,000 for taxation, the sum of £15,000 has been transferred to profit and loss, still leaving a considerable balance of profit in the fund.

VALUE OF INVESTMENTS.

The Stock Exchange Securities have been valued at their middle market prices at 31st December last, less accrued interest. In both the Life Assurance Fund and the General Fund the total market values considerably exceeded the book values. Although depreciation no longer exists, the Directors have decided to maintain the Investment Reserve Fund at £222,000 for the present.

PROFIT AND LOSS ACCOUNT AND APPROPRIATION.

£48,000 has been transferred to Staff Pensions Fund and £25,000 applied to increase the General Reserve to £1,925,000.

A dividend was declared of 11s. on each Ordinary Share, leaving a balance to be carried forward of £143,000, greater by £14,000 than the amount brought forward from the previous year.

GOVERNMENT RETURNS

For the week ended June 6, 1942, total ordinary revenue was £49,533,000, against ordinary expenditure of £125,141,000, and issues to sinking fund of £15,000. Thus, including sinking fund allocations of £1,283,155, the deficit accrued since April 1st is £52,791,000 against £68,822,000 for the corresponding period a year ago.

The Public's Schools

HOW much real headway is the Government making in its plans for education? It was hoped that some answer to this question would be given by the President of the Board of Education in his speech on the Estimates for his Department on Tuesday. He announced the formation of yet another body to co-ordinate the work of youth movements ; a fresh inquiry into industrial and commercial training and apprenticeship ; and, most piquant of all, the setting up of a committee to consider ways and means of extending the facilities of boarding-schools, irrespective of parents' means. No plan of action, it appears, has yet been drafted ; only the headings have been prepared.

True, Mr. Butler is making the right inquiries. Already since he became President of the Board of Education, he has asked committees to report on examinations and courses of study in secondary schools ; on the recruitment and training of teachers ; and now on vocational training, and, broadly, the use of the public schools. Obviously, he is searching, as most people interested in education have been searching for a generation, for the best solution to the problem of post-primary education. But this matter is not the riddle that these new inquiries might seem to suggest. One of the major achievements of this country in the period between the two world wars was the analysis of precisely this problem in a series of classic reports, which are now part and parcel of the literature of education. The Consultative Committee of the Board of Educa-

tion, with the aid of His Majesty's Inspectors—a body of men whose ability and devotion has been too little realised—have set before successive Governments most of the material that is required to answer the queries which are, very properly, engaging Mr Butler's attention now. The question is, quite simply, what kind of schools and schooling should be provided for adolescent children, in order to provide them with the utmost opportunity to make use of their talents and to enable the community to employ those talents later to the best effect in every branch of national life. The answers are, it is true, still a matter of discussion and controversy. But all the alternatives are now known ; and it should be the Government's purpose, not to re-state the choices, but to put before Parliament and the public a definite plan for education upon which the ultimate decision can be taken. There is a great danger, that reconstruction, in all its forms, will be frustrated by this tendency to repeat interminably the researches which are only the preliminaries to action. In education, perhaps more than in any other department, there has been this tendency to mark time, to announce again and again principles of reform which have become commonplaces, without making any resolute attempt to convert them into actual programmes.

Meanwhile, education remains depressed, even without the devastating consequences of wartime changes. Its material foundations—not in the secondary schools, but

which

Printed in Great Britain by Sir Christopher Press (1940), Ltd., Portland St., Longway, London, W.2. Published weekly by The London N.Y. Co. at Brentford House, Lancaster Place, London, W.2. Saturday, June 15, 1942. Entered as Second Class Mail Matter at the New York N.Y. Post Office.

in the elementary schools where the vast majority of children begin and end their schooling—are shabby and insufficient. Only one in five elementary school buildings is adequate and suitable for its purpose; and most children break off their education completely and finally at the age of 14. It might even have been better in the past twenty years to have done more in practice to meet this basic need, and to have said less in principle about reforms in post-primary education which have been applied only half-heartedly, and with a depressing unevenness over the country as a whole. The school looks two ways. It looks to the society into which its pupils will pass. But it looks first to the family from which its children come. That is the first essential link. No scheme for diversifying post-primary education or for opening the doors of public schools to children from all classes can have any reality while the foundation, the elementary school where children come fresh from their homes, remains so shoddy and so shameful as it still is.

Nevertheless, the ultimate key to fuller and more fruitful citizenship does lie in the opportunities for education which are given to children between the age when they have mastered the three R's and the age when they become adult members of society. Some people say that the right policy is to provide secondary education for all up to the age of 18; others maintain that the proper line is to provide part-time education for all children after they have left school and when they are tasting for the first time the experience of life and work. Some argue that the best training for all but a few children in the secondary stage is training in arts and crafts which will equip them with skills for their working life; others claim that every child in the later years of schooling has an equal right to the culture and intellectual discipline which reside in the liberal, literary and scientific curricula of the public, grammar and secondary schools. Most people are agreed that the so-called public schools, whose exclusive social cachet in present circumstances is more important even than their great traditions and the high quality of the instruction they give, should cease to be reserved for good families and big bank balances. It is significant that the new committee which is to consider extending the facilities of boarding schools to all those who desire to profit from them was asked for by the governing bodies and headmasters of the public schools themselves.

At first glance, it may seem, there is a confusion of counsel. It is perhaps this confusion which causes yet another President of the Board of Education, this time a sincere and earnest believer in educational reform, to walk again the weary treadmill of researches, inquiries and reports. Perhaps he believes that there is a single right answer to all these questions. If he does, he is almost certainly wrong. It is plain that any programme of reform must combine the best of all these proposals. The solution lies, not in secondary education for all, not in compulsory part-time education for all, not in vocational education for all, and not in an academic education for all, but in the widest possible variety of all these to suit the talents, the interests and the choices of all children—so that there is a round hole for every round peg, and a square hole for every square peg.

More and more, it is evident that every plan for the betterment of this democratic society must be a balance between different ways and aspirations. In industry, it has been said, the task is to combine the maximum use of the state's organising power with the maximum opportunity for individual initiative; this was the issue raised by Lord Reith in the House of Lords on Wednesday when he called for control and management of essential public services, such as transport, by means of public corporations. The same is true of education. On the one hand, the state must lay down and ensure minimum standards of accommodation and instruction for every school in the country, and for every child of every class; it must see that there is made open to every child, regardless of his or her parent's means, the chance to make a free choice between all the various kinds of schooling which are appropriate to different talents and

different temperaments. On the other hand, each school and each teacher, working at the highest level and in the best conditions that the state can contrive, must be left sufficient freedom and initiative to make of the schooling they provide a spontaneous and effective training—such as is too often so sadly lacking in the over-regimented, over-examined, over-ruled and over-regulated schools of the present time. Uniformity of facilities and opportunities there must be, but not a tyranny of rules and orders in shoddy surroundings.

This doctrine of uniformity in diversity is not new. In the literature of educational theory and practice, it is a truism; and the ways to achieve it, too, have been set out many times. It will not be achieved by any single dramatic act. To open the public schools to the best people in the communal sense, and not to the "best people" in an out-moded and exclusive social sense is imperative. It is of the highest importance both that the public schools should be preserved, and that they should be reserved for the children most likely to profit from their training. But the English public schools can no more be multiplied than Wren churches can; and to believe that to open the public schools by itself will solve the problem of secondary education is dangerous nonsense. They are limited in numbers. The bottleneck will still remain grievously narrow. What is most needed, if the exclusive entrée to public life provided by the public schools is to be ended, and if all children everywhere are to be given an equal chance of education and an equal chance to contribute by their work to the nation's profit afterwards, is a whole chain of new schools; and these should neither be mock Eton nor ersatz Arnold—in the aping style which in so many other ways, in dress and manners, in thought and in deed, so painfully reveals the present bankruptcy of taste and culture. The tradition of England did not end with the public schools. There are grammar schools with a different but not inferior record. Here and there, in modern secondary schools, a new achievement is already being worked out. The new schools should be the public's schools.

The problem of democratic society, at every point, is to use the nation's talents. In politics, there is a lack of honest, able men. In the Civil Service there is a lack of adventurous spirits. In teaching itself, the only profession for which training is freely subsidised from public funds, there is—beside the devoted labour of many thousands of individual teachers in soul-destroying surroundings—a lack of missionary zeal and first-rate competence. In industry, there is a lack of vision and courage. There is, too often, a lack of pride, enthusiasm, and capacity in the home itself. Everywhere the task is to open the door to the men and women who can best serve by their boldness and ability—and to give them room in their public work, and in their private lives, to carry out plans of action and to take responsibility. It is the function of the nation's schools to furnish the channels along which these men and women will pass; and only by making the schools themselves open to all equally, and at once uniformly well-endowed in equipment and personnel and infinitely diverse in their freedom to develop, can this be done. Talk in terms of abstractions does not help and is dangerous; leadership with a capital L and Youth with a capital Y are words which befog the issue and bemuse goodwill. What is needed is a practical, positive plan to provide the schools and the schooling that all reformers, in their different ways, are agreed should be provided. This is Mr. Butler's opportunity. The call is for action. He and his colleagues in the Government must say, with Cromwell, "Truly our business is to speak Things."

The Price Squeeze

Japan's Empire

IT is now clear that the battles of the Coral Sea and of Midway Island were a serious setback for the Japanese. For the first time, their progress has been definitely checked. It would be unwise, of course, to assume that anything like a decisive victory has yet been won by the Allied forces. But these successes in the Pacific are a warning to Japan that time to consolidate its spoils may be short.

The first phase of the Far Eastern war ended with the Burma campaign. After this victory, the Japanese, with the exception of Free China, virtually rounded off the conquest of the Co-prosperity area whose inception was announced some two years ago by Mr Hachiro Arita, then Japan's Foreign Minister. The Japanese are now engaged in consolidating their gains. The whole of China is very far from being conquered. Operations are by no means complete in the Philippines and New Guinea. But the Co-prosperity sphere is now a fact.

Plainly the conquered territories, even if rounded off by a complete victory in China, would not represent the limit of Japanese ambitions. The Co-prosperity area is the base from which Japan hopes to launch increasingly powerful and far reaching blows against Allied territory. The threat to India, Australia and New Zealand is already obvious, and there is no reason to suppose that even these are the ultimate objective. Japanese plans have failed to mature in one vital particular—that the assault upon the Malay Archipelago had to be undertaken before China had been subjugated. More than ever it is clear that the desperate resistance of the Chungking Government has so far provided the most serious obstacle to Japanese Imperialism. Thus, it is wholly consistent with Japanese policy that, after the successful termination of the Burma campaign and the closing of the main supply route into China, a fresh attempt should be made to eliminate Free China from the war. Without its conquest, the Co-prosperity sphere is incomplete. The success of General Doolittle's raid on Tokyo showed how insecure the swollen Japanese empire remains. Thus, the campaign is renewed in Chekiang and, by the back door, in Yunnan.

And in the occupied territories, development is proceeding very fast. Politically, insistent propaganda is attempting to win the support of the native populations for Japan. It is a propaganda based on colour; it suggests that the white races are inherently inferior to the Japanese and in no way superior to the Indonesians, Malays or Burmese. The attempt to demonstrate this racial theory is no doubt the true explanation of Japanese atrocities. For years, Japanese propagandists in the Malay Archipelago have been pointing out, and emphasising, specific defects of white rule. Now the conquerors are busy glibly offering

juster rule or eventual liberation, according to the temper of the local population. At worst, it is argued, the natives have changed their masters for the better; at best, pseudo autonomy under quisling rule is only just round the corner. The treatment is not uniform, because aspirations to self-government exist in very differing degrees. Strongest among the Siamese, who were independent, among the Burmese, who aspired to dominion status, and among the Filipinos, who were due to attain self government, the aspiration is weakest among the Malays, whose political apathy is their outstanding characteristic. In the Netherlands East Indies, the desire for freedom is marked among the more civilised Javanese, less strong in Sumatra, and virtually unformed among the backward natives of New Guinea. It is significant that the Dutch Government has recently appointed the first Javanese Minister in the Cabinet. Yet, the Japanese have adapted their psychological approach with skill. In every case, there has been a very definite attempt to impress the merits of Co-prosperity upon the native population, and to rule out any conceivable return to government by the white races. In Burma, the position is complicated by the inclination of the Burmese to support the cause of Free China while opposing British rule. Throughout the conquered territories, the victimisation of local Chinese populations has been an outstanding feature.

Economically, the process of integration and reorganisation is in full swing. The first step is to repair the results of scorched earth and war damage. The local populations have been pressed into service. Important progress is reported to have been made in the reconstruction of bridges, roads and harbour installations. The repair of machinery presents more serious difficulties, which must considerably delay the date when full development will be possible. An organisation for planning the reconstruction of the region and for taking over British and American commercial and industrial enterprise has, however, already been formed. It appears to be presided over by the official Council for the Reconstruction of Greater Eastern Asia, of which Premier Tojo is chairman. Under its aegis, specialised raw materials boards are said to have been set up for particular schemes, such as the exploitation of chromium and manganese in Malaya and the Philippines and the development of bauxite, tin and nickel in the Netherlands East Indies. Finance is to be provided by the newly formed Bank for the Development of the South Sea Territories, which has a capital of 100 million yen, and in addition has the right to draw further sums through the supplementary military budget. A more detailed account of financial measures in the Co-prosperity sphere is provided in an article on page 862. Forestry and agricultural policy is to be investigated by a committee

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

formed by the Central Council of the Nippon Industrial and Provident Societies, which is said to have distinguished itself by including Australia and New Zealand within the scope of its investigations. While these bodies are deliberating, the purchase and sale of important materials—of which a census has been taken by the military authorities—has been banned. The list includes textiles, iron, cement, phosphates, rice, maize, quinine, hides, copra and palm oil. It is believed that the reconstitution of former Allied enterprises will be entrusted to private firms under the supervision of the military authorities. Thus, all mines will be privately worked and all their production bought by the army. The Japanese Government apparently does not wish either to own or to operate the means of production. The result, as in occupied China, is considerable friction between the military authorities and industry.

Economic policy in the Co-prosperity sphere is, of course, at several different stages of development. In Northern China and Manchukuo, the population is about to be embarked upon the rigours of a Five Year Plan; the absorption of British and American business has been completed by the affiliated concerns of the important Northern China Development Company. In Siam, a similar undertaking, the Thailand Company for the Development of Industry, with a capital of baht 12,000,000, has only just been formed; its work lies ahead of it. The assimilation of industry in the newest conquests has not yet taken place; but banks and post offices in Java were reopened in April under new management. It is reported that the immediate programme for the latest beneficiaries of Co-prosperity includes the development of iron ore deposits to make Japan independent of United States scrap and a switch over in the Philippines from the production of sugar to the production of cotton.

It is useless to deny that Japan's raw material position has been vastly improved by these conquests. Colonel Okada, head of the munitions department of the Ministry of War, stated in April that there was no longer any difficulty in supplying Japan with oil; and there is no reason to doubt the accuracy of his pronouncement. The refineries in Japan and Manchukuo are probably adequate for war purposes, and there are some grounds for believing that a fairly high percentage of the oil fields in Sumatra may have been captured undamaged. The production of tin and rubber in Malaya has been resumed, and output is said to be rising steadily, although it is not clear on what scale. The food problem, which at one time was the dominant concern of Japanese economic policy, has been solved by the control of all but a fraction of 1 per cent of the rice normally entering into international trade. The addition of the rice surplus of lower Burma to the supplies available in the Yangtse basin of China, Indo-China and Siam brings the total available for Japanese colonial and occupied territory to some 78 millions quintals a year. The Japanese occupation of these territories came after the harvest, and it is believed that substantial destruc-

tion of stocks can only have taken place at Rangoon. The 1941-42 harvest in Burma is expected to be large since there was a marked increase in the area sown last year. It may be presumed that, after the needs of the rice deficit areas, including Malaya, the Netherlands East Indies, and Borneo, have been met, there will be some surplus which the Japanese can use for starch, alcohol and fuel.

The Co-prosperity sphere, however, is not without difficulties. The greatest of these is undoubtedly shipping. In order to reap the full benefits of integrated development in this wide-flung region, it is estimated by M. Matsukuma, the director of the important Japanese shipping company, Nippon Yusen Kaisha, that 10 million tons of merchant shipping are required. The greater part of shipping within the Co-prosperity area was formerly in the hands of Dutch and British concerns, and the tonnage which they operated is fortunately not available for the Japanese. A large construction programme has been launched to produce a standard wooden junk for coastal shipping and a type of "utility" vessel, known as a "wartime" ship, in which the use of steel is minimised. There is no doubt that the Japanese authorities intend to make use of the shipbuilding yards at Hong Kong, Shanghai and Singapore. At present the shipping bottleneck is very narrow and is responsible for drastic reductions in the import of foodstuffs to Japan and a marked curtailment of fishing.

A further and outstanding obstacle to development is the shortage of real capital—machines and industrial and agricultural equipment. The supply of capital goods to the conquered territories used to be almost entirely in the hands of the Anglo-Saxon nations. Equipment and machinery, now urgently needed by Japan, formerly came from England and America. The difficulty is not mainly one of finding monetary capital. It is the hard fact experienced by Germany and Russia; an adequate supply of capital goods cannot be produced without very serious privations for the Japanese population, as well as for the inhabitants of the occupied territories. The invader has not only to screw up production to totalitarian levels. He has also to make good the destruction of machinery for which the Allies were responsible. The conclusion must be twofold: development must be delayed; but time is on the side of the Japanese unless they can be evicted.

The political and military implications of this situation were pointed out by Dr. Van Mook, Lieutenant Governor of the Netherlands, shortly after his return to this country. The Japanese are now in possession of immense potential resources. Their future military progress may be conditioned by the extent to which these resources can be exploited. Full exploitation will take time; and, in this interval, the initiative must be retaken and used by the Allies. Very much more than the future of the Co-prosperity area hangs on the ability of the United Nations to see that these Asiatic and Pacific lands are developed only by peaceful nations in the interests of world prosperity.

Production to the Hilt

IN his broadcast in the United States last week, Mr Lyttelton lifted one corner of the curtain covering British war production. The picture was one of immense achievement. The production of weapons of war in Britain has doubled in a year. In his presidential address to the Amalgamated Engineering Union on Monday, Mr Jack Tanner, too, spoke of a tremendous increase in production during the past six months. Until this summer, when British production was overtaken by the output of American factories, this country was, overwhelmingly, the main arsenal of democracy. War output per head of the employed population is still much greater than in any other country.

Britain is all but fully mobilised. Two-thirds of its population between the ages of 14 and 65 are working full time in industry, in the armed forces, or in civil

defence. But there is no room or reason for any relaxation of effort or of ingenuity. The task now is not to bring in fresh industrial resources, but to extract the last ounce from the resources already harnessed in the war factories, and to make swift and shrewd adjustments in the disposition of resources, as the need arises, to meet changes in strategic requirements.

Mr Lyttelton was appointed to oversee precisely these tasks. The making of output programmes is more important than ever. Together, under Mr Lyttelton's direction, the plans of the supply departments must aim to make the most effective use possible of the productive resources available, and they must promise, for the right dates, the kinds and quantities of weapons and equipment that will be wanted on each battlefield. The Minister of Production has gone to the United States to extend these

principles to the combined field of Anglo-American manufacture. At home, he has the duty, in addition to the moulding of programmes, of securing the utmost technical efficiency and the utmost flexibility in the use of resources.

There is still scope for an appreciable expansion in the "yield" of finished war equipment per man-hour. In one respect, the output of munitions per worker will go on rising, automatically, as the proportion of labour, materials and plant employed in the preparatory work of constructing new factories and manufacturing equipment is reduced. The building and civil engineering industries, for example, should be able to release many workers during the next twelve months. But in the main the increase in the yield per man-hour must come through an actual increase in the efficiency of work. Primarily the problem is one of management, not only in the individual factory, but in the general disposition and utilisation of resources. The test between now and the end of the war, Mr Bevin has said, is of managerial ability.

It would be quite wrong to say that war production at present is inefficient. It would be equally wrong to say that there is no room for improvement. Industrial mobilisation had to be carried out quickly, and often in difficult conditions. The existence of loose ends and ragged edges is not surprising. Some of them have been set out in a memorandum prepared by the Amalgamated Engineering Union, on the basis of investigations carried out in engineering shops and shipyards during August and September in 1941, and February and March in 1942.

The list of defects compiled by the AEU from their latest inquiry (analysed on page 873) is not unfamiliar. It includes shortages of work; idle machines; shortages of materials, components, tools and suitable equipment; delay or discontinuity of orders; shortage of labour; misuse of labour; a wrong attitude of managements towards workpeople; faulty planning and organisation; inefficient progressing; working to too fine limits; unsatisfactory labour conditions; inadequate transport facilities; dissatisfaction with piece-rates or earnings; bad time-keeping or absenteeism; and the inefficiency of women and other inexperienced recruits. For the most part, the complaints of the AEU, not unnaturally, relate to faulty management and lack of collaboration between managers and workers. Compared with the complaints lodged during the first inquiry last year, there has been a substantial improvement. The setting-up of production committees, in particular, appears to have led to better relations in the factories. They had been established in about a quarter of the establishments that reported to the AEU during the second investigation. The practice of joint consultation has tended to increase the interest of workers in their jobs and their sense of responsibility towards their duties. By their technical knowledge and constructive ideas, workers have been able to make valuable contributions to the solution of production problems. The AEU inquiry was completed before the agreement to extend the system of production committees could be reflected in the returns, and further improvements in collaboration must have taken place.

Shortage of work and idle time are, to a point, inevitable when there is virtually full employment. In part, they replace the reserve of short-term unemployment which is the industrial buffer in normal prosperous times. They could only be obviated altogether by a perfection of liaison and of timing throughout the industrial system which is inconceivable. Very often, though, they are due to faulty management or faulty planning. The AEU found fewer this year than last. Workers were still dissatisfied with what they regard, sometimes rightly, sometimes wrongly, as the misuse of time, labour and machinery. New machinery is frequently not set up; some men are still working with obsolete machine tools; working hours are often not fully used; and there is some evidence of machines standing idle with plenty of workers at hand. Sometimes these frictions are unavoidable, sometimes blameworthy. Deficiencies in components and spare parts, most marked in the aircraft and tank industries, are still attributable to lack of co-ordination between main and sub-contractors, to other unsystematic methods of

placing orders and to conflicting priorities. Any suggestion that managements are planning, or actually executing, orders with an eye to the post-war period has a disturbing effect upon workers. The attitude of many managements is cited by the AEU as a serious impediment to maximum efficiency, though the increase in complaints under this heading is probably due to the increased interest of workers in production problems, rather than to any deterioration in the quality of management. Like the Citrine Committee, the AEU suggest that the contribution of the regional boards to the solution of production problems has until now been small. Where problems have been referred to the boards through trade union channels,

the results have been nil or have been followed by an inspection by a Supply Department affording no redress to the actual shortage or difficulty.

Whether the advent of Mr Lyttelton's representatives into the regions—to bring together the representatives of the departments, of industry and of labour in concerted work—will remedy these defects has still to be seen. It is easy to exaggerate these shortcomings of management—the AEU is unlikely to understate them. But these complaints do illustrate the ways in which improvements must be sought if the output per man-hour is to be increased. There is need for a bold lead from the Minister of Production to remove inept and unsympathetic managers, to end faulty planning and muddled ordering and to impose the highest standards of productive technique.

The task of securing flexibility in the disposition of industrial resources in the light of changing military needs is again the responsibility of the Minister of Production. Conditions must be created in which men, machines and materials can be transferred from the manufacture of one category of equipment to the manufacture of others more immediately needed and, within particular categories of equipment, from the production of one type to the production of another. Big changes cannot be made in a few days or even months. But, within limits, a good deal can be achieved. Already, some redistribution of workers has been planned by the Ministry of Labour to speed up the output of aircraft, tanks and ships, though there is as yet no evidence of much progress in effecting the transfer.

Looked at in the round, Britain's achievements in the production of arms, in the past two years, have been very remarkable. The fact that America's output is now moving rapidly ahead must be a further spur. To build up the strength needed to defeat the enemy, only the maximum output of both countries will suffice. Nothing less than "production to the hilt," as Mr Lyttelton has called it, would either do justice to the ability of British industry or measure rightly the ordeal that still lies ahead of the United Nations.

WILLS & TRUSTS

In the present wartime emergency difficulty may be experienced in selecting a suitable Executor or Trustee. This difficulty can be solved by appointing a corporate body having the status of a Trust Corporation

MARTINS BANK LIMITED

is a Trust Corporation and as

EXECUTOR & TRUSTEE

offers efficient service with security and continuity of management throughout the Trust. The fees are moderate; probably less than the legacy you would bequeath to a private Executor.

Enquiries welcomed at any Branch of the Bank

Total Assets - - £175,000,000

Head Office: WATER ST., LIVERPOOL, 2

Agency in New York

domestic consumption because of increasing purchasing power with gross inequities reflecting differences in income: it is desirable that rationing should be introduced when it can be mild and done without hardship even to the poorest: it is necessary to provide ahead for 1943 as well as 1942, because the demand for coal, as the war effort grows, is bound to rise. [*The Economist*, May 2nd, page 596.]

If there is to be public discussion about rationing, then it is a political scandal that these arguments are not being stated by those politicians who have special personal and party responsibility for ensuring that the interests of the community at large should not be overridden by special pleading. Small houses as well as mansions have a right to be heard.

Family Allowances

Family allowances have now been debated in the House of Lords, but not yet in the House of Commons—though an early opportunity for discussion of the subject there has been promised by the Lord Privy Seal. Nothing very new was said in the Lords last week. The debate was chiefly marked by the moving "maiden" speech of the Archbishop of Canterbury, and by the degree of unanimity expressed in favour of the introduction of some scheme of allowances. This unanimity of opinion was a reflection of the wide measure of support which the principle of family allowances is now receiving throughout the country from persons of all shades of political opinion. The Liberal party has long been in favour of the proposal, and so have some sections of the Conservative party. The Labour party carried a resolution in support of the scheme by a large majority at their Whit-sun Conference; the Co-operative Conference also pronounced in its favour, it is expected that considerable support will be forthcoming, as well as some strong opposition on traditional lines, at the Trades Union Congress in September. Lord Southwood, who moved the motion on family allowance in the Lords debate, was rebuked by the Lord Chancellor for having drawn a comparison between the cost of the war and the cost of the social services. Nevertheless, his statement that ten or eleven days of war expenditure would pay for an allowance of 5s a week (which, incidentally, is a meagre and insufficient sum for any effective scheme) to every child of 15 or remaining at school beyond that age cannot be ignored; carrying the analogy further, the total sum spent on social services, including education, in the year immediately before the war, would be represented by 42½ days of war expenditure. The value of such a comparison lies in the argument it presents to those who hold that financial considerations should not be allowed to impede social reform. The Lord Chancellor was sympathetic, but non-committal. He explained that he could give no intimation of Government policy, first because the financial questions involved were a matter for the Lower House, and, secondly, because any decision on family allowances must wait upon the presentation of Sir William Beveridge's Report. "Wait for the Beveridge Report" has now become the stock reply to all requests for information about the Government's intentions in regard to social questions. It was given again in the Commons on Wednesday in relation to old age and widows' pensions, though the Government did agree to make a special inquiry into these payments. Meanwhile, the public is kept guessing and hoping that, when it does come, the Beveridge Report will contain proposals for a bold and comprehensive scheme for social reform, and that the necessary legislation will then follow at once, whether the war is over or not.

Pacific Victory

With astonishingly small losses to themselves, the Americans have disposed of a sizeable proportion of the Japanese navy in the engagements in the Coral Sea and off Midway Island. In both battles, the Japanese appear to have been caught unawares by the ship and shore-based American aircraft. At Salamaua and Lae in New Guinea, their ships were smashed in harbour before putting out to court further disaster on the high seas. A feature of both battles was the predominant part played by the naval bomber. These sea battles were, in fact, fought out in the air. The days of naval engagements, in which the surface ships are the chief protagonists, seem to be drawing to a close. It is no longer simply a question of air cover. The chief offensive weapon is the dive-bomber and the torpedo-bomber. The latest Mediterranean convoy battle illustrated the same

point. It appears that surface ships were not engaged at all. They were only attacked—from the air. The Pacific battle has led, inevitably, to over-optimism—"the back of the Japanese navy has been broken." The Japanese navy has lost four or five aircraft carriers, light and heavy cruisers, and a number of destroyers; but no modern battleships have yet been sunk, and the Japanese are known to have concentrated on the building of aircraft carriers. Their chief difficulty now is the vast geographical extension of their commitments—to which, by taking the westernmost Aleutian Islands, they

have considerably added. Japanese ships are in Kiska harbour, Attu has been occupied. The fog and stormbound islands make a poor base for offensive operations, but they are the land link between America and Russia, which, whether the Japanese decide to strike at Siberia or Alaska, it is in their interests to break.

Japanese Strategy

The Japanese are keeping up their pressure in Chekiang and the severe fighting has developed into a battle for the railway which links this province with the province of Kiangsi. Their successes in the past week, since the fall of Kiangsi, have been modest and local, but the pressure is being maintained. The attack takes the form of a pincer movement, with troops in Chekiang and in Kiangsi attempting to encircle the Chinese forces in the gap. This smaller pincer operates within the area of the grand strategic operations is the real centre of immediate Japanese activity in the Far East. There has been more news of enemy movements in Inner Mongolia, and reports are circulating that an attack on Siberia is contemplated in the early future. The possibility has received serious consideration in the Chungking. It is, perhaps, given added plausibility by the recent attack on the Aleutian Islands. If Japan were to attack Russia, an effective base on the roof of the Pacific would be an important asset, if not a necessity. The control of the neutralisation of Dutch Harbour, the American base, would make it possible to cut the supply lines between the United States and Russia. Nothing is yet certain about Japanese plans for the summer. The possibilities range from Siberia to Australia and from the Mid-Pacific to the Indian Ocean. For the moment they are centred on China.

Mr Gandhi's Return

Early next month the Working Committee of Congress is to meet to consider another set of proposals. This time they come not from the British Government, but from Mr Gandhi. Sir Stafford Cripps's visit to India was to offer the means of constitutional independence and to secure co-operation in the war effort. Mr Gandhi's offer is quite different. So far as can be discovered, his programme is twofold: to meet Japanese aggression by complete non-violence and non-resistance; and, in order to make this possible, to secure the departure of the British. There can be no clearer sign of the impotence and aridity

into which Indian politics has fallen than the fact that Congress is apparently prepared to take these proposals seriously. The first result of the failure of Sir Stafford Cripps's mission was to give added strength, temporarily, to the moderate group in Congress and elsewhere which sought a settlement between Congress and the Moslem League, in order to secure a united front in the defence of India. But Mr Rajagopalachari was disowned by the Congress Working Committee, which has now sent out instructions into the provinces that Congress groups must be purged of his supporters. The pendulum has now swung back to the old frustrated intransigence. Mr Gandhi is listened to not only because of his personal hold upon the millions among the peasant masses, but because he is the only Congress leader, outside the Rajagopalachari group, who has a programme to put forward. Pandit Nehru, too, has asked the British to "get out"—though he apparently means the phrase politically, and not physically as Mr Gandhi means it. All this contrasts astoundingly with the claim of Pandit Nehru that

if the Indians could be convinced that this is their war and that this was for the freedom of their country, they could, like the Russians, the Chinese and the Americans, put their full weight into the cause of democracy.

It is a direct denial of the plain interests of India and of the Indian people. It is an attempt to use the confusion of Indian opinion to convert India to complete mass pacifism at a moment when such a step would be suicidal. The President of the All-India Peasants' Conference has said, without over-statement, that the principle of non-violent non-co-operation at this juncture is completely futile, and, significantly, he has called for an anti-Fascist front. Russian broadcasts to India have started, and they, too, are calling for an anti-Fascist front. At the moment, there is no sign which of all these appeals—the British appeal, the moderates' appeal, the pacifist appeal or the popular front appeal—will have the most success. All that can be done as the days pass is to press forward reinforcement and recruitment with the utmost speed, regardless of the political mêlée. Yet, in the last resort, the Indians must decide. Every effort to win back the trust and confidence that have been lost in the course of years should be made—if only to save India from the self-destruction which is being preached by India's own politicians.

New Ministry

It has taken a major coal crisis to convince the Government of the long-standing need for a Ministry of Fuel and Power. Even before the war it was unquestionable. The coal-mining industry, though undergoing rapid technical changes, was slow in adapting itself to new circumstances; distribution was known to be inefficient; electricity was rapidly encroaching upon gas; and crude oil had become a vital source of power. While coal, electricity, gas, and oil took up a good deal of Parliament's time during the inter-war years, there was no conscious direction of development. True, there was the Mines Department of the Board of Trade, concerned with coal-mining, and a small staff keeping watch over the gas industry. But electricity was the job of the Ministry of Transport. The one farsighted and constructive development sponsored by the Government was the provision of the electric grid system which, besides achieving economies, has stood the country in good stead since the outbreak of war. Now that the Government has decided to set up a Ministry for the immediate purpose of administering its coal plan, it is to be hoped that there will also be a genuine fuel policy. The selection of Major Gwilym Lloyd George as its first Minister is a reward for proved merit in administration. Mr Grenfell, Secretary to the former Department of Mines, has been dropped. But without any very obvious reason, Mr Geoffrey Lloyd, head of the Petroleum Department of the Board of Trade, has been retained; he and Mr Tom Smith are to be joint Parliamentary Secretaries to the new Ministry. Sir Frank Tribe, Deputy-Secretary to the Ministry of Labour, has been appointed Secretary to the Ministry, with Mr. W. G. Nott-Bower, hitherto Under-Secretary to the Mines Department, as Deputy Secretary. Sir William Brown has been seconded for duty in the Ministry's Petroleum Branch. The key post of Controller-General at the Ministry has been entrusted to Lord Hyndley, hitherto Controller-General of the Mines Department. This appointment, together with the retention of Mr. Geoffrey Lloyd, suggests that the old order is to be embraced within the new, which may or may not be a good thing.

Blockade and Neutrality

The German threat to blockade the coasts of the United States and sink indiscriminately all merchant ship bound thither raises in an acute form the problem of neutrality in Argentina and to a lesser extent in Chile. The share of the United States in the foreign trade of both countries has risen enormously—in Argentina from 12 to 36 per cent in one year. With the cutting off of their European markets, they are both dependent upon the United States for vital supplies. Chile's position is easier, for its ships can use the west coast route and slip through the Panama Canal to New Orleans. The Battles of the Coral Sea and Midway Island have also calmed the nerves of the Chileans. The chief obstacle to collaboration with the United Nations—the length of Chile's coastline—looks less serious, now that several Japanese aircraft carriers have gone to the bottom. Argentina's position is much more delicate. Argentine merchantmen must use the exposed Atlantic route—the tanker *Victoria* was sunk recently as a portent of things to come—and twelve ships (50 per cent of the entire Argentine merchant fleet) are already on their way to the United States. Argentine ships can use New Orleans, but the Mexican Gulf is U-boat infested. If Germany persists in its policy of "total blockade," Argentina will have to choose between losing its foreign trade or accepting the risk to its neutrality. The issue is certain to divide official and private opinion sharply. It is unfortunate that it has arisen at a time when the last hope of securing the return of Dr Roberto Ortiz—the Radical President, who was friendly to the democracies—seems to have disappeared.

In July, 1940, Dr Ortiz, on the grounds of ill-health, delegated his mandate to Vice-President Castillo and went into retirement from active politics. His return, conditional upon his restoration to health, has since been largely a matter of conjecture. In office, Dr Ortiz gave convincing evidence of his determination to ensure cleaner elections. Since the Conservative *coup d'état* of 1930, the Conservative oligarchy had ruled Argentina; and rigged elections were indispensable

THE ECONOMICS OF PRICE DETERMINATION

By C. C. Saxton

10/6 net

This book is intended to be a logical outcome of the methods of economic analysis of the theory of monopolistic or imperfect competition, propounded and developed by modern economists, particularly Chamberlin and Mrs Robinson. It will be of interest not only to academic economists and those having a fair knowledge of economics, but also to the larger industrialists who are concerned with the formation of prices for the products of industry.

REFLECTIONS ON GOVERNMENT

By Ernest Barker

21/- net

This book is concerned with the general movement of political ideas in Europe during the last quarter of a century. It is addressed to what may be called the "problem of liberty in Europe." It is a study of ideas rather than of institutions, and the ideas with which it is concerned are ideas of national (and not of international) government.

Oxford University Press

the 1941 income taxes, which proved steeper than he thought; and the newspapers have brought home to him the fact that the 1942 taxes are going to be steeper still. He is buying war bonds in ever-increasing quantities, with voluntary pay-roll deductions for bonds beginning to snowball.

Mr Average American has now become reconciled to the thought of American troops fighting in any corner of the world, no matter how distant; the fight which raged in Congress last year over whether to permit the National Guard to serve outside the Western Hemisphere is now inconceivable. He generally has confidence in the Government's prosecution of the war. But he is not convinced that the Government has enough confidence in him, because he does not feel that the Government is giving him sufficient information. He also thinks the Government is doing better on the war front than it is on the home front, with special groups, including labour and agriculture, having too much sway at the White House and the Capitol. He has become bitterly critical of Congress. Congress, of course, has been for generations the legitimate butt of any American joke. But in recent years more faith in Congress has been lost because of Congress's own partial abdication of its powers in favour of the President.

Finally, Mr Average American, even in the midst of war, is receiving daily proof of the fact that the United States is a vital part of the world. A resolve is growing that, when the war is over, the USA cannot become the United States Absent, but must take its share in world affairs, even though the cost be high. If America's participation in a world organisation such as the League of Nations were put to a vote now, the majority in favour would be overwhelming. The reaction of isolationism may indeed come when the fighting is over. But its chances should be far less than they were in 1919 and 1920.

American Notes

Primary Politics

The primary elections are now under way; they have already taken place in eight states. Under American law, candidates for office are selected by the vote of registered members of each political party. In some cases, particularly in the South, where the Democratic party has practically no opposition, victory in the primaries is an almost certain guarantee of election. In all states, the primaries determine the quality of the candidates to be offered to the voters in November, and give an indication of the issues and the temper of the electorate. Since the United States became a belligerent, there has been a considerable outcry against the low calibre of the present Congress. An organisation called the Union for Democratic Action has been formed to fight for better candidates against the party machines, and in particular to secure the defeat of notorious obstructionists and isolationists. Magazines as far apart as *Fortune* and the *New Republic* have urged on voters the importance of taking part in the primaries. The returns which have come in so far suggest that this campaign has met with little success. The primary vote has been light in every case, and they have provoked little interest. Campaigns have been fought on local issues; there appears to have been no response to the cry to elect men on their attitude to the war and to international collaboration. An isolationist record, particularly in the Middle West, has proved no obstacle to re-nomination. In some cases, it has been an asset. Illinois Republicans returned Day and Brooks. The former's isolationist record was so black that he did not even receive organisation support; nevertheless, he won by a small margin over his opponent, a supporter of the "Fight for Freedom" Committee. Indiana has continued its traditional isolationism; the pacifist Ludlow has been renominated. In Oregon, where labour issues were pre-eminent and foreign policy played only a negligible part, Senator McNary was renominated without even having to leave Washington. In South Dakota, Senator Bulow, an outstanding isolationist, was defeated in the Democratic primaries, but his Republican opponent will be Governor Bushfield, a pre-Pearl Harbour isolationist; and Karl Mundt, a notorious American-Firer, scored a 6-1 victory over his New Deal opponent, perhaps because of a last-minute *volte face*. In Iowa, the Willkie Republican, Mark Thornburg, was defeated by the choice of the *Chicago Tribune*, Governor Wilson. Because of the apathy of the voters, the influence of the political machines has been dominant. It is probably

natural for interest in elections, particularly in an off-year, to ebb during a great war which is bringing immense industrial and social upheavals. But there must be disappointment that the course of the elections so far does not suggest that the President will enjoy the aid of a conspicuously abler Congress next year. Nor are the omens very happy for the peace, should it occur within the life of the new Congress.

War Information

The consolidation of the Government's information agencies, which has been foreshadowed for several months, was accomplished last week by an executive order establishing an Office of War Information, with Elmer Davis, well-known liberal journalist and radio commentator, as its Director. The preamble of the order states that the re-organisation is made

in recognition of the right of the American people and of all other peoples opposing the Axis aggressors to be truthfully informed regarding the common war effort.

The new office supplants and takes over the duties of Archibald MacLeish's Office of Facts and Figures, Lowell Mellett's Office of Government Reports, the foreign information service of the Co-ordinator of Information, and the division of information of the Office for Emergency Management. Latin-American information services remain the province of Mr Nelson Rockefeller; and the Office of Censorship remains independent, although it is to collaborate with War Information. The most sweeping and promising powers are given to Mr Davis to order stiff-necked departments, such as the Army and Navy, to make available to him such information as he deems necessary, and to issue directives to the various departments and agencies concerning their information policies. He may require that their releases should be approved by the Office before dissemination. Mr Davis also has the power to curtail or eliminate any information service which he considers wasteful or not directly connected with the prosecution of the war. Besides ending the wasteful and confusing duplication which has irritated the public, the press, and the economy bloc in Congress, Mr Davis has the opportunity and the authority to create and carry out the imaginative and consistent information policy which is so badly needed, and has been conspicuously lacking. It is unlikely that this will be accomplished without a struggle, particularly with the Services—and with the State Department, of which Mr Davis has been a vigorous critic, particularly in regard to its attitude toward Vichy. But he will have the support of the President and other liberal elements in the Administration.

The Price Squeeze

Retail and wholesale prices have been frozen for the past month, retail prices since May 18th, wholesale since May 11th, both at the highest levels charged by each firm in March. These ceilings constitute the maximum that may be charged; lower prices are permitted. An odd feature is that two retailers may have conspicuously different ceilings for the same product, if the prices they charged in March varied. The staff to administer the scheme, estimated at 90,000 by Mr Henderson, has yet to be assembled, and among them is the plight of 2,000,000 retailers, who are "squeezed" between their price ceilings and the increased cost of replacing their stock. They claim that their March prices often did not reflect the current increase in wholesale prices, and that the freeze disastrously reduces their profit margins. The "squeeze" will evidently work the greatest hardship on those retailers who co-operated with the Government by trying to keep prices low; on those whose turnover has been greatly cut by the elimination of many consumers' goods, such as refrigerators and radios; and on "independents" as opposed to the chains which can make an equitable division of profits between their wholesale and retail departments without waiting for Government action. The Office of Price Administration has been sympathetic, but has made it clear that no arguments will move it to "puncture the price ceiling." It is hoped that economies in distribution and the elimination of frills will do much to restore profit margins. Where this is insufficient, the OPA is at work on the "rollback," that is, a readjustment of prices at the manufacturing and wholesale level to assure a juster distribution of the total profit. If an industry is

still unable to make ends meet, subsidies will be resorted to; but they are unlikely to provide peace-time profit margins, and would only be granted after the strictest Government investigation. It seems improbable, however, that the Government will be able to prevent, or desirous of preventing, a great concentration of distribution. As in Britain, the retailer will become one of the casualties of total war on the home front.

Seward's Folly

In 1935, the late General William Mitchell called Alaska "the most important strategic place in the world." Events are proving him a true prophet. The recent Japanese attacks on the Aleutians show that they are fully aware of the threat from American bases; and the value of the Alaska-Siberian route for supplying Russia and China is not being neglected. It is a striking fact that, as the bomber flies, Fairbanks in Alaska is almost equidistant from Chungking, Moscow, Berlin, and London; the distances are 3,740, 3,350, 3,480, and 3,390 miles. Kodiak, the Navy's big base in the Panhandle, is 900 miles nearer Tokyo than Pearl Harbour. In the past two years, Congress has appropriated \$150 millions to improve Army and Navy bases at Anchorage, Kodiak, Sitka, and Unalaska. There has been such a big boom that, in Sitka, even the jail is reported to charge \$3 a night for accommodating travellers. Transport has proved the main obstacle to the fortification of Alaska, as well as to its peace-time development. The Canadian Government has established a chain of air-ports across the North-west Territory, but supplies have had to be sent by sea, in addition to the food imports on which Alaska depends even in normal times. Since March, American engineers have been at work on a highway running from Edmonton to Fairbanks along the line of the airports. Agreement between the United States and Canada was reached under the auspices of the Joint Board of Defence; the United States is to build and maintain the road until six months after the end of the war, when it will become part of the Canadian highway system. The technical difficulties of building the road across swamp and in temperatures varying from 50 degrees below zero to 100 above in the summer are enormous; it has been estimated that a road-

bed of sorts will be completed in the spring of 1943, and that a temporary road may be available before the end of 1942. When the proposals for the road were shelved, before the war, it was considered unnecessary and too expensive—rather like the original purchase of Alaska for \$7,200,000 by Secretary of State Seward in 1867. For years, Alaska was referred to scornfully as "Seward's Icebox," or alternatively "Seward's Folly."

Shorter Notes

President Roosevelt has announced the beginning of an intensive 2-weeks' drive throughout the nation to collect scrap rubber. If sufficient is received, nation-wide petrol rationing may be cut off. The campaign will run from June 15th to June 30th. The oil companies, who are anxious to forestall further petrol rationing, have arranged that the country's 400,000 filling stations shall serve as collection depots. The President has pointed out that the Army and Navy have already cut their use of rubber by 25 per cent.

The War Production Board has approved the immediate construction of an oil pipeline from Texas to Illinois. The project has been turned down several times in the past because of the steel it would require. Presumably the shortage of petrol and fuel oil on the East Coast has led the WPB to revise its opinion that it would encroach on steel deliveries for the Army Navy, and Maritime Commission. The pipeline is to be completed by December 1, 1942.

General Motors has been ordered to refrain for three months from manufacturing any non-functional replacement parts for automobiles, lorries, or buses, as a penalty for the improper use of chrome steel and aluminium on automobile trim and hardware. The penalty appears disproportionately light, and what is harder to understand is why the manufacture of non-functional replacements is permitted at any time.

THE WORLD OVERSEAS

Air Training

(From Our Ottawa Correspondent)

May 28th

CANADA'S position as the chief air training centre of the British Commonwealth has been re-affirmed in the renewal, with amendments, of the agreement covering the Commonwealth Air Training Plan. The Ottawa air training conference, which resulted in the formation of the Combined Committee on Air Training in North America, preceded the negotiations between the partners in the Commonwealth plan. The conference of United Nations interested in air training in North America included Canada, the United States, the United Kingdom, South Africa, Australia, Belgium, China, Greece, Norway, New Zealand, the Netherlands, Poland, Czechoslovakia and Yugoslavia. An observer of the Free French committee was present. The conference opened the prospect, so it seemed, to some future United Nations' air training plan concentrated in the safe, open spaces of North America. Talk of such a plan is premature. Nevertheless, Canada, home of the multinational Commonwealth plan and haven of training stations of Norway and of flying students of several other countries, has begun to think in terms of genuine internationalism in air power. If an international police force of the air emerges in some future settlement of the world, its genesis may be traced to the Ottawa conference of 1942.

The Combined Committee, the latest device of United Nations collaboration, provides for pooling of knowledge and experience at the level where efficiency in air operations begins. One result, as an official announcement said, will be the closer approach to standardisation in air training methods than was previously possible. The Combined Committee consists of representatives of the United States, the United Kingdom and Canada, sitting in Washington under an American chairman. Its functions are advisory:

1. To exchange information on air training;
2. To initiate advice on training methods;
3. To advise on measures to secure the most efficient use of North American facilities.

Unusual precautions were taken to maintain secrecy about the activities and conclusions of conference committees. But it was safe to assume that the delegates, in surveying airman-power, the capacity to create training facilities and to build aircraft, examined the foundations of permanent world supremacy in the air. Mr Power, the Canadian Air Minister, forecast confidently that there would be no "bottleneck" of trained airmen to fly the machines coming from the aircraft factories of the democracies.

Renewal of the Commonwealth agreement came after the partners to it—the United Kingdom, Canada, Aus-

tralia and New Zealand—had reviewed progress and planned for the future. The original agreement, signed in Ottawa in December, 1939, would have expired in March, 1943. It has been replaced by a new agreement extending from July 1, 1942, to March, 1945. The success of the continuing plan drew the admiration of President Roosevelt, who, in a message to the Ottawa Conference, described Canada as "The Airdrome of Democracy."

The CATP was originally designed to achieve full production in April, 1942. Construction and training began in April, 1940. The first students were graduated in November, 1940. But in that year of blitz in Britain, not only was the construction of airfields and training stations greatly accelerated, but the scope of the plan itself was expanded by 25 per cent. Full production, including the increase, was reached on December 15, 1941.

Subject to secrecy about the number of graduates and the rate of graduation, there are several indications to judge the change that has occurred in the supply of airmen. The claim is heard in Ottawa that Canadians will soon form the largest national group of operational airmen in the RAF. Canada is now beginning to fill out its home defence force, and a substantial programme of construction of operational air stations is now under way. Final stages of air training are being completed in Canada, a change from the days when graduates were rushed to England to complete the last 25 hours of their training.

The Cost

Operating costs of the Commonwealth plan this year are 37 per cent higher than last year:

	(Canadian dollars)	
	Estimates 1942-3	Actual 1941-2
Pay and allowances	106,217,454	69,222,745
Construction and improvements	25,966,199	39,537,408
Aircraft, engines, etc.	36,785,986	42,044,147
Clothing and necessities	15,081,560	10,050,689
Stores	12,083,550	9,191,396
Rations	14,063,883	9,951,399
Bombs and ammunition	10,845,950	1,967,722
Gasoline and oil	16,771,610	3,000,775
Overhaul	27,206,609	3,975,775
	264,915,806	194,416,510
Expended to March 31, 1942	447,000,000	
	711,915,806	

Contributions in kind from the United Kingdom Government are listed at \$193,000,000; contributions in cash, Australia \$51,000,000, and New Zealand \$36,000,000. The aggregate three-year cost of the plan, to March 31, 1943, will be \$992,000,000.

Mr Power has become an exponent of "Canadianisation" of the Royal Canadian Air Force. He has advocated that Canadian airmen should be grouped together more than they have been in the past, when thousands of Canadians lost their identity within the RAF. The RCAF has 22 squadrons of its own in the RAF, with several more in process of formation. Less dispersal of Canadians in the RAF will not mean, in Mr Power's view, any dissent as far as Canada is concerned from the direction of air operations at the higher levels by the RAF.

The chief bone of contention for Mr Power is what he described as "the British passion for anonymity." Canadians, he said, "are in every raid, in every sortie; they are in every attack on Germany." Canadians were serving in the RAF, not only in Britain, but in the Middle East and the Far East. Speaking of home morale, Mr Power said the Canadian people should be kept informed of the latest possible news of the deeds of their airmen.

Finance Under Co-Prosperity

[BY A CORRESPONDENT]

THE financial organisation of the "Co-prosperity Sphere" in East Asia is based on the use of the military yen in a number of currency alliances between Japan and Nanking-China, Indo-China and Thailand, on the model of the German central clearing system. In Thailand, a central bank has been founded and the baht linked to the yen at a new parity. In the conquered territories, the

military yen has been introduced; but in occupied China it has been impossible to make this an effective currency. When Japan was unable to intervene in Shanghai, the rate of exchange fluctuated violently. After Shanghai was occupied, dollars and pounds sterling were burned, the gold standard abolished and Japanese exchange control abolished. The last connections with the dollar and pound sterling were severed on January 1, 1942, and exchange rates are now fixed by the Japanese Ministry of Finance.

The military yen is already in circulation in Burma, Malaya, the Dutch East Indies and the Philippines. The circulation of the yen is confined to Japan proper, and military notes are the only currency in legal circulation in the conquered territories. Transfer of the yen to these regions is prohibited. The military yen is issued by military order, and the supplementary military budget is its doubtful cover. Thus, it is only nominally equivalent to the yen. The military yen is to be exchanged against all local currencies, the cover for which was, however, generally withdrawn when the territories were evacuated. The rate of exchange between the yen and the military yen is fixed separately for each occupied territory. The true value of the latter is indicated by a statement from Tokyo that Japan safeguards its own currency by the issue of the military yen, which is to finance the reconstruction of the conquered territories. In the long run, however, the Central Bank of Japan is intended to be the only Central Bank in Greater East Asia.

Stamps for Portugal

[FROM OUR LISBON CORRESPONDENT]

June 6th

DURING the last twelve months there has been a boom in philately in Portugal. The cult may now be said to have reached the masses. Almost every second shop dealing in oddments, especially stationers, tobacconists, lottery dealers, bazaars and so forth, now give up much of their window space to approval sheets of foreign stamps. These sheets are made up on most businesslike lines, the stamps being mounted against a black background, prices clearly marked in white ink, and the whole card covered with cellophane. Closer inspection shows that the bulk of these wares is composed of finely printed and unused examples of stamps issued by the German Reich, by occupied Poland, by Italy and its African colonies, including Somaliland and East Africa and Eritrea, and by stamps purporting to be issued in occupied and protected countries at present under Axis oppression.

There has been a regular spate of designs in which the idealised portrait of the Führer, wearing a sort of staff captain's cap, fills almost the whole space. There is another stream of stamps from Italy, where the same picture of Hitler halves the oblong space with a fierce presentment of Mussolini wearing a tin helmet. As for the other designs, their variety surpasses one's powers of description. In one thing they all agree. They are finely produced, and not one of them is ever to be seen with a postmark of any kind whatsoever.

Latterly, there has also been a trickle of similar stamps, apparently similarly mass-produced for foreign consumption, purporting to represent the postage needs of the French African colonies. Can it be that, in this new development, there is another proof of Germany's plausible inventiveness and skill in selling nothing for something, and that "something" doubled in value by being thereby placed in foreign currency? Remembering the interesting and valueless *Kassenscheine* of Germany's cities after 1918, one has one's doubts about the ultimate value of these very pretty little productions.

A New Loan

Barely eight months ago, the Portuguese Government successfully issued 500 million escudos of Internal Consolidated Bonds paying 3½ per cent. It was absorbed almost at once, chiefly in large blocks. A further loan has been thought necessary to reduce the superabundance of liquid funds in the market. The issue has been decreed of a further 1,000 million escudos, in series of 100 millions each, interest being 3 per cent in this case, payable quarterly. In its preamble to the decree, the Government states that, as was the case previously, the issue is planned to absorb surplus funds which, lacking other outlets, are again increasing with dangerous rapidity.

RUBBER SOLES AND HEELS IN WARTIME

Three paramount needs face the country to-day—

- (a) SHIPPING SPACE
- (b) MAN-POWER
- (c) ECONOMY

The Rubber Sole and Heel Industry makes a valuable contribution to these needs.

SHIPPING SPACE. Phillips Rubber Soles and Heels wear at least *three times* as long as leather, the majority of which is made from imported hides. And hides bulk large. They take up approximately *three times* as much shipping space as the raw rubber formerly imported to sole a similar number of pairs, but now by the scientific incorporation of re-vitalised used rubber, further shipping space is saved and complete wearer satisfaction can still be guaranteed.

MAN-POWER AND ECONOMY. Because they outlast leather three times, the labour needed for repairs with Phillips Rubber Soles and Heels is only one-third of that required when leather is used. Phillips Rubber Soles and Heels treble the life of boots and shoes and thus enable wearers to economise in boot repairs and the purchase of new footwear.

German Europe

The Agricultural Dilemma

The comfortable margin of foodstocks available in Germany at the beginning of the war disappeared during 1941, in spite of considerable imports. German food supplies now depend mainly on current production in Greater Germany, which must be maintained if the food disaster of 1917-18 is to be prevented. The real state of affairs in German agriculture is suggested by the fact that, here and there, German peasants have already unofficially opened the harvesting season of 1942 by cutting part of the young cereal crops to use as feeding stuffs. This was stopped at once, however, by special decree. The situation is that peasants face a dilemma. If they maintain the number of livestock, the output of cereals and root crops is not sufficient for human consumption. If their crops are taken for human consumption, the number of livestock must be reduced. Before the war, the policy of agricultural self-sufficiency attempted to solve this dilemma internally by the expansion of root crops and by imports of feeding stuffs, fats, and dairy products.

Superficially, the present difficulties in Germany's agriculture seem to be mainly the result of unfavourable weather conditions in 1940 and 1941. Shortage of labour and reduced supplies of fertilisers, however, are really at the root of the problem. German official sources estimated that there was a shortage of roughly 600,000 workers at the beginning of this season. The labour dictator, Sauckel, therefore appointed a special dictator for the supply of agricultural labour; Goering had already introduced compulsory labour on the land on the model of compulsory labour in the armament industry. Prisoners of war and Russian civil prisoners will be employed in greater numbers on the land. A new drive for voluntary harvest helpers, who already numbered a quarter of a million last year, is to be started this year, and schoolchildren will be sent to work during the whole harvesting period. At present, the number of foreign workers employed in Germany's agriculture, that is to say, civilians as well as prisoners of war, is probably about two and a-half million. In actual numbers, they may have replaced the total of peasants and agricultural workers called up.

At the beginning of the war, German agriculture employed 10.9 million people in about 3.9 million farms. But 97.2 per cent of the farms comprised only 53.8 per cent of the total agricultural land; German agriculture is still mainly peasant farming. The small holdings prevent the effective use of modern machinery. There are only 100,000 tractors in use in the whole of German agriculture, and three-quarters of them are owned by farms exceeding 20 hectares in size, which themselves amount to only 18 per cent of the total number of farms. The outbreak of the war interrupted the programme of mechanisation. Now petrol shortage prevents the full use of even the present relatively small number of tractors. These facts are much discussed at present in Germany. Some sections of the press suggest the concentration of small farms into bigger units, which would make the effective use of modern machinery possible. Others, traditionally representing the view of the big landholders, think that the era of peasant farming will automatically end because of modern machinery and modern methods of farming. The authorities are afraid of changing their attitude towards the peasants and are endeavouring to improve the co-operative use of machinery. At the same time the co-operatives—that is, the credit, trading, and production co-operatives—which made peasant farming possible under modern conditions—have been subjected to a process of centralisation and unification. The aim is one unified co-operative for each district.

Pigs or Men?

More than 60 per cent of the total sales receipts of German farming is derived from the sale of dairy and livestock products. The peasant farms are responsible for the greater part of this output. The big landholders, on the other hand, have preferred the production of cereals and root crops. Concentration would undoubtedly favour the big landholders. Since the beginning of the war, competition has gone on between pig feeding and human consumption for potatoes and other root crops. The rationing of bread, meat and fats increased the human consump-

tion of potatoes by about 100 per cent. At the same time, shortage of imported feeding stuffs forced the pig breeders to use more potatoes to maintain the number of pigs. Silage, sugar beet tops and so on were reserved for feeding cattle. Milk production had to be maintained at any cost because of the shortage of fats. In normal periods, 45 per cent of the total fat consumption was imported.

Here are the reasons for the vicious circle in German agriculture. Only if imports of feeding stuffs and fats are adequate, can the home production of cereals and root crops be sufficient for all requirements. The expansion of oil-seeds and root crops before the war could not change the fundamental structure of Germany's agriculture, and it was sufficient for only a small increase in the number of livestock. At present, a considerable increase in the cultivation of these crops is necessary if the number of livestock is to be maintained. Yet lack of labour and, particularly, reduced supplies of fertilisers are causing a steady decline in the yield of cereals and root crops per hectare, apart from the adverse effect of bad weather conditions. The supply of phosphates has been reduced to 33 per cent of normal supplies and of nitrogen to 76 per cent. Only potash is available in normal quantities, and it is doubtful whether these quantities were delivered during the 1941-42 season because of transport difficulties.

The main problem at the moment, undoubtedly, is how to maintain the number of pigs, which used to provide 43 per cent of the home production of fats and more than 50 per cent of meat supplies. Pig breeding has been made compulsory for big farms, and producers' prices have been increased by the repeal of the slaughter tax. Since last autumn, the slaughter of pigs has been steadily on the increase; and the acute shortage of potatoes, because of winter losses, will probably force peasants to continue cutting down the number of pigs.

German agriculture is probably the most heavily subsidised agriculture in the world. All products are covered by high protective duties; the more important crops which are to be expanded usually get cultivation premiums; and the prices of a great number of products are directly subsidised. In spite of the exaggerated price level, there is a constant demand for substantial price increases in order to raise the total sale receipts of farmers by 40 per cent. The *Reichsnachstand* maintains that agriculture, compared with industry, is underpaid. Dr Reischle, one of the agricultural leaders, thinks that higher prices for foodstuffs would reduce the dangers of excessive purchasing power. The price commissar has made it clear, however, that food prices cannot be increased. In fact, the prices of vegetables and fruit, which were in very short supply during the winter and spring, show considerable advances since the beginning of the war.

Food Distribution.—Since the cut in the food rations in March, several less spectacular changes have taken place in the distribution of foodstuffs in Germany. The press admits that individual attempts to get more foodstuffs than the official rations will probably increase the longer the war lasts. Pigs, goats, poultry and rabbits are kept in great numbers by the inhabitants of big towns. Officially, people are only allowed to feed kitchen waste to them, but considerable quantities of rationed foodstuffs seem to have been used for this purpose. People slaughtering pigs must hand in their meat cards, but this is frequently evaded. Allotment gardening, on the other hand, is officially encouraged and supervised by expert gardeners. Roughly one-third of the total crop of vegetables is produced in allotment gardens; this year, an increase of 20 per cent is the official aim.

The potato shortage in big towns is likely to continue well into July. Rations have been fixed locally, and are sometimes extremely small. A weekly ration of 4½ pounds is far below the normal consumption. The acute shortage of vegetables could only be relieved by the distribution of dried vegetables and sauerkraut, which is a staple vegetable.

The most interesting sign of growing food difficulties during 1941 was the increasing direct purchase of fruit and fruit from the producer. The collection of fruit and vegetables by the marketing organisations decreased during 1941 by roughly 50 per cent compared with 1939-40. At the same time, fruit growers used their products to barter for other commodities in short supply. These direct pur-

chases have now been prohibited. The entire crops will be collected by the marketing organisations.

The standard bread is now of a very dark colour. Almost all the grain is used for making bread, and only small quantities of finer flour are provided for making cakes. Baking methods have had to be changed and special regulations were issued to all bakers. These regulations were prepared in several languages, because of the great number of foreign workers employed in the industry.

There are many signs that shopkeepers are frequently unable to supply the rations to which customers are entitled

Russia at War

The Aftermath of the Treaty

THE announcement of the conclusion of the Anglo-Soviet Treaty and of the Soviet-American Agreement was hailed throughout the USSR with an enthusiasm which far surpassed any similar manifestations in that country. This time no official inducement was needed for the innumerable meetings held in every factory, collective farm and army unit. The feeling that May 26, 1942, marks a historic turning point for Russia in its relations with the "outside world" was reflected in press comments as well as in resolutions passed by the meetings.

The Treaty [said *Izvestia*] signed on May 26, 1942, in London is noteworthy in that it is not confined, like that of 11 months ago, to establishing the military alliance, but goes further in expressing the firm desire of those countries to continue close collaboration in the peace settlements and in the post-war period of reconstruction in Europe. The very term of operation of the Treaty—20 years—and the procedure for prolongation prove the desire of the great States which participate in it for close friendly collaboration and mutual aid as a basis of a new order.

The significance and the implications of the Treaty can be gauged only against the background of Soviet foreign policy since 1917. During all that period, the notion of "hostile capitalist encirclement" weighed upon the mind of the Soviet people. Relations with foreign countries were taken up; treaties and agreements were concluded. But, at bottom, there always remained distrust of the "outside world," which gave a sort of an isolationist touch, not only to official policy, but also to the attitude of the average Soviet citizen. None of the previous diplomatic pacts was able to dispel that feeling. None of them covered a period of two decades. None of them covered so wide a field of co-operation as the Anglo-Soviet Pact. Now at last, in the middle of a war and in spite of its devastating effects, the average Soviet citizen can feel for the first time since 1917 that fear of the "capitalist world"—the term conditionally included Britain and the USA as well as Germany—has become groundless. And again, perhaps for the first time since 1917, the conception of a "new order" has been expounded by the official paper, not in ideological terms, but explicitly in terms of "collaboration and mutual aid" with Great Britain and the USA.

All this may mean a tremendous psychological breach in the wall of Soviet "isolationism." The Soviet people have, no doubt, grown weary of their long isolation. In terms of everyday life, this entailed the heaviest sacrifices in their standard of living in order to ensure the defence of their country. The promise of post-war economic collaboration with Britain and the USA implies the prospect of better living conditions after the war. It gives the average Soviet citizen the hope that in rebuilding the ruins of his country he will be assisted by the industrial power of the Anglo-Saxon world.

Second Front

The main point, however, which has impressed Soviet public opinion even more than the prospects of post-war co-operation is the "agreement on the urgent task to open up a second front in Europe in 1942." The press has naturally enough abstained from any specific comments. But the point has been presented in a way which leaves no doubt about the manner in which the Soviet public is bound to interpret that promise. Distinctions between the various kinds of fronts—by naval, air or land warfare—are entirely outside the scope of that interpretation. With the test of a cold and hungry winter behind them and the ordeal of the summer campaign in front of them, the

according to their coupons. Special regulations have been issued which define the status of regular customers. War workers and families with children are now regular customers, and shopkeepers must give them priority if rationed foodstuffs are in short supply. Finally, the variety of meals in restaurants has been cut down. On two days there is only a field-kitchen meal and on two more days no meat may be served. The situation will probably not be changed until the new harvest is brought in. But the arrival of early potatoes and fresh vegetables may ease the situation temporarily.

Russian people have found in the announcement about the "second front in 1942" an additional tonic for their endurance and willingness to sacrifice. *Pravda* summed up the popular reaction in the following words:

This year, 1942, must be the year of Hitler's final defeat. This thought runs through all the speeches at the meetings in the front line and in the rear, through all the resolutions adopted by the workers.

The point about the "second front" is also being widely referred to in the present drive in industry. Pledges to increase and exceed production quotas have been made at all the meetings called to celebrate the Treaty. And the Soviet workers are promising to make their utmost productive effort in the hope that relief from pressure will come sooner than might have been anticipated before. Soviet propaganda to Germany and to the occupied countries has also linked the call to revolt with the immediate prospect of Germany's involvement in a two-front war.

First reports from the occupied countries show [as a Moscow broadcast has put it] that the peoples are actively preparing to support the armed forces of the anti-Hitler coalition when a second front is opened in Europe.

Tank Production in May.—Reports on tank production in May were very optimistic. It is said that the May output exceeded April by a considerable percentage. The Kirov plant—the biggest Soviet tank factory, which has been evacuated from Leningrad to the Urals—exceeded in programme by 17 per cent in the production of the heavy K.V. tanks; and it turned out 43 per cent more engines than in April. At the same time, however, it has been disclosed that a number of evacuated tank and engine factories did not restart work earlier than in April. In spite of this delay, it is claimed, they are now turning out many more tanks than they did on their old sites.

Much attention has recently been paid to the intensification of the rationalisation of labour in tank factories. In many plants the 24-hours control graph has been replaced by an hourly graph, which makes it possible to check every fraction of working time.

Food Industries.—The People's Commissariat for Food Industries has published an appeal for "socialist emulation" in its factories. The position in the food industries has been described as satisfactory on the whole. But some "bottlenecks" have also been discussed. One of them is in the sugar industry, which has to make good—at least partly—the loss of the Ukrainian sugar output. The areas under sugar beet have been considerably extended in Kazakhstan, Central Asia, Siberia and Altai. But the building of sugar refineries has lagged behind; and the Commissariat is urging the refineries to start this year's campaign a month earlier than usually.

In the meantime, the shortage of sugar has been acute. The same applies to soap. Managers complain about the lack of soda, which holds up production. Cigarette paper, too, has been very scarce. There have also been difficulties in meat and fish industries. The usual complaint of factory managers is lack of fuel and other supplies. Railways are said to hold up supplies for food factories, on the ground that these are not essential branches of war economy. *Pravda* had to take the food producers under its protection. A special feature in food industries is the production of concentrates and canned food, a novelty introduced only recently into Russia. Concentrates and tinned foodstuffs are reserved almost exclusively for the Army; they have brought about a basic change in the diet of the Russian soldier, which until recently consisted of fresh food only. The economy of transport space seems to have been the main motive for this departure from the old Russian manner of feeding the Army.

parity to the final exchange rate of 2 to 1. Instead of effecting this devaluation at one stroke, they carried it through in several stages. The result was a flight from the Chungking dollar, mainly assuming the form of a sweeping and indiscriminate demand for goods. This brought about a sharp rise in prices, not only in terms of Chungking dollars, but, owing to the depletion of supplies, also in terms of Nanking dollars and military yen. Consequently, the Nanking authorities and their Japanese masters suffered grave disadvantages. Not only did they have to pay higher prices for their supplies; they also found it more difficult to secure the supplies they needed. A large number of holders of Chungking dollars have undoubtedly preferred, in anticipation of an Allied victory, to hold on to that currency rather than to exchange it for Nanking dollars.

Cheques as Receipts

In reply to a Parliamentary question, the Chancellor of the Exchequer has ruled that it would not be feasible "to recognise endorsed cheques with receipt stamps as full receipts of payment," on the ground that it would not be possible to make a general provision for this practice without at the same time legislating to maintain the position of the banks under the Bills of Exchange Act. The practical difficulties, in Sir Kingsley Wood's view, were such as to outweigh any gain that might result from the saving in paper supplies. This decision is incontestable as an answer to the specific question put to the Chancellor. But it is to be regretted that this question was framed in terms which ignore the possible methods, discussed in these columns

last week, of avoiding the legal obstacle in question. The answer will not satisfy those who would like to see the simple endorsement recognised as a receipt, though the analogy with American practice on which this suggestion is based may be misleading in view of the different legal background in the two countries. Still less will the answer satisfy those who regard the adoption of a non-transferable cheque as the means, not only of eliminating the unnecessary posting of receipts but as the key to more important economies through the simplification of banking transactions. A non-transferable cheque, it may be repeated, would not require endorsement and therefore would not require the repeated scrutiny at present necessary for trifling irregularities which might deprive the banks of their statutory protection. In presenting such a cheque for payment, the collecting banker would in effect guarantee that it had been credited to the payee's account, but this should involve little practical risk except in the case of cheques collected for new customers, where caution is in any case necessary under the present system. On balance, the legal position of the banks would probably not be prejudiced, while the simple cheque voucher would become effective evidence of payment. Since the bulk of the banks' staffs, as Lord Wardington has pointed out, are engaged in handling cheques, an appreciable saving in manpower might become possible. No doubt the matter will not be allowed to rest, though it must be borne in mind that the Treasury is not altogether an impartial judge of the desirability of such changes, in view of the possible dual loss of revenue from receipt stamps and the postage of receipts. It hardly needs pointing out that, other things equal, real resources should not needlessly be employed simply as a means of collecting revenue.

Investment

A Minor Relapse

The past week has brought to the stock market the reverse which seemed inevitable, on the assumption that the rise was based on military events, and in particular on hopes of an early end to the war. Just when a reaction from the rapid rise was due, events in Libya took the course which seemed only too probable, in view of the relative ease with which the Axis forces can be strengthened; and the setback might have been serious, but for the news of the Anglo-Russian treaty and the confirmation of America's successes in the Coral Sea and off Midway Island. As it is, the total extent of the fall is still moderate, there are signs of a halt in the decline, and the fact that industrial equities have been almost the firmest market suggests that the rise there was based, less on prospects of early victory, than on considerations of yields and the rate of interest. This is as it should be, but it is not improbable that holders have a difficult period ahead of them. The trend of *The Economist* profits index, published a fortnight ago, was still downwards, up to and beyond the beginning of this year, and the hopes that EPT at the full rate had exhausted its effects promise to be rendered out of date by the stringency of the conditions imposed by new Government contracts, and by the need for ever increasing depreciation, where works are fully employed. Unfortunately, the uninformative character of most published accounts makes it difficult to be dogmatic on the matter, but it is not improbable that the fall in net earnings, if not in dividends, will continue; and many recently published figures tend to confirm this supposition. At the same time, investors who have held through the troubles of recent years are not likely to sell equities at this juncture, except under the pressure of absolute need of money. There will probably be a considerable resistance to any material relapse, except possibly of quite short duration. At a little over 5 per cent, the average return on equities already discounts some measure of post-war recovery. Granted a belief in final victory, any development of policy, suggestive of progress towards a solution of post-war problems, may prove an even stronger "bull" point for ordinary shares than military successes.

Lower Shipping Earnings

Two of the smaller shipping concerns, *Clan Lines* which is a liner company, and *Court Line*, which despite its name is mainly a tramp undertaking, have just presented

results for 1941 which contain some points of interest. *Clan Line* income is down from £540,953 to £397,620, but the cut in depreciation, on a smaller fleet, from £374,400 to £243,000, is almost as great. In view of rising costs, the board has, however, transferred £50,000 to fleet replacement, against nil in 1940, and, although the transfer to pensions is down from £50,000 to £12,000, the ordinary dividend is cut from 20 to 15 per cent, and the carry forward slightly reduced. The fall is evidently due, in no small measure, to loss of ships, for the fleet valuation, after depreciation, is down by £958,300 to £2,189,800, while book value fell short of realised value by some £580,300, which is added to reserve. This fund has also been strengthened by crediting a further £286,400 in Government tonnage replacement account. Despite the resultant fall in business, placement account. Despite the resultant fall in business, creditors are up by over £1,000,000; but there are increases of £728,000 in debtors and cash and of £2,150,000 in investments, while subsidiaries have effected net repayments of £188,000 to the parent. Meanwhile, the accounts of the much smaller *Court Line* are complicated by a change in the basis of preparation, to which no reference is made. Comparable figures of profit appear to be £134,514, against £152,909 in 1940, before tax on the ordinary dividend in each case. Depreciation is unchanged at £40,000 and the distribution is maintained at 15 per cent. The directors complain that profits earned under the requisition agreement yield only 5½ per cent on the basic value of vessels as determined by the Ministry of War Transport—the agreed rate was 10 per cent. This company, too, seems to have had considerable losses, suggesting a further decline in earning power during the current year. The fleet valuation is not much more than half that of a year earlier, at £264,800. Government securities are up by £129,000 and cash and debtors by £613,000, against a rise in creditors of only £160,000. Fleet replacement account receives £324,000, in addition to £37,500 added to the Government tonnage replacement account. In the case of both companies, gilt-edged holdings now substantially exceed balance-sheet value of the fleet, but the new plan, under which companies may acquire Government-built ships under a rota arrangement, will presumably tend to reduce, although it cannot reverse, the trend during the current year.

Marking Reform

A further instalment of reform, arising out of the inquiry into the compulsory marking of bargains, and from

the need to economise paper and staff, is to be put into operation on Monday. No official statement of policy has been made, but it has clearly been found impracticable, in existing conditions, to insist upon the marking of every bargain. The enquiry revealed that, for the most part, brokers do mark all business done, and under the new regulations they are urged to continue this practice and to make an addition to the information given in one respect. When a broker receives orders from a number of clients to buy or sell any security at the same price, he may aggregate these and put them through the marking department as a single deal. Brokers are now asked, in all such cases, to specify the number of clients involved. This will mean that it is possible to obtain a closer estimate of the number of orders executed, and therefore of the amount of work involved; and it is proposed to publish these figures, section by section, in the official and supplementary lists issued daily by the Stock Exchange, London. This is the first time that any official figure will have been available, and it will be much nearer the truth than the official ones, obtained by adding up the number of bargains included in those lists, which is far from being the total actually marked. This is a step forward, although it is still quite impossible to obtain from the new information any idea as to the actual turnover, in terms either of money or of units of stock.

Company Notes

Cable and Wireless Operations

The 1941 accounts of Cable and Wireless (Operating) show a further substantial rise in total income from £7,494,871 to £9,075,649, the main increase being in net message receipts, which amount to £8,479,464 against £7,090,669. This was achieved despite an increase in tax payments from £518,209 to £715,675. Working expenses were more than £475,000 up, while there were marked rises in the cost of maintenance of cables, which required £989,759 against £728,542, and in taxation abroad at

£433,828 against £212,780. There is, however, an increase in the surplus of rather over £550,000 to £2,928,349. The failure of the management to raise the ordinary dividend from the 4 per cent paid in the past two years is, therefore, due to the fact that the EPT liability of the group has not yet been ascertained. The total of undistributed profits, subject to, and available for, this charge is raised from £1,613,607 to £3,341,956. The directors state that the operating company's EPT liability is dependent on the basis of assessment for Cable and Wireless (Holding). The balance sheet shows a rise in net surplus liquid assets from £5,661,235 to £7,942,924. This is due mainly to an increase in holdings of Government securities from

	Years to December 31,		
	1939	1940	1941
Net message receipts	5,344,969	7,090,669	8,479,464
Total income	5,730,929	7,494,871	9,075,649
Maintenance fees, etc.	4,120,560	5,119,100	6,147,300
Earned for dividend	1,610,369	2,375,771	2,928,349
Dividend	1,200,000	1,200,000	1,200,000
Dividend per cent.	4	4	4
Carried forward	437,836	1,613,607	3,341,956

£4,922,484 to £7,343,494, and to the deposit of £1,500,000 against nil with the Inland Revenue. Both items no doubt represent sums held on account of tax liability. Cash is down by £230,000, debts both to and from subsidiaries are up by some £200,000 and fixed assets lower by £400,000. On the liabilities side, creditors are up from £3,494,976 to £5,261,982. For the first time, the balance-sheet contains a note to the effect that liquid assets lost through enemy occupation of the company's stations have been written off. It is probable that the course of the Far Eastern war has been responsible for income as well as capital losses. The ordinary stock of the Holding Company was scarcely changed on the news, and at 60½ ex dividend it offers a yield of £6 12s. 3d. per cent.

During the last hundred years, innumerable testimonials have reached Milners giving details of violent assaults by fire, burglars, and bombardment that have been successfully resisted by their Safes and Safety Installations. Here is a typical example: "A Milner Safe in our head offices containing £1,300 successfully resisted an attack by burglars using oxy-acetylene plant."

MILNERS SAFE COMPANY LTD., 21, HAMPSTEAD LANE, LONDON, N.6 Telephone: MOUntview 6655

John Brown Results

The John Brown accounts for the year to March 31, 1942, show a decline in disclosed profits, after contingencies and all tax liability, including tax on dividends, from £592,263 to £537,508. With a reduction of some £3,000 in depreciation to £64,823 and other charges approximately

	Years to March 31.		
	1940	1941	1942
Profits after income tax, EPT and Contingencies	566,594	592,263	537,508
Depreciation	58,372	67,992	64,823
Fees	6,653	7,373	8,368
Debt service	90,232	90,000	89,514
Preference dividend	49,010	49,010	49,010
Ordinary shares:			
<i>Earnings</i>	362,327	377,888	325,793
<i>Paul's</i>	323,084	269,237	215,389
<i>Earnings</i>	16.8	17.5	15.1
<i>Paid</i>	15	124	10
Reserve for Contingencies	—	100,000	100,000
Carry forward	202,376	211,027	221,431

£ Tax free.

stable, there is a fall in equity earnings from £377,888 to £325,794, representing a tax free rate of 15.1 against 17.5 per cent. Ordinary capital receives 10 against 12½ per cent tax free, equivalent to a less tax reduction of 5 per cent. It is thus possible to repeat the transfer of £100,000 to contingencies and to raise the carry forward from

£211,027 to £221,431. It is, of course, impossible to tell whether the apparent setback to net profits is conditioned by the size of the undisclosed provision for contingencies. Apart from this, it seems probable that profit margins under new Government contracts must have been more effective in reducing profit than is EPT, unless indications of increased turnover are misleading. The balance sheet shows an important expansion in stocks and work in progress from £384,854 to £1,403,384. If work in progress is included at cost only and payments are relatively delayed, this would reduce last year's profits in favour of those of the current period. There is a corresponding decline in cash holdings from £4,477,753 to £4,124,470, while expansion on the part of subsidiaries is argued by an increase in temporary loans from £87,487 to £468,234, financed by a reduction in holdings of 2½ per cent National War Bonds from £515,264 to £175,000. Increases in creditors and debtors are normal, so that there is a net reduction in surplus liquid assets from £1,184,534 to £869,906. The 10s. ordinary shares at 26s. 6d. ex dividend yield £3 15s. 6d. per cent, tax free.

Boots Pure Drug

The preliminary statement of Boots for the year to March 31, 1942, shows net profits of £622,784 against £629,110. The directors state that these totals are after income tax—except tax on dividends—NDC and EPT. In the previous year, war damage contributions amounting to £45,000 were charged directly to contingencies reserve. It is not yet possible to ascertain whether the net figure for the current year is comparable in this respect. But assuming that it is so, there is a decline in estimated equity earnings,

after paying preference and preferred ordinary dividends, from £532,360 to £526,034, representing 41.7 against 42.5 per cent. Ordinary shares receive 24 per cent less tax, as in the previous year. It is not yet clear whether there is any allocation to freehold property reserve, to which £128,273 was transferred in 1940-41. As is well known, a definite shortage of many drugs and medical preparations in common use was accentuated last year. Limitation of supplies also further restricted sales of the many goods outside the purely medical field in which Boots commonly deal. The approximate maintenance of net earnings in these circumstances is highly satisfactory, and appears to have been achieved, in part at least, by entry into new fields, notably that of fertilisers. The 5s. ordinary shares, at 35s. 9d., offer the very conservative yield of £3 7s. 1d., which clearly discounts substantial recovery.

Forestral Land Accounts

The full accounts of *Forestral Land* for 1941 reveal the conclusion of the process of writing off goodwill in *La Forestal Argentina*, the subsidiary to which all Argentine assets were transferred in 1931. Consequently, the depreciation account in respect of this item, which figured in the *Forestral Land* balance sheet, is now eliminated by the transfer of the final £66,302 to the credit of profit and loss account, corresponding with a similar transfer from profits to general reserve by the subsidiary. The counterpart of the large credits taken by *Forestral Land* in the past was the redemption of debentures and the writing off of goodwill by *La Forestal Argentina*. Since this is no longer necessary, the latter is able to provide a larger sum in dividends, which explains the rise in trading profit and dividends paid by subsidiaries of *Forestral Land* from £264,487 to £547,318. With the completion of this stage of the financial plan, initiated ten years ago, the sum available in dividends should, of course, be even larger next year. The allocation of profits was fully analysed in a Note on the preliminary statement in *The Economist* of June 13th. It is pointed out by the vice-chairman, Mr Louis H. Kiek, that the net figure has profited by readjustment of administration charges with a total saving of some £11,000. All subsidiaries appear to have had a satisfactory year, and there has been a good demand for the tanning products of the group. The main difficulty has, of course, been the shipping position. The company's balance sheet shows the elimination of the depreciation account in respect of *La Forestal Argentina*, and, on the assets side, the disappearance of £410,000 sterling debentures held in that concern. The consolidated statement shows a rise in total liquid assets from £5,757,147 to £6,449,778 accounted for by an increase of some £570,000 in cash and of some £280,000 in holdings of British and South African Government securities, partially offset by a decline in stocks from £3,194,957 to £2,988,273. There is an increase in creditors from £887,390 to £1,214,747. The £1 ordinary shares and stock at 27s. ex dividend yield £6 13s. 4d. per cent on the 9 per cent payment.

Odhams Press Improvement

The accounts of Odhams Press for 1941 fill out the story of newspaper earnings last year. The rise in total profits from £606,229 to £805,169, a record for the past decade, confirms the impression that the press is one of the industries least affected by war-time difficulties. There is, of course, a substantial increase in tax liability, excluding tax on dividends, from £155,094 to £313,945. Other charges against profits, however, are relatively unchanged, so that there is still an important increase in equity earnings from £179,264 to £216,787. The £75,000 allocated in the previous year for the inauguration of an employees' life assurance and pension fund was not charged against profits in calculating earnings available for ordinary capital, nor is the provision of £81,635 in the current year, since this is assumed to be mainly a capital transfer. Thus, the rate of equity earnings is up from 34.9 to 41.2 per cent, and the ordinary dividend is raised from 7½ to 10 per cent, the highest payment since 1936. After transferring £50,000, against £40,000, to general reserve and making the provision for staff funds, the carry forward is raised from £86,861 to £87,413. These remarkably successful results have been achieved at the cost of a marked reduction in stocks from £649,915 to £401,587. The rise in cash of nearly £400,000 to £759,729 is the result, partly,

of the fall in stocks, and, partly, of the reduction in loans to subsidiaries from £703,521 to £575,478. There is little change in debtors, or in the total of trade creditors and bills payable. After the latest transfer, general reserve stands at £680,000 against total fixed assets, excluding copyrights, of some £783,000. Odhams have clearly profited substantially by the enforced economy for which paper rationing is responsible. If the year's progress has been achieved by an expansion in sales, the advance may prove ephemeral. The 4s. ordinary shares at 6s. 6d. offer a yield of £6 8s. per cent.

Kaffir Dividends

The Kaffir dividend season is already almost complete. For the most part, the story has been one of general reduction, but not on an unexpected scale. The first announcements, those of the *Rand Mines-General Mining* group, in which there were only two falls, excluding the reduction in the *Crown Mines* dividend, from 7s. 6d. to 7s., which had been fully discounted, proved to be better than the

* Financial Year ends June 30.

average. Increases in dividend were made only by developing mines such as *Western Reefs*, or by concerns such as *Grootvlei* and *East Daggal*, to which special considerations apply. The reason for the general reduction is, of course, the higher war levy on gross profits, which was raised by the Union Government from 16 to 20 per cent from January 1st last. There have also been certain increases in costs. The result from the standpoint of the investor is that the announcements contained no shocks.

Philip Hill Investment Trust

The accounts of the Philip Hill concern, renamed and reconstituted as Philip Hill Investment Trust, with its financial business relegated to a subsidiary Philip Hill and Partners, in February last, show a rise in profits from £190,955 to £211,774 in the year to March 31, 1942. The purpose of the separation of function envisaged in the reconstitution of the business was discussed in a note in *The Economist* of January 12th last. The shareholders again receive 10 per cent, but, since there is a tax liability of £108,003 against nil, the rate of equity earnings amounts to only 13.0 against 26.4 per cent. There is no transfer to reserve for depreciation of investments, against £100,000,

so that it is still possible to raise the carry forward from £70,660 to £86,608. The balance sheet is not strictly comparable with that of a year ago since certain fixed assets and certain liabilities have been transferred to the financial subsidiary. The directors state that investment depreciation reserve, which stood in the previous account at £955,434, has been used as to £655,434 to provide income tax on appreciation and to write down investments, including those held by the financial subsidiary, to market value, while £300,000, no longer needed for these purposes, has been retransferred to general reserve. Investments now held by the Investment Trust stand at £3,350,994, of which the quoted securities, amounting to

£2,903,761, are below market value. General reserve at £1,200,000 against £700,000 has also received £200,000 from dividend equalisation fund. There is a substantial rise in total creditors from some £25,000 to £105,000, but bank overdraft is reduced from £335,973 to £50,412. Whether this is due to allocation of part of this liability to Philip Hill and Partners, to whom £96,681 has been lent, is not clear, and the position calls for the publication of a consolidated statement. As far as profits are concerned, the results appear to be as good as could be expected, and the directors state that some improvement in financial business is to be expected. The 5s. ordinary shares, at 10s. 9d. ex dividend, yield £4 13s. per cent.

Industry and Trade

Coal

The Government's plan for securing an expansion in the production of coal has been debated in the House of Commons; the Ministry of Fuel and Power has been set up and some of the leading officials appointed; and the Greene Committee has been at work to consider the application for higher wages, as well as the kind of machinery that will be required by the proposed national wages board. The new Ministry has already issued its first Order placing the registers of premises subject to the control of coal supplies in the hands of the local fuel overseers on July 1st. But the Government's actual production plans, as stated in the White Paper, in the debate in Parliament and in Ministerial utterances, have only been made public in outline. If they are to bring results within the next few months, a number of important details must be filled in without delay. For example, there are the labour and financial problems involved in the concentration of output on the most productive pits. What arrangements have been made to secure the transfer of workers from one pit to another and for the financial consequences to individual collieries whose output will be reduced? In the case of the latter, is the solution to be adopted an extension of the levy-compensation principle? Again, the problem of securing an increase in output is intimately related to the problem of transport. An expansion in output in districts inconveniently situated from the point of view of disposal would add to the difficulties of transport. The transport situation is such that a determined effort must be made to secure economies next winter. Then there is the question of coal prices, which affects both producers and consumers. Has the Treasury decided to shoulder the whole burden of any increase in wages that may be granted in response to the claim of the miners? And what is likely to be the effect on the industry's price structure of the proposed measures to secure a redistribution of output and of deliveries? These and many other problems require an early answer.

Miners' Welfare

All efforts to increase the output of coal will fail unless the proposals of the White Paper on welfare result in a marked improvement in miners' conditions. It is a commonplace that coal-mining is arduous, dangerous and distasteful work. But it is too little realised that wartime has added special disadvantages of feeding, clothing and heating, disadvantages which, in the peculiar conditions of coal-mining, are more obvious in this industry than in almost any other. Every effort should be made, when the drive for more output is set on foot, to provide for the miner, in the right quantities and qualities, the food, clothing and fuel he needs to do his work properly. At present, there are serious disparities between districts. Moreover, a new effort should be made to conquer older-established disabilities. It is laid down in the White Paper that the proposed Coal Board

should consider such particular questions as occupational diseases

with a view to providing all possible preventive measures, clinical treatment and rehabilitation.

These matters have been trifled with for too long. A departmental committee dealt with the disease of nystagmus shortly before the war. Its recommendations remain a dead letter. Now, at a time when every miner has an immense value in the war effort, it is a fact of vital importance that, when this Committee did its work, out of a sample of 600,000 men employed in mines, 4,071 were partially incapacitated by nystagmus—and, of them, 2,318, or 57 per cent, had no work at that time. Nystagmus is not a dangerous injury. It is an ocular disorder, and can perfectly well be handled, medically and occupationally, if the right means are adopted. The main obstacle to proper treatment and to the employment of miners afflicted with this disorder is the fear of employers that there may be difficulties about accident insurance, under workman's compensation, if these men are further incapacitated. The Departmental Committee recommended that

unless the Mining Association can give an assurance on behalf of employers generally, we think that the Home Office should seek a definite undertaking from the employers in each district that they will do their utmost to re-employ men who have suffered from nystagmus when they are certified, or agreed, to be fit, either for their old work or for suitable work above or below ground.

Actually, it is doubtful whether exhortation is sufficient. The new National Coal Board, with regional boards, composed of representatives of both owners and miners, may be the ideal instrument for seeing that no nystagmic miner who could be employed or rehabilitated should remain idle, simply because of fears about insurance. This urgent necessity does not only apply to nystagmus. It applies to all the diseases which are the miners' constant companions, diseases which, by proper methods of cure and rehabilitation and by a sensible selection of occupational opportunities can be immensely restricted in their effects. The miner is worthy not only of his hire but also of his proper welfare. Mine owners should be under an obligation both to instal and maintain pithead baths; 28 per cent of colliery owners in fact do nothing about the maintenance of pithead baths, the cost of which has to be defrayed entirely by weekly subscriptions paid by the miners themselves—sometimes up to 6d. a week. Without all these measures to further miners' welfare, no amount of organisation and no amount of appeals will solve the coal problem adequately.

Petrol Rations

Last March, the Government decided to abolish the basic petrol ration for private cars at the end of this month. As in the case of commercial vehicles, petrol for private cars will continue to be available, but applicants must prove that they need it for essential purposes and that no alternative means of transport are available. It is to be hoped that the test will be strict and that, for example, no more petrol will be issued for business journeys which can be made by bus, coach or train. There is a modicum of justification in the agitation designed to secure permission for private car owners to use up any savings they may have made out of their basic ration after June 30th. But some fantastic arguments have been adduced in support of the demand for an extension; they even include appeals to the taxation of cars other-

wise likely to be laid up on July 1st. Subject to a few days' grace, the only answer to these demands is that the notice given by the Government to the public has been long enough—too long in view of the urgent need to economise petrol. To allow a month's grace, as the Government has decided to do, merely shows that it has once more yielded to a vocal minority.

AEU Production Inquiry

The results of an inquiry into hold-ups in production in munition factories and shipyards carried out by the Amalgamated Engineering Union during February-March,

CAUSES OF HOLD-UPS IN PRODUCTION

this year, are discussed on page 852. They are based on a sample comprising 740 establishments, and 882,000 workers. The accompanying table shows the nature of the complaints

THE COMMUNITY FIRST

The Free Trade Legion stands for more freedom of trade within our own borders as well as Free Trade in relation to other countries. It has for long been evident that an unwillingness to accept adjustments when required in our internal economy was one of the prime causes of difficulty in providing goods for export at prices which overseas buyers could afford to pay.

A principal cause of that increased rigidity in the Nation's economy was the constant demand by organised sections of manufacturers and workpeople for bigger rewards for their services. They persisted in those demands regardless of the value of the services they rendered with the result that the unorganised sections often received less than they were entitled to and the Nation's competitive power suffered in consequence.

Under pressure of this kind the system of Free Trade which had contributed enormously to the well-being of our people and to the welfare of all mankind, was abandoned. Rather than permit natural internal adjustments stability of the currency was also sacrificed.

Some believed that currency depreciation in itself would bring correction, but it failed. Instead of doing so, instability plus tariffs lost for the Nation large and valuable sources of income. Our earnings from shipping, insurance, banking, investment and from our great free commodity markets declined. Those earnings based on the character of our people and confidence in our money benefited all our people either directly or through social services. They can only be recovered by a return to proved principles and Free Trade.

Send for and sign the Manifesto of the Free Trade Legion, 38, Bedford Street, Strand, W.C.2. Get also "The Moral Case for Free Trade" and "The Price We Pay", both sevenpence each Post Free.

Protection is the root cause of unessential bureaucracy. Free Trade is the policy under which a vast bureaucracy cannot exist.

THE FREE TRADE LEGION WORKS FOR ALL THE WORKERS.

made, and the establishments from which they were reported, both in actual numbers and as a proportion of the total number covered by the inquiry. A distinction is made between establishments which had, and those which had not, set up production committees at the time of the investigation. The analysis gives a broad picture not only of the nature, but also of the relative importance of the various defects as seen by the workers who made the returns to the AEU.

Piece-Rates in Building

In view of the fact that Great Britain's manpower is now almost fully mobilised, the need for increasing the yield per man-hour has become urgent. In the main the problem is one of securing a more efficient and intelligent utilisation of the factors of production. It is the principal remedy on which the Government relies for an expansion in the output of coal. The intensity of work is only one, though in many industries important, aspect of the problem. In the building industry, for example, the introduction, in July last year, of a system of payment by results under the Essential Work (Building and Civil Engineering) Order, 1941, is understood to have led to an appreciable improvement in output. One of the conditions which have to be fulfilled before the Order can be applied to an undertaking is that, where practicable and desirable, arrangements must be made for remuneration to be calculated on a system of payment by results. In view of the success of the scheme, certain modifications have recently been introduced as a result of recommendations made by a joint advisory panel composed of representatives of employers' and workers' organisations. Broadly, bonuses, calculated on an hourly basis, are payable in addition to time rates for work in excess of basic output in respect of some twenty operations. Bonusing is normally by gangs, a principle which is to be applied wherever possible. The scheme applies only to sites scheduled under the Essential Work Order. So far as non-scheduled sites are concerned, builders and contractors are required, as a condition of holding their certificate of registration, without which it is illegal to carry on work, to observe the hours and conditions of employment determined by joint agreement in the industry, or by arbitration.

The events of recent years have shown that the attempts to correct unsound tendencies in our economy by unnatural methods involving huge national expenditure have not merely failed but have prolonged the period of great unemployment and undermined our basic industries. The proper remedy was to secure by agreement the elimination of uncommercial international debts and to allow Natural forces to operate. If, after the elimination of uncommercial debts we had returned to the methods adopted before 1914, a depression in business would have resulted in healthy bankruptcies providing opportunities for new growth. There would be periods of unemployment and of wage reductions, but because of the willingness to accept adjustments those phases would quickly pass and prosperity would revive.

By looking into the past we can see our way for the future. The time is coming when it will be essential to permit the revival of internal competition and to allow all men to secure the rewards of merit. Organised sectional interests must give way to the interests of the multitude of individuals who form the whole community.

The selfish interests of sections of manufacturers or labourers as represented by trade associations or trade unions must give way to the right of all men to offer their services in the market place and the right of all children to learn a trade or profession regardless of the interests of those already employed. Only in this way can the Nation's earning power be revived. The alternative will be one causing great hardship to the mass of the people.

The Free Trade Legion urges all clear thinking men to support its "Community First Campaign."

FAMOUS SINCE 1795

OTARD'S

COGNAC BRANDY

COMPANY MEETINGS

FORESTAL LAND, TIMBER AND RAILWAYS COMPANY, LIMITED

SATISFACTORY RESULTS

The meeting of the Forestal Land, Timber and Railways Company, Limited, is to be held on the 9th proximo.

The following is an extract from the statement of the vice-chairman of the company, Mr Louis H. Kiek, which has been circulated with the report and accounts:—

If, amid the stress and turmoil of the ever-extending conflagration, we have again been fortunate enough to present to you a satisfactory record of the year's operations, we may, without disparagement of the excellent work done by all at home and overseas, ascribe the result primarily to Mr Sullivan's own unremitting efforts in the well considered interest of the industry, of our customers, and of the Governments concerned, to solve problems of extreme difficulty and delicacy arising from the war.

INNUMERABLE DIFFICULTIES

The conditions under which our widespread business is now being conducted preclude my broadcasting statistical or other items of information which would normally be of interest to you. Suffice it to say that, in the face of innumerable difficulties, not the least of which were the periods of scarcity of cargo space, the total volume of sales has been maintained on as satisfactory a level as we could have reasonably expected. This applies to quebracho extract from Argentina, as well as to wattle extract from South Africa, both tanning materials of acknowledged importance and value to the Allies' war effort.

The accounts provide an instructive illustration of the successful completion of a stage in the financial programme envisaged at the time of the formation in 1931 of La Forestal Argentina, when all our Argentine assets were, for reasons fully explained at the time, transferred to that company.

The London profit and loss account has further benefited from a reduction, partly due to inter-office readjustments, of about £6,000 in London administration charges, and of £5,000 in expenses on our Harpenden Laboratories. The repayment in December, 1940, of the balance then outstanding of this company's 4½ per Cent. Notes has produced a further saving of close upon £40,000 compared with the year 1940. We show a net profit for the year, subject to taxation and other appropriations, of £593,683, against a corresponding figure of £512,880 for the preceding year.

The utilisation of the Argentine Company's divisible profits for the purpose of Debenture redemption and the corresponding book transfers in London from depreciation reserves to profit and loss account having now ceased, your company becomes liable in consequence to an increased charge for income-tax. We compute our total tax liability on all profits earned for the year to December 31st last at about £250,000, for which provision has been made. We have also placed a further £50,000 to the general reserve. After these allocations there is a balance of £293,683, at the disposal of this meeting, increased to a total of £428,158 by the sum of £134,475 brought in from last year.

A year's dividend on our 6 per Cent. Preference stock, already paid, requiring £112,000, and a final dividend of 3 per cent, as well as a cash bonus of 3 per cent, which we recommend for your approval, making, with the 3 per cent, interim distribution, a total of 9 per cent., less tax, on our Ordinary stock, will leave £149,309 to be carried forward to the current year's account, an increase of £14,834 on the sum brought in.

INCREASED LIQUID RESOURCES

It has always been an object of our special concern to maintain and, whenever possible, increase the financial strength of this company and of the Forestal group of companies. A glance at our own and at the consolidated balance-sheet will satisfy you that we have entered the current year with a further marked increase in our liquid resources, a situation which will enable us to face the post-war developments with added confidence. I may add that since the date of this balance-sheet, our already substantial subscriptions to war loans have been further increased, and that, in anticipation of our tax payments, we have invested important sums in tax reserve certificates.

FORSTER'S GLASS COMPANY, LIMITED
SATISFACTORY RESULTS

The twenty-third annual general meeting of Forster's Glass Company, Limited will be held at the May Fair Hotel, Berkeley Square, London, W., on the 23rd instant.

The following is an extract from a review by the chairman, Colonel Charles E. Ponsonby, T.D., M.P., circulated with the report and accounts: The net profit for the year is not very different from that of last year. This is very satisfactory, especially in view of the fact that during the past twelve months there have been many difficulties to contend with. Fortunately, owing to the fact that our plant has been employed to full capacity and goods manufactured have been delivered immediately to customers without the necessity for storage or additional handling, we have been able to carry the increased costs without increasing the sale price except in a few exceptional cases. If, however, it is found necessary to reduce the volume of production, this will certainly have an immediate effect on the profits we are earning, and may possibly necessitate an increase in sale price.

The amount available for distribution is £46,668, and out of this sum £5,000 (the same as last year) has been transferred to reserve account, bringing this account up to £120,000, and out of the remainder of £41,668 the directors recommend a distribution of a dividend of 10 per cent. and a cash bonus of 5 per cent. on the ordinary shares, both less income-tax, making a total distribution of 15 per cent., also the same as last year, leaving a balance of £16,996 to be carried forward to next year.

You will notice that of the 5 per Cent. Mortgage Debenture stock there is now only £7,000 outstanding, and that the 6 per Cent. Second Mortgage Debentures have disappeared from the balance-sheet. These Debentures were held by our friends, Messrs. Watney, Combe, Reid and Company, Limited, and as a result of the agreement to redeem them and issue the ordinary shares, the trading agreement which has been in existence between the two firms for some years has been extended for a further period of years.

As far as the present year is concerned, I can only say that so far production and sales are keeping up to the peak achieved during last year.

KONONGO GOLD MINES, LIMITED
PROFITS CUT BY TAXATION

The eighth ordinary general meeting of Konongo Gold Mines, Limited, was held, on the 16th instant, at the Institute of Chartered Accountants, Moorgate Place, London.

Mr Robert Annan, M.Inst.M.M., chairman of the company, presided.

The following is an extract from the statement by the chairman which was issued with the report and accounts for the year ended September 30, 1941:—

After providing for taxation and depreciation, the net profit, at £44,170, is less than half of that shown in the previous year. This position is due to the increase in taxation, particularly in excess profits tax, amounting to 100 per cent. on the accounts now presented as compared with 80 per cent. in the previous year.

The chairman then stated: Since the report was issued the Chancellor of the Exchequer has announced his decision not to give any substantial relief to the mining industry from the burden of excess profits tax.

In our particular case the price of gold has risen since 1939 by 14s. per ounce, of which the Colony takes half in additional export tax. Our output was therefore worth about £23,000 more than at pre-war prices, but our production costs, owing entirely to war conditions, have risen by almost £40,000.

Our true excess profit is therefore a minus quantity, but because we have doubled the rate of output since the standard year, which was our first year of production, we must pay over £58,000 to the Revenue. No one can protest against heavy taxation in support of the war effort—it is the inequality of incidence to which we object.

On the other hand, development of the mine continues to give good results. In the first six months of the current financial year 1,294 ft. of driving on the main Odumase Vein averaged 20.4 dwt. over a width of 48 in., with additional payable stretches on branch veins.

The Odumase Shaft had reached a depth of 1,450 ft. at the end of March, and sinking will be continued if the Government will permit us to import the necessary material.

The report and accounts were adopted.

EAGLE STAR INSURANCE COMPANY, LIMITED

PREMIUM INCOME EXCEEDS £5,000,000

The annual general meeting of the Eagle Star Insurance Company, Limited, will be held in London on the 25th instant.

The following are extracts from the statement by the chairman, Sir Edward M. Mountain, Bart., circulated with the report and accounts:—

Life Department: New life assurances were completed during 1941 for a net amount of £12,317,711—a substantial increase over the preceding year. The already moderate expenses show a further decrease.

Fire Department: The net premiums increased to £896,108, showing a profit of £72,000.

Accident and General Insurance Accounts: The premium income increased to £886,498 (including employers' liability) and the account yielded a profit of £117,000.

Employers' Liability Account: There has been an increase in the premium income of this department, largely contributed to by adjustments of premiums in connection with risks already expired. Claims paid amounted to £133,597, reserve for unexpired risks is provided on the usual basis of 40 per cent. of the premium income for the year. A small profit amounting to £3,000 is carried to the profit and loss account.

Motor Department: The premiums for the year amounted to £1,185,225, an increase of £109,468, and £35,000 was transferred to profit and loss account.

Marine Department: With £638,779 brought forward, and net premiums of £545,374, an amount of £50,000 was transferred to profit and loss account. The marine fund now stands at £711,512, representing 130.46 per cent. of the premium income.

Profit and Loss Account: Once again interest earnings plus trustee and other fees more than cover the total dividend payments. The balance brought forward from last year was £523,273, while interest earnings, Trustee and other fees and departmental profits amounted to £525,537, giving a total on the credit side of £1,048,810. The balance carried forward is increased to £554,254. The total premium income now exceeds £5,000,000 per annum.

At the Annual General Meeting of the
LONDON & MANCHESTER ASSURANCE COMPANY LTD

The Chairman, Mr A. H. Dawes, made these striking statements:—

- ★ Since the outbreak of war to the 24th March last the total amount subscribed to the new War Loans was over £2,750,000.
- ★ Our total holding of British Government Securities amounted to £8,396,536 and represented 42% of our Stock Exchange investments.
- ★ As compared with the previous year the total premium income, £3,674,370, shows the substantial increase of £164,534 while the funds increased by the record sum of £1,361,378 to £23,722,206.
- ★ In the Ordinary Branch the premium income reached the record figure of £1,500,272. Matured endowments totalled £619,606.
- ★ In the Industrial Branch a noteworthy feature is that for the first time the premium income exceeded Two Million Pounds.
- ★ In the Ordinary Branch it has been decided to pay on participating policies which become claims interim bonus at the rate of £1% per annum on the sum assured.

CHIEF OFFICE
50, FINSBURY SQUARE, LONDON, E.C.2. ©

RIO DE JANEIRO CITY IMPROVEMENTS COMPANY, LIMITED

The eighth ordinary general meeting of the Rio de Janeiro City Improvements Company, Limited, was held on 18th instant in London.

Colonel C. E. Ponsonby, who presided, said that under the agreement with the Government signed on March 2nd, 1937, the drainage rent was subject to revision after the end of 1939. He had no further information to give them, and, as the matter was still *sub judice*, it was not expedient to discuss the provisions of the proposed new agreement.

Last year he had called attention to the immense sum they had in Rio awaiting remittance. They had now been able to remit all their available currency. The heavy tax payable in Brazil on remittances and the increasing costs of materials and wages were responsible for the fall in their balance of revenue.

Although their net profits for the year were some £5,600 less than last year, the board had resolved to recommend the same dividend of 3¼ per cent. free of tax.

The report was adopted.

CHIEF ADMINISTRATION: ALDWYCH HOUSE, LONDON, W.C.2

General Manager: VERNON E. BOYS

BRITISH TIMKEN LIMITED

EXPANDED SCOPE OF OPERATIONS

MR JOHN PASCOE ON RECONSTRUCTION

The twenty-second annual general meeting of British Timken, Limited, was held, on the 17th instant, at the registered office of the company in Birmingham.

Mr John Pascoe, deputy chairman, said: Our chairman, Mr Michael Dewar, is still in the United States on behalf of the Ministry of Supply. I am sure you will wish me to convey to him our continued good wishes for the success of his work.

The profit for 1941, at £108,924 before taxation, was some £400 lower than for 1940 and is well below our E.P.T. standard.

Your directors propose to transfer to contingency reserve the same amount as last year, namely £20,000, and to pay the same dividend, namely 15 per cent., less tax, on the 400,000 ordinary shares, leaving to be carried forward the sum of £24,634.

The balance-sheet clearly reflects the greatly expanded scope of our company's operations, which has necessitated considerable assistance from the company's bankers, but the balance of current assets over current liabilities indicates that the essential strength of the company's financial position has been more than preserved. The contingency reserve now stands at £40,000.

NEED FOR RESERVES

Your board fear that at the end of the war the task of adapting ourselves to peacetime conditions and fitting ourselves for the struggle which must then lie before us may be heavy, and, although the Government should be thoroughly alive to the essential needs of the manufacturing units on which the standard of living in the country has depended and will always depend, the board regard the building up of the contingency reserves as of the utmost importance.

I should like to commend to shareholders the Federation of British Industries' report on "Reconstruction," in which are set out the considered views of industry as to the main problems which will need solution in the post-war period.

Your subsidiary company, Fischer Bearings Company, Limited, has had a satisfactory first year under our ownership and is continuing to increase its contribution to the needs of industry.

LOYAL STAFF AND WORKERS

The staff and workpeople of the company have continued, with the corresponding personnel of Fischer Bearings Company, Limited, to work long hours under trying conditions. Their output and spirits are high and are going higher, and they can be relied upon to continue to play their part in full measure.

The report and accounts were unanimously adopted, the retiring director, Mr A. J. M. Duncan, was re-elected, and votes of thanks to the directors, staff and workers were passed.

ARGENTINE ESTATES OF BOVRIL LIMITED

LORD LUKE ON IMPROVED ESTANCIA RESULTS

Presiding at the thirty-fourth annual general meeting of Argentine Estates of Bovril, Limited, held in London on the 16th instant, the Lord Luke, K.B.E. (chairman), after dealing with the financial statement, said that owing to the improvement in cattle values their estancias had done well. Higher prices had not only been paid for beef for export but also by the local butchers' market. Before the war, the Argentine used to consume well over 70 per cent. of its beef at home and export the rest—those proportions might have shifted a bit owing to the demand for export, which keen demand had raised cattle values even beyond those of the last war.

The export of South American beef was, of course, very largely to this country, and when one considered that those in the Services were getting on an average two to three times the beef they used to eat at home, and that owing to good wages a large section of the population must be eating more beef than they ever did before, it was, he considered, a great achievement by the Ministry of Food to keep up these full supplies throughout the country.

The fact was that reasonably priced beef could only be produced in the huge pasture lands of the Southern Hemisphere, but cattle could not be grown in a hurry like an annual crop and if one bought from farmers 2½ years' output in two years, one took away his reserve of older stock and left him unfilled pasturage, a condition in which he could say that he would have a good price or let his stock out on, say, another six months' or even a year's growth.

When it was realized that they were farming well over a million acres carrying a quarter-million head of cattle, it was obvious that they were not over remunerated for the large capital they had expended on their estates and factories. They also still have some 50,000 acres under cultivation, worked mostly by colonists on shares with them, but owing to a somewhat poor harvest and to the low prices, particularly of maize, at about £3 a ton, their share of the crops did not cover the land taxes, etc., they had to pay.

RECORDS and STATISTICS

STOCK EXCHANGES
London

Note: all dealings are for cash

The uncertain position in Libya and in Russia has brought to an abrupt close the recent optimistic upward movement, and throughout the markets a slight recession in prices has been registered. Turnover, however, has been slightly lower and the actual volume of stock coming on to the market is insufficient markedly to affect prices. Turnover in the gilt-edged market was rather low and with most buyers holding off, small declines reflected some light selling. Thus, old Consols fell ½ on Tuesday, when both Local Loans and ½ per cent War Loan eased ½, but in contrast, short-dated issues were steady throughout. Quiet conditions prevailed in the foreign bond market, where among South American stocks Brazilian and Chilean issues weakened slightly on lack of support. Events in Libya occasioned some weakness in Egyptian bonds, the 4 per cent Unified issue falling 2 points on Tuesday. Peruvian Corporation stocks were outstandingly firm at the weekend on some light demand, the 5 per cent

preference and the debenture rising a point. The home rail market suffered from lack of interest, and both junior and senior stocks were marked down from ½ to ½ point at the reopening. The following day further small declines, among them a loss of ½ for GW ordinary, were registered. Prices in the foreign rail market were generally steady. After further declines markets strengthened a trifle, although there was no improvement in the news. British and Foreign bonds were scarcely affected but the home rail market was firm.

The tone in the industrial market has been slightly easier, and in the absence of support prices in most sections have tended to weaken. Among brewery shares both losses and gains were slight at the reopening, although on Tuesday Distillers, Guinness and Bass all weakened slightly, among others. In the tobacco group BAT was persistently weak, losing ½ on Monday when Imps repeated an earlier loss of ½, while the following day BAT lost another ½ and Godfrey Phillips ½. Among motor and aircraft shares, losses of ½ for Rolls-Royce and Leyland on Tuesday reflected the general trend, although De Havilland gained 1s. at the reopening. The feature

of a generally quiet but irregular heavy industrial section was the demand for Richard Thomas issues, the ordinary and preference both advancing, although the latter reacted slightly on Tuesday. The shipping market was dull, and among generally small losses Union Castle fell 1s. 1½d. on Tuesday, but the Court Line remained unchanged on the annual report. Widespread but small persistent losses were suffered by textile issues in the absence of buyers but in no case were the total declines large. In the stores section Woolworth and Marks and Spencer among other issues both eased to lower levels. The miscellaneous group reflected the general trend to lower levels, and among leading issues Boots, Turner and Newall, Spillers and Wall Paper deferred all weakened. Boots losing 1s. before the week-end and a further 6d. on Tuesday. In midweek conditions became steady with a 6s. rise in Allied Iron on the higher dividend.

Activity in the Kaffir market before the week-end was restricted to light investment demand, but while the publication of the reduced half-yearly dividends exerted a depressing influence at the reopening the largest decline was a fall of ½ for Sub

Nigel. Conditions on Tuesday were quiet, except for a fall of 2s. 3d. for Libanon on the decision to close the mine for the duration of the war. Lack of support in the rubber market led to some marking down. In the current week, the oil market reflected the course of events in Libya. With buyers holding off, leading issues were marked down, Anglo-Iranian showing a fall of ½, and Shell ½ on Tuesday, after the previous day's losses of ¾. Ultramar was sold and lost 2s. on Tuesday. In midweek the only appreciable change was a firmer tone in the oil market.

New York

In view of the rather mixed reports about the war situation there was little incentive

on Wall Street. The small but general decline last Friday was partially recovered the next day, while in the early part of the current week selective buying occasioned some scattered gains. Later price rises up to a point occurred, with some increase in activity.

COMMODITY AND INDUSTRY NEWS

(a) for delivery before September 1, 1942, for application either to growing crops or to crops sown or planted before September 1, 1942, or—in the case of basic slag—to crops sown or planted before January 1, 1943.

(b) under the authority of a permit issued by a County War Agricultural Executive Committee.

(c) under the authority of a licence issued by the Minister of Supply.

Oils and Oilseeds.—Indian shippers continue to offer linseed and ground nuts for West Coast shipment, but Calcutta is still out of the market. Supplies of Indian linseed are likely to be smaller since the out-turn of the new crop has not come up to expectations. With a reduction of 8 per cent in the acreage sown, the estimated yield is 17 per cent smaller, at 361,000, compared with 434,000 tons last season. The Argentine Grain Board is making strenuous efforts to dispose of the huge exportable surplus of linseed and has reduced the price to exporters from \$20.40 to \$19 per 100 kilos, ex dock. Exports from the River Plate since January 1st have been only 215,000 tons, against 240,000 tons in the January-May period, and the proportion for Europe 23,000 tons, against 53,000 tons. The outlook for next season's crop is unsatisfactory. Excessive dryness is reported to have hampered ploughing of the soil in many linseed-growing districts.

Flints Maximum Prices.—The Board of Trade has made the Flints for Lighters (Maximum Price) Order (S.R. and O. No. 1065) after consultation with the Central Price Regulation Committee. The Order divides flints into three classes: pocket

Finance

GOVERNMENT RETURNS

For the week ended June 13, 1942, total ordinary revenue was £43,021,000, against ordinary expenditure of £97,654,000, and issues to sinking funds of £150,000. Thus, including sinking fund allocations of £1,433,155, the deficit accrued since April 1st is £607,574,000 against £633,553,000 for the corresponding period a year ago.

of America how great the scale of British war production had become. He picked out the present large output of guns. The Libyan campaign was an ironical postscript. The Imperial forces were outgunned as well as outgeneralled. Quality in the manufacture of arms is still even more important than quantity. It is of little use to the Allied cause that guns are made in tens of thousands, if those guns are not comparable on the battlefield with the guns of the enemy. It is not far short of a scandal that the tank and anti-tank armament of the British forces in Libya was so far behind the equipment of the enemy. There were improved guns in the field, but they were few in number, and even these were not equal to the best weapons of the enemy. The American material and equipment which went into action was good but well behind the German. Mr Lyttelton's main task, as Minister of Production in this country and as spokesman for British war production in the United States, has been to bring production programmes and strategic plans into line. It is no less needful to bring production into line with tactical requirements. Two weeks ago, instead of two years ago, a reorganisation was carried through at the War Office to secure the closest possible interconnection between industry and the most recent developments in science and military design. The lack of this relation was suffered by the gallant troops who were beaten in Libya; even their best weapons were devised two or more years ago. In the air, where British design and technique have held first place since the war started, the enemy, though outnumbered, was able to secure the advantage when the critical moments of the Libyan fighting came. No invasion of Europe could succeed in similar conditions of technical inferiority.

At the moment when Tobruk fell, Mr Churchill and Mr Roosevelt were in conference in the United States, with their military advisers, to secure "the earliest possible maximum of concentration of Allied war power against the enemy." Their spokesman, Mr Harry Hopkins, spoke of the "ring of steel" which was being forged around the Axis; he boasted of the second, third, and fourth fronts which were to be established; and he proclaimed that "Hitler's cities would be destroyed one by one." Then came Tobruk, the plainest possible temptation to divert men and material from whatever new fronts the Allied leaders may have decided upon. The enemy has not lost the initiative. By his stroke in Libya and by his threat to Sebastopol, he has forced the makers of Allied strategy to think again in terms of defence, rather than of attack. Egypt and the Suez Canal must be held. Palestine, Syria, Iraq and Iran must be kept safe against the invader. On the Egyptian frontier, and behind, stands the battered Eighth Army. Further east, in Palestine, Syria and the Middle East, the Ninth and Tenth Armies are stationed. Confronting these forces, on an arc from Sebastopol to Tobruk, through the Balkans, the Aegean Islands and Crete, stand the land and air forces of the German *Wehrmacht*. A choice has to be made by the Allied leaders. Is, say, the Ninth Army to move west to aid the Eighth? Is Egypt or Turkey to be the avenue of German attack? These are decisions which must be made on the instant, because no amount of reinforcement and supplies, over the many thousands of miles between the American and British arsenals and these battlefronts, can affect the course of the imminent fighting. Once again, the enemy, blockaded and inferior in productive strength, has shown the virtue in strategy of standing on interior lines with shorter distances over which to carry men and supplies. The loss of Libya means that, once more, the defenders of vital Allied bastions have been caught on the wrong foot.

Nevertheless, there is no need or cause for despair. Pessimism, like optimism, tends to come in waves of exaggeration. Opinion is too unstable. The elements of victory are unaffected; the superior strength of the Allies is still a fact. There is no reason in the new defeat to relax plans for the massed bombing of German cities. There is no reason to abate the determination, which has been expressed in the agreements

between Britain and the United States and Soviet Russia, and which is being worked out in the United States, to concentrate the vast products of British and American war industry against the hemmed-in enemy. In this context, Tobruk means two things. It means, first, that the proportion of strength needed to hold Egypt, the Mediterranean, the Levant and the Middle East will be greater than seemed likely a few days ago. It underlines, secondly, that the mounting war output of Britain and the United States will be useless in the field, unless its quality is high enough to match the ingenious equipment of the enemy, unless it can be deployed and disposed in the right places at the right time, and unless it is managed and manipulated with a military skill equal to that of the enemy's picked generals. Victory is still certain, if the apparatus of victory, which is now being put together, can be properly used.

This is a crisis of leadership, as well as of confidence. The two go together. Mr Churchill is still the only possible leader; and a Parliament which sought to bring him down might well bring down Parliament itself. Mr Churchill, as Defence Minister, will willingly bear responsibility for the decisions that have gone awry. As Prime Minister he must, in any case, carry the ultimate burdens of strategic policy; and the War Cabinet shares them with him collectively. But the Prime Minister has said himself that the day-to-day conduct of the war remains in the hands of the professionals. More than ever, there is a case for asking whether the tripartite Chiefs of Staffs Committee is a proper director of strategy; and for demanding that a Commander-in-Chief, untied to any single Service, should be appointed with a Great General Staff, chosen to take a three-Service view of military requirements. Nor is this to ask for an unknown superman; it was General Wavell who laid down before the war that command in modern fighting must rest, first, upon a grasp of "logistics"—the study of movement, supply, transport and distances—and, secondly, upon the single combined employment of all three arms.

This explosion of Allied opinion will spend its force. There will be cries for redress. There will be excuses and explanations. It is right and just that the present volume of criticism should be given voice. It may purge away the perplexity of the public. It will warn the leaders of Allied strategy that misadventures, accepted when weakness was the mark of Allied equipment, will not be taken for granted when superiority in output and material is claimed. The implications of Tobruk in terms of world war and strategy can be exaggerated. The implications of the defeat in terms of world opinion should be carefully marked. Morale in Britain would have suffered a serious perhaps irreparable decline, were it not that a majority of the people still believes in the decisive effects of bombing and in the imminence of a Second Front. Bombing there must be to the utmost limits of practicability. A Second Front there must be, as soon as the chances of military success in Western Europe seem reasonable.

But the people of Britain and the United States, and the struggling peoples of occupied Europe, must not be led up the garden. They must be called anew to blood and sweat and toil. They must not be given a seemingly sure hope and a seemingly sure date for their deliverance, if the chances are that events may not work out so well. There is no surer way to break confidence than to break promises, implied or openly stated. The best reply to Rommel's success in Africa and the best riposte to the German probing of Russia's defences will indeed be assaults upon the long-stretched frontiers of German Europe from the air, from the sea and on land in growing strength. The way to stem a run upon the banks is to issue credit freely. So, too, can confidence be rehabilitated now only by audacity and by the successes in the air and the land attacks which have been so freely promised. But the attacks must be successful. The only way to restore the confidence that has been shaken by lost battles is to win battles. Even in this country, which withstood alone the fierce blasts of 1940 and 1941, hope will pine without glory.

Russia and the World

THE provisions of the Anglo-Soviet Treaty and the Washington Agreement between the United States and the Soviet Union go far beyond the immediate issues of the war. The Preamble and Article V of the Treaty look forward to the day when Britain and Russia can

work together in close and friendly collaboration after the re-establishment of peace for the organisation of security and economic prosperity in Europe.

Article VII of the Lend-Lease master agreement, signed by both Britain and Russia with the United States, lays it down that the final settlement

shall be such as not to burden commerce between the two countries, but to promote mutually advantageous economic relations between them and the betterment of world-wide economic relations.

In the exhilarating atmosphere of common danger, with battles to be lost and won together, this assumption of political and economic collaboration between Russia and the rest of the world may seem obvious—even inevitable. It is very important, however, to remember that the assumption constitutes a departure from pre-war practice as great as Lend-Lease itself. Neither politically nor economically did Russia systematically co-operate with the West, or the West with Russia, between the Revolution and June, 1941. At times, non-co-operation went as far as the actual severance of all diplomatic and economic links. If a new chapter is indeed to be written into the relations of Russia, Britain and the United States, some more positive effort is needed than simply to rely upon the brotherhood in arms developing into a comradeship in peace. The obstacles which so obstructed collaboration before must be discussed, understood and exorcised.

Fear is the worst possible basis for any relationship, between people or between states, and the relations of the Soviet Union with the English-speaking world before the war were dominated by a profound mistrust. That the feeling was mutual did not make co-operation more easy. The first question now is whether there are grounds for supposing that this underlying psychological tension for which the war is over. On the Russian side, it was rooted in the Marxist interpretation of the particular stage of history in which the Revolution happened—an interpretation which the Allies corroborated by supporting first Kerensky and then the White Russians. Archangel seemed to give positive evidence that capitalist governments inevitably behaved as Marx had prophesied they would behave towards a communist state in the making. The innate and permanent hostility of capitalist governments was common ground between the Trotskyite revolutionaries who, on account of this hostility,

wanted world revolution, and the socialism-in-a-single-state revolutionaries, who, on account of the same hostility, wanted to concentrate on making Russia totally independent of the outside world in economy and defence. For twenty years, the Russian people lived in a state of complete psychological isolation. The world outside was hostile and capitalist. The gigantic sacrifices entailed by the Five-Year Plans and the preparations for defence were all emotionally buttressed on the fear of a capitalist attack.

The developments of the inter-war years and, above all, of the latest war have made nonsense of the Marxist interpretation, and provided evidence of its falsity so tangible that it is doubtful whether it can ever again have so strong an emotional hold. The aggressive nations have proved to be not the two oldest established or most powerful capitalist countries, Britain and the United States. On the contrary, neither has been one quarter aggressive enough. It was Russia's two powerful neighbours, Japan and Germany, both traditional autocracies in which the independence of military power had never been properly broken, who finally launched the world into war—and in neither case was Russia the first victim. The turn of the other "capitalists" came first. Thus, by the time Russia was attacked, capitalism, in the shape of an RAF wing or the Valentine tank or the Kittyhawk fighter or £750,000,000 of Lend-Lease credits, came to its aid. And there is no doubt that the deepest reaction of the Soviet people to the new circumstances has been profound relief at the end of their isolation.

If capitalist aggression has been the bogey of American and Anglo-Soviet relations on the Russian side, Communist infiltration has served the same unhappy purpose at the English-speaking end. The question is: can there be any weakening or dispelling of this bogey comparable to the explosion by the events of the war of the myth of aggressive capitalism? There is a high degree of probability that the destruction of the first legend will radically affect the other. So long as the Soviet Government was convinced of the underlying hostility of the surrounding world, it made the fullest possible use of the Comintern and the various national Communist parties in its general defence strategy. Until 1934, the policy was that, since all states were equally suspect, the local Communists should be used to disrupt and weaken their governments. In 1935, the growing gulf between "capitalism" in Germany, Japan and Italy and the capitalism of the rest of the world induced the Soviet Union to revise its policy. The Popular Front period was initiated, and the local parties worked for the unity of all anti-Fascist groups. When the non-co-operative policy of Britain and France broke up the Popular Front, the

Russians turned to direct negotiations with the Germans, and, from the German-Soviet Pact until the dawn of Hitler's invasion of Russia, the local Communist parties crusaded for a People's Peace to end the "imperialist war." Since the invasion of Russia, they have naturally swung again to full collaboration with the governments resisting German aggression. Obviously, it is not doctrine or the desire for revolution that has determined the policy of local Communists, but simply the national strategy of Russia. It follows that if the Soviet Government is rid of its fear of the West, and therefore of any wish to undermine the Governments of Britain and the United States, local Communists will remain as generally co-operative as they are at present in the war effort. These facts do not, of course, dismiss the further fact that Communism is also a protest against evil social and economic conditions. But this is not a problem of the state of Britain's relations with Russia, but of the state of Britain.

Such were the chief obstacles to political collaboration. The obstacles in the economic sphere were to a large extent a function of these deeper difficulties. In any case, it is false, when thinking of Russian policy, to distinguish between economics and politics. Economics are politics. Russia's trade relations with the outside world reflected the basic political position—extreme isolation. After a brief period of slightly expanding foreign trade under NEP, which continued into the early years of the first Five Year Plan, Russia's exports fell to under one per cent of its total output; and, in spite of this extremely low export figure, exports were higher than imports. Russia virtually did not participate in world trade at all.

Yet political distrust was not the whole story. When in 1929 the launching of the first Five-Year Plan created new demands for machinery which the Soviet Union had neither the capital equipment nor the skill to make, the Government turned to the outside world for help. Unhappily this was the time of the Great Depression. The bottom had dropped out of the market for primary products and Russia had only foodstuffs and raw materials, which could only be sold at bargain prices, to offer in return for expensive machines. There was no possibility of building up a healthy foreign trade under these conditions. Later, when the world pulled itself little by little out of the slough, there grew up among the capitalist states themselves a system of closed national blocs, with bilateral trade agreements, quotas and barter. Russia could not fit into this system either. Thus self-chosen political isolation was reinforced by the trend of world trade and by isolationist policies elsewhere.

To what extent will these conditions be modified by the war? The overriding political fear will have been banished. Total autarky will no longer seem essential to Russia's survival. The question remains whether, once the negative obstacle to economic collaboration has been removed, there will be any positive inducements to Russia's greater participation in world trade. There will certainly be none if the closed economic blocs which came to rule the capitalist world in the thirties are restored. In a world committed to self-sufficiency Russia

is more self-sufficient than most; and in some ways the war has encouraged this tendency by shifting the industrial centre of gravity away from the west to the great undeveloped regions of the Urals and Siberia. *Pravda* has said on a number of occasions that the populations—"tens of millions"—which have been evacuated eastwards will remain in their new places of work. A series of new and gigantic Plans, centred on these new industrial resources, could in course of time repair the terrible ravages of war and carry on the steady—and self-sufficient—expansion of the Soviet Leviathan.

The point is, however, that another phase of complete self-sufficiency would mean another desperate period of iron poverty and work for the Russian people, called upon again to make economic development possible by their own continued and enforced savings. In the past, every sacrifice in consumption has been justified by the struggle that lay ahead in which Russia would be compelled single-handed to take on the entire capitalist world. But, after the war, the Russians should be looking back on victory, not forward to war, and the victory will have been won in the company of Britain and the United States. In these circumstances, the Russian people may very well hope for a period of better times and easier living. This is hardly possible without some measure of collaboration from outside. It is not only that the enormous war losses must be made good. In 1939, Molotov pointed out that the production per head of the population in Russia was still far behind capitalist countries. In February, 1941, it was announced that the third Five-Year Plan—one concerned, at last, with an increased production of consumption goods—would take ten to fifteen years to complete. Here surely are solid reasons for economic collaboration between Russia and the West. The Lend-Lease agreements speak of increasing economic prosperity; and raising the living standards of the world is one of the aims now accepted by the United Nations. These naturally include the living standards of the Russian people, whose improvement will be slow indeed if they are again to raise themselves by their own heelstraps.

The obstacles to collaboration, political and economic, could be destroyed, and the biggest question of all still remain unanswered. Collaboration for what? If the United Nations cannot replace the unity of purpose imposed by war by a unity of co-operation for commonly accepted aims—the raising of living standards, the securing of peace, freedom from want and fear—then the mere absence of negative obstacles will not, in the long run, prevent a drifting apart, a regrouping on the basis of selfish and regional interests, and a recrudescence probably of the old fears and hates. The most hopeful thing that has come out of the various treaties and agreements of this war is the recognition that to coalesce in pursuit of limited and interested aims is not enough. There is still no guarantee that this insight given by war will survive into the slacker days of peace, but at least it has appeared on the horizon of men's minds. On its realisation the future of American and Anglo-Russian co-operation finally depends.

Wages Policy

THE wages award to coal miners and the claim of the engineers for higher wages are reported on another page. These two episodes are very different. The coal miners have asked for higher wages because their wages are low, relative to the importance and peculiar disadvantages of their work, and relative to the wages of other workers. The engineers are making their sweeping claim, which would increase the total wage bill of the engineering industry by over £100 millions a year, on the ground that their wages are high, and should be kept high relative to other occupations, because of the importance of engineering in war production.

Together, these two developments show the imperative need, yet again, for a national wages policy. So far,

there has been none; and the result has been that wage rates have risen, haphazardly, disparately, anomalously and unevenly, ever since the war started. Bowley's index of weekly wage rates (1924 = 100) was 106 in August, 1939, 121 in December, 1940, 132½ in December, 1941, and 134 in April this year. There has been little rhyme or reason in the increase. The industries which have benefited most are either those whose unions have exercised the greatest bargaining power, or those which have escaped Government control for the longest time. The whole process has been sectional, without any common policy either by the unions or on the part of the Government. Each increase has tended to lead to another, either because of its effect in increasing prices or because of its

effect in disturbing the traditional relationship between the rate of wages in one industry and the rate of wages in another.

The Government has not been unaware of the problems created by this scramble for increased wages. It is inevitable, in wartime conditions of full employment and overtime, that earnings, regardless of wage rates, should go up. This rise in earnings, together with the uneven but consistent increases in wage rates, soon caused apprehension among Ministers about the prospects of inflation. As early as 1939, it was laid down as a principle of Government policy that wage rates should not be raised more rapidly than the cost of living, and that the cost of living should be stabilised, so as to remove the reason for increases in wages. In practice, this first stage of wages policy was not successful. While attempts were made to keep down wages in war industries, that is, in those industries which came one by one under Government control, wage rates tended to rise elsewhere, wrong differentials in wage rates between industry and industry were established, or maintained, with the result that the willing movement of workers from the less essential industries to the more essential industries was impeded. By the spring of 1941, there was what was regarded as a dangerous increase in purchasing power, at a time when the amount of goods and services available for sale to civilians was of increasingly curtailed and restricted. In the Budget of 1941, therefore, direct taxation was extended to about five million additional wage earners—about 50 per cent of the total tax yield from this source, however, being set aside for repayment in the form of post-war credits. From the end of 1940 onwards a determined attempt was made to stabilise the cost of living by subsidising the price of necessities.

The Government's White Paper on wages policy, published in the summer of last year, warned trade unions and arbitration tribunals against seeking or granting increases in wage rates, which could not increase the amount of goods and services available for civilian consumption, and suggested, tentatively, the principle that increased wages should depend upon increased productivity. The White Paper was purely advisory. The Trades Union Congress was explicitly hostile to any attempt to impose a central or uniform wages policy; and, in any case, the traditional process of sectional collective bargaining by separate unions, according to their varying bargaining power, was left intact. It was made plain that not even the TUC had the authority to interfere with individual trade unions in wage negotiations. There was some check to wage increases. For the moment, since the cost of living, measured by the official index, had been steadied, wage claims became less insistent; tribunals were held back from being generous in their awards; wage negotiations tended to be long drawn out, which in itself was a delaying factor. The upward movement in wage rates during the past six months has been very much slower than in the earlier period of the war.

Meanwhile, the Government attacked the problem from another angle. Last year, rationing was extended to a wide range of additional foodstuffs and to clothing; to-day, it is estimated that something like three-fifths of retail expenditure comes under rationing schemes. Unrationed goods, like tobacco, drink and many household goods as well as luxuries, are subject to heavy indirect taxation. The aim has been to prevent the extra purchasing power created by extra earnings and increased wage rates from being spent. There are many politicians and some economists who believe that the need for a wages policy, in any financial sense, has been removed; the alternative, the control of physical consumption, is regarded as sufficient.

Actually, neither the view of the Government that the inflationary process has been arrested nor the view of outside authorities that the inflationary process does not matter is very soundly based; and the purely industrial problem has been exacerbated. Wage increases have been haphazard. Anomalies have been added to the wage structure. Unskilled piece-workers tend to receive more than skilled time workers. Heavy workers, the essential

but forgotten men of the war effort, tend to be paid less than light workers. The general tendency of the Essential Work Orders was to freeze wage rates in essential occupations, while they were still permitted to rise in uncontrolled employment. There has been considerable friction as the process of mobilisation has been extended, when workers have been directed from relatively well-paid jobs to essential work in which payment has been frozen at a lower rate. From the point of view, therefore, of the war effort alone, the present state of wages is far from satisfactory. In the context of public finance and post-war industrial prospects, the outlook is little better. Immediately, the disparate increase of purchasing power takes the form of anomalous differences between one family and another in the amount of free money which they have available to spend upon the few goods and services which are still unrationed; the discrepancy between soldier and civilian has become more marked. In the longer run, a large volume of purchasing power has come into being, which will multiply the task of the authorities after the war in controlling demand and averting inflation during the continued scarcity of the transition period. Finally, the entire cost structure of British industry has been raised. It seems likely that the competitive position of British industry in world markets, when the inevitable decline in British income from invisible exports is taken into account, may only be restorable by a considerable depreciation—with all the social and political consequences that this step would entail.

The recent increase in wages has indeed been far from alarming in extent. The support of the trade unions for the war effort has not been jeopardised by friction over remuneration. It is probably this consideration which has been most influential in determining the Government's decision to have no wages policy. Nevertheless, the remarkable claim which has just been entered by the Amalgamated Engineering Union should be regarded as a sign that the test may still be to come. In present conditions there is no reason at all why the engineers should not make this claim, in order to retain their differential above other workers in the wage structure. There is no reason also why other unions should not make similar claims in order to maintain or advance their relative stations. Each union is free to make the best bargain it can; and the engineers' claim may well be the beginning of a deluge which, during the past twelve months, has been dammed up by the effects of the White Paper and by the transition of the nation's workers from peace to war work. The need for a wages policy, decided by the Government and agreed by the TUC, was never more urgent.

It is easy to state, in general terms, the principles which it should be sought to apply. First, every wartime wage increase, except those designed to remove real hardship, should be intended to provide an extra marginal incentive to additional war output. That is to say, the principle should be payment by results, in terms of war effort; and it is perhaps a pity that the recent award to the coal miners, which did include an additional bonus to coal production over a standard set for each pit, did not tie coal wages more closely still to increased coal production. The second objective should be to remove all anomalies which are obstacles to the war effort. Only if the right kind of relative wage level, as between skilled and unskilled workers and as between essential and less essential work, is established, will wages serve as an instrument of war. The labourer is worthy of his hire; but the war worker is worthier than the non-war worker. The policy should therefore be to restrain all indiscriminate increases in earnings, and then to introduce high incentive bonuses for war production, together with measures to enforce savings and to prevent the present anti-social scramble for unrationed goods and services.

It cannot be too strongly argued that this is not merely a matter of wages. It is said, and rightly, that the effect of taxation, income tax and EPT has been to hold back profits with remarkable success; it is plain that income tax at 10s. in the £ and surtax are onerous deductions

from most salaries and other incomes. Nevertheless, it is politically impossible to impose any kind of a general wages policy, for war reasons or peace reasons, for financial reasons, for industrial reasons or for social reasons, if the amount which remains to be spent out of moderate and high incomes, after overhead commitments as well as taxation have been met, is left uncontrolled; and physical rationing does not rule out comfortable and

ostentatious living for those who can afford it. The only fair and reasonable condition of affairs in wartime is that expenditure as well as consumption should be rationed, by one means or another. Until this condition is secured, it will remain a very plausible answer for trade unionists to say, when the restraint of wages is proposed, that, even allowing for their larger commitments, other people have much more to spend than war workers.

NOTES OF THE WEEK

After Tobruk

Tobruk has fallen and Rommel's forces are in Egypt. Once again the question which has faced the commanders of each side at the end of every Libyan campaign must be answered. Can the attacking forces, which with every mile of advance go further and further away from the source of their supplies, round off the preliminary fighting in the Libyan desert by advancing to the capture of the enemy's base? This has been the problem each time the British have advanced as far as El Ageila; each time they have been unable to push on to Tripoli. This was the problem the Italians faced when they sat at Mersa Matruh; which Rommel faced after the first British retreat from Benghazi, and which he must now decide with his desert victory behind him. Unfortunately, the experience of the earlier campaigns does not give any precise guide. There is superficially a striking resemblance between Rommel's attack this summer and the British attack of November last: in both campaigns there was a swift initial success, followed by a setback, which nearly cost the attackers the whole campaign; this again was followed by a substantial victory, which sent the defenders scurrying back, the Germans beyond Benghazi, the British to Sollum. It is the differences that are really alarming. First of all, Rommel was able last November to withdraw much of his equipment intact. This does not appear to have been the case in the present campaign: the British supply of armour was disastrously broken up in the tank ambush of June 13th, and although no information is available about the number of tanks and armoured units that were able to reach Egypt, there is no doubt that the striking power of General Ritchie's Eighth Army is very seriously reduced. Secondly, the gap in quality between the equipment of the two armies appears to have increased rather than decreased in the months between the two campaigns. Not only has Britain failed to secure the lead; it has definitely fallen behind in the race for superior armour and fire power. The German Mark IV tank is better than anything that the British can put into the field. Reports that it is also air-conditioned or refrigerated bear out the belief that German thinking is far ahead of the British in working out new methods of technical efficiency. Another discouraging feature is the problem of reinforcements. The Axis supply line is perhaps 1/40th as long as the Cape route. If Rommel had only succeeded in producing losses equivalent to his own, the advantage would still have been with him. As it is, he may have gained an almost overwhelming superiority. All these factors added together present a gloomy enough picture to the British public, whose hopes had been inflated by the stupid optimism of statesmen and pressmen alike. Neutrals, too, particularly nearby neutrals in Turkey, have been very discouraged by this new failure of British arms. However, the only point in looking back on this disastrous Libyan campaign is to learn its lessons and avoid its failures. The real focus of attention now lies ahead in the battle in Egypt and the struggle for the Middle East.

The Stepping Stones

The defence of Suez and of Syria and Iraq may very well turn on the part played in the struggle by Crete and Cyprus. Crete is a key outpost of the German offensive, Cyprus of the Allies' defence. The Germans have been preparing Crete for offensive action for the last year, intensively so for the last six months. In spite of a certain amount of guerrilla resistance from the Cretans, they have been able to extend the existing air-fields in Crete and to build a number of new ones; to concentrate there a sizeable proportion of the *Luftwaffe*; and to make the island a centre—comparatively immune from air attack—for the

training of parachute troops. Reports speak of 50,000 men in training there, and towards the end of May, Kesselring, the Nazi air chief in the Mediterranean, is reported to have inspected the units. General Student, one of the Nazis' foremost paratroop experts, is also believed to be in Crete with the job of organising the island as a base for air-borne attack. This striking development of the offensive power of Crete helps to explain the difficulties experienced by the British convoys, for the narrows between Crete and the African mainland have become almost as hazardous as the approaches to Malta. The fall of Libya and Tobruk can only increase the danger. The RAF retaliated by heavy raids on Crete in March and April and during the Libya campaign the aerodromes at Heraklion, Kasteli and Tymbaki were strongly attacked. But it has not been possible to mount anything resembling the furious Axis attacks on Malta. Crete must, therefore, be presumed to be a good fighting base from which a formidable attack will sooner or later be launched.

The defence of Cyprus should not be as difficult as the defence of Crete proved when it was in Allied hands. Cyprus can be covered from air bases in Syria and the reinforcing of the island would be infinitely easier from the mainland, only 150 miles distant, than from either Crete or Rhodes, the nearest Axis bases. It is possible that the numerous signs of activity in the Greek islands and in Rhodes—where extra petrol is being stored and, it is said, barges are being constructed—are a preliminary to an attempt on Cyprus. The question is, therefore, whether the year's respite has been fully utilised on the Allied side. Press reports have spoken of a "subterranean honeycomb of defences"; the flat ground has been peppered with obstacles to prevent air-borne attack; there are a number of new landing-grounds; the beaches are constantly watched; ARP is compulsory; and the spirit of the islanders is said to be good—Malta has given them an heroic example. The Germans, too, have been active. A "Free Cyprus Committee" has been set up in Greece and quisling Cypriots broadcast regularly to Cyprus. Towards the end of April, they were moved to Rhodes, to be nearer the seat of operations, and their propaganda now includes a newspaper which is smuggled into Cyprus by air. However, the dissidents in Cyprus who oppose British rule demand union with Greece, and the Nazis are hardly in a position at the moment to offer that as an alternative.

Before the Offensives

A fortnight after the signing of the London Treaty there is still a glow of confident enthusiasm in Russia about its terms; in particular, insistence on a Second Front and "total victory in 1942" has pride of place in public comment. It should not be forgotten that this insistence on the need for more military effort from the Allies springs from a very sober appreciation of the military position. The fact that, so far, no major offensive has been launched on the Russian front does not mean that Germany's striking power has been permanently blunted. In Russia, as in Libya, armour and fire power can be decisive, and nothing in a comparison of the two war efforts suggests that Russia has been able to make good the losses inflicted in the first year of the campaign—still less that Germany can no longer launch a major offensive along the whole Russian front. If this is understood to mean that the Germans cannot attack equally hard along the whole line from Murmansk to Rostov, it is almost certainly true. It does not mean that they cannot concentrate an

overwhelming force at a single point along the line. The week's events have on the whole illustrated the Germans' continued superiority in sheer weight of metal. The defences of Sebastopol have been steadily ground down by the weight of material the Germans are able to throw against them. On the Kharkov front, too, the Russian line has been bent back by a sudden and heavy German offensive. The Russian desire for a western front is the natural desire to see Germany's superiority in machine power skimmed off by diversion to other fronts. The big tests of the summer lie all before the Red Army, but in the preliminary manoeuvring for position, some vital strategic points have already been lost.

Free Lance

A speaker in the Commons a few days ago spoke of the "slimy trail" which Lord Beaverbrook, he claimed, has spread over the face of politics during his career. Very rightly, the offending Member was sternly reproved. Such allegations do no justice to the services which Lord Beaverbrook has rendered to the country of his adoption. In his own way, Lord Beaverbrook is a great patriot. He is also a great publicist; it was this quality which stood out when he was in charge first of aircraft production in 1940, and then of the production of tanks and guns in 1941. Now the subject of his publicity is Russia. On Sunday, commemorating the first twelve months of Russia's defence against Germany, Lord Beaverbrook stole Mr Bevin's thunder by making his appeal to workers for all-out efforts some hours before the Minister of Labour appeared at the microphone to broadcast the Government's official piece. Lord Beaverbrook's zeal for Russia is right and deserving. His call for more output and for every sacrifice was apt and timely. Some of his central remarks, however, perhaps bore the marks of something other than patriotism and concern for an Ally. He said (as reported in the press), first, that a Second Front should be opened at once; secondly, that a Second Front could be opened at once; thirdly, that "people in high places" had been opposed to helping Russia a year ago; and, fourthly, that "people in high places" were opposed—for what he called "national interests" (which surely have some merit)—to opening a Second Front now. This is plain mischief-making. It would only have been helpful to the cause of this country or that of Russia if Lord Beaverbrook had given the names of these reactionaries. It is too much Lord Beaverbrook's practice in the speeches which he makes nowadays to puff out a cloud of suspicion against people who are left nameless. It is hard to avoid the view that these attacks have some other and political purpose, however dimly thought out as yet. All honour will be given to Lord Beaverbrook for his work for England in 1940 and 1941, even if reservations must be made about the actual efficiency of that work in terms of organisation and output. All honour, too, will be given to Lord Beaverbrook for his insistence upon the paramount importance of Russia. But, when he appears before large crowds, and speaks in vague innuendoes about guilty men, there must be some among his audiences who remember the repeated promises of the Beaverbrook press in 1938 and 1939 that there would be no war, which helped to trick the nation into complacency. There will be others who, when they consider the spectacle of the Eighth Army, beaten back because of its lack of modern tanks, modern anti-tank guns and dive-bombers, remember that Lord Beaverbrook himself was, at one time or another, responsible for the ordering and manufacture of all these items of equipment.

After Wilson

Sir Horace Wilson is to take the opportunity of retiring when he reaches the age of 60. It is significant that his successor as head of the Civil Service, Sir Richard Hopkins, who is Second Secretary at the Treasury, is two years older than the man he is to replace. This appears to mean two things. First, that there is no longer any wish to retain Sir Horace Wilson; and, secondly, that Sir Richard Hopkins is merely to be a wartime stopgap. The new head of the Civil Service is the obvious routine appointment—so obvious, that the pundits and people with inside information, who knew for certain that another man was to be chosen, were properly fooled. He is second in seniority to Sir Horace Wilson. It is very fortunate that Sir Richard Hopkins, as well as being the routine choice,

is a man of great wisdom and many talents. At a time when it is above all important that the Treasury should be regarding reconstruction, not simply in terms of money, but also in the context of a positive social and economic policy, Sir Richard Hopkins has shown himself alive to precisely this point. The wider issue, what kind of man with what kind of administrative experience and connections should be selected to make the appointments upon which the quality of administrative policy must depend, has been temporarily shelved. There is wide agreement that there must be no more Sir Horace Wilsons to tie down policy by restricting the choice of men to administer policy within the narrowest limits. It is felt by many people that the key appointments in the Civil Service should not be regarded as matters for Treasury decision merely because the Treasury pays them. There is a considerable body of opinion which holds that the head of the Civil Service in the future should be nearer to the Prime Minister and to the War Cabinet Offices—that is, nearer to policy—than has been the case in the past. But, for the duration of Sir Richard Hopkins's tenure of office, which cannot be more than three years, and may be less, these matters must remain simmering; and there is every reason for gratitude and relief that this, possibly the last of the old-style choices, should be in so many ways such an excellent appointment.

A Square Deal

It is good news that the Government has promised an "immediate examination" of the position of old age pensioners and widows, in response to the Labour motion debated in the House of Commons last week. As was shown by a recent Gallup Survey, the general public is very much alive to the difficulties suffered by old people at the present time. It was assumed that the taking over by the Assistance Board of the administration of supplementary pensions in 1940, and the introduction of the Determination of Needs Act 1941, would meet the principal grievances of old age pensioners. Unfortunately, any improvements that may have resulted from earlier legislation have largely been offset by the increase in the cost of living; in particular, the rise in the price of such extras as beer and tobacco has deprived old people of their main sources of enjoyment. Allowances for the increased cost of living have been granted in wage agreements generally and in the scales of public assistance; the claims of old age pensioners and widows for similar treatment surely deserve consideration. The Labour spokesmen did not, however, confine themselves to emphasising the wartime difficulties—they demanded the complete abolition of the means test principle as applicable to pensions. Although the personal needs test is regarded as a distinct improvement on the old household means test, there is widespread resentment among pensioners at inquiries by the Board's officials into not only their own means, but into those of their relatives. The definition of the term "household" in the Determination of Needs Act still seems to need clarification. The position of widows is even more unfortunate. While in the case of young, able-bodied widows at work, the pension is no doubt regarded as a bonus to their wages, 10s. a week is grossly insufficient to meet the needs of the elderly widow who cannot get work and is not old enough to qualify for a supplementary pension. Similarly the widow with young children, unless a nursery school is available, may be unable to go out to work; and in any case the scale of dependants' allowances is very inadequate. Widows who cannot get work and have no savings or private means must perforce fall back on public assistance, thus throwing the burden of their maintenance on to the locality. The Government's promise to investigate the situation, it was stated, will not prejudice the formulation of any long-term policy by the Beveridge Committee. The Committee may be expected to give full weight to the striking conclusion reached by the Royal Commission on Population—that by 1970 the number of persons over 65 will have doubled. It is therefore all the more important that plans should be made now for the provision of social and economic security for old people.

Shipping and Shipbuilding

The realisation of the object of the talks between President Roosevelt and Mr Churchill, the "earliest maximum concentration of allied war power upon the enemy,"

depends on the supply of shipping. Unfortunately, there is reason to believe that, in spite of the tremendous expansion in America's shipbuilding capacity and the efforts made in this country and in the Dominions, especially Canada, the supply of shipping tonnage at the disposal of the United Nations is shrinking. Germany is striving hard to keep the growing flood of American striking power at bay by an intensification of attacks at sea. While no statistics have been published since June last year, the losses of the United Nations are known to have been serious during the past six months, first in the Pacific and lately along the eastern coast of the American Continent, and presumably in the Mediterranean. Figures are issued periodically in Washington, but they relate to numbers of ships operated by the United Nations sunk, damaged or attacked without any indication about their aggregate tonnage; nor is it known what proportion of total losses they represent. According to a report of the Navy Department, issued in Washington on June 23rd, 13 United Nations merchant vessels were "victims of enemy submarine action" in the Caribbean during the twelve days from June 3rd, bringing total casualties—presumably in the Western Atlantic—since Pearl Harbour to 251; unofficial reports have put the figure at about 300. If these losses represent a large proportion of the total losses of the United Nations, and if the average size of the casualties was approximately the same as during the first 20 months of the war, the rate would not be alarming. Between September, 1939, and June, 1941, British, allied and neutral merchant shipping losses amounted to 1,734 vessels of an aggregate tonnage of 7,104,000 gross, representing an average rate of loss of 522 vessels in six months or about double the figure of 251 vessels for a similar period issued by the Navy Department. Such optimistic assumptions, however, are not justified on the basis of the undefined statistics issued in Washington, or as the result of purely speculative calculations. Even if shipping was being currently replaced—and it is impossible, judging by the pronouncements of Allied statesmen and unofficial reports from sober sources, to believe that they have been in several recent months—the position would still be grave. The tonnage needed to mass the full striking power of the United Nations at the enemy's weakest spots is enormous. How vital the shipping factor must be in Allied strategy is reflected in the conference on "shipbuilding and ship use" called by President Roosevelt and Mr Churchill in Washington on Tuesday, at which high American and British naval and shipping authorities attended. If Axis plans are to be defeated this summer, a tremendous effort must be made to expand the output of ships, to reduce losses by more and better protection, and to practise the strictest economy in the use of shipping.

Bargaining in France

The evil repercussions of the Libyan defeat will be felt not least in France, where Laval's see-saw goes up and down with the fortunes of war. The French political scene is, for the time divided sharply between a vast anonymous mass—the "stubborn" folk who will not collaborate—and one man, Laval, who quietly but surely is gathering to himself all the executive power in France that is not the monopoly of the invader. Marshal Pétain has fallen into the background on the Vichy side; Doriot and Déat seem to be losing the subterranean struggle for control. The triangle is Laval, the Germans and the French people. In this three-cornered relationship both the Germans and Laval have some bargaining counters. Laval can take his stand on what the French people will and will not stomach in the way of collaboration. Concessions to Italy appear to be unacceptable; so, too, does the surrender of the French fleet—or the imposition of the Déat gang as the "Government." Laval has also some purchase in exploiting Germany's increasing shortage of manpower. Against this is set Laval's utter dependence upon the Nazis. A nod from them and his whole house of cards of personal power comes tumbling down. The balance is thus very delicate, and the latest bargain between them illustrates the balance of forces and the underlying tension. Vichy has been pressing for eighteen months for the release of the French prisoners of war. Nothing lies closer to thousands of French homes. So far, the Marshal has bargained in vain. Now, however, Laval appears to have effected a compromise. In return for workers despatched to Germany, some French prisoners may return home. It is a skilful bargain. French workers threatened with un-

employment or evacuated from the Channel coast get work and bread. Prisoners come home. The French people see some concrete benefit from Laval's régime. The Germans get workers. Laval gets another lease of power.

Equality of International Sacrifice

President Roosevelt's latest quarterly report on Lend-Lease operations (which was mentioned in *The Economist* last week) gave the first official mention to a principle which, if it is ever worked out and applied, will be of the utmost importance. Briefly and roughly expressed, the new principle is that, if one of the United Nations has devoted to the common cause as high a percentage of its national income as another, then it has discharged its obligations and cannot be said to "owe" anything, in spite of whatever may stand against it, either in an old-fashioned financial account or in the new-fashioned physical accountability of Lend-Lease. This is the principle of equality of international sacrifice; and it is closely akin to the familiar principle of equality of sacrifice in taxation. In both cases the principle to be aimed at is that individuals (persons or nations) shall contribute to the needs of the collectivity, not equal amounts, but amounts that impose equal sacrifices. If this is a formal and accepted policy of the United States, then it is a very generous, very far-sighted and very welcome one. There are, of course—as so often happens when common sense has to be converted into precise language—a number of practical difficulties. Is the test to be the devotion to the war of an equal percentage of national income? As between Great Britain and the United States, that might work well enough. But the devotion to the war by China of 10 per cent of her national income would probably involve far more sacrifice than 40 per cent by the United States. Is the accounting to date back to the beginning of the war, or only to the period at which it was recognised to be a common cause? What allowance should be made for a country which, in addition to devoting a high percentage of its current income to the war, also draws on its accumulated capital reserves? Perhaps, at this stage, these questions are too meticulous, and they should certainly not be asked if to do so would imperil the acceptance of the principle. One matter, however, becomes very urgent, if this line of thought is to be pursued. There must be uniformity of definition of what constitutes income and of what expenditure is devoted to the war. National income estimates have advanced very rapidly in recent years on both sides of the Atlantic. The time has come to put them on an agreed basis.

Medical Reconstruction

The Medical Planning Commission, established by the British Medical Association with the co-operation of the Royal Colleges, has issued an interim report. It is only a draft, which is submitted to the medical profession for criticism; neither the Commission itself nor the bodies appointing to it are in any way committed to its conclusions. Nevertheless, the report is of great importance, because it shows the way in which the members of the Commission are thinking, and the suggestions it contains can hardly vary greatly from the views of the Commission as a whole. It is reassuring, therefore, that although the BMA is a big trade union, the basis of the Commission's discussion has not been the rights and interests of doctors, but rather the ways and means of providing a medical service which will promote health and prevent sickness as well as cure it, and of making all medical services available to every individual. So far, official views on medical reconstruction have been concerned only with the hospital services. The Medical Planning Commission's report deals in great detail with the much more troublesome question of the general practitioner as well. It describes a model form of health centre, staffed by the general practitioners in the area covered, with a certain number of assistants who would be newly qualified doctors. People would be allowed to choose their health centre—within reason—and choose their own doctor from those working there. The medical staff would take over all the ante-natal, post-natal, infant welfare and school medical work at present carried out by the medical staff of local authorities, although specialised branches of medicine, such as TB work and orthopaedics, would be undertaken at special clinics. The centre would work in close association with the local hospital, and since

the Government's policy for the hospital services places the responsibility for providing them on the local authority, it would probably be an advantage if the centre were the responsibility of the local authority as well. It follows that the scheme is conditional upon the reform of local government—and in particular of local government areas. The Commission suggests the establishment of a central authority concerned solely with the medical and ancillary services of the country, whose policy would be administered by committees of the reorganised local authorities. These new "regional authorities" would be responsible for staffing the hospitals in their areas and the health centres after consultation with the other doctors.

Thus, all the medical services of the country would be integrated instead of, as at present, being scattered among several authorities and private persons and institutions. This integration might have to wait until after the war, but the Commission adds its support to the view that in the meantime the benefits of national health insurance should be extended to the dependants of insured persons, and that those benefits should include consultant, specialist and laboratory facilities. The inclusion of dependants in the NHI, which would then cover about 90 per cent of the population, would help to make the family the basis of medical reorganisation and facilitate the establishment of health centres. But it would surely be better to go further and abolish the income limit for compulsory insurance. If the whole population were insured, and general practitioners and consultants alike were prevented from taking private fees, many of the obstacles in the way of medical reconstruction would be eliminated, and there could be no suggestion that the provision of medical services is in any way dependent upon income.

Children in Agriculture

An assurance that the employment of children under 14 in agricultural work will not be encouraged or facilitated, until every other source of supplementary labour has been fully used, was given by the Minister of Agriculture in the Commons last week. It will be generally welcomed. As a result of this statement, Mr Denman withdrew the "Prayer" for the annulment of the recent Order, which he and a number of Members of Parliament of all parties had tabled. The original Order had given rise to considerable uneasiness. Opposition had been expressed by influential educational bodies on the ground of interference with the school curriculum, and by the National Union of Agricultural Workers, which sees in the employment of children at 4d. to 5d. an hour a possible threat to the standards of agricultural labour. The scheme is also viewed by some critics as distastefully akin to the practice in Nazi Germany, where by a recent decree schools can be closed at the discretion of the local Gauleiter, to enable the children to help in the harvest. The crux of the matter seems to be whether the safeguards provided will be adequate to prevent the exploitation of the children or their employment on unsuitable tasks which might lead to overstrain. The Minister assured the House that he was satisfied with the adequacy of the measures for the protection of the health and well-being of the children. The local War Agricultural Committees have been instructed to see that the children do not work for more than 4 hours a day (the original Order had fixed maxima of 7 hours a day and 36 hours a week), and that, wherever possible, the work would be spread so as to enable individual children to be employed for half days only and, in term time, to attend school for either the morning or the afternoon sessions. In addition, physically unfit children will not be employed and strong penalties will attend any breach of the regulations by farmers. These assurances will go some way, though perhaps not all the way, towards allaying the anxiety which the original Order evoked. Apart from general guidance from above, the burden of responsibility now rests upon the local agricultural committees and education authorities. The nature and conditions of the work will depend to a considerable degree upon the individual farmer and the relative scarcity of labour in his particular locality. A watertight system of inspection to ensure that children are being used as supplementary and not as substitute labour would probably be impracticable, especially in areas where farms are scattered. It is to be hoped that the Commons will have an early opportunity of hearing how the scheme is working.

Family Allowances

The debate on family allowances in the Commons on Tuesday was overshadowed by the news from Libya. The Chancellor of the Exchequer, though he agreed to the terms of the motion which committed the Government to "an immediate consideration" of the institution of a national scheme of family allowances, was unable to offer any intimation of policy. He said again that any decision must wait upon the findings of the Beveridge Committee and the outcome of the Trade Union Congress discussions in September—and must also be attended by a more careful consideration of the financial position and relative expenditure on other social services. Nevertheless, the debate served a useful purpose in showing once more the unanimity of feeling on the subject, just as the House of Lords debate a week earlier had done; and it gave Members a chance of conveying to the Government—and to the Beveridge Committee—an indication of the widespread opinion in the country about the pressing need for social reform.

Conscription for Allies

The Allied Powers (War Service) Bill introduced in the House of Commons on June 17th is one of a series of Bills which have attempted to settle the legal status of Allied nationals in this country with regard to military service. Since 1940 the Allied Governments have had the right to call up their nationals in this country for service with their forces. But the Governments concerned had no power to apply compulsion to those nationals who evaded the call-up. A Czech or Belgian national who refused to join his army could not be dealt with by the Czech or Belgian military police, while instances in which the British police exerted direct pressure on Allied nationals were cited in the House of Commons as an abuse of power. Thus an able-bodied Allied national was not subject to the compulsion which was applicable to every British citizen. On the other hand, the Allied Forces Act of 1940 allowed Allied military jurisdiction to be applied to Allied soldiers. Similarly, sailors of the Allied merchant navies are subject to the jurisdiction of the maritime courts set up under the Allied Powers (Maritime Courts) Act of 1941. The Allied civilian was thus placed at a legal advantage compared with the Allied soldier and sailor. The new Bill puts Allied nationals eligible for military service under compulsion. But at the same time it gives them the right to opt for service with the British Forces. There have been thousands of Allied nationals living in this country for many years, among them people who have been brought up in this country from early childhood and who have never had any connection with the country whose nationals they have technically remained. The new Bill thus deprives the dodgers of the excuse for dodging, and gives those who are eager to serve the opportunity to do so with the British Forces, if British environment and British custom suits

YOUR WILL

Have you thought of the anxiety which may be caused to your dependants if for any reason your affairs have not been satisfactorily arranged?

In these days when life is so uncertain, the advisability of appointing a corporation rather than an individual as the Executor of your Will or in the capacity of Trustee needs little emphasis. By so doing, continuity is preserved and you are assured of efficient administration.

Full details can be obtained from any Branch of Lloyds Bank Limited or from its Executor and Trustee Offices at

Ewhurst Place, Ewhurst (near Guildford), Surrey,

Libya and the Second Front

The British defeat in Libya has reinforced the arguments of those who have steadily emphasised the difficulties and dangers of opening a new European front in 1942. There is, however, a large volume of public opinion in the United States which believes that the fall of Tobruk makes a diversion in the west more urgent than ever and which has welcomed Lord Beaverbrook's recent speech. This view has been pressed by several members of the House Military Affairs Committee in the last few days. The newspapers have, in general, been cautious, and more generous than one might perhaps have expected in dealing with events in North Africa. Although there is general agreement that the British were outgeneralled, outthought and outmanoeuvred, there is a disposition to accept some of the responsibility, particularly in regard to the equipment of the Eighth Army, and most commentators urge that there should be no recrimination. Members of Congress have been less restrained. Senator Ellender's outburst that he was "sick and tired of British failures" was only one of many bitter comments which reflect American disillusionment with the British direction of the war. The Libyan collapse followed so quickly on the announcements of American victories in the Coral Sea and at Midway that an unfavourable comparison could hardly fail to be drawn; and the result is a growing feeling that the United States must assume more responsibility for the progress of the war. Now that American confidence in the military strength of the United States has recovered from the blow of Pearl Harbour, and optimism about production is so widespread, the agitation for a Second Front, as a cure for all bad news, may not prove as amenable as formerly to references to the shipping shortage and the difficulties of a coastal landing.

The Warship Programme

The omission of any provision for new battleships in the Naval Expansion Bill which is now before the Senate, and the decision not to proceed with the construction of America's projected 60,000-ton giants, has been widely interpreted as meaning the end of the battleship. There are several points, however, which make the step less drastic than it seemed at first. The United States already has a 50 per cent greater strength in battleships than Japan, and it is not expected that this ratio can be materially reduced in the near future by the Japanese. This strength will be augmented by the completion of a number of smaller battleships, whose construction is not to be abandoned. The most urgent need, in view of the continued merchant ship sinkings is for numbers of smaller escort vessels, for the convoys, which are now in operation along the Atlantic Coast, and anti-submarine and anti-aircraft ships. About half of the construction authorised by the present Bill will be devoted to these types. The other half will go into aircraft carriers and cruisers. The lessons of the sinking of the *Prince of Wales* and the *Repulse*, as well as of the battles of the Coral Sea and Midway, have been taken to heart; but it is pointed out that if Japanese air power can be shattered, the battleship will once more become an important asset.

The Petrol Fiasco

Reports that many East Coast filling stations have run out of petrol are not surprising. In view of the available supplies, the rations established appear to have been too liberal; there was no adequate check on sales in the original scheme; and the need for cutting down consumption was so unconvincingly presented that many motorists applied for supplementary rations or resorted to bootleg petrol without any compunction. The temptation to treat the motoring public gently was overpowering, despite the warnings of Mr Henderson. But even the comparatively generous allowances appear to have aroused something like a rebellion against rationing, and both the decision to construct a new pipe-line—with, it is true, second-hand pipe—and the President's vagueness about the need for extending rationing, suggest that petrol is regarded as having explosive political possibilities. At the beginning of the

rationing period, it was estimated that the essential requirement of the region, in fuel oil as well as petrol, averaged about 1,300,000 barrels a day. Rail tank cars were delivering about 640,000 barrels daily, while established pipelines, tank lorries, barges, and production within the area were responsible for 200-300,000 a day. It was hoped that the railways could raise their deliveries to 800,000 barrels and that improvements in pipe-lines could fill the gap. Meanwhile, however, petrol was running away through a variety of loopholes. Some of these have been stopped by the abolition of "X" cards and the provision that coupons must be turned in by filling stations and wholesalers when they replenish their stocks; but it is still not clear that there is any check on the re-sale of petrol by industrial users, farmers, and other main sources of bootleg supplies. The pipe-line to be constructed from the Gulf Coast to the Atlantic will have a capacity of only 35,000 barrels a day, which will do nothing appreciable to ease the shortage. What is needed, if the principle of rationing is not to be discredited, and if really essential requirements are to be met, is more vivid proof of the need for economy; the political courage to set the ration at a realistic figure; and the creation of an adequate system of control.

The High Cost of Cartels

The arraignment of American business for its cartel arrangements with German companies is continuing, despite the agreement to suspend anti-trust suits when they interfere with the prosecution of the war. The most recent evidence presented to Senator Bone's Patent Committee concerns Carboly, Inc., a subsidiary of General Electric, which, it is alleged by the Department of Justice, used an agreement with Krupps to monopolise the sale of tungsten carbide and restrict its production in the United States. The company was said to have refused to license American companies which applied; and its high prices greatly restricted the use of tungsten carbide in machine tools. Mr Lewin, the Assistant Attorney-General, stated that the result was that German production of tungsten carbide was about ten times the American, although America produced twice as much steel as Germany. General Electric has taken the charges seriously enough to buy full-page advertisements in many papers in order to put its side of the case, and the president of the company, Mr Robbins, has claimed that the Senate Committee is attempting to act as a court. The reason given for postponement of anti-trust suits, agreed to in April, was that they distracted high company officials from concentrating on war production. The hearings of the Committee appear equally distracting. There are reports, however, that the War and Navy Departments have ordered suits to be discontinued without securing the prior consent of the Department of Justice as provided in the agreement. Carboly is one of the cases where action has been stopped, and apparently the Department of Justice is using the Patents Committee to put the facts before the public.

Shorter Notes

The War Manpower Commission has announced that men in the Armed Forces will number six to seven millions by the end of 1943 and eventually ten millions. The Commission estimated that 20 million workers will be needed in war production and transportation by 1944 and 12 million men and women will be needed to harvest the 1943 crops.

The rubber conservation programme of the Army has already eliminated two-thirds of the crude rubber used in the manufacture of light and medium tanks, cut the rubber content of Army tyres by 12 per cent, and lowered the rubber content of boots and overshoes by approximately 25 per cent.

Mr Wendell Willkie, the former Republican candidate for the Presidency, has caused considerable surprise by stating that he doubted whether he would ever run for public office again. His repudiation of the requirements of party regularity may eliminate one of the few progressive influences in the Republican party.

THE WORLD OVERSEAS

Japanese Merchant Shipping

(By a Correspondent)

LIKE Great Britain, Japan was predestined by its geographical situation to become a maritime nation. From a strategic point of view, its position is even more favourable than that of these islands. If the British Isles extended from their present northernmost point to the Bay of Biscay, their position would approximately correspond to that of Japan in relation to the mainland.

Composition of Merchant Fleet

In 1939, Japan's merchant marine was the third largest in the world, after Great Britain and the United States. Its steam and motor tonnage then numbered 2,337 vessels of 100 gross tons and upwards (against 1,103 in 1914), of an aggregate gross tonnage of 5,630,000 (against 1,708,000 in 1914). In order to obtain a complete picture of the position, 1,600,000 gross tons of registered and unregistered sailing vessels (including 40,000 tons of unregistered steamers) must be added, as well as new tonnage built or purchased since 1939, which may amount to another 350,000 tons. The gross tonnage of Japan's merchant fleet at the outbreak of war, in December, 1941, was therefore probably about 7,500,000, and is likely to be still about the same. Losses since the beginning of the war were probably offset by tonnage chartered in French Indochina and Thailand, or seized by force in Chinese coastal waters and Allied territories, altogether estimated at about 500,000 tons. This figure includes German and Italian ships formerly immobilised in Far Eastern waters. Not the whole of the aggregate tonnage of 7,500,000 gross can be used for transport purposes. The bulk of the sailing vessels are small craft, employed mainly in fishing and in the coastal trade. Shipping serviceable for overseas transport is probably in the neighbourhood of about 6,000,000 gross tons. In June, 1939, 38 per cent of the whole tonnage was less than ten years old. Japan's fleet possesses a good average speed. Recent statistics are not available, but the following table, based on about 4 million tons of steamships of over 1,000 tons in 1937, gives an indication of the position.

Number of Vessels	Aggregate Gross Tonnage	Speed Knots
88	162,000	7-10
361	1,051,000	10-13
353	1,674,000	13-16
144	1,025,000	16-20
10	97,000	Over 20

In 1938, out of a total of 2,045 steamships with an aggregate gross tonnage of about 5 million, 28 ships of over 10,000 tons had a tonnage of 359,000, and 213 of between 6,000 and 10,000 tons accounted for nearly 1.6 million gross tons. The largest category consisted of units between 3,000-6,000 gross tons; they numbered 431, with a gross tonnage of nearly 2 million. Vessels between 1,000-3,000 tons numbered 411, with a total of not quite 800,000 gross tons, and 962 vessels between 100 and 1,000 tons had a gross tonnage of about 350,000. In June, 1940, according to the *Frankfurter Zeitung*, Japan possessed 38 vessels of over 10,000 tons, and 885 between 2,000 and 10,000 tons. About 10 per cent of the Japanese steam and motor vessels were then believed to consist of tankers, of an average speed of 16-20 knots, and an average capacity of 10,000-12,000 gross tons. Another important group of vessels are the large depot ships engaged in whaling, which can be adapted for use as tankers or as seaplane carriers.

Japan's plans for the future development of the merchant fleet were gigantic. In 1941 a plan was officially published with a goal of 15,000,000 tons. The president of the Nippon Yusen Kaisha went further. Last November he declared that 20,000,000 tons were required for the post war period. So far, however, it seems doubtful whether the task set by

the General Four-Year plan—7½ million tons of ocean-going vessels by April, 1943—will be reached. Japan's ship-building capacity was still comparatively small before the war, when output amounted to 400,000-500,000 gross tons per annum.

Japan's Shipping Needs

The strain on Japanese shipping has been heavy since the beginning of the "China incident" in 1937 which superimposed an additional permanent demand of at least one million gross tons upon the regular needs of shipping. At the height of the campaign, requirements amounted to as much as 1½ million gross tons. In September 1940, a total of about 5½ million gross tons of tramp vessels of more than 2,000 tons was employed as follows:

Tons		Tons	
Europe & Africa...	38,000	South Sea and Straits Settlements	601,400
North America, Atlantic Coast...	181,500	Australia & India	257,900
North America, Pacific Coast...	505,700	Coastwise	2,519,500
		Others	(a) 1,016,700
		In docks	243,200

(a) This unspecified item seems to include the ships employed in the "China incident"; it rose from 14,600 gross tons in 1936 to 1,762,500 tons in 1938.

Voice of the North

There are times when we need some guidance to focus the happenings of the world to our own daily lives. Why not look for that guidance in *The Yorkshire Post*? Its fearless criticisms, its forthright and independent opinions and its responsible judgments have earned it the respect of all who read it regularly.

tion of labour. The discrepancy between the productivity of the new "industrial recruits" and that of the highly skilled Stakhanovites is too great to be overcome by example or precept.

Other difficulties are reported by *Pravda*.

The efforts of one shop are sometimes not consolidated by the efforts of other shops and sections.

Production above the plan by advanced workers, Stakhanovites and shock workers does not go to increase the general volume of production, but to cover up the shortages of the backward workers.

German Europe

Price Control.—There are now three main price categories in Germany, stop-prices, cost-plus-profit prices and fixed prices for armaments. Dr Fischboeck, the Price Commissar, has set up regional price control boards, responsible for the control of stop-prices for civilian commodities. The cost-plus-profit prices are based on elaborate costing regulations, and the fixed prices for armaments, which cover now roughly 1,700 armament manufactures and represent one-third of the total armament output in value, are fixed by the Government Departments. The main object of fixed prices was to reduce prices and to relieve industrialists from the cumbersome assessment of costs which was introduced at the beginning of 1939; the new policy seems to have met with some success, and Dr Fischboeck is now contemplating its extension to civilian commodities. There is no indication of the principles on which the staffs of the different Departments determine the prices of armaments. Industrialists have repeatedly moved to send representatives to these bodies but have been refused. The economic groups, however, that is, the former industrial federations, are consulted.

The main pre-occupation of the Price Commissar at present is the prices of civilian commodities and foodstuffs. The press openly admits that the official price index has become largely fictitious. Prices for textile commodities and clothing, for example, are at least 50 per cent above the prices of September, 1939. Vegetables, fruit and most food substitutes have also increased considerably in price. Rents for rooms and flats have been rising for a long time. During the first two years of the war, the prices of unrationed commodities were allowed to rise unhindered in order to accelerate the depletion of stocks. Now one school of thought in the German press suggests that rising prices for civilian commodities would be the most effective policy for skimming off excess purchasing power.

Dr Fischboeck takes a different line. He wants to safeguard the price level; to prevent any tendency towards further increases; and, where possible, to reduce prices. Electric bulbs, window panes and a number of electric articles have already been reduced by from 6 to 12 per cent in price; the prices of vegetables and fruit have been fixed; and the display of price lists has been made compulsory. There has been much talk about restoring confidence in the currency by maintaining stable prices. Price control remains a cornerstone of Germany's controlled economy.

Iron and Steel.—The Iron Co-operative is the fourth industrial organisation to cover an entire section of German industry. From ore mining to the rolling mills, the whole industry and all its organisations—cartels, federations and research unions—are now combined in one new organisation which will also take over the functions of the Reich Control Board. It is a giant vertical merger. The immediate object is obvious. It is a concentration of production on the most efficient plants.

Germany's iron industry has undoubtedly been affected recently by transport difficulties. The call up of stocks of raw materials and semi-manufactures from manufacturers for redistribution, for which a special company was founded, suggests that steel production was not up to requirements during the winter. It is of some interest that the president of the new organisation is Dr Roehling, who owns nearly the whole iron and steel industry of the Saar Territory. Roehling has been known as a promoter of the policy of using German low grade iron ore. In spite of commanding the French iron ore deposits, Germany's iron and steel industry has been forced to use increasing

Too much glamour is given to individual records, and this proved harmful for the work as a whole.

Other criticisms in the press, with a remarkable frankness, refer to the problem of quality and quantity. Some industrial managers are said to fulfil their quantitative plans at the expense of the quality of output.

The average increase in output which can be deduced from the May figures seems to be between 5 and 15 per cent. The "self-critical" campaign of the press is directed towards removing shortcomings and securing a new production peak for June.

quantities of low grade iron ores, which has doubled the costs of production. The huge Hermann Goering Works at Salzgitter, with a capacity of 4½ million tons of pig iron, will have come into full operation during 1941-42. There is thus the interesting situation that Germany is forced to use the most expensive processes at a time when labour is extremely scarce.

At the same time, Minister Speer has reorganised the way in which iron and steel is allocated to users. An iron and steel clearing bank will come into operation on October 1, 1942. The Control Boards will open iron and steel accounts for manufacturers who in turn draw cheques according to their requirements. The circulation of these cheques from one factory to another until it reaches the iron and steel plants is under the control of the manufacturers. Overdrafts are prohibited, and a system of penalties is thought sufficient to prevent any misuse.

Railway Transport.—The annual report of the German State railway company, the *Reichsbahn*, shows an increase, compared with 1940, in income from passenger traffic of 33.7 per cent, and in goods traffic of 11.9 per cent. This increase is partly explained by the incorporation of Yugoslav territory, as well as the acquisition of the last private railway companies in Germany. Total expenditure increased during the same period from Rm 7,250 millions to Rm 8,688 millions.

The depreciation account has been considerably increased because of the wear and tear of war conditions. The Balkan war, the war in Russia and the unusually cold winter strained resources to the utmost. The production of locomotives and rolling stock is said to have increased. The stock of locomotives suffered considerable wear. Great numbers had to be sent to the east, where the cold did much damage. More locomotives were demanded from Germany during the winter, which could only be replaced by requisitioning locomotives in occupied countries. In spite of these difficulties, the report claims that all essential traffic could be carried.

A number of decrees recently published show, however, that the German railway system cannot cope with demand. At the beginning of June, all non-essential goods traffic was prohibited. At the same time, Goering ordered the formation of special loading commands for a quicker turn round of goods trains. Time limits have been fixed during which goods must be loaded or cleared. Prisoners of war will be employed at railway stations. Passenger traffic is possible only with special permits; holiday makers get permits only if they are bound to travel for reasons of health.

Unemployment Fund.—For the first time, official figures have been published about Germany's unemployment fund. During 1934-37, contributions amounted to an annual average of Rm 1,480 millions. During 1938-41, the average increased to Rm 2,300 millions and in 1942 reached Rm 2,700 millions. This increase was due to the fact that the high contributions introduced during the economic crisis of 1930-32 have never been reduced; in fact, the fund has been used as additional Reich revenue. Credits amounting to Rm 3,000 millions have been refunded to the Reich. Another Rm 3,300 millions was used to finance the Autobahn. Marriage loans and family allowances used up Rm 1,300 millions. Finally, Rm 1,800 millions has been paid into old age pension funds; the contributions of the unemployment fund to old age pensions will be increased to Rm 1,480 millions in 1942. Unemployment contributions in Germany are an additional tax.

THE BUSINESS WORLD

Heavy Industry Shares

IN one context after another, during this war, the expectation that history would repeat itself has been falsified. The experience of the "heavy" industries of Great Britain has been no exception to the general rule. Between 1914 and 1918, this country's iron and steel producing plant proved inadequate to meet wartime demands, and by the time hostilities ended it was estimated that productive capacity had increased by around 50 per cent. When the transition from swords to ploughshares came to be made, it was discovered that the latter had considerably changed their character during the interim. In 1913, for example, one-third of the total steel output was used in shipbuilding, but in the post-war decades, demand was increasingly for steels for high-grade engineering and for the electrical and motor trades. The industry was hampered, further, because part of its redundant capacity was financed by temporary accommodation obtained during the war, which was subsequently "funded" by debentures and prior charges during a period of high interest rates. The outcome was a heavy crop of reconstruction schemes, after the Armstrong-Whitworth failure, which was one of the most spectacular in the history of the industry. It was only in the later thirties that steel company shares received a Stock Exchange status comparable, even approximately, with that of the years before 1914.

This sequence of events fully explains the investor's ultra-cautious attitude towards "heavy" steel and armament shares from the outbreak of the second Great War—or, more accurately, from the beginning of the rearmament period, a couple of years earlier. This time, however, matters have taken a course in many respects reassuringly different from that of 1914-18. No output figures have been published, for obvious reasons, but it is common knowledge that total production of, say, ingot steel, has shown no considerable increase—to say the least—compared with the peak years before the war. For this there are two main reasons. In the first place, the war has rendered many overseas sources of ores inaccessible, while shipping difficulties are now severely limiting opportunities of drawing on more distant sources, such as the United States—apart altogether from the limitations imposed by America's own war programme. This in turn has altered the balance of "charge" fed to the average furnace, which now contains, inevitably, a larger portion of scrap, whose collection, in the quantities demanded, is in itself a problem of considerable complexity. In the second place, demand has been increasingly for special steels required for delicate and costly modern weapons of war.

Inevitably, there has been some increase since the war in output capacity for special purposes. But the plant of the "heavy" industries generally has not undergone the dramatic expansion of the last war. Indeed, it has hardly been necessary to bring in all the sub-marginal plant which had to be drawn on in the last boom year before the war. Despite a certain unavoidable increase in costs, the "heavy" group of industries, as a whole, have been working profit-

ably, at something near an optimum production level, without needing more than a moderate increase of financial resources, and without laying up future "change-over" difficulties which are likely to be more formidable than those of the average run of industries when peace returns. Under a regime of 100 per cent EPT, of course, few, if any, of the immediate benefits of this state of affairs are reaching the shareholder. What is of much greater importance from his viewpoint, however, is the fact that no disastrous post-war heritage is being piled up, on a scale comparable with that of twenty-five years ago.

The table at the foot of this page furnishes chapter and verse for some of these tendencies. The eight companies, whose last three years' results are shown, are all directly engaged on production for the war effort, their activities ranging from coal mining, at one end of the scale, to finished steel products and arms at the other. Their profits, after taxation, have been falling continuously since the outbreak of the war, the total for the eight companies for 1941 being as much as 26 per cent below the 1939 figure. All of them, however, without exception, have greatly expanded their volume of activity since the war. In the absence of production figures, the best guide to such fluctuations is the stock-in-trade item in current balance sheets, though, as some of the companies are holding concerns, the changes in parent company balance sheets may not be proportionate to those of the groups concerned as a whole. For what they are worth, however, the returns show that the total stock figures of the eight companies increased between 1939 and 1941 by 70 per cent. Inventory prices are higher now than in the first months of the war, and when allowance is made for this factor, it would be fair to assume that the volume of stocks which the companies are carrying have increased by about one-third to one-half since the war. This is impressive but not overpowering, when it is remembered that production was somewhat below the peak of 1937 when the war broke out.

The financial strain of coping with increased production under war-time conditions is, however, greater than the stock figures, taken alone, would imply. The total "debtors" of the eight companies showed a rise between 1939 and 1941 of 100 per cent, and the total "creditors" of no less than 116 per cent. This latter item includes provision for taxation and "contingencies," some portion of which, undoubtedly, is of a reserve character. Unfortunately, there is no means of knowing what proportion represents resources which the Treasury will eventually drain away, and what residuum remains for financing increased output now and transitional needs after the war. Almost without exception, however, the companies are pursuing a conservative policy. In some instances, the rates actually paid have fallen since the war, in others they have been maintained. But in practically every instance they are well below the rates which are being currently earned.

The Stock Exchange's appraisal of "heavy" share pro-

The average yield on the shares shown in the table is approximately 7½ per cent against a little over 5 per cent on the mixed bag of representative industrial equities included in the *Actuaries' Index*. Investors, clearly, are reluctant to admit "heavy" steel shares into the category of "recovery equities," which are in such short supply in the market at present. Is this attitude altogether justified? Admittedly, there will be moderately heavy arrears of plant renewals to face after the war, and some of the special equipment installed recently will have fewer innate opportunities for profitable employment in peacetime. But these are purely transitional matters, which, *mutatis mutandis*, will have their parallel in every other industry.

The case against this group of shares, as the market sees it, really involves two assumptions. The first is that demand for steel products will decline very considerably after the war. That may be true of particular classes, but hardly of steel as a whole. On the contrary, requirements for building, engineering and shipbuilding may well be so pressing that, for a time, some form of rationing of

available steel for the home market may have to be resorted to.

Export prospects, necessarily, are much more problematical. For steel, as for all industries which hope to market any appreciable share of their total output abroad in the teeth of international competition, much depends on the currency and exchange policy which the British Government is prepared to adopt—and other Governments, particularly that of the United States, to tolerate—after the war. This is not the place to argue the pros and cons of post-war fixation of the sterling exchange at a level which may help to solve the difficult problem of a country which, having lost many of its foreign investments, in the common cause, must export to balance its international payments, but has been bequeathed a higher internal costs-structure by the war. But whatever policy be adopted, the "heavy" industries will almost certainly have to base their hopes of obtaining a sizable export business on their ability to supply the more highly finished types of product, rather than the cruder forms, at a competitive price in importers' currencies.

The second possibility which makes for caution on the Stock Exchange is that individual companies may find their financial position unbearably tight when the time comes for turning over to peacetime conditions. In some instances, undoubtedly, the transition will present a certain difficulty. But the industry, as a whole, should be helped by the fact that its EPT position is not unfavourable (the standard years having been a period of boom or near-boom conditions) and that its total capacity has not been unduly extended during the war. The adoption by the Government of a deflationary post-war economic policy would greatly handicap the industry, both productively and financially, as it did after the last war. But the omens seem to be definitely against such a possibility. On the whole, it may be suggested that, while "heavy" industry shares will continue to be a somewhat specialised section of the market, their particular "risks" are not unreasonably discounted by current Stock Exchange prices.

Finance and Banking

Half-Year End Doubts

Market confidence in an easy passage over the end of the half-year is now wilting slightly. Last Friday's further decline in Treasury bill applications to the abnormally low figure of £124 millions—and a corresponding rise in the market quota to 49 per cent—reflected the general anticipation of a restricted outlet for bills which has been fully justified in the event. On recent days, no more than one of the large banks has been a buyer on any scale. The market has consequently had to finance a further large addition to its holdings against precarious overnight money. It thus approaches the end of June turning-point with bumper portfolios which include very few end of June maturities. On the other hand, the banks should have no great difficulty in maintaining a satisfactory cash position. They are well supplied with end of June dates, while both TDR subscriptions and the week's Treasury bill payments can be concentrated on the early days of July. At the worst, a moderate amount of special buying should suffice to supplement market supplies of credit. Rather disappointingly, the expansion in the note circulation has been resumed with a rise of £2,857,000—against only £1,453,000 in the corresponding week last year—to a new record level of £796 millions. It may still be hoped that the "holidays at home" campaign will succeed in damping down the seasonal demand for notes; but withdrawals on the same scale as last year would now reduce the reserve of notes at the August peak to little more than £5 millions.

Coupon Banking in Force

The coupon banking scheme finally came into full operation on Monday last, when the use of transfer vouchers became compulsory, with a few minor exceptions, for all dealings involving more than 75 coupons. No doubt it is still early to pronounce on the success of the scheme, but its inauguration and initial working have been almost completely free from complaints and queries. One of the few difficulties arose out of the decision of some multiple

shops against the operation of coupon accounts by their local managers, who were instructed to remit coupons by post to the head office. This naturally created an unexpectedly heavy volume of work for the branches carrying the head office account, and also lead to some shortage of the head office account. It is obviously desirable that this additional work should be spread as evenly as possible over the banking system, though it will be realised that misappropriation of coupons, unlike misappropriation of cash, is not covered by existing fidelity bonds. A possible solution would be for the head offices to supply their branches with vouchers made out in favour of head office, since no voucher may be confirmed if it bears the slightest alteration.

Responsibility of Banks

In principle, coupon banking would seem to call for no less elaborate a code than that which governs normal banking. It stands to reason, for example, that the banks, as agents of the Board of Trade, could not expect to escape some liability to their principal if conversion of coupons accounts other than that of the transferee, or by the account other than that of the transferer, or by the opening of accounts without adequate enquiries. What constitutes reasonable care in such matters is laid down in a code of secret instructions which takes the place, in relation to coupons, of the Bills of Exchange Act and other enactments which govern ordinary banking. As experience accumulates, the compilation of a "Questions on Coupon Banking Practice" will no doubt follow, as a parallel volume to the familiar "QBP." Meanwhile, the nature of the Board's instructions is not to be made public, though it is known that it permits somewhat greater scope for the exercise of discretion than banking law. For example, banks are allowed to credit coupons to a customer's account, provided they are satisfied that the customer is intended to be the transferee, even though the transferee's name is not quite accurately entered. It is interesting to note, too, that in the transfer voucher, which

cannot be transferred by endorsement, does not require discharge and yet operates as a receipt, there is a precise equivalent of the non-transferable cheque.

Bombay Bullion Market

The advance in Bombay silver has been more restrained recently, but in the middle of this week the quotation stood at Rs 83 annas 5 per 100 tolas, an increase of about Rs 5½ in a fortnight. There has also been more demand for gold on the Bombay market, and a price of Rs 49 annas 7 per tola was recently quoted. This moderate recrudescence of speculative buying invites comparison with the hoarding demand which arose during the middle of last March as a result of Japanese successes in the Far East. At that time, silver rose to Rs 90 annas 8 and gold to Rs 56 annas 8, and the possibility was even discussed that the market price for fine silver might rise to Rs 109, at which level it would theoretically become profitable to melt coin into bullion. It remains to be seen whether the war news will stimulate a comparable boom in Bombay prices in the near future, but speculators will doubtless be restrained by the consideration that the Reserve Bank might at any time re-enter the market as a seller at a price well below current quotations. Meanwhile, it is interesting to note that the current Bombay silver quotation is equivalent to about 36½d in London, while the gold price represents approximately 198s. It may be of academic interest to point out that this gives a sterling-dollar cross-rate of a little over \$3.50.

Reichsbank Note Expansion

At the end of May the note issue of the Reichsbank attained Rm 20,547,951,000. Although the next return showed a decline as a result of the usual repayment of

end-of-month loans, it still remained well over the 20-milliard level. In three years the note issue has increased by more than 200 per cent, while since the beginning of this year alone it has increased by 33 per cent. During 1939 the expansion was comparatively moderate—from Rm 6.26 milliards to Rm 8.52 milliards. In 1940, when German arms production reached its peak, the advance was much steeper—an increase of nearly fifty per cent—to Rm 2.59 milliards. A year later the total in circulation reached Rm 15.21 milliards. The rate of expansion during 1941, in other words, was only about half that of the previous year, presumably because there was no further material expansion of arms production, and because the victories of the spring and summer inspired sufficient confidence to enable the Government of the Reich to re-borrow from the public most of what was spent in excess of revenue. On the other hand, the accentuation of the pace of currency inflation this year may have been due to the decline of confidence in ultimate victory, as a result of which the public is now less willing to lend to the Government or even to deposit its money with the banks. It is necessary to point out that the expansion of the note issue since the war has not to any noteworthy extent been due to the expansion of the territory of the Reich. The German authorities have taken elaborate measures to prevent the circulation of Reichsbank notes in occupied territory. They issued special occupation marks for that purpose, and both troops and civilian travellers are forbidden to take Reichsbank notes with them to occupied countries. It is only in Alsace-Lorraine, Luxembourg, Danzig, Polish Silesia and other Polish territories which have been added to the Reich (as distinct from the territory of the General Government) that Reichsbank notes are allowed to circulate, and these territories can only account for a fraction of the increase. The pace of note withdrawals in recent months seems to indicate that the Government is beginning to lose its grip on the financial situation, which has hitherto been managed very efficiently.

Investment

The Investor Waits

Although the country as a whole is very evidently perturbed at the loss of Tobruk, and the serious position which results from it, the investor, as such, has accepted the event with the calm arising from a conviction that peace, whenever it may come, must improve conditions for the holder of industrial equities. According to the indices of *The Financial News* there has been a fall of 2.1 per cent in equity values on the week, and of almost twice that amount from the recent high point, while the decline in fixed interest stocks has been slightly accelerated. These comparisons paint rather too bright a picture of the total effects. The minima, fixed by the Egyptian Government, for business on the exchange there, are so high that selling is impossible, and the whole weight of pressure to sell by holders in Egypt has been concentrated in London, making business distinctly difficult and costly. Again, in industrial preference shares, some appreciable selling has arisen, presumably because, after the recent closing of the yield margin between these and senior securities, prices are considered rather unduly high. This seems to suggest that a yield margin of one to one and a half points between these and irredeemable Government stocks is the smallest acceptable. With these exceptions, markets have been relatively idle, and it is clear that the investor is waiting to see what the next move will be. So far he appears to be concentrating his attention on military events, but there is, in the conjunction of the rise in miners' wages and the demands of AEU members for further increases, a threat of a new and more potent dose of potential purchasing power which cannot fail to affect prices in the measure that they remain, or become, free from control. If there is a fresh round of wage increases it will constitute an inflationary influence which must, soon or late, produce some adjustment in favour of equities as against fixed-interest stocks.

Lever Debenture Repayment

The decision to repay the whole of the 5 per cent debenture stock of Lever Brothers and Unilever on the next

interest date, namely October 1st, will scarcely come as a surprise. Although the amount involved is substantial, £2,752,000 according to the latest available figure, the group enjoyed a strong liquid position at the end of 1940, and there is reason to suppose that there will have been some further contraction in the demand for liquid resources, as well as some addition to them by the ploughing back of a part of last year's profits. The price of the debentures is only a shade above par, although it includes almost a quarter's interest, and this suggests a strong belief that an early opportunity would be taken to repay the stock, whose earliest redemption date was April 1st. The step is in accordance with a policy already established in pre-war days of reducing prior charges, and even preference capital, throughout the group as the terms of issue and the accumulation of profits permitted. Most of the capital was raised before the era of cheap money was ushered in by the War Loan conversion of 1932, so that, in any case, conversions would have paid. But almost ever since that date there have been exceptional hindrances to the further expansion of business, and although the activities of the group have continued to grow—at least until the outbreak of war—it appears that retained profits provide a substantial margin over immediate requirements. Those of the British company are, at the moment, swollen by earnings retained to meet possible post-war commitments to holders of Unilever NV shares. It will be interesting to see whether the accounts for 1941, which may well not appear for some months, will make a sufficiently good showing to suggest that the 4 per cent debentures, of which there are almost £2,000,000 falling due at the end of March next, will be paid off during 1943. In this case it is less clear that the money can be re-borrowed more cheaply.

Argentine Railways and Nationalisation

Since the prospects for the outright acquisition of the British-owned railways of Argentina by the Government of that country were discussed in *The Economist* in November, 1940, opinion on this subject has turned almost full circle. The Pinedo plan, which had held the field, was dropped, partly because Argentina's sales to this country

£22,000 to the carry forward. Details of earnings and appropriations for the past three years are set out below:—

	Years ended December 31.		
	1939	1940	1941
Trading Profit†	195,399	284,114	591,746
Net interest paid	104,291	104,532	87,264
Taxation	29,000	95,000	250,000
Depreciation	50,000	60,000	60,000
War Damage		25,000	22,000
Earned for dividends	12,108	Dr. 418	172,482

† After administrative expenses.

The company is both controlled and managed by Associated British Picture Corporation, which itself showed a marked recovery for the year to March 31, 1941. Its new accounts will be awaited with all the more interest in view of the Union result, although, in the absence of any divi-

dend, neither ABP nor the investing public is any the richer, so far. The balance sheet of Union Cinemas still reveals a highly unsatisfactory position. Bank overdraft has been reduced by £438,000 to £832,000, but creditors are up by £226,000 to £690,000, while the improvement in current assets is only £49,000 to some £130,000. The value of the statement is almost entirely vitiated by the inclusion of the item of suspense account, which, after a reduction of £145,000, due to surplus on liquidation of a subsidiary, still stands at £2,969,000. Actual earnings cover rather over four years' dividend on the senior class of preference capital, which has received nothing since 1937, while there are also arrears of second preference dividend and preference share redemption to be dealt with. The results are, therefore, distinctly encouraging for preference shareholders, and the prices have risen, in the past year, from 2s. 6d. to 17s. 6d. for the first, and from 10d. to 15s. 6d. for the second preference.

Industry and Trade

Miners' Wages

Last Friday the board of investigation, set up under the chairmanship of Lord Greene to inquire into the miners' claims for higher wages and the kind of machinery needed by the proposed national wages board, issued its recommendations on wages. While the board's recommendations do not meet the claims of the miners in full, they represent substantial concessions. The original claim of the Mineworkers' Federation was for a national minimum wage of 85s. per week from the age of 18, an increase of 4s. per shift for workers over 18 years of age and of 2s. a shift for boys. The proposed national minimum wage is at the rate of 83s. per week for underground workers and 78s. per week for surface workers, inclusive of the value of allowances in kind, in respect of workers over 21 years of age. A flat rate addition of 2s. 6d. per shift is recommended for underground workers aged more than 18 and for all other workers from the age of 21. Additions ranging from 1s. 3d. to 2s. 3d. a shift are proposed for underground workers under 18, and from 9d. to 2s. 3d. per shift for surface workers below the age of 21. The annual cost of these concessions, which are payable from June 1st, has been estimated at £23½ millions. According to the Mining Association, the average weekly earnings of all adult workers below and above ground, including the value of allowances, was £4 15s. 6d. last May; the corresponding figure for underground workers was £4 18s. 9d. and that for coal getters on piece-work £5 6s. 3d. The introduction of the national minimum, which is likely to affect a comparatively small proportion of workers, will provide for hard cases; the advance of 2s. 6d. per shift will mean an appreciable improvement in the earnings of the great majority of workers. In addition, the board recommended that miners should be given an opportunity to secure further increases in accordance with a sliding scale for any increase in output above a certain standard to be fixed for each pit. The board's proposals, which received the blessing of the Government, were accepted unanimously by a delegate conference of the Mineworkers' Federation on Tuesday. Mr W. Lawther, president of the Federation, announced that all legitimate grievances "in relation to minimum wage advances" had been removed and that the bonus scheme had been accepted in principle. It is now up to the miners to honour the pledges of the delegates to secure increased output. And the Government must decide how the bill of £23½ millions a year is to be met.

Engineers Stake a Claim

Last Wednesday, the conference of the Amalgamated Engineering Union at Blackpool unanimously carried a resolution to put forward a claim for higher wages for all members employed in all branches of the engineering, shipbuilding, shiprepairing and allied industries. Both Mr Jack Tanner, the president of the AEU, and Mr F. Smith, its secretary, criticised the claim which, according to the latter, involved an increase of about 35s. or 36s. per week and, according to another official, an addition to the wages bill of £100 millions a year. It was subsequently reported that the real claim was not so fantastic as stated by the press and that it was for the balance of last year's

claim of about 16s. per week, of which 5s. was awarded last December. Mr Tanner promptly informed the conference that the chance of getting the claim met was very small indeed and "what we are concerned with is to get an increase of war production."

According to a correspondent, the claim may be interpreted as evidence of dissatisfaction among the engineers. One of the main grievances is that a large number of men are still on "time rates," that is to say they receive a flat rate without any opportunity of bonus earnings. These include many highly skilled men, such as the maintenance staffs who are now continually called upon to put in extra effort without additional pay. Another grievance is that last December's award put the increase of pay not on to the "basic rate" but on to the so-called "war wage," an additional flat rate payment which, with considerable variation, has been in force since the last war but is not taken into account in the computation of bonuses. It is also possible that the old grievance concerning the reduction of overtime rates in 1931 is still active. The overtime rate was reduced in that year from time and a half, with double time after midnight, to time and one-half, with double time after midnight, to time and a half thereafter: third for the first two hours and time and a half thereafter. Night shift rates were also reduced. But there are a number of causes of friction which are only indirectly of a monetary character. They are mostly connected with the transfer of labour. It is felt that more foresight and better planning in the allocation of contracts would enable factories to work more continuously and that the necessity for workmen to leave their homes would thus in many cases be removed. Further, many matters connected with the payment of lodging allowances to men away from home are within the discretion of the local employment exchanges and there appears to be evidence of considerable anomalies and variations of practice. All these matters have given rise to disgruntlement which finds its expression in fresh monetary demands. In so far as these grievances are legitimate, steps should be taken to remove them. But their existence can hardly justify an addition of £100 millions a year to the wages bill.

Control of Wool Textile Trade

The problem of how to control an industry in which the average unit is small (some years ago over half the wool firms employed less than 100 insured workers per firm), which entails a number of separate processes all under different ownership and where there is a strong individualist tradition, is discussed in a Fabian Society pamphlet—"The Wool Industry in War and Peace." The most useful section of the pamphlet is the analysis of the mechanism of the wartime control, which the author believes has been one of the most efficient of the Government controls, although it is limited to one stage of the productive process only—the control of the raw material. As with most other controls, the Controller is a prominent representative of the industry; he is the chairman of the Woollen and Worsted Trades Association. This means that control is regarded as a necessary evil, imposed for the

duration of the war only, and to be abandoned as soon as the longed-for "return to normal" is achieved; and that more attention may be paid to future possibilities than to immediate war-time requirements. Concentration in the wool industry has largely been left to voluntary arrangements, and such concentration as has been effected has in consequence been gradual and haphazard, and due rather to the pressure of external circumstances than to deliberate policy. To-day, according to Mr Brook, productive capacity is far in excess of requirements and there is a large amount of redundant machinery and plant. Over 70 per cent of the capacity of the industry is engaged on meeting Government and export demands, but Government requirements have not been on the scale anticipated before the collapse of France. Civilian consumption has been curtailed by rationing and by the excessive charges made for "wastes," amounting in some cases to three or four times their pre-war prices; indeed, the author accuses the Government of welcoming high prices as a means of restricting civilian buying. The introduction of utility clothing—albeit not until after two years of war—and the fixing of profit margins and "ceiling" prices are welcome measures to protect the consumer against profiteering, although it only applies to about two-thirds of the clothing produced. It should be accompanied by the extension of the rationing scheme to cover woollen materials still outside. It is a pity that more was not said about the actual effects of concentration on the concentrated firms, how labour has been affected, and so on. It is to be hoped that this study of the wool industry will be followed by similar surveys of the effects of control and concentration on other industries, together with their implications for post-war reconstruction.

Bricks

In their report issued earlier this year, the Committee on the brick industry recommended a reduction in output to the level of falling needs, the closing down of selected brickworks as an alternative to a *pro rata* cut in production, and a care and maintenance scheme for the closed plants, financed by a levy of 3s. per 1,000 bricks sold by those remaining in production. In a second report, issued on Wednesday, the committee draws attention to "unfortunate delays" in the application of its recommendations, but exonerates the Ministry of Works and Buildings.

They appear rather to be the result of almost interminable inter-departmental negotiations, which, necessary though they may be in times of peace, are in our view inconsistent with the spirit and tempo of the current stern conditions of war.

To secure equitably the necessary contraction in output, the committee recommends a quota plan, which envisages ten areas, each producing a proportion of the national demand. It also proposes that the closing of works should be the responsibility of the Director of Bricks of the Ministry of Works and Buildings, and a tribunal is suggested for the adjudication of appeals. The committee proposes the fixing of minimum prices in order to secure stability. The care and maintenance scheme and the quota scheme are to be administered by a national building brick council, consisting of representatives of employers, trade unions and research organisations. It is to be hoped that final control will rest with the Ministry.

Bakers' Subsidy

The Minister of Food has not accepted the bakers' demands for the retention of the temporary additional subsidy, although he has made concessions. The history of bakers' subsidies was discussed in *The Economist* of June 6th, on page 806. The position then was that the Minister would consider the matter further, in the light of the bakers' comments on the results of an accountant's investigation, which had satisfied the Minister that there was no case for the retention of the additional subsidy. The additional temporary subsidy, varying from 2s. to 4s. a sack—the equivalent of 4d. per quarter loaf—was withdrawn on June 20th. Small bakers will benefit most from the concession granted on the same date of a reduced subsidy of 2s. per sack of flour to be paid on the first eight sacks used weekly in the making of bread sold at 8d. a quarter. This reduced subsidy will be temporary, pending a new costings investigation, which is to be completed not later than the end of September. An additional charge

of 4d. per 4 lb. of bread will be permitted to be made for deliveries in sparsely populated areas. The Minister's latest decision relates only to England and Wales, but the position of Scotland and Northern Ireland is under consideration.

Dried Eggs

Dehydrated eggs are now reaching consumers. One tin, the equivalent of a dozen eggs, at 1s. 9d., is available for each customer registered for eggs. In this way the equivalent of 540 million eggs will reach consumers during the next five weeks. Distributions will be made from time to time, at a rate, it is hoped, of at least one tin every two months, although releases will be larger when eggs in shell are most scarce. Caterers are to receive what appears at first sight to be a generous allocation—one lb (40 eggs) for every hundred meals served in one week. This represents an allocation of approximately 52 million eggs, but it is unlikely that distributions to caterers will be more frequent than those to consumers. The rough percentage of 7 per cent of rationed foods to caterers has been followed in this case. Supplies of dried eggs can compensate for the loss of fresh European eggs. The product is entirely egg, and is easy to transport, since it requires no refrigeration and takes only one-sixth of the space needed for eggs in shell. It will be imported from the United States, Canada, Australia and Argentina, and whole eggs will be imported only from Eire. The dried eggs can be used for all cooking purposes for which the yolk and white of egg are mixed, and will be a welcome addition to the larder.

Aircraft Metals in North America

In an article on aircraft metals, published in *The Economist* of March 14th, details were given of the American and Canadian production programmes for aluminium and magnesium. In the meantime, the United States War Production Board and the Canadian Government have greatly extended these programmes. According to the United States Bureau of Mines, America's supply plans for aluminium now call for no less than 2,500 million lb. in 1943. The programme consists of four parts. With its present capacity the United States is capable of producing 850 million lb. per annum. The facilities under construction as part of the earlier expansion plans will add another 640 million lb. to the country's annual productive capacity. Contracts placed by the United States Government with the Aluminum Company of Canada are for the delivery of 450 million lb. of Canadian aluminium in 1943, while a new United States expansion scheme for 640 million lb. is to be started this summer. The new expansion schemes for magnesium are no less impressive. The plan for the production of over 400 million lb. a year, outlined in the previous article, has been revised to one for 725 million lb. The Bureau of Mines has stated that, as part of the original plan, plant capacity for the production of 54 million lb. of magnesium per annum had already been completed; and that, at the end of last year, six American companies were engaged on the construction of new magnesium producing plants. Meanwhile, the War Production Board has placed contracts for the construction of plants to produce magnesium at the rate of 157 million lb. per annum by ferro-silicon processes developed by the National Academy of Sciences. An additional 24 million lb. are expected to be produced by the same method in works for which contracts are now being placed, while another 144 million lb. will be produced by electrolytic methods following the recent discovery of new and extensive magnesium brines in Michigan. Apart from the United States development programmes, which include the financing of plant extensions in Canada, the Canadian Government, acting through the Wartime Metals Corporation, recently formed at Ottawa, will spend between \$5,000,000 and \$6,000,000 on the erection of new magnesium plant in the Dominion. It is expected that the Dominion's magnesium production will start as early as this summer, although the final programme—like that of the United States—will not be completed before late next year. The new North American expansion plans for the two light metals will enable the United Nations to achieve an overwhelming measure of air superiority. The Axis powers lost their superiority in aluminium in 1941 and will lose their superiority in magnesium this year.

COMPANY MEETINGS

J. LYONS & COMPANY, LIMITED

FEATURES OF A DIFFICULT YEAR

MR HARRY SALMON'S STATEMENT

The forty-eighth ordinary general meeting of J. Lyons and Company, Limited, was held, on the 23rd instant, at the Trocadero Restaurant, London, W.

Mr Harry Salmon, J.P. (one of the managing directors), presided.

REPORT OF THE DIRECTORS

The directors have the pleasure to submit their forty-eighth annual report, with a balance-sheet and profit and loss account, made up to March 31st last, showing the financial position of the company at that date.

The business done may be considered satisfactory having regard to war-time conditions.

	£	£
The balance of trading account after providing reserve for contingencies is		896,500.00
To which is to be added the amount brought forward from last year		320,990.31
Showing available for distribution a total of		1,217,490.31
From this total the following dividends have been paid or provided:—		
On preference and preferred ordinary stock to March 31, 1942	490,353.27	
On ordinary, "A" ordinary and proportional profit stock and "B" proportional profit shares—interim paid December 1, 1941	92,813.65	
And the directors propose to deal with the balance as under:—		
To pay a final dividend of 3s. per £1 unit on the ordinary and "A" ordinary stock, making 4s. for the year	249,940.95	
To pay a final dividend of 7.2d. per £1 unit or share respectively on the proportional profit stock and "B" proportional profit shares, making 9.6d. for the year	28,500.00	
		861,607.87
Leaving to carry forward to next account	355,882.44	

The dividends received from subsidiary companies have been included in the company's trading account. In the aggregate the results of the subsidiary companies' trading show a profit. Losses of subsidiary companies so far as they concern this company have been dealt with in this company's accounts.

The board has suffered a great loss in the death of three of its members: Sir Isidore Salmon (the chairman), Mr B. S. Gluckstein and (since the close of the year) Mr J. M. E. Sierra. Sir Isidore Salmon had served the company since its formation and had been a managing director for 33 years; Mr B. S. Gluckstein joined the board in 1926 and Mr Sierra joined the company in 1907 and the board in 1939. They had all rendered most valuable services to the company and were very highly esteemed by their colleagues and the staff. Their loss is deeply deplored.

Messrs Geo. W. Booth and Julian Salmon retire from the office of director and, being eligible, offer themselves for re-election.

Mr L. Gluckstein, who has been appointed an ordinary director by the board since the last general meeting, retires and is eligible for re-election.

Mr H. H. G. Bennett, an employé director, retires and is eligible for re-election.

Messrs. Turquand, Youngs, McAuliffe and Company, the auditors, retire and are eligible for re-election.

(Signed) HARRY SALMON

Cadby Hall, London, W. 14.

June 10, 1942.

M. SALMON

Managing Directors.

CHAIRMAN'S STATEMENT

The following statement of the chairman had been circulated with the report and accounts and was taken as read:—

It is with the deepest regret I have to mention the loss we suffered during the year in the death of Sir Isidore Salmon and of Mr B. S. Gluckstein. This was a grievous blow to us all, and we greatly miss them both in our deliberations. My brother had been with the company since its formation, and his ability and energy, so wholeheartedly applied to everything he undertook, was an inspiration to his colleagues and the staff. His work in the wider sphere of public service received its measure of tribute at the time of his death. He represented Harrow in Parliament for 17 years. He had served on the Royal Commission on Transport and on important Government Committees, and, for the last three years of his life, had added to his business, political and other activities the work of honorary catering adviser to the Army. Mr B. S. Gluckstein had been a director for 15 years, during which time his wise counsel was of the greatest value to the board and the company. Since the close of the year another very valued colleague, Mr J. M. E. Sierra, has passed from us. He joined the company in 1907, later became its chief engineer, and was elected to the board in 1939. The high qualities of mind and character he possessed, coupled with his zeal in the company's service, had earned the respect and affection of us all.

Mr Leonard Gluckstein has been appointed a director, following a long and thorough training in the business. We welcome him among us, and know he will continue to show the devotion to the company's interests and the ability which have qualified him for the position he has now attained. It has always been our policy to have available what I may call a reserve of men who aspire to a seat on the board, and the wisdom of that policy is amply demonstrated at a time like this, when the hand of death has been so heavy on us.

Only one item in the accompanying report and accounts calls for comment, viz., "Debtors." The claims for war damage appearing in this account are only those which have been actually agreed by the Government; those which have still to be agreed are not included. This figure is also affected by the change-over to a cash basis of much of our former credit business. You will see that the balance of trading account is £896,500, and that we are proposing to pay the same final dividends as last year.

YEAR'S DIFFICULTIES

It has been a difficult year. In spite of all our efforts, we have been unable to meet the sustained demand for our goods and services. Restriction of supplies and curtailment of labour have continued to affect us, though I do not think I need enlarge on them. Transport is a difficulty which must increase as time goes on, for the authorities are seeking a drastic curtailment of our kind of transport we use in the nation-wide distribution of our goods and are introducing a localised system. The full effect of that on our business cannot yet be estimated, but it cannot be otherwise than serious. The regulations and orders made by the Government, running into many thousands, have necessitated a constant vigilance. You know the widespread nature of our business and will readily appreciate that there are very few of these regulations and orders which have not affected us to a greater or lesser degree. It is not an exaggeration to say that we have had to concern ourselves with not less than 6,000 of them. No one wishes to question the necessity in war time of many kinds of control and restriction, provided it is clear that the sole consideration in imposing them is the furtherance of the war effort. But proposals are now being made which do not fulfil that condition.

I do not wish it to be inferred, from any of this, that we fail to realise the magnitude and importance of the problems which confront the various authorities, and the efforts which have been made to solve them. We know particularly those with which the Minister of Food is concerned. He has said that his task is to

maintain a high standard of nutrition for the whole population; there is no doubt he has achieved outstanding success in it.

TRIBUTE TO STAFF

We try to accept our burdens cheerfully, and we bend our efforts to meet them in the way which will best maintain our stability. In this we have received in the past year, and continue to receive, the most loyal and wholehearted support from our staff of all grades; they share our business worries to the full, and, by their hard work and their cheerfulness in meeting their own personal difficulties, in a way typical of the whole nation, sustain the board in its task.

We have been privileged, during the year, to further the country's war effort by advice and assistance to various authorities, Government and otherwise, and to undertake, in a honorary capacity, the management of a large factory for the Ministry of Supply.

The number of our employees who have been called to war service has again considerably increased, and, with the deepest regret, we record that some of them have given their lives to the cause for which the nation is fighting, and will continue to fight until final victory. I am sure you will join me in conveying to those who have been spared our greetings and good wishes.

As this statement will reach you with the accounts, the proceedings of the meeting will be confined to formal business.

SELECTION TRUST, LIMITED

The ordinary general meeting of Selection Trust, Limited, of which Mr A. Chester Beatty is chairman, will be held, on July 2nd, at Selection Trust Building, Mason's Avenue, E.C. 2. Following is a summary of the report of the directors which embodies information usually given by the chairman at the annual general meeting:—

The gross revenue of £249,869 was nearly the same as for the preceding year. The amount arising from dividends and interest was less, but was supplemented by book profits from realisation of investments.

The profit for the year was £197,989, and the directors recommend the payment on July 6th of a dividend of 9d. per unit of ordinary stock, less income-tax at 8s. 6d. in the £.

The American Metal Company carries on a base metal mining, smelting and marketing business, and its investments include substantial holdings in Roan Antelope Copper Mines and Rhodesian Selection Trust. The company's major products, copper, lead and zinc, are important to the war programme to which the company is making every effort to contribute effectively. Domestic smelters and refineries operated to full capacity during 1941; the installation of increased facilities at the zinc smelters resulted in a substantially larger production than in the preceding year.

Roan Antelope Copper Mines reduced its dividend last year to 6d. and Rhodesian Selection Trust paid no dividend as it received no income from its holding in Mufulira Copper Mines. The latter company earned larger profits, but no dividend was paid in consequence of heavy taxation and the need to provide for expenditure of a capital nature.

Consolidated African Selection Trust and its subsidiary, Sierra Leone Selection Trust, continue to operate satisfactorily. A large proportion of the diamond production is required for industrial purposes, and efforts are being made to ensure an adequate supply for the war needs.

A large area of the Ultramar Company's concessions is being explored on joint account with Texas Company of U.S.A., through two Venezuelan companies, and drilling operations have discovered promising oil-bearing formations. Exploration work is proceeding but may be hampered by war conditions.

Selection Trust is maintaining its participation with Union Corporation and Western Holdings in the exploration and development of areas in the Orange Free State, and is also interested in areas adjoining the property of Western Reefs Exploration and Development Company. Work in these areas has been temporarily suspended owing to war conditions.

The search for new mining business has necessarily been curtailed by war conditions.

The company's largest interests are at present concerned with the production of copper and diamonds. The companies concerned are operating on a substantial scale and are doing their utmost to contribute towards the victory to which we confidently look forward.

EASTWOODS CEMENT GROUP

PRACTICAL CONTRIBUTION TO WAR EFFORT

Sir Horace Boot, K.B., M.Inst.C.E. (the chairman), presiding, on the 25th instant, at the annual meetings of Eastwoods Cement, Limited, Eastwoods Lewes Cement, Limited, and Eastwoods Humber Cement, Limited, said: It was decided this year to hold the three meetings together and the accounts were closed at December 31st last.

The Ministry of Supply, in collaboration with the Cement Makers' Federation, have instituted the pooling scheme designed to limit profit margins by wartime control of selling prices to the consumer and to pool resultant proceeds between all makers, by allocation of tonnage quotas automatically adjusted to current demand. The liaison between the Cement Makers' Federation and H.M. Government has become a pattern for other industries.

LOW CAPITAL COST PER TON

Our three cement works have a capacity of over 250,000 tons per annum and that, with the brick-making outputs of our other companies running into some hundreds of millions of bricks, is a formidable and practical contribution to the war effort. One feature of all our balance-sheets is the low capital cost per ton of output. Another is the very satisfactory financial situation resulting from a prudent policy in the past, which has left us ready to meet any contingency other than absolute catastrophe.

The Barrington Company shows a profit of £26,998. After paying the dividend of 10 per cent. for the nine months there still remains a total of £59,000 in the form of reserves and undivided profits and £17,212 is carried forward. The profit of the Lewes Company for six months, after provision for taxation, is £7,530. General reserve receives £2,000 and, after payment of the dividend, £8,279 is carried forward. Our forward programme at Lewes includes provision of another or larger kiln and silo capacity, expansion of storage and improvement of loading facilities. The works of the Humber Company at South Ferriby enjoyed equally satisfactory trading. The dispute with the contractors responsible for supply of the plant and machinery is still *sub judice*. After payment of the dividend of 6 per cent. £2,644 is carried forward. It is proposed to instal the second kiln at South Ferriby immediately the time is propitious and we are able to obtain licences for the heavy plant.

I am a little disturbed about deduction of income-tax at the source. The system should be simplified and manual workers should be able to understand exactly what it is they are paying. Contributions could be recovered by purchase of stamps as is now done under the scheme for health and unemployment insurance. The workpeople would then know that income-tax is the insurance premium we are all called upon to pay for the safety of the British Empire, and for a speedy return to peace and sanity in world affairs.

There has been waste and muddle in the allocation of coal for industrial purposes. Trouble has been caused through enforced use of unsuitable varieties and interference with normal sources of supply. When cement makers are forced to use low grades of unsuitable fuel there results waste of time, labour and money on hauling and handling, production is slowed down and the flow of railway wagons impeded.

ONE CENTRALISED ORGANISATION

In the Eastwoods Group there is one centralised organisation which controls all the various interests. Staffs were reorganised to meet war conditions. The same process is going on with female staff, and it is only with the utmost difficulty and considerable strain on our chief executives that the work has been got through without breakdown of essential services. We accomplish this by the exercise of ingenuity and co-operation, but there is growing up a new bureaucracy, which for forms and "red-tape" generally exceeds anything previously experienced. It is only by avoiding the joint evils of inflation and bureaucracy that we shall be able to compete again in world markets. We are flooded daily with requests for complicated information on every conceivable subject, and there is no peace for the manufacturer.

We are being asked to cut our staffs still further, and this will be achieved provided we can be guaranteed the retention of essential "key" personnel. I hope by next year the indomitable spirit of the British peoples will have prevailed, for prevail it must.

The report was unanimously adopted.

BRITISH ELECTRIC TRACTION COMPANY, LIMITED

CONTINUED PROGRESS

The forty-sixth ordinary general meeting of this company was held, on the 19th instant, in London.

Mr Richard J. Howley, C.B.E., the chairman, said that the gross revenue amounted to £767,588, which again constituted a record and represented an increase of £19,036 over the previous year. The profit for the year was £527,393.

The shareholders of Tilling and British Automobile Traction, Ltd., had received a circular letter from the secretary of that company regarding a scheme for reconstruction and for the transfer of the assets to two companies to be formed. The activities of the provincial omnibus companies had grown very considerably in recent years and the directors of the parent companies had come to the conclusion that greater efficiency would be obtained if the business of Tilling and British Automobile Traction, Limited, was divided into two parts and direct administration of each part was substituted for joint administration of the whole. The proposals provided for the formation of two companies, namely B.E.T. Omnibus Services, Limited, and Tilling Motor Services, Limited, the former would be controlled by the British Electric Traction Company, Limited, and the latter by Thomas Tilling, Limited.

As might be expected, the road transport and electricity supply companies in which they were so largely interested had been busily engaged. Their organisation had proved its usefulness under present difficult conditions and had shown that group control of locally managed public utility undertakings under skilled direction was probably the most efficient way of providing such services.

It might be that the setting up of public boards, as had been suggested, to operate transport and public services, was the answer to the desire of some leading politicians to rationalise services of that kind. It might be a way out of the danger which they appreciated would arise to our public economy under nationalisation. He was not convinced that large unwieldy boards would be either efficient or desirable in the national interest.

The report was adopted.

ODHAMS PRESS LIMITED

DIVIDEND OF 10 PER CENT

The 22nd annual general meeting of Odhams Press, Limited, was held in London on the 25th instant.

Lord Southwood of Fernhurst (chairman and managing director) said that the net profit for the year amounted to £611,445. The general reserve stood at £630,000 against £560,000 last year. It was proposed to transfer £50,000 out of the profits of the year under review, bringing the general reserve up to the substantial total of £680,000. The principal item in the profit and loss appropriation was the very heavy reserve for taxation of £313,945, compared with £155,093 last year. That heavy increase was a measure of the company's contribution to the war effort, which must be cheerfully borne. In order to play their part in assisting the Exchequer during war time, the directors had decided to discharge the greater part of the company's liability for taxation before the due date.

After the charges set out in the profit and loss account there was an available balance of £222,013. The directors recommended a dividend on the ordinary shares at the rate of 10 per cent. per annum.

The year under review had been a very difficult one, especially in regard to paper supplies. Fortunately the Newsprint Company under which all newsprint was bought on a co-operative basis, and under which every newspaper in the country was getting its fair share, had worked satisfactorily. On the other hand, since the date of the accounts the Ministry of Supply had found it necessary to issue an order reducing the newsprint consumption by a further 10 per cent., which had made it necessary to curtail the sales and in some cases the sizes of the company's newspapers and periodicals.

In addition to the difficulties of paper supplies they had also had to deal with the very heavy demands by the Government for man power, but shareholders might be sure that the directors would do the best they could to meet any and every situation as it arose.

The report and accounts were unanimously adopted.

HAWKER SIDDELEY AIRCRAFT COMPANY, LIMITED

GREAT RECORD OF COMPANY'S AEROPLANES

MR. T. O. M. SOPWITH'S STATEMENT

The sixth ordinary general meeting of the Hawker Siddeley Aircraft Company, Limited, will be held at the May Fair Hotel, Berkeley Street, London, W., on the 1st instant.

The following is the speech of the chairman, Mr Thomas O. M. Sopwith, C.B.E., F.R.Ae.S., which has been circulated with the report and accounts:—

The accounts show the comparative figures for the previous year, and you will observe that we have again provided the appropriate amount for the redemption of Five per Cent. Redeemable Cumulative Preference shares in accordance with the terms of their issue. The profits of the operating companies have been brought into the accounts to an extent sufficient to pay the same dividend as last year, and amount to £620,817, after providing for taxation. Adequate provisions have been made in the accounts of the operating companies for their Excess Profits Tax and other taxation liabilities; for their appropriate proportions of War Damage Contributions, and for such other purposes as their directors have considered necessary. Interim dividends of 15 per cent., less tax, and 17½ per cent., less tax, have already been paid, making a total for the year of 32½ per cent., less tax. This total is the same as that distributed last year, and it is not proposed to pay any further dividend for the year.

CONTRIBUTION TO WAR EFFORT

Of the products of your company—which have been and still are rendering yeoman service in every part of the world where hostilities are in progress—I can, unfortunately, speak only with reticence. You can, however, be assured that their contribution is one of vital importance and of great value to the armed forces. I need only, I think, call attention to three. There is the ubiquitous "Hurricane," with various modifications and improvements, but substantially the same, still used for varied jobs and with efficiency and certainty. The epic stories associated with the achievements of this remarkable machine will, I hope, be available to constitute a permanent record of gallant men and daring exploits. The "Lancaster"—the latest product, and I think the most efficient heavy bomber in the world—was the medium through which the historic raid on Augsburg was carried out; this aircraft in increasing numbers will add very materially to our bomber offensive. Lastly, certain of the "Whitley" bombers have been converted into commercial types to augment the fleet of British Overseas Airways. In the post-war development of civil aviation your company is adequately equipped both from the technical and production aspect to take full advantage of any opportunity which may occur.

During the period of the war I cannot indicate future developments other than by giving you an assurance that we are determined to maintain a progressive policy. There is little doubt that the quality of the R.A.F. equipment in darker days proved a deciding factor, and had it been possible then to have quantity as well the outlook might have been vastly different. To-day, however, the manufacturing potential is available, and able to provide the numbers of new types necessary to maintain the hard-earned superiority.

FRIENDLY RELATIONS WITH WORKERS

In the other ancillary products covered by your company, the same satisfactory state of affairs prevails, and the high standard of mechanical efficiency in certain equipment can be ascribed in part to developments carried through on our initiative. It is a pleasure to record that our relations with the works personnel are on a basis of friendly co-operation. You will, I am sure, join in recording thanks for the unexampled manner in which the executive, staff and workpeople have carried out their duties. They have not had an easy task, and have met and overcome the problems involved in changing requirements in a way reflecting very great credit on all concerned. Our maximum efforts are, of course concentrated on the productive endeavour, but your directors are constantly reviewing the post-war position and have suggestions under consideration to be put into force at the appropriate, and I hope not far distant, time.

CABLE AND WIRELESS, LIMITED

(The Operating Company)

DIVIDEND OF 4 PER CENT.

The thirteenth ordinary general meeting of Cable and Wireless, Limited (The Operating Company), was held on the 24th instant in London.

Sir Edward Wilshaw, K.C.M.G. (chairman and managing director), said that the accounts for the year ended December 31, 1941, disclosed a profit of £2,928,349, after providing £129,689 for cable renewals and £155,000 for amounts written off the cost of terminating a joint purse agreement and other expenditures. Adding the balance brought forward from 1940, there was £4,541,956 available. The interim dividend of 1½ per cent. already paid, together with a final dividend of 2½ per cent., making 4 per cent. for the year, absorbed £1,200,000, leaving £3,341,956 to be carried forward to the next account.

Ever since the Government became a considerable shareholder in the company, it had been his custom at this meeting to review their world-wide activities during the period covered by the accounts and to refer briefly to such developments as were in progress or in train. Existing conditions prevented that now, as they did last year. There were, however, one or two matters to which he should draw attention.

WORLD-WIDE ACTIVITIES

They would remember the argosies of children that had sailed to the greater safety of welcoming homes in the Dominions and shareholders were aware that the directors had made arrangements by which those evacuated under Government schemes had been

allowed to exchange free cable messages with their parents every month. Just as that concession had once brought reassuring news of their parents at home to the children overseas, so now, as the area of war extended, it brought cheer and comfort from the children to their parents.

Then there was the Expeditionary Force message, or E.F.M. service, enabling the Forces overseas and their folk at home, whether here or in any part of the Empire, to send messages to each other at the special low rate of 2s. 6d. There was no doubt of its amazing popularity. Last Christmas period they had handled over 1,250,000 E.F.M. messages in addition to their other traffic and were at present handling nearly 200,000 of those messages every week.

The pictures in the Press depicting the events of yesterday, photographed in all the distant theatres of war and of preparation for war, were handled over their wireless picture system, which had been and was being greatly improved and extended to meet a constantly growing demand. They had made efforts to give the widest possible facilities for Press traffic within the Empire which played so great a part in the Empire effort. They had made further drastic reductions in rates and introduced an Empire rate for Press traffic of 1d. a word for the duration of the war.

His final word must be about the staff. In the Far East many of them were interned and many missing, and there were others who would not return. At home and throughout their world-wide system, whether afloat or ashore, through days and nights of often perilous duty in the operation of a never-ceasing service, their staff worked long hours under abnormal conditions to get the traffic through, fully conscious of the vital part played by the lines of communication they maintained.

The report was unanimously adopted.

RECORDS and STATISTICS

STOCK EXCHANGES London

Note: all dealings are for cash

The disastrous climax to the first phase of the battle in North Africa completely overshadowed the news of Mr Churchill's visit to America. The general marking down of prices throughout all sections was not accompanied by any marked selling, but with buyers unwilling to enter into new commitments the trend continued downward. While the tone in the gilt-edged market was particularly firm at the end of last week, a fairly general marking down of both long and short-dated issues ensued at the reopening. Local Loans and 3½ per cent Conversion were lowered ½, and Old Consols ¼, while most short-dated issues eased ¼. Declines the following day were not so general, Old Consols losing ¼ and the 4 per cent issue ½. The feature of a rather quiet foreign bond market was the slump in Egyptian loans on the Libyan news. Both the 4 per cent Unified and 3½ per cent preference issues were marked down sharply on Monday, while the next day both issues lost a further 3 points. Among South American issues, Brazilian stocks, after some slight marking down at the reopening, displayed firmness, but the Peruvian Corporation debenture lost ¼ on Tuesday, when the 6 per cent Peruvian loan fell 1½ points. The San Paulo Coffee loans both weakened slightly. Marking down at the reopening, and some light selling of speculative holdings, occasioned a general reduction in home rail quotations, both prior charges and junior issues suffering losses of ½ to ¾, but on Tuesday the tone became firmer and prices remained steady at the reduced levels. Similar conditions ruled in the foreign rail market, where South American issues were sold, San Paulo falling 1½ and Antofagasta consolidated ordinary ¼ on Tuesday. Losses among Argentine issues were widespread, but seldom exceeded ½ point. Elsewhere Canadian Pacific issues suffered small declines. In midweek falls in Egyptian

bonds, and foreign and home railways continued, but the Funds were steady.

The industrial market was generally dull, and despite some occasional scattered support, the actual volume of business was insufficient to prevent the steady decline in most sections. Brewery shares showed no change at the end of last week, but in common with other sections at the reopening, marking down was general. Distillers, Guinness and Watney deferred all losing 1s., Watney repeating the same fall the next day, when losses were generally fewer and smaller. Tobacco issues displayed some weakness, BAT falling ½ and Carreras ¼ on Monday. BAT eased a further ½ the next day, while Imps fell 1s. 3d. in midweek. Losses were widespread in the motor and aircraft group, Leyland losing ½ on the profits statement, at the week-end, while Rolls-Royce fell the same amount on Monday and the next day, when Raleigh Cycle Holdings eased 9d. In general, the heavy industrial section reflected the small turnover. Although Horden Collieries fell 1s. 3d. and Babcock & Wilcox lost 9d. at the reopening, most prices showed little change. Interest in the shipping section was slight, and prices in consequence weakened, although losses nowhere exceeded a few pence. After their recent improvement textile issues suffered persistent losses, Bleachers 5½ per cent preference falling 9d. on the report, while Rayon issues, among others, were distinctly weak with daily losses of a few pence. In the stores group both Woolworths and Marks & Spencer fell steadily, while among other issues John Barker lost 1s. 3d. on Friday and a further ½ the following Tuesday. The miscellaneous section reflected the general downward trend, and among leading issues, Turner & Newall, Boots, Murex and Manbre & Garton all eased to lower levels in the early part of this week. Among stocks with Egyptian interests, Sudan Plantations dropped 1s. 6d. on Tuesday after earlier but smaller losses. Later the general sagging tendency persisted with Egyptian interests predominantly weak.

The readiness of the Cape to take up any stock at reduced levels was generally sufficient to keep prices in the Kaffir market fairly steady, and despite the general marking down at the reopening, losses exceeding ½ were few. Among these, Rand Mines lost ½, while Central Mining declined ½, but there was some improvement on Tuesday. Among diamond shares, De Beers deferred and Consolidated Diamond Mines ordinary fell ½ and 6d. respectively on the passing of the interim dividends. Small scattered losses reflected the small volume of business in the tea market, while in the rubber market slight activity was insufficient to affect prices. Marking down and occasional selling depressed prices steadily in the oil market. Anglo-Iranian was particularly weak, losing ½ on Monday when Anglo-Egyptian fell ½, both issues having suffered earlier losses. The downward trend was widespread at the reopening, but later losses were confined to the leading issues, Burmah and Shell also suffering small but persistent losses. Later the Cape turned a seller of Kaffir and diamond shares, while the oil market saw further declines.

BANK OF LONDON & SOUTH AMERICA LIMITED

Affords a
complete international banking service
through its branches in

ARGENTINA, BRAZIL, CHILE,
COLOMBIA, ECUADOR, GUATE-
MALA, NICARAGUA, PARAGUAY,
PERU, EL SALVADOR, URUGUAY,
VENEZUELA, SPAIN, PORTUGAL.

Head Office:

6, 7 and 8, TOKENHOUSE YARD,
LONDON, E.C.2

Agencies in:

New York, Bradford, Manchester

OVER 850 BRANCHES
in all parts of Australia, New
Zealand and the Pacific Islands
for the conduct of every type of
Banking business.

BANK OF NEW SOUTH WALES

Incorporated in New South Wales with Limited Liability.

London Offices:

29, Threadneedle Street, E.C.2
47, Berkeley Square, W.1

NATIONAL DISCOUNT COMPANY, LIMITED.

(Established 1856.)

(INCORPORATING THE BUSINESS OF MESSRS. REEVE WHITURN)

35 Cornhill, London, E.C.3.

Telegraphic Address: NATDIS, STOCK, LONDON.

Telephone: MANSION HOUSE 5241/3.
do. do. 7631/2.

Subscribed Capital - £2,153,335
Paid-up Capital - £1,000,000
Reserve Fund - £1,300,000

Directors.

SIR SIGISMUND F. MENDEL, K.B.E., Chairman.
Lt.-Col. THE HON. GEORGE AKERS-DOUGLAS.
COMMANDER THE HON. LOVEL W. COKE.
H. S. H. GUINNESS.
RONALD L. BASSETT. SIR CHARLES D. SELIGMAN.

Manager. R. E. de B. BATE.

Sub-Managers.

H. R. W. BROWN.
W. SHEPHERD.

Secretary.
W. SHEPHERD.

Registrar.
G. H. ELLABY.

Auditors.

PRICE, WATERHOUSE & CO.

Bankers.

BANK OF ENGLAND.
NATIONAL PROVINCIAL BANK, LIMITED.

Treasury Bills, Bank and Mercantile Bills Negotiated.
Money received on Deposit at Call and Short Notice
at the Current Market Rates of Interest, and for longer
periods upon specially agreed terms.

Loans granted upon approved Securities.

All communications to be addressed to the Manager.

THE EASTERN BANK LIMITED

HEAD OFFICE: CROSBY SQUARE,
BISHOPSGATE, LONDON, E.C.3

Authorised Capital - £2,000,000
Paid-up Capital - £1,000,000
Reserve Fund - £500,000

BRANCHES:

BOMBAY, CALCUTTA, KARACHI,
MADRAS, COLOMBO, SINGAPORE,
BAGHDAD, BASRA, AMARAH,
MOSUL, BAHRAIN

Conducts all descriptions of
Banking business with the East.

Current Accounts are opened
and Fixed Deposits are received
at rates of interest which may
be ascertained on application.

EXECUTORSHIPS and TRUSTEESHIPS
UNDERTAKEN.

Industry and Trade

Up to the end of 1940 there was little control over industry, except indirectly, through the rationing of raw material supplies, the prohibition of the production of certain consumers' goods and the curtailment of others; moreover, there were no restrictions on the freedom of movement of labour. But the position had then been reached when direct Government intervention became an essential condition of a further and rapid expansion in the production of the goods of war.

On March 4th, Mr Oliver Lyttelton, then President of the Board of Trade, announced that the output of some of the factory trades supplying the civilian home market was to be concentrated into the smallest number of plants. The object of the concentration scheme was not to bring about any further contraction in output, but to release for war work additional manpower, factory space and machinery. Its scope was limited in that it was originally intended to be applied only to industries manufacturing certain consumers' goods with a combined labour force numbering about 1,000,000 insured persons aged 16 to 64 in July, 1939. Even within the industries covered, firms employing less than 20 persons were excluded from the scheme. Within its limited scope the process of concentration was substantially completed by the end of the year.

Apart from securing the concentration of the production of certain consumers' goods, the Government took control over the movement of industry. The Location of Industry (Restriction) Order, 1941, which came into force on July 25th, provides that no person may, without a licence issued by the Board of Trade, (a) "carry on at any factory or warehouse having an area of 3,000 or more feet super any trade or business not carried on there previously," or, (b), "carry on at other premises having an area of 3,000 or more feet super, whatever their previous use, a business of production or storage."

Moreover, in order to prevent the dislocation of essential

industries, the Government restricted the movement of labour by the application of the Essential Work Order.

The output of war equipment showed a substantial expansion; the absence of any major dislocations was due, in no small measure, to the reduction in shipping losses and the lull in air raids during the second half of the year.

But although 1941 was a year of solid progress, the process of mobilising industry for war is still incomplete.

Agriculture

The year opened with an unusually severe frost and spring came late; hill sheep suffered from a shortage of keep, both home-grown and purchased, and the lamb crop was correspondingly small. The summer drought led to a poor and late growth of root crops in the south and east, and the heavy rains in August, while they ensured a good flush of grass in the autumn, delayed the corn harvest until in some districts it coincided with potato lifting. All through the year the weather seemed to aggravate what was already the most pressing problem of the British farmer—the shortage of labour to handle the greatly increased acreage under crops in the time available. The further call-up of agricultural workers was postponed from the spring till the late autumn; there was a large increase in the number of tractors and other machines employed; greater use was made of the Women's Land Army and the casual labour provided by urban workers and schoolboys. But the shortage of labour remained as the factor limiting a further increase in the production of crops.

The fixing, in July, 1940, of a national minimum wage for agricultural workers at 48s. per week did not have the expected effect of stabilising wages; representatives of farm workers continued to press for a minimum of £3 per week, which, after having been approached by a number of county wages boards, was adopted by the Central Wages Board in December. The experience gained in the spring in the rationing of concentrated feeding-stuffs for farm animals led to considerable modifications in the scheme adopted for 1941-2; issues of concentrates to dairy cows

were linked to sales of milk and issues to other farm animals were confined mainly to specialist holdings. The decline in the number of pigs and poultry on commercial holdings is known to have continued, though the shortage of eggs gave an inducement to an expansion in the number of backyard poultry. Nor did these modifications altogether prevent a fall in milk yields during the year, which was only partially offset by an increase in the number of dairy cows. Coupled with the large and continuing increase in milk consumption, this led to a shortage of liquid milk during the winter and consumer rationing was introduced in November.

The Ministry of Food continued to buy at fixed prices most of the major farm products; in June the sale of eggs from flocks with more than 50 birds was restricted to agents of the Ministry, and a national marketing organisation was also set up to dispose of the 1941 crop of onions and carrots. The prices paid by the Ministry for its purchases were such that the majority of farmers undoubtedly improved their financial position during 1941, and this was especially so in areas where cereals, potatoes and beet are important; the index of crop prices compiled by the Ministry of Agriculture rose from 86 (1927-29 = 100) in 1938 to a provisional figure of 168 in December, 1941. On the other hand, low prices for store sheep continued, and only a few hill farmers benefited from the rising prices of dairy stock. The subsidy paid on hill ewes was raised from 2s. 6d. per ewe in 1940-41 to 7s. 6d. for 1941-42, as a means of repaying to hill farmers some of their increased outlay on wages. There was also an extension of Government grants for drainage, bracken cutting and the renovation of pastures.

Manpower Policy

THE year 1941 witnessed a gradually increasing demand on the nation's manpower, and in consequence gradually sterner measures of mobilisation. The year opened with the abandonment of appeals and exhortation, proceeded with the principle of direction, and closed with the adoption of conscription of women. In January, Mr Bevin announced that the Government was to comb out non-essential trades, compile an industrial register of available manpower and prohibit, under Essential Work Orders, employers in certain vital industries from dismissing their workers or workers from leaving their employment except with the permission of the Ministry of Labour. In the same month, compulsory fire-watching duties were imposed on male persons in certain areas and in certain premises; this form of compulsion was extended by the National Service (No. 1) Act of 1941, passed in April, which allowed men called up to be posted to civil defence. Also in January a Royal Proclamation rendered men aged 18-19 and 37-40 liable to register for military service; these were the last age groups covered by the National Service (Armed Forces) Act of 1939. Moreover, it was announced that men would no longer be reserved under the Schedule of Reserved Occupations unless they were actually engaged on work of greater national importance than service in the armed forces or industry.

It was not, however, until March that the implications of the new policy—with its sanction of compulsion in the background—were fully revealed. First of all, a scheme for the concentration of a large number of civilian industries was announced, which it was hoped would release 500,000 to 750,000 workers in the next six months. On March 17th a new Registration for Employment Order laid upon all citizens the obligation to register for work of national importance; by the end of the year men up to 46 years and women up to 31 had registered. Nevertheless, the procedure was at first far too slow. Up to the end of June some 1,233,000 women had registered, but only 196,000 had been interviewed by officials of the Ministry of Labour to find out whether they were available for transfer to war work; again, of these 196,000 only 25 per cent were found to be so available. The Ministry of Labour had placed too generous an interpretation on essential work. Moreover, the concentration of industry had only released some 149,000 workers directly, though many more had left the industries affected before concentration actually took place.

As the demands on manpower grew, however, the procedure was tightened up. In September the Ministry of Labour announced that there would be a more selective process of interviewing, though women covered by the Schedule of Reserved Occupations, in addition to those already in national or vital service or responsible for house-

holds, were still exempt. At the end of October it was announced that the Undertakings (Restriction on Engagement) Order was to be applied to all women aged 20-30, which meant that such women could only be employed, or obtain employment, through the employment exchanges; the Order came into effect in February, 1942.

All these measures for mobilising womanpower were taken under defence regulation 58A, made in May, 1940, which gave the Minister of Labour power to direct any citizen to perform any service which he thought that person capable of performing. The emphasis was thus on direction. The women were directed to war work, but it was held that there was no power to conscript women for the armed forces. Instead, women called up were told that if they did not join the armed forces they would be sent to work in a munition factory. In the meantime, however, the demands of the ATS were growing rapidly and were far outstripping the intake of volunteers or those to whom this indirect compulsion had been applied. In December, therefore, the National Service (No. 2) Act of 1941, in addition to placing a general obligation to serve on all citizens, made all single women liable to conscription—either for the forces, for civil defence or for certain munition work—and will first be applied to women aged 20-30. Married women and mothers are exempt from conscription, but can still be directed into war work under Regulation 58A unless their family responsibilities make it a genuine hardship. Other provisions of this Act raised the age-limit for conscripting men for the armed forces from 41 to 51 and enabled men to be compelled to do part-time military duties, that is, to join the Home Guard. Finally, the Schedule of Reserved Occupations was virtually abolished by the substitution of individual for block reservation.

Labour Conditions

THE main trends remained the same in 1941 as in 1940; they were speeded up. Unemployment, in effect, disappeared; below 200,000 in November and December, it represented less than a safe margin of workers changing jobs; and a large part of even the core of "unemployables" was absorbed. The picture is one of acute labour shortage.

* Number of working days lost.

Other labour statistics give the same picture of a "seller's market" for labour. In spite of a Government White Paper in the summer, counselling restraint in wage claims, the index of wages continued its steady rise, though the attempt to stabilise the cost of living was largely successful. rose by considerably more than wage rates. Hours lost by strikes and lock-outs were again astonishingly few, most of the disputes being small, local, short-lived and often unauthorised. Manpower was the scarcest sinew of war; and, in general, the demands of labour were generously met by employers who, under war conditions, have small incentive to count the cost.

The worst feature of labour conditions, not shown in statistics, is welfare arrangements to meet the influx and transfer of workers into war industries. The limits upon the workers' standard of living are physical rather than monetary; they are set by rationing and shortages, rather than by earnings, and by the presence or absence of decent arrangements for housing, travelling and works feeding.

Export Policy

IN 1940 exports were organised and pushed to provide currencies to pay for essential imports, at first indiscriminately to all countries (including, oddly, Empire countries) and then "selectivity" to earn dollars and "hard" currencies. In 1941 the whole status of exports was changed, and the export drive was disrupted and largely abandoned, wisely and necessarily, but to the discomfiture of export industries and exporters, who had made ready to push their wares abroad.

In the first quarter of the year the "selective" export programme ruled. Then, in March, the introduction of Lend-Lease removed its prime justification—it was no longer necessary to pay for United States supplies in cash. Dollars were still needed to pay for old orders and new contracts outside of Lend-Lease arrangements, and hard currencies were still needed to pay for essential supplies from Latin America. But, from being a major war industry, exports became of minor importance. In July, a White Paper recorded a British promise not to compete with American exporters in neutral markets in goods in short supply because of Lend-Lease; the corollary of this, that the United States and Britain should together finance essential imports from Latin America, though expected, has not been made public.

By the end of 1941, therefore, the status of exports had changed radically. Formerly, export industries had enjoyed a priority next to, or even equal to, munitions. Now, no

labour, materials or plant needed for direct war work should normally be available for the export industries, whose resources became free for war production. The test, rightly and properly in total war, was now physical and not financial. The only exceptions were the interim need, pending an international financial agreement, to pay for essential imports outside of Lend-Lease; and the lasting need to furnish British overseas countries and friendly nations with essential civilian supplies. By the end of the year a ban on the export of everything but these countries' bare necessities was widely asked for on sound grounds of war economy.

Commodity Prices

THE rate of increase in the wholesale prices of basic commodities slowed down considerably in 1941. *The Economist's* index of prices advanced by 7.5 per cent between December, 1940, and December, 1941, and the more comprehensive Board of Trade index rose by 4.9 per cent during this period. Between August, 1939, and December, 1941, the two indices recorded rises of 54 per cent and 59 per cent respectively.

The comparatively small price increase in the past year suggests that control has been fairly effective. Since the interplay of supply and demand had been replaced by the control of imports and production and by the method of allocation and rationing, a measure of price stability was to be expected. Such increases as have taken place can be ascribed largely to higher costs of production or imports. Changes in the prices of the commodities included in *The Economist* index, as well as details of the index, are shown on page 30.

So far as retail prices are concerned, the Ministry of Labour's index of the cost of living for January 1, 1942, was only 2 per cent higher than a year earlier. Between September 1, 1939, and January 1, 1942, the index registered an advance of 29 per cent.

During the past year the Ministry of Labour's index of clothing prices rose by 21 per cent; fuel and light were 3 per cent, and miscellaneous items 5 per cent dearer. The index of food prices was actually lower at the beginning of 1942 than a year earlier.

The stabilisation of the Ministry of Labour's index of the cost of living has involved an increase in the subsidies.

Finance and Investment

The Stock Exchanges

IF 1940, the first full year of the war, mainly reflected the course of external military and political events, the past year, 1941, portrayed the logical consequences of wartime financial methods on the stock markets. It is certain that considerable encouragement was derived from the relatively favourable

course of the war, in particular the ever-increasing difficulties of the German armies in Russia, with our consequent immunity from the constant threat of invasion and air-raids.

Apart from some short period influences, the trend of prices was determined by purely financial factors. To a rising national income and volume of saving were added the proceeds of periodic Treasury vestings. These operations, much criticised for their total disregard of redemption dates,

included American, Canadian, South African and Indian securities, as well as the repayment of the 5 per cent LCC loan 1940-60 in February. These influences were early felt in the gilt-edged market, and despite the competition of war weapons' weeks throughout the country, prices advanced steadily. Thus, in October, 3½ per cent War Loan touched 106½, the highest level since 1936. The success of the

BRITISH AND AMERICAN INDUSTRIAL SHARE PRICES DURING THE PAST TWO YEARS

American: *Standard Statistics* Index of 50 Common Stocks (1926=100)

Treasury tap issues of the 2½ per cent National War Bonds fully reflected the rise in the Funds. Although by waiting seven weeks between the closing of the tap on the 1946-48 issue and the new loan in early October the top of the market was mixed, it was possible to extend the redemption date to 1949-51 and still obtain a favourable market.

By early summer, however, the steadily declining yield on gilt-edged stocks compelled the investor to turn his attention to equities. Although the severity of EPT continued to form the theme of innumerable chairmen's speeches, it was felt that its worst effects had been seen, and those shares with favourable standards and good post-war prospects soon advanced. Thus, according to the *Actuaries Investment Index*, the yield margin between Old Consols and industrial shares at the close of 1940 was 3.21, at the end of April it was unchanged, but by the end of September it had narrowed to 2.23. Over the same period, turnover, which during the Balkan campaign had fallen to barely 1,500 bargains daily, showed marked improvement, and throughout August to mid-October the number of bargains daily exceeded 3,000.

The year, however, ended on a more sombre note. Prices, which despite the increasing tension had been well maintained, reacted sharply on the actual outbreak of hostilities in the Far East. But as long as the underlying confidence in ultimate victory exists, financial and technical, rather than military, considerations will determine the trend of prices.

New Capital Issues

BRITISH Government issues in 1941 reached a new record for recent years at a level of £1,497.5 millions against £1,070.8 millions. The increase of £426.7 millions is, however, considerably less than the previous year's increase of £1,034.0 millions. The following table indicates the trend of

Calendar Years	British				Empire	Foreign	Total Issue	Index 1928=100
	Government	Home Corporations*	Others	Total Home				
1928	83.9	14.9	164.8	263.6	63.2	42.3	369.1	100

borrowing in the London market, excluding issues by Permission to Deal, over the past eight years and provides a comparison with 1928, the base year for purposes of the index, which now stands at 406. The second table analyses borrowing inclusive of issues by permission to deal and shows a rise in the amount raised last year from £1,088.7

TOTAL BORROWING, INCLUDING STOCK EXCHANGE "Permission to Deal" (Million £)

Calendar Years	British				Empire	Foreign	Total Issue
	Government	Home Corporations*	Others	Total Home			
1938	75.9	27.7	110.1	213.7	53.7	5.7	273.1
1939	36.8	12.1	66.2	115.1	25.5	2.2	142.8
1940	1,070.8	Nil	16.6	1,087.4	1.3	Nil	1,088.7
1941	1,497.5	Nil	8.0	1,505.5	4.2	0.1	1,509.8

* Including County and Public Board Loans.

millions to £1,509.8 millions. The total of extra-governmental borrowing, calculated on the wider basis, declined from £17.9 millions to £12.3 millions. Industrial borrowing at home was more than halved at £8.0 millions against £16.6 millions, but there was a moderate rise in Empire borrowing from £1.3 millions to £4.2 millions. Issues by home corpora-

tions were nil, while foreign issues totalled only £0.1 million. The third table analyses conversions over the past six years. There was no Government conversion in 1941, compared with the issue of £352.8 millions of 2 per cent Conversion in the previous year. Extra-governmental conversions, however, totalled £54.4 millions against nil. The foregoing tables suggest that the tendencies in the new capital market, which have been evident since the outbreak of war, of increased Government borrowing and virtual exclusion of industrial issues, were continued last year.

CONVERSION ISSUES (Million £)

	1936	1937	1938	1939	1940	1941
British Govt.	37.2	Nil	Nil	Nil	352.8	Nil
Other	109.7	58.5	23.6	26.0	Nil	54.4
Total	146.9	58.5	23.6	26.0	352.8	54.4

Exclusion of the unofficial borrower was more complete, and a high proportion of the non-governmental issues were, in fact, made by public utility companies. The rise in the total of Government borrowing was, however, less substantial than might have been expected in view of the vast increase in supply expenditure last year. The entire total was, of course, raised by reliance on issues through the tap. It is more than probable that the increased tempo of the war will demand an acceleration in Government borrowing in 1942.

Industrial Profits

Last year was a period of further mobilisation of industrial resources, and it might have been expected that this would be reflected in industrial profits. The gross figure, however, shows a rise of only just over 3.3 per cent to rather under £391½ millions for the 2,041 concerns which reported during the calendar year. The modest character of the rise is due to the effects of EPT at 100 per cent and the curtailment of non-essential production. Meanwhile, the net profit after debenture interest dropped from £198.6 millions to £175.6 millions, a fall of some 11.5 per cent. The movement of earnings over the past decade is shown in the first table below:—

Calendar Years	No. of Companies	Net Profits*		"Chain" Index 1928=100
		Current Year's Reports	Same Companies, Preceding Year

Unlike 1940, every quarter of 1941 contributed its quota to the decline in net profits, but the fall was heaviest in the third and lightest in the fourth quarter. The quarterly fluctuation appears, however, to owe more to the seasonal character of certain industries, which influences the date

DIVISION OF PROFITS (FOURTH QUARTER COMPANIES)

Reports Issued during Fourth Quarter	Proportion of Profits (after Deb. Interest)			Rate of Payment on each Class of Capital

at which they report, than to any change in general experience of industry as a whole.

With a fall in net profit, there is inevitably a rise in the proportion going to preference capital, and the following table for fourth quarter companies shows a considerable fall in the proportion received by ordinary shares. For fourth quarter concerns the fall in equity earnings continued, while the decline in payments broken last year was resumed.

The Money Market

JUDGED by the changes of interest rates which it witnessed, 1941 must rank as the least eventful year in the history of the London money market. During the year the open market discount rate remained fixed at 1½ per cent, and the short term money rate at 1 per cent. Yet, within this appearance of monotonous stability, it may truly be said that momentous changes have taken place in the functioning of the money market and in the machinery of credit control. The most important of these arose from the growth in Treasury deposit receipts, which, from the point of view both of the authorities and of the banks, have come to overshadow Treasury bills as a liquid asset and as a factor in the credit position. It should be noted that over the year the clearing banks' bill holding fell from £264,856,000 to the clearing banks' bill holding fell from £264,856,000 to almost uninterruptedly from £313,500,000 to £758,000,000. To complete the picture it should be pointed out that there was a fall of short loans by the clearing banks from £158,504,000 at the end of 1940 to £141,316,000 at the end of 1941. In other words, the dominant element in the banks'

AVERAGE MONEY RATES

Year	Bank Rate	Market Rate 3 Months' Bills	London Deposit Rate Banks	Short Loans
1929	5 10 0	5 5 4	3 10 0	4 12 3
1937	2 0 0	0 11 6½	0 10 0	0 15 1½
1938	2 0 0	0 12 7	0 10 0	0 15 7
1939	2 5 3	1 4 5½	0 13 7½	1 2 2
1940	2 0 0	1 0 10	0 10 0	1 2 3
1941	2 0 0	1 0 10	0 10 0	1 2 6

structure of liquid assets had by the end of the year come to be represented by a type of security created through direct contact between the banks and the Treasury and divorced entirely from the open money market.

The issue of Treasury bills increased from £2,151,000,000 to £2,547,000,000 during 1941, and towards the end of the year the outstanding amount of bills issued through the weekly tender was running £130,000,000 higher than at the end of 1940. But it is evident from the published figures of bank and discount company balance-sheets that an increasing proportion of Treasury bills—of tender as well as tap bills—has been making its way into non-market quarters. Public departments and overseas central banks and issuing

authorities have between them absorbed much more than last year's expansion of £396,000,000 in Treasury bills. In July, 1941, it became known that Treasury bills were being issued through the tap to Empire central banks. Long before that, the competition of these institutions at the weekly tenders for Treasury bills had become so keen as to keep the discount market on exceptionally short rations. It was to meet this situation that the weekly offerings of Treasury bills were increased from £65,000,000 to £75,000,000 during the year. Apart from these changes, made for the convenience of the discount market, all other fluctuations in the issue of Treasury bills disappeared. Their issue had become almost static, and it was the Treasury deposit which became the truly elastic element in the floating debt—and therefore in the liquidity structure of the banks.

The extent to which the banks have allowed their money, market assets to run down has increased the dependence of the discount market on the official buyer. The market has not had to borrow or discount at the Bank of England at the customary official rates for such assistance. But the market has repeatedly gone to the special buyer of bills when pressed for money and has almost invariably found him ready to buy selected and usually short maturities at the banks' buying rate of 1 per cent. The modern equivalent of being "in the Bank" involves, therefore, no penalties. The increasing resort to such open market operations taken in conjunction with the increasing direct contact between the banks and the central bank through Treasury deposit receipts has undoubtedly increased the artificiality of the discount market as such, and the market has increasingly turned its attention to dealing in and running Government bonds of short to medium currency. Owing to this long-standing change in the nature of the discount market's operations, the trend towards concentration among its member firms has made further progress during the year.

Foreign Exchanges

By January, 1941, the structure of foreign exchange control had crystallised. The registered account machinery, operated with the United States and Switzerland, remained undisturbed during the year with a middle rate of \$4.03 and of 17.35 Swiss francs to the £. Special accounts had by the end of 1940 covered the whole network of neutrals with whom Great Britain was transacting trade, with the exception of Russia, China, Japan and a number of Central American countries. After Germany's invasion of Russia, that country was brought within the fold of the trade and payments agreements. The financial agreement signed in July, 1941, provided for the financing of the whole of Soviet-sterling area trade through a centralised clearing account to be kept at the Bank of England in the name of the State Bank of the USSR. China was brought within the sphere of special account countries later in the year, and with Japan's entry into the war a quotation for the Chinese national dollar replaced the Shanghai dollar. The yen ceased to be quoted after the application of economic sanctions to Japan in July.

The agreements which led to the opening of Central American accounts with 12 Central American republics introduced a principle of some importance in the machinery of sterling exchange control. Until then the control, *vis-à-vis* non-sterling countries, had in general been operated on a strictly bilateral basis. The registered or special accounts through which the payments in question were being financed were made available only for mutual transactions between the sterling area and the country concerned. This tended to force the trade in question within the rigid limits of bilateral equilibrium. In the case of the 12 Central American countries, the trade and financial unit to which the scheme of payments was made to operate was extended to embrace all of them. Thus, it was possible to compensate payments, surpluses and deficits of the sterling area within this larger number of countries to the undoubted advantage of all parties concerned. The whole of the world with which Great Britain trades is now encompassed within the network of all parties concerned.

The main feature of the foreign exchange position is the extent to which trade is divorcing itself from the machinery of foreign exchange settlement. With the passage of the Lend-Lease Act, the arrangements whereby Canada is supplying munitions, materials and foodstuffs free of any charge to the British Government and the extension of the Lend-Lease principle to both British and American deliveries to China, the proportion of international transit of goods which now has a foreign exchange counterpart must be exceptionally small.

Overseas Countries

United States

THE outstanding feature of 1941 was the rise in production. The manufacture of durable goods rose from an average of 138 in 1940 to a figure estimated at 212 in November and probably higher by the end of the year. The production of non-durable goods was, on an average, 113 in 1940 and 142 in November, 1941. The rise in mineral production was less pronounced—from 117 in 1940 to 129 in November, 1941. The increase in output was accompanied by an increase in the index of factory employment from 107.5 in 1940 to 132.7 in October, 1941, and by an increase in the average working week from about 38 for 1940 to 41 in August, 1941.

Prices.—Prices rose throughout the year. The Bureau of Labour Statistics index of wholesale prices was 79 on an average in 1940, and 94 at the end of November. Much of this rise was attributable to farm products, which rose from 71 at the beginning of the year to 91 in November. Primary commodities rose higher—the BLS basic index rising from 119 at the beginning of the year to 157 in early December. The rise in the cost of living index was smaller—from 100 in 1940 to 108 in September.

Industry and Trade.—Building was extremely active throughout the year. From the average of 81 in 1940, the index of construction rose to 159 in September. The great (and more sustained) rise was in non-residential building; by early summer, residential building seemed to have reached a peak, perhaps owing to the pressure of priorities. Retail trade was high through the year; but the buying boom seemed to have culminated in the summer and was followed by a distinct setback in the autumn. With factory payrolls up from 105 in 1940 to 163 in September, and with agricultural income up by about one-third, the purchasing power of consumers was at a high level at the end of the year, although the rise in prices was reducing the capacity of certain groups.

While several price ceilings were introduced early in the year, and the number increased steadily thereafter, the principal "control" measure was an increasingly elaborate system of priorities, designed to allocate supply and so reduce the influence of demand upon price. As stocks seem to have been large, the supply to civil consumers without priority remained generally adequate, and no rationing of civil consumption was imposed up to the end of November.

Foreign Trade.—The amount of foreign trade in 1941 changed, compared with 1940, less than its character. For the first eight months exports at \$2,900 millions were only \$200 millions higher; but imports at \$2,150 millions were \$400 millions higher. Exports had come to be predominantly exports to the British Empire. Net gold imports, which had amounted to \$4,700 millions in 1940, dropped sharply after the Lend-Lease Act; they amounted to about \$800 millions in the first nine months, three-quarters of this coming in the first four months.

Finance.—The interest-bearing public debt increased from \$44,500 millions at the end of 1940 to nearly \$51,000 millions at the end of September and to approximately \$54,000 millions by the year-end. Up to the end of September, over half of the public offerings were of the "non-marketable" types—i.e., Savings and Defence Bonds and Tax Notes. After September, there were two public offerings of the marketable type, carrying a rate of 2½ per cent for long-term and 2 per cent for medium-term.

Banking.—No primary credit expansion—i.e., of the Federal Reserve Banks—occurred during 1941. The reduction of gold imports combined with an extremely heavy demand for currency reduced member bank cash by about \$800 millions during the year, while the increase in reserve requirements in November further reduced excess reserves, which, however, remained at nearly \$4,000 millions in early December. Commercial bank credit, however, expanded greatly, total loans and investments of the Reporting Member Banks rising from about \$25,500 millions at the beginning of the year to about \$29,700 millions in early December. Total deposits rose only half as much. The increase in member bank assets was almost evenly divided between commercial loans and investment in Government securities. During the year, the Reserve authorities introduced two control measures—one general (the increase in reserve requirements mentioned above) and the other selective—a limitation of instalment credit.

Canada

THE stage of full production was reached in many sectors of the Canadian economy during 1941, as the Dominion achieved a position as one of the main arsenals of democracy. Repercussions of the expansion in war production upon prices and distribution became more marked. Increasing shortages were a feature of the year, leading to greater and more direct controls than Canadians have hitherto experienced. The output of consumers' goods began to be shut down in the interests of war production. Priority methods were extended into many lines of business.

With war expenditures past the \$3,000,000,000 mark, vastly increased purchasing power began to spur prices upwards. The Government set itself to maintain the price level by establishing a general ceiling, without relaxing its efforts to divert purchasing power into war channels, away from the field of non-essentials.

The approach to conditions of all-out activity has not been uniform. The Canadian Bank of Commerce index of industrial activity, at the end of the year, showed the proportionate rate by measuring the percentage of current capacity utilised:—

Capacity diminished.—		Dec. 1941	Dec. 1941
Food, drink and tobacco	80	Non-ferrous metal products	149
Clothing (textiles, shoes)	108	Non-metallic minerals	106
Pulp and paper	101	Chemicals	114
Wood products	95	Miscellaneous	115
Automotive trades	147	Composite index	115
Iron and steel trades	149		

Foreign Trade.—Remarkable increases were recorded in external trade, both in exports and imports. Exports of Canadian products, exclusive of gold, reached \$1,621,003,000, compared with \$1,178,954,000 in 1940. Imports for eleven months ended November were \$1,322,905,951, compared with \$979,648,243 in the same period of the previous year. Great Britain and the United States continued to absorb the bulk of Canadian exports, but a notable growth occurred in exports to Egypt, to India and to the British West Indies. The increases were accounted for mainly by military supplies. Export increases were most marked in wood products, agricultural products, non-ferrous metals and animal products. But the greatest gain was in iron and steel exports, particularly motor transport.

A Canadian trade mission toured South America late in the year, bringing back most-favoured-nation agreements with Argentina, Brazil and Chile; a provisional agreement with Ecuador to remove its 50 per cent surtax as far as Canada was concerned; and understandings with Peru and Uruguay.

Agriculture.—Principal field crops in Canada in 1941 had an estimated value of \$649.1 millions. Wheat production fell from their high 1940 figure of 550 million bushels to 302 million bushels. This amount is less than domestic and probable export requirements before the new crop is harvested, so that the carry-over of wheat may be reduced by 100 million bushels from the figure of 480 million bushels at July 31st last. Total farm income in Canada in 1941 was in the neighbourhood of \$900,000,000, about \$66,000,000 below the 1940 level.

Banking and Finance.—Bank deposits of all kinds increased from \$3,100 millions to \$3,535 millions at the end of the second year of war. Current loans to the public, which amounted to \$826 millions at the outbreak of war, increased to \$1,153 millions in the same period, an increase of \$327 millions. Chartered bank investments in Federal, provincial and municipal Government securities reached \$1,539,498,000 in 1941. Cash and immediately available assets represented 19.5 per cent of the bank's total liabilities, compared with 22 per cent at outbreak of war.

Prices.—The Dominion Bureau of Statistics index of 567 commodity wholesale price series (1926 = 100) showed an increase of 11.4 per cent during 1941. The index declined fractionally in December, the first month in which the price ceiling policy was in effect. The cost-of-living index (1935-9 = 100) stood at 115.8 as the year closed. The wartime increase has been 14.9 per cent.

Seasonally adjusted indices of employment (1926 = 100) for all industries rose to 157.8 at the beginning of November, compared with 129.6 at the same date in 1940.

Australia

Industry.—Important progress was made during 1941 in the production of all kinds of instruments of war. Australian factories are now producing, among other weapons, large numbers of Bren guns, as well as tanks and various kinds of aircraft, including Beaufort bombers, Tiger Moths and Wirraways. Australian shipyards are engaged in the production of merchant ships up to 9,000 tons. At the same time, many non-essential industries—for instance, clothing and furniture manufacture—were also busy, partly in order to replace goods formerly imported from abroad. The number of persons employed in factories increased from 629,000 in December, 1940, to 692,000 in September, 1941. In this period, the index, for mining activities (other than goldmining) rose from 900 to 948 (1928-29 = 1000).

Labour.—The unemployed percentage of the total number of workers fell, according to trade union statistics, from 6.2 per cent in the last quarter of 1940 to 3.2 per cent in the third quarter of 1941. It was then particularly low in the following trades: engineering, etc., 1.7 per cent; wood, furniture, etc., 1.8 per cent; clothing, etc., 1.4 per cent; books, printing, etc., 1.0 per cent. It was still comparatively high in the building industry (5.1 per cent) and in the mining and quarrying industries (7.3 per cent). The number of retail shop workers was on the increase and reached in September a figure almost one-third above that of July, 1933. The average number of working hours per week was only 43.91 in the first six months of the year, compared with 44.04 in the last quarter of 1940. A number of trade disputes occurred early in the year, but these faded away with the growing tension.

The greatly increased national income resulted in increased spending on non-essential goods and various forms of amusements. The value of retail sales in Sydney in the quarter ended August, 1941, was 20.8 per cent above the corresponding period of 1940, though retail prices increased only by about 4 per cent during this period. No rationing, except for petrol and paper, has been introduced, though the latest import restrictions concerning 844 items (issued in December, 1941) have been introduced partly with a view to restricting civil consumption.

Finances.—According to the budget introduced in October by the new Labour Government, the Commonwealth's total expenditure will rise from £A255.4 millions in 1940-41 to £A325 millions in 1941-42; of this £A162.5 millions are to be spent on Australian home forces and £A59 millions on Australian forces overseas. The ordinary revenue is to be increased from £A150.5 millions to £A185.6 millions, while £A137.1 millions (against £A62.1 millions last year) are to be raised from internal loans.

Agriculture.—The 1941-42 wool clip is estimated at roughly 3.5 million bales, which is about the same amount as last year's. The grain prospects vary considerably between the various States.

Transport.—The active business conditions are reflected in the railway statistics. Australian railways reached a new peak in all their main activities during the period from July, 1940, to June, 1941. The respective figures, with those for 1939-40 in parentheses, are:—Freight carried per day, 14,556,000 net ton miles (13,524,000); number of passenger journeys per day, 1,127,000 (1,029,000); net revenue per month, £A943,000 (£A817,000).

New Zealand

Foreign Trade.—Up to the end of September, the latest period for which figures are available, New Zealand's overseas trade was well maintained. Export values for dairy produce, meat and miscellaneous items were all higher than in 1940, but those for wool were slightly lower.

Trade figures for recent years are as follows:—

Years ended	OVERSEAS TRADE £ millions.			
	In New Zealand Currency		In Sterling	
	Exports	Imports	Exports	Imports
1929	56.2	48.1	56.2	48.1
1932	36.6	24.4	33.4	22.2
1939	57.7	53.9	46.2	43.2
1940	68.0	47.6	54.4	38.1
1941	68.6	46.3	54.9	37.1

Owing to debt repayment and war expenses overseas, most of the active trade balance of £NZ22.24 millions was re-

quired for invisible items, and the exchange funds held by all the banks increased during the year by only £NZ3.5 millions to £NZ25.68 millions. Wholesale prices rose by 10 per cent during the year, but export prices, retail prices and wage rates showed very moderate increases.

Under war conditions, the greater proportion of the total trade has been with Britain and the Empire. Exports have been concentrated mainly on goods covered by the war agreement with Britain, and imports are confined chiefly to the more essential commodities. Under petrol restriction and import control, imports of motor vehicles have almost disappeared and imports of goods that can be produced in New Zealand and of materials for public works have been greatly reduced.

Banking and Finance.—Total bank returns have changed little during the year, apart from seasonal variations and a shift from Government advances at the Reserve Bank to Government securities held by the trading banks.

COMBINED BANK RETURNS

End of	Note Circulation	Deposits, Government and others				Net Exchange Funds Abroad
		Government	Advances, Government	Securities, Other	Other	
1935	6.5	70.6	6.9	47.9	40.0	
1939	13.4	69.4	35.1	54.0	8.6	
1940	15.9	84.3	47.6	47.0	22.2	
1941	17.7	85.8	47.0	48.6	25.7	

The note issue has continued to increase and there is some evidence that notes are being hoarded. The liquidity of the Reserve Bank's assets increased with the fall in Government advances, while that of the trading banks decreased with a decline in their deposits at the Reserve Bank and an increase in their holdings of Government securities.

State receipts and expenditure are now spread over many different accounts. For 1940-41, total receipts for the consolidated fund, the social security fund, the war expenses account and the public works accounts totalled £NZ98.4 millions and expenditure £NZ96.4 millions, but the receipts included £NZ26 millions of loan money. For 1941-42 a heavy increase in war expenses is budgeted for and a smaller increase in expenditure from the social security fund. Total expenditure is expected to reach £NZ138.7 millions, including £NZ69.7 millions for war and £NZ20.6 millions for public works. Taxation is expected to yield £NZ63.7 millions, other revenue £NZ13.3 millions, and loans £NZ56.9 millions.

South Africa

Finance.—South Africa's expenditure on the war is now getting on for forty times the pre-war peacetime expenditure on defence. The first estimate of war expenditure for the year ended March 31, 1941, was £14 millions; in August, 1940, the estimate was raised to £46 millions, but the final figure was £60 millions. In 1941-42, the estimate is £72 millions, and £80 millions has been budgeted for in 1942-43. In the current year, war expenditure has been met by revenue and borrowing in equal proportions, but total revenue, which, of course, has to cover non-war expenditure as well, has risen to about £79½ millions.

Trade.—In spite of this rise in revenue, it is probable that taxation is not heavy enough to offset the big rise in the Government's war expenditure, and there is a real danger of inflation in the present state of the Union's economy. By value, it is true, imports were well maintained in 1941, at £100 millions, against £96 millions in 1940. Although the United States has now become the chief source of supply and sent £38 millions of goods, shipments from the United Kingdom were well maintained, amounting to £30 millions, against £35 millions. But the price index of imports has risen to 1,810 (January, 1914=1,000), compared with an average of 1,488 in 1940 and 1,226 in 1939, so that the volume of imports is declining. Exports, excluding gold and wool, rose by £3 millions to £31 millions last year; but the sales of wool under the agreement with the United Kingdom Government, estimated at about £10 millions, and the sales of gold to the Bank of England, which may be put at £119 millions (the value of the output last year was £120 millions and £1 million was added to the Reserve Bank's holdings) left South Africa with a favourable trade balance of about £60 millions.

Banking.—Some £30 millions of this trade balance was utilised in the vesting of four South African sterling loans, (3 per cent stocks of the Cape of Good Hope and Natal, the 4 per cent Union stock, 1943-63, and the 5 per cent Union stock, 1945-75). In preparation for the vesting the Reserve Bank's holdings of British Government Treasury bills rose to nearly £22 millions in November, then fell away again to less than half a million at the end of the year. Illustration of the country's economic activity is provided by the note circulation of the Reserve Bank, which rose from about £21 millions in January, 1940, to £30 millions at the end of the year, and in the deposits of the commercial banks in the Union, which amounted to £136 millions on June 30th last year, compared with £125 millions on March 31st and £111 millions on June 30, 1940.

Agriculture.—There was a severe drought in 1941 which adversely affected agriculture in general, but particularly the dairy industry. There was a big drop in butter production, and in October the Dairy Industry Control Board, as a temporary measure, rationed the distribution of butter to 75 per cent of its normal sales. The drought also caused a heavy demand on feeding stuffs, and there was consequently an unusually big domestic demand for maize. The 1940-41 maize crop is estimated at 24,324,000 bags of 200 lb., against 20,700,000 bags in 1939-40. The wool clip in the year ended June 30, 1941, is estimated at 241,370,000 lb. and the current clip at 250,450,000 lb. Owing to the shipping difficulties, probably only about half of the Union's exportable surplus of citrus fruit was exported last year. The deciduous fruit crop, owing to its perishable nature, has lost its overseas market since the beginning of the war. For both industries, there are control boards which buy the fruit from the growers and pool the income received from sales. A great deal has been done to find a domestic outlet for the crops, and there has been a big increase in jam-making and in canning.

Industry.—There are many other industries which, owing to the war, have been either started or expanded in the Union. Not only is this true of the secondary industries, which aim at replacing many things previously imported from abroad, but there is also a big increase in direct war production. The general index of employment, including employment in mines and transport, but excluding alluvial diamond diggings, was 1,903 in October (July, 1925 1,000), compared with 1,802 in January and an average of 1,780 in 1940.

Eire

As a result of the compulsory tillage order and the guaranteed price of wheat the area under crops increased by over 100,000 acres. Yields did not rise in proportion and part of the produce was withheld by farmers from the market. Consequently, a serious shortage of flour and bread became apparent towards the end of the year. The livestock industry was seriously dislocated by foot and mouth disease, but the plague died out in the autumn and cattle exports were resumed on a very large scale. Industrial unemployment did not increase to the extent that was expected. Imports of many raw materials were fairly well maintained, and the situation was relieved by recruiting for the defence services and by emigration. Owing to difficulties in importing coal, transport was seriously impeded and railway services were drastically reduced. For domestic purposes the place of coal was largely taken by turf. Many other imports, in particular tea, tobacco and petrol, were reduced to small proportions, with the result that the balance of payments became very favourable and the sterling holdings of the banks increased. The monetary circulation and the volume of bank deposits increased, but advances and profits declined. During the first nine months of the financial year 1941-2, revenue amounted to £23,424,230, compared with £22,717,827 in the previous year, and expenditure amounted to £28,492,665, compared with £26,319,284. A loan of £7,000,000 at 3½ per cent was successfully floated, the whole issue being taken up by the public.

India

On the whole, the year 1941 was quite favourable, if the aftermath of Japan's plunging the Pacific into conflict is not taken into account. Industrial production during the year reacted to the stimulus of wartime demands, and the efforts of the Eastern Group Supply Council had a stabilising influence. The difficulties of shipping freight and increasing import controls encouraged domestic production on a scale

never previously attempted. The trend of industrial profits during 1941 was consequently more satisfactory than during the previous year. Several industries, particularly jute, cotton, steel, paper, chemicals, glass and engineering industries were working to capacity.

Currency.—The effects of currency developments last year may be felt to an increasing extent in the immediate future. There was a prodigious expansion in the total note circulation, which amounted to Rs. 353 crores, in the third week of January, 1942, compared with Rs. 182 crores in the pre-war year 1938-39 and Rs. 242 crores on March 31, 1941. This is partly the consequence of the steady increase in the sterling balances, transferred from the banking to the issue department of the Reserve Bank of India, amounting for the first nine months of the current financial year to Rs. 135½ crores. At the rate at which the redemption of the sterling debt of India is proceeding it will not be long before she ceases to be a debtor country.

Prices.—The wholesale prices of all commodities have recorded a pronounced increase since July, which was especially noticeable in regard to food articles (other than cereals, pulses and sugar) and cotton manufactures. The sudden rise in the prices of these articles produced serious unrest in certain districts in December. The technique of price control is yet far from efficient, and needs to be perfected at an early stage to relieve the distress of a large agricultural population.

Banking.—The banking situation proved satisfactory, though the invasion of Malaya led to some withdrawals from the smaller banks having business in that colony. The problem of idle money, shown by the increase of Rs. 95 crores in the deposits of the scheduled banks, is becoming increasingly important, as it may go into cold storage unless new channels of investment are opened up. Some part of it is indeed the result of the debt legislation in the agricultural provinces, which has had the effect of diverting funds from land.

Transport.—The gross traffic receipts have broken all past records, and the net revenue for the current year may well amount to Rs. 24 crores, more than twice the budgeted figure. The railways, the principal means of transport under the present situation, are faced with the problem of carrying an abnormal volume of traffic, and last year complaints were loud, both at Bombay and Calcutta, about the wagon shortage with reference to coal supplies to undertakings engaged in essential war work. The diversion of 200 locomotives and 10,000 wagons and other vehicles to meet military requirements to the Middle East and elsewhere has caused a shortage of stock. Motive power equipment is likely to create further difficulties, as locomotives whose life has expired cannot under present circumstances be easily replaced. The attempted construction of locomotives at the Ajmer shops of the B.B. and C.I. Railway cannot within a measurable distance of time meet anything but a fraction of the present demand. The Government must now be appreciating the wisdom of the recommendations of the Mount (Pacific Locomotive Enquiry) and the Manufacture of Locomotives Committees to start the manufacture of broad gauge locomotives more than two years ago. The transfer of freight from coastal shipping to the railways, increasing goods traffic produced by the rising tempo of war industries, military movements, and the very large increase in civilian traffic probably exceed the peak load capacity of the Indian railways, and the public are being requested to travel less. With drastic petrol rationing, the road offers a poor alternative.

USSR

In general terms, the economic plan for 1941, that is, the fourth year of the Third Five-Year plan, aimed at increasing particularly the output of iron and steel, non-ferrous metals, coal and oil. Heavy engineering, especially the manufacture of machine tools, was to be advanced to maximum output. At the same time, the decentralisation of industries was attempted by reorganising the country into nine regions, with a view to making each region as far as possible self-sufficient. The centralisation of the armament industries, on the other hand, was tightened. At the beginning of the year, determined attempts were made to improve the quality of manufactures, to increase the efficiency of workers, and to reduce absenteeism. The construction of new factories in the Urals and the Asiatic parts of the Soviet Union was accelerated. The extraordinary programme of training annually a reserve

of skilled labour amounting to 800,000 was well under way. The total number of workers was to be increased from 30.4 millions to 31.6 millions. The agricultural plan demanded the extension of the cereal crops by 8 per cent.

The general outline of the 1941 plan shows that the near-war economy of the Soviet Union was preparing for full mobilisation. The problems of transition to war economy after Germany's surprise attack on June 22, 1941, were, as in other countries, the rationing of civilian consumption, the reduction of civilian production, the supply and allocation of raw materials and manpower. Important changes were, however, not necessary, since consecutive Five-Year Plans had used these methods in varying degrees. The main problem was the evacuation of factories and workers in accordance with the withdrawal of the armies. At the height of the German advance at the beginning of December, the main industrial district of the Don Basin and the Moscow region were not only threatened, but partly occupied. The manufacturing industries of the Leningrad district were cut off from their supply bases. More than one-third of the entire industry of the country was lost. During June, July and early August, the armies withdrew from areas predominantly agricultural. Some of the harvest may have been saved, but a considerable part was destroyed under the scorched-earth policy. In August, the large-scale evacuation of factories, i.e., machinery as well as workers, began on a large scale, and was continued during September to November. It is suggested that from the two industrial centres, Kiev and Kharkov, roughly 830,000, or even one million persons, out of a total of 1.7 million inhabitants were evacuated, comprising mainly industrial workers and their families, who travelled east in the trains which carried machinery and plant equipment to new sites in the Urals and the Kusnets Basin.

The loss of the agricultural territories in the western provinces made the extension of cultivation in the Volga region and in Asiatic Russia necessary. As in industry, the Five Year Plans aimed at expanding and improving agriculture in the eastern regions of the Soviet Union. The 1940 cereal crops in these regions exceeded the 1913 crops by 88 per cent. Reports suggest that the greater part of the agricultural machinery used in occupied countries was successfully evacuated.

Transport.—The 1941 plan aimed not only at increasing the rail and river communications, but also at ending the unnecessary transport of coal, oil, steel, etc., from one centre of production to another. According to the plan, railway transport was to be increased by 4 per cent. A considerable part of the railways was lost in the occupied territories, and the exceptional demand on the railways for the transport of troops, population and factories was met mainly by a quicker turn round. The railway personnel worked longer hours under military control. In contrast, river transport, which carried only 8 per cent of the total freight in 1940, was to be increased by 28 per cent. It may be assumed that a considerable part of the freight was diverted from railways to inland waterways.

Finance.—Total revenue and expenditure were as follows:—

(In million roubles)		
	Revenue	Expenditure
1939	156,014	153,299
1940	178,080	173,259
1941 (estimate)	216,840	215,373

State loans, which are included in the total revenue, increased to 11,397 million roubles in 1940, and were planned to yield 13,200 million roubles in 1941. Preliminary reports suggest that state loans were at least trebled during the year. The most interesting point is, however, the steep rise in defence expenditure from 40,885 million roubles in 1939 to 56,102 million roubles in 1940, and 70,865 million roubles in 1941. Defence expenditure would thus have reached in 1941 32.4 per cent of total expenditure, even if there had been no war. More than two-thirds of the total revenue was derived from the turnover tax. In 1941, state loans provided 6.2 per cent of the estimated total revenue. Towards the end of the year a war tax was imposed on all able-bodied persons over the age of eighteen not serving in the fighting forces.

Switzerland

Trade and Industry.—Industry as a whole fared well and profits showed a rising tendency. Stock Exchange quotations of industrial shares, after a slight fall in 1940, advanced strongly and gained on an average over 20 per cent on the year. Some industries worked on contracts for Germany and Italy. In most cases this work, for which the Axis supplied the raw materials, covered civilian products. The quantitative turnover of the wholesale and retail trade showed a decline, but the money value improved further. Wholesale prices by the end of 1941 were 85 per cent over the level of August, 1939. Costs of living simultaneously advanced by about 40 per cent. The railway traffic established a new record, a direct result of the huge transit trade and the transfer of much road traffic to the railways owing to petrol shortage. Despite a disappointing crop the value of agricultural products sold by farmers advanced from 1,508,400,000 fr. in 1940 to 1,678,200,000 fr. in 1941, the rise being largely due to increased sales of grown products, although the value of total sales of animal products and animals remained more than twice as high as that of grown products. The tourist and hotel trade was one of the few to suffer from an acute crisis.

Foreign Trade.—The value of imports advanced from 1,853,600,000 fr. in 1940 to 2,024,300,000 fr. in 1941. Despite the advance of 9.2 per cent in import values, the imported quantity fell by 21.7 per cent on the year. The decline covered largely raw materials. Other imports remained largely unchanged. The value of exports advanced from 1,315,700,000 fr. in 1940 to 1,459,400,000 fr. in 1941, without showing much change in the quantity involved. Foreign

trade returns according to countries are no longer available, but it is probable that the share of the European mainland increased further. In July, the trade agreement with Germany was renewed, the new agreement covering the period to the end of 1942. Germany agreed to supply certain quantities of iron, steel, coal and promised assistance in oil supplies. Switzerland promised in return supplies of cattle, dairy produce and fruit.

Finance and Currency.—The favourable position of the Federal Railway (normally one of the weak spots in Swiss finance) and the easy conditions on the capital market, which enabled the Federal Government to place two loans totalling 830,000,000 fr., solved the country's financial difficulties despite the high budget deficit. The position of the Swiss National Bank remained very strong. The note circulation, after an advance of 223,600,000 fr. in 1940, advanced by another 63,300,000 fr. to 2,336,700,000 fr. in 1941. The banks' holdings of foreign exchange declined during the year from 999,300,000 to 679,000,000 fr., a result of dollar liquidations, but the gold stock rose by no less than 706,000,000 fr. to 2,878,500,000 fr.

Portugal

THE year 1941 closes for Portugal much more satisfactorily than seemed possible twelve months ago.

Prices.—The fixing of maximum prices for sundry standard foodstuffs, the limitation of exports, and the threat of rationing, have kept profiteering in check; nevertheless, the index has risen. Taking 100 as the monthly average of July, 1938, to July, 1939, increases in the Lisbon area have been as follows:—

	October, 1940	October, 1941
Foodstuffs	116.0	128.7
Light and heat	112.4	114.1
Total	115.4	126.2

A composite index number for colonial produce compiled for the same period rose from 2,424 in October, 1940, to 2,741 for October, 1941.

Banking.—Figures for September 30, 1941, compared with 1939, are given below:—

	(In contos. 1 conto = £10)		Total All Banks	
	Bank of Portugal		Sept. 30, 1939	Sept. 30, 1941
Cash	932,858	1,320,425	1,106,652	1,595,828
Deposits with other banks	...	...	876,422	2,729,978
Bill portfolio	427,001	330,723	1,765,472	1,736,782
Sundry advances	900	20,141	2,670,155	3,238,413
Deposits	895,448	2,444,981	4,749,179	8,555,720
Time deposits	...	...	983,580	1,049,028

Trade.—The following figures show imports and exports in January-August in the last four years:—

	Imports		Exports	
	Tons	Value in Contos	Tons	Value in Contos
Jan.-Aug., 1938 ..	2,396,255	2,305,872	1,540,460	1,145,594
" 1939 ..	2,291,873	2,066,650	1,468,502	1,339,182
" 1940 ..	1,841,635	2,523,538	1,139,228	1,612,643
" 1941 ..	1,016,258	1,558,556	529,952	1,536,388

Sweden

HEAVY Swedish armament expenditure helps to keep home production active. Sweden is now making up for years of disarmament with a five-year defence programme. The current Budget provides 2 milliard crowns (£117,647,000) for military purposes, which is nearly two-thirds of the total Budget. In addition, the Government has issued two defence loans—one for 40 years, and the other for five years.

Foreign Trade.—Exports last year were £89,000,000, which was slightly more than in 1940, but 30 per cent below the pre-war level. Imports were £98,000,000, which was 16 per cent less than in 1940 and about 20 per cent less than the pre-war level. The fall in volume was still larger, as the prices of imported goods are 150 per cent higher than before the war, and those of exports 40 per cent higher.

Industry.—Now that Germany has the French mines at its disposal, it is less dependent on Swedish iron ore, save for high-class steel. Exports of iron ore have therefore declined. Swedish iron and steel production has also declined, owing to lack of coal, as Sweden has to import all its coal requirements—at present from Germany.

The lack of coal has led to increased production of charcoal, particularly as difficulties arose over the clearing agreement with Germany. Charcoal is also needed for producer gas, which has entirely replaced petrol as motor fuel, since Sweden is completely cut off from petrol imports. Charcoaling provides welcome employment for the forest districts, now that Sweden is cut off from overseas markets for wood and pulp. Since the occupation of Norway, the production index of the timber industry has fallen from 117 to 50. The pulp factories are at present almost entirely producing fodder cellulose on state contracts—besides other by-products, needed as substitutes for things which cannot be imported. Chemical wood products are used for soap-making.

Agriculture.—The cellulose fodder is distributed to farmers through the state-controlled co-operative system; state control over Swedish agriculture has increased during the war. Sweden is in normal years self-sufficient in most food products, but the harvest has been bad for the past two years—only half of the pre-war average. The situation was saved by the huge stocks of grain which the state had put by. State subsidies to the farmers have increased and consumers have had to cut down their food consumption by about 10 per cent. About 70 per cent. of all food is rationed; the high Swedish standard of living is no more.

Self-Sufficiency.—The Government is trying to make the country still more independent of outside supplies. While producer gas is used for motor transport, electric power is increasingly used to replace coal in railway transport. Existing power stations supply 1,440,000 kilowatts and a Government two-year plan provides for building more power stations, supplying an additional 360,000 kilowatts and 2,100,000,000 kilowatt hours. There is also much activity to develop the cultivation of oil and textile plants.

Egypt

WHEN the year 1941 opened, the Italians were in retreat on all Middle East fronts, and sentiment had already recovered from the shocks of the previous summer. A sharp, though short-lived, reaction followed the German intervention in Libya and the Balkans, but a recovery set in with Russia's entry into the war.

Cotton.—The second Anglo-Egyptian cotton agreement resulted in the joint purchase of the entire crop of 8,065,000 kantars (linters included) by the British and Egyptian Governments at last year's price of 15½ tallaris for fgt Giza 7 and 14½ fgt for Uppers, plus an additional 2 tallaris per kantar to be paid by the Egyptian Government alone on the whole production. The acreage was subsequently curtailed to 25 per cent of Egypt's cultivated area. Other strong steps were taken to stimulate wheat production, which had shrunk below the country's needs and caused a strong rise in prices. The rice crop was a large one, but was sold at higher prices.

Industry and Trade.—Industry was active and not greatly hampered in the way of fuel and raw material, but the almost insuperable difficulty of obtaining new machinery on a large scale prevented any important additions to plant.

With the extension of hostilities, foreign trade was gradually restricted to a small number of countries, a growing percentage of the total being with the United States. Late in the year quotas were introduced for most imports.

Finance.—The note circulation increased from £E38,696,000 in October, 1940, to £E50,154,000 in October, 1941, and after April the cost of living index surged upwards (157 in January, 189 in September). The increased agitation for a readjustment in wages and salaries received some satisfaction. Rationing is still confined to petrol.

Argentina

Finance.—An estimated Budget deficit of 258 million pesos for 1941 compares with a deficit of 170,100,000 pesos for 1940. Customs revenue and port dues are 51 million pesos less than for 1940, and a tax reform Bill, calculated to reduce the current year's deficit by 80 million pesos, did not become law. Congress failed to ratify two trade loans from the United States totalling US\$110 millions, but the reported object of an Argentine military mission's visit to Washington in December was the negotiation of a Lend-Lease contract for US\$70 millions. This follows the passage of armaments Bills involving 1,450 million pesos. An internal loan of 250 million pesos in 2½ per cent Treasury Bonds was over-subscribed, and the conversion of all 5 per cent and 4½ per cent tax-free National Bonds,

totalling some 4,300 million pesos, to 4 per cent tax-bearing issues was successfully effected in November. The Treasury, which owes the central bank 767,500,000 pesos in respect of crop purchases, will itself finance purchases in 1942, presumably by further recourse to internal loans.

Grain Prices.—Basic prices (per 100 kilos) of 6.75 pesos for wheat, 9.25 pesos for linseed, and 6.25 pesos for maize have been in force throughout the year. Market prices of wheat and linseed have not deviated appreciably from basic prices, although linseed quotations have lately shown an upward trend owing to increased American demand. Maize has been unquoted since December, 1940. The 1940-41 crops yielded 7,380,000 tons of wheat, 1,460,000 tons of linseed and 10,238,000 tons of maize. By the end of the year, estimated exportable surpluses were 2,200,000 tons of wheat, 715,000 tons of linseed and 8,100,000 tons of maize. First estimates of wheat and linseed production were 6,000,000 and 1,700,000 tons respectively.

Foreign Trade.—By the middle of the year a decline in essential imports led to the abolition of exchange restrictions in respect of them. Imports last year were 1,276,399,000 pesos, and exports 1,463,479,000 pesos, leaving an export surplus of 187 million pesos. While imports from Europe and the Americas have declined during the latter period, exports to American countries, particularly the United States (with which a trade treaty has been signed), have notably increased. The following percentages show the proportions of Argentina's trade with Europe and the Americas respectively:—

	Imports		Exports	
	Europe	Americas	Europe	Americas
per cent	per cent	per cent	per cent	per cent
Jan.-Oct., 1940 ...	38.1	52.4	68.1	28.0
" 1941 ...	23.7	63.4	41.1	51.5

Chief sources of supply in the first ten months of 1941 were the United States with 28.4 per cent of the total (against 30.4 per cent in the same period of 1940) and the United Kingdom with 18.3 per cent (against 20.2 per cent). The United States has replaced the United Kingdom as Argentina's principal customer with 35.6 per cent of her total exports (against 15.1 per cent in the same period of 1940), and the United Kingdom follows with 32.3 per cent (against 38.5 per cent).

Brazil

BRAZIL's Budget for 1940 shows a prospective deficit of 638,000 contos (1 conto = approximately £12 10s.), revenue being estimated at 4,388,000 contos and expenditure at 5,026,000 contos, compared with 4,124,000 contos and 4,881,000 contos respectively in 1941, and 4,036,000 contos and 4,629,000 contos respectively in 1940. Foreign trade figures for the first ten months of 1941 show a rise in both the volume and value of exports, while imports were lower in volume and slightly higher in value. Exports were 2,955,000 tons valued at £67,016,000 (sterling), against 2,629,000 tons valued at £49,841,000 in the first ten months of 1940; and imports were 3,274,000 tons (£53,845,000), against 3,650,000 tons (£53,590,000). The foreign loan service has been maintained under the reduced percentage agreement, and in addition approximately £8,250,000 has been remitted abroad covering the earnings of foreign companies established in Brazil.

New industries that have started operations or are under construction include a joint American-Brazilian steel mill, a Government aeroplane motor factory, a plate-glass factory and an aluminium plant. Gold mining has continued on about the same level as the past two years, and all gold has been taken over by the Banco do Brasil. Mineral exports in the first six months of last year included 323,000 tons of manganese to the United States and 12,000 tons to Japan, and 176,000 tons of iron-ore to Great Britain, 137,000 tons to the United States and 68,000 tons to Canada.

Chile

BECAUSE of the United States' desire to buy Chile's output of copper and other strategic metals, as well as nitrate, export trade is improving. Latest figures, covering the first nine months of 1941, give exports at 569,014,300 pesos (of 6d. gold) against imports at 362,416,200 pesos, so that the active trade balance was 206,598,100 pesos, although this balance is not truly effective as the whole of the proceeds of copper and nitrate exports, which are included in the trade returns at their full value, do not become available to pay for imports. Nevertheless, the exchange position is

more normal, with the selling rate for imports steady at around 101.35 pesos per £ sterling under the Payments Agreement with Britain. Chile is now eager to take any imported goods which supplying countries are able to send. Exports of nitrate during the year ended June 30, 1941, were much lower than in the previous season, but there has since been a recovery owing to purchases by the United States and Egypt. The resumption of nitrate shipments to the important Egyptian market, made possible by the re-opening of the Red Sea route, has done much towards easing the sterling exchange position in Chile.

Manufacturing industries are thriving except where they are dependent upon imported raw materials. There is, however, increasing preoccupation with the growth of national expenditure and the appearance of inflationary tendencies. The deficit in the National Accounts in 1941 was about 130 million pesos, compared with some 120 million pesos in 1940, while the estimated deficit in the 1942 Budget is 189 million pesos. A Bill has consequently been passed which increases income tax and imposes higher duties on luxuries. Also, a National Defence Bill has been passed providing for borrowing up to 4,000 million pesos.

The total amount of the foreign debt on December 31, 1941, was as follows: £27,761,171; US\$167,095,500; and Swiss francs 108,680,500. These figures compare with £27,762,471; US\$170,208,500; and Swiss francs 108,728,000 at the corresponding date of 1940. Interest on the external debt was paid at the rate of 1.558 per cent of nominal capital. The Chilean Amortisation Bank has just made an offer to pay \$15.58, or its equivalent in sterling or Swiss francs, for each bond outstanding by way of withdrawal from the market. This payment was due to be made on February 1, 1942.

German Europe

THE war against Yugoslavia, Greece and the Soviet Union has added new territories to German Europe, but the protracted war against the Soviet Union prevented Germany from reconstructing the Continent according to the principles of the New Economic Order. Instead, Germany was forced to find in "industrial collaboration" compensation for the wastage of men and material in Soviet Russia. Agriculture and industry in Slovakia, Hungary and Roumania suffered from military mobilisation. Yugoslavia was split up into Croatia, Serbia, and Montenegro. Economic activity in Poland was hampered by using the territory as supply base for the campaigns in Russia, and the occupied Russian territories were not only devastated, but remained fighting zones.

Agriculture.—German reports suggest that the Continental acreage under cereals increased in 1941, but the total harvest exceeded only slightly the poor results of 1940. The livestock industries in western European countries, as well as in Germany, experienced serious shortages of feeding stuffs. Reductions in the livestock population were particularly marked in Denmark, Holland and France. Production in Germany, however, remained on a high level. Apart from an undisclosed number of prisoners of war employed in Germany's agriculture, the number of foreign agricultural workers in Germany exceeded one million. The supply of fertilisers, tractors and agricultural machinery diminished.

Industrial Collaboration.—Direct economic expansion by acquiring foreign industries almost came to a standstill during the second half of the year. Industrial collaboration, however, was extended and intensified, particularly with France, Belgium and Holland. Foreign manufacturing industries are mainly working on sub-contracts for German concerns. At the same time, German concerns collaborate with foreign concerns in the construction of substitute industries, such as artificial textile fibres, plastics, light metals, artificial rubber, and synthetic petrol. Sub-contracts in the French manufacturing industry reached the value of some Rm. 1,500 millions. Towards the end of the year supply difficulties in coal and raw materials were reported from occupied and dependent countries. Surplus manpower, especially skilled labour, had disappeared, partly by increased production and partly by emigration to Germany.

German Finance.—The profit and dividend stop, a war surcharge on the corporation tax, increased excise on tobacco and alcohol, the system of iron savings for wage-earners and employers, and the registration of shares marked the general policy of mopping up excess purchasing power. At the end of the year fixed prices for armaments replaced the cost-plus profit system. The tremendous increase in war expenditure was met by progressively rising borrowing, and by a considerably greater yield of revenue.

REICH DEBT (Rm. milliards)

	August 31, 1939	December 31, 1940	October 31, 1941
Long-term debt	25.01	42.99	59.59
Short-term	12.32	36.50	59.58
Total debt	37.33	79.49	119.17

The official estimate of total debts relating to December 31, 1941, amounted to Rm. 128,500 millions. Total debt thus increased during the year by 61.7 per cent. Small savings deposits increased during the same time from Rm. 26,000 millions to Rm. 36,000 millions. Official sources estimate the gross national increase in 1941 at from Rm. 110,000 millions to Rm. 115,000 millions, against Rm. 100 millions in 1940 and Rm. 95,000 millions in 1939. As a result of the continued cheap money policy, the interest rate on long-term borrowing by the state was reduced to 3½ per cent.

Total revenue was as follows, in million Reichsmark:

1939/40	23,600	*1941/42 (Apr. to Mar.)	32,000
1940/41	27,200	1941 (Apr. to Dec.)	23,900

* Estimate.

Including the war contribution of the communes, tributes and costs of occupation, total revenue is estimated to yield for the financial year Rm. 45,000 millions. Total expenditure covered by revenue and borrowing will thus exceed Rm. 90,000 millions.

Banknotes in circulation rose from Rm. 14,033 millions at the end of 1940 to Rm. 19,325 millions on December 31, 1941. The rise, amounting to Rm. 5,312 millions or 38.9 per cent., compares with an increase of Rm. 2,234 millions in 1940. The official price index (1913 = 100), on the other hand, remained almost unchanged, the advance over the year being only from 110.9 to 112.4.

German Industry.—Compared with 1940, when Germany's industrial capacity was still expanding, the year 1941 demanded the utmost effort to maintain war production. In the spring of 1941, a moderate programme of industrial concentration was carried out favouring the most efficient factories. Women workers, particularly domestic servants, were recruited in greater numbers. At the same time, more foreign workers were imported. Yet the continued heavy fighting against the Soviet Union demanded for the first time the full mobilisation of men for the Wehrmacht. After some hesitation, the original programme of full industrial concentration, which had been abandoned after the conquest of Poland, and seemed unnecessary because of industrial collaboration, was carried out towards the end of the year. At the same time civilian production was cut down to a minimum. The policy of combing-out unessential industries for workers was repeated, and the general rationalisation of all war industries was ordered. The labour reserves still available in Germany were, however, not sufficient for replacing the men who were called up. A new recruiting drive for foreign workers began. According to official figures, the number of foreign civilian workers increased from 1.4 millions at the end of 1940 to 2.1 millions at the end of September, 1941. In addition, there were at least 1.5 million prisoners of war employed. Yet at the end of 1941 the total number of workers, including foreign civilian workers and prisoners of war, was below the 24.5 millions employed in August, 1939.

France

Industry.—A shortage of raw materials, fuel and lubricants, as well as growing transport difficulties, caused an acute production crisis, especially towards the end of the year. The monthly coal output was estimated as 3,400,000 tons (pre-war monthly consumption was 6 million tons). Out of this not more than 25 per cent was allotted to civilian industries and private consumption. Lack of coal and coke severely affected the iron and steel industry. The monthly iron allocation for civilian industries was reduced from 230 thousand tons (in the spring) to 100 thousand tons in December, 1941. The production and consumption of electricity was sharply restricted and rationed. The output of textile industries of the most important centres declined to 15 per cent of normal; towards the end of the year there were periodical production stops ordered by Vichy, and the wholesale closing down of cotton mills and textile factories in 1942 was announced. The paper allocation amounted to 4 per cent of pre-war consumption. Even industries working for Germany were impeded by

the shortage of fuel and lubricants. Unemployment decreased—according to official figures—from 700,000 to 200,000, which is explained by the absorption of labour in agriculture and by widespread part-time employment.

Agriculture and Food.—A considerable recovery in French agriculture is illustrated by the following comparative table of harvests (official Vichy and German figures):—

	Pre-war Average	1940	1941
Wheat	8.5	5	6.5-7
Other grains	7	5	6
Potatoes	15	8	12-14
Sugar (1938)	872	470	695
Beet (1939)	8.5	2.5	7

The livestock position, however, showed a further grave deterioration; lack of fodder caused a decrease in stocks of all kinds; the loss of pigs is estimated at 3-4 millions.

In spite of the improvement in agriculture, food rations were being cut to starvation levels during the year. There were the following reductions between January, 1941, and January, 1942: coffee from 250 grammes to 150 (monthly), bread from 300 grammes to 275 (daily), meat from 360 grammes to 125-250 (weekly). The wine ration was 1½-2 litres weekly; milk, ½ of a litre per four days; potatoes, 2-4 kilos monthly; cheese and fat rations remained unchanged (50 and 100 grammes). The drastic cuts in rations, coinciding with the increase in agricultural output, prove that the French are being starved in order that the Germans may be fed.

Wages and Prices.—Official Vichy statistics give the following increase in prices (1929=100): flour, 135; meat, 130-160; milk, 160; butter, 255; eggs, 260; cement, 141; iron ore and magnesium, 140; copper and lead, 150; rubber, 500; textile (raw materials), 320; paper, 700. A general increase in wages was announced towards the end of the year; officially, the wage and price stop is still in force.

Foreign Trade.—According to German sources, imports in 1941 amounted to 24 milliard francs, against 46 milliards in 1938, and exports were 14 milliards, against 31 milliards. The adverse balance was mainly due to the surplus of imports from North Africa over exports there. The share of raw materials in France's imports fell from the normal 43 per cent to 26 per cent in 1941. The proportion of "vital industrial materials" (i.e., of war materials) in exports is stated to have risen from 15 per cent to 25 per cent and food from 5 to about 8 per cent. Trade with neutrals dwindled down to insignificant figures; for instance, French exports to Switzerland dropped by 70-75 per cent of normal.

Finance.—Expenditure in the ordinary budget was estimated at 100 milliard francs, of which 26.5 milliard francs was military expenditure, and in the extraordinary Budget 25 milliards; occupation indemnity was 130 milliards, and total expenditure 275 milliard francs. Revenue

was 75 milliards and advances by the Bank of France 70 milliards; the rest of the deficit was covered by borrowing.

Credit and Currency.—Deposits and current accounts with the *Crédit Lyonnais*, *Société Générale* and *Comptoir d'Escompte* rose from 58 milliards at the end of 1940 to 69 milliards on October 31, 1941. Easy supplies of credit led to an all-round reduction of interest rates: Treasury bills from 2 to 1½ per cent; the discount rate of the Bank of France from 2 to 1½ per cent; two-year bonds from 3½ per cent to 2½ per cent; and the rate on long-term credit to 4 per cent. Loans to the amount of 50 milliard francs were converted to lower rates. The currency in circulation expanded from 218 milliards (in December, 1940) to 263 milliards (in December, 1941).

Italy

THE most important feature of Italy's economic development in 1941 was her increasing dependence upon German collaboration. Planning is now in full swing, not only on German lines, but as a "joint" action under Berlin lead. An example is the mobilisation of manpower. There is no general shortage of labour, and the employment of women in industry is not very widespread so far. But nearly 300,000 Italians are working in Germany, about 60,000 of them farm labourers and 45,000 metal workers.

Foreign Trade.—Most important, however, is the collaboration in foreign trade. It has even been agreed that no supplies of any goods needed for the mutual war effort (in both directions) should be stopped merely because the lack of assets in the clearing balance would not justify the expectation of early payment. German-Italian trade amounted to Rm. 650 millions in 1939; Dr. Funk stated recently that this turnover has since been trebled so that the exchange of goods between the Axis partners should be about Rm. 2,000 millions by now. No trade figures are published, but it has been announced that in the second half-year of 1940 47 per cent of total imports came from Germany, and 43 per cent of exports went there; this percentage is said to have risen in the meantime. The effects of the blockade have become more apparent, as 50 per cent of pre-war imports were brought on sea routes now closed to Italy's merchant ships. There is certainly some compensation in supplies from south-eastern countries which are now cut off from the Allied markets.

Industry.—According to American sources, the production of aluminium, zinc, lead, mercury, silk, certain artificial textile fibres, fruits and vegetables exceeds normal home requirements. That does not mean that home consumption is satisfied. Supplies for civil needs are more and more curtailed. Extensive control of consumption has been gradually introduced, with clothing cards, standardisation of various manufactured goods, etc. Even goods in sufficient supply are severely restricted so that they may be used as a means of payment for imports. Coal supply

Banking.—The most interesting event in banking is the increase in the bill holding of the nine leading banks of the country by 3,882 million crowns to 5,329 million crowns, and the enormous increase in the debt of the Reichsbank towards the National Bank of the Protectorate included under the heading of "other assets." They reached 12,957 million crowns on December 31, 1941, compared with 7,816 million crowns in December, 1940, and 3,791 million crowns in December, 1939. In Slovakia, German plunder is evident from the Slovakian clearing balance with Germany, which amounts to about 1,500 million crowns and represents mostly the wages of Slovak workers in Germany which they are obliged to pay to their relatives. Notes in circulation at the National Bank of the Protectorate reached 9,397 million crowns in December, 1941, compared with 6,345 million crowns in 1939.

Linseed has come almost solely from India. Ground nuts, because of their high oil-content, have been given preference over cottonseed and soya beans of low oil-content. The main business of the mills has been the production of edible vegetable oils, which, with whale oil, are the principal constituents of margarine. As most of the material has been submitted to the extraction or solvent process, the result has been a diminution of the proportion of straight-run oilcakes for cattle feed. An 8 oz. fats ration per head per week involves an annual output of approximately half a million tons of margarine and cooking compounds.

Dairy Produce.—The Lend-Lease Act greatly facilitated the supply to the United Kingdom of dairy produce, imports of which had been affected by the extension of the war to Northern Europe in the spring of 1940. Exports of eggs from Canada were expected to reach some 1,580,000 long hundreds in 1941, compared with 1,050,000 long hundreds in 1940 and a mere 150,000 long hundreds in 1939. Large contracts were also made with Australia, New Zealand and Canada for increased supplies of condensed milks and cheese.

Meat and Bacon.—Demand has necessarily been concentrated on North America, to the detriment of exports from the southern hemisphere. The internal consumption of bacon and pork in Canada was restricted, and the export of live pigs and pork prohibited, in order to increase the volume of shipments to this country. Production was encouraged by an increase in prices paid for livestock products, and it is hoped that exports of bacon may amount to some 5½ million cwt. in 1941-42, compared with about 4 million cwt. in 1940-41. The enforced reduction in British meat imports led to the accumulation of surplus lamb and mutton in Australia and New Zealand; and agreement was reached between the three Governments that the United Kingdom would continue to buy the normal quantities of foods from these Dominions and would pay half the costs of storing the unshipped surplus. There was a similar surplus of beef in Argentina, which was only partly offset by increased shipments of canned meats, supplies of which were also sent to Britain from the United States under the Lend-Lease Act.

Sugar.—On the international market, the marked increase during the year in the demand from American refiners, in anticipation of a rise in domestic consumption, caused a rapid shrinkage in the stocks of Cuban sugar and a sharp rise in prices on the American market; by the end of the year prices were double their level of twelve months earlier. Shipping difficulties were the major factor for Javan producers, and somewhat larger exports to Britain barely counterbalanced the loss of exports to Europe.

Tea, Coffee, Cocoa.—Britain's tea requirements were met by bulk buying agreements for 505,000,000 lb. Similar contracts for 1942, comprising 501,000,000 lb., were placed by the Ministry of Food in December last. The weekly ration remained unchanged in 1941, but it is possible that the loss of supplying areas may cause a reduction later. The West African cocoa scheme, by which the British Government buys the entire crops of British, French and Belgian Africa, was continued for the season beginning October 1, 1941. The scheme has resulted in a substantial financial surplus so far, which will eventually be made available to native planters. America's entry into the war and the shortage of shipping, however, may cause a loss during the current season. The British coffee market was well supplied in 1941. The Ministry of Food prepared the resumption of imports from certain areas, and announced the import of 9,000 tons of East African and Indian coffee in partial execution of its buying programme. On December 12th the Ministry announced a scheme to facilitate distribution and price control. The world coffee crop in 1941-42 suffered from damage, and reached only 23,000,000 bags, against 30,850,000 bags a year before.

Home Production

Statistics of output have not been published, except in isolated cases. The main developments during the year have been summarised on page 3; details for individual commodities are given below:

Wheat.—A fixed price of 14s. 6d. per cwt. ex farm was paid for millable wheat of the 1940 crop; this was changed to a stepped price rising from 14s. 6d. per cwt. in August-November to 15s. 9d. in February-March for wheat of the 1941 crop. A price of 16s. per cwt. has been announced for the next harvest.

Barley.—The price of malting barley was uncontrolled, and owing to the stoppage of imports and the shortage of animal feeding-stuffs there was a very large rise during the autumn of 1941. The index of barley prices compiled by the Ministry of Agriculture stood at 297 (1927-29 = 100) in December, 1941, compared with 84 for 1938. The price of malting barley is to be controlled in 1942-43, and the maximum price for feeding barley will be raised from 13s. 6d. per cwt. to 14s. 6d.

Oats.—A stepped price similar to that for wheat was in force for milling oats of the 1941 crop, with a starting point of 13s. 9d. per cwt., but in the case of oats this was a maximum and not a fixed price. A price of 14s. 9d. per cwt. will be paid for next year's crop; feeding oats will be controlled at 14s. 6d. per cwt.

Potatoes.—The complicated price schedules, with differential prices for the varying types and localities of growth, were designed to give growers of the 1940 crop an increase of approximately 20 per cent in their gross returns per acre, compared with the prices obtained in 1938-39. In order to offset the effect on the retail price of the normal seasonal rise in growers' prices, a subsidy was paid in the spring months of 1941. The price schedule for the 1941 crop (which substituted a fixed price for the previous range of maximum and minimum growers' prices, while leaving the retail price as a maximum only) was designed to prevent the increase in growers' prices from raising retail prices. A subsidy of £10 per acre was paid to all registered growers, and this amount, together with the price received per ton, was designed to increase the gross returns per acre by some 40 per cent over those obtained in 1938-39. A further increase of 5s. per ton has been promised for the 1942 crop. There was in 1941 a very large increase in the area under potatoes, and a further increase was planned for 1942.

Sugar Beet.—It was announced that about 350,000 acres of beet were grown in Great Britain in 1941, an area equal to the average of the immediate pre-war seasons, but that an increase had been planned for 1942. The price offered for the 1941 crop was fixed at 66s. 2d. to 68s. 2d. per ton of beet of 16.9 per cent sugar, but this price is subject to later modification, if costs are shown to have risen substantially. A price of 85s. 8d. to 87s. 8d. per ton has been announced for the 1942 season.

Milk.—The reduction in the supply of imported concentrates and the greater reliance on home-grown and more bulky feeds led to a general fall in milk yields, which was naturally more noticeable in the winter; production in England and Wales during 1941 was expected to equal 1,053 million gallons, compared with 1,076 million gallons in 1938. Further, there was a large increase in the consumption of liquid milk from 754 million gallons in 1938 to 945 million gallons in 1941; by the end of the year more than three million mothers and children were taking milk under the National Milk Scheme, and great efforts had been made to expand the milk-in-schools scheme as well. Consequently, milk rationing was put into force in November, 1941, and it was announced that it will be maintained during the next summer in order to conserve supplies for condensing. It was announced early in 1941 that the producer prices for the six summer months would be raised by 4½d. per gallon over those paid in the corresponding months of 1939, and prices for the six months of the winter 1941-42 would be raised by 10d. per gallon in October and March, 1s. in November and February, and 1s. 1d. in December and January over those received in the winter of 1938-39. Farmers were also promised that these prices would be subject to retrospective adjustment if they could prove that the rise had not covered their increased cost. Under this guarantee an additional ½d. per gallon was granted on milk delivered in the summer months; on account of the rise in wage rates in December, 1941, the prices for January-March, 1942, were also raised by a further 1½d. per gallon. Very strong pressure was also brought to bear to abolish the differential pool prices, so that all milk of standard quality would receive the same price throughout England and Wales.

Livestock.—The shortage of feeding-stuffs over the winter of 1940-41 induced an official campaign to cull from the beef and dairy herds the poor quality animals, which give little return, either in meat or milk, for the food they consume. Prices paid by the Ministry for animals of low killing-out percentages were consequently raised temporarily in the spring. During the whole of 1941 there was a strong demand for pedigree animals and for good quality dairy stock, while the suspension of the imports of store animals

from Eire between January and November (owing to foot-and-mouth disease) was a further factor in pushing up livestock prices. The prices of store sheep remained low, mainly because the conversion of pasture into arable land diminished the demand for the product of the hill sheep farms; there was, on the other hand, a strong demand for ewes of the heavy arable breeds suitable for folding on thin soils newly brought under the plough. Prices for the bacon weight pigs were raised from 20s. per score to 23s. per score in September, 1941, since it was then agreed that the reduction in numbers had gone far enough.

Poultry.—During the early part of the year packing stations authorised by the Ministry of Food were allowed to offer to farmers a price for their eggs higher than that obtained from other buyers. At the end of June the sale of eggs from flocks containing more than 50 birds was entirely restricted to the Ministry's agents; there was both a reduction in the retail price and a rise in producer prices. The index of farm egg prices compiled by the Ministry of Agriculture (1927-29 = 100) stood at 145 in December, 1941. Feeding-stuffs were issued only for specialist flocks on a restricted basis, for pedigree flocks and for backyard poultry fed partly on household scraps and town waste. The use of wheat for feeding farm animals (other than tail corn) was prohibited early in 1941.

The price indices calculated by the Ministry of Agriculture for farm products are given below:—

INDICES OF AGRICULTURAL PRICES (1927-29 = 100)

	1938		1941			
	Average	March	June	Sept.	Dec. (a)	
Wheat	95	141	143	139	141

1942 Jan. 12	8 oz.	"	6 oz. (not more than 2 butter)	2 oz.	"	"	"

† Half rations for children under 6. ‡ Cooking fats only.
§ 8 oz. for agricultural and certain other workers; raised to 12 oz. from Dec. 15.
• During July an extra half-pound weekly was issued for jam-making.

Preserves and syrup were rationed from March 17th to one pound per month as a minimum: this was reduced to half a pound on May 1st, and became a fixed ration of one pound per four weeks from July 28th. Registration was also introduced for eggs, milk and onions. The allocation of eggs was approximately one a week in July and August,

three in September and two in October, November, December and January; children under six obtained four eggs per allocation period. A daily minimum of liquid milk was guaranteed to certain priority classes of consumers—one pint per day to expectant mothers and children under six and half a pint (in addition to the milk provided in schools) for children from six to seventeen years old. For ordinary consumers, it was hoped to supply about two pints of milk or milk equivalent (condensed or dried) per week during the winter months, but the difficulties of transporting small quantities of liquid milk made it impossible to secure an even geographical distribution of the limited supplies that remained when the claims of the priority consumers had been met. It was hoped to supply a minimum of two pounds of onions per registered customer during the winter of 1941-42 from the commercially grown crop. In addition to these commodity rations, a scheme of points rationing was introduced on November 17th for *canned meat and fish*, each consumer being allowed 16 points per four weeks.

Dried fruits, most types of pulse and rice, sago and tapioca were included from January 26, 1942, and the number of points was raised to 20 from the beginning of the rationing period on February 9th. Priority was given to children under six in the distribution of oranges; as imports of these were small and irregular, supplies were concentrated in turn in different localities. The Ministry of Food also provided for the free distribution of black currant juice to children under two, in order to ensure them an adequate supply of vitamin C which was formerly derived from imported fruit. The provision of works canteens, particularly at pit heads and in firms in the heavy industries, was pressed forward, as a means of giving supplementary rations to those engaged in heavy manual labour. Thus, during the year, there was both an extension of rationing for the ordinary consumer, in order to secure greater equality in distribution, and greater differentiation in rations, in order to improve the nutrition of certain classes of consumers.

Price Control

As measured by the Ministry of Labour's index of retail food prices (given below), food prices tended to fall throughout 1941:—

MINISTRY OF LABOUR'S INDEX OF RETAIL FOOD PRICES

	Sept., 1939	Dec., 1939	Mar., 1940	June, 1940	Sept., 1940	Dec., 1940	Jan., 1941
July, 1914 = 100	138	173	169	171	166	165	163
Sept., 1939 = 100	100	125	122	123	120	120	118

This fall was brought about by the Ministry of Food in order to implement the guarantee given by the Chancellor

Current Deposit Accounts.—Interest is allowed on daily balances from Rs. 300 to Rs. 1,00,000 at 4 per cent. per annum. Interest on balances in excess of Rs. 1,00,000 allowed only by special arrangement. No credit will be given for interest amounting to less than Rs. 5 per half year.

Fixed Deposits.—Deposits are received fixed for one year or for shorter periods at rates of interest which can be ascertained on application.

Savings Bank.—Accounts opened on favourable terms. Rules on application.

The Bank acts as Executor and Trustee under Wills and Settlements and undertakes Trustees Business generally. General Banking Business transacted.

of the Exchequer in his Budget speech that the cost of living index would not be allowed to rise appreciably above the current level. As the clothing component of the cost of living index tended to rise during the year, a counterbalancing fall in the index of retail food prices was necessary to ensure stability in the complete index. Fish prices, which had more than doubled since the war, were brought under control in June and substantial reductions achieved. Stricter control over the distribution of eggs was coupled with a reduction in retail prices. The retail price of sugar sold for domestic use was reduced by 1d. per lb. in December, 1940, and again in December, 1941. The geographical variation in bread prices was reduced by Order to a uniform price of 3d. per quarter; in certain remote areas and sparsely populated districts a higher price was permitted under licence. Bakers obtained an increase in the subsidy paid on flour used in bread-making. During the spring months a subsidy was paid to allow the normal increase in potato prices to growers without a corresponding increase in retail prices, and the price arrangements for the 1941 main crop,

which include an acreage subsidy to growers, should ensure a lower average level of retail prices in 1941-42 than in the previous season. As a result of these measures, the total subsidies provided by the Ministry of Food to keep stable the general level of food prices were stated to have risen from about £80 millions in 1940-41 to £109 millions in 1941-42, plus £20 millions on the sea transport of food; of these £109 millions, the Government's milk policy was expected to absorb £18½ millions. In addition to the foods included in the cost of living index, other prices were controlled by specific Orders, most of which contained provisions regulating the maximum margins permitted to wholesalers, manufacturers and retailers. By the end of the year almost the only foods whose prices were uncontrolled were fresh vegetables (other than potatoes, carrots, onions and tomatoes), the more expensive varieties of fish and game, and certain manufactured foods, such as cakes and biscuits. The prices of chocolate and sugar confectionery were controlled in January, 1942, by means of a complicated system of classification worked out by the trade.

Raw Materials

ANGLO-AMERICAN demand for a large number of raw materials showed an appreciable expansion in 1941; in addition to the increase in consumption, large reserves were accumulated, especially by the Government of the United States. The problem of surplus capacity, created by the suspension of shipments to the Continent of Europe, gave way to one of scarcity; and, in the second half of the year, the production of many materials, especially minerals, reached new records. The need for expanding production was intensified by the loss of some of the Allied sources of supply. In the spring, they lost lead, copper, chrome and antimony in the Balkans; in the summer, they lost coal, iron ore, manganese and other supplies in Russia; at the turn of the year, they lost tin, rubber, tungsten, oil, oilseeds and other important materials in the Far East. The need for economy led to closer Government control in Great Britain and the United States and to the curtailment of civilian consumption.

In the United Kingdom, the Ministry of Supply continued to control all industrial raw materials except vegetable oils, which are controlled by the Ministry of Food, and light metals, including light metal alloys, which are under the administration of the Ministry of Aircraft Production. When the year opened the markets in three important raw materials—cotton, rubber and tin—still enjoyed a substantial degree of freedom. Control over cotton was tightened at the end of March; rubber was brought under control on April 27th, the date of the appointment of a Rubber Controller; and the market in tin was closed on December 8th after the Japanese attack on Pearl Harbour. The imports, exports, internal sales and purchases, stocks and prices of virtually all raw materials are strictly controlled. In many cases the Government handles imports and internal sales, employing private firms only as agents; in all others licensing by the Controls of the individual materials ensures control over their utilisation. The greater part of British raw material supplies from overseas is still covered by the bulk-purchase agreements concluded by the Government with the large Empire and Allied producers earlier in the war, although the passing of the Lend-Lease Act resulted in certain changes. Towards the end of the year the Prime Minister and the Minister of Supply led important negotiations in Washington, which included, *inter alia*, the pooling of all Allied raw material resources. These negotiations were successfully completed early in 1942. Thanks largely to the reduction in shipping losses during the second half of the year, the supply of imported raw materials in 1941 was adequate for vital needs, including the reduced requirements for vital civilian requirements. Prices at the end of 1941 were only slightly higher than a year earlier. At home, the output of coal is reported to have been slightly smaller than in 1940, but the production of iron ore showed a further expansion.

In the United States the production of raw materials reached high levels last year; only the cotton crop was comparatively small. During the year a number of expansion schemes for aluminium, magnesium and synthetic rubber were initiated, which will have far-reaching effects on Allied supplies. In addition to its domestic supply, the country absorbed the whole surplus stocks, and almost the whole of the current production of Latin-American raw materials, with metals ranking first. Despite their enormous supplies, the American Government introduced

numerous raw material conservation and priority orders, and in the case of rubber even ordered a general restriction of consumption from the middle of 1941. The outbreak of war in the Pacific resulted in a tightening of Government control, and there is a tendency towards complete Government regulation, although the system employed differs slightly from that adopted by the British Government. Raw material prices showed a rising tendency in the United States, but "ceilings" introduced by the Price Administrator kept the increases within comparatively narrow limits. In the case of crops, especially cotton, the advance was stronger than in minerals, a direct consequence of the country's farm policy.

Coal

It is estimated that the output of coal last year was about 8 per cent less than in 1940 and about 11 per cent below that of 1939. For this decrease the chief reason was the heavy decline in the number of persons employed. By the spring of last year over 120,000 miners had joined the Forces or migrated to other employments or Defence services. A large proportion of this number was replaced by unemployed miners and other entrants, but a big gap remained unfilled, and in June last there were employed only 690,000 as against 765,000 in August, 1939. Meanwhile, the weekly rate of output had dropped from nearly five million tons in May, 1940, to only just over four million tons in March, 1941, and, alarmed by the rapid depletion of stocks and the anticipated increased fuel requirements of essential industries, the Government in that month appealed to owners and workmen to raise production to a minimum average weekly rate of 4½ million tons. This quantity was needed to meet current needs and raise stocks from the then low level of 15 million tons to 39 million tons, including an increase in the stocks at Government dumps from one million to five million tons. Inland transport facilities had recovered from the dislocation caused by the 1941 winter snowstorms and frosts and were favourable to the execution of the Government programme, but the handicap of a severe labour scarcity was accentuated by increased absenteeism, greater fatigue through co-operation in Civil Defence services, a persistent though diminishing drift of skilled men from the pits to the Forces, and widespread discontent among the miners at the disparity between their earnings and those of munition workers. On May 15th the Essential Work Order, with its guaranteed week and its ban on migration to other employments, was applied to the industry, and from June 1st the workmen were given a bonus of 1s. per shift as an incentive to more intensive individual effort. These measures, however, had little immediate effect, and a compulsory registration on July 17th-18th of all workmen between 20 and 60 years of age who had been employed in coal mining for six months or more since the beginning of 1935 only increased underground personnel by 17,000 after allowing for the natural wastage and loss of labour from other causes. In these conditions there were weeks when current production was barely equal to current consumption, and the best weekly output during the year fell short by about 5 per cent of the 4½ million ton target figure.

Of the year's reduced output the home market absorbed about 95 per cent compared with 77 per cent in 1938. Towards the end of the year exports were sanctioned only in very exceptional circumstances, and of the year's actual overseas shipments, bunkers accounted for 55 per cent and cargoes for 45 per cent. In the inland trade—where, incidentally, commercial disposals were about 1½ per cent less than in 1940—distribution was subject to the priority system and the Government stocking policy. By agreement between the Mines Department and the merchants, but at the cost of some inconvenience and expense to consumers, grades of domestic coals were reduced to four and of other fuels to three, and the public was asked to be satisfied with what coal it could get instead of its customary qualities; but neither essential industries nor public utilities went short for any length of time, and it is estimated that in December stocks exceeded 30 million tons.

In the regulation of prices the Mines Department authorised pithead increases only in cases of proved need, and anomalies in delivered prices, due to differences in transport costs of railborne and seaborne coal, were removed by methods of subvention. During the year wages were raised under the cost of living sliding scale by 6d. per shift on January 1st and by 4d. on July 1st, while on June 1st both the 1s. per shift attendance bonus and the guaranteed wage (for which the Government authorised a levy up to 6d. per ton) became operative, but the only flat rate price advances sanctioned by the Mines Department to meet these charges as well as other increased costs were 8d. per ton on January 1st and 10d. per ton on June 1st. Differential price increases were also granted to individual districts, and over the year local increases in proceeds ranged from 2s. 9d. to 4s. 2d. per ton, against which there were increases in wage costs ranging from 1s. 8½d. to 2s. 5½d. and in other costs from 10d. to 1s. 6½d. per ton. Profits improved substantially in Northumberland, Durham and South Wales, although averaging less than 1s. per ton, but in other areas they closely approximated those of 1940. The Coal Mines (War Levy) Scheme was amended so as to limit the compensation payable in the case of undertakings showing credit balances, and in June the levy was reduced to 2d. per ton, but the Central Council was given statutory power to grant additional financial assistance to collieries whose coals were necessary in the national interest. The guaranteed wage levy was raised from 1½d. to 5d. per ton.

Industrial relations were on the whole friendly, and the number of days lost through disputes was only 334,000, as against 505,000 in 1940. Co-operation was active on the joint District and Pit Production Committees as well as on the Coal Production Council. An application by the workmen for the establishment of a National Board was rejected by the owners on the ground that it violated the national settlement of March 20, 1940, providing for the continuance of district wage agreements for the period of the war, and by the Government on the ground that the "subject of rates of wages was a matter for negotiation under the existing machinery."

Oil

In the United Kingdom the year was marked by a tightening up of petrol rationing in Great Britain. The basic ration for public service vehicles was abolished in September, all issues thereafter being subject to the discretion of the Regional Transport Commissioners. For goods vehicles the basic ration was cut by one-sixth in May and by one-fifth in October (making a total reduction of one-third) and abolished altogether on March 7, 1942. For the first time since the beginning of the war, the private motorist's basic allocation was reduced by one-sixth for the quarter ended October and again by a similar amount in February-April, 1942. In addition, the grant of supplementary allowances for all classes of consumer was tightened up. Little headway was, however, made in the use of producer-gas vehicles, but in November the Henley Committee was asked to consider the availability of fuels for such vehicles.

Wholesale prices were advanced in July (this being the only change of the year) as follows: Kerosene by ½d. a gallon; gas oil by ½d. and diesel and fuel oil by 1d. Motor fuel was not affected, but was included in the list of price increases made in February, 1942. These were as follows: Petrol and kerosene (except burning oil), 1d. a gallon; diesel oil for road vehicles, 1½d.; gas oil, diesel oil and fuel oil, 1½d. a gallon. Prices for lubricants were advanced a week earlier. The retail price of petrol over most of the country is 2s. 1½d. a gallon and the wholesale price 1s. 10d.

As before, Britain's only oil problem was that of transport. Heavy tanker losses in the spring and early summer made it necessary to appeal to the United States for assist-

ance, and a considerable number of American tankers (estimated at about eighty) was transferred to British service. Since these vessels had to be taken mainly from the American coastal trade, a tight supply position inevitably developed on the Atlantic seaboard, which is normally supplied almost entirely by sea from the Gulf of Mexico. Appeals to American motorists to save fuel and the 7 p.m. to 7 a.m. closure of filling stations proving ineffectual, Mr Ickes (who had at the end of May been appointed Petroleum Co-ordinator for Defence) was forced in August to order a 10 per cent cut in supplies to filling stations in the eastern states. These restrictions were lifted in October, a sharp reduction in tanker losses having made possible the return by the British authorities of most of the borrowed vessels. The improvement was short-lived, for the entry of America and Japan into the war was followed by a serious increase in the rate of tanker losses. However, an enormous tanker building programme is under way in the United States, and the chairman of the Maritime Commission stated in January, 1942, that 208 tankers, with a gross tonnage of 2,196,000, would be constructed by the end of 1943. The United States is also assisting the Allied cause by arranging to step up its 100-octane aviation gasoline capacity to around 150,000 barrels a day (say, 6,000,000 tons a year) by the beginning of 1943 and to turn out some 400,000 tons of synthetic rubber annually, mainly from petroleum products.

Though German oil requirements on the eastern front cannot be accurately computed—estimates for consumption at the height of the campaign range from 300,000 to 2,000,000 tons a month—the invasion of Russia undoubtedly made serious inroads into Nazi stocks; but there is no conclusive evidence of a shortage of oil for military purposes. During most of 1941 the Germans had complete control of the Roumanian oil industry, which probably produced about 5,500,000 tons, and were certainly continuously extending their own coal-oil industry—to a present capacity of perhaps 5,000,000 tons a year. Besides these supplies, the output of petroleum and of substitute motor fuel in German-Europe was of the order of 2,000,000 tons in 1941. Drastic restrictions on civilian consumption were enforced, and considerable progress was made with producer-gas vehicles, of which there are now about 150,000 in German-Europe, besides more than 70,000 in Sweden and small numbers elsewhere.

The disasters which befell the United Nations in the Far East after December 7th made it necessary for them successively to destroy the oil wells and refineries of British and Dutch Borneo, Tarakan, Sumatra and Java, thus forfeiting an annual production of over 8,000,000 tons. In addition, by early March the Burmese fields had been rendered practically useless owing to the Japanese threat to Rangoon, where the refineries are situated.

Oil production in the United States rose by 4 per cent to some 200 million tons in 1941. Russian output is thought to have been somewhat larger than in 1940 at about 34 million tons, while Venezuelan production rose by over 20 per cent to 32 millions. Loss of markets was the cause of lower production in Iran, Iraq and the Netherlands Indies; but the Empire producers of Trinidad, Canada, India and Burma—as well as Egypt—recorded a modest advance. Apart from Venezuela, production in Latin America showed little change.

Non-Ferrous Metals

In the United Kingdom the organisation of the copper, lead and zinc control remained unchanged, and prices were maintained at the levels fixed in December, 1939. The bulk supply agreements concluded between the Ministry of Supply and the chief Empire producers in October, 1939, which were supplemented by a copper supply agreement for 116,000 tons with the Belgian Congo early last year, continued to provide the chief basis of supplies. On the whole, supplies of copper, lead and zinc were adequate to meet vital needs. In the case of lead, supplies were even excessive, due partly to the much reduced civilian consumption and the recovery of large quantities of scrap lead from bombed buildings.

Tin.—The market in the United Kingdom in tin remained free until December 9th, when, as a result of the outbreak of the war in the Pacific, a new Order bringing all stages of tin trading, including consumption and stocks, under Government control, was issued. The tin market of the London Metal Exchange, the last surviving British metal market, was closed on December 8th. Prices of tin in this country were depressed during the greater part of the year. The highest price of the year was reached on Feb-

ruary 21st—£282 10s. per ton—and the lowest price—£255—was quoted on October 30th. Domestic supplies of tin were excessive in the second half of the year, a direct result of the interruption of exports since April. As a result, visible stocks of tin in official warehouses in this country advanced from 2,145 tons at the beginning of May to 6,517 tons on December 5th, the last date for which figures were published. In the same period, however, the Ministry of Supply acquired quantities of tin directly from smelters and on the open market to prevent a major reaction in prices. Following the closing of the London market, the Ministry of Supply supplied consumers at £275 per ton delivered buyers' premises, a price which was confirmed as the official price early in 1942.

In the United States, consumption was high, probably exceeding 90,000 tons, against 74,050 tons in 1940. Deliveries however, reached almost 150,000 tons, against 115,497 tons in 1940, a reflection of the accumulation of stocks. Total stocks of tin at the end of the year, including 24,000 tons of tin in concentrates accumulated at Texas City, are believed to have reached 158,000 tons. The Texas City smelter approached completion at the end of the year and is expected to come into production in April, 1942. Owing to the Government's desire to accumulate a large strategic reserve, the export quota under the international regulation scheme has been kept at 130 per cent of the basic quota since the middle of 1940. The international tin agreement terminated at the end of 1941, but in November a decision was reached to extend it on a revised basis for a period of five years. But the Far Eastern sources of supply have now been lost to Japan. The latest world production figure published by the Tin Research Institute covers the first ten months of 1941, when 209,500 long tons were produced, against 187,600 tons in the corresponding period of 1940. World consumption in 1941 has been estimated at about 160,000 tons.

Aluminium.—This metal was controlled by the Ministry of Aircraft Production throughout 1941. However, the Aluminium Control was enlarged into a Light Metal Control, covering, besides aluminium, magnesium and all light alloys. British production of aluminium and magnesium are believed to have increased, but the bulk of British requirements had to be imported from North America, where the output of the United States exceeded 300,000 metric tons, against 187,100 tons in 1940, and that of Canada is believed to have reached 150,000 tons, against 110,000 tons. Aluminium prices remained unchanged in this country, but in the United States they were reduced to 15 cents per lb. on October 1st, against 17 cents at the end of last year.

Textile Raw Materials

Cotton.—Government control over raw cotton was tightened in 1941. The Liverpool cotton market was closed on March 31st, and official maximum prices were fixed on the basis of the Liverpool closing quotations on that date. Simultaneously, stocks (except consumers' holdings) and all new imports from April 1st were requisitioned by the Government. Imports and distribution were placed into the hands of Cotton Importers and Distributors, Ltd., which acted as agents for the Cotton Controller. Early in January, 1942, it was decided to discontinue the contract with this company on March 31st, when the Controller will take sole charge of imports and distribution. The consumption of cotton continued to decline. The New York Cotton Exchange Service has estimated British consumption during the season ended July 31, 1941, at 799,000 bales of American cotton (against 1,428,000 bales in 1939-40) and at 1,311,000 bales of other growths (against 1,565,000 bales in the previous season).

The world cotton crop for 1941-42 has been estimated at 26,710,000 bales, against 28,683,000 bales in 1940-41. The fall is due chiefly to the lower American crop, which in the last official estimate was reported at 10,976,000 bales, against

12,686,000 bales a year earlier. World consumption totalled 26,542,000 bales in 1940-41, against 28,486,000 bales in the preceding season.

Wool.—Growing shipping difficulties caused the Government to curtail raw wool allocations, but the selection of supplies for civilian needs was greater than in the preceding year, and included more crossbred wool. The combined wool clips of Australia, New Zealand and South Africa in 1940-41 at about 1,680,000,000 lb., showed an increase of 10,000,000 lb. on the year, although Australia's clip registered a fall. Following their setback in the first war season, exports from Argentina and Uruguay reached record rates in 1940-41. The great bulk of the Plate supplies was taken by the United States, which also received larger shipments from Australasia and South Africa. The British wool reserve in the United States (about 250,000,000 lb. Australasian wool) was handed over to the American Government as an emergency stock, but the British Government has built up a new reserve of Cape wool. The outbreak of war in the Pacific curtailed Australasian shipments in the last month, but stocks in Great Britain are believed to be substantial.

Other Materials.—Amongst other textile raw materials, supplies of flax were increased as a result of the Empire production drive, but military needs prevented allocations for civilian purposes. Silk remained very short. Control of jute was tightened, and on October 6th the Jute Controller of the Ministry of Supply took over all imports at a fixed price. The Indian crop for 1941-42 was estimated at 5,422,500 bales, against 12,562,452 bales a year before. Despite the sharp decline, the crop was larger than expected. The Government continued its bulk buying of East African sisal. Production in East Africa, which was reduced from 130,000 tons to 100,000 tons in the first two years of war, will probably be stepped up again owing to the loss of supplies of hard hemp fibres in the Dutch East Indies and the Philippines.

Rubber

THE British market in rubber remained free in the early months of the year, but subsequently it was brought under complete Government control. On April 27th, Sir Walrood Sinclair was appointed Rubber Controller. His first move was to introduce a Government rubber import monopoly early in May. Prices remained free until October 9th, when a maximum of 13.75d. per lb. was fixed for standard ribbed smoked sheet. This rate was fixed until March 31, 1942. Before the fixing of a maximum price the average monthly London price had fluctuated between 1s. 0½d. in January and 1s. 2½d. in April. It subsequently declined slightly, and the September average equalled the official maximum, fixed in October. Following the outbreak of war in the Pacific, all stages of rubber dealings were brought under a licensing system. On December 22nd control was vested in a Rubber Control Board under the chairmanship of Sir George Beharrel, which prepared certain economy measures including the prohibition of rubber consumption for certain purposes and the introduction of a licensing system for others. On January 9, 1942, control was retransferred to a Controller, Mr F. D. Ascoli, and the Control Board was continued as an advisory body.

In the United States, an import monopoly was introduced in June, followed by a systematic restriction of consumption from July 1st. The American buying programme was extended by the conclusion on March 7th of a new agreement for 100,000 tons, raising it to 430,000 tons. Early in the year the Government made some allocations for the construction of four small synthetic rubber works, a scheme which was expanded enormously following the outbreak of war in the Pacific. Present plans, announced in January 1942, provide for the installation of capacity with an annual production of 400,000 tons of synthetic rubber, but there are some unconfirmed reports that facilities are thus to be increased to yield 600,000 tons per annum.

Manufacturers

THE process of changing-over from the manufacture of civilian goods to the production of war equipment continued during the past year. By the end of the year the proportion of manufacturing resources devoted to the production of civilian and export goods had been substantially reduced, and the output of goods essential to the war had been appreciably increased. Many civilian industries, such as the manufacture of motor vehicles and wireless sets, have been completely, and other industries largely, converted to war production. The building industry has been occupied

in constructing the many new war factories that had been planned, and the peak of the construction programme has now been passed. A detailed record of the experience of the major industries cannot be given at this stage; neither the requisite statistics nor space are available. The iron and steel, shipping and shipbuilding, and the principal textile industries have been selected for brief reference. An account of the building and civil engineering industries, which was included in last year's *Co. & Commercial History*, was given in *The Economist* of February 22nd.

Iron and Steel

THE principal task of the iron and steel industry last year was to overcome the difficulties in maintaining a flow of production adequate for the fulfilment of the Government's construction and munitions programmes. One set of difficulties arose from the loss of many of the customary sources of iron ore supplies and another from the reduction in scrap deliveries from the United States. In addition, the iron and steel industry had to adapt its output to the changing needs of war. The industry's experience has been described as follows in the *Iron and Coal Trades Review* of January 9, 1942:—

The impact of war has inevitably led to disturbance of the traffic in imported ores. Access to many of the more important sources of supply has been completely severed. The other sources of foreign ore which we have been able to tap are by no means so conveniently situated as those normally used, and longer sea routes increase the burden on the mercantile marine at a period of extreme pressure. In these circumstances there have been substantial changes in furnace burdens, and the experience which has been gained may be of lasting benefit. At all events, it has been found possible to make much more extensive use of home ores and the output of these has been substantially increased.

In regard to scrap supplies a somewhat similar story can be told. Our dependence upon imported material has been progressively reduced by a round-up of scrap from home sources.

The manufacture and disposal of steel products have come under no less careful scrutiny. A number of plants whose products were not requisite for the production of the war have been closed down.

Distribution is controlled by an elaborate licensing system, which enables the authorities to direct the flow of material to destinations where it is most needed, and to keep a complete check on the uses to which the steel output is applied.

Increased use of domestic scrap and ore and the control of the distribution of steel: these were the chief measures applied to overcome the difficulties of steel supplies. On the whole, the output of crude steel, though somewhat below the industry's capacity, has been fairly well maintained; moreover, domestic production has been supplemented by heavy imports from the United States.

While iron and steel prices were raised several times in 1940, there has been no general increase in 1941.

Shipping and Shipbuilding

DURING the first six months of the year merchant shipping losses through enemy action were heavy; they totalled some 2,600,000 gross tons of British, neutral and Allied vessels. The rate of loss showed a sharp reduction in the second half of the year, when, according to the annual report of the Chamber of Shipping, they averaged some 180,000 per month, a total of about 1,100,000 gross tons for the period. It therefore appears that for the year as a whole the tonnage lost, at 3,700,000 gross, was almost as high as in 1940, when it totalled 3,800,000 gross tons of British, neutral and Allied shipping. Towards the end of the year, when Japan entered the war, the rate of loss again showed a serious increase.

Strenuous efforts were made by British shipyards to make good as large a proportion of the losses as possible. But owing to the urgent need for new naval vessels and the large volume of repair work, the output of merchant ships in the United Kingdom remained substantially below the rate of loss. During the first two years of war output is believed to have totalled about 1,500,000 gross tons, but the rate of production is understood to have increased in the second half of last year. The expansion programme in the United States was still in its initial stages last year, when the gross tonnage launched was well below the 1,000,000 mark; but for the current year an output of about 5,000,000 gross tons is envisaged.

The cost of running ships continued to rise in 1941, but, according to the annual report of the Chamber of Shipping, the rates of hire paid by the Government on the whole represent a fair bargain "within the narrow limits laid down." But it is again pointed out that "they make no provision for reserves to meet the high cost of replacement, nor do they contain any margin for contingencies." Shipbuilding costs have risen substantially, and are now some 60 to 80 per cent above the pre-war level.

Cotton Textiles

ON February 7, 1941, it became generally known that Sir Percy Ashley, the Controller, had said that production must be drastically cut. On March 1st came the first substantial

cut in raw cotton supplies to spinners, and from that date the concentration machine gradually squeezed the industry into the narrow proportions of its wartime rôle.

Because of the drastic reduction of supplies to spinners, the yarn section seemed at that time to be the most appropriate section for concentration. Spinning output was reduced to between 50 and 60 per cent of capacity by keeping some mills, which were named nucleus, open, and closing the remainder. Had this plan worked smoothly, the industry might not have suffered from the shortage of yarns it has experienced ever since. The operatives refused, however, to await the official axe, and, since all were threatened, thousands anticipated it by finding alternative employment in munitions. Thus the intention to transfer operatives from closed to nucleus mills to bring up staffing to full requirements went awry. The industry's leaders have spent much time ever since trying to get operatives back into the trade. Probably because of this experience, the authorities dealt more gently with the weaving branch and aimed at creating a surplus of machinery which could be brought into operation when the yarn position improved. The Essential Work Order was applied to both branches as a preliminary move to the decision, which it became evident towards the end of the year must be made, of listing cotton as a vital war industry. It was impossible to avoid the reflection that the final production position reached, after one of the worst upheavals in the industry's history, was a spread-over system which had been recommended in the first place by the trade's leaders, but rejected by the Government, which asked it voluntarily to bow its neck to the axe or have it forced on the block.

Hopes of compensation for being closed down were moderated by the Treasury to "care and maintenance" payments provided by funds to which all nucleus concerns contributed. From these, closed spinning mills drew at the rate of £7,000 a year for 100,000 spindles—terms which made them increasingly restless, as they did not provide for depreciation or payments to shareholders—and weaving sheds drew a maximum of £6 a loom of 40-inch reed space a year.

As a consequence of growing labour shortages in all production branches, operatives were able to make progress in wage claims apart from the agreement to tie wages to the official cost-of-living index by which they had risen 32½ per cent above pre-war rates by the end of the year. For the first time in the industry's history, weavers were guaranteed a minimum wage, and concessions were also granted in the spinning section, though the scarcity of labour suggested that these were preliminaries to more substantial claims to offset some of the peace-time misery which under-employment had caused in Lancashire.

The constriction of cloth merchandising marched alongside concentration. Total exports of yarn in 1941 were 28,800,000 lb. as compared with 66,700,000 lb. in 1940 and 113,900,000 lb. in 1939. Piece-goods shipments were 783,600,000 square yards as compared with 978,379,000 square yards in 1940 and 1,393,800,000 square yards in 1939. Towards the end of December the Cotton Board stated that new buying and market allocations for the first three months of 1942 would be 50 per cent of allocations for the four months ending December 31, 1941, and that the remaining 50 per cent would be held up pending Government consideration and whether changes were desirable following Japan's entry into the war.

This announcement, together with the fact that even a 20 per cent home trade quota had been extremely difficult to fill, foreshadowed the final phase of still less ordinary to commercial trade and the industry's capacity reduced to British and Allied war needs. Special attempts were made to meet the urgent needs of Russia and Australia, and it became clear that these war calls would be the chief concern of the exporting community. By the close of the year, practically the only active civilian markets were South Africa, Canada and South America.

Wool Textiles

THE wool textile industry underwent many changes during the year; the production of uniforms set a record for wool consumption. A system of priorities, giving first place to Government requirements, second place to exports, and what remained for home civilian trade, was established. There was no difficulty in supplying Government requirements for uniforms, and large stocks were accumulated.

While exports of wool yarn and tops continued to shrink during the year, shipments of tissues were bigger in volume than in 1940 and not far below the pre-war level. The course

of exports of yarn, tops and tissues since 1938 is shown below:—

	Yarn (‘000 lb.)	Tops (‘000 lb.)	Tissues (‘000 sq. yds.)
1938	35,000	32,454	90,554
1939	31,000	33,848	93,480
1940	15,000	28,470	83,045
1941	11,762	16,169	86,339

The divergent trend of exports of yarn and tops and of tissues is ascribed partly to the fact that while shipments of the first two were restricted by the operation of a licensing system, those of the last were virtually unrestricted. Since returns concerning the destination of exports of tissues are not available, it is difficult to ascertain how far the recovery in shipments of tissues during the second half of the year was due to the supplies sent to Russia. It is unlikely, however, that the improvement will continue, for the need to economise wool and labour has made necessary the extension of the licensing system to woven wool goods and blankets.

In addition to quotas fixed by the Limitation of Supplies Orders, the solution of the problem of civilian supplies was promised through the utility clothing scheme. Types of fabric were specified under the Limitation of Supplies (Cloth and Apparel) Order, and margins and prices fixed. A larger quota was allowed for the manufacture of utility cloth than for the ordinary trade.

Less raw wool was imported than had previously been possible, and this fact may have led to the extension of control to fibres which previously were free. Like the cotton trade, the wool textile industry was affected by the call for manpower, though it did not suffer to anything like the same extent. Production was concentrated into fewer mills after protracted negotiations, and had the effect of releasing workers, factory space and of saving coal. The extension of the war created new demands for woollens and blankets, which were sent to Russia, and the Polish Army in Russia was equipped with British uniforms.

Wool, tops and noils recorded no price changes during the year, and there were only slight changes in yarn quotations. The only changes were in 1/16s lustrés (40/44s), which rose from 3s. 5d. per lb. to 3s. 6d. on June 30th, and 2/48s (64s average), which rose from 5s. 7½d. per lb. to 5s. 9d. on June 30th and to 5s. 11d. on December 23rd. The concessions which had been allowed on the usual rates for export orders tended to disappear when utility cloths were introduced.

Retail Trade

THE chief influences in retail trade were the reduction in new supplies of goods covered by the Limitation of Supplies (Miscellaneous) Order and the introduction, on June 1st, of the clothes rationing scheme which is described below. Their effect was to reduce still further the volume of non-food sales, though the full impact of the reduction was cushioned by the existence of stocks which are now dwindling rapidly. Turnover in food, on the other hand, appears to have been fairly well maintained.

PERCENTAGE CHANGE IN VALUE OF RETAIL SALES FROM CORRESPONDING MONTH A YEAR AGO

	Food and Perishables	Other Merchandise
1941 February	+ 3.5	+ 1.8
March	- 2.1	- 2.1
April	+ 0.9	+ 2.9
May	- 4.3	- 2.4
June	- 3.1	+ 6.8
July	- 6.7	- 15.9
August	- 1.9	- 10.8
September	- 0.8	- 8.2
October	+ 0.2	- 23.5
November	- 0.4	- 2.3
December	- 1.9	- 7.4
1942 January	- 1.1	+ 12.0

Changes in the value, as distinct from the volume, of sales are shown by the accompanying tables. The first shows, for each month of the retail year 1941-42, the percentage change in food and non-food sales from the corresponding month of the preceding year. The value of food sales has shown comparatively little variation, but that of non-food sales showed a sharp reduction after June.

In the second table the value of turnover in 1941-42 by commodities and districts is compared with sales in 1940-41.

Rayon

DURING the early part of 1941 the rayon industry was actively engaged on developing export markets. Stocks of rayon goods on home account were very large, and there appeared to be little urgent necessity to increase them. In the spring, the process of "concentration" of the rayon yarn producing industry was carried out, and two or more units were closed down, the remaining production being concentrated in or near the Lancashire area, where consumption is greatest. By this means valuable labour and space was freed in the munition areas without impairing the efficiency of the industry. A factory built on the latest labour-saving lines was brought into fuller use and did much to offset the inevitable rise in overhead costs. Prices of rayon were increased, but the advance since 1939 was less than that in other textiles. With the industry on a much reduced output schedule, it became evident that if the export trade were to be continued at the same level, a very serious shortage would occur on the home market in the spring of 1942. It was therefore found necessary to reduce the export trade and to concentrate, in the case of the weaving-end, nearly three-quarters of the total output mainly on the production of the new type of "utility" goods. No details are available, but it is certain that in the hosiery trade an even larger proportion of the production was directed to the home trade. In hosiery rather more than in weaving, lack of silk supplies had laid an additional burden on rayon. The advantages in shipping space and foreign exchange of producing rayon rather than other textiles caused diversions from both cotton and wool, as well as silk.

During the whole of the year the official Rayon Control remained in abeyance and the industry managed its own affairs. The rayon producers set up a Rayon Allocation Office, and it was not until after the end of the year, when conditions of supply became very difficult, that the Ministry of Supply arranged for the approval of orders to be carried out by the Cotton Control. Under this arrangement, after the orders are approved, yarn supplies are still allocated by the industry through the Rayon Allocation Office, except in the case of staple fibre yarns, which are allocated by the Cotton Control. Export allocations which are not restricted officially to particular markets are issued by the Cotton Board. These arrangements refer only to the weaving of rayon cloth, and others will be announced for hosiery and ribbons. Meanwhile, the rayon industry has set up a Rayon Council, which includes all sections of producers and users.

Stocks

The total value of sales last year was only 3.2 per cent smaller than in 1940; food sales fell by 1.5 per cent and non-food sales by 5.4 per cent. But in view of the marked

AVERAGE DAILY VALUE OF RETAIL SALES AND STOCKS IN GREAT BRITAIN COMPARED WITH A YEAR AGO.

rise in the prices of many non-food items, the decline in the volume of sales must have been substantial.

Except in the piece-goods section and in the fancy departments, the value of non-food sales showed a reduction from 1940-41. The experience of the various districts shows little variation; apart from the 2.1 per cent increase in the total value of sales in London, all other districts recorded declines ranging from 0.3 per cent in Scotland to 4.5 per cent in suburban London.

The value of stocks (at cost) at the end of January was 4 per cent higher than a year earlier in the case of food-stuffs and 9.1 per cent higher in the case of other merchandise. But as the prices of the latter have risen by considerably more than 9.1 per cent, the volume of stocks must be appreciably smaller than a year ago.

Clothes Rationing

THE rationing of clothes to consumers was introduced by the Board of Trade on June 1st, 1941. Each individual was allowed a total of 66 coupons for the rationing year, June, 1941-May, 1942, and garments were rated according to the amount of material contained in them. The accompanying table gives some examples. There were certain exceptions to the scheme: protective clothing, hats, clothes for children under four years of age, second-hand clothes, household linens, furnishing fabrics and blackout material. The effect of the scheme as far as the retailer was concerned was that replacements depended on his turnover; they could be made only against coupons surrendered to the manufacturers. A short period was allowed in which coupons could be accumulated without coupons. Modifications in the coupon rating were soon introduced, differentiating between garments made of wool and other textiles, and coupons were required to be surrendered for second-hand garments above certain prices. Lower coupon ratings were allowed between July 6th and August 16th to enable retailers to clear stocks of certain summer garments which had sold slowly owing to the unseasonable weather before rationing was begun. It became necessary to ration babies' clothing, since the materials from which they were made were required coupons. From August 12th expectant mothers were able to obtain 50 coupons, and babies were allowed a proportion of the year's coupons at birth. The principle that rationing, to be successful, must be accompanied by price control was recognised. The fact that the ration would allow only for about half the pre-war purchases of clothing to be made meant that steps must be taken to ensure that a sufficient supply of cheap clothing should be available. To this end, the utility clothing scheme was planned, by which specifications for materials were laid down, for manufacture outside the usual quotas, and profit margins and maximum prices fixed, both for the cloth and for the garments.

Ration cards were available only to civilians, but members of the armed forces were permitted to purchase certain

garments not issued to them, on production of a certificate signed by their commanding officer. Officers were permitted to buy clothing for their own personal needs, on

CLOTHING COUPON RATINGS

Type of Garment	Man	Woman	Child
Overcoat, fully-lined and woollen, leather or fur	Coupons 18	Coupons 18	Coupons 11

And for every 6 inches or part thereof in excess of 63 inches	1	1	

signing the retailers' bill, which then became a coupon equivalent document.

Towards the end of the year the Board of Trade made a survey of the way in which consumers expended their coupons. The survey showed that spending was wise and evenly distributed over the period covered.
