apparently implied in the original announcement, which provided that factories, institutions and offices should receive an allowance based on the previous six months' consumption. Major Lloyd George said that the needs of miners for whom pithead baths are not available are under consideration. It is obviously unfair that workers who have water laid on at their place of work should be favoured as against those who have not, and it is to be hoped that Lord Woolton's consideration will extend, not only to all miners, but also to agricultural labourers, builders, quarrymen, dockers and other workers doing dirty work who do not enjoy washing facilities provided by their firms. The other main demand has been for an additional ration to persons doing their own washing and in charge of young children. On this, Major Lloyd George was less encouraging. He announced that Lord Woolton "has no evidence that the prescribed ration will not prove to be sufficient for every class of domestic consumer." Actually, of course, the need for soap varies widely. Where a high proportion of clothes is washed at home, and especially where clothes have to be washed every day, as with small children, the ration is insufficient. On the face of it, the ration cannot be just adequate both for adults who use a laundry and for the members of a family where clothes are washed at home daily. When the issue is further complicated by the "hardness" of water for washing, as it is in a considerable area of England, the struggle against dirt must be unequal. One interesting suggestion is that owners of children's ration books should be entitled to use margarine coupons for soap; the same raw material is, in the main, in question; and margarine is not consumed directly by infants. This idea implies an extension of the group rationing principle and deserves attention from the Ministry of Food. It cannot be too often emphasised that in the matter of rationing "to each according to his need" is a more appropriate ideal than "each man shall count as one." The overriding consideration, of course, is the expected serious shortage of ships and supplies, and a drastic solution is the only sound policy at this juncture, in this as in all other matters of rationing. No one can legitimately ask for an increase in the total supply of soap made available for rations. But a redistribution of the rations so that those who need more get more, and those who can make do with less get less, is both possible and desirable.

A Fresh Mixture

A new Committee on conditions in the women's Services has been set up. The one set up a month ago, consisting of four male and junior Ministers, was still-born. It was violently criticised from the outset because it contained no women, and was, in fact, made up of representatives of the four departments—the three Service departments and the Ministry of Labour—which were to be scrutinised. The new one contains five women, three men, and no Ministers. The episode has been stridently hailed already as a victory for women—which, of course, remains to be seen. Femininity is a badge neither of competence nor of incompetence. It will only be a triumph—for anyone—if the Committee does a good job properly; and its composition, on the whole, promises well. The women are Miss Violet Markham, Miss Thelma Cazalet, MP, Mrs Walter Elliot, Mrs J. L. Stocks, and Dr Edith Summerskill, MP; the men are Major Milner, MP, Air Vice-Marshal Sir David Munro, of the Medical Research Council, and Sir Frederick Sykes, MP. The only victory, from the point of view of the women in the Services, will be a report which shows what is wrong and why, and makes sure, for the future, of just the food, shelter and treatment they are entitled to and need to do their work. No frills are needed or asked for. The members of the Committee, men and women, have now to prove that they are capable of conducting an inquiry which will produce this. If they listen to loose-mouthed talk and tight-lipped criticism outside the Services, they will probably waste their time, just as they certainly will if they just sit in Whitehall and hear from high officials inside the Services about what is supposed to be the state of affairs, according to the book, the orders, and the instructions. The Committee must do some field work among the local panjandums. Orders are not always obeyed; instructions are sometimes ignored. If the Beveridge Committee had relied on what was supposed to be being done with skilled men in the Army, and not gone to see, it would have done the country a disservice, instead of the great service it has done.

Christian Teaching

The debate on Christian education which took place last week in the House of Lords on a motion of the Archbishop of Canterbury adhered mainly to general principles. It is known, however, that specific proposals, to which the Primate referred, are now before the Board of Education. The debate showed general agreement that the present dual system of education, by which denominational schools are apt to be starved of funds, while public elementary and secondary schools are precluded from offering any but the most general religious teaching, is not satisfactory. There was wide anxiety that the nation as a whole is becoming less Christian—though some of the evidence adduced, such as the increase in juvenile delinquency, can very easily be accounted for on other grounds. If religious instruction could be given a more prominent place in the curriculum of state schools, a large step forward would have been taken in the inculcation, possibly of Christian faith and certainly of Christian moral standards. But this is where the difficulties begin. What sort of instruction? And by whom? There is great force in the argument that a Christianity divorced from doctrine, a compromise syllabus that ignores all controversial issues, will be as flat and uninspiring as the "Scripture" that schoolchildren get now, that it will teach little more than the conventional virtues that Christianity shares with other religions. The Bishop of St Albans, for example, affirmed that Christian character cannot be produced if teaching is divorced from Christian faith and creed. But if the teaching of religion is to be denominational there are the great difficulties not only of providing for the major, let alone the minor, differences of belief and of finding teachers in very large numbers, but also of allowing for the great number of parents who wish their children to be educated in Christian philosophy but not in the dogmas of any church, which they believe are not for young minds. It is difficult to resist the conclusion that the teaching of a more vital religion than is possible within the present limitations is very necessary but that it cannot without great difficulty be fitted into the framework of an educational system whose structure is, by now, predominantly secular. Such teaching, outside the school curriculum might well be encouraged and perhaps even assisted by the state, and the law might possibly be amended to permit the use of school buildings for this purpose. But any attempt to go further will almost certainly meet with strong opposition.

Shorter Notes

The nomination of Dr Temple to succeed Dr Lang as Archbishop of Canterbury has been very widely welcomed. Since the retiring Primate specifically resigned in favour of a man more suited to dealing with the complicated and vital problems of reconstruction, it would have been odd indeed if the choice of a successor had passed over the churchman whose contribution to social thought has been most outstanding. As it is, Dr Temple's appointment is well in keeping with the nation's new mood of resolution for war and peace.

Stefan Horthy was last week elected by the Hungarian Parliament as permanent deputy for his father. It was reported that Admiral Horthy refused to make use of his right, under a recent law, to nominate three persons from whom a permanent deputy could be selected and left the Hungarian Parliament to make its own selection. Behind the whole affair, however, there was almost certainly pressure and intrigue on the part of the Germans; and the election of Stefan Horthy, a pro-Nazi, who as director of the Hungarian railways connived at the German troop movements through Hungary before the attack on Yugoslavia, only confirms Hungary's complete subservience to the Axis.

A further development in the grant of State bursaries to school children to serve the needs of the State has been announced. At least 50 scholarships of £200 per annum will be awarded, without a means test, to selected boys from secondary and public schools to enable them to study Japanese, Chinese, Turkish or Persian at the School of Oriental and African Studies. The Board of Education states that these scholarships are important both to the war

effort and for post-war development, and the successful applicants will be required to give an undertaking to be at the disposal of the Government for not more than five years after their scholarships end. The announcement follows the decision last summer to give State bursaries in science subjects at universities and technical colleges in order to meet the demand for trained men and women in radio work and in engineering and chemistry.

The following table, taken from a written Parliamentary answer, shows the amount of unemployment benefit, transitional benefit, transitional payments and unemployment allowances paid during the ten years before the war:—

Calendar Year	Paid at Local Offices of the Ministry of Labour and the Assistance Board				Grand Total, including Payments made through Associations
	Men (Aged 18 and over)	Women (Aged 18 and over)	Boys (Aged 16 and 17)	Girls (Aged 16 and 17)	
1929	£'000	£'000	£'000	£'000	£'000
1930	37,260	4,950	117	58	44,359
1931	61,294	12,628	335	207	78,244
1932	90,051	16,960	552	273	114,576
1933	88,617	7,971	447	180	102,681
1934	82,021	6,993	304	135	93,708
1935	73,609	6,803	220	104	83,725
1936	76,863	7,467	250	115	86,662
1937	68,908	6,622	250	133	77,353
1938	62,177	6,466	279	188	70,355
1939	72,917	10,936	452	343	87,144
1939	59,266	9,614	321	271	71,411

AMERICAN SURVEY

Politics 1917 and 1942

(By a Correspondent)

THAT history never repeats itself may be true, but it is a truth that practising politicians find it very hard to accept. And political manoeuvring in America at this moment reveals the determination of one set of politicians to promote, and of another set of politicians to avoid, the repetition of the political history of the last war.

For the second time in a short span of the national history, a Democratic administration is in office while the United States is at war. Normal party politics are frowned on by public opinion, and the increased gravity of the national danger has made the rôle of the Opposition party hard to play—at the political level. No one doubts that the regular Republican leaders have the complete triumph of the United States deeply at heart, but they cannot be unconscious of the fact that the future of their own party, as of the important political vested interests that it represents, is in danger. War concentrates power in the executive, and in America that executive is one man. The President may vary his advisers, he may get rid of old assistants and take on new ones, but he cannot divide or evade his own unique responsibility—and, even if he could, Mr Roosevelt is notoriously not the type to try. The range of the Federal Government must widen, the shadow of presidential power grow longer, and already in his first two terms, Mr Roosevelt has added immensely to the power of his great office and so to the power of the party of which he is the head. This aggrandisement of the presidency and of the Democratic party, if it is to be a permanent feature of American political life, means eclipse both for the personnel and for the policies and attitudes of the Republican party, as now represented in Congress.

Yet those Republican leaders are certainly remembering, in their present difficulties, the superficially encouraging precedent of 1917-18, when war did temporarily aggrandise the Presidency, then as now held by a Democrat, but when the Republican party rapidly profited by the revulsion against the strain and novelty of war. The President, who was almost omnipotent when the German danger was at its height, was defeated in the Congressional elections held a few days before the Armistice and his policy and party

The Government's ruling on holidays for industrial workers will be welcome. It recommends that they should take one week's holiday, staggered over the period between the beginning of April and the autumn, with for most workers a one-day break on Easter Monday, Whit Monday and August Bank Holiday, and two days at Christmas or the New Year.

Mr Churchill has revealed in answer to a Parliamentary question that the post of Intendant-General in Cairo was abolished early in January. This post, to which General Haining was appointed, was set up two months before the appointment of Mr Oliver Lyttelton to Cairo, and General Haining's responsibility was supplies, both to serve the Commander-in-Chief and also to deal with the mass of equipment arriving from the United States. Mr Churchill has now stated that the existence of a Minister of State, together with the provision of a senior army officer to be in charge, under the Commander-in-Chief, of the administration of the army in the Middle East, has made the post of Intendant-General unnecessary.

In the article "Neutral Iberia" in *The Economist* of last week (page 243), the 1941 wheat harvest in Spain was given as 31,445,000 tons, which was said to be well over 10 million tons short of the pre-Civil War average. In each case, tons should have read metric hundredweights.

dramatically repudiated at the presidential election of 1920.

This historical precedent is obviously present in more than Republican minds, as is revealed by the difference of opinion which is now known to exist between the President and the chief Democratic party manager, Mr Ed Flynn, boss of The Bronx and chairman of the Democratic National Committee. Mr Flynn has his eye, as the duties of his office make proper, on the Congressional elections of November, 1942. Like a good party man, he wishes to cash in on the prestige of the Administration; he wishes to condition the electors to express their loyalty and patriotic energy by voting a straight Democratic ticket. Given the constitutional necessity of having Congressional elections and the constitutional impossibility of having a coalition executive, Mr Flynn's tactics may seem reasonable enough. So far as the Republican party in Congress has had a foreign policy, it has been blind, complacent, irrelevant and petty. The American electors might be invited in Cromwellian terms to send these myopic public servants about their business. But Mr Roosevelt has not endorsed Mr Flynn's policy, and there are two good reasons why it does not appeal to him. The first is that if the record of the Republican party in Congress is black, that of the Democratic party in Congress is not much better than tattle-tale grey. To ask the electors to take the party labels as indicating the national usefulness of candidates is to be unjust to some Republicans and to be too kind to more Democrats.

Present in the minds of party leaders of both sides is the failure of Woodrow Wilson to secure the return of a Democratic Congress in 1918, with the disastrous effect on his authority in Europe which ensued. We all know the story. Wilson was persuaded by the spiritual predecessor of Mr Flynn, Postmaster-General Burleson, to appeal for the return of a Democratic Congress, not for the election of men of like mind with the President, whatever their label. Many of Wilson's wisest friends deplored the appeal. He himself hesitated, then took the plunge—and lost. Mr Roosevelt remembers 1918 and has resolved not to make the same mistake.

But it should be remembered that he is under far less

temptation to make the mistake than Wilson was. President Wilson was elected on a minority vote in 1912; he was re-elected, narrowly, in 1916 in face of a reunited Republican party. The recovery of Republican strength, while just failing to win the presidency, had cut the Democratic majorities in each House of Congress to very narrow margins. The prestige of the Republican party was great. The two Democratic victories were and looked accidental. In the Republican party were most of the great national leaders, Lodge, Penrose, Smoot, Elihu Root, Charles Evans Hughes, and two ex-Presidents, Taft and Roosevelt. Wilson, in any case, was going to be badly handicapped by his own party's weakness. The temptation to try to improve his hand was great. And always present was the fact that the Republican party had in its ranks not only the most effective conservative leaders but some of the most effective spokesmen of agrarian radicalism. There were Senators Johnson, Borah, Norris, La Follette in more or less regular communion with the party of Big Business. Mr. Wilson's re-election was opposed not only by the two Republican members of the present Roosevelt Cabinet, Messrs Stimson and Knox, but by Mr Harold Ickes, by the father of Vice-President Wallace, by Mr La Guardia, by scores of local leaders whose *clientèle*, if not themselves, have been absorbed into the New Deal ranks.

The Republican party to-day is weak and knows it. It has not won a national election for nearly fourteen years. It has not (ominous sign for the practical politician) elected a Governor of New York since 1920. It is weak in each House of Congress, and its not terribly impressive gains of 1938 were largely wiped out in 1940. Mr Roosevelt has not Wilson's need to strengthen his hand. And, even if his party position in Congress were weaker, his personal position is far stronger than Wilson's ever was. He has been elected President three times, and even on the last occasion his majority was impressive, though no longer spectacular. His last victory, too, was won over a candidate who was stronger than his party and who is far closer to the administration in spirit than he is to the average Republican Congressman or Senator. Mr Willkie is not a leader of a united Opposition. Perhaps he is not in opposition at all. How different from 1917 and 1918 when the Republicans had among their chiefs Theodore Roosevelt, almost as formidable a campaigner as his nephew-in-law. Then every commitment of the United States by the President was opposed and its validity contested by some of the chief leaders of the Republican party—and the Republican party was still full of the pride of life, still convinced that it had a divine commission to rule.

There is no likelihood that such a situation will recur. The Democratic party is much stronger than its rival and the President is much stronger than his party. He has shown, too, more regard for the political conditions of national unity than Wilson did. His appointment of Messrs Stimson and Knox and his insistence on the candidacy of Mr Wallace for the vice-presidency in the summer of 1940, like his support of Mayor La Guardia in the New York election of November, 1941, were proofs both of strength and wisdom. And, lastly, the United States is far more deeply involved emotionally and practically in this war than it was in the last. This is no crusade on a point of honour; war has been made, and so far successfully made, on the United States by a most formidable combination of powers. In 1917-18, for the American people, the war was dramatic, moving, but remote. In such an atmosphere, mere or pure politics were not wholly out of place. But they are out of place to-day in a grimmer, harder, less complacent world.

A Shifting of Effort

[FROM OUR NEW YORK CORRESPONDENT]

January 21st
INDUSTRIAL production in December was virtually the same as in November—the unadjusted index went down two points, but the adjustment lifted it two points. The index was as follows for the last four months of 1941:—

	INDEX OF PRODUCTION	
	Seasonally Adjusted	Without Seasonal Adjustment
September	161	167
October	163	167
November	166	167
December	168*	165*

* Preliminary.

This is evidence that something like a ceiling has been reached; and while this ceiling may be lifted, it seems likely that more is to be expected from shifting of effort than from general increases in output.

	BUSINESS INDICES		
	1935-9=100 for industrial production and car loadings 1923-5=100 for other series		
	Adjusted for Seasonal		
	Dec., 1940	Nov., 1941	Dec., 1941
Industrial production (total) ...	139	166	168
Manufactures (total)	142	172	175
Durable	164	209	215
Non-Durable	124	143	142
Minerals	118	131	130
Construction contracts (total) ..	115	138	133
Residential	90	74	68
All Others	136	189	186
Factory employment (total)	116.6	134.3	—
Durable Goods	117.6	143.7	—
Non-Durable Goods	115.7	125.4	—
Factory payrolls (total)	122.4	165.2	—
Durable Goods	131.6	190.3	—
Non-Durable Goods	112.1	137.2	—
Freight car loadings	119	135	137
Department store sales	101	116	110
Department store stocks	71	95	—

The first series to reflect clearly the effect of the re-allocation of effort is residential building. Last July the index of residential building (adjusted) was 115; in December it was only slightly more than half that. Total building, however, has remained high.

The announcement of the rationing of rubber tyres brought a general buyers' rush into all sorts of retail lines in January. This is the third of these episodes since August, 1939—the first came in September, 1939, and was inspired by the mere outbreak of war; the second occurred in August, 1941, and was apparently touched off by the stress on petrol shortage and prospective rationing. The third (now in process) seems to have been a contagion of the actual rubber shortage. In the first and last of these rushes, sugar has been the conspicuous object of the housewife's desire—out of memories of the sugar shortage of 1918.

The tyre situation may bring a pinch at some time during the year. Allocations for civil use are extremely small, but, with one expedient or another, they threaten no immediate difficulties. By the year-end, the synthetic product should be available in reasonable amounts. In the interval one might expect some Brazilian wild rubber to come into the market, but little promise is forthcoming of supplies from that source. It would be interesting to conjecture what proportion of passenger car driving in the country could be classed as strictly for pleasure—possibly as high as 10 per cent; but, of course, a good deal not so classed could be omitted without causing serious disruptions of the processes of production.

Tyres are the only articles now rationed, although the priority system acts in effect as a rationing system. It is, however, so inflexible in its workings that it seems probable that the rationing method will be extended before long, and would be welcomed. In some lines, assurance that one could obtain a limited amount would be preferable to the present uncertainty.

The rise in commodity prices continues unabated. The BLS index of 28 basic commodities, which averaged about 119 in January, 1941, began to advance in February, and by September had reached 155, at which level it showed some signs of stability until early December. The rise was then resumed and by mid-January it stood at 164. The comprehensive BLS index opened the year 1941 at 80, and closed at 94—an advance of over 15 per cent. The cost-of-living index rose about 10 per cent during the year. It is hard to appraise the impact of these price changes on the economy. Average hourly wage rates rose last year more than the cost of living, and these rates, supplemented by overtime, brought a substantial increase in real wages to many of the 12 million-odd factory workers. The rise in prices of farm products has increased the real income of the farmer, although by no means uniformly for the 6 or 7 million farm families. Railroad workers and coal miners also received substantial wage increases during the year, besides receiving fuller employment. Of the 55-odd million persons estimated as gainfully employed, at least half may be estimated to be recipients of a larger real income than a year ago, including those previously unemployed. It is possible that the proportion runs larger.

American Notes

A Lead to the Nation

Although President Roosevelt's broadcast on Monday night contained no sensations, it provided the first comprehensive and authoritative account of American policy and strategy after ten weeks of being at war. The speech accomplished three main purposes. One was to explain the nature of the war, stressing the vital necessity of maintaining communications all over the world between the "main reservoirs of power"—China, the Southwest Pacific, the Mediterranean, Britain, and Russia, and illustrating, on the basis of geography, the inevitability of early Japanese successes. Another was to denounce and dispel the rumour-mongers who have been insinuating that the government was concealing extensive damage to the US Fleet. And finally, the President outlined the main aims of American policy: to keep open communications and supply the free nations wherever they were fighting; to solve the problems of production and secure an overwhelming superiority of armaments; to attack the enemy wherever and whenever possible in the interval before a grand offensive is practical; and to co-operate fully and on a basis of equality and comradeship with all the United Nations in planning and executing both the war and the peace. Recalling the long ordeal of the War of Independence, the President called on the American people to display the same fortitude, self-sacrifice, and discipline in these "times which try men's souls." At one point he referred to the "solemn pact of truth between government and people" in a democracy. He has discharged magnificently his obligation to place before the country the essential facts, the perils and the promise of the coming years. Equally, he has performed an even greater function of democratic statesmanship; he has given an inspiring lead to the nation in demanding production, sacrifice, and unity. It is a call to which the American people will respond enthusiastically.

Wartime Shipping Control

In an Executive Order President Roosevelt has established a War Shipping Administration under Admiral Emory Land, formerly of the Maritime Commission, "to assure the most effective utilisation of the shipping of the U.S. for the successful prosecution of the war." Admiral Land will represent the United States in dealing with the British Ministry of Transport, particularly in regard to the operation of the combined Shipping Adjustment Board. The Administrator has wide powers, covering the operation, purchase, charter, requisition and use of all American merchant ships, the allocation of all such vessels, war-risk marine insurance and re-insurance, and the establishment of conditions for priorities. He is responsible only to the President. Admiral Land's experience and success as Chairman of the Maritime Commission fit him admirably for one of the most vital jobs in the direction of the war. The Maritime Commission was the only branch of the war effort to emerge unscathed from the investigation of the Truman Committee, published in January. It was warmly commended for having achieved its programme of a ship a day, and it has announced this month that production will be doubled within sixty days and trebled within six or seven months. With the nomination of Mr Averell Harriman to be the American representative on the Shipping Adjustment Board in London, and the selection of Mr Lewis Douglas, former Director of the Budget, to be Admiral Land's adviser, the control of American shipping resources appears to be in able hands. This is fortunate in view of the recent heavy shipping losses and the urgent calls on merchant fleets all over the world. It is to be presumed that the creation of machinery of control will now lead to the final tightening-up of the mobilisation of American shipping, which has hitherto been rather loose and incomplete.

Eagle and Ostrich

Senator Walsh demanded last week that the U.S. Fleet be concentrated along the American coasts to prevent Axis attacks. Senator Johnson is reported to fear a repetition of Pearl Harbour in his native California. The attacks on Aruba were immediately responsible for these outbreaks of what President Roosevelt has characterised as an "ostrich

or turtle policy." The shelling of the Bankline Oil Refinery near Santa Barbara, the first attack on the continental United States in this war, shows that the fears along both coasts are not groundless or hysterical. Fortunately the Administration had grasped the nettle firmly; President Roosevelt pointed out several weeks ago that both submarine raids and bombing attacks were quite possible. Last week Mr Stimson, the Secretary for War, said, "We must be prepared against pressure by the public to string out our defences along the coastal bases. To yield to such pressure is the surest way to lose the war." Instead, as both Mr Stimson and President Roosevelt have made clear, the administration is thinking constantly in terms of possible offensives against the Axis, as the best method of reducing the threat to the coastal regions and of winning the war. The Administration has shown admirable firmness and foresight in forestalling the demand that the American Fleet be reduced to standing guard over New York and San Francisco, and in steeling the people to endure descents upon their coasts. The speed and effectiveness with which its spokesmen, particularly Mr Stimson and Mr Berle, have denounced calls for a purely defensive strategy, have been applauded and echoed in the press. This is an encouraging indication of the determination and realism of both government and people.

A Pacific Charter?

The demand for a Pacific version of last year's Atlantic Charter has been expressed by Mr Elizalde, for the Philippines, and has received support in Chungking. It has been taken up with considerable enthusiasm in the United States where it is felt that America has a unique opportunity for leadership in the Pacific. President Roosevelt's suggestion that the Atlantic Charter covered the whole world does not fully meet the criticisms behind the proposal. The American people are taking justifiable pride in the gallant co-operation of the Filipino people with General MacArthur against the Japanese which the Filipinos themselves attribute to the American grant of independence and self-government. The Americans consider it a complete vindication of their imperial policy when contrasted with the apathy displayed by the native populations in Malaya, Burma, and India. The problem of India in particular has always held a special fascination for Americans, and the recent meetings of General Chiang Kai-Shek with the Indian leaders have concentrated attention on the possibilities of arousing India to a greater participation in the war. The demand for a specifically Pacific charter appears to be based in part, as the President implied, on a misunderstanding of the scope of the Atlantic Charter, Atlantic referring rather to the place of meeting than to the regions where it was to apply. However, Mr Churchill's statement that the situation in India was a separate issue certainly provides ground for American and Far Eastern doubts about the intentions of the United Nations, and there are special difficulties in convincing the Indians, Malays, Burmese and Chinese which do not exist in Europe. First among them is the long history of the exploitation of the Far East; it will be no easy job to persuade the peoples that the victory of British, Dutch and Americans over the Japanese will mean more than a change of overlordship. All the freedoms promised by the Atlantic Charter have not by any means the automatic appeal in the Far East that they have in much of Europe, where free and democratic ways of life are deeply ingrained. Finally, the purely physical problem of reaching millions who are illiterate, scattered over vast areas, and scantily equipped with radios is a tremendous one. The good offices of the Americans are essential, but plainly the Chinese provide the ideal ambassadors and leaders of the Far East, and the experience of the Dutch and British should be invaluable. A restatement of the Atlantic Charter, and a vigorous application of its provisions to the Far East is overdue, but it would be regrettable if it implied that there are degrees of sincerity among the signatories.

Dollar-a-Year Men

New regulations have been announced by the WPB covering the employment of dollar-a-year men and officials serving without compensation. They are the direct outcome of vigorous charges, particularly in labour circles, that businessmen offering their services to the Government at the worst favour their own companies in awarding contracts and at best carry into government work an anti-labour frame of mind. The new orders provide that dollar-

a-year men must have independent means of at least \$5,600 a year, can make no determinations directly or indirectly affecting private firms with which they are connected, and may be appointed only to positions requiring special business or technical knowledge, for which they are qualified by outstanding experience and ability. Those appointed on a "without compensation" basis may serve only in an advisory capacity and may not assume any administrative responsibility or exercise any authority over the staff of the WPB. If vigorously applied, the regulations should eliminate the idle and unqualified, and the possibility that industry could indirectly finance its representatives in government office. The provision concerning the award of contracts is a fundamental necessity of honourable public service, though presumably a certain amount of influence through personal contacts will still be possible. The "invidious distinction" remains between those who can offer their services to the government and those who must have a salary in order to live, but this is of less importance than the assurance that the first group is confined to those who are essential and are not attempting to forward the interests of any special group. This action by the WPB shows a quick response to public sentiment and should increase confidence in the government, particularly among the trade unions.

Mineral and Power Expansion

Mr Ickes, Secretary of the Interior, has announced a sweeping programme to mobilise the nation's unexploited natural resources in order to ensure adequate supplies of metals, oil, power, fuel, food and timber. The programme includes the construction of plants utilising new processes for obtaining more manganese, aluminium, and chromium; the opening of new deposits of copper, zinc, lead, iron, and tin; the building of new 100-octane plants permitting the manufacture of 200,000 barrels of aviation fuel; tripling the 1941 power output of the principal publicly-owned hydro-electric plants by installing new units, and increasing the production of coking coal for the steel industry by 10 million tons annually. The President has already asked Congress for \$57 millions for the construction of hydro-electric power projects considered essential to the war effort. The mineral programme is a continuation of the work of the Bureau of Mines, which during 1941 devoted itself primarily to a search for new methods of treating a number of low grade domestic ores and of finding substitutes for imported materials. With the exception of nickel and tin, favourable results were reported in increasing the domestic sources of over 500 strategical minerals. The most striking result was the discovery of a high-grade tungsten deposit in Idaho (referred to in *The Economist* of May 31, 1941, p. 741). Additional sources of coking coal are being developed in the Western States, and the Bureau was able to show that a number of oilfields which have not so far produced high octane aviation spirit can supply crude oil for this purpose. Much hope is placed in the use of new refining methods for the production of manganese of high purity and of ferro-manganese from the abundant low grade domestic manganiferous ores by electrolysis. The Bureau lays stress on the improvement of production processes for magnesium by direct electrothermal reduction. It has also investigated successfully the possibility of finding substitutes for imported graphite, special clays, mica, bauxite for high temperature refractories and kyanite. The Bureau's methods of producing gasoline, lubricating oil, and valuable by-products from domestic coal have been greatly improved. The work of the Bureau of Mines has provided an indispensable foundation for the wide expansion of domestic mineral and power production made necessary by the war and the endangering of foreign sources of supply.

Shorter Notes

About 340,000 of the nation's stock of 480,000 new cars will be released this year to priority customers, including doctors, visiting nurses, hospitals, certain local authorities and farmers with no other means of taking their produce to market. The rest will be kept for future years.

The Census Bureau has reported that last year more than 2,500,000 children were born, the highest figure since 1921.

A bill designed to promote production in the US of guayule and other rubber bearing plants has been vetoed by the President because it omitted provision for production in other countries of the Western Hemisphere. An amended version has been passed by the Senate.

Mr Kanzler, Chief of the Automotive Branch of the WPB, has announced that when the "big three," General Motors, Chrysler, and Ford, reach the peak of their present war orders, they will be producing at the rate of \$10,500 millions a year, a rate which will exceed by more than 250 per cent the dollar value of these companies' production in 1941. The industry will need 800,000 to 1,000,000 workers compared with a peace-time peak of 550,000.

The WPB has announced that the Army and Navy have been able to grant permission for the hire of more than 99 per cent of the unnaturalised workers seeking employment on secret war production.

Voluntary enlistments in the US Army reached an all-time high of 90,241 in January, double the highest figure for the last war.

The Senate, by a vote of 75 to 5, has repealed the legislation providing pensions for Congressmen.

The House Ways and Means Committee has rejected the President's request for \$300,000 for unemployment compensation to workers displaced through the conversion of industry to war production.

Persons entering waterfront areas are now required to possess identification cards.

The Supreme Court has ruled in favour of the Bethlehem Shipbuilding Corporation in a suit in which the government was trying to recover \$8,000,000 paid the corporation on contracts during the last war. In the Court's opinion, a 22 per cent profit on total building cost of the ships was exceeded in too many other instances to be regarded as extraordinary.

Attorney-General Biddle has announced that the nation's transport systems will be permitted to pool their resources during the war without incurring prosecution under the anti-trust laws if so ordered by the Office of Defence Transportation.

Federal Bureau of Investigation agents in Northern California have arrested a number of Japanese said to have been equipped with weapons, signal lights, radios, binoculars and cameras. There is said to be considerable alarm on the Pacific coast over the extent of Japanese espionage. Earlier it was announced that eighteen Germans, one Italian, and one Japanese had been charged with possessing contraband material such as shortwave radios, and had been turned over to the Immigration authorities.

Simplified procedures are to be adopted by the Civil Service Commission in filling government posts. Those appointed under the special procedures will not acquire civil service status.

Pacific coast shipyards have experienced another walk-out by the independent welders who are unwilling to pay dues and hold cards in the AF of L unions which have obtained a closed shop in the yards. It is reported that there was almost a pitched battle between the 400 welders and 1,000 shipyard workers.

THE WORLD OVERSEAS

The Plight of French Industry—II

(By a French Correspondent)

February 23rd

THE shortage of coal and oil has set a severe limit to the volume of industrial activity in France. The fuel crisis, however, at least in its most acute forms, is temporary. From March onwards, for example, the electric power produced from coal will be supplemented by the output of the hydro-electric stations. This is not the case with the raw material crisis, which must become increasingly severe until French industry is either completely paralysed or forced to work almost wholly for Germany.

When it concluded the armistice, the Vichy Government counted on a short war. It calculated that, between the armistice and the conclusion of peace, France could exist on her stocks of raw materials, of petrol and lubricating oil, or, to be more precise, that she could exist on the small fraction of these stocks which were left to her by Germany. The stocks at the disposal of the Vichy Government are now exhausted, or on the point of exhaustion, and the possibilities of replacing these by imports are virtually non-existent.

Rubber manufacturing works had to close for two weeks in October after a 50 per cent cut in their rubber quota. The Government has several times sounded the alarm regarding stocks of base metals; there are virtually no supplies of copper, zinc, nickel, lead and tin. A big campaign was launched on July 11th last for the salvage of unessential objects, but without much success. M. Lehideux, Minister of Industrial Production, ventilated his annoyance on October 12th that the Government appeal had not received everywhere the understanding which it merited. "A subtle propaganda," he pointed out, "has been at pains to disturb public opinion by letting it be understood that the collected metal will not be available for the use of France." And he proceeded to give the lie to this allegation by affirming that the occupation authorities had agreed to impose no levy on the results of the campaign. M. Lehideux was unable to convince the French of the purity of the Germans' intentions and the conclusion of the campaign had to be postponed. Raw material supplies from North Africa have stopped completely, the available shipping being insufficient to carry the food products to France.

The cause of the iron and steel shortage has a different explanation. France herself produces the necessary coal and iron ore. Normally, she exports iron and steel scrap. Nor does it appear that it is mainly the shortage of coal which explains the reduction in the supply of iron and steel available for French industry. The greater part of the heavy industry is situated in the occupied zone and is working for the Germans who exercise priority for the quantities of coal, iron ore and iron and steel scrap which they require. Iron and steel scrap has even been exported recently to Germany. So far as French civil consumption is concerned, it is fed by the heavy industry of the unoccupied zone and by a small quota permitted by the Germans from the production of the occupied zone.

Quotas of coal and scrap which the French authorities allow to the heavy industry of the unoccupied zone have been steadily reduced. Deliveries of coal have been cut from 30,000 tons in June, 1941, to 22,000 tons in October. Those of scrap, which ranged between 30,000 and 35,000 tons a month, have been reduced to 12,000—15,000 tons. French civilian needs in both the unoccupied and the occupied zones were estimated at 230,000 tons of iron and steel a month; at the end of 1941 available supplies had been reduced to around 110,000 tons. And the press does not disguise the fact that a further reduction is to be expected. The estimate of 230,000 tons a month already represents a considerable reduction on pre-war consumption which was of the order of 500,000 tons a month, the greater part

—about 350,000 tons—being destined for civilian consumption.

Almost as serious as the drastic reduction in available supplies of iron and steel is the scarcity of cement. Here, there is no question of a production crisis. In June, 1941, the output of cement reached the level of June, 1938. None the less, the quotas available for industry are very slender. The explanation lies in the requisitions of the occupation authorities, in the repair and construction of roads and railways, undertaken by the Vichy Government but often enjoined by the Germans, and in exports whose destination is not disclosed but which represent supplementary levies exacted by the Germans.

For the sake of completeness, it would also be necessary to account for the shortage of timber, of pulp, of textiles and of hides and skins, but the foregoing information is enough to indicate the insuperable difficulties with which French industry is grappling.

The consequences of the raw material shortage are extremely grave. In the first place, unemployment is begin-

ning to increase. The situation, in this respect, has changed completely in the last six months. In the middle of 1941, there was a labour shortage. To-day, the Government is obliged to employ all sorts of devices to prevent the number of registered unemployed from rising. It even found it possible to announce that the number had been reduced from 700,000 in January, 1941, to 300,000 in July, and 202,000 in November last. But the Government has for some time forced employers to continue to pay full wages to the workmen in factories in which production has been suspended through lack of fuel or raw materials. The result is, indeed, to prevent an increase in the number of unemployed, but the payment of wages does not alter the fact that the supply of consumer's goods is steadily dwindling.

To give only one example, the greater part of the French factories were closed from December 21st to January 4th by decree, the reason given being the insufficiency of the production of coal and electric power. Electric power stations, mines, factories producing foodstuffs and blast furnaces alone were spared this measure. The workmen were not thrown out of work, since they continued to receive 92½ per cent of their wages based on a working week of 40 hours. Moreover, civil industry is only on part-time work. The duration of work in the textile, leather and foodstuffs industries frequently does not exceed 20 to 30 hours a week.

Transport Difficulties

A further consequence of the grave lack of fuel and raw materials is the disorganisation of transport. Up to the present, despite the shortage of rolling stock—of which alone one-third was requisitioned at the armistice by the Germans—of coal, lubricating oil and of cement for the repair of the permanent way, the transport of goods has been more or less maintained although the distribution of foodstuffs has greatly suffered. Passenger transport has, however, been constantly reduced and will soon be no more than a memory of the past. While, in 1931, the daily capacity of passenger trains travelling on the French network reached 700,000 passenger-kilometres, this figure fell to 190,000 during last summer and to 170,000 at the end of 1941.

The great repair, rebuilding and construction works which the Government undertook immediately after the armistice have had to be virtually abandoned through lack of raw materials, especially iron and cement. Only one-sixth of the bridges, other than railway bridges, which were destroyed during the hostilities, have been completely rebuilt. The Vichy Government and the Germans themselves had evolved a plan to economise coal and to reduce the transport of fuel by pushing ahead the electrification of France. But this plan has had to be abandoned, at least provisionally, owing to the shortage of copper, and because all aluminium is reserved for military production.

The tragic circumstances in which French industry is struggling force the Government, in spite of its own wishes, to seek a formula which will allow economy of fuel and raw materials. This is the background against which the campaign for concentration and rationalisation of French industry has been announced. It is still too soon to discuss its scope, but it must have implications of great moment.

Moreover, last but not least, the German grip on French industry grows in proportion to the increase in its difficulties. Having effectual control of coal, petrol, lubricating oil, raw materials and transport, the Germans supply them only to factories which are working for them. It is possible to foresee the moment when the whole of French industry, in both zones, will depend on the Germans and will be compelled to conform to their production plans.

Agricultural Outlook in Eire

[FROM OUR DUBLIN CORRESPONDENT]

February 9th

THE experience of the war has acted as an educative force in the realities of Irish economics. Speeches have been made by Ministers in recent months expressing sentiments which they would have seriously questioned in their earlier years of office. The importance of maintaining a large volume of imports, for example, has been forcibly demonstrated by the scarcity of many essential articles of con-

sumption—such as tea, petrol and coal. Indeed, some of those who were inclined to regard imports with disapproval a few years ago have now transferred their disapproval to a large volume of exports, which, it is alleged, brings no return except "paper money." The implications of international trade are being more correctly appreciated in the restriction of war than in the abundance of peace. The Minister for Agriculture recently delivered a speech which is remarkable, not only for its lucid enunciation of some of the elementary principles of the laws of comparative advantage as the foundation of an export trade, but also for its revelation of the official view regarding the future of Irish agriculture.

The Minister, dealing with the question of settling more people on the land, which is so popular a means of solving the Irish unemployment problem, pointed out that the possibility of increasing the population employed in agriculture is limited. Emigration from the countryside is inevitable if the standard of living, already low, is not to be still further depressed. At present, only one-third of the holdings can be considered large enough to be described as economic, and it is on the continued existence of these large holdings that 100,000 agricultural labourers depend for employment. Further sub-division would increase the need for public works and unemployment assistance. To attempt to relieve unemployment by the creation of more small holdings would undo the good work of the Congested Districts Board and the Land Commission in enlarging uneconomic holdings in the past. These are the views of the Banking Commission, which emphatically condemned the policy of sub-division of holdings.

Comparison with New Zealand

Small holdings, the Minister proceeded to explain, do not produce an export surplus, and agricultural exports must be relied upon to pay for the large volume of imports which will be necessary after the war. Some of our export industries, notably dairying, are experiencing great difficulty in meeting competition from overseas. New Zealand enjoys the advantages of a better climate—which renders winter dairying easier than in Ireland—larger farms, more mechanised methods and higher milk yields. At present, Irish butter competes with New Zealand only with the help of a subsidy. This subsidy, the Minister stated, would be maintained during the war, but would be discontinued afterwards. Apparently the abandonment of the export trade in butter is contemplated. This is a counsel of despair, which should not be adopted until every possibility of reducing the cost of production of Irish butter is fully investigated by experts. The official spokesmen of the dairying industry are not convinced that the outlook is so hopeless. It is the duty of the Government, they suggest, to set about reorganising the industry by means of education and the encouragement of the co-operative movement rather than to acquiesce in the disappearance of an old-established and valuable export trade.

The prospect held out for the bacon trade is equally gloomy. At present no bacon is being exported, and pig production is profitable only because of the high price of bacon in the home market. No attempt will be made to revive the export of bacon by means of subsidies, which are in their very nature wasteful and unsound. The only articles on which reliance can be placed for export after the war are live animals, poultry and eggs. In respect of these commodities, the climate, the size of farms and the proximity to the British market give Ireland a high degree of comparative advantage. If this rather sombre picture of the post-war export position is correctly drawn, the corollary that imports must be reduced to the practicable minimum cannot be denied. At present, a considerable active balance of trade is being maintained by the export, mainly, of cattle; but this balance reflects the shortage of imports and will rapidly become passive as soon as the normal conditions of trade are restored. Apparently, the policy of growing the greatest possible quantity of human and animal foodstuffs at home is to be continued, with the objects of reducing imports and of providing employment. Additional rural employment on a small scale may be afforded by forestry, turf development and reclamation, but the possibilities of employment in these occupations is popularly much exaggerated.

Those views, which must be taken to be those of the Government as a whole, are interesting as showing the degree to which reality has shattered some widely-held hopes, based on false optimism, of the possibility of developing a very intensive agriculture by protective

measures. Indeed, it may be that the Minister's outlook is unduly dark. There are many students of Irish agriculture who believe that a considerable expansion of the export trade is possible provided that modern methods are adopted. There is admittedly room for much improvement in methods of breeding and feeding livestock, and the possibilities of co-operative production have not been fully explored. It may be that the success of such a policy depends upon free imports of cheap feeding-stuffs and the abandonment of all relics of agricultural protection. These are difficult problems on which opinions may legitimately differ, but they are problems so vital to the future of Ireland that their solution should be attempted only on the best obtainable expert advice, and their discussion should be taken clean out of the region of party politics.

Foreigners, Food and Fuel in Argentina

[FROM OUR BUENOS AIRES CORRESPONDENT]

January 11th

THE transfer abroad of funds belonging to non-American belligerents is already controlled by the Argentine Central Bank. In a decree issued yesterday the Minister of Finance extends this control to movements of funds within the country belonging to such parties. With the decree, the Minister issued a stern warning to any firm, subject to the control, which should use its commercial status to cloak movements of funds either inside or outside the country for purposes not established in its statutes. Both the decree and the accompanying warning refrain from any mention of nationality or names of firms, but the measure is interpreted by the Press as inspired by the disclosures in the reports published by the "Committee of Investigation into Anti-Argentine Activities." These reports revealed the active financial participation of German business concerns here in the propaganda work in Argentina undertaken by official Nazi organisations with headquarters in Berlin, which has been centralised in the German Embassy in Buenos Aires. Among other purposes for which substantial contributions by German firms have been used are the financing of the "nationalist" newspaper *El Pampero*.

In issuing his warning, in which he gave assurances that foreign firms proceeding in the normal course of business had nothing to fear, the Minister of Finance stated: "It is very regrettable that some firms should have deviated from their traditional honesty through the influence of extraneous factors and inspirations foreign to all commercial ends." He added that should the authorities discover the existence of pressure on foreign concerns, conducive to violation of the decree, a second decree signed by the Minister of the Interior would immediately be enforced. The contents of the latter are not revealed, but the Press surmises that it provides for the deportation or internment of those violating the regulations laid down in Dr Castillo's recently declared state of emergency.

The decree is one more reminder, if such were needed, that totalitarian propaganda, organised from Berlin and financed by German business interests in this Continent, is still a living force in South America. Reports of the suppression of Axis news agencies and Nazi-inspired newspapers in neighbouring countries are growing. In Brazil, where the Press was forbidden to condone the Japanese invasion of Pearl Harbour, three newspapers (two German-inspired and one Japanese-inspired) have just been banned, and the official German *Transocean* news agency in Bolivia has been prohibited from further operation.

Argentina's current wheat and linseed harvests are officially expected to yield 6,000,000 tons and 1,700,000 tons respectively. These figures show in the case of wheat a decline of 26.4 per cent and in the case of linseed an increase of 16.5 per cent, compared with the previous year's crops. During the year ended November 30, 1941, wheat exports amounted to 2,393,525 tons, or 33 per cent less than the annual average over the decade 1931-40. Including the new crop, the exportable balance of wheat at the end of the year was 6,200,000 tons. The Treasury, which owes the National Bank 767,500,000 pesos in respect of the Government's purchases of grain at minimum prices from farmers, will, in future, itself finance this policy, mainly, it is presumed, by recourse to internal loans.

CROOKES' HALIBUT LIVER OIL

THE SUPPLY POSITION

The Crookes Laboratories regret that Crookes' Halibut Liver Oil will no longer be readily obtainable in capsules, but only in liquid form. This is due to priority demands of national importance.

In the interests of national health, the Crookes Laboratories have taken every precaution in their power to ensure adequate supplies of Crookes' Halibut Oil in all parts of the country. Thus the public may rest assured that their needs of this vital source of Vitamins A and D are being safeguarded as far as circumstances permit.

THE CROOKES LABORATORIES

MAKERS OF CROOKES'

HALIBUT LIVER OIL

LIQUID, per phial, enough for 16 days—2/-

It is announced that during the coming year the National Grain Board will undertake the conversion into oil, at local factories, of 150,000 tons of its linseed stocks, which, including the current crop, are estimated at 2,400,000 tons. Of this amount, it is calculated that it will be possible to export some 700,000 tons during the year.

The annually recurring problem of the high cost and acute shortage of grain bags at harvest time may be alleviated by the Government's plan to manufacture bags from low-grade Chaco cotton. A factory costing 10 million pesos is to be established for the purpose. Approximately one-half of Argentina's cotton production is low-grade fibre, the local outlet for which has always been limited, while export possibilities, never strong, have inevitably faded under war conditions. The Government's decision is expected to stimulate cotton growers in the Argentine Chaco to increase production by removing the bogey of an "unmanageable surplus," which Argentine agriculturalists have in recent years come to dread. It remains to be seen, however, whether the country's demand for jute will be appreciably affected.

A Fuel Shortage?

While war conditions have caused a decline in Argentine exports and the accumulation of unexportable grain surpluses, the complementary problem of a scarcity of essential imports has assumed increasing importance during the past year. Fuel imports are particularly affected. With the entry of the United States into the war, there is much speculation here as to the measures to be taken to maintain these at a reasonable level.

Argentina's petroleum production is increasing. Stocks of home-produced petroleum in October, 1941, were 299,171 cubic metres (against 265,500 in September, 1939), while stocks of the imported product were 85,697 cubic metres (against 92,438 in September, 1939). Work is about to proceed on a pipeline to obtain Bolivian supplies, and the reciprocal trade treaty recently signed with Peru promises increased supplies from this important producer in exchange for Argentine frozen meat. In regard to coal, however, Argentina's low-grade production is negligible in comparison with her requirements. Brazil and Chile send very limited and generally inferior supplies, and the country is largely dependent on Great Britain and the United States. The following table compares coal imports (in tons) from these two sources during the first six months of the years 1939, 1940 and 1941:—

	1939	1940	1941
Great Britain.....	1,068,803	747,139	405,589
United States	Nil	334,661	51,215

German European Trade Relations

THE authorities claim that Germany's foreign trade in 1941 was equivalent to four-fifths of the total volume of imports and exports in 1938; the total value was greater than in 1938, which indicates a considerable increase in prices. This would mean that Germany had been able to replace some 60 per cent of her imports from overseas and from the Soviet Union by imports from occupied, dependent and neutral countries on the Continent. But the ratio between imports and exports must certainly have changed. During 1940 Germany maintained almost normal exports to the Danubian countries. In 1941, actual exports to all European countries fell, and dwindling imports from Danubian countries were compensated by imports of manufactured goods from the occupied countries in the west under the system of "industrial collaboration."

There is hardly any way of arriving at an accurate estimate of internal European trade. At the request of Germany, Norway, Denmark and Hungary have suspended the publication of trade returns. Nothing is known about the imports and exports of France, Belgium, Holland, the Protectorate of Bohemia and Moravia, and the Government-General of Poland. The neutral countries, Sweden and Switzerland, no longer publish detailed figures about the volume and distribution of their foreign trade. From the Balkan countries, only summary figures are given. The

Argentina's coal stocks in October, 1941, were 850,000 tons, compared with 1,068,000 tons in September, 1939.

In an extensive review of the fuel situation, *La Prensa* considers that, while it may be possible to alleviate the coal shortage to a slight extent by recourse to neighbouring countries, hope for increased deliveries from the two major suppliers lies in the following factors: (1) that British and American shipyards are gradually defeating the submarine menace; (2) the limiting of hostilities to the Pacific for some time to come will leave America's eastern seaboard clear for South Atlantic shipments; and (3) the expressed intention of both Great Britain and the United States to maintain foreign trade to the utmost of their ability.

The Shipping Problem

For her own part, Argentina is doing something to facilitate fuel supplies by providing tonnage. Her State Mercantile Marine, formed last October by the acquisition of sixteen Italian ships laid up in Argentine ports, and recently augmented by four refrigerated Danish vessels similarly laid up, is now actively engaged in inter-American trade. Negotiations are practically completed for the purchase by the same concern of four large French ships. Of this newly-acquired fleet, several of the former Italian ships are already being used to bring coal from the United States, and the authorities have indicated that coal cargoes will be given preference by these vessels for return freight. It is expected that, during the first few months of 1942, 300,000 tons of coal will be brought by them to this country. The former Danish vessels, which are refrigerated, are unsuitable for this traffic, and of the French ships to be bought three are large passenger vessels (one of which has just been practically lost by fire). Although on the outbreak of war between Japan and the United States there was some uncertainty whether the ships would continue to run to United States ports, it is now clear that they will. There are no Japanese ships in Argentine ports, and it is understood that three German cargo vessels acquired by a local syndicate will not be put into service until after the war.

La Prensa estimates that, in order to provide the tonnage required to import the country's calculated annual requirements of 2,500,000 tons of coal, 120 ships of 6,000 tons each would be wanted. The State Mercantile Marine has no oil tankers, of which there are seven operating under the Argentine flag, three being used for the private requirements of one shipping concern. According to *La Prensa*, fifteen tankers of 10,000 tons each are necessary to maintain the country's essential petroleum imports. United States tankers have hitherto provided the greater part of the necessary tonnage, but fears are expressed locally that the United States will now find her tankers indispensable for war purposes.

scanty figures which are still published show that Germany's share in the total foreign trade of the various European countries ranges from 50 per cent at the lowest to 85 per cent at the highest; Italy, Sweden, or Switzerland usually take second place after Germany.

The total value of the imports and exports of a number of countries have been as follows, in millions of their respective currencies:—

	VALUE OF TRADE					
	Imports			Exports		
	1939	1940	1941	1939	1940	1941
Sweden (kronor)	2,499	1,999	1,672	1,889	1,338	1,351
Switzerland* (francs) ...	1,665	1,703	1,823	1,175	1,179	1,306
Denmark (krone)	1,750	1,390	1,300	1,578	1,517	1,250
Finland (mark)	7,573	5,180	7,900	7,710	2,980	3,900

* The figures for Switzerland cover only 11 months.

The first fact emerging from this particular table is the recent excess of imports over exports in each case. But the figures are deceptive. The value of Switzerland's imports, for example, increased in 1941 by 7.1 per cent over 1940, but the volume of imports fell by 23 per cent. Similar discrepancies are experienced by other countries; and the fact is that Germany's system of continental trade is based on arbitrarily fixed prices, fixed in Germany's favour. The

prices of German exports have usually been advanced, whereas the prices of goods imported into Germany, and exported by these other countries, have been reduced.

The few summary figures that have been published about the value of the foreign trade of Danubian countries, however, generally show an excess of exports over imports. This is illustrated by Roumania's foreign trade during the first six months of 1941. The value of Roumania's exports fell during this period compared with the first six months in 1940 by 22 per cent, though the volume of exports fell during the same period by 76 per cent; the value of imports fell by 39 per cent, and the volume by 35 per cent. The bad harvest and the difficulties caused by mobilisation forced even the Germans to pay higher prices for Roumanian exports, of which 65.5 per cent were shipped to Germany.

In fact, closer examination of the few detailed figures that are available show that Germany's imports from continental countries have usually exceeded German exports; and the majority of the countries, having thus run up considerable clearing credits (chief among them are Sweden, Switzerland, Denmark, Slovakia, Roumania and Bulgaria), are naturally trying to reduce the accounts by demanding greater imports from Germany. Germany has usually promised increased exports of coal, chemicals and manufactures; but, since the war against the Soviet Union started, deliveries have remained far behind the quotas fixed. Then the countries with large clearing credits became by necessity favourably inclined towards the system of a central clearing, so that they could resume and intensify their trade relations with the countries under German occupation.

By the central clearing, run by Berlin, Germany was able to direct discussions in such a way that the northern countries, on the one hand, and the Balkan countries on the other, were drawn closer together. Sweden's clearing credit with Germany a short time ago amounted to Kronor 50 millions. In discussions with Germany, Sweden agreed to use the central clearing system in trade with Holland and Belgium, which may make it possible to reduce the clearing credit. At the same time, the Swedish Government refused to grant new credit guarantees for exports to Germany, which means principally smaller supplies of woodpulp and cellulose to Germany. Germany was forced to recognise the appreciation of the Danish currency by 8 per cent; by this means, it is hoped to reduce the price of Danish imports, but Germany stipulated that there should be no change in the price of German coal and coke. At the same time, Germany succeeded in getting a promise from Denmark to supply butter to Finland; and the German press promptly described this as proof that Denmark had realised the duties arising from signing the renewed Anti-Comintern Pact. In return, Denmark was promised onions, paprika, pulse, timber, radio valves and women's clothing, all from Hungary. But the main cause of the difficulties in Denmark's foreign trade has not been changed. Germany's share in total Danish trade has now reached 80 per cent, and Germany's clearing debt has risen from Kronor 364 millions in September, 1940, to Kronor 758 millions in September, 1941.

Official information about Finland's foreign trade is very scanty. Germany's share has increased to just over half. Sweden takes second place; and Swedish exports to Finland have greatly exceeded imports from Finland. But it is reported that further credit guarantees for exports from Sweden to Finland have now been suspended.

In the trade of the Balkan countries, Switzerland plays a role which is similar to Sweden's part in the trade of the Scandinavian countries. France, Belgium and Holland are a separate group. In France, a German commissar for foreign trade has overriding powers, and 200 German customs officers control the most important points of France's customs frontier. It appears that the export capacity of France is fully employed on orders based on "industrial collaboration." The export surplus in trade to Germany must therefore be considerable. Recently, imports of raw materials and semi-manufactures for German orders decreased. No clearing problem exists, because payments for exports to Germany are financed by the Bank of France, which makes advances towards the costs of occupation. Recently, there were attempts to resume more normal trade relations with Belgium, Denmark and, particularly, Sweden, Spain and Hungary, but no definite agreements have been concluded. Belgium's foreign trade with Germany is also governed by "industrial collaboration," and Holland has been practically part of Germany, commercially, since the customs frontier was abolished. In recent months, Italy has been able to secure first place in trade with Croatia,

but in all other Balkan countries Germany still takes first place. Slight increases can be noticed in Italy's trade with Scandinavian countries.

During 1941, then, the regional grouping of European countries under German direction had some success. But the war strain on Germany's industry and the burden on the European railway system, because of the fighting in Russia, prevented Germany from increasing the volume of foreign trade on the Continent. The losses of imports from Balkan countries were, on the whole, hardly compensated by the gains derived from "industrial collaboration" with the western countries.

Plate Glass Cartel.—At the beginning of February the domestic cartel of the German plate-glass industry formed the Plate Glass Export Company of Cologne. The former export cartel, domiciled at Aix-la-Chapelle, was dissolved. Before the incorporation of Austria, there was only one important outsider, the Bavarian Plate Glass Company; and after the Sudetenland had been added to Germany, the Bavarian, Austrian and Sudeten manufacturers of plate glass formed a rival cartel. But the two cartels soon concluded a price agreement. In the summer of 1940 the two cartels amalgamated. The new cartel will be in force until 1960.

Share Prices.—After a temporary slump in share prices at the end of last year, which was the result of the restricted registration of transactions in shares, prices have again risen. The index compiled by the *Frankfurter Zeitung* moved as follows:—

	Average Quotations	
	25 Shares	15 Debentures
1940: Highest	180.56	105.81
Lowest	138.36	102.23
1941: Highest	223.22	107.87
Lowest	171.70	105.75
1942: January 9	201.56	107.70
30	206.09	107.84

In spite of all warnings, capital was again seeking investment, and the supply of shares fell again. Shares of German colonial companies showed considerable appreciation, especially those of the New Guinea company. The situation calls for further restrictions to discourage fresh advances in prices. From February 1st onwards, the provision of compulsory statistics of turnover has been extended to more groups of shares. Brokers are now compelled to disclose their orders. These new orders, supplementary to the original registration of shares order, caused a slight fall in prices during the first week in February.

Opposition to Concentration?—The ultimate fate of small-scale businesses under the new concentration programme is agitating the public. Small business men violently oppose the idea that only large-scale modern factories are efficient. A small manufacturer argues in a letter to the editor of the *Deutsche Allgemeine Zeitung* that concentration, in other words, the closing down of small factories, will not necessarily increase total production. In spite of rationalisation, the writer maintains, large-scale factories work at higher costs of production than small ones. The discussion has now been carried to a point where economic and political arguments are being mixed. Concentration and rationalisation are recognised as inevitable if maximum production is to be achieved; maximum production, on the other hand, is not only necessary for winning the war, but also for "preventing the return of the Jews." The press tries further to explain that the demarcation between small and big factories differs in different industries; and the leaders of big business explain that the programme does not really mean the closing down of all small factories; it is intended to close down only the inefficient factories whether small or large.

Lubricants and Fats.—A special order has been issued regulating the supply of lubricating oils for internal combustion engines. Henceforth lubricants will only be supplied against special permits of the commissar for mineral oils. The fat content of grease and cooling liquids used with machine tools has been reduced. The use of whale oil in processing leather has been prohibited.

THE BUSINESS WORLD

Works and Buildings

THE main purpose of the Ministry of Works and Buildings, when it was set up in October, 1940, was to adapt the building and civil engineering industries to war-time conditions. Its task was a threefold one. First, it had to organise existing building resources. Secondly, it had to weld the construction plans of the various Government departments into a single programme, to take over their non-specialised work, to restrict civilian building to a maintenance basis, and to adjust the size of the industry to the changing needs of war. Thirdly, it had to ensure that building resources were used as efficiently as possible. In *The Economist* of July 5, 1941, an outline was given of the Ministry's plans. The time has now come for recording the measure of success or failure in their execution.

The organisation of the industry's resources has been a task of some complexity, but it was an essential preliminary to their control and efficient allocation. The measures taken to secure control over the building materials industries were discussed in the article of July 5, 1941. Control over building operations and over building and civil engineering firms has been secured by a number of Orders. So far as labour is concerned, the Essential Work Order applied on June 9, 1941, ensured the maintenance of the then existing force of operatives engaged on essential works. In order to ensure that all labour in the building and civil engineering industries released from a contract shall be available without delay to the employment exchanges for re-employment on essential work, two further Orders were issued by the

Ministry of Labour on December 18th, after consultation with the Central Council for Works and Buildings, and the Joint Advisory Panel to the Ministry of Works and Buildings of the building and civil engineering industries. The one is an amended form of the original Essential Work Order, and the other, the Building and Civil Engineering (Restriction of Transfer) Order, prohibits the contractor from retaining his labour (except key workers and certain specialists) after the completion of a contract, and from transferring them to another site, without the permission of a national service officer. With these Orders the Ministry has established a measure of control over the employment and movement of building operatives.

In order to secure control over building and civil engineering concerns, the Ministry last August ordered the compulsory registration of all firms as well as of the building departments of local authorities and municipalities. Private firms with maintenance departments were excluded from the scope of registration, unless they also undertake outside work. The preliminary results of the census, given below, reveal the large number of small firms engaged in the building trades, which has been one of the administrative difficulties in the achievement of central control. They also show that the proportion of labourers to the total number of operatives increases with the size of the firm:—

NUMBER AND SIZE OF BUILDINGS AND CIVIL
ENGINEERING UNDERTAKINGS (a)

No. of Employees	No. of Undertakings	Composition of Labour Force	
		Craftsmen %	Labourers %
0-19	79,985	64.2	35.8
20-99	5,371	54.5	45.5
100 and over	1,224	38.0	62.0

(a) Including general builders and civil engineering contractors, plumbers, joiners, carpenters, painters, roofers, plasterers, glaziers, demolition contractors, scaffolders and others.

The compulsory registration of building concerns has greatly strengthened the Ministry's power of control over the industry. It has enabled the Ministry to call for regular returns from existing firms concerning the nature of their work, and thus to exercise supervision over the activity of the industry as a whole. It has enabled the Ministry to restrict non-essential operations and to exercise direction over individual concerns. Registration has also made it possible for the Ministry to control entry to the building industries by making it illegal for new firms to enter them without registration. Applications for permission to set up in any one of the branches of building are treated in accordance with the national interests, and are decided, not by any organisation of the trade, but by the Ministry itself. Finally, the Ministry has been able to improve labour conditions by making registration and, therefore, the right to continue operations, contingent on the observation of standard terms of employment. By the Essential Work (Building and Civil Engineering) (No. 2) Order, the Minister must satisfy himself, before registration, "(a) that the terms and conditions of employment of persons employed in the undertaking are not less favourable than the recognised terms and conditions as provided for by the Conditions of Employment and National Arbitration Order, 1940, or of that Order as amended by any subsequent Order, and (b) that satisfactory provision for the welfare of persons employed in the undertaking exists or is being made." These provisions go far beyond the Fair Wages Clause, which only operated where it was inserted in a contract.

The allocation of building resources, the second task of the Ministry, was begun before the industry had been properly organised. The programmes of individual Ministries

had been formulated without reference to the national building resources, and, in view of their size, co-ordination was the only alternative to chaos. The machinery of allocation was described in the earlier article. Briefly, the Ministry called for the plans of the various Departments, which were welded into a national programme by its Works and Buildings Committee—a committee of the former Production Executive—in consultation with the Departments concerned. The programmes of individual Departments, expressed in financial terms, were then translated into numbers of operatives, and each Department was allotted a labour force, subject to periodical adjustments in the light of changing needs, calculated on the basis of the estimated total number of operatives available. On the whole, this method of allocation has proved more efficient than inter-departmental competition, especially as the size of the individual building programmes far exceeded the building industry's capacity. But it is defective in certain respects. In so far as its failings were due to the lack of organisation of the industry and of machinery to move labour, and to the absence of accurate data concerning available labour and the real needs of the Departments, they will be remedied automatically as the Ministry is able to strengthen its control over building resources and to secure more accuracy in Departmental building estimates. But global allocation has also given rise to difficulties, when the size of local programmes exceeded local resources. These difficulties have been mitigated but not overcome by an arrangement whereby the various Departments submit each of their projects to the Works and Buildings Committee. There is reason to believe that the efficiency of the system of allocation could be improved by handing over to the Ministry still greater control and a far larger share of the actual work of construction.

The adjustment of the building industry to changes in the nature and volume of its work has made considerable progress as a result of the various measures adopted by the Ministry of Works and Buildings, in whose formulation it has been assisted by a Central Council of experts appointed last August. Until now the Ministry's main problem has been to transfer the largest possible proportion of the country's building resources to war work and to utilise them to capacity. The demand for essential works of many types—munition factories, hutments, aerodromes, fortifications—has been very substantial. Labour, rather than materials, has been the chief bottleneck, for the industry's unskilled labour force was depleted soon after the outbreak of war. An estimate made in the early summer of last year put the number of operatives at 750,000, against some 1,350,000 before the war. In view of the urgency and size of the Government's building programmes, there is a strong presumption that the labour force available for civilian maintenance work (this was restricted by making repairs costing £100 or more subject to licence)—the "garrison" as it is called—has not been reduced rapidly enough, though it may of course be contended, and not without some justification, that the lull in air raids could not have been foreseen. That a further reduction would have been possible was revealed by last summer's census, which showed that the total number of male operatives was then not 750,000, as had previously been estimated, but 820,000; the earlier estimate had not made sufficient allowance for the influx of Irish workers nor for the slowing down in the call-up.

But the peak of wartime construction has now been passed and the national shortage of able-bodied men and

women is growing ever more acute. Until next autumn the volume of construction will remain heavy, but, on present estimates, it will then begin to decline rapidly with the completion of the major part of the Government's building programme. Apart from the need for increasing the efficiency of the industry and economising labour, the Ministry will therefore be confronted with the problem of concentration. During the last war, the labour force of the building and civil engineering industries was halved. A similar reduction during the present conflict would bring it down to about 650,000; but an even greater measure of concentration will probably be necessary which will give rise to all the problems that had to be faced by other industries in a similar position.

The third part of the Ministry's task, that of increasing the efficiency of the industry, is no less important than the others. So far as the efficiency of labour is concerned, there is some evidence of an increase in output per head in the second half of last year. For example, the consumption of cement in the late summer and autumn of 1941 was higher than in 1940 or, indeed, in any previous year, in spite of the reduction in the industry's labour force. While to some extent the improvement may be due to the change in the nature of the work, it appears that the extension of the system of payment by results, sponsored by the Ministry, has played an important part, and the increased use of machinery has probably also been a contributory factor. But the waste of materials still appears to be very considerable, due largely to the insistence of Government Departments and other consumers upon pre-war specifications. The Ministry's powers to alter specifications are at present limited, but a small and independent committee of experts, responsible to the Ministry and with authority to inspect building plans before their submission to the Committee of Works and Buildings as well as building sites, might prove of assistance in securing greater economy.

An important step taken by the Ministry to ensure greater control over building prices is the preparation of a standard schedule of prices which will be applicable to some 80 per cent of its own constructional work and which, it is to be hoped, will be adopted by other Government Departments. The schedule lists no fewer than 1,646 items of constructional work. It is subject to percentage additions or deductions with variations in the prices of materials, wages and other costs, and it will greatly simplify the work of quantity surveyors and of architects as well as render largely superfluous the "cost plus" contract.

The task of organising the building industry for war, of utilising its resources to the full and of increasing its efficiency has been a complex one. After overcoming some of the initial difficulties, which were considerable, the Ministry has made headway in all directions. But the task is still far from completion. The industry's resources are not yet fully organised, controlled and directed, its capacity is still neither used to the full nor always employed to the best advantage, there is still too much waste of labour and materials, by Government Departments, other consumers and contractors, they still show too little inclination to depart from wasteful practices and to hand over to the Ministry a greater measure of control. The building industry and the Ministry of Works and Buildings, as well as its relations with other Departments, are still in a state of transition. But the position has now been reached when a period of rapid progress and adjustment is both possible and essential.

Finance and Banking

Big Money Turnover

The turnover of credit has been exceptionally heavy over the past week. The banks are still making substantial tax payment transfers, as may be seen from the latest Exchequer returns which reveal that with five weeks of the financial year to go, revenue has almost reached the estimate for the year. In addition the Warships Week campaign is now in full swing, and the volume of funds flowing to the Exchequer through small and large savings has increased accordingly. Further, the market has again had to take up £75,000,000 of Treasury bills this week, after an interval of six weeks, during which the weekly offerings have been below this figure. After a similar interval, during which the banks were not asked to make any Treasury deposit payments, they have, this week, had to transfer to the Exchequer £20,000,000 in this form. Finally, many of the

clearing banks have this week been engaged in their monthly making-up. Given this array of influences on the credit position, it might have been assumed that apart from the exceptionally large turnover of funds, which has, in fact, occurred, credit conditions in the money market would prove difficult. This was not the case. Thanks to an expansion of the credit base, in which the operative factor was an increase of £6,375,000 in the Government securities held by the Bank of England, the past week has proved an exceptionally easy one for the money market. Bankers' deposits have risen by £1,058,000, despite a further expansion of £928,000 in the active circulation, and an increase of £612,000 in Government deposits. The banks have thus been ready buyers of bills from the money market, and their purchases have included some May maturities.

GRINDLAY & COMPANY LTD.

Bankers and Agents

Affiliated with National Provincial Bank Limited

have pleasure in announcing that arrangements have been concluded for the acquisition of the banking connection of Messrs. Thos. Cook & Son (Bankers) Limited.

Customers of Messrs. Thos. Cook & Son (Bankers) Limited may be assured of the personal service for which the house of Grindlay has been famous for over a century.

Bombay Silver Fluctuations

The Bombay silver market has continued to react in a very agitated manner to the rapid approach of hostilities to the frontiers of India. The threat of invasion has inevitably led to further hoarding demand for the metal and the turnover of the Bombay market has, over the past fortnight, been well above the recent level. The prices quoted have also reflected the prevailing nervousness, especially since Friday of last week when the Reserve Bank suddenly stopped its sales, which until then had kept the market reasonably steady. The sales made by the Bank consisted recently of unrefined bars of demonetised silver and therefore of .916 $\frac{2}{3}$ fineness. These sales were made on the basis of a price of Rs62 $\frac{1}{2}$ per fine ounce. Bars of this fineness had been made good delivery in the Bombay market, but owing to the delay in having the silver refined, they had fallen to some discount on the ruling price for fine silver. This discount had recently amounted to about 12a per ounce, and on the basis of the Reserve Bank's selling price for melted coin, the "parity" for fine silver in Bombay should have ruled around Rs63 per ounce. The open market price had during the earlier part of last week been pulling away from this parity. By Thursday it had risen to Rs66 14a. On Friday, when news came that the Reserve Bank was no longer selling, the price shot up to Rs70. This week the quotation has lost some of the ground gained in this sudden spurt and by Tuesday was down to Rs68 12a. The rise was then resumed and the quotation towards the end of the week rose towards Rs70 again. The Reserve Bank has as yet declined to re-enter the market, and the quotation is well above the parity indicated by its recent selling price.

India's Silver Reserve

The policy of the Reserve Bank has been the subject of a great variety of interpretations. One negative remark which can be made about it is that it is not due to the exhaustion or even to any serious encroachment on the silver reserves of the Indian Government. It is true that Government silver has been sold during the past year both in Bombay and in the London market where it has provided the greater part of the metal used here for industrial purposes and for coinage by the Royal Mint. But the steady reminding of rupee coinage from .916 $\frac{2}{3}$ to .500 fineness has brought the Government substantial amounts of silver over the year. On March 31, 1940—the last date for which complete statistics are available—these reserves amounted to 106,477,000 fine ounces in bullion and 43,766,000 fine ounces in demonetised coin. The reserve is unlikely to have fallen much below this huge total. The reason for the suspension of silver sales may be the natural desire to test the market during the present abnormal phase and to protect what is, in fact, the only substantial reserve of silver in the sterling area. It must not be forgotten that silver has in some respects become an essential industrial metal. With supplies of Australian and Burmese silver threatened, there is added reason for conserving available stocks. Indian speculators must, however, always reckon with the possibility of the Reserve Bank resuming its sales on the basis of its former price, and there must, therefore, be an appreciable element of danger in buying at the prices which have recently ruled in Bombay. The London quotation for cash has kept rigidly at 23 $\frac{1}{2}$ d., and the forward quotation which last week had risen $\frac{1}{2}$ d. above this figure has now returned to parity with the cash price. All possibility of silver arbitrage between London and Bombay has long since disappeared, and the two quotations can, therefore, move independently of each other.

Far Eastern Banks

With the civilian evacuation of Rangoon, the British banks with offices in that city have evacuated their branches to Mandalay. The Japanese advance in the Far East has by now made sad inroads in the network of branches of the great Far Eastern exchange banks. The Hongkong and Shanghai Banking Corporation has already lost all but 9 of its 42 offices. The Chartered Bank has 21 of its 45 offices still intact. Measured in terms of current income, these are serious losses. In terms of actual assets, they are far less severe. The buildings remain for the most part undamaged. If any bearer securities were left in the offices now in Japanese occupation they must have been of next to no importance. No bullion was allowed to fall into Japanese hands. The goodwill of these undertakings remains intact though its reinstatement as an earning asset can only follow the victorious conclusion of the war against Japan. Given

that condition, the apparent losses to the immensely rich and remunerative Far Eastern banking business will be rapidly recovered. The Japanese authorities have already announced that they propose to liquidate the business of the British and American banks in Shanghai. The process is bound to take considerable time and must create a measure of confusion and chaos which will take months to unravel.

Danish-German Exchange Adjustment

Information filtering from Denmark sheds further light on the recent appreciation of the krone in terms of Reichsmarks. Though the adjustment of the Danish krone was expressly designed to meet the abnormal situation arising out of German-Danish trade, the movement affected every currency quoted in Denmark. It was the krone which appreciated and not the reichsmark which depreciated. The following adjustments have thus been made in the rates of exchange officially quoted in Copenhagen:

	Aug. 31, 1939	Beginning 1942	Present Rate
Sterling	22.40	20.93	19.34
US Dollars	4.59 $\frac{1}{2}$	5.18	4.79
Reichsmarks	192.15	207.45	192.15
French Fcs.	12.80	11.75	10.85

The appreciation of the krone followed protracted negotiation with the German authorities and was only agreed upon after stiff initial opposition from the German side had been overcome. The main concern of the Danish authorities has been to arrest the menacing trend toward inflation which has been apparent in their country since the German occupation. While the supply of consumption goods in Denmark has been steadily drained by German purchases, the credit and currency circulation has been rapidly expanding, as a counterpart of the huge clearing credits which Denmark has been accumulating against Germany. It seems too much to expect that this state of affairs, which is the product of consciously planned trade policy on the part of the Germans, can be remedied by the old orthodox measure of exchange adjustments. There may, however, be some deflationary impact in Denmark from the fact that the National Bank must, as a result of the exchange adjustment, take a book-keeping loss of Kr.150,000,000 on the large reichsmark clearing balances which it had accumulated.

Moreover, the Danish authorities are determined to push on with their deflationary measures and some Kr.300,000,000 of Government bonds have been issued to the National Bank with a view to being sold in the open market to mop up redundant purchasing power. As against this, the farmers have had to be protected against the effects of the currency appreciation and the export price of butter (most of which goes to Germany at fixed reichsmark prices) has been temporarily adjusted so as to keep the krone price stable. The 8 per cent appreciation of the krone means a corresponding cut in the income derived by Denmark from invisible exports such as the shipping services rendered to Germany. Moreover, the large number of Danish workers now employed in Germany must suffer a corresponding loss in the remittances which they make to their families in Denmark. The exchange agreement is, therefore, by no means a complete victory for Denmark. In any case, its whole intention can be circumvented by increasing the prices of the goods which Germany exports to Denmark. A time must come when the exhaustion of raw materials and machinery in Denmark will involve a swing in the Danish-German balance of trade which for close on two years has been violently "favourable" to Denmark. When that time comes it will probably be found that Germany will raise the reichsmark prices of the materials and manufactured goods exported to Denmark and will do so by a percentage greater than the recent adjustment in the krone-Reichsmark rate.

South Africa's Balance of Payments

The information given by Mr Hofmeyr in the course of his budget speech, regarding the external trade of the Union in 1941, provides the first rough measure of South Africa's balance of payments last year. Imports amounted to about £100,000,000, of which the largest share was provided by the United States, namely, £38,000,000 against £30,000,000 from the United Kingdom. Exports, excluding gold and wool amounted to £31,000,000. The value of the wool clip, which is now taken over by the British Government, may be placed in round figures at £10,000,000. The

value of South African gold production last year was £120,000,000, of which all but about £1,000,000, added to the holdings of the Reserve Bank, was sold to the British Government. On this basis, there must have been a trade balance of some £60,000,000 in favour of South Africa for 1941. Some of this was absorbed by invisible imports, but the bulk of it must have been used in the repatriation of capital. Of this some £30,000,000 was accounted for by the vesting of South African sterling securities last October, and the balance by the transfer of South African securities (mainly gold shares) from British to South African ownership.

Mutual Insurance Association

It is announced that an association, known as The Mutual Insurance Companies' Association, has been formed with the objects, *inter alia*, of considering "all matters connected with the business of its members, including the taking of such measures as may be expedient for the protection of the interests of its members." The ten founder members are Builders' Accident Insurance, Ltd; Cambrian Insurance Company, Ltd; Chemists' Mutual Insurance Co, Ltd; Co-operative Insurance Society, Ltd; Employers'

Mutual Insurance Association, Ltd; Gresham Mutual Indemnity Co, Ltd; Iron Trades Employers' Mutual Insurance Association, Ltd; Midland Employers' Mutual Assurance, Ltd; National Employers' Mutual General Insurance Association, Ltd; Timber & General Mutual Accident Insurance Association, Ltd. These are all companies largely associated with the transaction of workmen's compensation insurance on mutual principles, and their combined premium revenue from this source amounts to nearly £5 millions, a large proportion of the total for all insurance companies of about £11 millions. It is reasonable to suppose that the prime motive for the formation of the association at the present time is the need for an organisation to give evidence on behalf of mutual companies in current Government enquiries into the workmen's compensation system, in the same way as the Accident Offices' Association represents the tariff companies. In this connection it is of interest to note that an employers' liability insurance association has recently been established by Lloyd's Underwriters, presumably for the same purpose. Not all mutual companies interested in workmen's compensation insurance are members of the new association, but it is expected that others will shortly adhere. The association has, of course, no concern with life assurance; mutual life offices already possess in the Life Offices' Association a medium for the expression of their views.

Investment

A Sensible Recovery

The general selling which followed the *débâcle* at Singapore seems to have spent itself. Already at the close of last week, after the announcement of the formation of a new War Cabinet, there was a tendency to view the war more optimistically. The averting of a crisis in domestic politics and a renewal of confidence in the qualities of the executive have checked the downward trend which was generated by sales of tin and rubber issues directly affected by the Japanese conquests. The disposition to discount local defeats, however severe, and to concentrate on the prospect of final victory was intensified this week by the renewal of the Russian counter-offensive and by the substance of Mr Roosevelt's fireside chat. There is still a tendency to play for safety, and the gilt-edged market enjoyed almost alone the first modest revival, although oil shares, which had been oversold, and certain industrials, among them stores and breweries, also staged a recovery. There is reason to suppose the realisation that ground must still be given in the Far East has caused further possible setbacks in Burma to be generally discounted. It is probable that only unexpectedly bad news will prevent next week's reinvestment of India moneys from forcing prices up. A rise in home rails is already overdue. Price falls which took place after the dividend announcements, for technical and speculative reasons, now provide tempting yields in all classes of issues.

More Railway Results

The results of the London and North-Eastern and Great Western Railway and of the LPTB proved rather less satisfactory to the market than those of the two main lines previously announced. Virtually the whole increase in total net income of the "Berwick" line was in the controlled revenue, and the actual distribution of 2 $\frac{1}{2}$ per cent on the 4 per cent second preference stock had been accurately gauged by the market. Against this, the decision of the Great Western board to carry the whole of an increase of £137,780 to reserve, merely maintaining the ordinary dividend at 4 per cent, proved a severe disappointment. There appears to have been a change of policy at Paddington in the opposite direction to that adopted at Euston, and this was reflected in a rather severe fall in Great Western ordinary. Finally, LPTB, with an increase in controlled revenue, was only able to distribute 2 $\frac{1}{2}$ against 3 per cent, simply because it had virtually exhausted its "C" stock fund in making the larger payment a year ago. If the net revenue remains unchanged in the current year, there will be sufficient available, with the amount in the fund, to pay 3 per cent, once more. The following table shows, as nearly as may be, the comparative figures for the two years for all five companies.

	1940		1941	
	Share in Pool	Other Revenue Net	Share in Rent Charge	Other Revenue Net
G.W.	6,504,292	289,695	6,670,603	261,164
L.M.S.	14,125,612	581,698	14,749,698	500,513
L.N.E.R.	9,867,713	483,279	10,136,355	510,672
Southern	6,569,801	185,989	6,607,639	326,621
L.P.T.B.	4,811,981	41,255†	4,835,705	8,954†
	41,879,399		43,000,000	

† Transfer from "C" stock fund and profit on investments.

Considerable discussion has been heard in recent months of the effect of road transport and Irish railway earnings on the position, but the figures published seem to bear out the previous experience that the carriage of goods by road yields a net income to the railways far inferior to what they would earn if the goods went by rail. The following table sets out the appropriations for the five companies. Out of a total increase in net revenue of some £1,136,000, rather under two-thirds has been distributed in increased dividends by three of the companies, leaving rather over one-third to be added to reserves and carry forward.

	To Reserves		To Carry Forward		Dividend	
	1940	1941	1940	1941	1940	1941
G.W. ordy.	£	250,000	+ 87,030	- 25,191	4	4

Tonnage Replacement

In commenting on the results of the Lamport and Holt Line for last year, results which included considerable loss of tonnage and a modest decline in profits, the chairman, Sir Philip Haldin, made some very outspoken comments on the official attitude to the problem of replacement. Earnings are insufficient to cover these charges, now double the pre-war level, and it is not permitted to insure for the full replacement value, so that, according to Sir Philip, there is nothing but a vague Government promise on which to build hopes that the merchant navy can be maintained after the war. The real question, however, which Sir Philip did not ask, is whether this state of affairs is not common throughout industry, and whether it is possible to avoid it. It will be generally agreed that physical replacement, by

ships suitable to post-war conditions—if those can be foreseen—is impossible and, probably, undesirable during the war. Presumably, all that Sir Philip claims is command of sufficient liquid resources to enable the company to replace its ships as and when it thinks fit, after the war. But unless a special exception is to be made of the shipping industry, a policy which puts all owners of physical capital in a position to bid against one another after the war for goods and services, which are likely to be relatively scarce, would simply raise prices higher than if a less generous policy were adopted. It may, in any case, be necessary, for a period of years after the war, to control in some measure the use which shall be made of many economic resources. All that any firm or industry has a right to ask is that the balance should be held as evenly as may be between competing claims, and that Governments should frame their policy, first, with a view to winning the war, and then with due regard to forwarding of good international relations, rather than to benefiting sectional interests.

No Dorman Long Dividend

The decision to pay no dividend for the year to September 30th last on the preferred ordinary and ordinary capital of Dorman Long came as a considerable shock to the market. Payments on preferred and ordinary shares were reduced from 18 to 15 and from 10 to 7 per cent, respectively, in the previous year, and there were then no surplus earnings. Some reduction had, therefore, been discounted, but the severity of the directors' decision remained unexpected. The preliminary statement shows a fall in trading profits of over £200,000 to £1,189,378. Provision for directors' fees and taxation totals £441,421 against £438,850 and depreciation again receives £275,000. There is no transfer to pensions fund against £15,000, but the allocation of £100,000 against nil to general reserve provides for war damage contributions already paid and so is a proper charge against profits. Earnings for fixed charges are consequently reduced from £666,179 to £372,957, while debenture, sinking fund and preference service require a draft on the carry forward of £104,595, reducing it to £52,320. This melancholy tale is hardly a good omen for the start of the iron and steel dividend season. It must be remembered, however, that Dorman Long is exposed to certain exceptionally unfavourable influences which also affected results in the previous year. Separation from normal sources of supply and possibly shortage of labour in the concern's coal mining subsidiaries are probably mainly responsible. The £1 ordinary shares dropped 5s. 6d. on the news to 14s. 9d.; the £1 preferred ordinary 6s. 3d. to 27s. 6d.; the 8 per cent non-cumulative 2nd preference shares at 20s. 7½d. yield £8 2s. per cent.

First London Store Dividends

The first dividend announcements of the leading London department stores suggest that retail trade in this area enjoyed a distinct recovery in the period to January 31st last. The preliminary statement of Harrods shows a rise in net profits, before transfer to tax reserve,

DIVIDEND COMPARISONS

 ‡ For 18 months ending January 31, 1942.
 * On 1 year's payment.

from £485,609 to £560,120. Tax reserve receives £120,000 against £50,000, leaving equity earnings less than £5,000 higher at £140,120, representing 7.6 against 7.2 per cent. The ordinary payment is raised from 4 per cent, to which it was reduced from 10 per cent in the previous year, to

5 per cent. The transfer to staff funds is £5,000 lower at £25,000 and the carry forward is raised from £201,907 to £206,268. This improvement is not exceptional. D. H. Evans announces net earnings of £94,355 against £85,883, and William Whiteley an increase in the net figure from £60,941 to £107,550. Eighteen months' arrears of dividend have been declared by the latter concern on the 5 per cent cumulative preference stock, leaving gross arrears at £33,750 to January 31st last. Peter Robinson are paying a further six months' arrears on the 4 per cent first mortgage debenture stock to August 1, 1941. The company obtained a three years' moratorium on this liability in March, 1941, but was able last month to declare a six months' payment to February 1, 1941. No profit figure is yet available, but there is good reason to suppose that income exceeds last year's figure of £34,400. The most important factor conducing to the general improvement in the London store earnings has undoubtedly been the cessation of enemy bombing last spring.

A Provincial Contrast

The profits of Lewis's, Ltd., a concern which controls stores in the North and Midlands, show a fall, after deduction of tax, from £928,098 to £793,744 for the year to February 1st last. The directors state that gross profits exceeded those of the previous year and that the whole of the decline is due to higher taxation. There was, however, some loss of potential earnings on account of enemy action in the earlier part of the year. After repeating the allocation of £60,000 for contingencies and taxation and reducing total depreciation transfers from £35,000 to £10,000, the earnings for deferred shares are down from £386,991 to £293,030, representing 249.4 against 369.5 per cent. The directors have reduced the customary 275 per cent dividend to 250 per cent, which is not quite completely covered by earnings. Since there is also a transfer to general reserve of £24,155 against £50,000, the carry forward is reduced from £57,563 to £32,688. The balance sheet shows an ominous drop in the value of stocks from £878,721 to £559,865, accompanied by a corresponding rise in cash holdings from £116,508 to £440,052. It is indicated that investments, with a book value of £456,797 against £482,304, show an unspecified depreciation. Total reserves, before transfers from current profits, amount to £1,930,381 against £1,847,846, while capital reserve is reduced from £255,924 to £171,747 to provide certain war damage contributions. The accounts show that, relatively, the Lewis's group enjoyed a less substantial revival in business last year than did the London stores. This was to be expected, for, having been less severely disturbed by Blitz conditions, the provincial concern stood to profit less from a return to normal. Earnings in the current year are, above all, dependent on the extent to which saleable goods can be secured. The £1 deferred shares are held by Lewis's Investment Trust. The £1, 15 per cent, cumulative preferred shares, at 51s. 3d. ex dividend, yield £5 17s. 0d. per cent.

I. and R. Morley Accounts

Profits of I. and R. Morley, manufacturers and distributors of textile piece-goods, declined in 1941 from £336,206 to £328,869. The accounts show a moderate increase in taxation from £198,099 to £209,268, leaving equity earnings reduced from £82,607 to £65,643. Thus, the ordinary dividend, maintained at 5 per cent, is covered by earnings of 9.6 against 12.3 per cent. The allocation to general reserve is almost halved at £20,000, and the carry forward is some £600 higher at £39,178. The moderate setback to earnings appears to be due as much to the influence of lower profit margins as to the weight of increased taxation. It is probable that turnover was maintained at the maximum possible under clothes rationing. The balance-sheet shows a rise in the surplus of liquid assets from £1,003,029 to £1,067,962. Stocks stand at £559,528, against £603,413, of which £56,916 in the previous year was destroyed by enemy action. Cash holdings are reduced from £391,108 to £267,682, but more than £200,000 has been invested in Government securities, raising the total of this item to £401,033. Creditors and debtors show normal increases, while the total of general reserve, after the latest transfer from profits, stands at £140,000. The accounts as a whole suggest considerable stability of earn-

ing power, even under war conditions, and the margin of cover for ordinary dividends still remains comfortable. The £1, 5 per cent, cum. pref. shares at 21s. 7½d. ex dividend, yield £4 12s. 6d. per cent.

Borax Consolidated Profits

The preliminary statement of Borax Consolidated shows a rise in net profits from £464,148 to £554,996 for the year to September 30th last. This figure is, however, struck before provision for depreciation or taxation so that it is possible that there is a decline in equity earnings from the 9.3 per cent realised last year. Provision for British income tax in the previous year rose from £102,125 to £150,437 and it is certain that the liability must have been higher last year, while the company must also have faced the necessity of meeting war damage contributions. The dividend on deferred capital is maintained at the 7½ per cent distributed over the three previous years. It is clear from the preliminary figures that gross profits rose substantially and it may be assumed that the final disappearance of continental markets was compensated by increased sales at home and possibly by an expansion in the output of United States Potash, in which Borax Consolidated is substantially interested. The £1 deferred ordinary stock, at 29s. 9d., yields £5 3s. 5d. per cent.

Rubber Trust

No final dividend is to be paid on the ordinary stock of Rubber Trust for 1941, so that the 3 per cent interim remains the total for the year against 10 per cent in the four previous years. The directors are to be congratulated on making an immediate adaptation to military circumstances in the Far East, despite the fact that net profits, before tax, declined only from £178,446 to £162,310. The free surplus, which amounts only to £45,733, against £106,389, there being presumably a substantial rise in tax liability, is devoted as to £45,000 to raising dividend equalisation account to £50,000, and as to £733 to raising the carry forward to £96,744. The book value of investments at December 31, 1940, amounted to £3,171,295, when market value already indicated a depreciation of £358,897. Since then the further fall must have been very substantial. The company's general reserve stands at £500,000. The distribution of investments as shown in the previous accounts included 48.3 per cent in the Netherlands East Indies, and 28.8 per cent in British Malaya. There are also small holdings in India, Ceylon and the United Kingdom. Clearly there is nothing to be done but to wait for the eviction of the Japanese from British and Dutch possessions. The £1 ordinary stock prior to the announcement stood at 29s. 7½d.

Industry and Trade

Shipping Losses

In view of the "most serious increase in shipping losses" during the past two months, to which Mr Churchill drew attention in the House of Commons on Tuesday, the need for employing existing Allied tonnage as efficiently as possible and for speeding up their construction programmes has become more vital than ever. British, Allied and neutral merchant shipping losses have been heavy; the total gross tonnage lost through enemy action up to the end of last year, inclusive of merchant ships used as naval auxiliaries, has been estimated by the Chamber of Shipping at 8,600,000, equivalent to 48 per cent of Britain's pre-war sea-going and coastal steam and motor tonnage. True, enemy losses have also been heavy; they have been officially estimated at 5,225,000 gross tons for the same period, exclusive of 496,000 gross tons destroyed by Russia and of 128,000 tons lost by Japan. These losses have weakened the sea communications of Germany and Italy, and, in so far as they represent captures, they provided a slight net addition to Allied shipping. But they have in no sense offset the loss of Allied shipping resources. Allied shipping needs are enormous and growing, and available resources are inadequate for the rapid massing of their full striking power in all the theatres of war. Mr Roosevelt's shipbuilding programme, which was announced on January 6th, and envisages the construction of some 5,000,000 gross tons in 1942 and 7,000,000 tons in 1943, will increase Allied shipping tonnage, even if the average rate of loss of the first twenty-eight months of war continues. But as the present annual rate of output in the United States is probably still well below the 5,000,000 gross ton mark, the possibility of a serious and sustained increase in sinkings during the next few months, when the need for increasing fighting power in distant theatres of war is vital, requires drastic measures and, in particular, the utmost economy in the use of available merchant tonnage. It may be necessary, for example, to cut Britain's food imports, at least temporarily, in order to set free shipping for other purposes. The prospect for the next few months is grim.

Pooling of Allied Shipping

The pooling of shipping controlled by Great Britain and the United States was agreed between President Roosevelt and Mr Churchill on January 15th. The necessary organisation has now been set up, with Admiral Land and Sir Arthur Salter in charge of its American, and Lord Leathers and Mr Averell Harriman of its British, sections. Admiral Land has pointed out in a letter to President Roosevelt that the principal tasks of the new organisation will be to "prepare and maintain currently a full survey of the employment of all tonnage, both in the American and British pools, to make possible economies in the use of shipping by interchange and combined use of resources, and to prepare and maintain a full survey of all shipping requirements."

British Shipowners' Views

While British shipowners are determined to contribute everything in their power towards the attainment of victory, many of them are perturbed about the future of their industry after the war. For example, Mr Philip Runciman devoted a large part of his presidential address at the annual meeting of the Chamber of Shipping on February 26th to post-war problems. In particular, he was concerned with the question of the replacement of tonnage after the war, which the industry will be unable to finance out of its own resources, with the need for a large British merchant marine, and with the possible effect on passenger traffic of an expansion in civil aviation. The annual report of the Chamber of Shipping, issued this week, contains much useful information concerning the effect of the war on shipping and of the various measures taken to improve the position. It records a considerable increase in the speed of the turn-

round of ships at British ports. Like Mr Runciman's address, the annual report is concerned with post-war problems, and it emphasises that the maintenance of private enterprise in shipping "as the first essential to a prosperous and efficient mercantile marine during and after the war"—a proposition which is quite unexceptionable—is the primary objective of the General Council of British Shipping, charged with the formulation of the industry's shipping policy.

Cotton Trade Wages

The pressure for higher wage rates continues unabated in spite of all official exhortations. It is not likely to cease in the absence of the adoption of a national wages policy. All the trade unions in the cotton industry have now applied for a general increase in wage rates. Since the Ministry of Labour's cost of living index has been stabilised and, consequently, has not yielded any more dividends in recent months to cotton operatives whose wage rates are linked to the index, the new application has apparently been made on the ground that their earnings are far below that of munition workers. During a week in July last year, for which the Ministry of Labour collected data on the earnings of workers in the principal industries, the average earnings of adult male cotton operatives were £3 18s. 5d., compared with an average of £4 19s. 5d. for all industries. Women workers in the cotton trade were more than relatively better off, for their average earnings amounted to £2 4s. 7d., against an average of £2 3s. 11d. for all industries. In the metal, engineering and shipbuilding industries the average earnings of men and women were £5 11s. 5d. and £2 8s. 2d. respectively. Unfortunately, the Ministry of Labour's inquiry did not extend to the average number of hours worked, which are believed to be higher in the munitions industries than in the cotton trade. Despite the discrepancy between men's earnings in the cotton and other industries, the relative position of cotton operatives has been improved since 1938; a comparison of weekly earnings during the last pay-week in October, 1938, and the week ended July 12, 1941, shows an increase of 54.3 per cent in those of male cotton operatives, against a rise of 44.1 per cent in the average of all industries. At a meeting between representatives of the Northern Counties Textile Trades' Federation, representing the weaving section of the industry, and the wages committee of the Manufacturers' Association, the former staked a claim for an increase of 2d. per hour, or 8s. per week on the basis of a 48-hour week, in the wage rates of all adult workers. Spinners and cardroom workers have demanded an increase of 16½ per cent on current wage rates. These applications will probably be resisted by the employers' organisations, but a compromise solution seems likely. An increase in costs of production will probably involve a further rise in the prices of cotton textiles to the consumer.

The Tinplate Industry

Eight months have now elapsed since the appointment by the Minister of Supply of a representative committee, under the chairmanship of Lord Essendon, to consider the application of the policy of concentration to the tinplate industry, and four months have passed since that committee sent its report and recommendations to the President of the Board of Trade. It is reported that no steps have yet been taken to give effect to those recommendations. Manufacturers have apparently not been able to agree among themselves about the extent to which redundancy exists, or the basis of compensation for scrapped mills, and the Government Departments concerned seem to be less persuaded now than they were last July of the urgency of the need for action. The labour employed in the industry has already been automatically reduced under the pressure of economic forces and Government restrictive measures, its capacity has been adjusted to wartime tinplate requirements, and arrangements have been made governing the relations of the British and United States tinplate manufacturers in the conduct of the tinplate export trade. It is to be hoped, however, that short-term considerations will not be allowed

delay the preparation of plans for the modernisation of the industry. It can have little hope of retaining its competitive position unless it is brought up to date.

Rise in Agricultural Prices

The implications of the increase in the prices of farm products announced on January 20th in compensation of the rise in minimum agricultural wages from £2 8s. to £3 per week are discussed on page 281. The accompanying table provides a rough indication of the rise in prices since 1939. The prices to be paid to farmers for this year's cereal crop are not much higher than those paid for last year's harvest, but they are substantially above the pre-war level. The new wheat prices, for example, are three times as high as in 1939, and those of millable oats have

PRICES OF IMPORTANT COMMODITIES (b)

	1939 (Average Prices)	Current Prices	New Prices (1942 Harvest)

(a) Not available.

(b) Comparisons are approximate.

(c) Prices vary according to grade and district.

been doubled. The new price of malting barley is yet to be announced, but this grain has already risen sky-high in price in the absence of control. The price of sugar beet for the 1942 crop, which was announced on December 12th, is also substantially higher than before the war. Cattle, sheep and lamb, and pig prices have also been raised to yield a higher average return; but in view of the many variations in grade and other adjustments it is not possible at this stage to compare the average prices likely to be received in 1942 with those obtained in 1939. The new milk prices have not yet been announced.

Substitute for Tungsten

As the Allies have lost some of their Far Eastern sources of supply of tungsten, the important steel alloy metal, and are faced with the possibility of losing others, its use must in future be confined to purposes for which no efficient substitute is available. Fortunately, there is another metal, molybdenum, which, for many purposes, can be substituted partly or wholly for tungsten, and which is available in comparatively large quantities to the United Nations. As was pointed out on page 267 of last week's *Economist*, molybdenum will in future be used to a larger extent in the production of high-speed steels. The metal has been known for more than 150 years, but its application in industry had made little progress before the exploitation of the Climax mine in Colorado, which began in 1918. It was in Germany that molybdenum was first used as a substitute for tungsten during the last war, when she was cut off from supplies, but had access to the small molybdenum output of Norway. Her success initiated a period of intensive technical research into the possibilities of using the metal in steel alloys. Among other uses, molybdenum has gained special importance in the manufacture of high-pressure boiler parts, engine blocks and parts, turbines, gun barrels, machine tools, cutting tools and armour-piercing projectiles. Some 95 per cent of the world's total supplies is produced by the United States, which itself contributes as much as 90 per cent. Two-thirds of the output in the United States is produced by the Climax Molybdenum Company from its mines in Colorado; the remainder is a by-product derived from the smelting of copper in Utah, New Mexico and Arizona. There are only three sources of supply of some importance outside the United States; these are in Mexico, whose molybdenum is produced as a by-product in the smelting of copper by the Greene Cananea Consolidated Copper Company, a sub-

sidary of the American Anaconda concern, in Norway, where it is produced by the Knaben mine in Fjotland, and in French Morocco, where a company exploits a deposit in the Azegour district. Small quantities are also produced in other countries, such as Peru, Australia, Burma, Turkey, Roumania and Greece. In recent years world production of molybdenum, in terms of metal, averaged about 16,000 metric tons to which the United States contributed 15,000 tons, Mexico and Norway some 500 tons each, and French Morocco 200 tons. World production of tungsten has been nearly twice as high as that of molybdenum, but it is believed to have fallen below the annual rate of 30,000 tons since the beginning of the war. But as the atomic weight of molybdenum is only about half that of tungsten, its output roughly equals that of the latter in volume.

The Imperial Institute

The annual report of the Imperial Institute for 1941 shows that, in spite of many difficulties, its scientific departments dealing with plant and animal products and with mineral resources continued to do useful work. In particular, they have carried out valuable investigations into the use of materials for the purposes of the war. For example, of eight samples of manganese ore submitted from the Gold Coast to the Mineral Resources Department, three were found to be representative of ores suitable for the production of good quality ferro-manganese. Again, the Department's services have been utilised for the purpose of finding substitutes for scarce materials. It has been successful in discovering an adequate substitute in South Africa for American asbestine, a fibrous talc powder used as a filler in rubber and in certain types of paint which it has been difficult to secure. It has also been able to assist a concern interested in the recovery of oil from waste products, such as oil-rags, and dependent on a now almost unobtainable filtration agent of foreign origin, to replace it by a domestic product. In view of the need for additional sources of supply of a number of essential raw materials, the experience of the technical sections of the Imperial Institute should continue to prove of material assistance to the Government and industry.

Textile Exports

Returns of the volume of exports of cotton and rayon yarn and fabrics for 1941 show that, compared with 1939, shipments of cotton yarn fell by 75 per cent and those of rayon yarn rose by 202 per cent. In piece-goods there has been the same tendency; exports of cotton piece-goods are down by 44 per cent, while those of rayon piece-goods are up by 58 per cent. Rayon exports in both yarn and piece-goods were higher in 1941 than in any previous year. There are several explanations of these divergent trends. Exports of rayon in all forms before the war was very small owing to the severe competition of the three Axis countries. The exclusion from the world markets of Germany, Italy and, more recently, Japan, has benefited rayon more than cotton. Again, a large part of the cotton export trade, particularly in yarns, was done with the Continent of Europe, whilst rayon exports went primarily to markets which for a long time were scarcely affected by the war. The supply of raw materials at the outbreak of war was probably better in the rayon than in the cotton trade. Moreover, rayon was not in demand for service requirements and for reasons both of foreign exchange and shipping space it was regarded as an ideal form of export. Finally, the general movement in favour of the newer synthetic fibres has continued, even though the war has upset all normal calculations. The prospective volume of rayon exports, however, will be conditioned, not so much by marketing possibilities, as by the supply of materials, labour and shipping space.

COMPANY MEETINGS

THE IMPERIAL TOBACCO COMPANY (OF GREAT BRITAIN AND IRELAND), LIMITED

DISTRIBUTION OF 17½ PER CENT. (TAX FREE)

PROBLEMS OF DISTRIBUTION AND SUPPLIES

LORD DULVERTON'S STATEMENT

The annual general meeting of the Imperial Tobacco Company (of Great Britain and Ireland), Limited, was held, on the 24th instant, at Bristol. Lord Dulverton (the chairman) presided.

The following is an extract from the statement of the chairman, which was circulated with the report and accounts:—

On the assets side of the balance-sheet the first variation of any moment is in stock-in-trade, at approximate cost, and advances to leaf-buying branches abroad, which is less than last year's figure by £3,253,780. Last year, however, as the wording then stated, this item included "estimated amounts recoverable under war risks insurance policies in respect of leaf damaged or destroyed." During the past year our claims have been formulated and the net amount still due comes under the heading of debtors and not stock. It would, of course, be contrary to public policy to state the sum involved, but I may say that it is substantial. As regards our stock of tobacco, there was a considerable decrease in stocks of leaf in bond, largely offset as regards sterling value by an increase in factory stocks, on which, of course, duty at the present very high rates has been paid. I shall have more to say about the company's leaf position later.

Debtors you will find are higher by £3,765,232. This is partly due to the fact that as our trade increases the balance due from our trade debtors increases, and partly to the transfer referred to above.

Government and other securities show an increase of £1,544,435, due entirely to an increase in the amount of Government securities held as compared with the position held at October 31, 1940.

LIABILITIES

Deposits by and current accounts with subsidiary and associated companies show an increase of £749,620, due mainly to the fact that some of our subsidiaries, through such causes as, for example, the holding of smaller stocks, found themselves with further surplus cash, which they deposited with the parent company.

Creditors, provision for income-tax and other taxation and bonus to customers, and other provisions as set out in the balance-sheet, amount to £30,362,592, an increase of £1,951,789. The increased provisions that we have had to make for taxation more than account for this increase. We have paid very substantial sums on account, and adequate provision for all liability under this heading to October 31, 1941, has been made.

The general reserve is increased by £500,000 transferred from the profits of the year under review, and now stands at £9,000,000.

PROFITS AND DIVIDEND

The net profit for the year shows a figure of £7,981,241, a decrease of £991,587. After providing £10,000 for directors' fees and transferring £500,000 to general reserve account, there remains a balance of profit for the year of £7,471,241.

It is now proposed, subject to your approval, to declare a final dividend of 7½ per cent. and a bonus of 2½ per cent., both free of income-tax, making a total distribution for the year of 17½ per cent., free of income-tax.

The balance remaining to be carried forward to the accounts for the current year is £1,666,436, which is about £45,000 more than the amount brought in at the commencement of the year.

The free-of-tax dividend is 2½ per cent. less than last year, but the gross dividend is substantially the same. I think you will agree that this is a satisfactory outcome of a difficult year's trading.

DISTRIBUTION

At this time last year the smoking public were going through a period in which supplies of cigarettes and tobacco were becoming

increasingly difficult to obtain. It was soon apparent that this was no temporary phase due to transport difficulties, etc., but a very genuine shortage due to the increased level of demand. In April of last year the Government decided to release more leaf tobacco from bond, and since then we, in common with other manufacturers, have been supplying a greater volume of goods than ever before in the history of the trade. There is still a limit to permitted deliveries, but the limit has been fixed by the Government at a level which nearly, if not quite, satisfies public demand. The acute shortage, to which some of you may remember I drew attention in a broadcast speech last summer, has been replaced, not by a period of plenty—but by one in which smokers generally can obtain as much to smoke as can reasonably be expected in these times of stringency.

CURRENT TRADE AND PROSPECTS

The dominant note of my remarks last year was anxiety about future supplies of leaf tobacco—in particular, that important part of it which comes from the United States of America. It would be a mistake to pretend that that anxiety no longer exists, but it has certainly been to some extent allayed by the action of the US Government in including tobacco in the commodities now sent to this country under the Lease-Lend arrangement. Shipments of US leaf are now made to HM Government, who in turn sell them to manufacturers for payment in sterling. Under this plan the question of providing dollar exchange does not arise, and so long as other urgent calls on shipping space admit of sufficient tobacco being included we can look forward to the future with greater confidence. The manufacturers and the smoking public of the country are indebted to the US Government for their generous action in initiating the Lease-Lend arrangement.

Besides USA tobacco, we use—as I have frequently told you—an important amount of tobacco grown in the Empire. The principal tobacco-growing countries of the Empire—Canada, Rhodesia, Nyasaland and India—have succeeded in spite of wartime difficulties in growing very useful crops, and here, again, provided adequate shipping is available, we may hope for a steady maintenance of supplies.

During the year the effects of the war on the tobacco trade have been noticeable in many other ways. The greater scarcity of packing materials—paper, cardboard, tin, etc.—has resulted in the simplification of the number and form of our packings and the continual search for more economical forms of packing. The problems of industry in war-time are very different from those in time of peace. In the latter it is the aim of the manufacturer to pack his goods in the most attractive form—in war-time the problem is to turn out the goods at all, and to overcome the innumerable difficulties arising out of the scarcity of some materials, the intervention of the various Controls, and the ever-growing shortage of labour.

It has been the policy of your company—and I think I may say of the tobacco trade as a whole—to give HM Government our wholehearted support in carrying out the measures that they deem necessary. Difficulties, and very serious difficulties, were bound to arise, but our task has been made easier by the wisdom and understanding of the Tobacco Controller. The tobacco trade may consider itself fortunate in having as Controller a man with a life long knowledge of the trade, and a readiness to take into account all sides of a question.

Proposed by the chairman, and seconded by Mr G. A. Fall the resolutions proposing the adoption of the report and statement of accounts and the resolutions declaring the dividends were passed unanimously.

TEMPERANCE PERMANENT BUILDING POWER SECURITIES CORPORATION, LIMITED

RESERVES STRENGTHENED

The 88th annual meeting of the Temperance Permanent Building Society was held on Wednesday, 25th inst., in London.

Mr Cyril W. Black, FSI, FAI (the chairman), in the course of his speech, said: The year which has recently closed has witnessed a continuation of the process of adjustment to new conditions brought about by the war, and it is doubtful whether, in all its long history, the society has ever faced a year more fraught with complexity. Nevertheless, we have come through it with our essential strength not only unimpaired but actually increased.

The balance on profit and loss account available for appropriation is £128,390 compared with a figure in the previous year of £146,062. It is not necessary to look far for the causes of the reduction of nearly £18,000 in this balance. The amount payable for income tax shows an increase of nearly £14,000, and we have incurred special expenditure of a non-recurring nature as a direct consequence of war conditions of over £5,000. These two items alone more than cover the reduction in the profit.

The balance sheet shows an improved position both in regard to reserves and liquidity. Our reserves consisting of general reserve fund, contingency fund and carry forward now amount to a grand total of over £1,070,000, an increase of over £13,000 on the previous year. The ratio which our reserves bear to the aggregate of our share capital and deposits has risen to approximately 21.65 per cent. This ratio is higher than ever before and much in advance of the reserve position of any other large building society.

NEW RATES OF INTEREST

During the year we have been compelled to give notice of a further reduction in the rates of interest payable to investors, the new rates taking effect from October 1st last. Shareholders who invested prior to 1931 now receive 2½ per cent interest, while subsequently issued shares earn 2½ per cent. Depositors receive 2½ per cent. All these rates are free of income tax to the recipient. These reduced rates were rendered necessary by two main causes: (1) The increased liability of the society for income tax and (2) the new liability for contributions under the War Damage Act.

I am glad to be able to repeat the assurance I have given in previous years that our borrowing members are, on the whole, continuing to honour their obligations satisfactorily. In cases of genuine difficulty brought about by war conditions we have temporarily reduced or suspended capital repayments, while in cases where properties have been rendered uninhabitable through enemy action we have been happy to grant the utmost relief pending settlement of claims.

The report was unanimously adopted.

MERLIMAU PEGOH, LIMITED

The thirty-first ordinary general meeting of Merlimau Pegoh, Limited, was held, on the 18th inst., in London, Major W. M. Sime, OBE, JP (the chairman), presiding.

The following is an extract from the chairman's review, which was circulated with the annual report and accounts:—

Recent unfortunate events in Malaya have seriously affected our company. We have been deprived, for the present, of all our estates. It was in order to lessen the inconvenience to shareholders which the late presentation of the accounts might cause, that the directors decided to declare a second interim dividend of 6 per cent, making 10 per cent for the year. We have added £2,000 to the general reserve account and transferred the £20,000 which stood at the credit of the special cultivation reserve account to the investment and contingencies reserve account, making the latter £40,000. We have provided £10,000 for deferred replanting. Before the invasion of Malaya took place your directors had decided to limit their replanting programme owing to shortage of labour in the East and because of the need to produce as much rubber as possible. To what extent it may be necessary to adopt a much more comprehensive programme after Malaya has been freed from the enemy it is, of course, impossible to say.

The report and accounts were unanimously adopted.

PROFITS MAINTAINED

The nineteenth annual general meeting of the Power Securities Corporation, Limited, was held, on the 25th instant, in London.

Mr William Shearer, the chairman, after expressing sorrow at the death of Mr George Balfour, the late chairman, said that their profits had maintained more or less the same standard as in the previous year and, while it was idle to prophesy in abnormal times like the present, they could say that, subject to no unforeseen contingencies, the business in hand should enable them to maintain a fairly level keel during the current year. The work completed by Balfour, Beatty and Co. in 1941 was of considerable volume. The work in hand at present was well up to their average standard and would keep them fully occupied for a considerable time.

Notwithstanding the troubles in Iraq during May and June, their staff had come through their ordeal safely, and by arrangement with the Government and the Consulting Engineers they had been able to recommence part of the works in July. Progress had been good and they anticipated the completion of the essential portion of the contract early in the current year. A section of the works, by arrangement with the Consulting Engineers and the Government, had been suspended.

In order to compare the profit with the 1940 figure, the income tax, amounting to £57,559, must be deducted from the year's profit of £124,679, which this year was shown gross. The result was £67,120, which compared with the previous year's figure of £69,027. Administration and general expenses amounted to £13,885 against £18,853, a reduction of approximately £5,000, accounted for by an all-round saving in expenses and bank interest. The balance carried to the balance sheet was £52,035 against last year's figure of £48,973, a net increase of £3,062.

The chairman made reference to the excellent work carried out during a difficult year by the staff at home and abroad and also to the large number of employees serving in HM Forces.

The report was unanimously adopted, and the proposed dividend of 6 per cent. was approved.

F. W. WOOLWORTH AND COMPANY, LIMITED

SATISFACTORY RESULTS

The thirty-third annual general meeting of F. W. Woolworth & Co., Ltd., was held, on the 20th instant, in London, Mr W. L. Stephenson (the chairman) presiding.

The following are extracts from the chairman's statement which was circulated with the report and accounts: The company produced a profit of £6,404,759 for the year 1941, a fall of £1,553,400 compared with the previous year. The recommended final distribution is down by 6d. per unit. I would remind stockholders that a year ago I ventured the opinion that increased war activity would bring new difficulties and further restriction. It has, and that is the reason for both reduced profits and lower dividend.

Last year was a most difficult one for the retail trader. All, large or small, faced the same limitation of supplies: all were affected by the widening of consumer rationing, further depletion of staff, contraction of selling space, etc.

In view of all this I look upon the result of the company's trading for 1941 as most satisfactory. Substantial sums have been written off profits for the year, many of them of a nature peculiar only to war conditions. For instance, War Risk Insurance on Merchandise amounts to £229,544, firewatching and ARP expenditure cost £264,742, contributions to our men in the Services run into six figures.

The figure provided for taxation on the profits of the company for 1941 at £3,557,205 is considerably lower than the provision for the previous year owing to the heavy reduction in the sum required to meet excess profits tax for the year under review.

As the war continues it is to be expected that there will be further diminution in consumer supplies, causing contraction in the business of retail distribution, and this company, in common with other retailers, will have to face up to it. Our main effort will be directed towards protecting the company's goodwill and resources, with the hope that when our people return from their service to fill their jobs again we shall have preserved the organisation so well that there will be plenty of outlet for their energies.

The report was unanimously adopted.

THE STERLING TRUST

SATISFACTORY RESULTS

The twenty-fifth ordinary general meeting of the Sterling Trust, Limited, was held, on the 24th instant, at the offices of the company, 310 Gresham House, Old Broad Street, London, E.C.

Mr Richard S. Guinness, chairman of the company, who presided, in the course of his speech said: As was anticipated at our last meeting, we have suffered varying fortunes in the past year.

Our investments in this country and the Empire which, on the basis of the valuation referred to in the report amount to over 82 per cent. of the total, have not only maintained their average value but have shown a welcome appreciation and produced 77 per cent. of our total revenue. I wish I could give an equally satisfactory account of our holdings in other parts of the globe. On present-day valuation a considerable depreciation is evident, and owing to widespread defaults the contribution to our revenues is disproportionate. We have suffered a further reduction in revenue by sales under Government requirements of USA holdings, which now represent under 2 per cent. of our invested funds.

Notwithstanding these difficulties, we are able to report that our "overall" depreciation is reduced to 7 per cent. after allowing for reserve and carry forward, as compared with 16 per cent. in 1940. Our holdings in German issues have been valued at nil. Gross revenue shows a decline of £25,949 and there remains, after income-tax provision, a balance equivalent to, say, 6 per cent. available for ordinary dividend, and your directors have recommended a total dividend of 4½ per cent. upon the ordinary stock, a reduction of 1 per cent. upon 1940, which we regret, but which the fall in revenue renders inevitable.

We have carried on our work hampered by ever-increasing difficulties in finding remunerative investments to replace realisations and adjustments forced upon us by war-time exigencies; thanks to the energies of our officials and depleted staff we are able to show an average yield of 4½ per cent. upon our invested funds, and we ask you to join the board in appreciation of their activities. I cannot promise that this yield can be maintained, as war conditions must lead us to invest an ever-increasing proportion of our available resources in British Government securities.

The report and accounts were unanimously adopted.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

MARKET sentiment, which displayed a distinct improvement on the news of the Cabinet reconstruction, derived further support from President Roosevelt's speech and the latest Russian successes. Despite the continued Japanese advance, there are indications that the recent downward trend may soon be brought to a close. The early part of the current week has witnessed a revival of enquiry, which is reflected in some substantial marking up, in particular of first-class equities. Re-investment support pending the disbursement of the Canadian and Indian moneys in the gilt-edged market, occasioned daily advances up to ½ in the irredeemable issues during the early part of the week, but purchases of tax certificates led to small declines for short-dated issues. In midweek more subdued conditions left long dated issues generally unchanged. After a general rally in South American issues on the previous Friday, there were few further changes in the foreign bond market early this week, although the 5 per cent China loan of 1912 fell two points on Tuesday. The dividend announcements gave rise to some activity in the home rail market at the end of the previous week, when GW ordinary lost 1½ and London Transport "C" stock 1½ points on the disappointing payments. Some scattered realisations were effected at the ex-dividend prices at the re-opening, but, later, junior issues displayed a steady tendency. Senior stocks remained steady until midweek, when preference issues were generally sold. Conditions were dull immediately before and after the weekend in the foreign rail market, senior Argentine issues falling sharply, but the market became steadier on Tuesday, recovering sharply in midweek.

The dull conditions of the last few weeks in the industrial market gave way to a distinctly better tone at the end of the previous week, although the volume of actual business was by no means large. Brewery shares reflected the demand for leading equities, and substantial improvements were well spread over leading issues. In the motor and aircraft group, prices were generally steady until Tuesday, when a number of improvements were recorded, Ford Motors rising 1s. among other gains. The slight advance in the heavy industrial group on the previous Friday gave way to some irregularity and later prices were depressed by the Dorman Long results. Shipping shares were depressed on Monday, but there was a modest rally the next

day, while the report of the Chamber of Shipping occasioned a further improvement in midweek. Some irregularity at the re-opening among textile issues was followed by a general recovery the next day. Tobacco shares, in particular Imps, were persistently firm. In the miscellaneous market, Murex eased ½ on Monday, when Turner & Newall advanced the same amount, while the following day, Brazil Traction and International Nickel rose ½ and ¾ respectively. In contrast to other sections, prices of leading equities continued to advance in midweek.

The earlier steadiness in the kaffir market was not maintained at the re-opening, war reports proving an unsettling factor. Cape selling was light, although Sallies and West Wit. Areas both lost ½, among other losses of ½. President Roosevelt's speech provided some encouragement the next day, but the improvement was insufficient to wipe out the previous day's losses. Later, the market was subdued by the announcement of higher Union taxation. The tin market was generally inactive, and the trend mainly was downward. Turnover in the rubber market was slight. After displaying some steadiness at the re-opening, prices resumed their downward trend, although some enquiry for cheap stock was noted in midweek. Tea shares also reflected selling in the early part of the week. A sharp rally in the oil market on bear covering purchases was witnessed at the close of the previous week, Anglo-Iranian rising ¾, Burmah ¾ and Shell ¾. Some speculative selling at the re-opening occasioned small losses for the leaders, but with the improvement in sentiment the next day, these losses were more than recovered. Burmah Oil was sold in midweek as the threat to the company's refineries became more pronounced.

New York

REPORTS of the stubborn Dutch resistance off Bali assisted sentiment on Wall Street before the weekend, prices moving within narrow limits, with slight support for rail

and industrial issues. President Roosevelt's speech on Monday fully offset the later adverse news from the S.W. Pacific, and a firmer tendency was apparent when the markets resumed business after the holiday. Lack of further incentive in midweek, however, gave rise to an easier trend.

GOVERNMENT RETURNS

For the week ended Feb. 22, 1942, total ordinary revenue was £65,146,000, against ordinary expenditure of £99,200,000, and issues to sinking funds of £115,000. Thus, including sinking fund allocations of £9,096,701, the deficit accrued since April 1st is £2,412,245,000 against £2,172,528,000 for the corresponding period a year ago.

PRIVATE PLACING

Brush Electrical Engineering Co.—This company has placed privately £50,000 5 per cent cumulative £1 preference stock and £27,000 ordinary stock.

BY STOCK EXCHANGE INTRODUCTION

Howden (James) and Co.—£100,000 4 per cent debenture stock representing a new introduction.

CONVERSIONS AND REPAYMENTS

Amersham Water Company.—The £100,000 outstanding Five per Cent. Mortgage debentures of this company will be paid off at par on June 30, 1942. Holders can renew the debentures for five years on existing conditions, but with a reduction in rate of interest to 4 per cent per annum as from July 1, 1942.

Bolsover Colliery.—This company will redeem on June 30, 1942, the whole of the £40,000 6 per cent debentures outstanding.

Chinese Government 4½ per cent Gold Loan 1898.—£764,850 bonds have been drawn for redemption at par March 1, 1942.

COMMODITY AND INDUSTRY NEWS

Export Licensing.—Under a Board of Trade Order which came into force on February 24th, the control in respect of raw materials manufactured partly from waste is withdrawn and, apart from certain destinations to which the exportation of all goods is prohibited, no licences are now required to export this class of goods.

Cotton.—Although fresh business in the market is limited, there has been a little more activity amongst traders. Greater efforts are being centred on the diversion of goods bought for the Far East to other markets. Much satisfaction has been expressed at the announcement by the Cotton Board that applications may be made for the transfer of any outstanding market provided to Empire and Allied countries provided that the applicant already has a basic allocation for the market concerned. Further developments in connection with the claims of the operatives for increased wages have caused little interest, as it is settled by arbitration. Yarn supplies show a slight improvement as a result of the overtime being worked in the mills, but certain counts and qualities remain scarce. According to some reports, future supplies of raw cotton are not likely to be quite so satisfactory as was generally hoped at the beginning of the year.

Unrationed Foods and Canteens.—The Ministry of Food has announced an amendment of the priority arrangements for the supply of certain unrationed foods in industrial canteens and other priority establishments, which will come into force on March 9th. All canteens serving workers in industrial undertakings which have been classified in Category A or B of the Industrial Group for obtaining the benefit of the priority arrangements, the foods covered by the priority scheme are biscuits, cake and flour, confectionery, cocoa powder, starch food powders, sugar and priority beverages (fruit juices, non-alcoholic cordials, etc.), coffee essence and foods and sugar confectionery. The group vary according to a prescribed scale.

Trading With The Enemy.—The Chancellor of the Exchequer and the President of the Board of Trade have appointed Mr. S. Gregory, CB, to be Controller-General of the Trading With The Enemy Department. This department was formerly called the Trading With The Enemy Branch, and is a joint department of the Treasury and the Board of Trade. The Board of Trade announce an Order, containing 520 additions to the "black

Shorter Comments

British-American Tobacco.—The second interim for 1941-42 amounts to 2.08 per cent, tax free, the same as the first interim. Total payment to date at 4.16 per cent, free of tax at 9s. 1d., compares with 7.5 per cent, free of tax at 7s. 4d., for the same period last year.

Hiram Walker Gooderman and Worts (Can. \$000s).—Consolidated profit quarter ended Nov. 30th \$3,984 (\$3,012), other income \$86 (\$39). Depreciation \$243 (\$206), debenture interest \$280 (\$130), bank interest, etc. \$45 (\$9). Tax provision \$1,887 (\$1,111), net profit \$1,614 (\$1,595), equal, after pref. divs. to \$2.03 (\$2.01) per common share.

British Linen Bank.—Net profits after tax for year ended Jan. 15th, £204,283 (£231,684). Contingency res. £50,000 (£75,000), depreciation nil (£10,000), property reserve £25,000 (nil). Div. (less tax) £100,000 (£115,000), carry fwd. £99,455 (£100,172).

Peruvian Corporation, Ltd.—Gross traffic receipts for Jan., 1942, £80,429 (£67,820),

aggregate receipts since July 1st £512,971 (£461,145).

Leicester Permanent Building Society.—Total assets on Dec. 31st £16,593,245 (£16,511,014). Cash £806,086 (£730,166). Total number of mortgages 31,294 (31,966), totalling £14,089,525 (£14,829,094). Paid-up shares £12,203,466 (£12,077,563). Subscription shares £915,166 (£921,803). Deposits and loans £2,009,822 (£1,970,523). Income-tax £162,000 (£260,000). Interest to shareholders £367,328 (£422,812). Forward £28,640 (£21,284). General reserve £1,150,000.

Northampton Town and County Benefit Building Society.—Total assets on Dec. 31st £8,175,078 (£7,727,572). Shareholders' credit balances £6,009,523 (£5,719,162). Due to depositors £1,577,548 (£1,447,009). Owing by mortgagors £5,383,638 (£5,814,607). Income-tax liability £89,738 (£61,916). To reserves £35,000 (£15,000), making total reserves £560,000 (£525,000).

San Francisco Mines.—Operating profit year ended Sept. 30th £156,721 (£22,232), mining revenue £638,453 (£493,117), less costs and expenses £481,732 (£470,855). Net profit after tax, depreciation, etc., £108,612 (Dr. £15,845). Div. 7½ (nil) per cent.

mines by a National Coal Board. The Coal Board is proposed as an alternative to nationalisation, and the Government, owners and miners would be represented on it. The National Council of Labour is to discuss the plan with the Secretary for Mines and other interested persons.

disregard surface formulas and bring out the fundamental unity. How many people are there in this country to-day who seriously deny that the State must plan and supervise all those activities that are essential to ensure to the citizen the basic necessities of a decent life and to secure to the community the essential needs of its existence? How many people are there who seriously deny that, in any foreseeable time, a vast range of activity both must and should be managed by individuals free to follow their genius and enterprise? Perhaps, in each category, there are a handful of fanatics; but barely enough, put together, to fill a college debating society. The overwhelming majority, behind the politicians' slogans, are really at one. Any one who is in the habit of talking with business men knows that they concede with alacrity the necessity for planning and direction, on a far wider scale than hitherto, to meet the basic necessities of the State and its citizens. And no Socialist who has seen the workings of the State can overlook the importance of leaving the fullest possible room, in the economic field as in the political, for the enterprise of the man with a vision and for the freedom of the man who is right when the majority are wrong. Here is the opportunity for the Prophet. It will not be enough for him to secure "agreement." Agreement by itself is stale, flat and unprofitable. Any two men can agree if they can sufficiently dilute their beliefs until they reach the agreed consistency of water, until there is nothing left from either belief that could possibly offend the other. This is how Coalition cabinets are built. But the task of the Prophet is to fuse agreement into faith. He must take from each side not what is most inoffensive, but what is most effective and dynamic, and from the marriage of principles as opposite as male and female breed a new birth with life of its own. The task of the Prophet to-day is to make the Right enthusiastic about planning the abolition of poverty and injustice, to make the Left the most fervent advocates of the safeguard against tyranny and oppression that is to be found in individual enterprise and independence from the State. This reconciliation of the faiths should be Britain's particular service to the twentieth century, just as her very similar reconciliation of the political faiths of Order and Freedom was her gift to the nineteenth. We, here in Britain, standing between the two worlds of Disciplined Order and Disordered Freedom, are the only people who can seize this historic opportunity. We need not be a spiritual buffer State. We can charge the Spokesman to

Scatter, as from an unextinguished hearth
Ashes and sparks, my words among mankind!
Be through my lips to unawakened earth
The trumpet of a Prophecy!

If any such message is good for peace, it is good for war also. Indeed, one of the basic mistakes we have made is to concentrate myopically on the differences between the

expedients of war and the expedients of peace, and to overlook the obvious fact that the spirit and the energy and the faith that make a sound community in peace are also necessary to make a victorious nation in war. If the principles are sound, they have their wartime and their peacetime applications. If there are no principles, the community will flounder alike in war and peace. The tasks to which the Prophet would call the nation should therefore be imagined as a double summons; peace must learn the lessons of war, and war those of peace.

The single principle and the double application can easily be illustrated. Thus, one of the most obvious necessities for peacetime regeneration is an attempt to cut through the social inequalities into which its peculiar educational system has led the British nation and to open the field of selection for leaders, *de facto* as well as *de jure*, to the whole of the youth of the nation. Precisely the same principle needs to be applied at once to the armed forces. When the generals are selected entirely from a narrow professional caste and the officers from a small social class, when the citizens in the ranks are treated only as the subject-matter of discipline, is it surprising that the resulting army is less effective than those in which rank reflects merit only, not social aloofness?

Or again, in peacetime, when the economic aim of the State is the welfare of its citizens, the most direct way of securing it would be to establish a national minimum below which no citizen would be allowed to fall. Similarly, in wartime, when the object of policy is to reduce consumption as much as possible, there should be a national maximum of consumption above which no one should be allowed to rise. Again, if monopoly is a danger to the productive efficiency of the community in peacetime, it is no less dangerous to allow industries to "control" themselves in war. If the first call on the energies of the State in peacetime must be to prevent individuals from being flung into destitution by the accidents of the trade cycle, then an equal effort is necessary to prevent the economic burdens of wartime remaining on the shopkeepers, the hotel keepers, the garage proprietors on whom they chance to light. The Nazis have a creed for peace and war; if the democracies are to triumph they, too, must have a faith for war and peace.

This is the need for the Prophet. But where is he to be found? Some men are born prophets, some achieve prophecy, and some have prophecy thrust upon them. The present state of public affairs, with its party bankruptcy and political vacuum, is thrusting the rôle, if not of Prophet, then certainly of Spokesman, on two men. One is Sir Stafford Cripps, who can prophesy to the Left. The other is Mr Anthony Eden, who can prophesy to the Right. If they will explore in common the areas of their faiths and begin, in unity, to proclaim to the world, not a dilute compromise, but a bold amalgam, they will be the means of dedicating the British people to a new birth of greatness.

Palestine was, before the war, universally recognised as Britain's colonial failure; yet there appears to have been no attempt by either Arab or Jew to use the war as a weapon for forcing Britain's hand. What is far more disquieting is the apparent inability of Britain to make full use of the goodwill that undoubtedly exists among the more advanced colonial peoples, rather than the apathy of the much larger number of primitive people, who can hardly be blamed if their instinct is to disappear into the jungle or bush at the approach of the bomber and tank. It is not the apathy of the Malays or the Hausa of North Nigeria which should cause surprise and concern—they are apathetic by nature. It is the unwillingness of the Malayan authorities to enlist the co-operation of the Chinese and Indians, who were prepared to give it; the dislike of the Nigerian authorities for the politically minded Ibos, whose transport work in the Abyssinian campaign has nowhere received the recognition it deserves; and the attempts of the Jamaican authorities to damp down the activities of the People's National Party, which, apart from its proposals for constitutional reform, has drawn up a remarkably sound programme for Jamaica's war effort.

It is quite true that the apparent reluctance to associate the colonies more fully in Britain's war effort rests on something more than mere obstructiveness and the colour bar, though both these factors are formidable indeed. Great Britain has, rightly, acted on the thesis that as the colonies had no say in this war, they must not be allowed to suffer by it any more than can be helped. Voluntary enlistment in local defence regiments is welcomed and encouraged, but there must be no question of conscription. In war or peace, forced levies of native troops have always been distasteful to British colonial rule. This principle still holds good today. On the other hand, whether we like it or not, the war is touching the colonies more nearly every day, not only through actual fighting, for paramilitary factors, such as the building of United States naval bases in the West Indies, but also through economic factors, such as the heavy demand for some colonial products and the loss of markets for others, and the need to cut down shipments to the colonies to the minimum. And, above all, there is the conviction, which in spite of Malaya is still adhered to, that it is British colonial rule, not the German new order, which offers the best future for colonial peoples.

If, then, this is after all the colonies' war, can Great Britain reverse its attitude and ask for a greater military participation from them? The answer surely is that first of all there must be a clear definition of British colonial policy, so that those in the colonies who are politically conscious will know exactly what they stand to gain by a British victory. It was a great disappointment to these people when Mr Churchill specifically excluded the colonies from the 'sovereignty clause' of the Atlantic Charter. But the statement of policy need not, in fact,

should not, be entirely political. It should also include schemes for economic development and welfare; it should give an assurance that the whole colony, and not only the foreign-owned company or the settler, will receive compensation after the war for damage suffered or livelihoods lost; it should make even the primitive native feel that he has something to gain if Britain wins but that he will lose everything if she is defeated. There is a good precedent to hand in the Ethiopian Agreement, under which Great Britain, while restoring the full sovereignty of the Emperor, is still providing advice and, what is more important, financial assistance.

Obviously, it will not be possible to frame a Colonial Charter in any but the most general terms, because of the very different stages of development which each colony has achieved, both politically and economically. Nor should the political difficulties be minimised. The Government has the lesson of the Balfour Declaration to prevent it from promising something that cannot be fulfilled. But, in addition to the general framework of the Charter, more specific proposals for the individual colonies could be drawn up with the help of the local governments and the most advanced and enthusiastic of the inhabitants, of whatever colour or tribe they may be. And, having been drawn up, the programme should be publicised in the 'colony concerned by the most effective method, which in Africa at least would be by films. Intensive propaganda of this sort might stir the apathy of the Hausa and fire the enthusiasm of the Ibo to an extent which would make compulsory service unnecessary.

If, however, the help of the colonial peoples is to be actively enlisted, it can only be on a condition which is just as important as giving them a stake in a British victory. There must be no question of sending them into modern battle untrained and unequipped—in fact, if compulsion is used, it should preferably be for service for which natives are well fitted, such as transport and repairs. Still less must there be any question of obtaining their co-operation and then walking out on them. There must be no repetition of a Malayan retreat while the natives are left to the mercies of the invader. Instead, the example of Java, where the Government has declared that there will be no evacuation of white civilians because they feel at one with the native inhabitants, should be taken to heart. If British dependencies are to be asked to fight for their protecting power, the protectors must fight as well.

It is now, too, when so many colonial precepts are in the melting pot, that the Colonial Office should re-examine its attitude towards indirect rule. In Malaya, there was no indirect rule properly so called, but there was a similar principle in the States of governing through the Sultans with British advisers, and it was the Malays who enjoyed priority in appointments in the civil service over the far more enterprising and energetic Chinese. The trouble is that indirect rule has become so much ingrained in British colonial policy that it is now

The Colonial Melting Pot

THE loss of Singapore was primarily a military defeat. There may have been, and probably was, inefficiency on the part of the civil administration, culpable negligence in the European community and apathy in the Malays, but the fact remains that the defence of Malaya and Singapore was Britain's responsibility and it is Britain that has failed.

Nevertheless, the military defeat has provoked justifiable misgivings about British colonial administration. The British people have been proud of their treatment of subject races and have honestly believed that no other colonial power has offered or given so much. They read of the stream of war gifts pouring in from the colonial empire—from Malaya, most of all—and assumed, too lightly as it turned out, that when the war reached their lands the colonial peoples would leap to arms in support

of Britain, whose defeat would mean their slavery. Instead of this, it is learned that the Malays were at the very best bewildered spectators, and for the most part completely apathetic; that "the Government had no roots in the life of the people of the country"; that the bulk of the native labour force melted away. It is not surprising, therefore, that with bombs near Fort Lamy on the frontier of Nigeria and the shelling of the Dutch West Indies, it is being asked whether the story of Malaya will be repeated elsewhere.

It would be a mistake to draw from the reports of apathetic Malays the conclusion that there is little sympathy among the colonial peoples for Great Britain and a complete lack of practical co-operation. Malta has been one of the most frequently bombed places of the war; yet the resolution of the Maltese is undiminished.

frequently regarded as an end in itself instead of as a means to an end—that the people should be well governed until they can govern themselves. In Nigeria this has too often meant bolstering up inefficient, and sometimes corrupt, Emirs and chiefs for the sake of a formula, with the result that the original purpose of indirect rule, slow but steady progress on a sound basis, is defeated.

But there is a possibly greater danger even than bad government in the misuse of indirect rule, and that is the sense of frustration it instils in the more politically conscious natives who, under another system, might rise to be the natural leaders of their countrymen. It is worth recalling the resolution, passed at a conference of the West African Students' Union last year, that the object of indirect rule should be the establishment of a United Nigeria with a Federal Constitution, and that, whenever during the operation of indirect rule "there is any conflict between the old and the new order, democratic considerations should always prevail."

Frustration, in fact, is probably the keynote of the dissatisfaction that is felt in the colonies today. Not only is there the frustration felt by the advanced minorities who see the progress of self-government held up because the great majority are not ready. There is also the frustration felt by the British colonial servant. Charges of inefficiency have been levelled at the administration in Malaya, and there have been calls for new blood and new ideas in the whole of the colonial service. That recruitment does not take place from the widest possible field is certainly as true of the colonial service as it is of the home civil service, but it is a fault which can only be remedied by domestic reconstruction. So far as the colonies alone are concerned, what is disheartening is that the recruits who go out are generally both able and energetic and frequently idealists as well, but by the end of ten years their spirits are broken and all they look forward to is promotion, an early retirement and a pension.

Partly, this breakdown in morale is due to over-centralisation inside the colony which sometimes goes so

far that not even a Resident, much less a District Officer, can grant a native dispensary assistant an increase in salary of 5s. a month without higher approval. It is significant that in the last days of Malaya the Governor declared that "every officer must accept responsibility to the full in taking decisions. . . . Officers who cannot take responsibility should be replaced by those who can. Seniority is of no account." But besides losing his sense of initiative and responsibility, the colonial servant feels frustrated. He is frustrated because he sees that there is such a lot to be done; yet every time he suggests a reform or a development scheme it is quashed, frequently by a dead hand at the top, but even more often through lack of funds—while at the same time he sees large sums of money leaving the colony to benefit taxpayers or shareholders in the United Kingdom. There was room for hope that with the passing of the Colonial Development and Welfare Act this cause of frustration would disappear, but as a Note on page 319 points out, the amount of financial assistance so far given under the Act has been very small; in any case, financial assistance alone will not solve the problem of raising colonial standards of living.

Finally, there is frustration because of the lack of interest taken in colonial affairs. The British people may wonder now at the apathy shown by the Malays, but it is nothing compared with their own apathy towards their colonial possessions—until, of course, they are about to lose them. Schoolchildren in this country are taught nothing about the colonies except, perhaps, when and how they were acquired. If a tithe of the industry that is put by adults into amassing information about the countries of Europe were transferred to the colonies, there would be fewer colonial black spots, fewer examples of loose living and self-indulgence in the European communities, fewer stories of cultured Chinese gentlemen being excluded from the white man's clubs, and a more progressive colonial policy might be achieved. It is high time that the British people learned that they are trustees, and that for the colonial failure, no less than for the military defeat, the responsibility is theirs.

Manpower Policy

ON Thursday, the use of womanpower was debated in the Commons. There have been complaints that, although all the women between 20 and 35 years of age have been registered for war employment in the past year, there has been a lag in their "direction" into industry. Similarly, there is a feeling that the delay in calling-up the first instalment of women aged 20 and 21 for service with the armed forces under the National Service Act of last December, which made women aged 20 to 30 liable to conscription, has been needlessly long. In each case, it is alleged, the causes are the same: official reluctance to use compulsory powers; local prejudice against the employment of women; and the absence of adequate provisions for training, accommodation and welfare. These complaints are neither new nor wholly true. The inhibitions cited are those which have impeded the full use of manpower and womanpower ever since the war began. In actual fact, an unprecedentedly high degree of mobilisation for war work and war service has now been attained. In no other country are women conscripted for the armed forces; and the difference between conscription for the forces and direction into war work is largely one of terminology.

Nevertheless, in this grave emergency, the question must still be frankly asked: how many more men and women can be brought into effective war employment, and how quickly? It remains imperative to get rid of every trace of the inhibitions and obstacles which have made each stage in the development of manpower policy since September, 1939, too slow, too late and too small.

When the war started, it was said that the mistakes of 1914, when the men needed indispensably in war industry were swallowed up as volunteers in the Army,

were being avoided. Under the first National Service (Armed Forces) Act, all men between the ages of 18 and 41 were liable to be conscripted. In the Schedule of Reserved Occupations, a compendious list was made of the occupations and occupational qualifications which would debar men from being called up. The appearance of this machinery was more impressive than the reality. The needs of the forces for men, and still more for weapons and machines, were set astonishingly low. The Schedule of Reserved Occupations was a vast hotch-potch of essential and non-essential jobs and qualifications. All the men who remained in industry, because of their age, their occupation or the slowness of the call-up, could engage themselves in work that aided or impeded the war effort as they pleased. It was the period of Business as Usual. There was some rationing of food, and raw materials and shipping space were controlled. But the object was still to maintain employment in civilian trade and industry as high as possible. It was a period of haphazard and uncontrolled competition for labour in which the war factories, still too few in number, competed against each other and against civilian industry for their personnel. The small war industry could not be expanded suddenly; but the opportunity was not even taken to compile a complete National Register of the skill, experience and occupation of every individual, so that when mobilisation was carried further, there could have been in existence, for the use of the armed forces as well as for industry, a precise statement of every individual's capacity. Nor was any serious attempt made to train men, and still less women, in anticipation of the certain demand for war workers to replace those called-up or to man the new factories as they come into production.

The immediate cause of these, and many other, failures was the blindness of the Government, the trade unions, employers and the general public to the dimensions of their task. The fundamental flaw was under-programming, the basic fallacy a belief that, with a few controls here and there run by the industrialists, traders or trade unionists whose interests were affected, the war could be run, and won, by the voluntary methods of peacetime.

In May, 1940, Mr Churchill replaced Mr Chamberlain; and, at the Ministry of Labour and National Service, Mr Bevin, the trade unions' strongest leader, replaced Mr Brown. In general terms, a Labour-Capital compact was made. The Emergency Powers (Defence) Act conferred power upon the Government to require all persons to place themselves and their property at its disposal. In May, an Order in Council gave powers to control war production undertakings, and permission to the Minister of Labour to direct any person to perform any services. In June, an Order required engagements in building, civil engineering contracting and general engineering to be made through labour exchanges, and laid down that miners and agricultural workers could be employed only in their own industries. In July, an Order forbade strikes without notice, set up the National Arbitration Tribunal, defined the recognised terms and conditions under which workers could be required to work and provided for the listing of all departures from trade factories to facilitate their restoration after the war.

Actually, in this second period, from May, 1940, to March, 1941, little use was made of the Government's new powers—though appreciably more progress was made, by agreement, in mobilisation, in transfer, training and dilution. This was largely due to the fact that, in its industrial, as distinct from its labour, policy, the Government now abandoned Business as Usual—under the pressure of the Battle of the Atlantic, which seriously curtailed the import of materials for industry. This is the period of Limitation, in which labour was squeezed out of non-essential industry by restrictions on supplies. From June, 1940, a series of Limitation of Supplies Orders reduced employment appreciably in civilian trades; and a proportion of the men and women released passed into war work; but there was still no compulsion upon them to do so, and many of them were in fact "lost," preferring to move from job to job, regardless of their importance for the war effort, in search of the best pay, which had no necessary relation to "essentiality." The need for additional workers in war factories steadily grew in the post-Dunkirk months as production programmes were speeded-up and new factories came into use. The call-up for the armed forces was also accelerated; and successive amendments in the Schedule of Reserved Occupations released more men for service. By the winter of 1940, it was plain that the mobilisation of manpower for war work—to produce the weapons and equipment of the fighting Services—was once more behindhand. The combination of industrial restriction and voluntary methods of recruitment had failed to produce a sufficient flow of recruits; and by the concentration of civilian manufacture in a few, efficient plants, the organisation of which was begun by the Board of Trade in the early spring of 1941, it was hoped to squeeze out many thousands more men and women for more essential work.

But three facts were now obvious. First, full mobilisation would not be possible until the rough-and-ready and indiscriminating Schedule of Reserved Occupations, which immobilised many men in unimportant work and allowed other essential workers, such as the heavy labour of agriculture and coalmining, to be swallowed by the forces, was replaced by a test of every individual's actual job, to discover if the job itself was indispensable and its occupant irreplaceable in it—so that, broadly, every man would have the choice between war work and war service, with no third alternative. Secondly, mobilisation could not be complete, and the gaps in the war factories filled, until millions, rather than thousands, of women could be recruited. The manpower problem was fast becoming a womanpower problem. Finally, it was clear that the required apportionment of the nation's labour

force could not be achieved, on a sufficient scale and at a sufficient speed, without positive directions from the Government. Voluntary mobilisation had not succeeded. Above all, perhaps, the reserve of labour, especially of women, in non-industrial work, in shops and offices, had not been effectively tapped.

The third period of manpower policy, from March, 1941, until now, has been a period of, first, Registration and, then, Direction, in which the compulsory powers assumed in May, 1940, have been increasingly used. In January, 1941, the Minister of Labour admitted the serious state into which mobilisation had again fallen; in the same month, a Royal Proclamation made men aged 18-19 and 37-41, the last classes covered by the Act of 1939, liable for military service. Mr Bevin announced that a register of all available labour would be made; that non-essential occupations would be combed out; and that compulsion would be used. It was also made known that a distinction was to be drawn, within the Schedule of Reserved Occupations, between "protected" and other work, with higher ages of reservation for those, whatever their occupational qualifications, not actually engaged in employment scheduled as vital for the war effort. In March, 1941, eighteen months after the war began and barely twelve months ago, the Registration for Employment Order gave the Minister of Labour power to register the industrial particulars of any person of any sex; women of 20 and 21 and men of 41 and 42 were required to register forthwith—to be "directed," where necessary, into war work. The Essential Work (General Provisions) Order empowered the Minister of Labour to draw up a schedule of essential undertakings from which no employee could resign or be dismissed without official permission.

These powers were still not applied with any eagerness. The reluctance of the Government to use compulsion in industry, and of the workers to accept it, is political. In industry, the argument runs, the "conscript" is publicly compelled to take service with a private employer. In the spring and summer, though registration proceeded from age-group to age-group, voluntary means, persuasion, exhortation and advice, were still mainly relied upon. The compulsion that was used was mainly negative; Essential Work Orders were applied to various industries, with the odd result that workers in certain vital occupations were immobilised under strict orders, while men and women in all sorts of dispensable work were free to move about and bargain for better pay. But, in March, 1941, the Government had also embarked on a scaled-up war production programme. After June, the needs of Russia set the target higher. In August, Mr Bevin admitted, in effect, that the voluntary recruitment of women had not been successful. In October, the Restriction of Employment Order, dating back to June, 1940, requiring engagements to be made through local employment exchanges, was applied to all women between the ages of 20 and 30; and it was announced that shopgirls between 20 and 25 would be transferred to that shopgirls or more essential work. More and more, the emphasis at the interviews with those who registered was on direction and less and less on advice.

This more positive policy was brought to a new stage last December. A new National Service Act made women aged 20 to 30, liable to conscription for the armed forces, certain industrial tasks or civil defence, and raised the age of military service for men to 51. A new Schedule of Reserved Occupations, by the provision that reservation ages were to be raised by a year a month in 1942, virtually abolished the principle of group reservation, and, with special arrangements for agriculture, building, civil engineering contracting and coal-mining, substituted instead the principle of individual scrutiny. Direction is now a policy and no longer simply a threat.

This does not mean that criticism and complaints are now out of place. The process is still slower than it might, and should, be, and it is still reluctant. There are still technical impediments. The inadequacy of training facilities, in factories now and not in official centres, remains chronic; and the frequent absence of satisfactory billeting, travelling and welfare provisions

especially for women, is probably the greatest single obstacle now to mobilisation. The policy has hitherto been to remedy bottlenecks as they have arisen and not to avoid them beforehand. But it is now a fact which ought to be admitted, that mobilisation has gone a very long way; and the only way of increasing the labour force of war industry to any great extent is deliberately to

cut down the standard of living further—which cannot be escaped. But it is also a fact that no efforts will be wasted which urge the Government to use its powers fully and promptly to compel all persons to do war work and all employers to provide training facilities and the conditions of work that the required recruits, as well as the existing hard-pressed workers, must have.

The Debatable Land

THE Ukraine is one of the great debatable lands in world history. Few regions have been exposed as persistently to the pressure and counter-pressure of rival conquest. And it is very appropriate, now that the unhappy country is once more in the thrall of an invader, that M. Hrushevsky's massive study of the Ukraine* should appear in an English translation. The struggle that is being fought out in the winter snow between Kiev and the shores of the Black Sea is yet another phase in the long agony of Southern Russia. Is it the final phase? With which side will mastery remain?

The tragic history of the Ukraine is rooted in geopolitics. The country lies in the endless Eurasian plain on the cultural frontiers between Western and Eastern civilisation. There are no geographical frontiers—to east or west. The great rivers—Dniestr, Bug, Dniepr, Donets—divide but do not protect it. On the contrary, they draw down yet another pressure—from north to south, down the waterways to the Black Sea. Add to this the fact that the vast open region is rich in soil and minerals and its unchanging history of war and exploitation explains itself. It has been at the mercy of every movement of peoples across Eurasia. It has been the battleground of Slav and Tartar, of Pole and Muscovite, of German and Russian. It is still a battleground to-day.

The Ukraine emerges as a recognisable cultural unit in the ninth and tenth centuries, when Kiev was the centre of a flourishing river civilisation which stretched from "the Varangians to the Greeks"—from the Baltic to the Crimea. In the thirteenth century, this land of promise was wiped out by the Tartar invasion. Christian Kievan civilisation held on precariously in the north to emerge later as Muscovy. The south was submerged. Kiev was sacked, the land stripped. For hundreds of years the Ukraine proper was little better than desert. Direct access to the Black Sea was not recovered until the time of Catherine the Great.

With the gradual decay of the Tartar power, the pressure from the east relaxed. Its place was taken by a counter-pressure from the west. The Ukraine was recolonised, not from the north, but from the Slav lands of Poland and Lithuania, the *Rzecz Pospolita*. The Poles tried to follow the colonists, including the lands they opened up within the political and social structure of the Polish state. The attempt ended in the bloody disaster of Khmelnytsky's revolt in 1648. The Ukrainian peasants appealed from the Poles to the rising power of Muscovy and since the Agreement of Pereyaslay in 1654 the Ukraine has been part of the great Russian Empire. The pressure from the north had apparently conquered.

The Czarist empire's more or less peaceful colonisation of the whole of the Asiatic hinterland during the eighteenth and nineteenth centuries abolished, probably for ever, the pressure of the nomads from the east. The pressure from the west remained, but it was no longer Polish. The old *Rzecz Pospolita* was a dream behind a dream. Poland itself was partitioned and the new power centre in Europe was Germany—as it has remained to this day. The first direct German assault on the Ukraine was one of the final phases of the first world war. Now in the third year of the second world war, almost the whole of the Ukraine is under German control. It is still the debatable land of Eurasia. Even to-day its frontiers are still in doubt.

* "A History of the Ukraine." By M. Hrushevsky. Cambridge University Press. 629 pages. 24s.

Yet there is good reason to suppose that the world is witnessing the final phase in the long struggle for mastery. It is most improbable—short of a complete collapse of the Russian state—that the Nazis will be able to maintain their hold. They have nothing to offer, nationally or socially. The Ukrainians are Slavs, and it is even a matter of dispute whether they can be accounted a separate nation from the Great Russians. Separatist Ukrainian nationalism was the creation of poets and dreamers—of whom Hrushevsky was a warm disciple—and on the two occasions in which it could have become a force—during the German occupation of 1918 and again in the invasion of 1941—it failed. The truth is that the mainspring underlying the Ukrainians' sense of separateness is not national or racial but socio-economic. And here again the Germans have nothing to give.

The urge behind the recolonisation of the Ukraine in the fifteenth and sixteenth centuries was the desire of the peasants of Poland and Lithuania to get away from the crippling obligations of serfdom under the Polish and Lithuanian gentry. The epitome of the Ukrainian spirit was the Zaporogian Sech, the camp of the free Cossacks on the Dniepr rapids, which began as a frontier post against the Tartars. Later, the turbulent and freedom-loving men from all over the Ukraine enlisted under its colonel or Hetman, and finally the Hetman became the national leader of the free peasants. When, in the seventeenth century, the Poles sought to extend serfdom to the Ukraine, the Zaporogian Cossacks led the 1648 revolt and their Hetman Khmelnytsky negotiated a union with Muscovy, on condition that the free landowning peasantry with all its rights should be maintained.

Muscovy broke its pledge. By the nineteenth century, serfdom was everywhere the rule—but at the cost of frightful bloodshed. The Ukrainians toyed with an alliance with the Turks and with the Swedes, before the steam-roller of Great Russia finally passed over them. In the eighteenth and nineteenth centuries, there was no rival power to the west of Russia to which they could appeal. The great question when, in the twentieth century, Germany emerged as the new centre of expansive power, was whether the Germans could retrieve the mistake of the Poles—and of the Russians—and offer the Ukraine national autonomy and social freedom, or, in other words, offer the peasants the land.

This in simplified terms was the issue behind the German occupation in 1918. The Germans were supporting the independent Ukrainian *Rada* (Council). Their only hope of rallying the people to the independent régime was to offer them what the Soviets in the north—the successors to Muscovy—would offer them, peace and the land. But the Germans were still at war and their able general Groener, who was charged with securing the riches of the Ukraine to feed the German armies, discovered that to divide the land would end the supplies. Peasant ownership was incompatible with mass production. The Germans had willy-nilly to turn to the great landowners, form a Union of Cornraisers (*Khliboroby*), suppress peasant agitation and finally remove the *Rada* itself.

Has the position altered radically to-day? In one respect, certainly. The twenty years of the Soviet system have knit the Ukraine more and more closely into the great Russian economy. Industrialisation has brought new workers into the south and broken down the sense of independence. It has changed the predominantly peasant basis of the community. Soviet education has tended to

produce the mass citizen whose sense of local particularity is far less strong than his loyalty to the great Soviet experiment. In one respect, however, the problem is somewhat the same. After the brief spell of free peasant ownership under the NEP, the Ukrainian masses were forced back into a collective framework, and in the early 'thirties the unhappy land was once again devastated by fruitless resistance, ruthless reprisals and starvation. Collectivisation was established, but the Soviet authorities have given evidence of some uneasiness over the extent to which the peasants have become reconciled to it; they have made concessions to the principle of private ownership, the latest not long before the outbreak of war.

It can thus be argued that if the Germans can restore the principle of a free peasantry in the Ukraine, they can still hope to rally some support—it is significant that they have made absolutely no attempt to play their nationalist card. Skoropadsky, the "last of the Hetmans," has been left in Berlin. But there is evidence that they cannot offer

any socio-economic advantages either. If they are to secure supplies, the new large-scale system of agriculture, which corresponds to the old large estates of the landowners, must be maintained. And if the choice before the Ukraine is collectivisation run from Berlin or collectivisation run from Moscow, there can be absolutely no doubt where their choice lies.

The Nazis in the 1940's are committed to the same fatal policy as were the Germans in 1918 or the Poles before 1648—that of maintaining a very unpopular economic framework and of aggravating it by alien domination. Thus the evidence suggests that this latest German invasion represents the last thrust of expansion from the west. After the victory of the United Nations the process of knitting the Ukraine ever more closely into the Russian economy will be accelerated. The struggle will have forged an unbreakable bond of solidarity between north and south. The oldest debatable land in Eurasia is within sight of stability.

NOTES OF THE WEEK

New Model

The new Government has at last been completed, and there are two important questions outstanding. First, it is not yet known whether the new Minister in charge of Production, Mr. Lyttelton, will, in fact, be the Minister of Production that is needed—and, in fact, was promised before Lord Beaverbrook slipped away. Secondly, there is the surprising relegation of reconstruction, formerly the province of the discarded Mr Greenwood, from War Cabinet to merely Cabinet status, with Sir William Jowitt, who was Solicitor-General, and is of what might have been called in the old days a "Lib-Lab" persuasion, in charge as Paymaster-General. It may be that Sir William's Bar colleague, Sir Stafford Cripps, will speak in the inner circle for reconstruction. But the Ministerial "spheres of superintendence," which can make the War Cabinet into a more workable, competent and individually self-confident team than its forerunner, should be made plain in terms of responsibility. Surveying the scene, now that the entire administration has been reconditioned, the observer can hardly avoid one of two comments. In mere numbers, the changes are very slight, for Sir Stafford Cripps is the only new member of the War Cabinet, and Sir James Grigg and Sir William Jowitt the only important incoming Ministers. But, in their effect, the changes can be considerable. Colonel Llewellyn has earned his promotion to a vital job at the Ministry of Aircraft Production and Dr Dalton has gone to the Board of Trade, taking with him the Leith-Ross department for dealing with world surplus commodities, just when the Ministry of Economic Warfare is declining for lack of neutrals to treat with. Lord Moynie has been unlucky to lose office in giving way to Lord Cranborne, who had to make room for Mr Attlee as Dominion link in the War Cabinet. Instead of being Minister for Raw Materials, detached from the Ministry of Supply, as at one time suggested, Lord Portal has become Minister of Works and Buildings, in place of Lord Reith, who, for no clear reason, has departed. In the shuffle of junior Ministers, seven back-benchers have entered office for the first time. The changes may even prove to be very remarkable; the way is open for great success or resounding failure—that is all. Apart from a strong point still occupied by Sir Kingsley Wood at the Treasury, the old illogical, compromising basis of the Government has gone. It can now be what the courage and resolution of its individual members can make it. An example at the top in the destruction of delays and indecisions could be made to run like a fire through the departments and Services, so that the war-machine might at least be manned from top to bottom with men with willingness, power and competence to act. There, at home, will be the first test of the new Cabinet and Ministers. Sir James Grigg has made a start at the War Office by ordering a smelling-out of all ineffective officers over 45. It may be asked why officers under 45 are not to be similarly scrutinised; and the test will obviously depend for its success on the ruthlessness and impartiality of the testers—who should not be aged local commanders. But this is a welcome beginning. In India, there is a vast urgent problem still unsolved; and in the whole field of strategy, material and moral, there is a void which can only be filled by a New Model Government.

The Defence of Java

The situation in Java is obviously critical. In spite of the smashing losses inflicted on the Japanese invasion fleet, the enemy was able to establish three bridgeheads—at Serang, Indramaya and Rembang—and from them to push rapidly inland. The most serious penetration followed on the landings at Indramaya. The Japanese, using cyclists, light motorised units, and even some tanks, advanced rapidly to Soebang, only forty miles from the Dutch headquarters at Bandoeng. However, at this point their penetration has been halted, significantly at the edge of the Javanese plain, and there is now a brief time during which the situation can still be restored provided the invaders are firmly attacked and cut off from reinforcement. Dutch, Empire and American troops are all fighting in the island, and the Commander-in-Chief, General ter Poorten, is an able and unorthodox soldier. There are no signs of cleavage between the Dutch and native populations—the relationship is Philippine rather than Malayan. Another resemblance with the American stand at Bataan is the nature of Java's mountainous terrain. But the United Nations face the usual handicap—shortage of ships, shortage of aircraft. The Japanese have been able to raid Java repeatedly in formation flights, and the gallantry of the fighter pilots has not so far been sufficient to make up for their shortage of machines. On sea, too, heavy as were the losses inflicted on the Japanese, their navy took a smashing toll of the defending warships, and it is uncertain how many remain to go into action from heavily bombed bases to meet the new invasion fleet which is certain to arrive in the next few days. The situation is very serious.

India Prepares

Now that Malaya has fallen and the United Nations are making their last Far Eastern stand in Java, it is obvious that the South-Western Pacific defence zone commanded by General Wavell has ceased to be a reality. The central factor in the picture is the Dutch defence of their own soil, and the only person fully competent to direct operations in Java is General ter Poorten. General Wavell has returned to India to take up again the task of Commander-in-Chief, and a formidable task it is likely to be. It is impossible to say how effective the defences of India are at this moment. As in all British overseas possessions, no very large army has been maintained in India, and at the present moment some of its most skilled troops are serving on other fronts. The degree of mechanisation is probably still small and the Five-Year Defence Plan introduced in September, 1939, must still be far from completion; it would be particularly useful to know the extent to which the project of modernising the coastal defences of which the main ports has advanced. The Japanese attack, if it comes, is most unlikely to come by land from Burma. There is no rail communication between Burma and India, and very little communication of any other kind. The position on the sea is not so happy—with Singapore and Rangoon as bases, the Japanese have a definite advantage, and their campaigns in Malaya and the Dutch islands show to what good effect they can use the technique of landing on almost any kind of coastline—and following up the initial attack

by a quick and efficient penetration. It is a technique that was probably acquired and perfected in the myriad Japanese coastal raids carried out in recent years on Kwantung Province and South China generally, when every outlet for China's coastal trade was being stopped up. Clearly it is a technique that can be adapted against India, just as the use of islands as stepping stones can easily be extended to the Andaman Islands, Reunion and Madagascar. However, the Chinese analogy has certain hopeful aspects. China's resistance has been successful in some measure because of the distance the Chinese could retreat, whereas nowhere in the South Seas has it been possible to develop defences in depth. India is large enough to swallow an invader—particularly an invader thousands of miles from his main base. Another aspect, of course, is not so hopeful—the Indian people do not feel for the British *raj* what the Chinese feel for Free China.

The Plain Truth

There has been a welcome increase in public frankness, and the latest communiqués and bulletins have been commendably stark and factual. In his first speech as Leader of the Commons, Sir Stafford Cripps asked for "seriousness and austerity" in this grave situation; and nothing that has been recently said in Parliament has won a wider welcome. It is perhaps a pity that the sentiment did not more deeply affect the Ministerial speeches on later days, which introduced the Admiralty Estimates and the Food Vote. There is a tendency for speeches of this kind, which are in effect annual reports on policy, to be departmental apologies. The successes of the Admiralty and the Ministry of Food last year were striking enough. It is right that they should be stated and acclaimed—but not in order to put the present dangers in a "proper perspective." In fact, they put these dangers in an entirely false perspective, because nothing that was achieved in 1941 can alter the fact that there are desperate perils in 1942. These chronological balance-sheets, whatever lip service may be paid in their course to the current dangers, blunt the sense of urgency by fallaciously weighing the smooth of yesterday against the rough of to-day and to-morrow. What was required of the speeches of Mr Alexander and Major Lloyd George in the public interest was the clear, unmistakable impression that, relative to the strategic and economic needs of the United Nations, the shipping position was likely to be as serious for several months as it has been at any stage in the war, and might well be appreciably worse until American shipbuilding and an Allied counter-offensive, itself needing great numbers of ships, can redress the balance. These points may possibly be found embedded briefly in the text of the speeches; but they are not underlined. Mr Alexander's conclusion was that vast shipbuilding programmes would restore Allied seapower and offset shipping losses. Major Lloyd George's was, cautiously, that "it might even be necessary to reduce to some extent the existing rations." These are surely not the calls to sacrifice that are needed. It is not a question of creating "an atmosphere of undiluted depression when events are temporarily against us" (as Sir Stafford Cripps put it). It is a question of fact, a practical question of economic policy. It is imperative, for an interim period of uncertain length, that still more shipping space, manpower and materials—the maximum possible, in fact—should be saved by the people of this country. The first requisite for this is a much sterner statement of the short-term position than these Ministers apparently dare to make, the second a much more drastic policy of restriction and curtailment than has yet been hinted at.

Half Measures?

Major Lloyd George's statement in the Commons on the food position was appreciated for what it was, a technical masterpiece; but the majority of speakers were not blind to the fact that it was, among other things, a masterpiece of understatement. It has not yet been brought home to the public that the aim of food policy is to provide not the fullest, but the most meagre, diet consistent with winning the war—because the war will be won more quickly and more certainly that way. Major Lloyd George promised that cuts will be made, if necessary, and that the scope of points rationing will be extended. It is to be hoped that the changes will be drastic. From the psychological standpoint it is better to go the whole length at once and to let the future hold the hope of better times, than to plan a gradual downward trend. While food policy is governed

by such real considerations as shipping and agricultural requirements, the whole matter is complicated by the vital, but less tangible, question of morale. In this respect, much harm has been done by stupid propaganda which represented the restricted nature of the German diet and standard of living in the early stages of the war as a weakness instead of as an aid to victory. It is perhaps not very easy to persuade the average consumer that lower and less varied rations are not only necessary, but should be pushed ahead of actual need, though this is the real point. Consumption must be narrowed down to basic requirements. And it is important to recognise that more harm is done to morale by the persistence of inequality, as exemplified by luxury restaurants and the black market, than could be done by any conceivable extension of rationing. The direction of a stricter régime is plain enough. Technically, it is stated, it is difficult suddenly to require customers to give up coupons for restaurant meals; but, morally and economically, it is necessary that they should do so, as they did in the last war; and the alternatives of meatless days in restaurants or even restricted restaurant prices are just tinkering. Profiteering in early fruit and spring vegetables must be prevented this year. The prices of wines and spirits should be recognised as a scandal due to parasitic manipulation. Beer and tobacco are probably placing too high a drain on the nation's resources, and should be restricted or rationed. The new penalties against black market racketeers should be used to the hilt. The public will not mind deprivations, if they are needed, if no one is allowed to make unfair gains.

Bread

Last year the country was officially urged to eat wholemeal bread and save shipping; but it was very difficult indeed to buy any wholemeal bread. Now the Government is not so certain where duty lies. To substitute wholemeal for white bread generally, that is, to increase the extraction of flour from wheat from 75 to 85 per cent, would save some quite remarkable tonnage of shipping in a year—a figure of 700,000 tons was given in the Commons on Tuesday. But this argument is not final. The residue of the wheat, the offal, is used to feed animals, and is thus a factor in the supply of milk, meat or eggs—though by no means so important a factor as the more choleric or disingenuous opponents of wholemeal bread suggest. The decision as to which is needed most at any point of time, shipping space or feeding stuffs, must be based upon a complicated balance of advantages and disadvantages which probably only the Government, having the facts at its disposal, is able to strike. Nevertheless, the position is not satisfactory, for the presumption must be in favour of shipping and the wholemeal loaf. Last year the Government, or at any rate the Ministry of Food, did decide that the shipping position made the wholemeal loaf necessary. But nothing happened; the loaf did not appear. One reason was given in the House on Tuesday; it is "a bread which, frankly, is not what the people of this country prefer." Popular taste must, of course, carry weight in matters of diet, so long as it does not interfere with economic necessity; but it may be suspected that another reason, not without influence on policy, is that it is also a bread which the millers and the meat interests do not prefer. If shipping considerations required wholemeal a year ago, it would appear that they do again now, when the gravest strain at sea has returned. It may indeed be that the Government is waiting to act "the moment the balance tips down on the side of 85 per cent extraction"; but it is to be hoped that all narrowly interested voices are being left sternly unheard.

More Economy

The latest steps to provide the public with utility clothing at reasonably low prices are discussed on page 338. These measures are accompanied by certain limitations on the design of garments to save material; but, apart from the stated aim of supplying all sections of the population with cheap essential clothing, the objective is to save labour. It is a new stage in war economy, which was actually set on foot last year, though it might usefully have been begun even earlier, for many more goods than clothing. In 1940, supplies of materials to civilian manufacturers were restricted for shipping reasons. In 1941, civilian industry was called upon to concentrate production in a few efficient factories to release manpower. This year is the third stage, when manufacturers will be pressed increasingly to produce utility

goods which use less labour in their manufacture than higher quality goods. The policy is based on inducements rather than commands. Special quotas of material are given to manufacturers who turn over to utility production; some priority is given to labour substantially engaged in this work; and an attempt has been made in fixing maximum margins under the second and more stringent Prices of Goods Act "to allow a ceiling high enough to secure that an ample proportion of productive capacity participates in the production of utility clothing." The scale and speed of this programme are vitally important in the present emergency, when the only substantial reserve of manpower for war work is still engaged in maintaining the quantity and quality of the civilian standard of living. Variety is one of the elements in the standard of living that can be most easily dispensed with—and least easily defended. There are still too many official apologies and excuses for the very cautious approach that has so far been made towards standardisation. Why it should still be felt necessary to proclaim that there is no intention to impose a standard design on clothing, and to claim proudly that "even the most fastidious" will still be able to satisfy their individual tastes, passes comprehension. The Member of Parliament who demanded last week that we should all be clad in overalls was not talking nonsense. He was carrying the present policy to its logical, and possibly inevitable, economic conclusion.

Shape of Things to Come?

Like the raid on Vaagso—which was by all accounts a model of efficiency—the combined British attack on the German radiolocation station at Bruneval showed how successful can be an offensive operation when it is carefully planned and conducted with the full co-ordination of all three Services. Parachutists were dropped from two-engined Whitley bombers. Their task, to wreck the station, was performed speedily and very thoroughly while fighter aircraft created diversions in the neighbourhood. The parachute troops then withdrew to the beach, where the defences had been stormed from the rear by a landing party, and then, taking with them a few prisoners, all the British forces were safely evacuated in light craft of the Royal Navy. Clearly, the operation was only on a very small scale and, high though praise must be for the skill of the operation—the only obvious criticism is the use of expensive bombers for parachute landing operations; the Germans use very jerry-built craft—it would be false to boost up the attack to the scale of a major action. The real problem now is whether, like Stavanger and Vaagso, it is to remain a successful but isolated and therefore insignificant episode; or whether it is the first of an expanding onslaught on the French coast in which both the scope and the frequency of the attacks develop on a large scale. M. Litvinov has called for a second front, and certainly the Russians will need all the diversions that can conceivably be provided in the course of the next three months. Raids such as the one on Bruneval can serve an admirable purpose if they are designed to do what the Germans invariably do before launching an offensive—test out a defence line for weak or vulnerable points from which a powerful infiltration movement can be launched. The coasts of France are becoming Germany's Maginot Line. It must be turned, and it is to be hoped that Bruneval is not an isolated action but part of a larger and more boldly conceived strategy towards this end.

The Ways of Admiralty

The Admiralty survived the reconstruction of the Government unscathed. The Navy stands firmly first in the trust and affections of the British people. But some of the most serious questions at the present time concern the Navy, and one after another they came up last week in the debate on the Navy Estimates. The "sinkability" of heavy British warships is already being investigated by the Admiralty; the pounding that many of them have taken without sinking will be set on the other side. The escape of the German battleships in the Channel is accepted by few laymen and none of the naval Members of the House of Commons as a strategical gain—in spite of the comfortable words of the Prime Minister and Mr Alexander. There is widespread uneasiness—and exasperation—that the plainly vital question of air and naval co-operation remains a shuttlecock in heated arguments between personalities and interests. There is not a little concern about the minor role which the First Lord seems to play in the affairs of the Admiralty by contrast to the major part of

the First Sea Lord. All this does not indicate any lack of recognition of the unceasing, arduous labours by which the Navy has held, and still holds, the war effort itself together, or of its skill and courage. It arises rather from the knowledge that this country, at home and abroad, stands or falls by sea power; and, in to-day's crisis, no body or institution can be sacrosanct. The core of the present disquiet was stated last week by Sir Percy Harris, who described the Admiralty, from his contact as a member of the Select Committee on National Expenditure, as "efficient, but slow and cumbersome." He expressed disquiet about the inferior status allotted to technical officers—engineers, scientists and experts—in the naval hierarchy; about the outmoded practices of His Majesty's dockyards, where engineer officers must always be under executive officers; and about the fact that

when engineering is so vital in the organisation of the Navy, the Board of Admiralty should hold firmly to the line that on no account can an engineer admiral, however capable he may be, be admitted into the sacred circle.

There is very clearly a view among sober and responsible people with close experience of the Admiralty that enterprise, initiative and inventiveness are hobbled by hide-bound ways; and the First Lord—who, admittedly, has not often been permitted to speak for his department on important matters—might have devoted more of his Estimates speech (and might devote more of his current time) to constructive self-searching on the lines of these questionings. The Navy less than any other Service can afford to fall short in these dangerous days.

Air Apologia

On Tuesday night, in bright moonlight and against light defences, RAF bombers made a heavy and successful attack on Paris factories working for Germany. The loss of life was large, and the effect on output no doubt considerable. The raid served as a prelude and an example for Sir Archibald Sinclair's speech in the Commons on Wednesday, in which he defended the British bombing policy. Again, he promised an all-out air offensive against the enemy with the biggest aircraft and the biggest bombs. Last year's promised offensive had not happened, except sporadically in a few localities, because of Russia's need for aircraft, the Navy's need for raids on special targets and, above all, the weather. This time, it seems, it will happen; and the distraction of enemy fighter squadrons from Russia to France since last summer, Sir Archibald said, must be set against the missing Blitz. To the layman, the position, after two and a half years' experience, seems clear; the war will not be won by bombing or without it. Air attack is artillery at long or short range, and the success of the RAF's offensive will depend upon the ability of the other arms to follow it up—and the RAF's ability to aid them directly. Inevitably, the Minister's story was one of high courage and determination; and he made a stupid—and disingenuous?—mistake when he treated criticism of air strategy and tactics as criticism of RAF personnel. This sort of partisan pleading is too frequent and confuses the issue. The Minister knows very well how high the men of the RAF stand in everyone's estimation. He also knows that co-operation

between the RAF and other arms, through no fault of the flyers, has been gravely and, sometimes, fatally lacking; and for him to treat criticisms based on this fact simply as pleas for the "dismemberment" of a deserving Service is unhelpful—and less than his duty. There may be good answers to the critics, but "righteous indignation" is not one.

Battling for the Strong Points

The great issue in Russia in the next six weeks is whether the Red Army can destroy Hitler's advance line, a series of strong points—Staraya Russa, Rzhev, Vyasma, Orel, Kursk, Kharkov, Gorlovka—stretching from Leningrad to Taganrog and the Sea of Azov. A glance at the position of the armies shows that the Russians have swarmed across the line in the north, central and southern sectors—at Velikiye Lugi, Dorogobuzh and Krasnograd. It also shows that the German strong points are all holding out, although Staraya Russa is virtually surrounded and Rzhev and Vyasma are in obvious danger. In the south, the German positions in Taganrog are threatened on both flanks, southwards from the Donetz front and across the ice of the Sea of Azov, where a considerable battle is developing, the Russians attempting to storm Taganrog, the Germans trying to get some reinforcements to the Kerch peninsula. The present Russian offensive must demolish the various strong points if any substantial distance is to be put between Hitler and the objectives of his much-heralded spring cam-

paign. If the strongholds are not reduced, then they will become the springboards of the new German attack—just as Germany's failure to capture Leningrad, Moscow and Rostov last autumn made possible the launching of the Red Army's winter counter-offensive. There is not much time left, for once the heavy thaw sets in, both armies will be immobilised, and by the time the fine weather begins, the Russians may have to face all over again the ordeal of June, 1941. It is true that they will face a German army that is far less *frisch und fröhlich* than it was after the unchecked victories of 1940; but there is some evidence to show that the Germans have surmounted both easy optimism and almost equally easy defeatism and are settling down in grim earnest to make the new spring offensive a death blow—whatever the direction in which it is to fall. The Russians have largely made good their industrial losses in the Ukraine, they have won battles, they have earned self-confidence by checking the unchecked and defeating the

undefeated. Yet it should not be forgotten that one of the chief differences between June, 1941, and spring, 1942, is that Hitler's armies are now four-fifths of the way to Moscow.

The Risk of Appeasement

It is difficult to see why Washington should be any the wiser for the recent interchange of letters between President Roosevelt and Marshal Pétain. It appears that on February 10th the President sent a personal letter to Marshal Pétain, reminding him that if Vichy France went further in giving aid to Germany than was warranted under the armistice agreements, then it would be necessary to include Vichy "in the category of governments which are directly assisting the declared enemies of the people of the United States." To this letter the President received the reply that the Vichy Government was not transgressing the terms of the armistice, and there for the moment the matter rests. The Marshal's communication makes it clear, perhaps, that he personally has no wish to go further than he must, but the events in North Africa and the behaviour of Admiral Decoux in Indo-China—both of which point to a definite willingness for closer collaboration among men on the spot—are not covered by Marshal Pétain's assurances. It should not be forgotten how many of the new men in authority are the creatures of Admiral Darlan and have actually gone to their action stations in the course of this winter's lull. The real problem is whether the continued complaisance of the United States strengthens Marshal Pétain's position against his own wild men. If it does, then the policy can be justified on grounds of expediency. Appeasement can sometimes pay—but only if the relative strength of the appeasers is growing during the period of conciliation. It would obviously be fatal to maintain Vichy's neutrality if all the time it was only a cloak for the elaboration of a strong policy of joint action with the Germans. It would be folly to appease Pétain in order to immobilise the French Fleet if the appeasement period were being used to recondition and reassemble the fleet for action.

The Status of the Free French

The policy of appeasing Vichy has a subsidiary inconvenience in that it destroys all possibility of logic in the United States' attitude towards the Free French National Committee. The United States is pledged to support all peoples who are resisting aggression. General de Gaulle's movement exists for no other purpose and has, in fact, been recognised as "essential to the defence of the United States" for Lend-Lease Act purposes; yet the necessity, supposed or real, of conciliating Pétain entails a generally cold and at times—as, for example, over the incident of St. Pierre and Miquelon—hostile attitude towards the Free French. This attitude is becoming more and more difficult to maintain with the spread of the war to territories where the Free French exercise full sovereignty. Even if the exigencies of its Vichy policy compel the State Department to ignore such contributions to the resistance of the United Nations as the ceaseless activity of the Free French Navy and of the Free French squadrons fighting with the RAF, it is impossible not to recognise the actual government of territories which are likely at any moment to enter the war zone. The United States has therefore adopted the compromise policy of recognising Free French authority in areas in which defence talks have to be undertaken. The Pacific islands—New Caledonia, the New Hebrides, Marquesas and Tahiti—guard a possible southern supply route across the Pacific and are an outer ring of defences for Australia. If the Japanese ability to mop up islands were to spread to this periphery, the defence of Australia and effective communications between Australia and the United States would be in obvious jeopardy. The islands thus occupy a high priority in the allocation of defence materials for the Pacific. Talks have had to be initiated and the Free French have very properly insisted that their status should be recognised. Accordingly, the United States has given limited recognition for the Pacific area. The matter cannot rest there. What of Free France's African possessions? Strategically, they too are growing in importance as the direct air link with the Middle East and an important base for the defence of the Southern Atlantic. At present, the United States has consular representation there, and an American Observer Mission under Colonel Cunningham has visited the territory. But this is not enough. Even if the United

States policy *vis à vis* Vichy still impedes general recognition, local recognition should be given wherever the Free French are established—including St. Pierre and Miquelon; it should be given generously and it should be given at once.

Civil Defenders

The lot of the civil defence service at the present time is very unhappy. Its members feel as unwanted and unnecessary as they did in the twelve months before September 7, 1940, with the added cause of unrest that now they are very much wanted and necessary elsewhere. Civil defence, they have been told, is an honourable service, equal in status to service in the armed forces or in industry; yet it can neither fire the imagination of its members nor line their pockets. It is significant that very few, in fact not enough, men who have been given the option of the National Fire Service when called up have taken it. The recent measures for employing civil defence workers on constructional and similar tasks near their own depots and allowing part-time members to enlist in the Home Guard were only a beginning. Last week, Mr Morrison announced that arrangements are being made to release civil defence workers to take up industrial employment. They will still be under an obligation to do part-time civil defence duty and will be liable for recall in case of emergency, so that their place of employment must usually be local. Nevertheless, it is an important step in preventing the extraordinary waste of manpower which adequate defence against air attack causes; and one of Mr Morrison's remarks suggests that it will not solely depend on the initiative of the civil defence workers, but that the appropriate authorities will find work for them. The question of remuneration, whether they will rank as ordinary employed—as they probably should—or continue to receive their civil defence pay, has not yet been settled. But it has also been announced that the latter is to be increased. The basic pay for whole-time women members will be raised from £2 7s. a week to £2 12s., and for men from £3 10s. to £3 14s.—this must perhaps be heralded as the first occasion on which women have been given a higher rate of increase than men, but it hardly affects the substantial difference between their rates of pay. In addition, whole-time members are to be given post-war credits on the same lines as those to be given to members of the armed forces. Both announcements should help to make the civil defence service more conscious of its worth, but an obvious corollary is that all civilians not engaged in direct war work should be effectively obliged to do part-time civil defence duties.

Helping the Colonies

It is just over two years since the Government formally abandoned the principle that the colonies should be self-supporting and announced that financial assistance for development and welfare schemes would be granted from the Imperial Exchequer up to a maximum of £5 millions a year. Before the necessary legislation could be put into effect, France had fallen, and it was not until last June that a start was made with the new policy, and colonial governments were asked to submit applications for assistance. In a Parliamentary reply given on January 28, Mr George Hall revealed that up to then 180 applications had been received—101 from the West Indies, 20 from East Africa, 16 from West Africa and 43 from the rest of the Empire. In another reply, however, on another day, Mr Hall stated that to date 40 schemes from the West Indies had been approved involving a total expenditure of £476,805, while another 5 are awaiting "final approval." The total financial assistance given to the colonies under the Act, as revealed in yet another Parliamentary answer, was £827,357 up to the end of last year. Thus, instead of five millions, less than one million has been granted; the West Indies, to which one out of the five millions was to have been allotted, received less than half a million; and more than half of their applications have not been accepted. It may very well be that these schemes would have involved machinery and materials which are unobtainable or scarce, and in any case a warning was given from the outset that the £5 million maximum would not be reached in wartime. Nevertheless, the suspicion is growing that the Colonial Office is only half-hearted about the whole business, and it is not dispelled by the revelation that the Marquess of

Dufferin and Ava, who has a full-time job at the Ministry of Information, spares one hour of his time a week to be chairman of the Colonial Development and Welfare Advisory Committee whose task is to examine the 'colonies' applications and give recommendations. If only one hour a week is necessary, the formality might well be dispensed with altogether. It is to be hoped that Lord Cranborne, the new Colonial Secretary, and Mr Harold Macmillan, the new Under-Secretary, will infuse new life and energy into this, and every other aspect, of colonial administration.

Not Enough Coal

The issue of a direction by the Secretary for Mines restricting deliveries of house coal in the London Civil Defence Region coincides with the publication of a report of the Select Committee on National Expenditure on coal production. The report is timely and forthright. Its examination of the present incipient coal shortage is, however, concentrated on output; as far as consumption is concerned, the members of the Committee restrict themselves to recommending economy, in the hope that the solution of output problems will obviate the necessity for a national rationing scheme. But it should be clear by now that the problem must be tackled from both sides—more production and less consumption—at once. The London restrictions allow deliveries only to consumers with less than half a ton in stock on March 2nd and limit deliveries to six hundredweight in the next six weeks; the scheme does not affect boiler fuel and is said to have been necessitated only by the length of the cold spell. In fact, a full-scale rationing scheme for all classes of consumers is probably overdue, irrespective of whether deliveries to London retailers have fallen behind schedule. The elimination of all unnecessary use of coal should be the prerequisite of any sound policy; it is not rationing, but industrial shortage for the war effort, that is the danger to be avoided. The Select Committee itself rightly points out that the industrial use of all fuel must increase as the war effort expands, while the loss of miners to the forces and to munitions industries after the fall of France virtually prohibits a corresponding rise in output. Of 70,000 miners, mainly coal face workers, who left the industry for the forces or for occupations to which the Essential Work Order is applied, there has been a net return, as the result of exhortation and compulsory registration, of only about 17,000. Moreover, absenteeism, following the removal of the penalty clauses attached to the attendance bonus, has become a major problem; and the difficulty of adequately feeding miners for whom there is no canteen and whose wives are working in factories is a very real deterrent to all-out working. There is an urgent need to introduce some effective sanction against unjustifiable absenteeism; to secure at least the temporary release of many thousands of miners from the forces and industry; to improve feeding facilities; and to reserve more transport space for coal deliveries. But it would be short-sighted and wasteful to imagine that rationing, where it is feasible, is or ought to be regarded as unnecessary or avoidable.

More than a century's accumulated business experience and conservative progress form the background of the comprehensive service which the Westminster Bank is able to place at its customers' disposal.

The Bank's vast resources, its constant touch with current affairs and its extensive system of branch offices in England and Wales and agents elsewhere, combine to enable it to offer a wide range of facilities, details of which will gladly be given on request by the manager of any branch.

Collective Action

The resignation of the Bishop of Oslo, Dr Eivind Berggrav, which has been accepted by the Quisling administration, has been followed by the resignation of the entire Norwegian episcopate. Since some nine-tenths of the Norwegian teachers have resigned from their professional association and are threatened, in consequence, with dismissal, the newly appointed Minister-President is faced with an acute church and educational crisis. The former springs from the refusal of the Dean of Trondheim to abandon his arrangements for the service on February 1st, the day on which Quisling was appointed Premier, in favour of a quisling clergyman; the latter from the decision of the Government compulsorily to enrol all children over ten years of age in the Quisling youth movement. All Norwegian schools have in consequence been closed for a month. In the religious sphere, the Norwegian bishops are supported by their deans and by the vast majority of the clergy. The resignations are embarrassing for Quisling and his followers, who can now hardly hope to continue to bluff Hitler or Terboven that Norway is an active participant in the New Order, or that his own competence can be relied on. It is also embarrassing for Hitler who for various reasons would prefer conversion to repression for Norway. Yet, when the country provides proof that it is so solidly "unreliable," it is difficult to avoid making martyrs, always a dangerous policy. Nor, from the Nazi standpoint, can the repercussions in Sweden be satisfactory, and recent intensified pressure on this obdurate neutral may well have been offset.

The Civil Estimates

There is nothing unexpected in the Civil Estimates for the coming financial year. Their total, excluding the revenue departments, is £425,655,803, against £428,860,519 in the current year. The biggest drop is, naturally, in the Assistance Board, whose requirements are estimated at only £8,670,000, compared with £19,680,000 for 1941-42. This fall must be mainly due to the steady decline in unemployment, but it may also be due to the fact that it is now nearly a year since the Board had to cope with the needs of the bombed. In the same class of estimates, pensions are allotted altogether £104,635,000, against £103,241,000, £1 million of this increase being the statutory addition to widows', orphans' and old age contributory pensions. The estimate for the Ministry of Labour and National Service is up from £31,610,000 to £34,930,000, which is presumably the result of the continued expansion in the work of that department in registering and mobilising manpower. The Ministry of Health's estimate is also higher, at £25,902,771, compared with £24,646,200. In other classes, the biggest increase is shown by broadcasting, which is up from £6,900,000 to £10,000,000. The estimate for colonial development and welfare is nearly double at £1,407,000, against £773,010; even so, the total is very small. The continued expansion in the activities of the Board of Trade is reflected in the rise in its estimates from £660,790 to £1,484,583; and the same factor presumably accounts for the rise in the estimates for the Ministry of Works and Buildings, which is up from £909,470 to £3,477,000. In the revenue departments, the estimates for both the Post Office and the Inland Revenue are considerably higher. For the former, the increase is £8,777,000 at £102,523,000, while the rise for the Inland Revenue, which must be the result of the application of income-tax to small incomes, is from £9,705,560 to £12,147,170. These two departments, with Customs and Excise, bring the total sum wanted for purely civil expenditure to £546,697,773, against £538,826,779 in the current financial year.

Accident Hospital

Birmingham possesses the first accident hospital in this country, and has thereby brought a little nearer to a solution the urgent problem of rehabilitating persons injured by accident. The problem has an added importance in war-time; and Birmingham deserves all credit. It was recently stated in the first annual report of the Birmingham Accident Hospital and Rehabilitation Centre that, during the past two years, the number of industrial injuries in Birmingham area requiring treatment at hospitals has increased by at least 40 per cent—the total being well over 100,000. The new Birmingham venture furnishes not only the ordinary requisites of treatment (it has 322 fully equipped beds, of which 50 are now reserved for air-raid casualties), but it also provides a specialised medical staff, industrial nursing and a mobile surgical unit. In addition,

a rehabilitation service has been fully developed, rehabilitation being widely defined to cover both the psychological and the physical treatment of patients during the "ambulant" stage of their recovery as well as while they are in bed. The hospital, moreover, is intended to become a training centre for industrial nurses and first-aid workers; and it is linked with the local University as a teaching centre for undergraduate and postgraduate medical students. It has not been entirely in vain that the Delavigne Committee on Rehabilitation urged the need for institutions like those on the model of the famous fracture clinic of Dr Boehler in Vienna. It is a triumph for industrial medicine; but the economic aspect of the matter is not quite so satisfactory. Apart from capital requirements, the budgeted expenditure for 1942 amounts to £60,000. The Board expects £40,000 of this to be met by contributions from the Birmingham Hospitals' Contributory Association, the Ministry of Health and the City of Birmingham; for the balance of £20,000 the Board must "look mainly to industry," as the hospital has no other source of income. This precarious position is disturbing; and it is characteristic of such institutions in this country, where a prime need is that all medical services should be placed on a broad national statutory footing. It should be recognised that it is, at bottom, the imperfection of Workmen's Compensation, which does not provide any medical treatment at all, and of National Health Insurance, which only provides a scanty amount and no specialised treatment whatsoever that leaves this Birmingham venture in need of funds. Such developments as the Birmingham Accident Hospital should not be allowed to remain isolated and struggling examples for lack of financial security and an integrated national policy.

The Revenue

With exactly a month of the financial year to go, the yield of revenue has exceeded the Budget estimate. The total collected to February 28th was £1,848 millions, against an estimate of £1,786 millions. In part, but only in part, this is explainable on accounting grounds. Receipts under the War Damage Act are entered, in the first place, "below the line." When any expenditure is made under this Act, however, an amount sufficient to meet it is brought in under the head of "Miscellaneous Receipts." This item, which was expected to amount to £20 millions over the year, accordingly stands at £77 millions. But this is not the only explanation of the heavy collections. Customs and Excise, which was expected to yield £577 millions, has already brought in £641 millions. The satisfactory financial result is thus a direct reflection of the economic failure to keep consumption down. The same comment possibly also applies to the fact that EPT and NDC, in combination, have already produced £34 millions more than was expected for the full year. Income tax looks like exceeding the estimate by a small margin, but surtax is lagging. Expenditure is also high and rising, and the appearance of a further Vote of Credit of £250 millions for 1941-42 raises the total estimate for the year to £4,957 millions.

Shorter Notes

The Ministry of Information is to be commended for producing an Income Tax Quiz for Wage Earners (H.M. Stationery Office, 2d.). In view of the large number of new taxpayers without previous experience with income tax returns, the issue of a simple explanatory official booklet was necessary. The preparation of a simple guide for the new taxpayers was no easy task, for the problem is complicated; and if the booklet does not provide a simple answer to all the questions and problems the publishers can scarcely be blamed. The methods used for the distribution of the booklet have been as unorthodox as its phrasing, for Woolworth's have been selected as one of the distributing agencies. And its success is measured by sales which are reported to have reached some 500,000 copies.

The most extraordinary feature of the waste paper campaign has been the long delay before what seem quite elementary measures are taken. Appeals to the public to save paper preceded effective steps to prevent the misuse of paper, and only now, after the campaign has been in full swing for over four months, is it being made an offence to burn or destroy paper or cardboard, except for lighting fires, or to mix it with refuse. The Ministry of Supply estimates that since the beginning of the war half a million tons of paper has been lost in this way. Why, then, was the Order not made sooner?

AMERICAN SURVEY

Food for Freedom

INTEREST in the vast American armaments programme should not be allowed to obscure the crucial importance of developments on another front—the American farm. The Secretary of Agriculture said recently, "Food is a whole arsenal of weapons in this struggle . . . Our national self-interest and our humanitarian instincts challenge us to do this job of producing food and do it on a scale that will write history . . . In the day of victory when the nations sit down at the peace table our food stock piles, ready to be drawn on by the famished peoples of the Old World, will give great force to our views." In the nearer future American food products will have to satisfy an unprecedentedly large demand from the American armed forces, the civilian population, some of which is being withdrawn from agriculture to the munition factories, and from the Allied Powers which are being supplied through Lend-Lease. Last September the production goal for 1942 was set at 2 per cent above 1941, itself 2 per cent over 1940, and 12 per cent above 1924-29. Since the entry of the United States into the war it has been announced that 1943 should show a 6 per cent increase over 1941. Figures of over-all production, however, minimise the effort. Vastly expanded quantities of certain foodstuffs, notably milk, cheese, poultry, eggs, meats, some fruits and vegetables, are called for, while other crops, particularly wheat, cotton, and tobacco, will be cut. Conversion is the order of the day in agriculture as well as in industry, but the farmer is fortunate in that the changes now urgently demanded are to a large extent in line with long-term changes in consumption and have been actively encouraged by the government since the early days of the New Deal.

"Parity" Attained

It seems likely that with hard work and careful planning, American agriculture will be able to deliver the goods. The growing predominance of industry during the present century has made it easy to underestimate the weight of American agricultural capacity. Even to-day there are 6,000,000 individual farmers and during the 1941 harvest about 10,000,000 workers were employed. Conditions on the farm are better than they have been for more than ten years. Farm plant and livestock numbers have made a notable recovery from depression lows. There are adequate stocks of feeding-stuffs, although there will have to be transfers from surplus to deficit areas, and calls on the "ever-normal granary" (i.e., Government stocks) amounting to about 200,000 bushels. Farming as a whole was more prosperous in 1941 than for many years. Farmers found themselves in the happy—and unusual—position of being able to sell larger quantities at higher prices. The average level of prices for all farm commodities was higher in October, 1941, than it had been since 1929; it was 22 per cent above 1940. Prices for truck crops, meat, dairy products, chickens and eggs, and cotton rose even more sharply than this average, with grain prices lagging. The prices paid by farmers for the commodities they buy did not rise nearly so sharply; with farm labour excluded, the index rose by only 4 per cent between 1940 and 1941. The famous "parity," which has featured so prominently in the farmers' objectives of recent years, is defined as the relationship between these two price indices—those of what farmers sell and of what they buy—that existed in the period August, 1909-July, 1914. In 1941, for the first time in over fifteen years, the ratio went above "parity." On the other hand, wages for farm labour have reflected the growing movement from the land into the defence industries. In the middle of 1941 they had almost reached the average of 1930 and altogether, during 1941, rose 30 per cent. Taxes have also been rising from the 1934 low; the federal motor vehicle tax of 1941 alone will cost farmers about \$25 million a year. Higher prices for farm products are mainly responsible for pushing the total of cash farm income in 1941 up to \$11.2 billions; and the figure for 1942 is expected to be about \$13 billions, which approaches the record of \$14.6

billions in 1919. The highest income reached in the twenties was about \$11.3 billions in 1929, but the average for 1924-29 was only \$10.8 billions. Farm income is higher than it has been since 1930, and over twice what it was in 1932. Farm-mortgage debt has been declining since 1925, aided by widespread foreclosures in the bad years. In 1936 there were 23.3 foreclosures per 1,000 mortgaged farms; this rate has steadily declined, and in 1940 reached 8.9. During 1941 there was a further decline. Under the New Deal some progress has been made in agricultural conservation and in encouraging the shift from products like cotton, which faced declining markets, into diversified farming and into new products such as soya beans.

The expansion planned for the next two or three years is being carefully watched to see that it does not bring about any destruction of agricultural resources or entail an increase in equipment and livestock which would prove burdensome after the war. For instance, dairy farmers are being advised not to increase their herds but to raise output by more use of concentrates. Subject to these considerations, national, state, and regional goals have been set as high as possible. The amount of planning called for on the part of the Government and of the individual operator is unprecedented in American agricultural history. National goals have been set up for all major products; these are then broken down into the amounts that can be contributed by the various regions and finally into goals for the individual farmer. Outstanding increases are expected in milk, which is to rise from 117 billion pounds to 125 billions, an increase of 7 per cent; in the production of cheese, up by one-third in 1942; condensed and evaporated milk, up by one-fourth, and in the manufacture of dried, skimmed milk for human consumption, which is likely to be double what it was in 1941. The goal for eggs is 4,000 million dozen for 1942 as against 3,700 in 1941. Chickens for slaughter will rise from 680 to 750 millions. Slaughter of beef cattle is estimated at 28 millions as against 25 millions in 1941, but this will involve no increase in the cattle population, which has nearly reached the record high of 1934. Nearly 80 million hogs will be slaughtered in 1942, an increase of about one-seventh. The marketing of sheep and lambs will show only a very slight increase, while wheat acreage will decline about 13 per cent and cotton acreage will remain about the same at 23 millions.

"Profits and Patriotism"

The Government has at hand the powers necessary to direct and aid the expansion of production, in control of prices, the machinery of crop quotas, crop loans, and agricultural advice, and in the fact that the Federal land banks and the Federal Farm Mortgage Corporation hold approximately 40 per cent of the farm mortgage debt of the United States. During September, Mr Wickard, the Secretary of Agriculture, attended regional conferences all over the country; individual farmers are being approached by county officials of the Department of Agriculture and by Agricultural Adjustment Committeemen. The policy of the Government is based on the appeal of "profits and patriotism" rather than penalties. A high price programme is likely to be followed where additional production is necessary, in dairy and poultry products, truck farm produce, vegetable oils, and livestock. The intention of the Administration is to stabilise cotton, wheat and other basic crops at or near parity, and hold corn and feed stuffs below parity in order to encourage the feeding of concentrates to dairy cattle. Whether the government will be able to carry out this policy depends on its ability to outmanoeuvre the farm bloc, which is bent on raising prices all round. This would not only increase the danger of inflation but would destroy the Administration's carefully worked out programme of price incentives to producers. Expanded production is made safe for the farmer by the establishment of floors for the principal products at 85 per cent of parity. This is effected

by the granting of government crop loans up to this figure. In order to avoid high production costs prices of articles needed by farmers will be held down.

Two widespread difficulties are the shortages of labour and agricultural machinery. Government action to retain essential labour on the farms is a possibility, and the drying up of seasonal labour supplies may be offset by community harvesting, and by the use of the Civilian Conservation Corps, the WPA, and perhaps even the Army. Scarcity of materials and the conversion of machinery plants to war production are responsible for the shortage of machinery. Manufacturers of agricultural machinery have been given a high priority rating—A-3, and will produce about 83 per cent of their 1940 production. The production of certain types such as dairy equipment and peanut pickers has been increased, with the result that other machines, such as harvesters, will be produced in only small quantities. This discriminating production policy follows the lines of the proposed farm price policy. More short-term credit will be needed by farmers, but ample funds are easily obtainable in most cases from the Commodity Credit Corporation, the Farm Credit Administration, and the Farm Security Administration. Lack of equipment, labour, and experience in new types of farming are the main obstacles. The need for Government aid and education is particularly acute among the small farmers, who amount to about half the farm operators, and as far as regions are concerned, in the South, where the reduced outlets for cotton, wheat, and tobacco make a shift to diversified farming most urgent. Backwardness in methods and equipment below the Mason-Dixon line offers a challenge to the Government; an improved diet there would show great results in better health. Co-operative ownership of machinery is being developed, and the FSA is establishing co-operatives as demonstration projects in more efficient farming.

American food production is a great and essential asset of the United Nations. The drive to expand output is one of the biggest enterprises undertaken by the United States, and it is almost revolutionary in method. The most chaotic and depressed industry of recent years is undergoing a reformation which will have enormous consequences after the war. The perfection of planning technique and machinery, the improvement of methods and equipment, and the shift from staple crops all suggest that in meeting the wartime emergency American agriculture is greatly improving its ability to contribute to the "economy of abundance" and to hold its own after the war in relation both to industry at home and to agricultural competition abroad.

American Notes

Conversion Gets Under Way

The methods adopted in the conversion of the automobile industry are of particular interest because the industry is both the first and the largest to be converted *en bloc* to war production. If the methods are successful, they are sure to be a model for many other industries scheduled for conversion. Full utilisation of the industry's resources is assured by the fact that civilian production has come to an end; if the companies are to continue to exist they must secure war contracts. Mr Kanzler, head of the automotive branch of WPB, is responsible for reporting idle machine tools and other facilities to the War Production Board and for expediting the assignment of orders, if current contracts for the Army and Navy do not entirely absorb the industry's resources. As contracts will be granted to the company which can complete the job in the shortest possible time, and competitive bidding has been abandoned, the industry is laying stress on the adaptation of mass-production machinery, whatever the cost, in preference to the use of slower general-purpose machine tools. Comprehensive lists of the armaments demanded are already available, and are designed to help the individual producer in applying for contracts by showing the general categories of work, the specific articles needed, and the type of equipment needed to produce them. The facilities and machine tools of the entire industry will be made available to industrial companies through purchase, lease or use for a single job. Reports on idle machine tools are already being made by 1,500 companies to a central committee, and it is estimated that eventually about 150,000 of the industry's 350,000 machine tools will be reported. This information will be made available to all members of the industry, other defence contractors, the armed forces and the WPB in order to ensure that they are fully employed. The reports are so designed that an experienced engineer will be able to tell

immediately whether the tools are suited to his needs. Sub-committees of the Automotive Council for War will provide contractors with information on improved methods of production, and patents and industrial processes will be pooled. The industry is richly supplied with the tools, the technical talent and the administrative ability to make it a true arsenal; the only doubt which exists is whether companies habituated to the fiercest competition and jealous of their individuality will be able to throw off peacetime habits and collaborate wholeheartedly in production.

The Tax Proposals

The Administration's tax proposals for the fiscal year 1942-43, which were made public on Tuesday, are intended to raise an additional revenue of rather over \$9 billions; bringing the total for the year to some \$27 billions; Federal expenditure out of the general Budget is estimated to be about \$56 billions. The tax proposals rely in the main on sharp increases in income and corporation taxes and on higher duties on such articles as petrol, tobacco, liquor and on transport, telegraph and telephone services. The present Federal income tax is levied on all incomes in excess of the personal allowances, which are \$750 for a single man, \$1,500 for a married couple and \$400 for each dependant. It consists of a flat rate "normal" tax of 4 per cent and surtaxes ranging from 6 per cent to 77 per cent. Mr Morgenthau's proposal appears to be (though the cabled reports are far from explicit) that these surtax rates shall be increased by 10 per cent and that a proportion of the tax payable should be withheld at the source. This will, of course, impose a sharper increase on the smaller incomes, but this is not unjust, since it is in these ranges, rather than on the higher incomes, that American income taxation bears most lightly. Any direct comparison of American with British income taxes is difficult because of the existence of State taxes. But these are usually light. In New York the highest rate is 7 per cent and in California 15 per cent, and even these rates affect only the very largest incomes. Federal and State income taxes, with Mr Morgenthau's additions, will still be substantially lower on all small and middle incomes than British income tax. The tax proposals are of interest as a reflection of the Administration's policy and viewpoint, but it should be remembered that Congress need not accept them, either as a whole or in detail; it is jealous of its power to tax, and a long period of haggling, compromise, conference and revision is an essential preliminary to the enactment of American tax legislation. Two points at issue are the "withholding" tax, favoured by the Administration and opposed by Congress, and the imposition of a general sales tax, said to be popular with Congress and disapproved by the Administration.

Manpower and Labour

While the unions and the public are still concerned with such problems as the union shop, labour disputes, wages policy and the forty-hour week, there are signs that a broader view of the mobilisation and distribution of manpower is emerging. The creation within the Labour Department of a new division for the mobilisation of industrial manpower is being considered. The establishment of the US Employment Service and the move towards economy of manpower in Government offices point in the same direction. Mr Hillman remains in charge of labour supply at WPB for the present, though the scope of his authority may shortly be reviewed in relation to the functions of the War Labour Board and the Department of Labour. Meanwhile the demand for a national labour policy continues to be voiced by Congressmen and the newspapers. Congressional opinion is said to be increasingly in favour of legislation against all labour disputes, longer working hours without overtime pay and a final decision on the question of the closed shop and check-off, but has shown little willingness to accept other equally urgent restraints, notably on excess profits and on farm prices. The defeat of the Smith amendment, which would have suspended all maximum-hour legislation and overtime pay for the duration, was partly due to the opposition of the Administration, but also to its sweeping nature, rather than to any softening in the general anti-labour attitude of Congress. Mr Green and Mr Murray have asked President Roosevelt not to bar wage increases in view of the rising cost of living, and have insisted that if wages are to be frozen there must first be more effective

price controls, strict rationing and an increase in the excess profits tax. The forthcoming decisions of the Labour Board on demands for increased wages and the closed shop in "Little Steel" and double Sunday pay in the automobile industry are eagerly awaited as an indication of the policy to be adopted. An increase in maximum hours seems inevitable, but wages policy is a part of the entire price programme of the Administration. The necessity of comprehensive control and equality of sacrifice is appreciated, but whether it is practical politics remains doubtful.

War Secrets

The leakage of military secrets to the enemy, particularly of aircraft drawings and army codes, has alarmed the Department of Justice, but the press appears to be even more alarmed at the Bill drawn up by the Department, which provides fines and gaol sentences for persons "wilfully and knowingly" revealing confidential plans and documents. The problem is evidently one of steering a way between penalising legitimate criticism and allowing information to reach the enemy. The Department is concerned because of its inability to secure convictions in more than one case of a number which it has handled. The press is unanimous in its disapproval of the Bill as drawn, and in its concern lest the rights of free discussion be endangered. The freedom enjoyed—and exercised—by the American press has been exceptional, and in the period of pre-belligerency there were a number of outstanding cases of irresponsible publication of information of interest to the Axis. Attorney-General Biddle, testifying before a Senate Sub-Committee, pointed out that the press has never been free to disclose Government secrets. This argument seems somewhat ingenuous, as up to the present penalties and procedure were not established which would permit action to be taken. It seems likely that the "threat of a political censorship" is being exaggerated and exploited by the press, which has always been overwhelmingly anti-Roosevelt. The aims of the Bill are irreproachable, and Attorney-General Biddle has agreed to its revision in order to protect the rights of both public and press. The beginning of a "statistical blackout" shows that the Administration is becoming increasingly aware of the necessity of withholding information from the enemy. Positive control of the dissemination of military secrets is a wartime necessity, and, provided the Bill is carefully drawn, there should not be much difficulty in discriminating between legitimate comment and violation of trust. The American press is so jealous of its freedom that it may be depended upon to see that the restrictions go no further than is essential.

Defence Housing

The consolidation of the sixteen government housing agencies into one organisation to be known as National Housing Agency is long overdue. The stream of workers into munitions towns has already created a serious shortage of accommodation and services, and the multiplicity of federal agencies has made an effective policy impossible. In one only—the Defence Housing Administration—the Truman Committee found "many mistakes, gross waste, extravagance, inefficiency and petty jealousy on the part of the administrative heads." The conflicts of policy and personalities between the other agencies have been notorious; in his Press Conference, President Roosevelt referred to "duplication, conflict, disputes and overlapping both among themselves and with private contractors." The new agency, under John W. Blandford, will contain three units: the Federal Housing Administration, the Federal Home Loan Banking Administration, and the Federal Public Housing Authority. Housing units formerly part of the Federal Loan Agency have been transferred to the Commerce Department under Mr Jesse Jones, who will supervise the new agency. Important decisions on housing policy which will have to be made include the division of authority between federal and local governments, the scope allotted to private builders as opposed to Government housing and the standards set up both for private and public building. Until these are made public, it will be impossible to tell whether the housing programme is likely to succeed or fail, but the establishment of a single authority is an indispensable step toward securing a unified policy and effective action.

The Oil Position

Oil shortages reported along both the East and West Coasts are due largely to transport difficulties, but it is also true that during 1941 production did not keep pace with demand. Crude oil production increased by less than 4 per cent, from 1,353 to 1,404 million barrels, while demand for the principal liquid products is estimated to have risen about 10 per cent, from 1,184 to 1,314 million barrels. Consumption of domestic motor fuel increased by 12 per cent, as did the demand for residual fuel oil, used mainly for industrial purposes. Lubricating oils used increased by 30 per cent. Larger imports and a draft on inventories have been necessary. The decline in exports and the restrictive influence of tyre rationing and the embargo on automobile production seem unlikely to offset more than slightly the greatly increased consumption by industry and the armed forces in 1942. Steps are being taken to increase production, particularly of aviation petrol; a goal of 150,000 barrels a day of 100-octane spirit has been set. To achieve this a considerable deterioration in the quality of motor gasolines will be necessary to supply the requisite high-grade blending agents. Other action being taken by the Petroleum Co-ordinator, Mr. Ickes, includes pooling of supplies and facilities where necessary, and regulations governing the sales of fuel oil to East Coast consumers. To prevent hoarding, fuel oil supplies are to be permitted only up to 75 per cent of tank capacity, and purchases are forbidden unless tanks are 20 per cent or less full. It is estimated that this will make available three million additional barrels between now and April 1, the period of peak demand. Mr. Ickes' recommendation that production quotas for March be reduced by 105,000 barrels from the February level is a direct result of the tanker diversions and recent sinkings. Mr. Ickes has recommended that the industry prepare a programme for the sharing of all available tanker tonnage, regardless of the ownership of the tankers, and the increased use of the railways and tank cars is being pressed. The construction of an east-west pipe-line has been proposed, but this would take time, would require steel, and is opposed by the railroads. The necessity of rationing gasoline has been predicted by the industry's war council, and it has been suggested in the press that a 15 per cent cut in consumption will be ordered in seventeen eastern states and some in the north-west.

Shorter Notes

In spite of intervention by the President, the Senate has passed the Bankhead Bill which forbids the Government to sell its stocks of agricultural commodities below parity prices. There are rumours that the farm bloc may go further, and attach a rider to the war appropriations Bill forbidding sales below 110 per cent of parity. In this eventuality the President might have to veto the bill despite the urgent need for the appropriations.

Mr Nelson, head of the WPB, has announced a national drive to increase production by (1) accelerating the conversion of peace-time industrial plants to war production; (2) increasing use of plant already engaged on war orders toward a theoretical maximum of 168 hours a week for each machine; (3) granting recognition and awards for outstanding achievements both by management and labour; (4) establishing joint labour-management committees in war plants to consider suggestions for increasing production.

The Supreme Court has ruled that labour unions and workers are exempt from the provisions of the Federal anti-racketeering act, reversing the opinion of the New York Court of Appeals, which had sustained the conviction of the Teamsters' Union for allegedly extracting about \$1,000,000 annually from out-of-state truck drivers, often by the use of violence.

Admiral Land, War Shipping Administrator, has announced that owners of ocean-going freight vessels over 1,000 tons will be required to file "information required for preparation and execution of charter agreements."

The Census Bureau has reported that employees of Federal, state and local governments number 6,861,000, or about 13 per cent of the nation's labour force.

THE WORLD OVERSEAS

Russia and Europe

(By a Central European Correspondent)

AXIS propaganda has once again been using the bogey of Europe falling a prey to Bolshevism with the connivance of the British. Sir Stafford Cripps' speeches have been especially exploited for this purpose; and, over the innumerable German-controlled wireless stations, broadcasting in all European languages, the prospect of the Bolsheviks "sitting in Berlin" has been presented as the avowed war aim of Great Britain. The effectiveness of this scaremongering should not be under-rated; though, on the other hand, there have been some signs of a highly sober reaction—the Finnish Social Democratic newspapers, for instance, have commented upon Sir Stafford's speech as showing that "Britain has no intention of leaving the European nations to the mercy of Bolshevism."

If the Allies win the war Soviet Russia, it is said, is bound to gain a decisive say in European affairs. The question, for Europeans, is: What will Russia do? And what matters most is not the short-term diplomatic zig-zags, which merely reflect the pressure of changing events, but rather the long-term trend of Soviet foreign policy, viewed against its economic, social and ideological background.

The first problem concerns the Soviet attitude to expansion. During 1939-40, there were two powers in Europe expanding by the conquest of new territories and the subjugation of independent nations—Germany and Russia. Now, Russia itself has become the object of German aggression. But the short-lived period of Soviet expansion has given rise to the question: Will Russia resume her expansion after the war? Was there any tendency to European domination inherent in the Russian policy of 1939-40? Were the Baltic States, Eastern Poland and Bessarabia to Russia what the Saarland and Austria and Czechoslovakia were to Germany, that is, the local and "peaceful" preludes to a wider struggle for supremacy? The reply to these questions will determine the attitude of very many people on the Continent towards current developments.

Economic Factors

The analogy with Germany itself provides part of the answer. The dynamic character of German expansion was to a large extent "explained" on economic grounds. Germany was impelled to acquire a *Grossraumwirtschaft* by the pressure of a tremendous industrial machine; and this industrial machine provided Germany with a most potent engine for world war. Now Soviet Russia, on the other hand, is a *Grossraumwirtschaft* in itself. However great its achievements in industrialisation, Russia is still very far from reaching the industrial saturation point. Its resources of fertile soil, raw materials and labour power, actual and potential, provide for its industrial growth a basis which is, in proportion to its existing industrial apparatus, too broad rather than too narrow. In pre-revolutionary days,

liberal Russian economists propounded a programme of so-called internal colonisation. So far, the possibilities of internal colonisation have only been opened up; in the exploitation of raw materials and in industrialisation, Siberia and the Asiatic republics have just made their first start. Economic planning and monopoly state control over industry enable Russia to proceed with the undertaking of large-scale works and thus to widen its internal "market" almost indefinitely. All this leads to the hypothesis that Russia's recent expansion had no serious economic motive behind it. In fact, the quantitative addition of the adjacent western territories to Russia's wealth was insignificant.

Moreover, Russia has for more than a decade been accumulating enormous masses of arms and equipment at the expense of its population's standard of living, which is still very far below other European standards. Home propaganda pointed to the threat of war or intervention, in order to induce the people to accept the heaviest material and moral sacrifices. After this war, Russia will have to face the task of raising the standard of living. The population has had no respite for three decades from war, revolution, civil war, preparation for war and another war. Whereas the strength of the German war machine corresponds to the general level of German industrial resources, skill and efficiency, the Russian war machine stands in all these respects much above the average level of Russia's industry. It has been set up by a unique, almost inhuman, productive effort.

Frontiers and Strategy

These economic considerations suggest that Soviet "expansionist" ambitions have been local only. In fact, this was the character of Russian expansion in 1939-40; its strategically defensive meaning has been demonstrated by the subsequent course of the war. Eastern Poland, the Baltic States and Bessarabia were no more than the defensive barriers to lock up the approaches to the Russian fortress—whereas Austria and Czechoslovakia furnished Hitler with jumping-off grounds for continent-wide campaigns. Historically, Russia's expansion westwards has always been actuated by considerations of a broadly strategic nature. At the end of the eighteenth century, it was Russia's uneasiness in the face of the growing military power of the Prussian state that led Catherine the Second to take part in Poland's partition; a similar Russian fear in a similar situation caused the fourth partition of Poland. It need hardly be added that to the nations directly concerned, that is, to Russia's western neighbours, subjugation means subjugation whatever its motives; the loss of national independence or of a considerable part of national territory can hardly be sweetened by the consciousness that it was due only to the strategic necessity of straightening out the frontiers of a powerful neighbour.

There has been a distinct tendency on the part of the Soviets to regard the acquisitions of 1939-40 as essential for their future military security. Sir Stafford Cripps alluded in his Bristol speech to the Russian desire to maintain "strategically sound boundaries." Simultaneously, Soviet broadcasts in Polish made significantly unfriendly comments on the Polish-Czechoslovak federation-agreement. It seems that there is a disposition in Moscow to interpret the concept of "strategically sound boundaries" in a somewhat rigid manner. One might ask what land frontier on earth is strategically "sound" enough in an era of deep armoured sweeps and unrestricted air warfare; and it may be, perhaps, that, even from the Russian standpoint, co-operation with federated small neighbours with no grievances against Russia might be of a higher military value than a "sound" strategic boundary with injured national feelings and fresh resentment aroused all along it.

Non-Intervention?

Finally, there are the ideological aspects of the Russian problem. Much as Axis propaganda has dwelt upon this point, nothing can obliterate the fact that ideological scruples were no obstacle to the Soviet-German agreements of 1939-40. The dream of revolutionising Europe has in fact faded from the minds of the present generation of Russian statesmen. There is no reason to doubt M. Stalin's sincerity in his assertion that Russia fights for Russia and for nothing else. Russian home propaganda is based on a sort of ideological compromise; it appeals to the revolutionary reminiscences of the recent past, but it also evokes the age-long national Russian tradition. It calls upon the people to defend their achievements in socialist economy, but it also taps the inexhaustible resources of purely patriotic sentiments. This ideological compromise seems to have been able to bridge over the conflicting tendencies of Russia's social life, and to bring about the consolidation of the regime unanimously reported by visitors to Russia, and evidenced by the course of the war. Propaganda for foreign, and especially for German, consumption, has not gone beyond the Popular Front pattern, perhaps in a more moderate version, strongly tinged with Russian patriotism.

Yet, however little Soviet Russia is concerned with world revolution, it remains a fact that, in 1939-40, social upheavals followed in the wake of every advance of the Red Army. Eastern Poland, the Baltic states and Bessarabia underwent totalitarian sovietisation. This was the inevitable outcome of their incorporation into the Soviet Union; two different social and political structures could not co-exist within the framework of one state. Against this, the experience of Soviet policy in the Spanish and French Popular Fronts should be set; in those countries, the Soviets opposed any attempts at a Soviet revolution by unorthodox left-wing extremists. This may be taken of the way in which the general ideological trend appears to coincide with the economic and strategic tendencies of Russia's expansion: it assumes a local or regional character.

It would, however, be futile to say that there was no risk involved in the present situation. Whatever the extent to which Russia has given up expansionist ambitions, and whatever the political line taken by its Government, other factors, independent of the conscious will and the political aims of Soviet statesmen, may count. The Red Army carries with it the legend of an international Soviet revolution. It may be out-moded; but it still influences the imagination of considerable sections of the European proletariat. It is impossible to foresee all the possible implications of the impact of that legend upon a Europe hollowed out of its old traditions and turned by the Nazis into an amorphous social and political chaos. Many of the old ways of European life are likely to have gone for ever. But all that can be said now is that whatever risk there may be is a matter of the future: it may or it may not materialise. It is the risk that has sprung from Nazi totalitarianism, spelling the doom of European civilisation, that is the hard reality of today.

Allied Labour in Britain

[BY A POLISH CORRESPONDENT]

February 18th

THE number of Allied civilians in Great Britain is comparatively small, and there is consequently no possibility of employing foreign labour on the scale that Germany has. Including Russians, Americans and Chinese, the total number of Allied civilians is under 100,000, of whom 40,500 have registered under the International Labour Force Registration Order. Over 86 per cent of the registered Allied civilians have already been absorbed into different industries, and they are making a useful contribution to the war effort. They include highly skilled technicians, and have brought with them some important processes and new trades.

At the outbreak of war, the position of Allied foreigners living in this country was not clear. The pre-war regulations, protecting British workers against foreign labour and forbidding any foreigner to take on employment without a special permit, were still in force. Until July, 1940, the Labour Exchanges were very reluctant to issue labour permits to foreigners, especially as in the first few months the country had not reached the stage of full employment and the Exchanges had still to cope with great numbers of British unemployed. After Dunkirk the position radically changed. The new influx of refugees from France, Belgium, Holland, Denmark and Norway, the feverish expansion of

Since 1880 the Journals of the House of Benn have circulated amongst industries covering more than half the output of Great Britain. Manufacturers, wholesalers and retailers, ranging from producers of the smallest appliance for the home to the heaviest plant in the engineering industry, read one or other of the following papers:—

The Cabinet Maker
The Hardware Trade Journal
The Electrician
The Gas World
The Fruit Grower
The Chemical Age
The Timber Trades Journal
The British Trade Journal
& Export World
The Miller
The Leather Trades Review
Industria Britannica
The Newspaper World.

Several of these journals have a special appeal to influential concerns throughout the British Empire, Latin-America and Allied markets.

Such an organisation has an important part to play in carrying vital news to key points in the national effort and is doing its full share. Conditions compel the publishers to limit subscription lists and restrict advertising space, but they will gladly send any further information on request.

The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States.

production, and the establishment of the headquarters of nearly all the Allied Governments in London, together with the care and guarantee they could give to their nationals, enabled the Ministry of Labour to reconsider its policy towards the employment of foreign labour and to regulate the matter on a national basis, instead of leaving it to the local exchanges.

Co-operation with the Unions

The reason behind the restrictions on foreign labour was the wish to safeguard British workers against undercutting wages and outside competition. Mr Bevin was well acquainted with the problem and found a solution without endangering the position of British labour. In August, 1940, he announced the organisation of the International Labour Branch to ensure that the best use was made of the skill and experience of all refugees in the common cause. The International Labour Branch was organised in co-operation with the Allied Governments and similar national authorities in Britain, and the manpower of Allied nations, and also enemy aliens friendly disposed to the Allied cause, came under its scope. Arrangements were made, under the auspices of the TUC, acting in conjunction with the International Federation of Trade Unions, for foreign workers to become members of the appropriate British trade unions and also of their national trade union groups. The exiled trade union leaders in this country had, therefore, the opportunity of reorganising their refugee workers in similar trade union organisations to those in their own countries. There are now Belgian, Czechoslovak, French, Norwegian and Polish trade union groups in this country. Foreign workers are assured of the same conditions of employment and the same benefits under social services, such as workmen's compensation, the national health insurance, unemployment insurances and evacuation of their families from danger zones, as British workers.

When practicable, the International Labour Branch has encouraged the placing of foreigners in national groups: for instance, Belgian, Norwegian and Czechoslovak groups are employed in forestry; Norwegians in rope manufacture; Belgians, French, Poles and others in aircraft works and engineering; Belgians, Dutch and Poles in diamond polishing and cutting; Belgians and fishermen of other nationalities for the naval auxiliary service, and so on.

There is also a central Allied Register for foreigners with professions and skilled trades. Over 700 Allied doctors have been admitted to registration after selection by the Central Medical Committee. These doctors are allowed to serve with British and Allied civil defence organisations, in hospitals and public health services, but not in private practice, except as assistants.

Exchanges for Foreigners

As a result of the registration of male foreign Allies from 16-65, and of women aged 16-50, a full record is now available of the distribution and employment of Allied labour. To facilitate and supplement the machinery for placing foreign workers, special employment exchanges were opened in the London area for certain nationalities. These exchanges are working hand-in-hand with the Allied authorities and are staffed partly by British and partly by Allied officials. Foreign workers are thus enabled to speak in their own language and to explain their problems to their fellow-countrymen, who act as officials of the Ministry of Labour.

The number of Allied foreigners in this country is as follows:—

Belgians	13,000
Czechoslovaks	10,000
French	11,500
Dutch	5,600
Greeks	1,700
Norwegians	2,200
Poles	9,000*

* In 1939. The current estimated figure is about 15,000.

The Allied Governments have recently also tried to release from military service highly skilled men serving with the forces. In some cases, for instance, doctors have been transferred from the Allied services to the British forces. The Government training centres also accept Allied foreigners whenever there are vacancies, and from the reports of the managers it is clear that the foreign workers are very keen to pick up the required skill in as short a time as possible.

Spanish Labour for Germany

[BY A SPANISH CORRESPONDENT]

February 23rd

THE Nazis have met their labour shortage by importing workers from all over Europe, and Spain has not been excepted as a source of supply. On May 31st last year, a meeting of the Spanish Cabinet approved an agreement with Germany for the exchange of workers and technicians. The Spanish Government promised to send the Germans 100,000 "producers" (to use the new Falangist term). The agreement was not put into effect until last October, when a recruiting campaign was launched in Spain.

The elaborate machinery by which the agreement is carried out illustrates the German methods of enlisting foreign labour for their fields and factories. In Spain, the recruiting is being dealt with by a commission made up of representatives of the various government departments, assisted by the CNS (*Central Nacional Sindicalista*), the Falangist labour organisation.

Spanish volunteers must not be involved in any legal proceedings—a guarantee, at least officially, of immunity from anti-Nazi sympathies. They must also have completed their military service or be between the ages of 16 and 19, and they must not be in a reserved occupation. Candidates are medically examined by commissions of German doctors stationed at all the recruiting centres in Spain. Some Spanish specialists have volunteered to assist in this work. Those who pass the examination can make contracts individually with the representatives of German firms, who are in Spain for the purpose. Candidates must accept the discipline of the Labour Front from the moment they join the expeditions sent to Germany. They must also undertake to send home at least half of what is left of their salaries after paying for food and lodging.

In the recruiting propaganda, special emphasis is laid upon the fact that every worker on leaving the country will be presented by the Spanish authorities with new clothing and shoes—a piece of generosity enforced by the clothes shortage in Germany. No mention is made of any issue of clothing ration cards for them in Germany; an influx of over two million foreign workers might prove a heavy tax upon the German stocks.

From the German side, the whole business is run by a delegation in Spain of the German Ministry of Labour, presided over by Herr Fritz von Eberspacher. German and Spanish officials met in Hendaye and arranged the timetable for the trains to take the workers to Germany. There is to be an interpreter for each group of 500 workers, and many of the innumerable members of the Hitler Youth now in Spain have volunteered for the job.

The Spanish workers are housed in labour camps in Germany, where they are promised Spanish food, the workers' rations, which are larger than those of the "normal" German consumer, and an amenity described as "workers' gardens." Life in a labour camp in winter does not sound very inviting, but the Nazis are astute enough to make it as comfortable as possible, realising its propaganda value among the Spaniards. Even if there are complaints, the censor will deal with them, and little will leak out to Spain.

The workers come automatically under the authority of the German Labour Front, which provides them (according to the propaganda in Spain) with "social tutelage (guardianship in labour matters) and moral and material assistance," but which is their absolute master in all labour questions. They will enjoy the advantages of the Strength through Joy movement. They are given the benefits of national insurances and free medical service. Other foreign workers have, in fact, been given promises similar to those made to the Spaniards, and these have been broken on any pretext, so that the worker tried to get a job other than that mentioned in his contract.

Reward for Services

From authoritative sources it is learned that foreign workers in Germany have been made to work 10, 12 and even 14 hours a day. Nevertheless, German recruiting propaganda promises the Spanish workers an eight-hour day. As for wages, they are promised an average of 0.60-0.90

Portugal's Economic Relations with Spain

[FROM OUR LISBON CORRESPONDENT]

February 16th

HISTORICALLY and politically, the unheralded journey of Dr Salazar to meet General Franco and Señor Serrano Suñer at Seville, on February 12th, is an event of importance in Latin Europe. Viewed from a strictly economic standpoint, there is as yet nothing to warrant great optimism, unless the public announcement of an economic Iberian "bloc" is followed by acts which will allow supplies of essential goods, proportionate to its needs, to be granted by Great Britain and the United States. These needs are in the main made up of fuels, lubricants, certain metals, raw cotton, and grain; the value of the freshly enunciated policy of economic collaboration—incidentally, already provided for by the Treaty of Amity and Non-Aggression of March 17, 1939—hangs entirely upon the ability of the two parties to work together for their own advantage, and not for the benefit of veiled third parties whose interests are directly opposed to those of Great Britain and the United States. Portugal, to take one small instance, needs copper scrap for the making of sulphates with which to protect her vines; Spain produces copper in quantity. Is it not, therefore, natural to suppose that the copper needed by Portugal should come from Spain and not from the United Kingdom? Her requirements in iron and steel are modest, and could also be supplied, having regard to present world conditions, from her neighbour. And if one turns to Spanish requirements, which are chiefly foodstuffs, oils and sub-tropical produce, one finds Portugal particularly well fitted to carry out a trade profitable to herself and beneficial to her neighbour.

Of Portugal's *bona fides* there can be no doubt; the question to which nobody seems able to find an answer is whether Spain can and will be able to limit her dealings to actual requirements or be forced to keep up the flow that is believed to leak away via the French frontiers. As in so many other shady situations in this world war, Vichy France appears to be the go-between, the pipe through which passes the steady leakage of essential supplies, so urgently needed by Spain, but so profitably saleable elsewhere. If the recent meeting results in the stopping of that leak, both Spain and Portugal will have cause to rejoice; if nothing comes of it, then the only course left seems as obvious as it would be unprofitable to all parties concerned.

German Europe

Agricultural Prospects

THE agricultural season 1940-41 in German Europe ended with the second poor harvest since the beginning of the war. In 1940, the continent harvested 37 million tons of wheat against an average of 42.8 million tons in 1930-39. The few figures available for the harvest in 1941 suggest an increase of some 7 per cent compared with 1940. Root crops, which partly made up for the fall in cereals in 1940, were smaller in 1941. Germany's potato crop, for example, yielded only 65 million tons in 1941 against 70 million tons in 1940. Neither Germany nor any other continental country was able to maintain the livestock population, because of lack of feeding-stuffs; and only Germany succeeded in extending the cultivation of oilseeds. During 1941, rationing of bread, flour, meat and fats was introduced in the Danubian countries which normally export agricultural products.

Germany and Italy probably consumed during 1941 the greater part of the emergency stocks which had been accumulated before the war. The food supplies of the continent thus depend for the duration of the war on current production. Agriculture in the occupied provinces of the Soviet Union will hardly yield surpluses. The greater part of the occupied provinces are now in the fighting zone; and the territories under effective occupation lack labour and machinery.

Before the war, current production covered roughly 80 per

cent of the consumption of foodstuffs in Germany, France and Greece; 90 per cent in Sweden; 43 per cent in Norway; 67 per cent in Holland; and 95 per cent in Italy. Poland and the Danubian countries exported foodstuffs; and Denmark produced considerable export surpluses on the basis of imported feeding stuffs. Germany lacked feeding stuffs and fats. Germany's wartime supply of foodstuffs depended on normal exports from the Danubian countries. In 1940, additional imports from the Soviet Union enabled Germany, moreover, to maintain her livestock population.

The 1941 harvest in German Europe was not only poor because of bad weather conditions. The Balkan campaign disrupted agriculture in Yugoslavia and Bulgaria; and the mobilisation of Slovakia, Hungary and Roumania against the Soviet Union reduced agricultural production in Germany's main supply countries. At the beginning of the 1941-42 agricultural season, Germany was forced to keep her entire army in the field, with the inevitable result of a greater consumption of foodstuffs. At home, the agricultural industry again lost workers; and the influx of foreign workers increased the population by several millions. According to German figures, prisoners of war and foreign civilian workers in Germany number at least five millions—more than the whole population of Switzerland.

The agricultural situation in German Europe in the third year of the war presents a dilemma. Production in France, Belgium, Holland, Norway, Finland, Greece, Poland and Yugoslavia is far below the reduced wartime rations, and the surplus production of the Danubian coun-

The table brings out three investment points very clearly, and none of them is wholly reassuring. First, the majority of the companies have an unfavourable EPT standard. Secondly, although wartime profits in general have been up to, and in some instances have exceeded, the level of 1937 (which was one of the industry's best pre-war years) there is a tendency for earnings in the latest war year to fall off in proportion to the lateness of the date to which the accounts are made up. The companies whose 1941 figures are compiled up to March 31st show, in most cases, an increase in profits as compared with 1940. Concerns with accounting dates to June 30th or later, however, generally reveal a decrease in earnings, the most noteworthy exception being the Lancashire Cotton Corporation. It is common knowledge that the earnings position has deteriorated further in the period since many of these companies issued their last accounts, which has included "concentration," a decline in exports, and the permeation of price control through the structure of the industry. Thirdly, many of the companies—with Lancashire Cotton Corporation again a prominent exception—are already distributing profits up to, or near, the hilt. This tendency is important in view of the fact, brought out by the next table, that, at present market prices, the dividend yield on some shares—based on the

last complete year's payment—is not particularly generous:—

SHARE PRICES AND YIELDS

The conclusion suggested by the present article seems indubitably to be that investors should be chary in following up the recent rise in cotton textile shares, if it should happen to be renewed in the near future. And, even where the most promising shares are concerned, a decidedly selective policy seems to be indicated. Even relatively profitable branches of the industry, like thread-making, are vulnerable, e.g., on the export side, while well-run and hitherto prosperous concerns like Tootal Broadhurst, which have built up a wide market for their branded goods, may be unfavourably affected by wartime emphasis on standard qualities. The finishers, who before the war had generally

followed a policy of levying increased charges on a decreasing volume of work, have now to cope with the general problem of reduced wartime yardage, plus the shutting down of certain of their factories under the concentration scheme and, in some instances, a capital structure which still has too many prior obligations—including preference dividends in arrear.

Once the industry has overcome its present labour difficulties, its status as a "war industry" should ensure shareholders in its larger units of moderate dividends—though not necessarily at the rates recently paid—so long as the war lasts. When hostilities are over, there may well be a release of pent-up consumption and re-stocking demand. But when that honeymoon is over, the industry will have to face the somewhat grim realities of a world in which the achievement of prosperity will depend, apart from the supplying of a limited home market, mainly upon ability to export the higher quality ranges of textiles to overseas countries which, for the last thirty years, have been evincing an increasing determination to manufacture the "bread and butter" lines for themselves. When that time comes, the work of the wartime axe, in mercilessly cutting away the dead wood in the industry, will have been valuable. But concentration for wartime objectives is not necessarily the same thing as concentration to ensure maximum international competitive ability in peacetime. Undoubtedly, Britain's cotton textile industry will have a permanent part to play in the post-war trading world. But in choosing shares for investment now, investors might be well advised to restrict themselves to those companies which are relatively well assured, not only of reasonable earning power during the war itself, but of opportunities for post-war profits commensurate with their existing capital.

Finance and Banking

Treasury Deposits Discounted

The movements of funds affecting the money market position have been particularly heavy over the past week. Preparations for the Indian Government payments on the £70,000,000 of vested sterling securities immobilised funds at the end of last week, while a total of about £50,000,000 was then released last Monday. Revenue payments have continued high, and Warships Weeks in some of the big provincial cities have further disturbed the cash position of the banks primarily affected. The money position became suddenly difficult towards the end of last week, and the agent of the Bank of England had to come to the help of the discount market with special purchases of bills, while some of the non-clearing banks found it necessary to discount Treasury deposit receipts at 2 per cent at the Bank of England. This last move is evidence of the extent to which the banks have allowed their bills and money market assets to run down—a trend of which the February clearing bank returns already published provide startling confirmation. By Wednesday, the effect of the India loan disbursements had made themselves felt and the credit position turned comfortable, with the clearing banks again ready buyers of bills from the market. The latest Bank return, however, reflects no overabundance of credit, bankers' deposits having fallen by £7,978,000 to £128,848,000. The circulation is still climbing, and at £751,478,000 is £1,906,000 up on the week and within £300,000 of the high record set up on December 31st last.

Treasury Deposits and Tax Certificates

The national debt return for February reveals the issue of a further £51,020,000 of Tax Reserve Certificates in the four weeks to February 28th, and the redemption of such certificates—the first yet to be made—of £10,400 over the same period. The encroachment of these subscriptions on bank deposits has occurred at a period when deposits would in any case have been falling as a result of the seasonal spurt in revenue payments, and of comparatively large subscriptions to other Government loans in connection with the Warships Weeks campaign. In consequence, the banks have been hard put to it to maintain their cash basis at a normal level. Their efforts to achieve this are reflected in the monthly debt return, which shows that during February, Treasury deposit receipts were reduced by a net amount of £87,000,000. The amount raised from this source during the month was £20,000,000, and the redemptions

totalled £107,000,000. The nominal maturities for the month were £30,000,000, but it may be assumed that about a third of these had been encashed prior to maturity. Therefore, some £90,000,000 of Treasury deposits repaid during the month represented encashments prior to maturity.

The floating debt return shows a further increase of £24,435,000 in ways and means advances from public departments, which by the end of the month had reached the high total of £215,400,000, having risen from £128,870,000 on November 29th last. This may reflect the accumulation of funds by the Indian Government in anticipation of the sterling debt payments which took place at the beginning of this week. Ways and means advances from the Bank were outstanding to the amount of £21,750,000 at the end of February, an increase of £12,500,000 on the month. While Treasury bills issued through the tender fell by £40,000,000 over the month, those issued through the tap were up by £28,735,000. The usual summary of Exchequer returns, for the financial year to February 28th, showing the respective shares of revenue and borrowing in meeting expenditure, is given below:—

£000		£000	
Total ordinary expenditure.....	4,296,984	Total ordinary revenue.....	1,848,035

The Circulation

The monthly estimates of the true currency circulation in this country, which appear in the Bank of England's Statistical Summary, have been amended in two important respects. In the first place, the figures relating to the currency in Eire have been excluded, and the statistics now published are those for the United Kingdom. Secondly, the

index of estimated circulation is no longer adjusted for seasonal variations. It has been found since the beginning of the war that the seasonal fluctuations in the demand for currency have lost much of their importance—both absolutely and relatively. The shortening and "staggering" of the holidays has tended to smooth the seasonal impact of the holiday demands for currency while more fundamental secular trends in the circulation have largely swamped the seasonal variations. The series of statistics, amended in these two ways, has been carried back to the base year, 1935. The revised index of estimated circulation in the United Kingdom, which stood at 129.4 on the outbreak of the war, had risen to 194.3 by January last, an increase of 50.4 per cent. Over the last twelve months of this period the expansion in the circulation amounted to 25.8 per cent. The only important factor for which no allowance is made in the Bank of England estimates is the amount of currency held outside the United Kingdom. There can be no doubt that this has been considerably reduced since the outbreak of the war, and, in particular, during the weeks that followed the announcement that an embargo on the reimport of Bank notes would be applied. When this return of notes is allowed for it may be assumed that the true expansion in the circulation has been somewhat greater than the official estimates suggest.

A Central Bank for Eire

A bill providing for the establishment of a central bank in Eire was introduced in the Dail by the Finance Minister this week. The bill proposes to establish a bank to be the principal currency authority in the State, to dissolve the Currency Commission and transfer its powers and duties to the new bank, and to confer other powers on the bank. The Government of Eire have thus accepted the recommendations of the Banking and Currency Commission, which reported in 1938 and recommended that the Currency Commission be converted into a central banking organisation and given the required additional powers—especially to discount, make loans and keep the cash reserves of the commercial banks. The new legislation, of which full details are not available at the time of writing, may well create interesting problems for banks whose sphere of activities extends to the United Kingdom as well as Eire.

Switzerland's Gold and Dollar Reserves

The last two returns of the Swiss National Bank to reach this country, spanning the period November 29, 1941, to February 7, 1942, indicate a substantial conversion of foreign exchange holdings into gold. The gold reserve has risen over this period by Frs. 518,400,000, and the foreign exchange assets have fallen by Frs. 496,100,000. These two large, compensating movements are obviously related. The operations they reflect are a conversion of part of the US dollar assets of the Swiss National Bank into gold, which remains earmarked for that institution in New York. Until May, 1940, the foreign exchange reserve of the National Bank had remained fairly stable around Frs. 360,000,000. Then began a steep ascent which by the end of June, 1941, had carried the total to Frs. 1,311,000,000. In the main this increase was due to sales of dollars by Swiss nationals, who anticipated—and with some measure of prescience—restrictions on their freedom to dispose of dollar assets. These dollars had in large measure to be purchased by the National Bank. This institution has, in its turn, followed the policy of gradually converting its excessive holding of dollars into gold, and by the conversion indicated by the last two returns, it had brought its foreign exchange reserve back to the comparatively normal level of Frs. 440,600,000, and raised its gold holding to Frs. 3,124,100,000, or Frs. 955,800,000 higher than it was at the end of May, 1940. It should be noted that these considerable fluctuations in the National Bank's foreign exchange reserve take no cognisance whatever of the clearing balance between Switzerland and Germany. The Swiss authorities have been wise enough to isolate their currency and credit structure from the substantial Reichsmark claims which they are accumulating in the course of their trade with Germany. The Swiss clearing is, in fact, being financed directly by the Federal Government, which at the end of 1941 was called upon to advance Frs. 400,000,000 in order to restore the balance of the account.

Bombay Silver Goes Higher

The hoarding demand for silver in India is still keen, and, with the Reserve Bank continuing to hold its hand, the price has been climbing. A quotation of Rs. 73.1a per

100 tolas was reached on Wednesday and the demand was reported to be still unsatisfied. (In last week's note on the rise in Bombay silver the rupee quotations were erroneously given as "per ounce"; this should, of course, have read as "per 100 tolas".) At the rupee price touched this week, silver in Bombay has given a straight London parity of about 32d. per standard ounce or nearly 36 per cent higher than the ceiling of 23½d. to which the London price is now fixed. This disparity would, in normal times, disappear at once; but, as things are, it remains, since there is no means of arbitrating silver between the two centres. It is interesting to note, however, that while the Government of India has suspended sales at the higher price in Bombay it has even this week been a seller of small amounts in the London market at 23½d. In justification of this policy it can be argued that the sales in London satisfy a genuine industrial demand for the metal while in India they would feed a speculative and hoarding demand which the authorities naturally desire to keep in check.

The Trend of Fire Losses

A welcome reduction in fire waste is revealed by the estimates of losses from ordinary fires—as distinct from fires due to enemy action—amounting in 1941 to £10,254,000; this total is £2,386,000 (nearly 20 per cent) below the very high 1940 total of £12,640,000, but remains substantially in advance of the 1939 figure of £9,088,000. Moreover, losses in January, 1942, at £1,419,000, were higher

than in any single month of last year, with the exception of July. Estimates are prepared on the basis of known large outbreaks in Great Britain and Ireland, an arbitrary 60 per cent being added for fires in which the damage does not exceed £1,000; they relate to direct damage without inclusion of consequential loss. The causes of high losses persist in the continuous but imperfect adaptation of factories and plant to the war effort, in the employment of unskilled operatives working for long hours and in the obstacles presented by the blackout to the prompt detection of fires. Some improvement has no doubt resulted from the presence of fire-watchers on factory premises, but this precaution has not brought so great a reduction in ordinary fires as had been hoped for. The long overdue creation of a National Fire Service has hardly had time to bear fruit. How far the experience of insurers, whose results in the home field were in 1940 very poor, will react to the lower losses must depend on the corresponding premiums. In this connection the damage caused by enemy action must have caused some diminution in insurable goods and property. Values, it is true, have risen, and this feature is emphasised by the purchase tax; but few householders, and not all business firms, have yet brought their insurances into line. The whole system of rating is built up on the basis of insurance for full value, and as insurers have the right, in the event of under-insurance, to apply pro-rata average in calculating the amount of any loss payment, however small, policyholders should take steps to ensure that sums assured are adequate, apart from the need for full protection against total loss.

Investment

Funds Take the Lead

As was indicated last week would probably be the case, the actual disbursement of the money for the vested India stocks has brought a renewed wave of buying. But it is also the case that demand has been very largely concentrated

FIXED INTEREST AND EQUITY SECURITY MOVEMENTS (July 1, 1935=100)

Financial News indices of 20 fixed-interest securities (converted to new base) and 30 ordinary shares

upon fixed interest stocks, and among those on the irredeemable Government securities. So far the effect upon industrial equities has been little more than to counteract the minor recession which followed the recovery at the beginning of last week. It is quite definitely the Funds which have benefited, and for the first time for months there may have

been a net demand for them from outside London, instead of the steady trickle of provincial selling. This latest recovery finds little reflection in the accompanying chart, compiled from the indices of *The Financial News*, which includes only the average for the last week of February. The concentration on the Funds is in part a natural consequence of the type of security which is being paid off, for the yield on India stocks is closer to that on British Government securities than is that on any other class. At the same time, the general course of prices shows that, in the changed circumstances, the reaction in equities had not fully adjusted the yield position as between them and first line investments, the need for which has been repeatedly stressed in *The Economist*. The indications are that the relative improvement in the senior issues may go further. The payments for Canadian securities, due in rather over a fortnight, may perhaps go into slightly more speculative holdings. The stocks being paid off are, however, very high grade, as they carry at least the guarantee of the Canadian Government, and although many of the holders are probably trusts, it is doubtful whether much of the new money will find its way into anything junior to "gilt-edged" equities.

An All Round Setback

February saw a generalisation of the tendency to unload, which in January was concentrated on tin, rubber and Australian investments. Leading equities did not escape the depression which followed the fall of Singapore and the Japanese progress in Burma, although in the last week of the month they participated in a substantial recovery. The following figures, selected from the *Actuaries' Investment Index*, show a moderate rise in the price index of 24 per cent Consols and an increase of over two points in gas stocks and electrical manufacturing. It is noticeable that the failure of certain gas companies to declare ordinary dividends has produced no corresponding reduction in yield. Outside these groups, prices were generally lower. Cotton shares, with a fall of nearly five points, now yield over three per cent, while building materials have dropped over three points to yield over 4 per cent. Among productive equities, the most severe fall is that of eleven points for oil shares, a slump due wholly to the course of the war. In this market, a slump due wholly to the course of the war. In this market, the reverse was to some extent corrected in the last days of the month on an assumption that the contraction in supplies in might spell higher profits for those concerns remaining in Allied hands. The brewery and stores groups were also among the major casualties of last month's selling, although

in the latter case, too, the favourable dividend announcements of the last week aroused new hope. The fall in home rails was in part sympathetic, in part due to profit-taking after the dividend announcements. The yield is now the highest provided by any group of domestic equities, a

reflection of acute post-war uncertainty. The important miscellaneous group fell back by only 2.7 points, as did the total of all industrial equities included in the index, providing a yield of 5.17 per cent compared with 4.93 per cent at the end of January last and 6.40 per cent a year ago.

Railway Reports

Reports of the four main line companies add little to the information in the preliminary statements. For the most part, the slightly more detailed figures tell the same story as the earlier ones. There is, however, a substantial discrepancy in the case of the LMS, the result of which is that instead of a fall in non-controlled revenue, as was

clearly indicated by the preliminary statement, there is, as was expected, a substantial rise. This is due mainly to an increase of almost £172,000 in receipts from the Northern Counties Railway, although three road transport concerns—the North Western Road Car, Scottish Motor Traction and West Yorkshire Road Car—made appreciable contributions. These three companies, and still more United Automobile Services, explain the appreciable expansion in the outside revenue of the "Berwick" company. The Great Western actually suffered a decrease in similar sources, as did the Southern on its carrier company holdings, but for this line a rise in interest receipts more than offset these declines. The discrepancy in the LMS figures is similar to one which occurred a year ago, with regard to which the late Lord Stamp gave a partial explanation. This was not very revealing, but it suggested that the renewal provisions made were heavier than those allowed under the pooling scheme then in force. The lack of clarity in the very curtailed figures submitted by the railways is disgraceful, but scarcely more so than that which has always surrounded their published accounts. As usual, the statutory minimum of information has become in practice the maximum. It can only be hoped that the chairmen will be more explicit in their remarks to stockholders. The balance sheets show expansion in renewals funds, which is relatively large in the case of the LMS, but in the absence of further figures this has little meaning. There is no further light whatever on the matter of War Damage.

Higher Rand Taxation

The additional taxation imposed in last week's Union of South Africa budget on the gold-mining companies of the Rand is, in the circumstances, very moderate. Further, it is in a form which is calculated to raise the least opposition, per pound of revenue produced, since it is imposed on profits and does not tend to prevent the extraction of low-grade ore. The increase is almost identical with that imposed a year ago, but is smaller in that the rate of tax on gross profits is raised by four points to 20 per cent, whereas, at that time, it was expanded by 5 points, from

J. A. MCLEOD, President.

The Bank of Nova Scotia conducts a general banking business. Fully equipped for Exchange, Collection and Letter of Credit Transactions. Particular attention is devoted to business with Canada, Newfoundland and the West Indies, where branches of the Bank have long been established.

LONDON OFFICE: 108, OLD BROAD STREET, E.C.2.

E. C. MACLEOD, Manager.

(The Bank of Nova Scotia is incorporated in Canada with limited liability.)

H. D. BURNS, General Manager.

R. A. ELDER, Assistant Manager.

11 to 16 per cent. Further, to add to the satisfaction of the British holder of gold-mining shares, there is no increase in the non-resident's tax, whose imposition a year ago caused some heart burning. This is very pleasant indeed for the investor. On the whole, the shares have fallen on the news, but that is presumably due to the bull speculator selling now there is nothing more to go for, and, when that is over, there may be a recovery. It is, however, a little odd that, at a time when everybody is being urged to expand the war effort, the premier industry of the Union—whose contribution is, at best, indirect—should be given almost an encouragement to expand. The Government will get a slightly larger share of the total proceeds, and that total is likely to be increased by mining higher-grade ore, but not to a sufficient extent to maintain dividends in every case. Last year, there was a fall of rather over £1,000,000 in the total distributed. This year the shrinkage might well be less, but for the fact that the rise in costs is probably a factor of growing importance.

Company Notes

Austin Motor Earnings

Preliminary figures of the results of the Austin Motor Company for the two separate years ended July 31, 1940 and 1941, show a modest decline in gross profit in the earlier period and a recovery to a new high record of just over £1,750,000 in the second. General charges, of which the details are not so far revealed, but which seem to consist mainly of maintenance and normal depreciation, reduce, but do not change, the direction of these movements, but there is a special depreciation charge in each year, which alone means that the net amount available was lower in 1940-41 than two years before. In the later year, it was necessary to provide for war damage contribution, and, although it is possible to make an allocation to contingencies which received nothing from 1939-40 profits, almost half the total added is taken from the carry forward. The actual equity earnings, although up on the year, at 27.1 against 21.8 per cent, compared with 43.1 per cent for the last pre-war year. The following table gives such details as are available for the past three years:

	Years ended July 31st		
	1939	1940	1941
Gross profit	1,609,580	1,530,787	1,760,993
General charges	893,360	776,807	924,658
Deb. interest and S.F.	71,500	71,500	71,500
Preference dividends, net ...	144,187	65,250	57,719

Contingencies	105,000	...	100,000
Carry forward	312,290	356,047	311,595

† Gross.

It will be necessary to await the full accounts for any further details of the appropriations from gross profits and for such light as the balance-sheet may throw on current trading. The general picture presented is, however, a familiar one. The change over from peace to war-time production, or rather the completion of it, caused a reverse in the earlier year, although a smaller one than might have been expected. The second period shows the improvement associated with fuller production, which, rather unexpectedly, is reflected in higher equity earnings; but this is possibly due to the method of providing for taxation. The provision of 1938-39 contained £240,000 not payable until January, 1941. If the provision for the subsequent year was on the same basis, but at the new rate of 10s., and that for the third year still at the same rate, it would explain the very modest rise in this provision. Possibly, the full accounts will throw light on this point. Meanwhile, on any reading, the figures are satisfactory. The 5s. "A" ordinary, at about 15s. 6d. ex dividend, yield only some 3.225 per cent, which clearly discounts a marked improvement in post-war years.

The Courtauld Payment

The announcement of a second dividend by Courtaulds, in respect of the year 1941, and the statement which accompanied it, although welcome, do not greatly enlighten the shareholder as to the real value of his investment. The payment, which is in substance a final of 5 per cent, making 7½ against 8 per cent for 1940, is as good as could be expected. For more than three-quarters of the period, the company has been deprived of its American Viscose holding and there is no means of assessing to what extent the board has allowed for any income which may be derived from the compensation payment, still to be fixed. Nor does it seem possible to deduce from the decision to postpone the preparation of accounts and the holding of the annual meeting that a settlement of the arbitration on the amount to be paid for the Viscose holding is imminent. It is possible to hope that it is reasonably near, but other accounts have been held up for many months for no better reason than negotiations with the authorities as to terms of contracts. There is, of course, no indication as to what the result of the arbitration is likely to be, but it is reasonable to read the company's statement as a pointer that whatever is received is likely to be conserved in its entirety, at least for the time being. On the face of it, the payment of 7½ per cent suggests that there has been no marked fall in earnings, which for 1940 amounted to some 9.4 per cent. If this is so, the result must be fully up to the most optimistic expectations, for it indicates that the company has done almost as well, despite the loss of the American interest, the disappearance of more export markets, and the substitution for these, and for a material section of the internal demand, of Government orders. The switch-over is likely to go farther this year with, probably, a further modest fall in earnings, ignoring the Viscose compensation. The £1 stock units, at 32s. 6d. ex dividend, give a yield of approximately £4 12s. 3d. per cent, so that the price discounts eventual recovery rather than an early recession in profits.

Higher Retail Profits

The substantial nature of the recovery in earnings which was generally enjoyed by the London department stores last year is emphasised by the publication of two further preliminary statements, those of *John Barker* and *Garage*. Payments on ordinary capital for the year to January 31st last are being maintained at 10 and 7½ per cent, respectively, but in both cases net profits are higher. The increase in the net figure of *John Barker* from £196,897 to £253,748 is after tax, other than tax on dividends, and is probably a fair indication of the change in the total amount available. Pensions fund receives £10,000 as usual; £25,000 is written off both properties and fittings, and the transfer to general reserve is £5,000 higher at £35,000. For the fourth year in succession, there is a small increase in the carry forward, which amounts to £207,264 against £205,323, and it is possible to estimate that the rate of equity earnings is up from 14.7 to 16.7 per cent. The improvement in the results of *A. W. Garage* is less substantial, and the net profit figure of £97,066 against £93,343 is struck before taxation. Since tax liability rose by some £8,500 in the previous year, it is clear that the amount of equity earnings is below the 1940-41 level of £50,087, although it is possible that the earnings percentage is above last year's rate of 11.9 per cent. The improved results should not be regarded as the reversal of a trend, since it is clear that further restriction in consumption cannot be long delayed, but as the direct result of the cessation of bombing. The £1 ordinary shares of *John Barker* at 41s. 3d. yield £4 19s. 4d. per cent. The *Garage* 10s. ordinary shares offer £6 14s. 10d. per cent at the current price of 11s. 10½d.

Further Boot and Shoe Results

The latest accounts of boot and shoe companies reporting to end-December last suggest that trading conditions became increasingly difficult during the latter half of the year. The results of five concerns, all of which are interested in both manufacture and distribution, are analysed below. In each case, the results of the first six months trading, prior to clothes rationing, were sufficiently satisfactory to ensure approximate stability of gross earnings. In the case of *Greenlees*, the Scottish concern, there is even a slight rise in gross income from £88,738 to £88,831. The

amount of equity earnings is lower in all cases, a development which was inevitable in view of the check to expansion.

Company (Years ending December 31)	Total Dis- closed Profits	Earned for Equity		Divi- dend	March 5, 1942

* After tax, except tax on dividends. * After tax, including tax on dividends.
† Before tax on dividends.

sion of turnover, the increase in the standard rate of income tax and the necessity of meeting war damage contributions.

The greatest stability in equity earnings is shown by *H. E. Randall*, whose 7½ per cent dividend is still covered by earnings at the rate of 8.4 per cent. The 10 per cent payment on deferred distributed by *The Public Benefit Boot Company* is under-earned. The fall in equity earnings from 13.1 to 2.9 per cent. is largely due to the necessity of paying some £15,000 against nil for ARP and war damage contribution. The 25 per cent payment on the deferred capital of *Lennards* is still covered more than four times, but the high gearing of the capital apparently fails to inspire market confidence, and the shares offer a yield of 20 per cent. The only reduction in dividend is that of 2½ per cent to 12½ per cent on the ordinary capital of *J. Sears*. The steep fall in the rate of earnings from 21.3 to 13.0 per cent may be due in part to the lower income received from *Freeman, Hardy and Willis*, which announces a fall in net profits from £199,955 to £176,743. The boot and shoe group must, of course, suffer increasingly from the difficulties inherent in wartime trading. It should, however, derive a certain advantage from the fact that its products are peculiarly indispensable articles of clothing.

Cammell Laird Dividend

The preliminary statement of Cammell Laird for 1941 announces a final ordinary payment of 6 per cent, making 10 per cent unchanged for the year. Net profits are, however, substantially reduced at £186,548 against £241,852 after all charges. The rate of equity earnings is down from 23.7 to 21.0 per cent, a decline for which higher tax liability

and war damage contributions could easily account. There is the usual transfer of £100,000 general reserve, which involves a draft on the carry forward of £2,202, leaving a total of £102,611. In the previous year, the carry forward received an addition of nearly £40,000, following a rise in the amount of equity earnings from £225,394 to £241,852. The iron and steel market was encouraged to learn that, however hardly EPT and higher costs have borne on profits, there was no shock in store for the ordinary stockholder. Unlike the investor in Dorman Long, the equity holder is not exposed to the hazards of a highly geared capitalisation. The 5s. ordinary stock, at 7s. 9d., offers a conservative yield of £6 11s. 1d. per cent.

Destruction in Malaya

The statements of Mr C. V. Stephens at the meetings of Malayan Tin Dredging and Southern Malayan Tin Dredging make it clear that the complex question of compensation for damage to property in that area is not to be allowed to rest where it is. Despite the absence of a War Damage Act in Malaya, the directors of the two companies are preparing claims for compensation for submission to the appropriate authorities. In both cases, dredges were sunk in response to official instructions, and there is a probability that damage to plant will prove irreparable. It is no doubt

true that, when the war is won, the management and shareholders have, in equity, some claim on the Government, that is, on the country as a whole, for some contribution toward the cost of fresh equipment. The position is analogous to that of the shipping companies whose fleets may be lost through the hazards of war—with the difference that the tin mining industry enjoyed neither the benefits nor the disadvantages of requisition. None the less, the suggestion that time and labour should be devoted to the discussion of compensation claims at the present juncture appears out of place. There will be no compensation unless the war is won, and the assessment of claims is hardly a helpful contribution to this end. The position is completely dissimilar to that which aerial bombardment induced in Great Britain, since no payment on account can assist the Malayan enterprises to carry on in the national interest. Consequently, the present is no time to examine the controversies surrounding the basis and rate of compensation or the share of reconstruction which should reasonably fall on the company as its contribution to the common good. At the same time, managements will in general feel that they have a duty to urge such claims, and the position calls for a Government statement as to the course to be adopted. This should emerge in reply to the memorandum already presented by the tin and rubber companies, but it is doubtful whether any clear indication of probable action can be given until after the war.

Industry and Trade

The Need for More Ships

The full extent of the aggravation of the shipping problem since last December has become apparent in recent weeks. The collaboration of the Allied navies has not prevented a serious increase in merchant shipping losses at a time when the need for additional carrying capacity has been intensified by the outbreak of war in the Far East. The need for more fighting and merchant ships is great and urgent. The pooling of the merchant shipping resources and of the naval vessels owned and controlled by Great Britain and the United States and their utilisation to the best advantage, necessary though it is, can only mitigate the difficulties. It is clear that the United Nations will not be able to deploy their strength to the full without large numbers of additional merchant and naval vessels. Indeed, the course of the war will depend to a considerable extent on the quantity and kind of new vessels that can be put into commission this year. The need for new ships this year is as urgent as was the need for fighting aircraft in Great Britain in the summer and autumn of 1940. The welding of the ship production plans of the United States and Great Britain into a single programme is therefore as essential as collaboration in the use of existing ships. Only experts can work out the programme of construction and the details of collaboration. The mere fact that the tonnage of merchant ship construction in Great Britain remains below capacity as estimated before the war does not necessarily mean that the shipbuilding industry is not utilised to the full; the Government may have found it necessary and advantageous to utilise a larger proportion of the country's shipbuilding capacity for the construction of naval vessels. But there are persistent reports that the total volume of its output is not as large as it might be. If they are true, immediate and drastic action is imperative.

Scrap and Iron Ore

There is as yet little news concerning the progress of the new scrap campaign initiated last January. The object of the campaign is to secure an additional 40,000 tons of scrap per week in order to enable the steel industry to operate at a higher level than in 1940 in spite of the virtual suspension of scrap shipments from the United States. In order to secure large quantities of the heavier and more useful kinds of scrap, it was announced in January that a national survey of existing supplies was to be made and that owners of material exceeding three tons in weight would be required to disclose it by Order. But although nearly two months have now passed since the announcement of the new scheme, no such Order has yet been issued. It is to be hoped that the delay will not be prolonged and that the Order will be

widely drawn, for its success must depend in no small measure on the way in which scrap is defined. But a substantial increase in the supply of scrap is not enough if steel production is to be increased this year. The proportion of scrap that can be used for making steel is limited by technical considerations. An expansion in the output of steel will therefore necessitate larger supplies of pig iron, the other of the two main ingredients of steel. But if the supply of pig iron is to be increased, the output of iron ore—the raw material of pig iron—will have to be raised. Although production showed an increase last year, a determined effort will have to be made to secure a further expansion in 1942.

A National Coal Board

As an alternative to the nationalisation of the coal-mining industry, the Mineworkers' Federation has worked out a scheme, approved by the National Council of Labour, for the control of the mines by a National Board, representing miners, owners and the Government. While details of the scheme have not yet been published, it is understood that the Federation does not contemplate any serious disturbance of the central and regional machinery which the Government has created for the regulation of output and supply during the war. The immediate purpose of the miners' leaders is to secure for the Federation a more direct and active participation in the management of the industry, embracing commercial and financial matters as well as industrial relations. The miners have been aiming at fundamental changes in this direction since the outbreak of the war. In September, 1939, their representatives on the Joint Standing Consultative Committee asked for and were granted an extension of the scope of the activities of that body "to cover all questions of a general character affecting the industry." The achievements of this Committee include the agreements linking flat wage rates to the cost of living index, providing for the payment of an attendance bonus of 1s. per shift, for local co-operation between employers and workmen in the avoidance of non-unionist disputes, for the establishment of national and district safety boards, and for the adoption of the recommendation of the Rockley Royal Commission on Safety in Coal Mines in favour of quarterly compulsory inspections of mines by full-time workmen's representatives. In addition, the Committee has been the mouthpiece of the industry in the discussion of output and manpower problems with the Government.

In April, 1941, when applying to the owners for a national minimum weekly wage of £4, the Federation asked for a Joint National Board with executive as well as advisory

powers. In a memorandum to the Mines Department the Federation included "the establishment of a Joint National Board to cover all problems affecting the coal-mining industry" among its conditions of recommending the acceptance of the Essential Work Order by the miners. Both demands were unsuccessful. The differences between the employers and workers on this issue are as acute as ever. The pre-war Governments were in principle favourable to the establishment of a National Board, but the present Government is pledged not to raise issues of a political and controversial character during the war. Pending the restoration of peace conditions it would, in the present grave national situation, seem the wiser for the Federation to develop the good work of the Joint Standing Consultative Committee. The test of any new scheme introduced during the war must be its effect on the efficiency of the industry. And although full details of the Mineworkers' Federation plan are not yet available, it is doubtful whether any scheme of this kind will pass this test. It is no less a fallacy because it is frequently stated to claim that a body chosen on the principle of representing interests is fitted to run an industry efficiently. It is competence not representativeness that is needed in such a body—and competence only; and, in any case, representation is already provided for in Parliament and in the machinery of collective bargaining.

Pre-Fabricated Houses

The idea of manufacturing dwelling-houses and other building units required in large numbers in the factory and of assembling them on the spot has long been discussed as a means towards cheapening their cost. Experiments have been made in many countries, but even in the United States, the home of mass-production, this method has made comparatively little headway. A stimulus has been given to research and experiment in this country by the urgent need for economising steel, timber and labour, and by the frequent shortage of constructional facilities in districts where new buildings are needed quickly. This movement has been encouraged by the Ministry of Works and Buildings, and a number of types of hut, in reinforced concrete, in timber framework with plaster-board or asbestos cement cladding, and in plywood, have been developed. The reinforced building is reported to have the advantage of being economical in the use of both steel and timber.

According to a report issued by the British Concrete Federation, a design in reinforced concrete has been evolved which is largely pre-fabricated and capable of erection on the site with a high proportion of unskilled labour. The method of construction is said to be almost as simple as that employed in children's constructional toys. A light-weight raft foundation is prepared, into which are fitted reinforced concrete posts which take the weight of the roof beams and are slotted for the insertion of walls. The roof consists of breeze concrete slabs, and the walls are formed by an inner and an outer panel with a cavity of one and a half inches between them; the inner panel is of light-weight breeze concrete, and the outer panel consists of dense pressed concrete. The walls have been designed to give protection against the changeable British climate; the buildings are warm in winter and cool in summer. Hostels of this type are already being constructed, but designs have been prepared for many other purposes, including emergency school buildings, canteens, recreation halls, emergency houses for munition workers, communal baths for evacuation areas, laundries, and welfare centres for rural districts. While no information has been given about the cost of these pre-fabricated buildings, the experience gained by their adoption may play an important part in the evolution of construction methods after the war.

Allied Tin Smelting Facilities

Before the war some two-thirds of the world's supply of tin ore came from the Far East, chiefly from Malaya and the Dutch East Indies. The greater part of those sources of supply have now been lost by the Allies. The metal content of the prospective output of tin ore in Bolivia, the Belgian Congo, Nigeria and in other non-Pacific countries accessible to them has been estimated at about 80,000 tons

per annum, though it appears that determined efforts will be required to reach this target in the current year. But although 80,000 tons of virgin tin would go a long way towards meeting the essential needs of the Allies, the extraction of the requisite quantity of ore is only the first step in the production of the metal. Unfortunately, the proportion of the world's smelting capacity lost since the outbreak of war has been even greater than that of tin ore supplies, for it was concentrated largely in the Far East, on the islands of Penang, Singapore and Banka. The refinery in Holland, with an annual capacity of 28,000 tons, and that in Belgium, capable of producing 7,500 tons per annum, were lost in 1940. The only other facilities in actual operation not located in the Far East are in Great Britain and in the Belgian Congo. The capacity of the plant in the Belgian Congo has been increased from 2,500 tons at the outbreak of war to some 10,000 tons per annum. The smelting industry in Great Britain produced 58,000 tons of tin in 1929, but in recent years output, chiefly from Bolivian and Nigerian ore, has been appreciably below that level. Present Allied refining facilities are therefore inadequate for treating the ore still at their disposal; moreover, the shipment of the bulk of the ore for treatment in this country has many disadvantages, especially as the United States is by far the largest consumer of the metal. Fortunately, the solution of the refining problem, created by the loss of the facilities in the Far East, is already in sight. The new smelter at Texas City in the United States is scheduled to come into operation next month. Its initial annual capacity of 18,000 tons will be doubled before the end of the year, and a further expansion to 50,000 tons is understood to have been planned. Since the quantity of new tin available to the Allies can be supplemented from their stocks and by an increased output of reclaimed metal, a serious shortage of tin for vital purposes is therefore improbable in present conditions.

A Complete Banking Service

THROUGH its widespread organisation, Barclays Bank offers the fullest possible facilities for the transaction of every kind of Banking Business, at home and abroad

Full particulars of the various services provided may be obtained from any Branch of the Bank

Exports of Wool Textiles

While exports of wool yarn and tops continued to shrink in the past year, shipments of tissues, which recovered in the third and fourth quarters, were bigger in volume than in 1940 and not far below the pre-war level. The course of exports of yarn, tops and tissues since 1938 is shown below:—

	Yarn (‘000 lbs.)	Tops (‘000 lbs.)	Tissues (‘000 sq. yds.)
1938	35,000	32,454	90,534
1939	31,000	33,848	93,480
1940	15,000	28,470	83,045
1941—			
First Quarter	2,503	4,278	15,313
Second „	2,600	4,477	14,929
Third „	3,459	4,022	22,875
Fourth „	3,200	3,392	33,222
Total	11,762	16,169	86,339

The divergent trend of exports of yarn and tops and of tissues is ascribed partly to the fact that while shipments of the first two were restricted by the operation of a licensing system, those of the last were virtually unrestricted. Since returns concerning the destination of exports of tissues are not available, it is difficult to ascertain how far the recovery in shipments of tissues during the second half of last year has been due to the supplies sent to Russia. It is unlikely, however, that the improvement will continue during the current year, for the need to economise wool and labour has made necessary the extension of the licensing system to woven wool goods and blankets. Each firm has been notified concerning the volume of goods it may send to individual overseas markets. The initial allocations are meagre.

Dearer Lubricants

Substantial increases in the price of branded lubricating oils and greases came into force on Monday. This was the inevitable consequence of last month's advance in the rates at which the Lubricating Oil Pool—the organisation of importing companies—sells to blenders and distributors in this country. The Pool's current selling prices (per ton, bulk, duty paid) are shown below, together with comparative figures for earlier dates. The reduction in the number of grades, and the changes in the method of quoting, introduced at the beginning of the war make comparison with pre-war rates impossible; and the comparison with December, 1939, should be regarded as approximate only:

	(Per Ton)	Before Latest Increase	Current Price
Mineral Colza	Dec. 5, 1939		
Pale spindle oils	£12.2.6	£13.2.6	£14.12.6
	£8.15-	£11.2.6-	£14-
Machinery & engine oils	£16.17.6	£18.5	£21.7.6
	£10.12.6-	£12.2.6-	£15.5-
Refrigerator oils	£17.12.6	£22.2.6	£25.10
	£12.5-	£14.2.6-	£22.17.6
Filtered cylinder oils..	£16.15	£14.10	
	£16-	£19.10-	£23.17.6-
Dark cylinder oils	£31.12.6	£30.5	£33.12.6
	£10.2.6-	£11.17.6-	£15.5-
Dark lubricating oil...	£21.5	£19.7.6	£22.10
	£7.15	£10	£13.5

The magnitude of some of the recent increases in the prices of these vital products has led consumers to question the wisdom of maintaining in the special case of lubricating oils the pre-war marketing arrangements which reward the oil salesman with substantial commissions for performing the function of diverting orders from one company to its competitor. Criticism has also been heard of the wholesale price increases which set the upward spiral in motion. There have, it is true, been certain advances in American lubricating oil export prices since October, 1940, when the last change was made in the British wholesale price schedule; and shipping costs have, in all probability, also

The 79th number of the annual **Commercial History** will be published as a supplement to **The Economist** next week; it will contain a summary of war-time economic changes in 1941 at home and abroad.

risen. But so long as they keep the public in the dark as to the full reasons for their action, the Pool and the distributing companies must expect criticism.

Organisation of Road Transport

In contrast to the railways, which, for all practical purposes, form a single operating unit, road transport is divided between those who use their own vehicles to transport their own goods or themselves, and those who hire vehicles to carry goods or pay fares in public service vehicles. In consequence, the interests of the various categories of road-users are often conflicting; this explains the difficulty in the way of the collective organisation of road transport. In the 40 odd years of the present century a number of associations have been formed which have established themselves as the representatives of particular sections of the road transport industry. Some of these do, in fact, represent more than one branch of the industry, but other associations have preferred to concentrate on a purely sectional basis. In more recent years the need for an all-embracing organisation which could, on matters of general interest, act as the mouthpiece of the representative organs of all those concerned in the use of roads, led to the foundation, in 1932, of the British Road Federation, whose membership embraces 56 national associations. In an industry where there are hundreds of thousands of separate vehicle owners and operators, unity of representation can only be achieved through associations which group themselves together. There will always be some operators who stand out of the associations, but the great majority of them are now inside one or other of the representative organisations which are members of the British Road Federation. Contact between the road interests and railway transport is maintained by means of a special liaison committee set up for the purpose, known as the Road and Rail Central Conference, the membership of which is equally divided under joint chairmen of the two forms of transport.

Wartime Dress Reform

The Director-General of Civilian Clothing, Sir Thomas Barlow, has outlined further plans made by his department to clothe the community with clothes of the maximum utility and the minimum of material. These plans include the designation of 1,200 firms to make utility clothing, and the control of the amount of material and accessories to be used in non-utility garments. Two-thirds of the material produced for home consumption is to be of utility specification. Utility clothing already beginning to appear in the shops is of good quality and the simplicity of such garments is an advantage rather than the contrary. The idea of utility garments must be more positive than merely saving materials, accessories and labour; the utility mark must be a guarantee of quality. Clearly, it is better in the national interest to make as few garments as possible, and it is therefore essential that such garments as are made shall have the capacity of being worn for several years without renewal. To advise on the best methods of carrying out the utility garment programme, Sir Thomas has set up panels, with a membership nominated by the trade associations concerned. Non-utility garments will continue to be made but under control. Without doubt the long rows of buttons which never unbutton and elaborate pleating and frills should long since have disappeared from women's dresses. Skirts, it would appear, are likely to be shorter. By cutting out all unnecessary and by limiting the number of available colours, widespread economies may be possible and may be reflected in lower prices. In new clothing the abolition of the turn-up on trousers, of double-breasted coats and of sleeve buttons is likely to take place. Side by side with these proposals, the War Office has announced modifications in the regulation pattern of officers' service dress and khaki drill jackets by the removal of box pleats from breast pockets, the replacement of the lower patch pockets by slit pockets with no button, and the substitution of a plain sleeve for the present built-up cuffs. Further economies might be made by reducing the hems on skirts, the consideration of every button from the strictest utilitarian point of view, the non-use of shoddy materials with no lasting properties, the limitation of the manufacture of neckties, limits on the dimension of scarves and handkerchiefs, and the extension of the use of protective clothing. Cleaning processes which reduce the life of garments should be reviewed, and in fact every method of making existing clothes last longer should be adopted.

COMPANY MEETINGS

PROVIDENT MUTUAL LIFE ASSURANCE ASSOCIATION

INCREASED NEW BUSINESS

The 101st annual general meeting of the Provident Mutual Life Assurance Association was held, on the 4th instant, in London. Mr Owen Hugh Smith, the chairman, said that the life assurance fund had increased during the year by £441,000, and there was again a moderate growth in the premium income, which was now over £1,260,000. Gross interest, dividends, and rents were higher than in 1940, and although they had paid more income-tax the net figure had also risen slightly. But reckoned on a larger life assurance fund the gross rate of interest showed a fall to £4 14s. 8d. per cent., and the net rate had likewise fallen to £3 12s. 7d. per cent. Those falls were mainly due to the increase in the proportion of their assets invested in British Government securities. Since the commencement of the war they had subscribed close upon £1,000,000 to new British Government Loans.

The total claims paid were again higher, and for the first time exceeded £1,000,000, largely accounted for by the growing volume of their business. The death claims directly due to the war amounted to some £43,000, but apart from those their mortality experienced continued to be favourable. The total new business amounting to £1,721,950 was some £35,000 in excess of the figure for 1940. That result was very creditable to their new business organisation throughout the country, and was especially gratifying when it was borne in mind that large numbers of those whom they might have expected to effect new policies were on active service, as were also many of their agents.

So far their profits had been less seriously affected by the war than might have been expected. It was true that the rate of interest earned on their funds had fallen, and as the result of their policy of investing all their surplus income in Government loans it would no doubt fall further. But on the other hand their investment position was very satisfactory, death claims arising from the war had not been unduly heavy, and there had been a saving in expenses. They were confident that when those difficult times were over the association would emerge in a strong position.

The report was adopted.

SAN FRANCISCO MINES OF MEXICO, LIMITED

A WELCOME IMPROVEMENT

The twenty-ninth ordinary general meeting of San Francisco Mines of Mexico, Limited, was held, on the 4th instant, at Winchester House, Old Broad Street, E.C., Mr C. T. Pott presiding.

The chairman, in the course of his statement, said: The results for the year show a welcome improvement upon those for the previous period, and in fact upon any period since 1936-37. The operating profit at £156,721 compares with £22,232 for the previous year, an improvement of £134,489. After charging reserves for depreciation of plant and Mexican taxation and the usual London overheads and crediting interest earned, the net profit is £108,612. Deducting £21,665 which stood to the debit of profit and loss account at the beginning of the year, £86,947 is available for appropriation. From this the directors propose the payment of a dividend of 9d. per share, which, after allowing for directors' special remuneration, will leave £5,960 to be carried forward. The company's profits standard is such that no liability for excess profits tax is incurred.

The better operating results are due mainly to increased prices for lead and zinc, and would indeed have been better still if it had not been for the shortage of labour, making it only possible to mill 407,860 tons of ore, or 93 per cent. of the tonnage milled in the preceding year. As a matter of fact, it was necessary to place the mill on a five day per week operating basis in April last.

SATISFACTORY DEVELOPMENT WORK

Last year, owing to labour shortage, development work was limited almost entirely to the opening up of the more promising ore-bodies, and no long-range development could be attempted. The result of this limited development work was satisfactory and gives ground for the hope that an expansion of the work now made possible by the increased labour available will continue to disclose good grade ore, both in the San Francisco and Clarines mines.

The political situation in Mexico has become more tranquil, and there is evidence of a more sympathetic attitude to mining enterprise except in the matter of taxation. A proposed excess profits tax has been dropped, but the rate of income-tax has recently been materially increased. Furthermore, the metal export tax which had been partially suspended has been reintroduced. We can only hope that the legitimate protests which the mining community is making will result in obtaining some amelioration of such taxation.

In the first four months of this year we have made an operating profit of over \$270,000. The outlook for metal prices is encouraging, but on the other hand we are encountering difficulties in obtaining essential supplies. We do know, however, that the mine continues to open up well, and that the metals we produce, all of which go to the United States, are essential for the war effort.

The resolution for the adoption of the accounts and the payment of a dividend of 9d. per share was unanimously passed.

MALAYAN TIN DREDGING, LIMITED

The adjourned thirtieth annual general meeting of Malayan Tin Dredging, Limited, was held, on the 27th ultimo, in London.

Mr C. V. Stephens (the chairman), in the course of his speech, said: The profit for the year is £125,513. The directors recommend a final dividend of 5 per cent., less tax, making 55 per cent. for the year, the same as in the previous year.

It is with profound regret that I have to refer to the ill-fortune which has befallen our company, and all other companies operating in Malaya, through the invasion of the Japanese. It appears that just before Christmas the general manager received official orders to sink all the dredges and that he took the necessary steps accordingly. We may find, after the Japanese have been driven out of Malaya and we are able to return to the property, that the dredges have been reduced more or less to scrap iron, the value of which probably would be nil. Our plant having been sunk under official orders, it follows as a plain matter of equity that we are entitled to be compensated for the damage sustained. In the confident expectation that the principle of compensation will be duly accepted by Government we shall take steps to prepare our claim for submission to the appropriate quarter.

The report and accounts were adopted.

SOUTHERN MALAYAN TIN DREDGING, LIMITED

The adjourned fifteenth annual general meeting of Southern Malayan Tin Dredging, Limited, was held, on the 27th ultimo, in London.

Mr C. V. Stephens (the chairman), in the course of his speech, said: The profit for the year was £177,302. The incidence of excess profits tax caused the total dividends for the year to be limited to 40 per cent. The tonnage won constituted a record for your company.

Referring to conditions in Malaya, the chairman said:

The general manager, acting under official orders, took the steps necessary to sink the dredges. It is impossible to say what the condition of the dredges will be like when they again come into our possession. In the confident expectation that the principle of compensation will in due course be admitted by Government, steps will be taken to prepare our claim for submission to the appropriate quarter, but on what basis such compensation will be calculated no one can make any forecast.

The present outlook is far from good, but I have no doubt the tide will turn and that the time will come when we shall again enter into possession of our property.

The report and accounts were unanimously adopted.

OFFER TO NEW READERS

Any reader who makes his first acquaintance with this journal with this week's issue is invited to fill up the attached: To The Publisher, Economist Newspaper Ltd., Brettenham House, Lancaster Place, W.C.2

In order to test the value of your publication I should like you to forward it to me by post for the next four weeks. If I then decide to become a subscriber, it is understood that there will be no charge for the copies thus received, but otherwise I shall be willing to pay 4s. to cover their cost.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

THE effect of the re-investment of the Indian vesting disbursements on the gilt-edged market overshadowed all other activity in the early part of the current week. Nevertheless, interest was not centred entirely on the Funds, and there was a welcome extension of inquiry to other sections for leading industrial equities. The feature of the *gilt-edged* market was the advance in the irredeemable stocks at the reopening. Old Consols and Local Loans both rose $\frac{1}{8}$ on the ex-dividend prices, while $3\frac{1}{2}$ per cent War Loan advanced $\frac{1}{8}$. The improvement was, to a much lesser degree, shared by dated loans, while Tuesday witnessed a further general advance, Local Loans and $3\frac{1}{2}$ per cent War Loan gaining a further $\frac{1}{8}$. In contrast, the *foreign bond* market was dull, although a small general improvement reflected some inquiry for Mexican and Chilean bonds on Monday, and Peruvian Corporation issues the following day. Otherwise prices remained steady. The *home rail* market lacked interest, and prices fluctuated within narrow limits, although GW ordinary gained $\frac{1}{4}$ at the reopening. Tuesday witnessed some demand for the prior charges, the "Berwick" 3 per cent debenture rising $\frac{1}{2}$ points among other smaller improvements. Some support was forthcoming for South American issues in the *foreign rail* market, and with stock in short supply prices advanced. The rise in the Funds

continued on Wednesday morning, but later selling predominated and prices closed below the best.

The general advance in the Funds gave rise to a distinctly better tone in the *industrial* market, and after the renewed decline prices were definitely firmer in several sections. Brewery shares advanced steadily on consistent support, with Bass particularly prominent, although Guinness moved against the trend on Tuesday, losing $\frac{1}{8}$. Later, Meux's gained $\frac{1}{8}$, on the increased dividend. In the motor and aircraft group, Rolls-Royce advanced $\frac{1}{8}$ both before and after the week-end, but generally prices fluctuated narrowly. Heavy industrial issues enjoyed numerous small gains at the opening, but some irregularity was apparent on Tuesday. Shipping shares lacked interest, but prices generally remained steady. The announcement of the redemption at par of the Elder Dempster Line Holdings 3 per cent debenture raised the price 28 points. Among textile shares, Courtaulds reacted on the dividend announcement before the week-end, and other issues were generally dull. Stores issues were prominent at the close of the previous week, J. Barker, Harrods and Marks & Spencer all rising $\frac{1}{8}$, but prices reacted slightly at the reopening. The tobacco group was firm throughout, Imps gaining $\frac{1}{8}$ and Carreras $\frac{1}{8}$ on Tuesday after some earlier improvements. In the miscellaneous section, Cable and Wireless issues weakened slightly on Monday, when Murex repeated the previous Friday's loss of $\frac{1}{8}$. In midweek there was some recession in turnover but with little effect on prices.

The *kaffir* market reflected the Cape's considerable satisfaction on the modest increase in taxes as announced in the Union budget at the end of the previous week. Substantial gains on Cape orders were registered on the Friday, but buying was not resumed during the early part of the current week, which brought some London slightly lower levels. The volume of business in the *rubber* and *tea* markets was negligible, but there was a further easing of quotations. The developments in the East Indies were hardly conducive to business in the oil market, where before the week-end Ultramar fell $\frac{1}{8}$ on profit-taking, although Trinidad Leasehold advanced $\frac{1}{8}$. Quiet dealing at the reopening, but the following day prices improved slightly. In particular, Trinidad and Venezuelan issues were firm. In later dealings, these markets remained inactive, with some small changes in oil shares.

New York

SENTIMENT on Wall Street improved on the reports of the Allied resistance to Japanese landing efforts on Java at the end of the previous week. While a definite trend failed to develop, small gains were well scattered among leading issues. After a slight recession at the reopening, some short covering purchases occasioned a slight recovery the following day. In midweek the new tax proposals and higher freight rates brought a general reaction.

Export Control.—Under the Board of Trade Export of Goods (Control) (No. 9) Order, which comes into force on March 17th, control is extended to cover containers made from black plate and, in the case of certain destinations, to asbestos scrap and waste. The Order also extends the existing control in respect of paper, paper board and certain articles manufactured therefrom. Another Board of Trade Order has revoked all outstanding export licences for scrap and waste wholly or substantially made of rubber.

Flour Mixtures Order.—An Order of the Minister of Food prohibits the manufacture, except under licence, of flour mixtures and the packing of flour and flour mixtures in small containers for sale by retail. The Order, which is entitled the Flour and Flour Mixtures (Licensing and Control) Order, 1942, defines flour mixtures as any article of food, except cooked manufactured products, containing 25 per cent or more of wheat flour, including self-raising flour and any mixtures of flour with sugar, saccharin or dextrin. The restrictions come into force on March 30th. Persons manufacturing or packing 10 tons or less of flour or flour mixtures a year are exempt from the licensing requirements.

Horse-hides Controlled.—By the Control of Horse-hides (No. 1) Order, 1942, which came into force on March 5th, the acquisition of home-produced horse-hides by tanners and the disposal of such hides to tanners becomes subject to licence. Maximum prices for horse-hides are fixed and the holding by any person of more than 25 horse-hides is forbidden except under licence. Inquiries arising out of the Order, which was made by the Ministry of Supply, are being dealt with by the Leather Control.

Tomato Prices.—The Home Grown Tomatoes (Maximum Prices) Order came into force on March 1st, and prescribes four price periods and six price areas, according to which the prices vary. The periods are March 1st to June 14th, June 15th to August 2nd, August 3rd to November 1st, and November 2nd to the end of the year. Area 1 is any area not specified in the other areas; area 2 covers roughly London and the Home Counties; area 3, northern counties and the Lowlands; area 4, the Highlands; and area 6 covers Northern Ireland. prices by growers vary from 9d. to 1s. 4d. per lb., on sales by primary and secondary wholesalers from 10s. 5d. to 17s. 10d. per 12 lbs. net; on sales by retail from 1s. 3d. to 1s. 11d. per lb.

Food Mission in Canada.—A change is announced in the machinery of negotiation for procuring food supplies for this and other British countries from Canada. Negotiations have hitherto been conducted directly (in the case of Canada) from this country, and through the British Food Mission to the United States, in the case of supplies from the latter country. This mission has now been reconstituted as the British Food Mission in North America, and its functions and duties have been extended to Canada. The Canadian headquarters of the newly constituted mission have been established at Ottawa, and Mr G. H. S. Pinsent, CMG, until recently financial adviser to the British Embassy, Washington, will have charge of the Mission's Canadian business, under the general direction of the Hon. R. H. Brand, the head of the Mission.

Cotton.—There has been relatively little business on the Cotton Market, and while a considerable inquiry has been dealt with in some quarters, difficulties in arranging terms of fresh contracts tend to increase. Ordinary business is small, due, partly, to the small export quotas available for shippers and partly to limitations upon the manufacture of goods for home civilian use. Government buying has been fairly extensive, and there are definite indications that a larger proportion of the output of the industry is being set aside to meet war requirements of the Home and Dominion Governments and the Allies. The owners of spinning mills stopped under the concentration of production scheme have made a claim to the Cotton Board for better terms for care and maintenance. It is understood that a request has been made for £15,500 per year instead of £7,000 for a mill of 100,000 spindles. There have been further reports that yarn deliveries from spinners are on a larger scale, as a result of the overtime worked in the mills, but many manufacturers are harassed by the short supply of twists, especially ring beams.

Pottery.—The Board of Trade have renewed for a further three months the general licence authorising unrestricted supplies of certain articles, if made of plain,

Nature of Borrowing (Conv. Excl.)

CONVERSIONS AND REPAYMENTS

Elder Dempster Holdings, Limited.—The outstanding £217,378 3 per cent. convertible non-cumulative income debenture stock will be repaid at par, with accrued interest, June 15, 1942.

Shorter Comments

Brazilian Traction, Light and Power Company, Ltd. (\$000s.).—Gross operating income in January \$3,726 (\$3,292), net earnings before depreciation and amortisation \$1,983 (\$1,703).

Bank of Nova Scotia (\$000s.).—Total assets year ended December 31st \$380,393 (\$328,683). Cash \$35,784 (\$26,072). Government and public securities \$122,392 (\$119,881), other loans and discounts \$123,694 (\$112,768). Deposits \$297,571 (\$269,640), acceptances and letters of credit \$31,482 (\$6,703). Net profit \$1,936 (\$1,941).

undecorated, earthenware or of china undecorated or decorated merely with a plain band not more than one-eighth of an inch in width, or with a plain line and edge. The articles include tea and breakfast cups and saucers, mugs, beakers, plates, coffee-pots, teapots, jugs, sauce-boats, meat, vegetable and pie dishes, casseroles, bowls, pots, teapots, jugs, sauce-boats, meat, vegetable and pie dishes, casseroles, bowls, basins, ewers and chambers.

Waste of Paper.—The Minister of Supply has made the Salvage of Waste Materials (No. 2) Order, which comes into force on March 9th, under which to burn, destroy, throw away or to dispose of, paper and cardboard, except to a collector or buyer, or to mix it with refuse, will be punishable offences. The definition of waste paper is "any waste, scrap, worn-out or disused material or article, being paper or cardboard or an article made therefrom, but does not include any secret or confidential document."

and the Moslem League, the one for an independent All-Indian parliamentary democracy and the other for Partition, are irreconcilable. Mr Jinnah, on behalf of the Moslem League, flung a warning of "revolt" into the middle of the Cabinet's discussions, when he feared that his Moslem followers might be placed under Hindu majority rule. Pandit Nehru and Mr Gandhi, on the other hand, have refused even to discuss collaboration until the Congress view does prevail, and India is free to make its own war and choose its own allies. It is the rôle of political leaders, especially in opposition, to set differences in unreal high relief; and it is the character of Eastern bargainers to put their first bids artificially high. Moreover, the parties are not India. Congress membership is less than 1 per cent of the total population, the League's membership less than 1 per cent of India's Moslems. But it is with the political leaders that Sir Stafford Cripps must make his accord. That this nettle should not have been grasped until now, when it may be only days before Indian territory is attacked by the Japanese, appears fantastic. But it is small wonder that the Cabinet has faced this last chance with high seriousness and refused, even now, to commit Britain and India publicly to any scheme, until there is some earnest that its consequence is likely to be co-operation and not conflict. It is Sir Stafford Cripps' task to obtain that assurance.

If this offer is as generous as may be hoped, then the British Government, very belatedly, has done its duty. It remains for the leaders of Indian opinion, for the present safety and future freedom of their peoples, to do theirs. If they are patriots as well as politicians, there is more hope for a settlement than the record would suggest. It would be hypocritical to deny that the expediency of the moment has given British policy the air of a death-bed repentance. The spokesmen of the *status quo* in India had always given the needs of Indian and Imperial defence as their chief justification. Now the

ground has been cut away under them by events; without the free aid of all Indians—the martial localities are already playing their usual notable part in the Forces—India may well be indefensible. But the presence of Sir Stafford Cripps is a guarantee that much more than expediency is involved. The question is for what regime the Indian communities will fight and work together. The new answer that has gone out to India, whatever its exact form, must be the old one—that is, the freedom and responsibility which have been promised by Britain to India for a generation. The means may now be different from those envisaged in 1919 and 1935, for it is clear now that continental, eastern India cannot copy small, insular and parliamentary Britain precisely; but the end must be the same. This is no sudden change of heart. No nation has shown more tangibly than the British its recognition of the truth of Aristotle's contention that a democracy cannot maintain an autocratic Empire without being corrupted and enfeebled.

The mission may fail. The British Government may perhaps have done the "right thing" at last; but there is no single "right solution" for complicated human problems like those of Ireland, Yugoslavia or India. Southern Irish and Ulstermen, Croats and Serbs, Hindus and Moslems—they are split by religion and history; they can only come together by tolerance and the will to agree; and it remains to be seen whether Britain's offer, Japan's threat and India's danger can create these bonds. Whatever the upshot of the message—and it should not be disguised that the effects of failure may be almost as disastrous as the consequences of making no offer at all—this passage to India is an episode of personal piety and, it may perhaps be believed, of national wisdom. The Prime Minister, whose earlier views on Indian government are no secret, has shown courage as well as the Lord Privy Seal. The next and decisive step will be India's answer—unless Japan intervenes in the parley.

Spartan Living

THE Japanese are in sight of India and Australia; the Germans are almost ready for a desperate effort in the spring; and the shipping problems of the Allies, because of their needs, much more than because of their losses, are acute. In London, the new Government is in harness and its deeds are anxiously looked for. One view about the Ministerial changes is that they were due to carping intrigue intended to eat away the authority of Mr Churchill. No one can deny that there have been manoeuvres and bargains and even feuds; but this view is, nevertheless, quite false. Already it has done serious harm in the United States, where a number of unfriendly newspapers have seized upon it. The true interpretation is quite different. The need for government in a higher gear has been demonstrated by the course of events. The call for a more urgent sense of crisis, for stricter command and obedience in administration, for greater competence in all places of responsibility and for the utmost austerity of living has come from the mind as well as the heart of the entire nation. It is not panic or hysteria—or intrigue—but self-preservation and common-sense. Mr Churchill has been fortified not undermined.

To require the prompt removal of perilous shortcomings is not to deny the existence of very considerable achievements. On the home front, the need is to change and to better, not to scrap; production must be improved, but it is already immense; rationing must be made much stricter, but it is already severe. Dealing with the demand for reform of the Army, one writer has pointed out, rightly, that the maintenance of discipline is as imperative as the infusion of zeal; but discipline without ruthless efficiency and enthusiasm is useless and wasted—an empty shell. The blade of the war effort is already broad; and what is wanted is not words—there have been too many—but a prompt, specific and aggressive programme to add the sharp point of urgency, the cutting

edge of competence and the clean cut of sacrifice. It is the extra margin of strength that this country can muster at once that will count decisively during coming months in the balance between victory and defeat.

The new Government's immediate task behind the battle-zones is to mobilise the nation's economic resources to the full. Russia can only convert resistance into success by outside aid; and Japan can only be halted by material reinforcements. For the best part of twelve months, American supplies cannot tip the scale in any theatre beyond the Eastern Pacific; and, if the process by which the Allies have been consistently defeated in detail for lack of supplies is to be arrested, it can only be by British output. The near future of the free world depends upon the ability of the British Government and the willingness of the British people to cut down the British standard of living in order to release resources and ships for war production. The very success of the war effort so far in marshalling all the idle or needless reserves of labour and plant for war work makes this further abnegation indispensable. Voluntarily, the same order of sacrifice is required of Britons as the Germans have imposed, for their winter arms drive, upon their own people and the people of German Europe.

It is not hard to rough out the needed programme. The limitations upon output and strategy are set by manpower and shipping. Most of the frills and luxuries of civilian living—apart from the remarkable waste of ships and labour in maintaining the cigarette and tobacco industry on a peacetime footing and the anomalous persistence of jewellery, toy and cosmetic industries, however shrunken—have already been removed. But this is only a proof that harsh and drastic action is required. Between now and next autumn, nothing is over-harsh or over-drastring which will free men and ships; and the measures must be quick-acting. Policies which will

take many months to have effect may aid in winning the war, but they may not help in not losing it; and the knife will need to go deep into the standard of living to achieve a worth-while saving.

More ships are needed, in March not in August, to bring in war materials and to take out and transport supplies and expeditions. Food and clothing require bulky imports, and the first attack of "austerity" must be upon them. The only reserve of labour for the war factories, moreover, is in the clothing, distributive and service industries which minister to civilians.

Admittedly, the diet of the bulk of families is already far from generous; and the shipping space that will be saved by banning off-the-ration feeding in cafés and restaurants—which for fairness and expediency should be done forthwith—though appreciable, is not large. The key to immediate food policy was given in Major Lloyd George's recent statement that food stocks were nearly a third larger than a year ago. Then, it is true, they were uncomfortably low; but stocks are collected for emergencies, and the time has come to live as much as possible on them and as little as possible on shipped supplies. The time was certainly overdue to save between 500,000 and 700,000 tons of shipping in the year by substituting wholemeal for white bread by compulsion and not by appeal—which is at last to be done next month. The immediate end is to curtail or suspend shipments of food without any delay. The means is to reduce the size of rations wherever possible; to make up basic rations out of stocks; to extend group rationing to cover unrationed foods; by requiring the surrender of coupons in all clubs and restaurants, including "British restaurants," to root out unrationed feeding, except in canteens where direct war workers are fed; and to put an end, not only to black markets, but also to the manufacture and sale of expensive unrationed foodstuffs in "high-class" stores. These steps, apart from the administrative difficulty of providing coupons for restaurant meals, could be taken now.

Shipping space is a first consideration. The enemy's chief attacks at sea are now against tankers, and the need for tankers to fuel land, sea and air forces at the fronts is mounting. The obvious riposte at home was to abolish the basic ration of petrol, which was announced in the House on Thursday; but the time to do this is at the end of the licensing quarter on March 31st, at the latest, and not at the end of the licensing half-year on June 30th. It is the easiest thing in the world to refund licence money to motorists who can no longer run the cars they have licensed, but it is iniquitous to spare them the petrol which the Allied Forces and war transport must have. The argument that most motorists must have their basic ration for a minimum of essential journeys is not valid. In fact it is doubtful whether, in this small country, with its well developed public transport services, any private

motoring, except for, say, doctors or in isolated districts, is essential at a time like this; in any case, the few who may really need petrol can be given it by test. At a stroke, when the basic ration is abolished, all unessential motoring, for recreation and entertainment, will become illegal and punishable. Nor should needless travel by any other means be sanctioned. Every effort to cut down the use of the railways so far has failed, in spite of their burden of war traffic and the need of war industry for coal. It should not pass the wit of a determined Government to restrict day-to-day travelling to the holders of season tickets and workers' or business passes, and to limit the journeys of other civilians by allotting a set number of travel vouchers per year. On Thursday, the Home Secretary announced that horse racing, dog racing and boxing would be further restricted to save transport and confined to set days and holidays, and football competitions kept strictly within local areas. Workers cannot do without amusements, and cinemas and theatres, which are not to be cut down more, use up only small resources. But all entertainments which involve the transport of men, animals or spectators over more than a mile or two should be banned altogether.

Food and travel are obvious instances of urgent and long-delayed economies. Clothing is no less so. The curtailment of the making and buying of clothes would save men as well as ships. To suspend or reduce shipments of cotton and wool for civilian manufacture would free room for war supplies; to cut the present clothes ration by a quarter or more and to impose utility garments of standard design upon all buyers, as the present stocks run out and are replaced, would release a large number of much-needed workers for the war factories. These steps, again, can be taken at once. By contrast with the enemy, the people of this country are even better clothed than they are fed, and any further hesitation in order to preserve "pluto-democratic" standards of fashion and variety will be intolerable.

Manpower, in fact, is as crucial as shipping. War output depends upon the intake of fresh labour, mainly women, and the present rate of recruitment, though large, is probably below requirements. Skilled workers the munitions industries must, for the most part, find by measures of economy within their own ranks; unskilled workers they must draw from textiles, clothing, distribution and the service trades—which probably still do not employ very many fewer workers than are engaged in munitions proper. There are still many more workers and much more plant and materials engaged in the export trades than financial and other considerations, in present conditions, make absolutely necessary. It is not a question of pruning surplus labour—there is none—but of a major surgical operation. The programme for Spartan Living as applied to industry is plain enough: the curtailment of clothing manufacture—with the ration

—by a quarter or more; the lopping of semi-luxury trades like tobacco and drinks; the abolition of needless advertisement and sales departments everywhere; the banning of wasteful branded manufactures and marketing; the cessation of all production for export which is not indispensable in the barest national interest; the deliberate “slimming” of retail trade by concentration and the closing down of shops, with compensation, to release the maximum number of workers; the shutting down of whole unnecessary industries like jewellery (which is discussed in a Note on page 369); and the most vigorous economy in the use of manpower in all civilian trades—by the introduction of working hours as long as those in war factories, and other means. Again, the fiat can go forth immediately. These are no more than the next steps in a process which began with the limitation of supplies in 1940 and passed on to the concentration of firms last year. What is urgently needed now is

still more restriction, the wholesale standardisation of manufactured products and the concentration or suppression of entire industries—and a prime need is a policy of compensation to prevent financial considerations from standing in the way.

There is nothing new in this list of projects, and they are all perfectly feasible. If the shipping and manpower positions are not, after all, grave enough to require them—which is hardly credible—the Government should say so plainly. If, as seems certain, every ship saved and every worker freed is a counter against disaster, a tally in the bare margin between success and failure, the Government should act at once—in all these ways. If it did not act, and simply spoke of “austerity,” then the critics of the critics would prove to have been right; the changes in the Government would have been pointless. But hopes of bold deeds are high. Plans are drawn, and some are now known. The rest cannot come too soon.

Vichy Marks Time

THE bombing of Paris, talk of a severance of diplomatic relations between Vichy and the United States, the extent of Franco-Japanese collaboration in the Far East, and the urgent problem of Reunion and Madagascar have all helped to fix a spotlight on the policy of Vichy. But it is important to realise that it is only the focus of attention that has shifted. The conditions revealed are still very much the same. The talk of breaking off diplomatic relations is for this reason rather misleading. It suggests the development of a new situation, whereas the most that has happened is that a little fresh light has been thrown on a familiar, unhappy scene.

For eighteen months now the life of France has dragged on within the framework “of the Armistice interpreted in the spirit of Monthoire.” Its broad outlines are clear enough. There is, properly speaking, no military collaboration. Whatever may have been the pressure put on Marshal Pétain, he has so far succeeded in maintaining his neutrality by a rigid insistence on the terms of the Armistice. Much of the evidence brought forward since the somewhat sensational dismissal of General Weygand last November to indicate a change of policy at Vichy is quite compatible with the maintenance of the Marshal's original position. For example, if it is true that the *Dunkerque* has been brought back to Toulon, it does not follow, as was at first assumed, that Admiral Darlan intends to place it, as a fighting unit, at the Germans' disposal. Article 8 of the Armistice provides for the assembling of French naval units in specified ports, there to be demobilised and placed under Axis control. The same article contains Hitler's solemn promise not to use the French fleet for his own war purposes. Again, the very widespread reshuffle in the colonial military and civil administration during and after the departure of Weygand was not necessarily designed to bring in collaborationists. It could be claimed to have been more in the nature of a purge of pro-Allied elements. The attitude reported of M Buisson at Dakar—that he would defend his colony against all comers, Allied or Axis—may well be true of most of Vichy's colonial servants.

The kind of military collaboration upon which the Axis Powers continue to count—and with reason—is negative. It looks as though neither the Germans nor the Italians are going to press for the use of French bases or of the fleet provided Vichy is determined to “defend” her own colonies against Allied action. The example of Syria is an obvious case in point. There was little or no direct Axis collaboration, but the French tied up quite a substantial body of Allied troops and material.

The glaring exception to this attitude is, of course, the position in the Far East. Here, although there has been no direct military collaboration between Vichy and Japan, there has equally been no attempt to defend French interests, while economic collaboration has been as close

as conditions of war permit. An excuse for the policy of defending French soil against everybody except the Japanese can perhaps be found in the complete defencelessness of the French in the Far East; but what would the reactions of Vichy be if very much the same situation were to develop in Madagascar, for example, or Senegal? Rumours that a Japanese Military Mission has arrived in Madagascar are probably false, and certainly premature; and Washington has been given a pledge that no Japanese encroachments in the island will be permitted. But would Vichy admit that, say, the United States was as entitled as Japan to take French territory into “protective custody”? If there were Allied intervention in Madagascar or Senegal, would the Governor-General co-operate with the invading authorities as cordially as Admiral Decoux has done in Indo-China?

There may have been no direct military collaboration between France and the Axis, but the steady increase in direct economic collaboration is being maintained. Now that the December meeting between Pétain and Goering at St. Florentin can be looked at in a three month perspective, it seems almost certain that the visit was connected not with bases or ships but with the stimulation of France's war potential to fit into the German economic master plan for the crucial winter 1941-42. And, although the evidence for this is less conclusive, it is quite possible that Darlan's subsequent visit to Turin to confer with Ciano was directed as much towards securing for straitened Italy some small part of France's output as towards a discussion of “Corsica, Tunis and Nice.”

Given this background of consistent and growing economic assistance to the German war effort, the Vichy Government has no more grounds to protest at the British bombing of Billancourt than at the battering of Brest. (Whether, except as a preliminary for invasion, bombing of this sort does not rouse more political resentment than it does military good is, of course, another question.)

The political scene, too, is quite unchanged. The division between the Armistice men and the New Order men is as sharp as ever, and there seems to have been little or no shift in the balance of power. If Darlan is really the leader of the collaborationists, then he probably does the cause little but harm, for there is every evidence to suggest that he is regarded with almost universal ridicule and contempt. The dangerous men are those who work more quietly—the Benoist-Méchin, the Lucien Romiers—who have much closer contacts with the economic machine. The great strength of the Armistice men is Marshal Pétain himself, who, even when he is not loved, is at least respected, and whose honour is committed to a strict maintenance of the Armistice terms.

Given this comparatively static situation, can it be said that a new policy on the part of the United Nations would radically improve it? There is, of course, only one

obvious new step—the widely discussed possibility of a breach of diplomatic relations between Vichy and the United States. It is difficult to see exactly what such a policy would be expected to contribute to the present position. The presence of Admiral Leahy at Vichy is a counterweight to pressure both from Berlin and from the wild men in France. If this reminder of American wishes and American strength were withdrawn, the Armistice men might find their position less easy to maintain. The Allies' best safeguard against the throwing of France's fleet into the naval balance at this highly inconvenient moment is the Marshal's sense of honour, and there is some reason to suppose that the Americans can still reinforce it. If the United States were at this moment feeding North Africa, then recent events—the despatch of food to Tripoli for example—would justify an end to such material help. But the food supplies were cut short

on the dismissal of General Weygand, and have not been resumed. Thus, in present circumstances, the United Nations have at least two instruments of pressure on Vichy—the one, a promise of further supplies; the other, the threat to break off relations. It would be folly to throw these away before the provocation from Vichy is graver than it is to-day.

Such a policy is hardly appeasement, since no particular concessions are involved. It has dangers akin to those of appeasement—that the Allies' long-suffering is being exploited to strengthen German control and the position of the collaborationists. It should, therefore, be pursued only with the utmost caution and vigilance—for example, in the prevision and forestalling of any Japanese initiatives in the Indian Ocean. But, for all its risks, measured against the alternative of severing the last link with Vichy, it is probably the sensible course.

NOTES OF THE WEEK

Another Kurusu?

If the mission of Mr Kurusu to Washington is any analogy, the departure of the new Japanese Ambassador, Mr Naotake Sato, for Moscow has ominous implications. He has himself given an unpromising interpretation to his journey by declaring to a Tokyo press conference that “the liberation of Greater East Asia from the Anglo-American yoke will be facilitated by the clarifying of Japanese-Soviet relations.” In Axis language, clarification has hitherto had one meaning only, “putting on the spot.” Fresh from their victories, the Japanese are not likely to be modest in their demands for reinsurance. Vladivostok remains the only free base within striking distance of Japan, and even though the Russians, hard-pressed in Europe, have so far abstained from the Far Eastern fighting, so long as the war continues and they are allies of the British and the Americans, Siberia remains a potential base for a new attack on Japan and an entry point for Allied supplies. If the Japanese are now to launch out on even more ambitious schemes of conquest, entailing operations even more distant from home waters, they cannot ignore the possibility of being caught in the rear. The situation is very delicate for the Russians. A massive spring offensive by the Germans might make appeasement not a policy but a necessity. If, however, the Japanese repeat the tactics of Germany in June, 1941, or their own Pearl Harbour tactics, the Russians will be given little opportunity to make concessions of any kind. Much turns on the degree to which the Russians and the Japanese have had to deplete their Far Eastern armies. Both sides claim that their forces have even been reinforced; on balance, the claim is more credible on the Japanese side since their armies have been fighting a less formidable foe. There is little the British and Americans can do at this point to fend off Japanese pressure on their sorely tried ally, save possibly to concert plans for rushing assistance to the Siberian outpost and for co-ordinating Russia's defence with a new offensive move in China. It is to be hoped that the appointment of Lieutenant-General Stilwell, the former United States Military Attaché in Tokyo, to be General Chiang Kai-shek's chief of staff presages some such co-ordination of military strategy.

Diversion in Russia

The degree of co-ordination between German and Japanese strategy has almost certainly been over-rated. The Japanese entered the war at a time set by the cutting off of their American and British supplies, not by any Berlin need for a diversion. To-day, after three months' smashing victory, Tokyo is even less likely to be influenced by German demands or German needs, and any attempt to link the arrival of the new Japanese Ambassador in Moscow with the situation on the German-Russian front puts a false perspective on the essential independence of Japanese policy and probably over-estimates the immediate danger of the Germans' position. The Russians have undoubtedly made headway in the last week. The encircling of the Vyasma outpost has been carried further by the capture of Yukhnov and Sychevka, the Germans' attempt to break out

of Staraya Russa have been repulsed, and there are important, though rather confused, developments in the south, where the Germans are being compelled to counter-attack vigorously in order to maintain contact with their Taganrog positions. Yet, for all this, the Germans' “hedgedogged” line still holds, and the drain on reserves is one that both sides are feeling. A diversion in the Far East would suit Hitler's purpose, naturally, for materials and men would have to be diverted from the western front. But the Nazis have nothing to offer Japan which they do not already provide by the mere fact of fighting. The decision for or against war with Russia will be made, not in Berlin, but in Tokyo.

Total Barbarism

The atrocities committed by the Japanese on British soldiers and civilians at Hongkong will come as a shock only to those who have comfortably assumed that there is still some safeguard inherent in the possession of British citizenship, or who have managed to close their minds to the four years' agony of the Chinese people. The indignities inflicted on the British represent a conscious Japanese effort to extract the utmost “loss of face” from the defeats of the United Nations in the Far East. Surrender in itself entailed this loss of face. But the Japanese are determined to underline the fact with the utmost brutality conceivable. To this challenge there is only one reply—victory; and a wide dissemination of the unadorned facts will serve a purpose if it rouses in the free peoples a fierce determination to defeat, at whatever cost, this ugly tribal militarism which they have allowed to grow strong in East Asia. But victory is not enough. By their behaviour in China, and now in Hongkong, the Japanese have given final proof that they are totally unfitted to wield military power. If a period of occupation, disarmament and re-education is accepted as a necessary corollary to the defeat of Germany, how much more necessary is it for the barbarians of Japan. The evacuation of China and Manchuria will not be sufficient. The Japanese mainland will have to pass under the control of the United Nations for many years after victory. Nor can there be any emergence of the Japanese people until China's material and military strength, broadly based on its 400 million people and on a civilised

philosophy, has become the dominant force for peace in Asia. Then there can be talk of "co-prosperity" and "civilising missions"—under Chinese leadership. These are the ultimate consequences of Japan's behaviour. The immediate task is grim defence, determined attack and total dedication to victory. That British politicians who encouraged and excused the early stages of the Japanese career of aggression are still in high offices of state is an open scandal.

The Loss of Java

Java has fallen, and with it the Japanese conquest of the "South Seas" (*Nan-Yo*) is almost complete. The reasons for the final defeat in Java were those of Malaya, Singapore, Borneo, and Sumatra—Japanese control of the air and Japanese control of the sea. As one correspondent wrote from Bandoeng, shortly before the end, "Our lack of aircraft is pitiable. Virtually, no assistance can be given to our ground troops . . . we cannot stop the Japanese from using the single air base they have so far obtained." Under pitiless dive-bombing, and with no prospect of reinforcement or relief, the Allied forces fought on well after the overrunning of the plain of Java and of the capture of Batavia—resistance is probably still continuing in a few isolated pockets—but the strain imposed was too great, and the Japanese claim the surrender of over 100,000 troops. With the fall of Java, the focus of the campaign shifts to Burma, to the Indian Ocean, where Ceylon may soon be in danger, and to Australia, where the investment of New Guinea by the Japanese is advancing fast. But, even if the Dutch East Indies fall for the time into the background of military activity, the future reinstatement of the Dutch has a high priority in the war aims of the United Nations. The Dutch threw everything they had into the struggle, and can maintain that their contribution was proportionately far higher than that of the more powerful nations to whom they looked for support. There was no hesitation when Japan struck at Hawaii, no attempt to buy security at the expense of the British and the Americans. At the same time, the lesson of the campaign must be learnt—that defence, pooled and co-ordinated after the outbreak of war, is bound to fail. In the Far East, as in Europe, collective defence must take the place of the pre-war anarchy.

Invasion Plans

The spring invasion season is at hand, and official preparations are once more under way. A year ago, the Government issued a pamphlet telling the people to "stay put"—that is, to stay in their own districts, but otherwise to carry on a normal life, unless fighting should break out in their immediate neighbourhood. Last week-end, a new defence regulation was made, empowering the Minister of Labour to direct any persons, in an area declared an operational area by a Regional Commissioner, to perform specified services or to report for work to a representative of the defence forces, a Government department, a local or public authority, or a public utility undertaking. Thus, from staying put, Londoners may suddenly find themselves transferred to driving underground trains for the LPTB. Bit by bit, a fairly comprehensive picture of the Government's plans in the event of an invasion has been obtained. Government itself can, if necessary, be carried out by the Regional Commissioners, who can be empowered to make local defence regulations for any of the purposes authorised by the Emergency Powers Acts, and by the regional staffs of the departments. Justice will be secured by the war zone courts, established last April, by which the hearing of serious criminal cases will be expedited in an area declared a war zone. For food, the Ministry of Food has built up reserve stocks, amounting to several weeks' supply, in the hundred areas into which the country has been divided for the purpose. The maintenance of essential services has now been secured by the new defence regulation.

What is still uncertain is how these plans will work and whether those responsible for carrying them out know what they will have to do. Moreover, there are still gaps, even in the paper plans. It ought, for instance, to be officially stated whether there will be any evacuation of civilians from an operational area, and a definite ruling on whether travelling will be allowed should be made. There are some enthusiasts who would have the Govern-

ment stage a full-dress invasion rehearsal, affecting civilians as well as the defence forces, which might certainly answer some of these questions in a practical way. But it is not easy to see how any rehearsal could be a success in the absence, not only of the leading lady—or, more appropriately, the villain—but also of part of the plot. The enemy keeps his invasion plans a secret, and it might be folly to lose a whole day's production—or even more—and dislocate transport, in order to show him the Government's plans for defeating him. Moreover, the public finds it very difficult to take rehearsals of this sort seriously; it is significant that letting off tear gas has not encouraged the carrying of gas masks. If, as has even been suggested, the Government should pretend that the rehearsal was the real thing, there is the danger that in the actual event of invasion the citizens of London would mock the sound of Great Tom himself with cries of "wolf." But what could, and should, be done is to decide on the cast. Even though the final shape of the plot—including the *dénouement*—is unknown, it can be settled who in each area will be actors and audience respectively; the minor parts can be allotted, and those selected to play them can be made to learn and study their scripts. These are crying and very urgent needs.

Expenditure and Savings

The Chancellor of the Exchequer secured from the House of Commons on Tuesday a final Vote of Credit for £250 millions for the expiring financial year and a first Vote of £1,000 millions for the coming year. On each of these occasions he has more gigantic figures to reveal. The total of expenditure out of Supply grants to March 7th was £3,880 millions. Expenditure is currently running at the rate of £14½ millions a day, of which about £12½ millions a day falls on the Vote of Credit, and of which again the fighting and supply services require about £9½ millions a day. If this rate of expenditure were maintained exactly, the total expenditure from Votes of Credit to the end of the financial year would be £4,183 millions, but the Chancellor asked the House to provide a total of £4,250 millions to allow for contingencies and for the usual last-minute burst of expenditure. To either sum there should be added the £707 millions of estimated expenditure to be financed otherwise than out of Votes of Credit. The total of expenditure thus rises to the incredible figure of £4,957 millions. In the coming year, even if there is no further increase, the total will be about £5,300 millions. With these two new Votes, the amounts voted for this war exceed the total voted for the last war by a comfortable margin.

The debate that followed the Chancellor's speech rambled, as is usual on such occasions, over a very wide field. But the subject that engaged more attention than any other was the alleged defects of the National Savings campaign. There is no doubt that the committee's methods are increasingly coming under fire, and it is no defence, as Mr Benson pointed out, to announce rising totals of savings collected, when they are rising more slowly than the total of incomes out of which they can be collected. The primitive economics of Warships Weeks are also deceiving fewer and fewer people. The appeal to local patriotism is, of course, perfectly legitimate, but it is surely time to abandon the belief that the piling up of large totals by devices such as the re-investment of past savings and lump-sum subscriptions of corporate bodies and firms is serving any purpose other than to swell the pride of the National Savings Committee. The debate did at least elicit from Captain Crookshank the statement that "a really good War Savings Week in a particular area is probably best tested if, after it is over, every shopkeeper says, 'It is the worst week I have ever known.'" It would be an immense gain to common sense (and to Truth in Advertising) if the campaign would take this as its motto.

Manpower Crisis

Even to maintain the expanding programme of war output, and still more to increase the programme in the face of new dangers and commitments, fresh labour must be found for the war factories at a greater rate than at present. Mr Bevin has made it plain that the present inflow of new workers is below present requirements; and the greatest need is for women. Technically, the only way in which many war factories can raise output to a maximum is by increasing the number of shifts worked, which can only be

done with the aid of more workers. A measure of the task in hand was given by Mr McCorquodale's statement in the Commons last week that 150,000 women have lately been placed in war jobs every month, which is, apparently, not enough, even though there are now 1,500,000 more women in munitions and other vital work than two and a half years ago. It is probable, in the light of Mr Bevin's and Mr McCorquodale's statements, that *The Economist's* estimate early in the war, that an addition of 2½-3 million women to these essential industries would be needed and possible, still holds; and, in view of the crucial importance of British output in the Allied effort until United States production is in full flow, it seems likely that most of the 1-1½ million still required will be needed this year—nearly as many in the next 9 or 10 months as in the 30 war months that have gone. These estimates have no authority. But, by way of illustration, they at least make it plain that every trace of reluctance on the part of the Government to comb out and call up women, and on the part of firms and employers to take them on, for whole or part-time work, and to train them, is culpable; they are being released too slowly from other industries and recruited too slowly for war work. By now, over 5 million women between the ages of 20 and 36 have registered for national service. But only 1,500,000 have been interviewed, and, at the rate of 50,000 a week, even allowing for the high proportion of those registering in the upper age-groups who will not be interviewed because they are already in war service or have family ties, it appears that it may take the best part of this year to scrutinise even these. Registration of women aged 18 to 19 and 36 to 41 is proceeding. This bottleneck in interviewing seems likely to dam up the flow of recruits very dangerously. It makes a shortfall in recruitment almost inevitable. The refusal of employers to provide training facilities or to work out part-time schemes for married women is equally dangerous. Neither the willingness of the women nor the large-scale intentions of the Government's plans for mobilisation are in question. But the position seems to be that neither the Government nor industry has provided, or is providing, the necessary machinery for taking the women on at sufficient speed; and the results may be disastrous.

The Use of Labour

Proofs multiply that it is ham-handed and wasteful to reserve, protect or call-up men in groups according to their occupation. The Schedule of Reserved Occupations, now in liquidation, broke down because it exempted men from military service who were doing no war work at all and took away from agriculture, coalmining, building and several other industries irreplaceable heavy labour, which was graded "unskilled." Now the unequal incidence of the Essential Work Order, which is applied to scheduled firms in scheduled industries and protects their labour, is having, on a smaller scale, a similarly maladroit effect. A prior, production should be protected and distribution not. But, in the case of the coal trade, as recently pointed out by the Select Committee on National Expenditure, the results of leaving distribution unprotected have been disruptive, and have contributed to serious delays and shortages. Coalmining is now protected by an Essential Work Order because coal is a vital element in war production. war transport and the civilian standard of living. But it is obviously as important to distribute coal as it is to produce it, and the cases cited by the Committee of "coal merchants having to hold up wagons in sidings because of a lack of labour to unload into the delivery lorries" are due to a failure to see the problem as a whole. It is doubtful, however, whether the solution is quite so simple as merely to apply the Essential Work Order to the coal distributive trade, which might freeze some manpower which ought to be released or replaced. At any rate, two basic needs seem plain before this labour is finally protected: to rationalise coal distribution in single depots regardless of separate firms; and to scrutinise the case of every worker in the trade with the utmost care and consideration for this state of affairs.

Minister of Production

Mr Lyttelton is to be Minister of Production with chief responsibility for the War Cabinet over the whole business of war output. When Parliament was calling for the reconstruction of the Government, which has now happened, the central plea was for a Minister of Production: Mr

Churchill knew that, with Lord Beaverbrook at work anywhere in the field of supply, no other Minister of Production was possible. Lord Beaverbrook was chosen. Then he departed, and in the light of Parliament's original demands, it is very odd that Members, and the press, accepted Hamlet without the Prince of Denmark so meekly. Perhaps it is because the Lord Privy Seal had so far stolen the play. More likely, it was because it was generally supposed that Mr Lyttelton was still to be Minister of Production in the full sense called for, in spite of the disappearance of the Ministry—and without the distractions inherent in the position of his short-lived predecessor. This has proved true. He is to be an authoritative Minister of Production, with a small selected staff of experts, without the unnecessary paraphernalia of an executive Ministry. Whether Lord Beaverbrook will emerge again to take up his remaining duties on the Anglo-American economic boards is not known, even to Mr Churchill. But Mr Lyttelton will, in any case, supervise this work; and, at home—apart from the allocation of labour resources which remains, illogically but inevitably, with Mr Bevin—he appears to have full and effective powers over production. Four tasks stand out: to replace the Production Executive with a single decisive voice; to fortify the regional boards with responsibility for the technical execution of production orders in their areas; to employ the factory committees as mainsprings of technical enterprise and industrial morale; and to improve the quality of planning at the centre.

Burma: Change of Command

In spite of the evacuation of Rangoon, the news from Burma has one encouraging feature. After weeks of retreat the fighting on the Pegu-Rangoon and Prome-Rangoon and Prome-Pegu roads has given evidence of a new vigour in the use and direction of the British forces. The Burma fighting is to continue on the central front, where Chinese and British forces will fight side by side—and there is some hope that the new tactics will be pursued vigorously. The earnest of this is the succession of Lieutenant-General the Hon. Sir Harold Alexander to the Commandership-in-Chief. He took over from General Hutton on March 5th,

To MEMBERS of the Scottish Widows' Fund

Most of our new-business staff is on war service but the utmost will be done to maintain the Society's life assurance service.

In two ways MEMBERS can do much to help:—

1. Keep correspondence with the Society at a minimum, and
2. Either to us or to your agent, give introductions to likely new members.

REMEMBER, we cannot now send anyone to urge you to increase your own life assurance—just DO IT WITHOUT BEING ASKED.

Write to your agent or to the Secretary,

SCOTTISH WIDOWS' FUND

Head Office:
9, St. Andrew Square, Edinburgh, 2

and it is no coincidence that the new spirit began to manifest itself after that day. His appointment raises in an acute form a number of the still unsettled problems of the Far Eastern campaign. There is general agreement that in Malaya and Java the Allies were so heavily outclassed in the air and in equipment that prolonged resistance was impossible. Hitherto, in spite of the magnificent air support given by the RAF and AVG and the use of a certain number of British tanks in the Pegu area, the retreat in Burma has been almost as rapid. If General Alexander's offensive tactics should mark a turning point in the fighting, would it not suggest that faulty leadership and poor morale had played almost as decisive a part as lack of air support and equipment?

Mobilising the Colonies

The details, given in a Parliamentary answer last week, of the proposed conscription of labour in Kenya must arouse serious misgivings. It is quite true that the resources of the colonies cannot be fully mobilised without some form of compulsion, and, as was argued in an article in *The Economist* last week, there are strong reasons for asking the colonial peoples for active co-operation in the war. But the Kenya proposals are an example of the worst way to go about it. An increased production campaign is called for from Kenya to help supplies in the Middle East, and it has been established by an official committee that it can only be achieved if the present labour shortage is made good. Therefore, an Essential Undertakings Board will declare what undertakings are essential to the successful prosecution of the war, the defence of the colony and the maintenance of essential supplies and services. District labour committees, including a representative both from employers and employees, will consider applications from "essential undertakers" for Government help in recruiting labour; selection committees, composed of Africans, will select male Africans under 45 years of age to comply with the requirements of the labour committees; and there is provision for exemption tribunals to hear appeals, while a central wages board will fix conditions of service, which will also apply to voluntary labour. The disquieting things about these proposals are, first, that though "it can be assumed that the cultivation of certain crops in the Highlands will be scheduled as essential," that is, European-grown crops, similar crops grown by the natives are evidently not to be essential, and it is not said that there will be any control over European production to see that it is efficient. Secondly, it is almost certain that the employers' representative on the labour committees will be far stronger than the labour representative—who will presumably be an African—and it would be much better to have an entirely Government committee. Thirdly, a minimum conscription age has not been fixed—significantly, perhaps, in view of the prevalence of child labour in Kenya; moreover, the minimum period of service has been fixed at 84 days, against the maximum fixed by the ILO convention for forced labour service of 60 days. But, quite apart from these drawbacks in the details, there is the general cause for uneasiness that the scheme, together with the similar conscription of native labour for agricultural work in Northern Rhodesia, seems designed to further the interests of the white settler rather than the war effort of the Empire as a whole. The advantages of conscription, as Britain knows it, is that it is applied to all sections of the community. In Kenya, though the Governor has powers to conscript all British subjects aged 18-50, he has used them sparingly, if at all; and it is now proposed to conscript one—politically inarticulate—class for service, not with the Crown, but with a dominant minority whose attitude towards the Africans has always inspired justifiable mistrust.

The Caribbean

The contrast between mobilisation in Kenya and in the West Indies is startling. In the former, compulsion is to be applied to coloured peoples to serve white individuals. In the West Indies, on the other hand, there has been little attempt to make use of the very whole-hearted wish of the coloured peoples to serve the Empire as a whole. The proposal to recruit West Indians in special West Indian regiments has been refused; and little has been done to raise a civil defence service or local defence corps, although in some of the colonies, particularly Jamaica, many of the islanders feel that their services are not being used as

much as they might. The People's National Party, in its programme for Jamaica's war effort, besides calling for direct participation in the war, urged "an immediate economic and financial policy designed to increase the country's war effort, to utilise to the fullest extent the resources of the country and increase the national output." It also declared that the living and health standards of the masses must be improved, and emphasised the importance to the West Indies of the close relationship between Britain and the United States and the possible closing of the Pacific trade routes.

These declarations of the PNP, made last year, have particular interest in view of the creation of the Anglo-American Caribbean Commission. This Commission, which will consist of three members from each country, will be concerned with labour, agriculture, housing, health, education, social welfare, finance, and related subjects in all British and United States territories in the Caribbean. One of its purposes is to avoid unnecessary duplication in research, but it is to be hoped that it will go much farther than that and, in fact, the appointment of Sir Frank Stockdale, Comptroller for Development and Welfare in the West Indies, as the British co-chairman supports this hope. One of the reasons why so little has been done to implement the Colonial Development and Welfare Act has been the inability of Britain to supply the necessary machinery and materials. Housing remains one of the greatest needs of the West Indies, and it is considered that much could be done with local raw materials, provided these could be developed. To do so, however, would need a certain amount of machinery; for instance, the establishment of a cement factory in Jamaica, recommended by the West India Royal Commission, has been held up because of the lack of exchange to buy the necessary equipment. It is in specific cases like this that co-operation with the United States could be very fruitful, quite apart from the general desirability of international co-operation for colonial development.

Rommel in Supreme Command?

Rumours are circulating freely that General Rommel's visit to Rome portends his appointment to the supreme command of all Axis forces, land, sea and air, in the Mediterranean war zone. Such an appointment would probably imply promotion to the rank of field marshal, if only for the reason that Field Marshal Kesselring is reported to be taking command, under Rommel, of Axis air forces. The news, if true, points to a widening of the Libyan campaign into a full-scale attempt to oust the Allies from the Italian Lake, and to close it to their navies at both ends. Such a scheme would require unified command and combined operation, and, consequently, the veracity of the reports concerning Rommel's future may prove a useful pointer. Meanwhile, the lull in the Western Desert has lasted five weeks. The promise of a renewal of offensive action by the Axis has not been fulfilled. Activity on both sides has been confined to clashes between armoured fighting columns, patrolling in the No Man's Land along the Tmimi-Mekili line, with Rommel still strongly holding the latter village. Air activity has been maintained, with British bombing attacks on Palermo, Benghazi and Tripoli. It is uncertain whether Rommel has received appreciable reinforcements, but he has not hitherto felt himself strong enough effectively to defeat the opposing British forces. And in some six weeks the campaigning season will be over, and both sides will be faced with the alternative of postponing the issue until next December, or of shifting the centre of Mediterranean fighting. Whether or not Rommel is to be invested with supreme command, there is in the circumstances, urgent need for ensuring that our own forces throughout the Mediterranean enjoy the benefits of unified direction and tactical co-operation.

New Penalties

The new and severer penalties for black market offences are excellent; but they do not go all the way. Longer terms of imprisonment may be given: a maximum of twelve months on summary conviction and of fourteen years' penal servitude on indictment. Moreover, a direction may be given by the prosecution that cases shall come before assizes rather than quarter or petty sessions. The decision that persons condemned to

imprisonment shall not thereby escape all financial penalty is also just and necessary. Convicted persons must pay a fine equal to the profit which they are estimated to have made, and may in addition be made to pay three times the value of the transaction. Mr. Morrison has announced that the new regulation is to come into force within a matter of days. But the new scheme still contains a weakness. Imprisonment is permissive and discretionary; and it should be made inescapable in all proved cases. Indeed, it is very probable that short and wholly unavoidable terms of imprisonment, coupled with fines, would be more effective than the rare application of long terms of penal servitude. It is a considerable tightening that parties to an offence who have received a commission, or, indeed, any valuable consideration, for participating in trade which has been proved illegal, will be presumed guilty. This welcome new regulation can be made watertight if the prosecution does in fact consistently use its powers of imposing a joint sentence of imprisonment and fine.

Shorter Notes

From March 23rd, millers will be prohibited from manufacturing any flour other than national wheatmeal or a similar variety. But, in order to use up stocks of white flour, sales will be allowed, until April 6th, to licensed bakers, provided that three times the quantity of national wheatmeal is delivered at the same time. Between March 23rd and April 6th, makers will be allowed to include up to 25 per cent of white flour with the national wheatmeal when producing national bread; but from April 6th the only bread on sale will be national wheatmeal or other authorised brown breads; and from April 20th the manufacture of any article of food will be prohibited, unless at least three-quarters of the flour contained in it is of not less than 85 per cent extraction.

Limitations are also to be imposed on the production of sugar confectionery and biscuits. The chocolate trade is to limit its production to slab chocolate, filled bars, and what the trade calls "enrobered count lines"—what the public calls this is not known.

It is difficult to understand why Mr Morrison is so adamant about the *Daily Worker*. Questioned once again last week whether he intended to lift the ban, he replied that he did not, because, in effect, he had no confidence in the declaration of the editorial board that the paper would "give its full support to the Government and do everything possible to strengthen British-Soviet unity." In view of the editorial conduct of the *Daily Worker* in the past Mr Morrison has justifiable cause for his mistrust, and he is probably right in affirming that the effect of the ban on production is exaggerated. But to raise the ban, which could easily be conditional, would be a sign of strength on his part, not weakness.

Last autumn, the Beveridge Committee on the use of skilled labour in the Forces proposed the creation of a single Mechanical Engineering Corps in the Army in order to make the most effective and economical use of engineers. Last month, when the Committee reported, the War Office had still not made up its mind, and was disposed to regard the change as dangerous and untraditional. This week, however, it was announced that the entire engineering side of the RAOC, the maintenance personnel of the RASC, except for formation workshops and independent companies, and a large part of the maintenance personnel of the Royal Engineers are to be formed into a new and separate Corps.

In accordance with the powers given in the National Service (No. 2) Act, 1941, compulsory enrolment in the Home Guard is to be applied in areas approximating to the Eastern, South-eastern, and Southern Commands, but excluding the Metropolitan Police District. In some of these areas fire-watching is already compulsory for men, and it is not clear whether, in such circumstances, civil defence or home defence will have priority.

CROOKES' HALIBUT LIVER OIL

THE SUPPLY POSITION

The Crookes Laboratories regret that Crookes' Halibut Liver Oil will no longer be readily obtainable in capsules, but only in liquid form. This is due to priority demands of national importance.

In the interests of national health the Crookes Laboratories have taken every precaution in their power to ensure adequate supplies of Crookes' Halibut Oil in all parts of the country. Thus the public may rest assured that their needs of this vital source of Vitamins A and D are being safeguarded as far as circumstances permit.

AMERICAN SURVEY

The First Three Months

THE Japanese bombs dropped on Pearl Harbour in the early morning of December 7th. It is, therefore, for just over three months that the United States has been at war, and the outlines of a war economy and of a war polity are beginning to emerge from the mists and confusions of the first few weeks. The coming of war had been elaborately planned for and discussed over several years, but it is safe to say that nobody envisaged the extraordinary conjuncture of events by which the United States has been the victim of attack, and is yet almost powerless, for the moment, to strike back. Apart from the one shattering raid on Pearl Harbour, the only fighting has been in the Philippines, where all that the people and Government of the United States can do is to admire from afar the gallant resistance of General MacArthur. So far America's war has been, if not "phony," at least remote and undramatic, with little fighting, and equally little opportunity for direct sacrifice at home. The obvious comparison, indeed, is with the Chamberlain phase of Britain's war.

From this test the American way of waging war emerges with credit. Indeed, there is every reason why it should, since Americans have had every opportunity of observing the perils of the Sitzkrieg. Even so, there might easily have been less energy shown and less determination to plan on the maximum scale. There are, of course, weak spots in wartime America. It is already clear, for example, that the political game was only temporarily suspended, not abandoned. Party politics in the strictest sense have been modified; there has been no indication that the Republican Party, as such, is trying to embarrass the Administration. But the solidarity on Capitol Hill is rather thin. The immediate effect of the outbreak of war was, of course, very greatly to enhance the prestige of the President, partly because of that recourse to the executive arm which always accompanies a war, but mainly because events had proved Mr Roosevelt to have been so completely right in his foreign policies. But criticism, and even opposition, are creeping back. Mr Roosevelt is a great politician and a great political leader—but no one would claim for him that he is a great administrator, and there is a rising volume of criticism of the administrative defects of the Government. Much of this was stilled by the appointment of Mr. Donald Nelson as undisputed chief of production; but other departments, especially the War and Navy Departments, are coming under fire. The criticisms are remarkably similar to those to be heard in London—too much bottle-necking of authority and too little decision, too much tenderness towards the aged and the incompetent, too much confusion of functions.

The Opposition Reappears

Criticism of this nature is entirely salutary. The same cannot be said of the line being taken by many of the former isolationists. With them, blindness to the true issues is apparently a malady which cannot be cured even by such a clear demonstration of its folly as was provided at Pearl Harbour. The persistent and growing clamour is that American forces should be kept at home, that the Navy should do nothing more than patrol the coasts, that Japan is the only enemy, that America is being cheated by her allies. The hatred of Mr Roosevelt, when it is combined with hatred of Britain and reinforced by hatred of "entangling alliances," can lead to the most astonishing doctrines. This section of opinion is still small; but it is very vocal; it will feed on bad news (especially of other nations' disasters), and it cannot be left out of account in assessing the pressure to which the President is subject.

The greater is the credit that he and his lieutenants deserve for the policies they have stated and pursued. Mr Roosevelt has recognised no grades of totality in war, no limitations of liability. The war is to be made total as quickly as may be. The Budget has been drawn up on the assumption that, within the first eighteen months, the rate of expenditure will reach half of the national income. The

figures of the production programme have deliberately been set at, or even above, the maximum attainable. There has been a deliberate tendency to anticipate, and even to exaggerate, the sacrifices that will be imposed on the ordinary citizen. There is no small-mindedness in the scale of planning. All this runs directly counter to the methods that were followed, and to a remarkable degree still are followed, in Great Britain, where the tendency has consistently been to under-state and under-plan, to defer and to deprecate.

The test of these large plans will, of course, lie in the progress of production. The actual achievements of the American defence programme up to the Japanese attack were disappointing. The Prime Minister has stated that British production in 1941 was double that of the United States, and since the ratio of population is one to three, it follows that the American productive effort was only one-sixth of the British. Even when every allowance is made for the later start, this is not very impressive. Since Pearl Harbour, however, the tempo has quickened. There is a new sense of urgency and there is a new organisation. There is almost universal agreement at present (whatever future months may bring) that Mr Donald Nelson was the right choice. He is comparatively young, but of weight and eminence. He is a business man; but his experience was in the lively atmosphere of mail-order retailing, and he is immune to the sub-conscious "Business as Usual" reservations of the industrialists. Almost alone among the businessmen brought to Washington in the past eighteen months, he has consistently urged that the task be conceived on a maximum scale.

Mr Nelson's Organisation

Perhaps even more important than Mr Nelson's personality are the powers he has been given. All the previous defence bodies—the National Defence Advisory Commission, the Office of Production Management, the Supply Priorities and Allocation Board—have been advisory bodies only. The placing of contracts lay with the Army and Navy Departments, whom only the President could instruct—and he would not do so. Mr Nelson has power to issue directions and to lay down policies, and these powers inhere in him personally, not in the War Production Board, of which he is chairman.

The WPB is organised in six main divisions, with a sort of General Staff gathered round the chairman. The lynchpin of the whole structure is the Requirements Committee, the supreme allocations and priority authority. Mr W. L. Batt, as chairman of this Committee, as well as head of the Materials Division, which has charge of all raw material matters, ranks as Mr Nelson's chief lieutenant. The other branches of the General Staff are the Progress Reporting Section, under Mr Stacy May, one of the clearest heads in Washington, and the Planning Committee. This latter has not yet been appointed, but Mr Nelson has let it be known that it will be largely composed of New Dealers rather than businessmen, because of their proved prescience in seeing the emergency coming and forecasting its shape and size.

Of the six divisions of the WPB, Mr Batt's Materials Division has already been mentioned. There is also a Production Division and an Industry Operations Division, under Mr W. H. Harrison and Mr J. S. Knowlson respectively. The exact distribution of functions between these two is not entirely clear; but it would appear that Mr Harrison is responsible for letting contracts and Mr Knowlson for seeing that they are carried out. The version of industry falls to Mr Knowlson, who has the reputation of being a hard-driving executive. The Purchases Division, under Mr D. MacKeachie, is responsible for all articles for which the organisation of production is unnecessary. Mr Sidney Hillman's Labour Division, which has been taken over bodily from the OPM, has hitherto functioned

more or less as a conciliation service, but its future task is clearly to be that of supplying manpower. The sixth division is that of Civilian Supply, whose chief, Mr Leon Henderson, is also, outside the WPB, the Price Administrator. If Mr Batt is Mr Nelson's chief lieutenant, Mr Henderson doubles the rôle of lieutenant and ally.

Of the methods that are being followed by the new organisation, it is too early to speak in any detail. It is already apparent, however, that there are a number of differences from British practice, some imposed by circumstances, some chosen by policy. Paradoxically, raw materials threaten to be a more immediate bottleneck than they were in Great Britain. The American programme is far larger, and there is no country, three times as big, to draw upon, such as Britain has had in the United States. Manpower, on the other hand, is a remoter limiting factor—or perhaps it would be more correct to say that it is being so treated. It is difficult for the United States, which has suffered so severely from mass unemployment, to believe that there can ever be a shortage of labour, and it is, of course, true that the demands of the armed forces will be, proportionately, much lighter than in Great Britain. Nevertheless, it is difficult to imagine a country spending half of its national income on war without a shortage of manpower developing, and it may well prove, in a few months' time, that far too leisurely a beginning is being made with this aspect of total mobilisation.

Of the deliberately chosen departures from British precedent, the most striking are the methods adopted to secure the conversion of industries. The British plan was (with a few exceptions) to deal with firms and even with individual plants, not with complete industries, and the members of one peacetime industry can now be found making a great variety of different things for all three of the production Ministries. The American plan is to take an industry as a whole and to convert it as a whole, not necessarily to the manufacture of a single category of goods, but to a consistent programme. The automobile industry is the first and largest of the industries to be converted, but, at the time of the latest reports, seven entire industries had been scheduled for complete conversion. The American plan looks neater on paper; it will be interesting, in a year or two's time, to try to form a judgment on whether this appearance is deceptive.

The production programme faces a number of tests. Some of these are technical in character—the conversion of industry, the provision of transport, the expansion of raw material capacity. But the mobilisation of manpower impinges on the political sphere and the general restriction of civil consumption (as distinct from the rationing of specific scarce materials) is more political than technical. It is here that the real test of America-at-war will come. In the last analysis, it is not the engineer but the politician who will determine how far American mobilisation will go. So far the omens are not too reassuring. The behaviour of the farmers' lobby and of the labour movement still look more like manoeuvring for sectional advantage than a desire to share in the common sacrifice. Perhaps it would be over-hasty to base conclusions on no stronger evidence than this. The American body politic has hardly had time yet to control its conditioned reflexes. There will be plenty of opportunities in the succeeding quarters of the war to show that the separation of powers does not involve the shirking of responsibilities.

American Notes

Demand for an Offensive

The final stages of the tragedy in the Far East have been accompanied by a rising demand from all sides for offensive action and reports this week suggest that it may not be far off. Criticism of British failures has been less noticeable, and Americans have admitted their responsibility for the inability to hold Java. There has been growing understanding of the part played in the disaster by a policy of scattering defences thinly over the whole area, and widespread agreement that the United Nations must abandon "Magenot mindedness" and consideration of political repercussions before military factors, that they must avail themselves of the advantages inherent in attack: surprise and the ability to concentrate their forces, and to make the enemy fight on unfavourable ground. The attack on the "old men" of the Administration to which, so far, President Roosevelt has turned a deaf ear, is part of this drive for more aggressive action. Alluring blue-prints for offensives—some of the most wildly impracticable nature—have

caught the public fancy. One of them, a plan for an American invasion of Italy this spring, is proposed in "Defence Won't Win the War," a book which is reported to be enjoying a great vogue. There are proposals for a land attack on Japan from China, and for the use of Russian bases for joint Anglo-American bombing of Japanese cities. There is even a plan for landing an American army in Portugal to take over Vichy France. Needless to say there is a comfortable silence as to how these offensives are to be transported and supplied, and the Administration, which has to wrestle with such problems, is proceeding with its own more modest and realistic moves. But hare-brained or not, the popularity of such schemes marks an immense change in the American attitude toward the war. It was not so long ago that public opinion was overwhelmingly opposed to sending a single soldier outside the Western Hemisphere and the Administration had to approach every move with the utmost wariness. Now it can be sure of support for any enterprise, provided it is sufficiently vigorous and daring. The only danger is that if public expectations are raised too high, the American people may become impatient of the inevitable weary months of waiting, disappointments, and reverses while the training, the shipping, and the supplies necessary to a successful offensive are built up.

Reorganisation of the Services

During the last two weeks both Army and Navy have undergone reorganisation at the top to centralise responsibility and increase co-ordination within the Services. The Army has been divided into three sections—Ground Forces, Air Forces and Supply Services—under the Chief of Staff. In addition, special forces and commands may be created by the Secretary of War as the situation demands. All the powers and functions of the Chiefs of Field Artillery, Infantry, Cavalry and Coast Artillery are transferred to the Army Ground Force under Lt.-General Leslie McNair, formerly Chief of Staff at General Headquarters. Duties of the Combat Command and the Chief of the Air Corps are transferred to Lt.-General Henry H. Arnold. The naval changes involve a transfer of the duties of

the Chief of Naval Operations to the Commander-in-Chief of the U.S. Fleet, in a move to unify control over the movements of ships with the provision of supplies. These two analogous reforms have been welcomed by the public as a sign that the Army and Navy are being streamlined for action. There remains the question of co-operation between the Army and the Navy. Lack of co-ordination between the two was in great measure responsible for the losses sustained at Pearl Harbour, and the nature of the fighting in the Pacific, where the Army and Air Forces are so dependent upon the Navy, makes the most complete agreement and understanding more urgent than ever. President Roosevelt has characterised as unnecessary a Bill introduced into the Senate by Senator Clark intended to create a single Department of Defence, and certainly it is a change of attitude rather than of machinery that is needed.

Fifth Column Precautions

In response to alien scares along the West Coast, General Dewitt has announced the establishment of prohibited and restricted areas in the four Pacific Coast states. All enemy aliens and Japanese Americans are to be evacuated from a coastal strip 30 to 125 miles wide running from Canada to Mexico, considered "particularly subject to attack, threatened invasion, espionage and acts of sabotage." All military encampments, naval establishments, aircraft factories, airfields and the principal coastal cities are also prohibited territory. All enemy aliens, but not citizens, will be removed from another strip behind the prohibited zone. The remainder of the four states constitute "military zone two." It is expected that about 70,000 Japanese Americans and 140,000 enemy aliens, principally Japanese and Italians, will be moved out during the next four months. They have been principally occupied in farming, and a civilian staff has been appointed to assist the Army in minimizing the very considerable dislocation and personal hardships which will be caused. The increase in prohibited and restricted zones and the transfer of control to the Army are in direct response to popular alarm caused by reports that Japanese had bought up all the land surrounding important airfields and were assisting Japanese submarine attacks on the coast. Attorney-General Biddle has announced that 3,849 enemy aliens have been arrested on a variety of charges. The precautions which have been taken seem completely reasonable in view of the importance of the Pacific Coast as an aircraft and shipbuilding centre, and its vulnerability. So far, there is no sign of the hysterical anti-alien campaign of the last war, which provided an ugly page in American history.

Hire Purchase Restrictions

The Federal Reserve Board has issued an order designed further to restrict buying on hire-purchase (known as instalment buying in the United States) by reducing the time over which payments may be spread from 18 to 15 months and increasing the required amount of the down payment, from 20 to 33½ per cent in the case of refrigerators, vacuum cleaners, radios, sewing machines, and other large items, and from 15 to 20 per cent for rugs, watches, bicycles, lawn mowers, and certain other articles. Control over instalment buying was first instituted by the Board in August, 1941, at the request of the President, and Mr Eccles, Chairman of the Board of Governors, explained that it was intended to damp down consumer spending and conserve strategic metals used in the manufacture of consumers' durable goods. The volume of instalment credit stood at about \$6,000 millions in the middle of 1941, an all-time peak, and nearly double the figure of 1938. Instalment debt for the purchase of automobiles was about \$2,500 millions, over a third of the total. The Federal Reserve Board pointed out in its Bulletin that the sales of consumers' durable goods had expanded two or three times as much as income payments to individuals, and that they were seriously affecting the supply of materials and labour for the defence industries. An increase of \$550 millions in bank loans was in large part due to an expansion in retail instalment paper, eagerly sought by the banks to supplement their declining earnings. The increasing severity of the restrictions shows that opportunities to curb spending are not being neglected, and that other methods beside taxation are being employed. Such restrictions, however, are an inadequate substitute for a wage and price policy and have

the disadvantage that they affect only those who are unable to pay cash. The conversion of many of the industries producing consumers' durable goods, already under way, provides a more effective and equitable method of reducing spending and conserving materials and labour.

The Ingredients of Steel

Last year the United States produced more steel than ever before; the output of steel ingots reached some 83,000,000 short tons (of 2,000 lbs) and was 24 per cent above the previous record established in 1940. This tremendous expansion involved a heavy increase in the consumption of iron ore and scrap, the two main ingredients of ordinary steel. Production of iron ore, of which 86 per cent came from the Lake Superior district, was about 104,000,000 short tons, an increase of more than 20 per cent over the figure for 1940; the output of pig iron reached 56,000,000 short tons, or 19 per cent more than in the previous year. The consumption of scrap last year has been estimated by the Institute of Scrap Iron and Steel at 59,600,000 short tons, an increase of nearly 28 per cent from the previous year. The increase in the use of scrap has therefore been relatively greater than the growth in that of iron ore. Indeed, the heavy call on scrap has not been met without difficulties; at the end of last September, stocks at the plants of suppliers and consumers and in transit were about 5,700,000 short tons, equivalent to only some five weeks' requirements at the current rate of intake. In so far as the scrap problem—it has become a problem—can be attributed to faulty price policy, the solution is readily at hand; in spite of the reduction in prices last year the quantity collected was enormous. A more fundamental cause of the present shortage is the growth of the open-hearth furnace, which requires a high proportion of scrap, at the expense of the Bessemer process. In August, 1941, for example, the average charge of the open-hearth furnace consisted of 48.1 per cent of scrap and 51.9 per cent of pig iron, and that of Bessemer plants of 5.9 per cent of scrap and 94.1 per cent of pig iron. These difficulties, however, do not mean that the output of steel will actually fall in the current year. As has been demonstrated by the British steel industry, the proportion of scrap and pig iron charged into the furnaces can be varied within limits. A recent survey undertaken by blast furnace operators and steel experts in Pittsburgh and Youngstown revealed that the output of pig iron can be pushed up this year by about 4,500,000 short tons. Nor, provided the necessary measures are taken, is there any reason why scrap deliveries should fall appreciably below last year's level.

Shorter Notes

Mr Harrison, Director of Production for the WPB, has announced that airplane production is ahead of schedule, and that all other parts of the President's programme are meeting expectations with the exception of shipbuilding, where a bottleneck in certain items has held up production. Mr Nelson, Chairman of the WPB, has expressed his belief that instead of being allowed to lag, the shipbuilding goal should be increased beyond the President's figure of 8 million deadweight tons.

The National Industrial Conference Board states that in its opinion two million women will need to be drawn into factory work if a labour force of 15,000,000 war workers, which it is thought will eventually be necessary, is to be created. There is a reserve of about seven million women between the ages of 14 and 44, not regularly employed, of whom possibly five million might be put to work.

About 35,000 young people have been dropped from the rolls of the National Youth Administration in response to an order limiting it to activities aiding the war effort. The Civilian Conservation Corps has been almost entirely converted to war projects, and is employing only 100,000 as compared with 266,000 last April. These changes are part of the pruning of all the government's non-defence activities.

THE WORLD OVERSEAS

Brazilian Metals

[BY A CORRESPONDENT]

March 9th

SEVERAL agreements for developing Brazil's natural resources in the interests of the Allied war effort were concluded between the United States and Brazilian Governments last week. To one of them, the British Government has become a signatory; it covers the completion of the Victoria Minas Railway with United States help and the transfer of the British-controlled Itabira Iron Ore Company, Ltd., to the ownership of the Brazilian Government. The United States Government provides the funds for the extension of the Victoria Minas Railway, the development of the Itabira iron ore mines and the extension of the ore-loading facilities at the port of Victoria (north of Rio de Janeiro). Both the United States and British Governments will receive iron ore in return. This move was preceded in January last by the formation of a Brazilian company (Cia Brasileira de Alumínio) for the development of the Pocos de Caldas bauxite deposits. The capital of this company (60,000 contos) is Brazilian and has been supplemented by a substantial long-term loan by the Banco do Brasil. The United States Government has agreed to grant priority to equipment and machinery needed for the development and equipment of the mines. The development of the Itabira iron ore mines and the Pocos de Caldas bauxite deposits is of outstanding significance to both Brazil and the Allies. To Brazil, it gives an opportunity to place its one-sided national economy on a broader basis; for the Allies, it creates new and extensive sources of supplies of two of the most important strategic metals.

Brazil is enormously rich in iron ore and may well be the richest iron ore country in the whole world. The mineral is found in almost every state, but so far mining developments have been confined to Minas Geraes. The known iron ore reserves of this state alone have recently been estimated, in a special United States Bureau of Mines publication, at 1,500 million tons of compact hematite with an iron content of over 65 per cent; 3,500 million tons of so-called itabirite with 50 to 60 per cent iron; and 10,000 million tons of lower grade ore of between 30 and 50 per cent iron. The Itabira deposits cover only part of the Minas Geraes reserves, but they are concentrated in a comparatively small area eight miles long and 1½ miles wide, and contain a great part of the state's richest hematite. The principal concessions have been held by the Itabira Iron Company, which has substantially developed its concessions, but communication difficulties have kept production and shipments at a small level. In the last year before the war, Brazil's iron ore exports reached their maximum of not more than 362,690 long tons, and since then shipments have declined rather than increased. An improvement in communications from the mines to the coast, together with the supply agreements with the British and United States Governments, are likely to lay a foundation for big shipments in the future.

Transport Difficulties

The Victoria Minas Railway, which is to be extended under the new agreement, at present connects the port of Victoria with Drummond, which in turn is connected by a 25 miles long motor road with Cauê on the northern end of the Itabira concessions. The United States Bureau of Mines estimates that, by an improvement of the motor road and the extension of the railway's rolling stock, ore shipments could be raised to 1,000,000 tons per year. If the railway were changed to broad gauge, and extended to the mining area, as is likely under the new extension plans, this figure could be raised to 4,000,000 tons per year. The new agreement does not refer to communications other than the Victoria Minas Railway, but, according to the US Bureau of Mines, there is a branch road, 30 miles in length, which connects Itabira with Santa Barbara on the Brazilian Central Railway to Rio de Janeiro. The improvement of this road, or the linking of Itabira to the Central Railway, would

probably extend the annual capacity of the Itabira shipments to something like 10,000,000 tons.

The development of the Brazilian bauxite deposits has so far been even less extensive than that of the iron mines. Bauxite is found in wide areas throughout the country, but here, too, Minas Geraes has been the chief centre of activities. There have been smaller developments in the States of Espirito Santo and Maranhão. According to the US Bureau of Mines, the ore reserves of mines in the three states so far closely examined amount to 19,600,000 tons, that is, enough for 5,000,000 tons of aluminium metal, but rough estimates of the country's entire bauxite resources approach ten times this figure.

The production of bauxite in Brazil has so far been confined to the Pocos de Caldas plateau in Minas Geraes, where mines with a reserve of 6,600,000 tons of ore have so far been developed. Actual production so far, however, has been unimportant (less than 20,000 tons per annum). The extent of Brazil's future production depends chiefly on the development of communications to the coast and the rate of sea freights from there to the chief aluminium producing countries. Under satisfactory transport and freight conditions, the output of Brazilian open-pit mines could without difficulty be raised to several hundreds of thousands of tons per year.

At present, the rail communications to the coast are inadequate. The Pocos de Caldas plateau lies 200 miles from São Paulo, and slightly more than that from Santos, at present the only port of shipment. There is only one railway (the Mogiana with a one metre gauge), and this line has not sufficient rolling stock to cope with more than 50,000 tons per year. Before the mines can become important for export, therefore, an extension of rail facilities

Library or Newsagent

is required. Moreover, the freight charges from Santos to the United States are at present, owing to the high war risk rates, higher than the United States price of bauxite. Nevertheless, the development of the Pocos de Caldas deposits by the Cia Brasileira de Alumínio is of great interest to the Allies, a fact which is stressed by the United States' promise of priority supplies of equipment. At any rate, the present aluminium programme in the United States and Canada is taxing the United States and Guiana bauxite deposits to such an extent that additional sources of supply are needed as a reserve. Moreover, the new Brazilian aluminium company intends to start with the production of aluminium after the development of the bauxite mines. This is a definite economic proposition, and it may well be that the United States Government will later assist the company in its aluminium production programme. As Brazil's requirements of aluminium are only small, the great bulk of the national output could be exported to the Allies, whose requirements already exceed today 500,000 tons per year.

New Zealand in Wartime

[FROM OUR CANTERBURY CORRESPONDENT]

December 18th
A RECENT decision of the Arbitration Court indicates an important change of policy. Regulations exist permitting the Court to make general adjustments in all award rates of wages in response to changes in the cost of living. In August, 1940, the workers asked for a general rise of 10 per cent under these regulations and were awarded a 5 per cent increase. In December of 1941, they applied for a further increase of 7½ per cent, but their application was rejected on the ground that the economic and financial conditions of the Dominion would not permit any increase. During the whole of the past year, the Government has made earnest efforts to give effect to a policy of stabilisation by such means as price control and subsidies, and it is becoming clear that stabilisation of wages is the major part of stabilisation of internal costs and prices. Since the depression period, wages have risen steadily, and the purchasing power of award rates is now about 8 per cent higher

than in 1926-30. But the increase in rates over the past year has been very slight and the rising trend appears now to have been checked. Shortages of labour are acute in some quarters, hours have been extended and shift work adopted in urgent cases; and, though the rates are unchanged, earnings have increased owing to longer hours and overtime.

The outbreak of war in the Pacific creates a demand for further internal adjustments. The withdrawal from industry and trade of men trained during the last two years for home defence and emergency measures further depletes the manpower available for production. It is expected that overseas shipping will be considerably reduced in the future and increase difficulties of export surpluses and import shortages. Holidays and holiday facilities have been curtailed in order that production may be maintained; motor transport has been further reduced; and the right to purchase petrol for private purposes has been cancelled.

A Swing from Labour?

There is, however, some criticism of the rigidity of legal regulations of industry and trade and of the bureaucratic methods adopted, since it is held that these tend to hamper rather than to assist industry; and the burden of wartime taxes is very heavy. The municipal elections last year showed a very decided swing against Labour candidates, and the latest by-election returned an Opposition candidate for what was formerly a Government seat and showed a changeover of about 20 per cent in the total votes cast. It is widely felt, too, that in view of the demands of war there should be much more economy in other Government expenditure. Up to 1936, total state taxation in New Zealand never reached £NZ23 millions. For the present year, about £NZ45 millions of taxation is required for ordinary purposes, in addition to about £NZ17 millions for war, and the estimates provide also for loans to be raised totalling £NZ56.9 millions, of which £NZ44 millions is for war and £NZ12.9 millions for public works. There are indications that public works expenditure is being curtailed, but the first half-year's returns show that other ordinary expenditure is conforming closely to the estimates. War expenditure for the full year was estimated at £NZ69.7 millions. For the first half-year, war expenses amounted to £NZ6.6 millions in 1940 and £NZ15 millions in 1941. In view of developments in the Pacific, very substantial increases in this expenditure now appear probable.

Three Years of Occupation

[BY A CZECHOSLOVAK CORRESPONDENT]

ON March 15th, it will be exactly three years since the Nazis entered Czechoslovakia. In three years, the Germans, in spite of terror, pillage and persuasion, have come no nearer to the aim they had set themselves when they entered Prague—to win the political support, or acquiescence, of the Czechs. Only industrially have they gained, and gained markedly, in terms of war material, but only against stubborn resistance.

Czech universities have been closed; national organisations such as the Legionaries and the Sokol have been disbanded; Czechoslovak resistance has grown; and the Germans have given up mass murdering as futile. It was in the third year of their rule that the Nazis sent Reinhard Heydrich to start manslaughter. More than 400 Czechs were executed, and over 1,300 of all social classes and professions were imprisoned. But the Czechs increased their sabotage, and as Hitler's war machine needed more material to replace the losses on the Soviet front and to prepare a spring offensive, an attempt was made to cajole the Czechs by releasing a few hundred students from concentration camps. Still the Czech workers hampered production, and the tactics were changed again. A new Protectorate Government was set up on January 19th this year, with the Prussian official Walter Bertsch as economic dictator.

The policy of Bertsch shows plainly the industrial importance of the Protectorate to Germany. The manufacture of fine mechanical instruments and optical articles is permitted only for the German army. Orders received by textile factories were cancelled. All building was stopped. Czech workers were forced to work wherever Germany might need them, in Germany or in their own country. Working hours were increased from ten to twelve a day. Plainly this is a programme of full-scale war industrial mobilisation. The workers of Czechoslovakia will never give up the fight or abandon hope, and those who invite the British to send bombers will continue their three years' sabotage.

German Europe Financial Outlook

The Reich Minister of Finance has estimated that during the financial year 1941/42 he will have spent between Rm 90,000 and 95,000 millions, of which roughly Rm 6,500 millions was contributed by occupied countries as costs of occupation. The expenditure covered by internal revenue and borrowing would thus amount to 77 per cent of the national income, which is estimated at between Rm 110,000 and 115,000 millions.

	GERMAN BUDGETS (Rm 1,000 millions)			
	Tax Revenue	War Con- tribution of Communes	Borrowing	Total
1939/40	23.6	4.8	21.2	49.6
1940/41	27.2	5.4	38.0	70.6
1941/42*	32.0	6.4	51.0	89.4

* Estimate.

It is very doubtful whether more than three quarters of the total national income can be used for public expenditure. If the estimate of the national income is correct, the high percentage represented by public expenditure shows that Germany is drawing heavily on capital—exhausting stocks of manufactured goods and postponing the replacement of capital goods. The methods of estimating the national income, however, are unreliable. Various German sources arrive at different figures, and use different definitions. One source estimates civilian consumption at roughly 39 per cent of the total national income; but this estimate includes in the national income Rm 17,000 millions derived from the contributions of foreign countries, through costs of occupation and their trade balances. The use of three-quarters or 80 per cent of the national income on public expenditure is out of all known proportions. If correct, it would suggest not only a remarkably depressed standard of living but an enormous wastage of capital assets. Actually, the use of foreign resources, foreign productive capacity and foreign workers is reflected in Germany's national income, and the high percentage of public expenditure is rather an indication that Germany has been successful in exploiting the continent.

Financial conditions in occupied and dependent countries reflect the tremendous drain on national resources to the advantage of Germany. Belgium's finances are a typical example.

	BELGIAN BUDGETS (In 1,000 million francs)		
	Revenue	Expenditure	Deficit
1940	7.59	21.39	13.80
1941	15.53	36.64	21.11

Costs of occupation in 1941 amounted to 15,150 million francs, and 69 per cent of the deficit was covered by the issue of Treasury bonds. Belgium's national income in 1941 is estimated at 46,000 million francs, which would mean that total expenditure amounted to four fifths of the total national income. The German administration agreed on the payment of state expenditure partly in Treasury bonds which must be accepted as legal tender. The notes in circulation rose from 39,770 million francs at the end of 1940 to 52,170 million francs at the end of 1941, or by 31.2 per cent.

In the Danubian countries financial conditions have been changed by successive re-drawings of frontiers. In Hungary, Roumania, and Bulgaria, the budget estimates increased considerably during 1941, but the actual war expenditure of these countries is kept secret, and returns of national debt have been suspended. Substantial loans have been issued in all these countries, and the situation in Roumania was eased by a German loan amounting to Rm 600 millions.

Financial conditions in German Europe are dependent on financial trends in Germany. The exploitation of western European countries has enabled Germany to maintain her tremendous war expenditure. In the third year of the war, half Germany's expenditure is still covered by revenue. The character of borrowing has changed. In August, 1939, short term borrowing amounted to 33 per cent of the total; at the end of December, 1940, it was 46 per cent, and exactly 50 in December, 1941. The relative stability of prices and wages suggests that Germany is

drawing heavily on capital. "Industrial collaboration" and import surpluses from dependent and neutral countries enable Germany to spend an unusually high percentage of the national income on the war. Financial control in Germany is still effective, particularly in diverting excessive purchasing power by the system of price control, progressively increasing taxation and various schemes of iron savings. There is hardly any effective control in western European countries, and conditions begin to resemble those of the inflationary period in Central Europe after the last war.

Bank Report.—The Berliner *Handels-Gesellschaft*, one of the big German banks, was the first to publish its annual report. Total assets increased in 1941 by 20 per cent against 18 per cent in 1940. The most interesting items are as follows:—

	(In million Reichsmarks)			
	Total Deposits	Advances	Treasury Bonds	Taxes
1938	239.4	81.9	54.6	2.7
1939	268.4	102.2	85.9	2.8
1940	338.0	101.7	146.0	3.6
1941	428.5	115.2	216.1	3.4

Net profits fell from Rm 4.2 millions in 1940 to Rm 2.3 millions in 1941. The dividend remained unchanged at 6½ per cent. Investments in Treasury bonds, which amounted to 17.8 per cent of total assets in 1938, were 45.2 per cent of total assets in 1941. From 1938 to 1941, total deposits increased by 79 per cent. It is of particular interest that the slight fall in advances which occurred during the first year of the war has now been changed into a slight increase.

European Hollow Glass.—The new type of European cartel in the form of a compulsory marketing organisation under state control is now being extended to the hollow-glass industry. Germany has already organised the plate glass and bottle manufacturing industry. As a first step, the German, Bohemian and Slovakian cartels have been amalgamated by a Glass Trustee Company. At present, negotiations are being conducted for the cartelisation of the following hollow-glass industries:—

	No. of Factories		No. of Factories
Germany	257	Slovakia	7
France	126	Holland	7
Belgium	40	Denmark	4
Italy	120	Bulgaria	6
Poland	40	Roumania	6
Sweden	34	Croatia	1

Germany reached the first agreement with the Slovakian industry in spring 1941. In August, 1941, the Dutch factories joined. By joining the German cartel, the Slovakian and Dutch industries accepted German output and price regulations. Agreements with other countries are said to be on a parity basis. Agreement with France was reached after the French Production Committee began functioning in May, 1941. On the basis of this agreement, Germany secured the markets in northern and south-eastern Europe. Understanding has been reached in discussions with Italy, Belgium and Hungary, and the discussions with the unimportant industries in south-eastern Europe are progressing favourably. The German cartel regulates production, prices and markets. The agreements with other countries, however, are confined to prices, quotas and markets only, for the purpose of a European marketing organisation.

Cinema Organisation.—A short time ago, representatives of the Reich Film Chamber, under the control of the Propaganda Ministry, formed the *Deutsche Filmtheater GmbH*, for the purpose of acquiring and running cinemas. A subsequent order of the Reich Film Chamber excluded joint stock companies from owning cinemas. After a period of 12 months, cinemas can be owned and run only by personal owners. The majority of the cinemas, however, are owned by the "Ufa" concern, and these cinemas will be taken over by the new *Deutsche Filmtheater GmbH*. The company will concentrate on running the biggest cinemas, which, it is explained, must be in the hands of a state-owned concern. At the same time, no person is allowed to own more than four cinemas. The new owners will be recruited from soldiers and must be "politically reliable" and fit for the representation of German culture.

Russia at War

Record and Information.—Since the beginning of the war *The Economist* has published a regular record of economic developments in Germany, and since 1941 in German-controlled Europe. Since January 17th this year, a much wider survey of events in the United States has become a weekly feature. Since June last year, the achievements of the Soviet Union have been a decisive factor in the conflict; and it is proposed now to attempt a regular account of Russia at War. This section will in no respect be able to compete with Germany at War, and still less with the American Survey, both of which are based upon a mass of press and other material which, in the case of the Soviet Union, is unfortunately absent.

Economic information about Russia is extremely scarce. Up-to-date statistical data are rarely published in Russia, even in normal times. In a country where public discussion usually centres upon the details of the work of one particular industrial plant or of one particular collective farm, but is not permitted to touch the basic lines of economic policy, the knowledge of statistics and of the relevant economic facts has become the privilege of small circles of administrators working at the top of the planned economy. Moreover, Russia's industries were placed on a war footing earlier than those of any other European country, and consequently the statistical black-out became thorough there at a time when European economic life was still flooded by the lights of free research and public knowledge.

Battlefield Economy.—The term "war economy" hardly describes conditions in Russia. Battlefield economy is a more appropriate description. The whole structure is in a state of flux; tremendous dislocations have taken place and are still taking place. Long-term considerations, which still retain some meaning in a "normal" war economy, are obscured by the fact that, in effort, achievement and failure alike, it is only the desperately short run that counts. In relation to British standards of war economy, Russian economic conditions look to a large extent like the conditions of the Soviet Forces in the thick of the battle compared with those of the Allied Armies, which are still preparing and training for the tests to come. It is obviously impossible to look for exact statistical knowledge of the developments in this military and industrial battlefield while the fortunes of the fight are swaying and the toll of casualties—again industrial as well as military—is growing.

All that can be done in these columns is a careful record and a tentative estimate of developments based on the piecemeal information available. Incomplete and belated information, as well as errors of judgment, will be unavoidable. It is hoped, however, that this section will serve its purpose if it contributes a little to widening knowledge of the economic conditions in which Russia is making its heroic war effort.

The Evacuated Industries.—It has now become possible to get a general idea of the position in Russia's evacuated industries. Soviet newspapers have published very detailed reports about the achievements obtained and about the difficulties experienced by the factories on their new sites. There have been two stages in evacuation. First came the industries from the areas of actual warfare, which were moved away as circumstances allowed. Then there were the threatened regions—Leningrad, the Moscow basin and the Ukraine—where time allowed for a more systematic and purposeful manner of evacuation. In many cases, factories were split up in those regions; where production of immediate importance to the front was concerned, skeleton factories were left on the spot, but valuable equipment was transferred to the rear and the skeleton factories were fitted with old tools previously used for scrap. In Moscow and Leningrad, a feverish search for scrap-tools and scrap-iron has been the feature of the last few months; and as the industries concerned had been steadily modernising their equipment in recent years, considerable reserves of old machinery seem to have been available. The "mother-factory," thus re-organised, attempted to maintain the flow of arms and munitions to the nearby front, while the better-equipped "daughter-factories" were established far in the rear. *Pravda* reports

instances in which the splitting up of one original factory has given birth to three new ones.

There have been four main reception areas:—(1) The Volga region, with its centre in and around Kuibyshev; (2) the Southern Urals; (3) the Kuznetsk basin (Kuzbass); and (4) Siberia and the Soviet Far East. To which area any industry was transferred depended on empirical considerations, and such factors as access to raw materials and transport facilities, which frequently conflicted. For transport, the Volga region is in a better position than any of the other zones; but the character of the country is still predominantly agricultural, and evacuated industries could hardly find there the necessary support in local industries. Its raw material resources are inadequate and its man-power has been almost totally mobilised, so that an acute labour shortage was bound to arise. This region seems to have given shelter to light industries, mainly textiles and footwear, as well as to plants producing grenades and shells. Most Moscow firms seem to have gone there.

Tank, gun and aeroplane production has moved to the Urals. Magnitogorsk provides the iron ore and Degt'yarki the copper. The neighbouring Sverdlovsk foundries have been able to supply the evacuated works with machine parts at record speed. The Ural transport facilities are comparatively good; the Semipalatinsk-Kazan-Moscow railway runs through Sverdlovsk; and from Magnitogorsk there is an easy access to the alternative Tashkent-Moscow line. The main difficulty is the coal supply: the Ural coal is of a poor quality and the Kuznetsk coal is more than 1,000 miles away. According to the Third Five-Year-Plan, in 1942 Magnitogorsk had to draw 50 per cent of its coal from the nearer situated Karaganda coal-fields; and this aim, it seems, has not yet been attained. There are reports of newly discovered high-quality coalfields in the Urals and of new technological processes by which the poor coal of the local mines is being coked. Nevertheless, the Urals have still to be supplied from Kuznetsk and Karaganda, as well as from local mines, and even from the Ukraine. The productive capacity of the Magnitogorsk centre has enormously increased by the absorption of the Dniepropetrovsk factories.

Whereas armament production has been concentrated in the Urals, machine-tool factories seem to have been transferred to the Kuznetsk basin. This must have been due to military considerations, since on economic grounds the best location would have been the other way round. Kuznetsk is a coal basin and for iron ore it used to rely on Magnitogorsk. It is, however, stated that abundant iron-ore supplies from new mines in adjacent southern Siberia have been secured, and that 75 per cent of the Kuzbass demand for iron is already being met from those sources. Whether this is so or not, it is obviously strategically right that actual arms manufacture should be concentrated in the Urals, nearer to the front line, rather than in the 2,000 miles distant Kuzbass.

There is very little indication about the Siberia and Far Eastern area. Its main asset is that its manpower has been less affected by mobilisation; in the Far Eastern territories, there has been no general call-up so far. But the labour available there is primitive and unskilled.

On the whole, it seems that the winter has given the Soviets the opportunity, not only to score successes on the battle fields but also to achieve a less spectacular, but not less great, feat of economic organisation. The bulk of the industries evacuated have had time to settle down and to resume production.

Muddle and confusion have, naturally enough, not been lacking. Correspondents from the spot complain of bad housing conditions and irregular food supplies. Factory managers report of difficulties in their attempts to re-establish disrupted relations with other productive units. Other complaints refer to the competition for labour and the raw materials between evacuated and local factories. The Government has exhorted the managers of the native industries to abandon their "selfish attitude" and not to exploit their better knowledge of local conditions and their business contacts to the detriment of evacuated plants. But the scale and tempo of reorganisation have been remarkable. A very considerable part of the endangered Soviet capacity has been saved and put to effective work by incredible feats of improvisation, hard labour and self-sacrifice.

THE BUSINESS WORLD

Aircraft Metals

THE efficiency of many of the modern engines of war depends in no small measure on the ratio between tractive power and total weight. This ratio is of special importance in the case of aircraft, where it vitally affects size, load and speed. But it is also becoming increasingly important in the manufacture of tanks and in other mechanisms. As a result, technical development in the manufacture of light alloys has been speeded up in an effort to reduce weight without loss of strength. It is scarcely surprising, therefore, that the demand for aluminium and magnesium, which combine low weight with strength, has shown a striking expansion in recent years. The saving of weight is illustrated by the fact that a certain casting of a high-grade magnesium alloy weighing 6 lb. would weigh some 10 lb. in aluminium, 26 lb. in steel and 28 lb. in brass. Apart from its low weight, the brightness of polished aluminium renders it suitable in the production of search-light reflectors. Magnesium also has other uses; its high combustibility in powder form makes it useful in the production of incendiary bombs, tracer ammunition, star shells, flares and signal lights. The production of the two metals has already been expanded enormously, and present plans envisage yet further substantial extensions. In view of their crucial importance as raw materials in war, the supplies available to the United Nations and to the Axis Powers must have a considerable influence on the quality and quantity of the equipment at their disposal and, therefore, on the course of the war.

Both aluminium and magnesium have a comparatively short history as industrial metals. Some fifty-five years ago the introduction of the Hall-Héroult process for the manufacture of aluminium reduced its price to a commercial level. Magnesium was first produced in 1857, but its high price prevented any substantial industrial use until about twenty years ago. But during the past decade the production of both metals has been rapidly increased. The raw materials for both are in plentiful supply, for aluminium is the second and magnesium the sixth most abundant element in the world. Considerations of cost make bauxite almost the only source that is commercially worth working, but lack of bauxite has driven Japan and Scandinavia to use certain types of clay. Both Germany and the United Nations have access to abundant supplies of bauxite. While the former can draw on the rich deposits in the south of France, and on those of Hungary, Yugoslavia and Greece, the latter have plentiful supplies at their disposal in British and Dutch Guiana and in the United States. As is shown in an article on page 357, Brazil's bauxite deposits are also to be exploited more actively. Again, neither party is short of the raw materials needed in the manufacture of magnesium, which include salt brines of various types, magnesite, dolomite, and even sea water. The real limiting factors in the case of both metals are not so much raw materials as manufacturing capacity—which requires very heavy capital costs and abundant power—and transport for moving the bulky raw material to the plant.

The expansion, since 1929, in the production of aluminium and magnesium in Allied and Axis-controlled countries is shown in the accompanying table. The world output of aluminium was more than doubled between 1929 and 1939, due largely to the rapid expansion in Germany, which ousted the United States from the leading position in 1938. The process of plant extension in Germany appears to have been slowed down after the Nazis acquired control of the rest of the production of Continental Europe. However, in spite of desperate efforts by the Nazis, the French output has failed to rise since 1940. In Italy, too, the rate of expansion slowed down after the country's entry into the war. Transport difficulties have reduced the supply of bauxite to Switzerland and Scandinavia, and in Norway the industry has been compelled to

use low-grade domestic clay—Labradorite—which contains an average of only 15 per cent of aluminium oxide, against 55 per cent in the normal grade of bauxite. Japan, no doubt for the same reasons as led Germany to expand her output before the war, set up an aluminium industry in 1934 and was able to produce some 35,000 metric tons in 1940 and 1941. The Malay Archipelago is an important source of bauxite supplies to Japan. In spite of all their difficulties Axis supplies are large and, until 1940, exceeded the output of the Allies.

In 1941, the Allied Powers gained the lead in production, though until recently a large proportion of the output of the United States was used in the manufacture of civilian supplies, such as motor cars. Great Britain has never been among the leading producers and, although output has been doubled during the past five years, it did

WORLD PRODUCTION OF ALUMINIUM AND MAGNESIUM

(a) Axis Group covers countries whose output is at present directly or indirectly controlled by the Axis countries. (b) Anti-Axis Group covers British Empire, United States and Russia. Russia has recently lost the greater part of its capacity, but owing to the destruction of plant, this part is not available to the Axis. (c) Figures for 1929 are not available. Sources: Where possible, official figures; 1939 and 1940 United States Bureau of Mines estimates; 1941 estimates prepared from available material.

not exceed Japan's in 1940 but probably showed a further increase in 1941. Since supplies of bauxite are bulky and have to be imported, it has hitherto been considered more economical to draw a large proportion of the needs of the British market from the other side of the Atlantic, where both the United States and Canada are large producers. Canada has undertaken to deliver large quantities both to the United States and to the British Aluminium Control. Canadian output rose from the then record of 41,700 metric tons in 1937 to 75,000 tons in 1939 and 110,000 tons in 1940. Last year production probably reached 150,000 tons, and a further 50 per cent expansion is expected to take place in the current year with financial assistance from the

United States. That country has introduced a colossal programme of expansion, and the 300,000 tons estimated to have been produced in 1941 are to be exceeded very appreciably this year. Until the end of 1940 the Aluminum Company of America, with its five large production plants, was the only American producer. Its expansion programme introduced in 1940 was originally scheduled to cost \$150 millions, but was later increased by one-third. Since the beginning of 1941 the Reynolds Metal Company, with the financial assistance of the Government, has begun operations in a reduction plant at Lister (Alabama). Together with the output of the Aluminum Company, this has raised the annual rate of output to 350,000 tons and will increase it to about 425,000 tons this year. Last July, moreover, the Office of Production Management adopted a plan for the construction of seven Government aluminium works with an annual capacity of some 300,000 tons, to be completed this year; this will raise the productive capacity of the United States to an annual rate of 725,000 tons—well in excess of the combined output of the Axis—before the end of 1942. Russia, which began producing aluminium in 1931, has unfortunately lost—at least temporarily—the greater part of its capacity, especially the Dnieper plant, which was responsible for half the total output in 1940. But the destruction of most of the plant has prevented the Germans from adding to their own resources.

Owing to the development of a large magnesium industry in Germany before the war, the balance of production in 1939 was even more in her favour than was the case in aluminium. Indeed, last year the output of the Axis still exceeded the combined production of the United Nations. According to the United States Bureau of Metal Statistics, world production of magnesium doubled between 1937 and 1940, chiefly because of the rapid expansion of output in Germany. That country produces magnesium in three plants from potash brines, dolomite and magnesite; its supplies were increased by the addition of France's output, but Switzerland and Italy, the only other producers on the Continent, can furnish only comparatively small quantities.

Japan's output, though substantial, was only about one-fifth of Germany's in 1941.

The United Nations have facilities for the production of magnesium in Great Britain, in the United States and in Russia. Until 1940, Great Britain was the leading producer. Since then, according to official American reports, imported magnesite has been replaced in Great Britain by domestic dolomite and sea water as the chief raw materials. As in aluminium, the United States has initiated a vast production programme. In 1940 it was the world's third largest producer, and the Dow Chemical Company, with its works at Midland (Michigan) and using local salt brines as raw material, was then the sole concern interested in the manufacture of magnesium. In January, 1941, a second plant of that company at Freeport (Texas), using sea water as its raw material, began production. Last autumn the Todd, California Shipbuilding Corporation started production at Permanente (California), also from sea water, and has planned to raise output to an annual rate of 12,000 tons by next spring. If the various programmes are carried out on time, the United States will produce almost as much magnesium next spring as the whole world produced in 1940. But these programmes have now been overshadowed by new plans designed to raise production, with Government assistance, to the enormous annual rate of 200,000 tons by the end of 1942.

In sum, the Axis Powers lost their superiority in aluminium in 1941, and they will lose their superiority in magnesium in the current year, in spite of a long start. A decisive balance of advantage in these two vital metals will go a long way in assisting the United Nations to gain superiority in the quality and quantity of their tools of war. The enormous growth in the production of aluminium and magnesium will leave the post-war world with a capacity out of all relation to former peace-time demands. But technical progress and drastic price reductions will ensure for the two metals a larger market than before the war and may have far-reaching consequences upon the consumption of other metals.

A Central Bank for Eire

THE Central Bank Bill, introduced in the Dail last week by the Eireann Minister for Finance, implements the basic recommendations of the Banking Commission of 1938 regarding the responsibility for the issue of currency and control of credit in Eire. It provides for the dissolution of the Currency Commission and the establishment of a Central Bank, which will take over the functions of the Commission and supplement them by most of the duties appertaining to a fully-fledged central bank. The Bill departs from the majority recommendations of the Banking Commission in providing for complete Government control of the Central Bank. The Bill also envisages some provision for tackling the long-standing problem created by the utilisation of a substantial proportion of Eire's banking resources outside the country, namely in Ulster and the London market.

The new Central Bank is to be an institution wholly owned and controlled by the Government. Its capital, fixed at £40,000, is to be subscribed by the Government and held in the name of the Minister for Finance. The paid-up capital of the Currency Commission is to be returned to the existing shareholding banks. The board of the new bank is to consist of a governor and not more than eight directors, of whom two, at the most, may be civil servants. The governor is to be appointed by the President on the advice of the Government. All other directors are to be appointed by the Minister for Finance, three of them from a panel prepared by the associated banks. The banking directors will thus be in a minority on the board. These provisions regarding the control and ownership of the Central Bank run counter to the recommendations of the Banking Commission; but when the trend is as strongly in the direction of open and direct state control of currency and credit as it is to-day, it would have been surprising if the Central Bank Bill had given expression to the classical and orthodox principles of central banking "independence."

The existing functions, organisation and staff of the Currency Commission are to be transferred *in toto* to the new Central Bank, and it is perhaps permissible to speculate that Mr Joseph Brennan, chairman of the Currency Commission since its foundation, will be the first governor of the Central Bank. The new institution will become responsible for the issue of legal tender notes which, over a period

of years, are to become the sole paper currency in Eire. The Consolidated Bank Note issue, which, even now, makes up only about a quarter of the total currency in issue, is to be gradually abolished. As bank notes are withdrawn, they will be replaced by equivalent amounts of legal tender notes, and the whole issue is due to be extinguished within twelve years. While such notes remain outstanding, each of the issuing banks will pay the Central Bank a charge of 2½ per cent per annum on the notes actually outstanding in its name (at present the charge is paid in part to the Currency Commission and in part to the Revenue Commissioners, the latter being calculated on the authorised maximum issue). The new bank is also to have charge of the issue of token coins, and will thus have under its responsibility the whole mechanism of currency issue in Eire. The Bill proposes no alteration in the existing provisions for the backing of legal tender notes, and it is, therefore, to be presumed that at least for the time being the currency in Eire will continue to be backed in the main by sterling bills and securities, apart from the comparatively small amount of gold which the Currency Commission obtained before the war.

In addition to the currency issuing functions the new Central Bank is to be given the following powers:—

- (1) To receive non-interest bearing deposits from commercial banks and to provide for the settlement of clearing balances between them.
- (2) To rediscount bills of exchange and make advances to banks against bills and Government securities.
- (3) To fix and publish discount and loan rates.
- (4) To buy and sell Government securities in the open market.

The Bill also provides for the licensing of all banks and bankers in Eire and for deposits to be made with the High Court by all banks. These deposits are fixed at £10,000 until 1945 and thereafter £20,000. The Central Bank will, in addition, be given the power to investigate the position of hire-purchase finance companies and to obtain from them such information as may be thought desirable.

It will thus be seen that the new institution is to be equipped with much of the customary armoury of a central bank. There are, however, certain interesting gaps in the familiar list of orthodox central banking functions. The Central Bank will apparently not keep the Government account, nor will the deposits maintained with it by the

commercial banks be compulsory reserves calculated as a proportion of their own deposit liabilities (apart from an interesting but as yet undefined provision to be mentioned later). It is evident moreover, that the facilities offered by the Bank for rediscounting and the scope available for its open market operations will both be limited in the extreme. Given the present structure of Irish banking assets and the whole economic position of the country, it is in London and not in Dublin that the mechanism of credit expansion and contraction must be centred for some time to come. The new Central Bank is likely to be little more than the existing Currency Commission under a new name; it would be more accurately described by the old-fashioned title of Bank of Issue.

This moderation is no more than a reflection of the actual circumstances of Irish banking. Eire does not possess an entirely autonomous banking or currency system—not because of any political decisions but simply because of the facts of the case. The currency of Eire is based on sterling, and it would be foolish to base it on anything else. So long as the commercial banks can, as at present, obtain Irish currency in exchange for sterling, it is difficult to see how the necessity for rediscounting with the Central Bank could ever arise. "Bank cash" in the Irish system is, or is obtainable for, sterling, and it is therefore in sterling that the reserves are kept. This is recognised by the Government, for the official explanatory memorandum attached to the Bill states that if no provision is made for the Irish banks to maintain minimum reserve balances with the new bank, it is because such a move might make for contraction of credit, whereas, in fact, the "commercial banks in Ireland are not prone to err in the direction of unduly expanding credit."

There is no suggestion in the Bill that any change is contemplated in the present basis of the Irish currency. There is, however, another peculiarity in the Irish situation. Nearly all of the commercial banks in Eire have offices and transact business also in Northern Ireland, and one of them, the National Bank, has an extensive business in Great Britain. This, of course, is not unique in banking experience. But what is unusual is the lack of balance between assets and liabilities inside and outside Eire. In the fourth quarter of 1941, the eight commercial banks had liabilities of £161 millions but assets of only £77 millions in Eire; in the United Kingdom, they had liabilities of £75 millions and

assets of £158 millions. This, again, is not due to wickedness or past history; it simply reflects the inadequacy of the means of utilising funds in Eire and the superior attractions of Ulster industry and the London Stock Exchange and money market. The Eireann Government, however, is not satisfied with this state of affairs. The memorandum states that it is "desirable that the banks should increase their investments within the state, having regard to the relatively large holdings of external as compared with internal assets," and the memorandum goes on to urge the banks to assist in the repatriation of external assets when times are more favourable for such a movement. The Bill makes provision for action on the part of the Central Bank designed to achieve this objective. Whenever the assets of a commercial bank held within Eire after a date yet to be specified fall below a certain proportion of its liabilities in Eire, the Central Bank, with the consent of the Minister for Finance, may require the bank in question to make with the Central Bank an interest-free deposit of a specified amount or to be calculated in a specified manner. The relevant clause of the Bill has been left purposely vague, and it is in this vagueness that its dangers are to be found. If the Central Bank, acting under the political pressure to which it will be prone, were at any time to implement its wide powers under this section with rigour, it would be able to cause the Irish banks considerable inconvenience and loss. Under these circumstances it may be that the banks will consider the advantages of a separation of their business in Eire and the United Kingdom—a move for which an interesting and perhaps anticipatory precedent was recently set by Guinness, Mahon and Company.

Except for a certain looseness in the drafting of some of the residual clauses, this section is the only part of the Bill to which reasonable exception can be taken—and even then the danger is contingent rather than actual. The outsider may observe that there is very little apparent reason why Eire should want to have a Central Bank, since the present arrangements work smoothly. But the dignity of the state apparently requires it—Irish comment makes significant reference to the fact that the new institution will be eligible for membership of the Bank for International Settlements—and the institution envisaged by the present Bill will certainly do no harm to the soundness of the currency and banking system of Eire.

Finance and Banking

Warships Weeks

The position in the money market continues difficult. The margin of surplus credit has throughout the week been narrow, though always sufficient to make it unnecessary for the discount market to have to seek accommodation from special quarters. The banks have been buyers of bills on a small scale, but in view of the coming calls on them in connection with Warships Weeks, they prefer the exceptional liquidity of short loans to that of bills. The market, which obtained the comparatively high allotment of 38 per cent at last week's tender for Treasury bills, has thus been constrained further to increase its holdings of bills. The banks have been helped by a small repayment of Treasury deposits this week, the £25,000,000 call for new TDR's comparing with nominal maturities of £45,000,000 and with actual maturities of £30,000,000, the balance having been encashed prior to maturity. The Bank return reflects the flow of funds to Government accounts, public deposits having risen by £8,808,000 to £20,988,000 over the month. Bankers' deposits have had to take the strain of this movement and of a further £2,097,000 expansion in the circulation. They have thus fallen by £11,222,000 to the comparatively low level of £117,626,000. The latest increase in the circulation carries the total of notes to £753,574,000, a new high record.

Clearing Banks' February Statements

Abnormally wide movements are revealed by the clearing banks' February statements. The volume of bank credit underwent a considerable contraction during the month, and the whole of its impact, on the assets side, fell on liquid assets. February is a heavy revenue month, during which the Treasury is normally able to repay floating

debt out of the current surplus. This year, however, revenue even at its seasonal peak has at no time equalled the huge expenditure of the Government, and the customary seasonal explanation of the contraction in bank credit does not, therefore, hold good. The impact of heavy revenue payments has, however, been reinforced by large subscriptions to Government issues. Warships Weeks have begun to make their effect felt, and, as was shown by the February debt return, the flow of funds into tax reserve certificates continues unabated, and provides a substantial drain on bank deposits. The clearing banks' deposits fell by £137,170,000 last month, and though this was explained to the extent of £13,403,000 by a reduction of the amount of cheques in course of collection and items in transit, the net movement represents the largest monthly contraction in bank deposits since the clearing banks began the publication of their monthly returns. The shock of these heavy withdrawals was taken by encashing Treasury deposit receipts, which are £93,000,000 down on the month, and by letting bills run off. The latter movement amounts to £45,574,000 and reduces the composite bill holding to £111,467,000, which is also a low record in the history of the clearing bank returns. The banks' smaller purchases of bills were to a large extent countered by substantial sales of bills by the market to the agent of the Bank of England. But, in addition, the market itself was compelled to hold larger amounts, and this is reflected in an increase of £4,448,000 in the clearing banks' short loans. The cash basis was further reduced by £12,381,000 last month, and though the ratio of cash to deposits improved from 10.25 to 10.30 per cent, it still indicated a decidedly taut position at the latter figure.

The contraction of liquid assets was accentuated by the banks' continued purchases of gilt-edged and by the rising trend of advances. Investments were £8,875,000 higher after a roughly equal increase in January. These are the first fruits of the Warships Weeks campaign, of which

the climax will be reached this month. The March clearing bank returns are not expected to reflect more than a fraction of the effect of London Warships Week, since the banks will be making up before the week has run its full course. A further increase of £13,874,000 in advances last month

COMBINED STATEMENT OF LONDON CLEARING BANKS
(In £ millions)

	Feb. 1941	Oct. 1941	Nov. 1941	Dec. 1941	Jan. 1942	Feb. 1942

Total assets	2,951.5	3,421.4	3,458.5	3,582.0	3,470.5	3,327.9

continues the recovery in this item which began in January. This is normally a time when temporary accommodation for tax payments is being extended by the banks, and it is yet too early to suggest that the rise in this item over the past two months indicates a reversal in the long-term downward trend which has been maintained since the early months of the war.

Exit the NEI Guildler

Japan's continued advance in the Pacific areas was signalled in the foreign market this week by the disappearance of quotations for the Netherlands East Indies guildler. Following the Japanese occupation of Java, all sterling and dollar assets of the NEI Government and private individuals have been taken over by the Netherlands authorities in London and New York. This action is of an obviously precautionary nature and intended to prevent these funds

being used in a way contrary to the national interest. The loss of the East Indies means that the Netherlands Government is now deprived of its most prolific source of revenue. Fortunately, the bulk of the merchant fleet remains, and this, together with the colonies in the West Indies and Netherlands Guiana and the substantial sterling and dollar reserves accumulated in recent times, should preserve the financial independence of the Government.

Silver Rupee Price Soaring

The price of silver in India, now divorced from the restraining influence of official sales, has soared to new heights this week. The quotation of Rs. 89 per 100 fine tolas reached on Wednesday is equal to a flat sterling parity of 39.59d. per standard ounce. The shipping parity cannot be calculated at the moment, but allowing for the import duty alone, the effective London-Bombay parity would be 36½d. on the basis of the above quotation. The course of the silver price in India has confirmed the wisdom of the Indian Government in suspending its sales of the metal as soon as it became evident that a major speculative and hoarding demand for the metal had got under way. With the main Empire sources of production threatened it behoves the authorities to conserve available stocks for essential requirements. It may even be questioned whether the time has not arrived for the Government of India to suspend its sales of silver in the London market at the price of 23½d. or at least to subject those sales to the closest selective control. The rise in the rupee silver price creates a number of interesting possibilities. If it proceeds to the point at which a quotation of Rs. 109 per 100 tolas is reached, the bullion value of the rupee coinage of 11/12ths fineness will rise over the present parity of 18d. One may assume that the bulk of the Indian coinage is still of this fineness, though a considerable start has been made at recoinage at 500/1,000 fineness. It is probable that in anticipation of a further rise in the price of silver a considerable amount of hoarding of full silver weight coins is now taking place, and the decision of the Government to stop sales of silver may also have been induced by the fact that its reserves of coin were being depleted by the replacement of currency going into hoards. The position is full of the most interesting possibilities, but it would be unwise to attach too much significance to the manifestations of a hoarding rush for silver in a completely closed and isolated market such as that now represented by India.

THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

CAPITAL - - £3,000,000
RESERVE FUND- £3,000,000

Head Office: 38 BISHOPSGATE, LONDON, E.C.2

London (117/122 LEADENHALL STREET, E.C.3)

Branches (28 CHARLES II STREET, HAYMARKET, S.W.1)

Manchester Branch: 52 MOSLEY STREET

Over 40 Agencies and Branches throughout the Far East, &c.

Drafts granted on Agencies and Branches, Bills of Exchange bought and received for collection. Letters of Credit and Travellers' Cheques issued, and every description of banking business transacted. The Bank also undertakes Trusteeships and Executorships.

COMMONWEALTH BANK OF AUSTRALIA

(Guaranteed by the Australian Government) Branches and Agencies throughout Australia. Banking and Exchange Business of every description transacted. Bankers to the Government of the Commonwealth of Australia, the Government of the State of Queensland, the Government of the State of South Australia, the Government of the State of Tasmania. Commonwealth Savings Bank of Australia, 5,894 Agencies at Post Offices in Australia.

As at 30th June, 1941:—General Bank Balances ... £180,752,179
Savings Bank Balances ... 150,553,865

Investment

Reinvestment Forces Decline

The effect of the re-investment of the India monies is rapidly wearing off, and, as it does so, the steady trickle of provincial selling of the Funds is resumed. So far, this has not sufficed fully to satisfy the demand of the big houses, but it is not improbable that there will be a halt in the rise in fixed interest securities, if not a reversal of the movement, before it receives a fresh stimulus from the Canada payment in ten days' time. Meanwhile, in other sections, ill news from the Pacific theatre has fully offset the upward drag of rising prices for the Funds, and industrial equities are, according to the index of *The Financial News*, little above lowest of the past six months. There are no doubt a number of special factors operating at the present time which tend to reduce prices of trustee securities. Of these, heavy tax payments are probably of minor importance. There can be no doubt that many private incomes are still falling and, with income tax payments one year, and surtax liabilities two years, in arrear of the actual receipt of income, some selling appears only too probable. It is also the case that the present unexampled drive in the national savings campaign not only produces a very effective competition for new savings, but causes, to some extent, the sale of securities in order that the showing in the local Warships Week shall be as large as possible. In this connection, it is almost certainly the case that the rise in clearing banks' investments during February represents additions to holdings of "tap" issues and not purchases in the market. A further factor of some importance is the approach of the new budget. When all allowance is made for the effects of the receipt of taxes at the increased rates for a full year, for the natural resilience of the revenue in time of expanding production, and for other favourable factors, it will nevertheless be necessary to impose some new taxes as well as to stimulate saving. It may even be the case that there will be an increase in income tax, as well as a reduction in the surtax minimum. It appears probable, however, that the inevitable reduction in civilian outlays will be achieved either by the imposition of indirect taxation, or more probably, and with greater justice, by direct limitation of supplies. Whereas a rise in income tax affects all securities in the same way, any or all of these alternative methods of reducing outlays would tend to affect most the concerns producing the commodities taxed or otherwise restricted. It is possible that the current weakness of equities as against the Funds reflects this argument. This would not, however, account for a fall in the shares of concerns working entirely for the war effort, and it is reasonable to suppose from the general character of the setback that the main cause is a growing conviction that the war is to last longer than was, optimistically, supposed up to the entry of Japan.

Halifax and Abbey Road

Restricted operations, greatly increased liquidity, steady mortgage repayments and stability of funds characterise the 1941 results of our two largest building societies. Halifax, during the year to January 31st last, advanced a mere £1,497,955 on new mortgages, compared with £20,340,000 in the last pre-war year. At the end of the year, shares and deposits were only £300,000 lower at £118,209,665—new subscriptions and accrued interest more or less equalled controlled withdrawals. Total mortgage funds, however, fell from £100,539,000 to £94,394,000; in short, the average mortgagor fulfilled his obligations creditably, and repaid substantial sums in capital, notwithstanding the relief granted to many borrowers to meet difficult wartime circumstances. The inevitable consequence of this combination of a virtually closed mortgage department, stable investment funds, and steady loan repayments is a striking increase in liquid funds and investments of more than £6 millions to £29,839,000. This is a formidable total. It is even more striking when expressed as a percentage of total assets—24 per cent, compared with about 17 per cent at January 31, 1939. Identical trends are shown by the Abbey Road accounts for 1941—£210,508 advanced compared with £6,280,666 in 1939, and an improvement in the liquidity ratio from 6 per cent to over 10 per cent. Since 1939, there has been some fall in deposits and shares through the natural process of repayment, from £48 millions to £45½

millions. These results suggest that the societies are striving to maintain their total funds, and they are left with only one outlet for funds released by mortgage repayments—the gilt-edged market. Their policy is evidently to build up their resources towards the resumption of free lending after the war. There is much to be said for this—not least because the societies are now canalising a substantial flow of funds into gilt-edged which might, in private hands, be tempted towards the consumption goods market. But it is not an easy choice. Gilt-edged stocks yielding 2½ per cent cannot replace mortgages yielding 4½ per cent without straining the societies' revenue position. It is already tight, and the only apparent relief would seem to lie in a further reduction in investment rates. Even at the reduced levels of 2½–2½ per cent tax free, these are still well out of line with the general structure of interest rates.

Tax Free Preference Payments

The reduction in the net income of many investors has occasioned them and their advisers to scrutinise more closely the exact rights attaching to their holdings. This is presumably the explanation of the increased interest shown of late in the method of calculating the net amount payable on preference shares and other securities which are "free of tax" up to a stated amount in the pound. The position is somewhat complicated, but the overriding considerations can be stated in fairly simple language. The rules governing the payment of income tax cannot be altered by arrangement between two parties. Consequently, the arrangement to pay preference dividends less tax at a given rate merely sets out a means of determining what the net payment actually shall be. It follows that there can be as many different answers to the question, what will be the net receipt on a dividend free of tax at 6s. in the pound when the standard rate is 10s. in the pound, as there are effectively different contracts. So long as they keep within the law and the income tax rules, the articles of association are the deciding factor. In practice, however, the mere statement that a dividend is free of tax up to 6s. in the pound is held to mean that the maximum gross (taxable) amount bears the same relation to 20s. as the amount of the dividend does to 14s. That is, 6 per cent on £1,000 equals £60 net, or $£60 \times 20 \div 14 = £85$ 14s. 3d. gross. On this sum, tax has to be charged at 10s. in the pound and the net receipt is £42 17s. 2d. That is the usual arrangement, but there may be others. A case in point is that of the Austin Motor Company whose "B" preference stockholders have to bear tax in excess of 6s. on a gross sum of 6 per cent. The relevant extract from the articles, kindly supplied by the company, reads as follows: "The 'B' preference shares shall confer the right to a cumulative preferential dividend at such rate that after deduction of tax thereon at the current rate—the amount remaining shall be the sum of 6 per cent per annum—less the amount of any income tax for the time being payable in excess of 6s. in the pound computed on a gross sum of six pounds per cent per annum on such capital." That is, at present, 6 per cent less (10s. minus 6s.) or 4.8 per cent after tax against 4.286 per cent after tax under the more usual method. Evidently, this is a matter of considerable importance to holders of the "B" capital and of the equity, and serves to stress the need for a careful enquiry as to the exact rights attaching to shares.

Dealing in Australian Shares

Although the matter is of more interest to the student than to the British holder of the securities concerned, there will be general satisfaction that the Commonwealth ban on general business is, apparently, to be withdrawn. According to present indications, there is to be substituted for it a system of movable maxima and minima, from which it is possible that this country might learn something. The suggested basis is that the dealers in securities should fix a fair price in view of current conditions and that business should be permitted within a range of prices from 10 per cent above this basic figure to 10 per cent below it. This very generous allowance will prevent ragged speculation

from driving quotations unduly far in either direction, but, of course, at the cost of making it sometimes impossible to deal in the shares in question if the speculation actually arises. Presumably, however, if the movement is unjustified by events, a swing back will occur and business will again become possible on the old basis. This is somewhat similar to arrangements adopted in Canada, particularly in commodity markets, in times of severe strain. It seems well adapted to existing conditions in Australia, and should not greatly affect turnover. In the event of a real and permanent change in the underlying conditions which would affect the "real" value of a security, business would soon become impossible owing to the maximum or minimum being reached. And to guard against this, the dealers are charged with the duty of a periodic revision of the basic price. The arrangement has the weakness that it is not easy to say how the real value is to be distinguished from the market price. It is, however, perhaps a good deal easier in the Commonwealth than in this country, with its much more numerous list of securities, to reach a reasonable conclusion, and, provided they are not unduly influenced by a very natural desire to maintain turnover, it is probable that dealers are less liable to be driven into the state of mind which dictates panic selling or over-optimistic buying, than is the ordinary member of the public. Much will depend upon how readily they change basic prices, but, for the immediate future, selling will mean a heavy sacrifice in almost every section, and business is not likely to be very active.

Foreign Debt Announcements

The foreign bondholder has received further heavy, if not unexpected, blows in the shape of default on the 4½ per cent Siamese Loan, 1907, and of the issue of a communiqué by the Greek Government formally stating that no further payment can be made on the external debt for the duration. It has, of course, been obvious that since Japan invaded Siam and Germany conquered Greece there could be no further payment on the foreign debt of these countries. No payment has in fact been made on Greek loans since April 1, 1941. The bonds and coupons of the 4½ per cent Siamese Loan, 1907, fell due on March 1st last—the first interest date since the country came under enemy occupation. As Siam is at war with this country, it must be presumed that the Government will also default on the 4 per cent Sterling Conversion Loan, 1936, interest on which is due on April 15th, and on the rest of its external debt. From the standpoint of the investor, a very different reception must be accorded to these two announcements. The Greek Government, since the conclusion of the agreement in January, 1940, by which Greece undertook to pay 43 per cent of the interest due, has done much to raise her standing as a debtor. The agreement concluded a dispute which had lasted for some three years, and since then the Greek Government continued to transfer interest throughout the critical and gallant campaign against Italy. No debtor can meet its obligations when separated from all sources of income, and there can be no doubt that Greece will resume payment at the earliest opportunity. In the case of Siam, however, it is notorious that virtually no attempt was made to curtail Japanese infiltration prior to actual invasion, or to resist in a military sense. This default is salutary, if painful, for the investor in foreign bonds, who has hitherto attached to Siamese issues almost the status of investments in a Crown Colony—on the slenderest

THE ALEXANDRIA WATER COMPANY, LIMITED ALEXANDRIA, EGYPT.

NOTICE IS HEREBY GIVEN that the sixty-fourth ordinary general meeting of the shareholders will be held at the company's offices, 61 Avenue Fouad ter, Alexandria, on 9th April, 1942, at half past four in the afternoon for the transaction of the ordinary business of the company, pursuant to Act of Parliament and to ratify the proceedings of the ordinary general meeting held on the 4th April, 1941.

Holders of share warrants to bearer desiring to attend or to be represented at the meeting must deposit their share warrants in London before the 26th March, 1942, or in Alexandria before the 6th April, 1942, until after the meeting at the National Bank of Egypt, 6 King William Street, London, E.C. 4, or at the National Bank of Egypt, Alexandria, or at some other approved bank in London or Alexandria.

Dated, Alexandria, Egypt, the 2nd March, 1942.

By order of the Board,
T. D. KEY
ROBERT WALTON } Joint Managers.

of evidence. The war in the Far East will inevitably set fresh values on the standing of investments in that area, based on a more realist appreciation of the political issues at stake. The total of the 4½ per cent Siamese Loan, 1907, outstanding in London is £754,220. At the end of 1939, the total amounts of the Greek debt outstanding were: gold francs 750,696,000; £13,391,680 and \$38,278,500, of which the first two sections were quoted, but not exclusively held, in London. There are, in addition, Greek liabilities on the Repartitioned Debt of the former Ottoman Empire.

Company Notes

London Brick Results

Full accounts of London Brick for 1941 show an increase in trading profits of £28,246 to £365,565, while total income is up from £354,325 to £386,210. In the previous year, however, profits were struck after the provision of £60,250 to be written off motor vehicles, while no such provision was considered necessary in 1941. Depreciation receives £100,000, as before, so that the available surplus is up from £219,195 to £251,080 and the ordinary dividend—which is again 10 per cent—is covered by earnings of 15.1 against 11.7 per cent. The directors have placed £50,000 against nil to general reserve, raising the total of the fund to £450,000. Thus, the carry forward is only £1,080 higher, at £103,390. Three years' results are analysed in the following table:—

	Years ended December 31st		
	1939	1940	1941
	£	£	£
Total profits, after tax and reconstruction.....	336,344	354,325	386,210
Depreciation	100,000	100,000	100,000
Fees	3,229	3,130	3,130
Preference Dividend	32,000	32,000	32,000
Ordinary stock:—			
<i>Earnings</i>	201,115	219,195	251,080
<i>Paid</i>	200,000	200,000	200,000
<i>Earnings %</i>	10.1	11.7	15.1
<i>Paid %</i>	10	10	10
General reserve.....			50,000
Carry forward	83,115	102,310	103,390

The directors state that for the first nine months of the year trading conditions were more satisfactory than in 1940, but that the concern was hampered in the last quarter by a falling off in Government requirements and also by the ban on long distance transport of bricks. Thus, the balance sheet shows a rise in stocks from £181,888 to £236,201. The sharp contraction in debtors from £518,252 to £351,534, accompanied by a rise in the total of cash and Government securities from £380,520 to £652,817, suggests that substantial payments have been received on Government account. There is a decline in investments—valued at less than market prices—from £469,831 to £347,615, while tax-free loans to the Treasury have been reduced by £50,000 to £150,000. On the liabilities side, creditors are slightly higher at £286,562 against £269,781, while the reserve for tax and contingencies is unchanged at £370,000. The directors state that the share capital of Clock House Brick and the assets of Aylesford Pottery have been acquired, a transaction which no doubt accounts for the item, shares in subsidiary company, of £74,000 against nil. Stockholders should expect some further slowing down in official demand for defence and factory construction this year. The £1 ordinary stock, at 48s. ex dividend, yields £4 3s. 4d. per cent.

Sudan Plantations

The capital and income position of *Sudan Plantations*, and its subsidiary, *Kassala Cotton*, were significantly affected, in the year to June 30th last, by the conclusion of an agreement for the transfer to the Sudan Government of buildings, electric light and water installation ten years prior to the expiry of the concession in 1950. The transfer is to be made for specific sums, £385,400 in the case of *Sudan Plantations*, and £64,652 in the case of *Kassala Cotton*, which are payable at the end of the period, the dividend paying a fixed annual rent in the meanwhile. For *Sudan Plantations*, the amount due is some £100,000 below the gross valuation of the buildings, and, in consequence,

FREE TRADE—AND NO COMPROMISE

The announcement in November last of the foundation and purpose of the Free Trade Legion has brought remarkable results.

Letters have poured in to the Headquarters of the Legion from many parts of our own Country and of the free World. They show an anxiety that the work of the Legion should be accelerated. They indicate that the policy is ripe for development. A writer from Winnipeg—Mr. H. G. L. Strange, of the Searle Grain Company—says: "I will do everything I can in this country to forward the splendid objects of your Legion. I predict that the crusade upon which you are entering will sweep the Democratic countries of the World." All the evidence confirms that view.

Protectionists and planners of industry who would put our people in chains will stand no chance against the rising tide of revolt in the public mind that has now begun.

Everywhere people are realising the truth of the declaration by that great American statesman, Mr. Sumner Welles, that tariffs caused the rise of Nazism and they know that an important contribution to the breaking of Nazism and the uprising of Liberal forces in enemy Countries would be a declaration of complete and uncompromising Free Trade by the great Democracies.

Already the Democracies have travelled far along that road. The recent declaration by the Governments of the United Kingdom and of the United States that any meeting of obligations between the two peoples shall be carried out in such a manner as not to burden commerce between the two Nations buttresses still further the admirable clauses of the Atlantic Charter. Moreover the Governments are to discuss measures which will reduce tariffs and other trade barriers.

The Free Trade Legion and all right-thinking British people will support their Governments to the full in any measures of that kind. They are steps towards winning the War and winning the Peace.

The Free Trade Legion goes further than the Governments have yet gone. It is supported by many people who have always believed that the abandonment of Free Trade by our Country was the greatest economic blunder ever committed in our long and glorious history. They ask for a declaration now of our intention to return to Free Trade regardless of what other Nations may do.

That is the essence of our campaign.

It is unlikely that all countries will immediately agree to abandon their protectionist policies. Even in the United States there will be some who will fail to realise that the standard of life of all mankind can only be raised by abundance, natural prices and the free flow of goods and services. Consequently, there may be discussions and delays. But in the long run all proposals for anything less than complete Free Trade for our Country will have to be abandoned, for only by that step can we hope to survive as a great Nation and recover our former strength and prosperity.

It is as well also for us, at this moment when the destiny of our Country and Empire and indeed of all the English-speaking peoples is in the balance, that we should recognise that it is our mercantile marine, our Royal Navy, with their co-operating fighter aircraft, which alone stand between us and utter disaster. That mercantile marine can only be maintained under a policy of Free Trade. Indeed, it is true that the policy of Protection in all its phases was responsible for the serious reduction in the numbers of our mercantile vessels between the two wars and the reduction in the numbers of our sailors in merchant vessels and fishing fleets by over eighty thousand.

Even agriculture must rank second to the mercantile marine, for, though we are convinced that agriculture can flourish under Free Trade, we are equally convinced that our lands and cattle will not for ever remain in British hands without the reserve defence services of men and ships provided by a powerful mercantile marine.

We emphasise these points particularly for the younger people amongst us. In the past thirty years the young people have heard little of the policy and benefits of Free Trade. And, if further justification for our campaign were needed, we would emphasise the importance of making good the gap in the knowledge of the rising generation. In the coming years great decisions will have to be taken by people who are now in their early youth. It is the duty, therefore, of the older people who know of the happy conditions which prevailed under Free Trade to pass down their knowledge and experience.

We invite old and young to join with us in a cheerful crusade for the revival of all the greatest elements in our national life so that the British people may proudly carry on the good work of their forefathers in their service to all mankind.

Send for the Manifesto of the Free Trade Legion, 38, Bedford Street, Strand, W.C.2.

President—Major HON. L. H. CRIPPS, C.B.E.; *Honorary Secretary*—Commander GEOFFREY BOWLES, R.N.

The Free Trade Legion stands for Free Trade, retrenchment and reform, private enterprise, individual responsibility and sanctity of contract.

We send greetings to all those who have written to us from South Africa, the United States and Canada, the Argentine and Brazil. All letters received have been answered.

2s. 6d. a week to a maximum of 62s. 6d. a week at 32 years of age. The employees benefiting from the Tribunal's award are (a) those in receipt of a basic weekly wage of less than £3, numbering some 195,000 men and 750 women in the conciliation grades and 3,500 men and 10,000 women in the salaried staff; (b) those standing at the maximum rates of Class 5 in the clerical, stationmaster and supervisory grades and at the maximum rate of Class 2 in the case of female staff, numbering together about 19,600 persons; and (c) women clerks performing duties similar in character and value to those of male clerks. In view of the fact that wages in the lower ranks of railway workers have hitherto been comparatively low—even agricultural workers now receive a minimum weekly wage of £3—the Tribunal's award does not appear unreasonable. The increase in wages does not affect the position of shareholders, for the railway companies now receive a fixed annual sum for their services from the Government.

Progress of Scrap Campaign

In a Note on page 336 of *The Economist* of last week, it was pointed out that there was then still little news concerning the progress of the new iron and steel scrap campaign. Since then the Ministry of Works and Buildings, which is in charge of the collection of scrap, has released information which suggests that a fairly good start has been made. During the first seven weeks of the campaign, up to the end of February, the quantity collected was 176,000 tons, equivalent to about 25,000 tons per week. Moreover, it is understood that the weekly rate of collection is now gradually rising towards the 40,000-ton mark, which is the target originally set and which will presumably be required in addition to last year's supplies if the output of steel is to be raised sufficiently to offset the reduction in supplies of scrap and steel from the United States. Moreover, there have been indications of an improvement in the output of iron ore, which is scarcely less vital than an increase in deliveries of scrap.

Retail Trade in January

The average daily value of retail sales, calculated by the Bank of England, usually shows a recession in January from the seasonally high December figures. This year the peak in December was not as high as usual, and the index for all sales (1937 = 100) fell by 16 per cent from 126 to 106, compared with a decline of 23 per cent, from 132 to 102, a year earlier. The value of sales in January was, however, relatively high, being 4.1 per cent greater than in January, 1941. The main classes of sales responsible for the increase compared with a year ago were: men's and boys' wear, with a rise of 20.1 per cent; boots and shoes, in which turnover rose by 32.6 per cent; the furnishing departments, where the rise was 32.4 per cent; and household piece-goods, with an increase of 28 per cent. In general, it is probable that these rises indicate the relatively large advance in prices which has taken place in these departments. The index of sales of food and perishables which stood at 110 in January and 123 in December, 1941, was 108 for January last. The slight decline on the year of 1.1 per cent was close to the average monthly decline in 1941 of 1.5 per cent. The smallest increase since June in the total value of stocks at cost was recorded in January, when the rise was 7.9 per cent on the year. Retailers did not in general follow their peace-time policy of reducing stocks in January. Such "sales" as took place were limited, and the tendency was to conserve rather than to clear stocks.

Traders' Coupon Vouchers

The Board of Trade has devised a new system for the arrangement whereby traders' clothing vouchers of 500 coupons may be obtained from post offices. Clothing traders have been permitted to exchange 490 loose coupons for 500-coupon vouchers at post offices on presentation of sealed envelopes endorsed with their name and address and a declaration that the envelopes contain the requisite number of coupons. After the issue of the vouchers, the envelopes went to the Board of Trade for examination and checking. Inevitably, some envelopes contained nothing but waste paper and bore false names and addresses. Some offenders were traced and sent to prison. But since the announcement that banking facilities for clothing coupons are to be established, the fraud has shown signs of spreading. The Board

of Trade has stated, however, that the fraud is not widespread and has in no way reached a scale which threatens to undermine the rationing system. Since last Monday vouchers are no longer issued until the contents of the envelopes have been examined. To enable this to be done, the envelopes will have to be deposited two days before the vouchers are claimed. The banking system for coupons, which is expected to start in a few months' time, would in any case have killed this gratuitous source of supply. The Board of Trade is to be congratulated on having closed a door to the black market, for it seems to have put a faith in human nature which was not found to be justified. In any case, the number of coupons in the envelopes had to be checked, and it seems unlikely that much additional administrative work would have been required to operate the new system from the beginning.

Cotton Trade Wages

There are no signs that the claim for higher wages in the cotton industry will be settled by negotiation between the employers and the trade unions. The application of the operatives in the spinning branch is for an advance of 3s. 4d. in the £ on current wages, and in the weaving section the claim is for a flat increase of 8s. 0d. a week for each operative. The Master Spinners' Federation has rejected the demand of the Operative Spinners' and Card-room Amalgamations, the president of the Federation having stated that his committee has not found anything in the reasons for the application which justifies the granting of an increase other than that provided by the cost of living agreement of March, 1940. The Manufacturers' Association have reached a decision, but they have not made known what it is; it may be taken for granted, however, that the claim will be refused. It is believed in trade circles that both these applications will be settled by arbitration by the National Arbitration Tribunal for the spinning section, and by a decision of the Joint Conciliation Committee, of which Sir Charles Doughty, KC, is chairman, in the weaving branch. As since the outbreak of war the operatives throughout the industry have received advances amounting to 35 per cent on the wages existing in September, 1939, there is a feeling that the present movement is not justified. Should any concession be secured as a result of arbitration proceedings, then the spinning employers will undoubtedly make a request to the Cotton Controller for an increase in price margins. Broadly, the cost of any wages advance would indirectly have to be met by the Government, either through a reduction in payments of EPT by individual firms or by an increase in the prices of cotton goods purchased by the Service Departments.

Manganese

In view of the potential threat to communications with India, the problem of Allied supplies of manganese, essential to the production of iron and steel, has acquired a new significance. In recent years, world production of manganese ore fluctuated between 5,000,000 and 6,000,000 tons per annum, with a manganese content of slightly less than 50 per cent. To this total, Russia contributed some 3,000,000 tons and India between 900,000 and 1,200,000 tons. Russia has been exploiting two large deposits, the Nikopol deposits in the Ukraine and the Tshiatury deposits on the southern slopes of the Caucasus. The one, which provided about one-third of Russia's supplies, is in the hands of the Nazis, and exports from the other, formerly shipped from the Black Sea port of Poti, are now limited through lack of adequate transport facilities. In India, manganese ore is mined in the Central Provinces and shipped from Bombay, Calcutta and Vizagapatam. But even if the threat to communications with India should become serious, the Allies would still be in a better position than during the last war, when Russia and India were the only large producers. During the interval, production in South Africa and the Gold Coast has been increased very considerably to a capacity of about 1,500,000 tons per annum; some 500,000 tons can now be supplied annually by Latin America, mainly from Brazil, Cuba and Chile, and a further 200,000 tons by the Sinai Peninsula in Egypt. Moreover, a good deal of technical progress has been made in recent years in the treatment of low-grade ores which are found in abundance in the United States. The United Nations are therefore unlikely to experience a decisive shortage of manganese.

COMPANY MEETINGS

LONDON MIDLAND AND SCOTTISH RAILWAY COMPANY

REVISED CONTROL AGREEMENT

SIR THOMAS ROYDEN'S SPEECH

The nineteenth annual general meeting of the London Midland and Scottish Railway Company was held, on the 6th instant, at Friends House, Euston Road, London, N.W. 1.

Sir Thomas Royden, Bart, CH, chairman of the company, who presided, said: In the report before you a brief description is given of the terms of the revised financial arrangements with the Government for their use of our undertaking.

We had supposed that the original agreement would be left undisturbed, as the whole object of the scheme of control is to assist the Government in the efficient prosecution of the war and the maintenance of supplies and services essential to the life of the community, and this object was being achieved quite successfully. In this hope and belief we were mistaken.

The Government told us that as from January 1, 1941, it was proposed to substitute for the existing scheme a guarantee of revenue. After much negotiation it was agreed that beginning January 1, 1941, the Government would pay to the four main line companies and the LPTB an annual sum of £43,000,000 to the end of control. This payment of a fixed amount was in substitution for the pooling arrangements. We were further informed that the Government had decided that the new war damage scheme was to apply from the beginning of control. During negotiation it was made perfectly clear that £43,000,000 was the maximum that the Government was prepared to pay, and in all the circumstances your Board, in common with those of the other companies and the LPTB, having heard the proposals of the Government, agreed to accept them. The payment which we shall receive under the new scheme, leaving aside for the moment the question of war damage, is a fixed sum of £14,749,698 per annum instead of a minimum sum of £13,465,624, the latter carrying with it in addition a participation in the net revenue of the Pool above that minimum. In neither case do these amounts include the net revenue from our holdings in Irish railways or investments in road transport undertakings. The actual profit earned by any railway for 1941 is not ascertainable, but the LMS amount is certainly substantially greater than the amount payable to us under the new agreement.

PROVISION FOR CHARGES REVISION

The agreement further notes the standard revenue of £20,579,930 which was settled by the Railways Act of 1921, and, to meet the changed conditions, provides that, before the end of control, time will be given for adjustment of the level of charges. In addition, records will continue to be kept of the increased costs due to war conditions, and these will enable a close estimate to be made of the true net revenue of the controlled undertakings as a whole. These obligations of the Government will have an important value after the war, and are some recompense for the retention by the Government of a substantial proportion of our profits during the war period.

The provisions for war damage on the railways are by the new agreement brought into line with those affecting other public utility undertakings, and will in due course be embodied in an Act of Parliament. The scheme has not been completed, but broadly, it will provide that not more than one-half of the damage will be borne, in agreed shares, by the railway undertakings concerned, the balance being borne by the Exchequer. This may or may not be to our advantage. It depends on the total amount of the damage, as under the original agreement the amount payable by the railways was the damage in excess of £10,000,000 per annum. The liability falling upon us, whatever it will be, will not be a charge in ascertaining net revenue, as Parliament has decided that for all purposes it is of a capital nature. In due course proposals for dealing with it will be placed before you, but not until the war is over. Various ways and means are under consideration, but it is not intended to make large reserves during the war for that purpose. Meanwhile, following a provision of £300,000 in 1940,

£400,000 has been set aside this year to meet war-time contingencies generally.

RESULTS OF THE YEAR

The result to us of the year's working is an improvement of the net revenue compared with 1940 of £544,000. The portion of this in respect of the net revenue accruing under the Government agreement, after meeting various items not chargeable to the Government account, shows an increase of £340,000, and there are gratifying increases of £172,000 from the Northern Counties Committee and £32,000 from road and other transport investments.

Of this increase of £544,000, the additional provision for war-time contingencies which I have mentioned absorbs £100,000, and the proposed dividend of 2 per cent., compared with 1½ per cent. in 1941, requires £476,000.

During the past year action has been taken on many matters on directions from the Minister. These directions, although limited to the period of Government control, may affect the value of our post-war assets or the earning capacity of the company and must, therefore, and they will, be kept under close and continuous review in case it may prove necessary to take steps to protect our position after the war.

TRAFFIC RECORD

We have successfully carried a larger volume of traffic than ever before in our history in the face of many acute operating difficulties. In the first place, there has been a very considerable reduction in new locomotive construction, owing to the shortage of labour and materials. The position has been further adversely affected by the demands of Government Departments for locomotives for use in their establishments and for service overseas. We have, therefore, had to meet abnormally large requirements with considerably less motive power. To meet these abnormal conditions, methods have been adopted to increase the availability of the locomotives at our disposal by speeding up repairs, revising the regulations governing the maintenance and servicing of locomotives at the depots, reallocating engine duties so as to release the heavier types of locomotives for freight work, and by mutual arrangement with the other railways for transfer of locomotives to one another. Some of these steps have required heavy expenditure which would not be justifiable in normal conditions, but they have been justified by the present national circumstances.

With altered conditions of imports and exports there has been a great change in the flow of traffic from those obtaining before the war, and there is not the same regularity in such flows. In order to meet this new demand a quick turn-round of freight rolling stock is essential, and in March, 1941, an Inter-Railway Freight Rolling Stock Control was set up in order that the whole of the combined railways' rolling stock might be distributed in accordance with the immediate needs of the traffic offering. Whilst each railway continues its own internal control and distribution of rolling stock, the Inter-Railway Control adjusts daily the distribution of the stock between the respective railways to meet the ascertained needs of the traffic to be conveyed. The new organisation has proved very satisfactory and enables the available freight rolling stock to be placed as quickly as possible at the points needed, and improves the turn-round of all the wagons and their equipment. An example of its useful work is the supply of wagons to the collieries. There has been a very great improvement in this respect; even during the recent spell of very bad weather it was possible to keep the pits adequately supplied with wagons, and the collieries have expressed to us their appreciation of the arrangements.

Passenger travel increased substantially, owing, in the main, to much new workmen's traffic and a growth in movement of members of His Majesty's Forces.

There was also a considerable increase in merchandise carried, and the loaded wagon miles run were considerably greater than those in the pre-war peak year of 1929.

REGULAR CONTACT WITH GOVERNMENT DEPARTMENTS

Regular contact has been maintained with Government Departments and trade organisations to enable traffic to be worked evenly and to avoid congestion and wagon detention. No less than 258 of our officers are working in liaison with Government Departments, and still more can be done to improve the turn-round of wagons and thus secure an even flow of traffic for production requirements.

To effect a saving in locomotive power and to increase track capacity for working Government and other traffic of national importance, the train services are under constant review so that essential services, whether for passenger or freight traffic, shall have priority. It has thus been found necessary to withdraw a number of passenger trains, mainly of a local character, and this has produced a definite benefit to other services, including new daily trains for the large additional influx of workers to Government and other factories.

Owing to the congestion of passenger traffic on certain sections of the railways in the London area at peak periods, the Minister decided, in order to provide the maximum accommodation in the available trains, that first-class accommodation on all passenger services operating inside the London area, and between London and certain places outside that area, should be withdrawn and one class trains should be provided.

CURTAILMENT OF PASSENGER FACILITIES

There are some people who seem unable to understand why we have been forced to the regrettable necessity of curtailing passenger facilities in this way. I have already explained to you the problems we are faced with so far as the shortage of locomotive power is concerned, and the need for dealing with a vast increase in Government and other traffic of vital importance for the successful prosecution of the war. The decision to curtail passenger facilities has not been welcome to us, though we receive letters from some who seem to think we are doing it for the sake of doing it. Even now there are people who do not understand what total war requires, and that if we are to win through all considerations of personal comfort must be put on one side, and we must devote ourselves to the main task of organising our resources—of which the railway is a major one—so as to bring the highest striking power to bear on the enemy. If people are asked to stay at home unless they have to travel for essential purposes, that surely is a reasonable request. If they are asked to take their own food with them on a journey, that is not much to ask. We all remember pre-war standards, but the only standard now is that we must all pull together to win this war.

Throughout the year the special trains required for the conveyance of troops and military equipment were numerous, and I am glad to say were moved without a hitch. These trains often interfered with the running of many ordinary long-distance trains, which in turn affected the working of local trains far away, but this reaction is avoided wherever possible.

The report was adopted.

GENERAL INVESTORS AND TRUSTEES, LIMITED

The thirty-fifth annual general meeting of General Investors and Trustees, Limited, was held, on the 12th instant, in London. Mr Gerald T. Moody (chairman of the company) presiding.

The following is an extract from the statement of the chairman circulated with the report and accounts:

This company has so far weathered the storm, and the revenue allows the board to recommend a final dividend on the Ordinary stock of 6 per cent., making 9 per cent. for the year, the same as in the previous year. The maintenance of the revenue shows that prudence has been exercised in the past, and that the securities selected were of a substantial character. The strength of our investment position is upheld by the fact that at January 31st last we owned £100,000 British Government Securities in addition to cash balances amounting to £54,298.

In the year now current our revenue is likely to be adversely affected by the war in the Far East. Our portfolio being widely spread, the loss may, however, be made up in part by improvement in other quarters.

The report was adopted.

SOUTHERN RAILWAY COMPANY

WARTIME PROBLEMS

The annual general meeting of the Southern Railway Company was held, on the 12th instant, in London.

Mr Robert Holland-Martin, CB (the chairman), first dealt in detail with the revision of the financial arrangements with the Government in the form of a fixed annual payment by the Government to the controlled undertakings instead of the pooling and sharing arrangement established by the original agreement. The four main line companies and the London Passenger Transport Board, after due consideration, had decided that the Government's offer of a fixed annual payment of £43,000,000 was one that should be accepted. The Southern Railway's share of that payment was £6,607,639. The railways by accepting this payment had not by implication in any way abandoned the principle of standard revenue. Any anxiety, therefore, which stockholders might feel as to whether the agreement had jeopardised the statutory background in relation to standard revenue might be set at rest.

Dealing with the accounts, the chairman said that the net revenue for the year amounted to £6,934,260, an increase of £178,470. After meeting the interest on debenture stocks and dividends on guaranteed and preference stocks, the balance available for dividend on ordinary stock was £2,031,745. After deducting the full 5 per cent. on the preferred ordinary stock there remained £652,415, which would enable them to pay a dividend on the deferred ordinary stock of 1½ per cent. for the year and carry forward £101,336.

YEAR OF DOGGED ENDEAVOUR

He had to record the work of a year of dogged endeavour and skilled application necessary to surmount the hundred and one problems that daily beset the war-time operation and maintenance of the railway. In times of peace the Southern had been predominantly a passenger line. War and the national interest today compelled the movement of freight to take precedence of the convenience of passengers. The efficient handling of that vast and growing freight traffic—so essential for the successful prosecution of the war—was a tremendous task. It was not to be wondered at that the requirements of freight traffic sometimes impinged on the regularity of their passenger trains.

The elimination of first-class accommodation in their London suburban services had incommenced a large number of their regular passengers. The change had been accepted loyally and with few complaints, their regular first-class travellers appreciating that it was one more personal sacrifice in the interest of the nation.

The maintenance of the way and works in a condition to take the heavy burden of war-time traffic was no easy task. It was a job, however, tackled with energy and skill. He wished that it was possible for him to detail some of the many marvellous repairs of war damage that had been achieved. It had indeed been a wonderful performance on the part of all.

ELECTRIC LOCOMOTIVES

From a railway point of view one of the most interesting events of the past year had been the completion of the first of two electric locomotives. Up to the present the whole of their electric rolling stock had consisted of multiple unit trains and they had retained steam engines to work goods trains and also passenger trains going beyond the electrified area. They had always realised, however, that the full benefit of electric traction could only be secured if all traffic over electrified lines could be worked electrically. The first electric locomotive had been successfully tested on 750 tons passenger trains and 1,000 tons freight trains.

Suggestions had been made that they did not plan ahead their war policy. Nothing now could be further from the facts in regard to transport. Their railway experts, knowing intimately the special features and considerations affecting their own systems, sat down with the officers of the Ministry who had knowledge of Government policy and the likely development of the war machine. Along with representatives of other forms of transport there were mapped out the requirements for ports, factories, service depots, aerodromes, months ahead and now, as various complementary railway works came to fruition, they realised to the full the value of that planning.

The report was adopted.

GREAT WESTERN RAILWAY COMPANY

REVISED GOVERNMENT SCHEME

SIR CHARLES HAMBRO'S ADDRESS

The annual general meeting of the Great Western Railway Company was held, on the 11th instant, at Paddington Station, W.

Sir Charles J. Hambro, KBE, MC (the chairman), who presided, in the course of his speech said: The net revenue for the year amounted to £6,931,767, of which £6,670,603 is our fixed annual payment under the revised financial arrangement with HM Government, to which I shall refer later. The balance of £261,164 represents, subject to minor adjustments, the net income from sources not coming within the scope of the fixed payment. The balance brought forward from last year amounted to £289,129, and after allowing for an appropriation of £250,000 to the contingency fund, it is proposed that a dividend of £2 10s. be paid on the Consolidated Ordinary stock for the half-year to December 31st last, making £4 per cent. for the year.

In present circumstances, with so many uncertainties in regard to the future, we thought it prudent to make this allocation of £250,000 to the contingency fund, which now amounts to £4,069,095. This is a free reserve and is, of course, available to meet any abnormal position that may arise in the future.

REVISION OF FINANCIAL ARRANGEMENTS

When I addressed you last year I told you of the intimation which had been given to us by the Government that in their view some modification of the financial arrangements then in operation would be necessary on account of the war damage compensation proposals of the Government. The Chancellor of the Exchequer in his Budget speech shortly after our meeting also referred to the desire of the Exchequer to avert further increases in railway rates and fares, with a view to checking the upward movement in prices, which the Government were anxious to stabilise.

These were the new considerations which necessitated a revision of the financial arrangements previously agreed, and in the negotiations which followed the Government indicated their desire that the new basis should be a fixed annual payment to the companies and the London Passenger Transport Board in lieu of the previous arrangement.

This proposal was readily accepted by the companies, who had previously pointed out the difficulties and objections, both political and practical, which were likely to arise under the old agreement, and the only point at issue was the amount of the fixed annual payment which should be made.

After taking all factors into consideration they decided to accept the Government's final offer of an annual payment to the four main line companies and the London Passenger Transport Board of £43,000,000 to operate from December 31, 1940, for the remaining period of control, which is to be continued for a minimum period of one year after the cessation of hostilities. Our share of the £43,000,000 is £6,670,603.

Prominently in the minds of those who conducted the negotiations was the preservation of the statutory rights of the companies with regard to the earning of their standard revenues. These revenues are a factor in the pooling and sharing provisions which apply up to December 31, 1940, and are noted in Appendix C to the new agreement, which also contains an express paragraph (Article 33), the effect of which is that, subject to any action which the Legislature may take in the meanwhile (a contingency against which we obviously cannot provide), time will be given for the operation of any statutory machinery governing the level of rates, fares and charges before control comes to an end, and in this way the pre-war rights of the companies in this important matter are confirmed and kept alive. The protection thus afforded will, I hope, remove the anxiety felt by certain of the proprietors, who feared that the acceptance of a fixed guaranteed payment might jeopardise the application of the standard revenue principles after the expiration of Government control, or be regarded as an implied admission that these principles have for all practical purposes ceased to be effective.

WAR DAMAGE PROVISION

With regard to war damage, the new agreement provides that after December 31, 1940, no charge shall be made in the

net revenue account of any accounting period in respect of war damage, and cancels the earlier arrangement under which the cost of restoring such damage up to a maximum of £10,000,000 in any year was to be charged to revenue expenditure.

The future position as regards war damage is still the subject of negotiation. Under the proposed scheme it is understood that public utility companies are to be grouped, and presumably one such group will embrace all the railway undertakings.

The suggested contributions of the members in each group will be 50 per cent. of the aggregate war damage payments made to the members of the group payable in four annual instalments, the first to fall due on July 1st next. As I have previously mentioned, there are preliminary difficulties to be surmounted before the scheme matures. You will appreciate that until the discussions with the Government assume more definite shape, and hostilities have ceased, we cannot form any estimate of the ultimate scope of the liability which we shall have to meet.

The directors fully recognise that at first sight the new agreement may appear to be much less favourable to the stockholders than the former agreement. This is certainly true if regard is had only to the financial results of the past year, but as I have previously indicated, there can be no assurance that railway earnings will remain at the present high level during the whole of the control period. No one can foretell what may happen to our traffics during the course of the war or in the period immediately following the cessation of hostilities. The matter was, therefore, not one which could be dealt with on ordinary commercial lines, and we made it clear in our discussions with the Government that we could not regard any settlement which might be reached as in any way reflecting the existing or potential value of our undertakings either individually or as a whole. In the view of your directors, the offer finally made by the Government, while not generous, could not be regarded as unfair to the stockholders if full recognition was given to the national interests as represented by the Government spokesman.

The agreement takes effect as from September 1, 1939, and the revisions to which I have alluded operate from December 31, 1940. Thus, the pooling and sharing scheme under the original arrangements is recorded in the revised agreement as having effect up to December 31, 1940. I should perhaps also explain that the revised agreement retains all the original arrangements in relation to maintenance charges, trust funds and other detailed matter. The trust fund has not yet been constituted, but its provisions will ensure that money is available for carrying out all maintenance and renewal work on pre-war standards, although the arrears can only be overtaken as circumstances permit.

POST-WAR PROBLEMS

With regard to the post-war position, you have no doubt seen in the press the recent announcement that the boards of the four main-line companies and the London Passenger Transport Board have set up a commission to consider post-war problems. As you are aware, post-war planning is now a part of our national policy and we understand the Minister of Works and Buildings will be largely responsible for the work, which must inevitably involve questions of transport; it will be one of the main objects of the commission to keep closely in touch with the various Government departments and other bodies considering the problems of reconstruction and development.

During the year the four main-line railway companies have concluded an arrangement in conjunction with Hay's Wharf Cartage Co., which is controlled by the railway companies, for the purchase of the share capital of the well-known tourist agency business of Thos. Cook and Son, Ltd. These shares became vested in the Custodian of Enemy Property, and the activities of the company under normal conditions lend themselves to closer co-operation with the railway companies in view of the interests which they already possess in similar businesses and of the working economies which can be effected.

The report was adopted.

LONDON AND NORTH EASTERN RAILWAY COMPANY

REVISED CONTROL AGREEMENT

The nineteenth ordinary general meeting of the London and North-Eastern Railway Company was held, on 6th instant, in London.

Sir Ronald W. Matthews (the chairman) said that once more stockholders were deprived of the review of the company's business which in normal times accompanied the report and accounts. It would be a matter for satisfaction to all railway stockholders that there was today, by Press and public, a fuller appreciation of the services being rendered by the railways to the community and a better understanding of the difficulties with which the companies were faced. The reasons for the comparatively minor inconveniences which the travelling public had to suffer after two and a half years of war had been fully explained and there was little for him to add except a warning that as freight movements by rail increased, as they inevitably must, so of necessity must passenger facilities be curtailed.

It was, he thought, worth impressing on the public that there were in these days journeys of great urgency to be undertaken and that a thoughtless traveller, journeying without due cause, might well exclude another whose inability to travel might have far-reaching effects.

INCREASED NET REVENUE

The company's share in the "Pool" for the past year was £10,136,355 and the total net revenue was £10,647,027, an increase of £296,035 over the net revenue of 1940. After providing for all fixed charges and setting aside £300,000 to the fund for contingencies, the directors proposed to pay full dividends on the first and redeemable preference stocks and two and three-eighths per cent. on the four per cent. second preference stock.

In June of last year the Minister of War Transport had approached the four main line companies and the Transport Board with a view to a revision of the original financial arrangements, because war damage was now dealt with on a national basis and because the Government's declared policy of stabilisation of prices cut at the basis of the existing arrangements for the adjustment of fares, rates and charges to meet variations in working costs and certain other conditions arising from the war. The railway companies and the Transport Board had recognised that changes in the existing agreement were inevitable, and in the negotiations which followed the Government had insisted that any revision must take the shape of a fixed annual payment by the Government to the controlled undertakings in lieu of the pooling or sharing arrangement established by the existing agreement.

After prolonged discussion a final offer was received from the Government to fix the annual payment to the four main line companies and the Board at £43,000,000. The Boards of the undertakings had decided that the offer was one which must be accepted, it being agreed that that annual sum would be divided among the five undertakings in certain proportions.

STOCKHOLDERS' POSITION SAFEGUARDED

As to whether the railways, by accepting that figure, had not by implication admitted that the principles of standard revenue had ceased to apply to railways for all time, he was advised that express provision had been made in the revised agreement amply safeguarding the position of the stockholders in that respect. Any anxiety which stockholders might feel as to whether the agreement had jeopardised the statutory background in relation to standard revenue might be set at rest, for, so far from the agreement prejudicing that position, it confirmed the undertakings in their statutory rights before the cessation of control.

With regard to war damage, the agreement expressly provided that the cost of restoring war damage would not be charged to the control account, so that the burden of the railway companies' contributions, as they might be determined by future legislation, would fall to be discharged by each railway undertaking concerned.

In conclusion he dealt with the acquisition by Hay's Wharf Cartage Company, Limited, which was controlled by the four main line companies, of the shares in Thos. Cook and Son, Limited, at present vested in the Custodian of Enemy Property—but not the banking business of that company—saying that the companies would among other advantages be able to effect substantial economies in ticket-booking facilities generally.

The report was adopted.

SCOTTISH WIDOWS' FUND AND LIFE ASSURANCE SOCIETY

IMPROVED PREMIUM INCOME

MR KENNETH MURRAY'S ADDRESS

The one hundred and twenty-eighth stated annual meeting of the Scottish Widows' Fund and Life Assurance Society was held in the society's head office, Edinburgh, on the 10th instant, Mr Kenneth Murray, WS (chairman of the ordinary court of directors), presiding.

In moving the adoption of the report and accounts, the chairman said: It is inevitable that, so long as the country is at war, the effect on the society's business will become more pronounced as time goes on, and increasing difficulty will be met with in the conduct of its affairs. About 60 per cent. of the male staff are now away on full-time national service, as compared with a little over 40 per cent. a year ago, and further calls are to be expected in the coming year not only on the remaining male staff but also on the female staff.

The new business completed during 1941 amounted to £2,301,000 gross and £2,229,000 after deduction of reassurances. This net total is only about £160,000 less than last year, and reflects great credit on our branch secretaries and the reduced staffs working under them. It is also a testimony to the loyalty of our agents, to whom our thanks are due.

You will see from the accounts that the total premium income for the year was £2,200,000, and nearly £25,000 higher than in 1940. Interest income, on the other hand, both before and after deduction of income-tax, was lower, but the average net rate on the whole of the assurance and annuity funds at £3 10s. 7d. per cent. was only 2s. 6d. less than in the preceding year.

Claims by maturity were lower, and so also were the claims by death, although these included cases for a total of £126,000, which were the direct result of war operations.

FAVOURABLE "W" PLAN RESULTS

The experience under the society's "W" plan, which normally extends civilian war risks cover to new with-profits policies without extra charge, is again favourable. Only one claim for a sum assured of £250 has arisen since our last meeting, and so in the two years, during which the plan has been in operation, there have been only four claims with original sums assured amounting in all to £1,350—a total far below what was expected when the plan was introduced. In the middle of a war, which may yet last a long time, it would be imprudent to assume that this favourable experience will continue, but we can again record our satisfaction with the plan. The good response to the plan is ample evidence of its attractiveness and of the valuable service which the society is rendering to the public.

The assurance and annuity funds increased during the year by nearly £700,000 and now stand in the balance-sheet at £35,400,000.

SUPPORT TO WAR EFFORT

It was explained from this chair at our last meeting that British Government securities must, in war-time, be the principal form of investment for our new funds. This is reflected in the balance-sheet by an increase over the year of nearly £1,300,000 in these securities. Not only has the whole of the increase in funds been invested in new war loans, but the greater part of all other sums which became available has been applied in the same way, and so your society continues to give the maximum support, on the financial side, to the national war effort.

The balance-sheet contains the usual statement, which it has for many years been the society's custom to give, that the Stock Exchange securities stand at or under their market selling prices at December 31st. It is gratifying to be able to state that the general rise in prices of securities over the year has increased substantially the already large margin between the market values of the securities and the values at which they appear in the balance-sheet. This margin enables the directors, even in these difficult times, to look forward with confidence to the continued success of the society.

The directors' report and accounts, as audited, were adopted unanimously.

LANCASHIRE ELECTRIC LIGHT AND POWER COMPANY, LIMITED

SIR JOSEPH NALL'S ADDRESS

The annual general meeting of The Lancashire Electric Light and Power Company, Limited, was held, on 11th instant, in London. Sir Joseph Nall, MP (the chairman), after expressing regret at the death of the late chairman, Mr George Balfour, said that all proper maintenance of plant had been carried out and charged to revenue as usual, adequate provisions for depreciation and taxation had been taken care of and the fullest possible use made of their productive capacity throughout the year.

Notwithstanding the fact that they were engaged and scheduled in an essential industry, no less than 25 per cent. of their regular employees had joined the Armed Forces. Their demonstration show rooms and depleted staffs were at the disposal of the Ministry of Food for instructing the public in war-time cooking and were much appreciated.

Of the future he need only say that this company, in common no doubt with the vast majority of company-owned Public Utilities, whilst concentrating on giving the best possible service required under war conditions, was giving careful thought to the problems which would undoubtedly arise when peace was once more restored.

Company-owned Public Utility undertakings had no need to apologise for their existence; they presented a very fine record of enterprise and achievement in times of peace, and of resourcefulness and readiness to meet the emergencies of war.

They would be failing in their duty as custodians of those great enterprises if they did not give the general public every opportunity of understanding and fully appreciating all that British industry and commercial supremacy owed to the great company enterprises of this country. It was essential to the post-war re-establishment of British industry that they should in due course be enabled to resume their normal activity and progress, with reasonable freedom from any extension of the deadening hand of bureaucracy.

The report and accounts were adopted.

BRITISH ASSETS TRUST LIMITED

SATISFACTORY RESULTS

MR W. H. FRASER'S ADDRESS

The forty-fourth annual general meeting of British Assets Trust, Limited, was held, on the 12th instant, at the offices of the company, 9 Charlotte Square, Edinburgh. Mr W. H. Fraser (the chairman) presided.

The chairman, in moving the adoption of the report and accounts, after referring to his own appointment as a director and chairman of the company and to the great loss which the company had suffered by the death of Mr A. W. Robertson-Durham, said:

From the accounts you will see that the gross income for the past year amounted to £332,949, against the previous year's figure of £337,165. A year ago it seemed that there must be a very considerable reduction in our revenue, and I am glad to report that this has materialised to such a small extent. The reduction is more than accounted for by two causes. In the first place, certain dividends, amounting to some £3,500, which we might fairly have expected to receive during our financial year, were not received until after the close of the accounts owing to delay in the issue of annual reports; and, in the second place, an additional £3,600 has had to be provided for United States Withholding Tax, the rate of which for 1941 was increased from 16½ per cent. to 27½ per cent. It seems very likely that there will be a further substantial increase in the rate for 1942.

DIVIDEND AND BONUS

On the payments side, management expenses are lower as the result of a saving on our American expenditure. As might be expected, taxation is again higher. After deducting management and other expenses, income-tax, debenture interest and preference dividends, there remains £42,534, which is equivalent to earnings on the ordinary stock of 17.3 per cent., against 17.5 per cent. for the previous year, which, I think you will agree, is a very satisfactory result. We again recommend payment of a dividend of 10 per cent. for the past year, and in addition a bonus of 2 per

PEARL ASSURANCE COMPANY LIMITED

Facts and Figures from the Statement by
SIR GEORGE TILLEY, F.C.I.I.
President and Chairman of the Company on
the Annual Report and Balance Sheet for the
year ending 31st December, 1941.

FUNDS - £117,248,840
INCOME - £20,585,003

INVESTMENTS

The funds show an increase of £4,859,697. The market value of the investments exceeded the price at which they stand in the balance sheet.

LIFE BRANCHES

In the Ordinary Branch sums assured under new policies issued during the year amounted to over £9,500,000. Premium income in the Industrial Branch exceeded £9,830,000, an increase of £317,000.

FIRE AND GENERAL

In these Branches the premium income exceeded £1,693,000.

BONUSES

In the Ordinary Branch a bonus of £1 per £100 assured was declared on policies entitled to participate in full profits that become claims by death or maturity during 1942.

In the Industrial Branch a bonus has been declared on policies, with certain exceptions, effected before 1st January, 1935, that become claims by death or maturity during 1942. Up to date a total sum of over £6,900,000 has been allocated for bonuses to policyholders in this Branch.

The bonus for 1940 in both Branches is continued unchanged for claims during 1942.

TOTAL CLAIMS PAID EXCEED £155,000,000

Chief Offices: High Holborn, London, W.C.1.

cent. Although we are proposing to distribute this bonus for the third year in succession, I should like to emphasise once again that this must not be looked upon as a regular dividend, as while the war lasts income prospects must remain very uncertain. These payments will leave a surplus of £13,015, and after the addition of £10,000 to the income reserve fund the sum carried forward will be increased by £3,015.

From the balance-sheet you will see that we have again reduced the amount of our terminable debentures from £450,707 to £381,827; deposits and loans are higher.

Investments, after deducting the capital reserve fund and contingent fund, stand at £6,829,796 and compared with market value show a depreciation of 4.09 per cent., as against a depreciation of 12.81 per cent. a year ago.

THE FUTURE

Looking to the future, the course of the war in the Pacific is bound to have an adverse effect on our income during the current year. Although the company has very little invested directly in rubber and tin shares, we hold considerable investments in home companies, part of whose interests are in the East and whose dividends are likely to be reduced. Last year the chairman warned you that increased taxation and the limitation of supplies would lead to a reduction of revenue, and these two causes seem to be having increasing effect at the present time. For these reasons it seems likely that our income will show some falling off in the current year, but not, I hope, to such an extent as to preclude us from again submitting a satisfactory report.

The motion was seconded and adopted.

Note: all dealings are for cash

THE collapse of resistance in Java and the fall of Rangoon, like earlier military reverses, had already been largely discounted by the markets. Nevertheless, sentiment was depressed, and in the absence of adequate support small declines were general throughout all sections other than gilt-edged and some railway and other prior charges. Some scattered realisations, mainly of irredeemable and long term issues before the week-end in the gilt edged market, were followed by rather steadier conditions in the early part of the current week, 2½ per cent Consols reversing the previous day's loss of ½ on Tuesday, but movements were few and slight. Earlier support for Chilean bonds in the foreign bond market was not fully maintained at the reopening, when Mexican issues weakened slightly, and the German Potash bonds both fell a point. Tuesday witnessed a small but general decline among Brazilian bonds, while the 5½ per cent Japanese loan of 1930 rose a point, the 5 per cent Chinese loan of 1913 losing the same amount. The chairman's statements on the question of war damage reversed the earlier movements in the home rail market for the junior issues, which with the exception of the "Berwick" stocks, all advanced ¼ at the reopening, while larger gains were registered the next day for LMS ordinary and Southern preferred. Senior stocks were steady. In the foreign rail market, Argentine issues lacked support on the realisation that no benefit would accrue to the companies from the increased tariff rates. Losses were small but persistent, although BA Pacific debentures were especially weak in the early part of the week. In midweek the rise in Funds was resumed with several improvements of ½, while the home rail market was also firm.

Withdrawal of support in the industrial market before the week-end occasioned a widespread decline in prices, although the actual volume of selling was slight. Some improvement was evident at the beginning of the current week, but conditions were generally unsettled. In the motor and aircraft group Leyland Motors and Lucas both eased ¼ on the previous Friday, but the news of the further delay in the accounts of the former company occasioned further declines in the current week. A marked improvement in brewery shares was registered on Tuesday, but in general the earlier losses, including 1s. 9d. for Guinness on Friday, were not fully recovered. Heavy industrial issues suffered small but well spread losses on Monday, but the following day a steadier tone was noticeable. Stores issues moved to slightly lower levels during the early part of this week, although Marks and Spencer recovered some of the previous day's loss on Tuesday. The shipping group was dull, Cunard ordinary suffering small but persistent losses both before and after the week-end. Textile shares reflected the general tone of the market with small but general declines at the reopening, but showed some improvement later. In the tobacco group BAT and Imps recovered earlier losses in the early part of this week, but Godfrey Phillips weakened. Elsewhere Cable and Wireless suffered sharp losses, the ordinary stock falling 5 points in the first two days of the week, after a fall of 2 points on the previous Friday. The preference issue lost ½ points over the same period. Later the industrial market was quietly firm with some rises in textile shares and heavy industrials.

Fears regarding the maintenance of gold production and the war news occasioned substantial declines throughout the kaffir market. Despite the denial of the former proposal, prices continued to fall sharply at the reopening, East Geduld and Rand

Mines losing ¼ among other smaller losses. On Tuesday, however, the tone became steadier. Many small declines were registered at the reopening in the tin market, but conditions later improved. The rubber and tea markets witnessed scattered selling, but the volume of business was slight. Despite the war news, the oil market reflected very little selling in the early part of this week, and leading issues, including Burmah oil, improved slightly on enquiry. Canadian Eagle ordinary, however, eased slightly on the decreased earnings. In midweek the kaffir market was strong on Cape support and the Anglo-American dividend.

New York

FURTHER Japanese successes and the prospect of increased taxation depressed sentiment on Wall Street, and in mild selling on the previous Friday, Du Pont, Eastman Kodak and US Rubber all fell to the year's lowest levels. Some selective buying of leading issues in the early part of the current week gave rise to more stable conditions, but the war news continued to depress activity. Later there was a sharp reverse in electric, chemical and tobacco issues.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

(Incorporated in the Colony of Hongkong. The liability of members is limited to the extent and in manner prescribed by Ordinance No. 6 of 1929 of the Colony.)

COMMODITY AND INDUSTRY NEWS

"Coupons and Quotas."—The Board of Trade has issued a booklet, which explains in simple terms the provisions of the Consumer Rationing Order and the Cloth and Apparel Order from the point of view of manufacturers, wholesalers, makers-up and retailers. It revises the previously published Explanatory Notes for Traders. It contains new material and presents a complete and up-to-date picture of the limitation and rationing schemes for cloth and clothing. The utility clothing scheme is described in detail and the full range of controlled goods, together with their general and utility quotas, is included. There is a full index to the booklet.

Raw Cotton.—The Controller informed Liverpool and Manchester raw cotton merchants that those desiring to offer their services in connection with the sale of raw cotton to consumers should inform the Control on or before March 12th. Firms will be required to perform the following duties to the satisfaction of the Controller: (1) to sell cotton to consumers out of the quantity allotted before arrival of the vessel; (2) to render returns of cotton sold and its destination; (3) to sample at mill or warehouse, examine samples, and advise if any claim should be made on the shipper; (4) to invoice and see that payment is made, keeping ledger accounts for the Control; (5) to investigate claims received from spinners; and (6) to return complete records of each cargo handled.

Cotton Trade.—Makers of cloth suitable for war purposes are busy and a fair amount of fresh buying has taken place, not only for the Home Government, but also for the Dominions and the Allies. On the other hand, export buying has been restricted and some producers' order lists are shortening. Many employers are still harassed by the shortage of labour, and it is expected that the overtime working in the mills will be continued. The spinning employers have rejected the application of the operatives for an increase in wages of 16½ per cent on current earnings. The claim will probably go to arbitration. The Cotton Board has issued a list of cotton and mixture cloths to be proposed to the Board of Trade for the forthcoming utility schedule. Though these lists are not final and there may be further amendments, they give a forecast which is bound to prove fairly accurate. For production reasons most cotton utility cloths have had to be planned in yards below 26's.

Paper Control.—Direction No. 6 under the Control of Paper (No. 36) Order, issued by the Ministry of Supply, limits the quantity of paper to be consumed in the production of any news-bulletin, magazine or periodical in the four months March to June, to 19½ per cent of the quantity consumed in the corresponding period of 1939, except under licence. This generalises the limitation already in force for the principal periodicals.

"Coupons and Quotas." Issued by the Board of Trade. Published by H.M. Stationery Office. 84 pages. Price 1s. net.

Canners' (War Time) Association.—The food canning industry has formed the Canners' (War Time) Association. The constitution and rules have been prepared and approved by a fully representative meeting of canners, and an executive committee has been elected. Licences will only be granted by the Ministry of Food to members of the Association, and canners may apply to the Ministry for membership.

Export Licensing.—Under a Board of Trade Order, which becomes operative on March 24th, control is extended to cover internal combustion engines (and parts), tobacco, cigar and cigarette making machinery and plant, roof capping or ridging, flushing and guttering of iron and steel, hair combs of non-precious metal, machinery belts and belting (including conveyor and elevator bands) wholly or partly of natural or synthetic rubber, rubber latex, balata or gutta-percha, brushmaking fibres, lead acetate, sodium acetate, and in the case of certain destinations, to rabbit and hare skins (dressed or undressed). The control in respect of rubber latex is intended to cover manufactures wholly or mainly of this material. Sewing-machine needles, the exportation of which was previously controlled to all destinations, may now be exported without licence to destinations within the British Empire. The existing control in respect of perambulators, mail carts and invalid carriages is extended to cover all types of these vehicles, irrespective of the proportion of metal content.

Drapery Trade Wages.—A supplementary agreement has been reached by the Joint Industrial Council for the Retail Drapery, Outfitting and Footwear Trades, to the one reported on page 423 of *The*

GOVERNMENT RETURNS

For the week ended March 7, 1942, total ordinary revenue was £54,132,000, against ordinary expenditure of £102,735,000, and issues to sinking funds of £2,195,000. Thus, including sinking fund allocations of £11,501,795, the deficit accrued since April 1st is £2,509,055,000 against £2,270,412,000 for the corresponding period a year ago.

↑ Receipts in Argentine pesos

It is difficult to be very enthusiastic about either set of definitions. They bear in almost every sentence the trace of compromises. The Labour compromise has been adequately discussed. The Admiralty reservations make a large hole in the Minister's co-ordinating powers (how can he draw up an armour-plate programme, if he has no power over either the design of ships or the naval building programme?). The compromise over the Raw Materials Department, which is under the Minister of Supply but answerable for all important matters to the Minister of Production, is as ridiculous as the judgment of Solomon (neither claimant apparently loves the child sufficiently to prevent it from being cut in two). The arrangements for representation in Washington (which are discussed in detail on another page) have the same air of patchwork. It is disappointing to discover that, even after the last change of Government, it is still apparently necessary to save Ministers' faces, to save their *amour propre* and to spare them from the brutal fate of being faced with a clear decision. The new methods—and the new men—do not reach even as far down as the second rank in the Ministerial hierarchy.

Nevertheless, the immediate need is to make the best of a scheme which, if not perfect, is at least workable. Powers and functions are only means to the end of greater production. How can this be secured? Plans and counter-plans are thick upon the ground, and nearly everybody who is to be met upon the streets or in the clubs knows for certain exactly what needs to be done to raise British production to the peak. Mr Lyttelton will be making a grave mistake if he dismisses all these ideas. It is perfectly true that the present volume of production in the United Kingdom is (with a few exceptions) quite astonishingly large, and that if it were permissible to make the comparison with the output of Germany and the conquered territories, the results would astonish the critics. It is true, too, that (again, with a few exceptions) the quality of the arms that are being produced is excellent. But no successes achieved are any warrant for silencing criticism. The task of the United Nations is not merely to equal the Axis production, it is to exceed it by the largest possible margin in the shortest possible time. There are four long years of Nazi maximum production to be overtaken. The overtaking cannot start until the current rate of production is larger than Hitler's; and if it is to be finished in time for a crushing offensive in 1943, there is not a moment to be lost. Any proposal that would increase production this year must be examined.

There are two particular proposals which have received a great deal of public attention. These are the movement to have Production Committees of workers and managers in every factory; and the various suggestions for increasing the powers and responsibilities of the Regional Boards. In both of these proposals there is a substantial degree of merit; both should be adopted; but neither is very likely to make a major difference to output. Experience with Production Committees (or with the similar bodies which, under different titles, have existed in industry for many years) has been rather varied. A lively and efficient management can use a Production Committee to get the very best out of its labour force, by giving the men frank and intelligible explanations of what is happening and by expounding the reasons for actions which might otherwise appear merely stupid. Where such a management exists, it is unlikely to need the formal mechanism of a committee to keep it awake to the ideas and suggestions that arise in the minds of the workers. On the other hand, where the management is slow and stiff, a Production Committee is unlikely either to satisfy the workers' grievances or to improve the management's methods. This is not, of course, to say that such Committees do no good at all. Particularly in times like these, there is a real, if indirect, benefit to be obtained from anything that fosters the spirit of co-operation, that encourages the atmosphere of team work for a common end. The system adopted for the Royal Ordnance Factories (which is discussed in a Note on page 405) should be generalised to all factories engaged on Government work. But no

miracles should be expected. Broadly speaking, the chief advantage of Production Committees will be to give the management an opportunity to speak to the workers and explain what is happening, rather than *vice versa*, and the effect on production will usually be limited to what follows upon the creation of a better spirit of contentment and comprehension among the workers. But this will not be small; and it should not be neglected.

Much the same can be said about the proposal to promote the Regional Boards to a more prominent place. Local organisation and control have undoubtedly been neglected hitherto, and there has been too much centralisation in the overworked Ministries in London. But the reverse tendency should not go too far. Control must necessarily be very largely at the centre, and the more intense becomes the nation-wide shortage of materials, machinery, manpower and factory space, the more essential does it become to have a central plan and a central allocation (a fact which, incidentally, goes far to explain why regional control cannot develop so far in this war as in the last). But within the field of progressing and of arranging for sub-contracting, there is much useful work that could be done—and can only be done—by strong Regional Boards, representative of all of the Ministries concerned, but endowed with powers of their own to make whatever adjustments, within the central programme, would best promote the efficiency of production or speed up deliveries.

It is probable that a much greater immediate effect could be produced on the volume of output by methods that lend themselves very much less easily to simple generalisation than either Production Committees or Regional Controls. For example, neither of these two can get very far if there are defects in the central planning of the production programme—if the materials, or the labour, or the machine tools are not available when they are wanted, or if one part of the programme has to come to a stop because another part has been allowed to depart too far from the schedule. For an astonishingly long period of the war, production proceeded without anything that could properly be called a plan. At present, the different production Ministries each have their planning staffs, of varying efficiency and authority. But these are only the first rudiments of a plan for production as a whole. The volume of British production is now so large and its variety so wide that a skilful manager could vary the nature of the output much as an organist mixes his stops. But that would require both a much closer correlation of production with strategy and far more agility at the centre than the present rather cumbrous mechanism allows.

Another direction in which much could be done if only it were possible to turn abstract nouns into concrete realities is in the field of management. The Government has from the start possessed the powers to replace any management it chose—but they have hardly at all been used. In wartime, there is a very great deal indeed to be said for a policy of drastic action *pour encourager les autres*. Everybody who has a hand in the production programme knows of instances of proved incompetence or proved selfishness. A few ostentatious displacements would work wonders, especially if they were accompanied by a thorough policy of searching out the efficient managers, wherever they may be, and placing them in the most responsible positions. Far too much tenderness has been shown for far too long to the existing managerial structure of industry. It needs to be quite drastically combed out.

Apart from the perennial question of the controls—a subject to which *The Economist* has devoted continuous attention since the beginning of the war, and to which it will revert in the immediate future—these two lines of action probably provide the most favourable opportunities for immediate progress. Without neglecting either workers' representation or regional organisation, Mr Lyttelton will be well advised to devote his attention first to the central planning of the programme and to the quality of the managements, both in the Ministries and in industry, who will have to execute it.

United Command

ONE issue stood out in each of the recent debates in the Commons on the Service Estimates. This was the need, voiced by speaker after speaker, for combined strategical planning between the Navy, the Army and the Air Force and for combined operation in battle. The reason for this unanimity is plain. The outstanding fact in the successes of the Germans and the Japanese has been the high degree of co-operation between all available forces, strategically and tactically; the outstanding fact in Allied failures has been the absence of this co-operation. The layman speaks, or ought to speak, with the greatest possible diffidence in these matters. But the evidence cannot easily be misunderstood or gainsaid. Apart from the Battle of Britain, which was an air fight pure and simple because the enemy had no sea power, the episodes that are remembered with most pride are those in which co-operation, enforced or arranged, were conspicuous: the evacuation from Dunkirk by a miracle of improvisation when an army was saved after the battle had been decisively lost; the small but stirring raids on Lofoten, Vaagso and Bruneval; the very occasional bombing and shelling of Axis Mediterranean strongholds; and the joint air and land attacks on Italian armies in Libya. These, however, were all exceptional, not routine as they should be; and in North Africa, the advantage was not pushed home, in part at least, because the types of aircraft best suited to combined fighting were lacking. The inquiry into the recent escape of the German warships from Brest has not revealed "any serious deficiencies in foresight, co-operation or organisation." But this is, presumably, within the existing arrangements; the implication of the episode surely is that the arrangements for sea and air co-operation themselves are fallible.

Indeed, the core of the current controversy is in the air. The critics, by no means all amateurs or laymen, contend that the Air Ministry has failed to provide the aircraft, in numbers or kinds, required to co-operate with the Army and the Navy, and this is why, unnecessarily and unfortunately, the discussion has been distorted into a disputation for and against the "dismemberment" of the RAF. Actually, of course, it is the end that matters, not the means, and the desired end is obvious enough. It is that no naval or military unit should go into action without adequate air cover, air reconnaissance, and air artillery, any more than it would fight without its other weapons or without ammunition. The argument against the critics is still the old one of insufficient supplies. But to say that warships or ground troops should fight without air support, because there are no aircraft to spare,

is as reasonable as to say that they should fight without shells, because too few shells are being made. Air support is not an "extra."

One remedy would be to have three air forces, one to work with the Army, one to work with the Navy and one to work alone. It is this suggestion that raises the cry of "dismemberment." But this would be a clumsy and untidy solution. It would multiply the "overheads" of air command and air training, and it would complicate the process of aircraft production. When the need is unity not division, it would be a retrograde step. The point is that this question of air co-operation is only a special case of a much wider and much deeper problem. Its lack is symptomatic of the fact that, from top to bottom, the fighting Services are planned and organised as three separate entities, which by every sign appears, to the lay eye at any rate, dangerously inappropriate to the conditions of modern warfare. The British *Wehrmacht* is tripartite and federal. Logically, the best way to ensure that every fighting unit on land or at sea was trained, equipped and employed as an integrated force, made up of all arms in their due proportions and deployed at the right time and in the right place, would be to integrate the three Services; and the example of Germany and Russia, with their triple-purpose Fighting Forces, would seem to reinforce this argument. But an academic logic in technical matters is the layman's snare. The experts are no doubt biased in favour of the *status quo*; they are military experts, naval experts or air experts, not *Wehrmacht* experts. But they are experts. They know, or should know, what is possible; and it needs no great *expertise* to recognise that it would not be possible to carry through a complete merger of the Navy, Army and RAF in wartime. Nor is this needed; the immediate problem is air co-operation with the Navy and the Army respectively. The analogy with Germany and Russia is imperfect. They are great land-powers, and it was inevitable that they should regard their air and sea forces as ancillary to their armies. The British problem is very different. On the one hand, Britain is primarily a sea-power; on the other, many decisive battles must be fought on land, with the Navy's task merely to keep open communications behind the lines. Obviously, the union of the three arms must be looser than in the case of the continental powers.

To admit this is not to dispute the growing opinion that the three Services must work as one, but simply to state that some solution other than amalgamation must be sought. The requirements are simple: unity in command; co-ordination in training and equipment; and co-operation in action. To secure the first, a "General"

Staff seems plainly needed, and at present there is none. The day-to-day conduct of the war is directed by the Chiefs of Staff Committee, made up of the professional heads of the three Services, the First Sea Lord, the Chief of the Imperial General Staff (a misnomer which means simply the Chief of the Army Staff) and the Chief of the Air Staff, all men trained exclusively in their own separate services and mainly concerned in their daily duties with their separate administrative problems. There are, it is true, to aid this tripartite and representative body, the Joint Planning and Joint Intelligence Staffs of the three Services, specially selected to consider problems in common. But they, too, are tripartite and representative. There are no "general" officers who belong to no single Service but to all three, though these specially selected officers are the nearest approach; and, in practice, there is no command higher than the Chiefs of the separate Staffs in consultation. There is the Minister of Defence at the very top, with no Service attachments; clearly in a true "General" Staff he would be in supreme charge, under commission from the War Cabinet which directs all phases of war policy. But there is Mr Churchill's own word that he does not in fact interfere much with the Chiefs of Staff in their several and collective work. From day to day, there is neither a Commander-in-Chief nor a General Staff.

The need is that, within the bounds of what is currently feasible, command should be more and more unified—not "co-ordinated." Mr Churchill, in the planning of all operations, should be the opposite number to Mr Lyttelton, in the planning of all production, with his expert and independent staff. In both fields, strategy and production, "co-ordination" by representative committees and liaison officers has not succeeded in producing an integrated policy; the result inevitably tends to be, not a common mind on common problems, but a symposium of separate programmes. A prime lesson of war administration so far is that liaison arrangements are a confession of failure on the part of the departments or Services concerned to dovetail their working. The question is where the "general" officers are to be found to man this "General" Staff and the commands below it. In the Army, officers who reach a certain rank become "general" officers and cease to belong to separate formations and regiments. This principle might be extended to the Defence Forces as a whole, so that no force larger than, say, a brigade was other than a joint force of all three arms, or at least two, officered by commanders drawn initially from one or another of the three Services, but belonging to none and trained in the joint and common problems of all three. By this means, a "General" Staff at the top and "General" Staffs in command of all higher fighting formations could be made and manned. The changeover could not be quick; and there would obviously have to be wide exceptions for the Navy, which necessarily operates from day to day largely in isolation. But the Navy could by no means be exempted from this interlacing of planning

and direction; it cannot range the seas without air aid; and offensive action against the enemy in any theatre must be a combined operation of all three Services. The mere appointment of one of three parallel commanders of the three Services to be Supreme Commander at the top, in a region or theatre of war, is not enough. Under present conditions, this may be necessary and desirable to co-ordinate operations. But, without the "generalisation" of his functions and training, and those of his colleagues and their staffs, he and they will remain military, naval or air men, not over-all and "general" commanders. Gaul will still be divided into three parts, though one may be larger and more important than the other two.

This "generalisation" of command would appear, on the evidence, to be the essential first step. From it could spring the unification in strategic planning—and in production programmes—and the co-operation in all operations that are clearly required. From it, too, would inevitably come plans for much more common training, at any rate of all officers expected to undertake responsibility in the field, in preparation for combined tactical action. Modern war is, admittedly, an unprecedentedly specialised business. The cobbler must stick to his last—the airman to his aircraft, the artilleryman to his gun, the soldier to his weapons and the seaman to his ship. Specialisation of function is obviously as important as unification of command—but no more important; and ways and means of co-operation between all arms in battle are a necessary part of the equipment of all officers in charge of companies, squadrons and naval vessels, no less than of those in the higher commands. Only co-operation in tactical training can make co-operation in strategical planning effective.

There are thus three stages in the reforms that the layman, diffidently, now believes to be necessary. First, the creation of a true General Staff; secondly, the establishment of joint commands under "general" officers; and, thirdly, the interweaving of training and the interchange of personnel. The main obstacle is the hard fact that there are three separate Services in being, the chief inhibition the sectional loyalties upon which *esprit de corps* throughout the British fighting forces has been built for generations. Within a single Service, the Beveridge Committee has recently made it plain that the rigidly sectional and regimental basis upon which the Army is organised is the biggest hindrance to the most efficient and economical use of industrial processes and industrial craftsmen in mechanised operations. Certain loyalties—the disciplined pride of the Guardsman or the regimental soldier, the spirited skill of the air pilot and the quiet efficiency of all ranks and ratings in the Navy—must remain as the foundation of the special contribution which each fighting man has to make to the subtle, complex whole of modern warfare. But they must surely be transcended by a common and wider loyalty. Bound, the bundle of sticks is strong; split up, it is broken with ease.

Reconstruction and Planning

THERE has been no word about the new Government's attitude towards reconstruction and planning, for defence, production and austerity have, inevitably, filled the stage. But the calls for new men and new measures rightly set reconstruction among the most pressing tasks; to-day's zeal is hope for to-morrow. Both reconstruction and planning have new Ministers. The new Paymaster-General, Sir William Jowitt, has taken over Mr Greenwood's responsibility for devising plans for social and economic betterment; education, the social services, industrial and agricultural reorganisation and post-war conditions of life and work are presumably his province. Within this field, rebuilding and planning the use of the land are the duty of the new Minister of Works

and Buildings, Lord Portal, who has taken the place of Lord Reith. The machinery is in position; it is news of its working that is wanted.

Sir William Jowitt's intentions remain a sealed book, while he takes his bearings. He lacks Mr Greenwood's Cabinet status, but, within the War Cabinet, the Lord Privy Seal will probably take a keen personal interest in his work, and the Lord President of the Council, Sir John Anderson, whose responsibility for the home front naturally embraces reconstruction, will be his supervisor. Mr Greenwood and Lord Reith made up a reconstruction committee of Ministers with the Lord President; and this committee, it has been stated, remains, with Sir William Jowitt and Lord Portal in place of the departed. The

committee is a symbol and an instrument of the Paymaster-General's task, which is to make the Government as a whole, and the Ministries one by one, reconstruction conscious. Post-war reconstruction and post-war government will be one and the same thing for a generation. This committee is the parent of all the post-war Cabinets, and Sir William Jowitt's duty now is to draft their programmes.

These are reasons why to set up a Ministry of Reconstruction would be a fatal error, for all the departments will be, or ought to be, Ministries of Reconstruction after the war. A separate Ministry would segregate and sterilise reconstruction, as happened after the last war. Only a Minister is needed, to make all the Ministries who will execute and administer post-war policies realise the importance of laying their plans now. They could not spare any able men to staff a Ministry of Reconstruction in wartime; but Sir William Jowitt can go among them to discuss. He will do well to be informal and unofficial in his approaches, and to bring into sparetime talks the widest possible range of people in all the Ministries, as well as from industry and the professions. Men hard at work on, say, labour problems for the Ministry of Supply, distribution problems for the Ministry of Food, employment and welfare problems for the Ministry of Labour or trade and industrial problems for the Board of Trade, obviously have ideas about reconstruction. But they are too busy to write memoranda or make contributions outside their work unasked. They must be sought out—and many others like them, wherever they can be found, in factories, offices, studies and the Services—for their brief invaluable advice.

Sir William's agenda, then, should be plain. He must keep reconstruction alive in the Cabinet, with the aid of the Lord President and the Lord Privy Seal; he must keep it uppermost in the minds of the Ministries who will apply it; and, casting the widest net, he must pool ideas and prepare the plans. The task does not end in Whitehall; it will be of small use if reconstruction is active there and passive as a public issue. The wish for better things now and after the war, for more justice, greater security, improved economic efficiency and better and broader education, needs no bringing to life; it is, or can be, the dynamo of the war effort itself—which is the final justification for Sir William Jowitt's job at a time like this. He must translate this wish into real terms. The researches of Sir William Beveridge and his helpers into social insurance could be made the basis of a published programme for a National Minimum; this week's news that the General Council of the Trades Union Congress has at last accepted the principle of family allowances, provided they are paid by the State, might well be made the starting-point for a drive to work out in public the detailed application of a policy to secure minimum social standards. A Charter of Education to make full use of all the nation's talents could be announced; and every step to betterment that can possibly be taken while the war is actually on should be taken. Reconstruction will only succeed if it enlists public opinion as well as the support of the departments. Last time, it won neither. This time, Sir William Jowitt, with full Cabinet backing, should have both the climate of opinion and the atmosphere of the Ministries as his special charge.

What in fact he and the Government intend to do is quite unknown. The fear that reconstruction may again be sidetracked is strong. The fact that Mr Greenwood was a member of the War Cabinet, while Sir William Jowitt is not, does not help; and the recent appointment of Sir Alfred Hurst to Sir William's staff came as a distinct shock. At any rate, it revealed the Civil Service view of reconstruction. Sir Alfred was Permanent Under-Secretary at the Department of Mines and, in the present serious coal situation, it is safe to say that no notably efficient member of the Department would have been released at this juncture. This transfer cannot be promotion; it can only be intended to make room for more energy at the Department, which suggests that the official attitude, the attitude of the Head of the Civil Service, is

that reconstruction is a sideline and not particularly important. It suggests, too, that Sir William Jowitt is already having the formal and inelastic values of officialdom imposed upon him; it is a straw in a wind that will blow away all his best endeavours unless he is careful, resolute—and supported in Downing Street.

There have been fears, too, about the future of planning. Lord Reith, who has gone, was no planning expert, but he was a fervent believer; and the transformation of the Ministry of Works and Buildings into a Ministry of Works and Planning, which was announced before the Government changes, has not been made. In fact, however, planning is not likely to suffer from the advent of Lord Portal, who may possibly be able to cope rather more smoothly with other Ministers than his predecessor did. The new Minister's work before the war in the depressed areas of Wales made him sharply aware of the physical problems of redevelopment. He has been given Mr H. G. Strauss as an additional Parliamentary Secretary, to be responsible for planning functions; and Mr Strauss's interest in his new duties is shown by the fact that he is chairman of the Scapa Society and a member of the executive committees of the National Trust, the Town and Country Planning Association and the Georgian Group.

The planning of building and land use is probably the only aspect of reconstruction which does require a new Ministry—to administer functions which either did not exist or were too thinly scattered among other departments. The need has been recognised, and the delay in bringing forward the Bill to register the new departmental title will only be short. Lord Portal will necessarily turn first to building, before he attends to land and forward planning, because the building industry has reached a critical wartime stage. But there is no reason to suppose that he and Mr Strauss will not press on to urge local authorities to make wider and more vigorous use of their town and country planning powers, especially with reference to the redevelopment of bombed and slum areas, which was singled out by the Uthwatt Committee for positive public action. Indeed, the areas which must, inescapably, be rebuilt and replanned will almost certainly serve, as they should, as the thin end of the planning wedge. The really important question is how positive public action will be. The keenness of the new Ministers to make planning as well as building the preoccupation of their department need not be doubted. But what planning powers have they got? What sort of plan is intended?

In short, the position of planning is precisely where it was before Lord Reith was replaced. No more than a start, albeit a welcome one, has been made. The Ministry is a central body for planning, but its power to plan is still minute. It is not yet the central planning authority that all the experts, including the Uthwatt Committee, regard as indispensable. The powers it is shortly to take over from the Ministry of Health under the Town and Country Planning Acts are negative; they are powers to bar bad development, but not to impose good. The wartime power of the Board of Trade to control industrial location remains with the Board of Trade; and the Ministry of Planning has neither a plan nor the means of imposing it. Whether Lord Portal wishes to remedy this is unknown, though the plain need to redevelop wrecked and squalid regions makes it likely that he will. If he does, he will need the aid of Sir William Jowitt and the consent of the Cabinet, for it will involve two major decisions, both still unmade—first, whether there shall be a national plan for the development of the nation's land; and, secondly, whether the nation will make the land in development areas its own by purchase, not to manage it bureaucratically, but to make planned development possible. Physical planning is a tangible and immediate branch of reconstruction; and the first test of Sir William Jowitt's status might well be his ability—and willingness—to press upon the Cabinet and the Commons the legislation needed, in the form of declaratory acts, to register these decisions. In his campaign to catch and hold public opinion, it would be a milestone.

East and West

FOR the time, the curtain has rung down on Britain's colonial holding in the Far East, and whenever it is rung up again it will certainly be on a radically different scene. For more than a century, Britain has played a part in the Far East, the part, almost exclusively, of a trader. Where—as in Malaya—administrative responsibilities were undertaken, the job was done largely to create a framework within which peaceful trade would be possible. In China, concessions, foreign settlements, extra-territoriality had the same purpose. The system had its advantages for both parties. China was not left poorer: by trading with British merchants. Chinese labourers were not worse off for working in British owned mills. Similarly in Malaya, the natives did directly benefit from the presence of British business interests.

Nevertheless, the system was open to abuse. In the co-operation between British capital and native labour, native labour sometimes got less than its fair share—in Malaya, for example, there was no income tax, while the community's social services were undeveloped. In China, the conception of extra-territoriality bred indifference to the problems of the community in which trade and industry were being carried on; and indifference was all too often tinged with irresponsibility and opportunism. As a result of many decades of British administration, the Malays, though better off, were not actively moving towards nationhood. After a hundred years of trading with Britain, the people of China resented all the signs of indifference—lack of social contact, lack of responsibility, lack of community—and all the other frictions flowing from the system of concessions and extra-territoriality.

This western method of trade relations—of which Britain was the chief exponent—was negative, and its faults were largely faults of omission. Taken over by the Japanese and fused with expansive tribal militarism, it has become a positive force for evil. The British tended to share inequitably the wealth they created. The Japanese do not share at all. The British offended the Chinese sense of equality by carving out extra-territorial rights for themselves. The Japanese wipe out the rights of the Chinese people.

To apply the word "imperialism" to both systems is misleading. The Japanese have not simply developed and reinforced and magnified whatever in the old system tended towards exploitation and the violation of national right. The new imperialism is not just the old writ large. It is based on quite different and quite opposite principles. It is as far from the old system as gangster rule from democracy. Yet equally clearly, there can be no return to the old system once the Japanese have been defeated. This defeat is, of course, the first step towards reconstruction in the Far East. The Japanese have a singularly cynical attitude towards their national policy. Almost the only criterion is success. If they are left to profit by anything they have gained by fighting, they will be confirmed in their reliance upon the "new order" method. But the Japanese are not only guided by their own success. They are equally under the influence of the success of others and if, after the war, the victorious Western Powers returned to the ways of economic indifferentism and unprogressive colonial administration in the Far East, the Japanese would sooner or later produce their own version. In the future, whatever policy is adopted by the victors will be aped by the Japanese simply because it is the policy of the war-winning side. The future of Britain and America in the Far East cannot thus be anything that could remotely lead to a return to Japan's "new order." The need is for entirely new principles—or rather, the consistent application of principles to which lip service has long been paid. For the colonies—Malaya, Indo-China and Netherlands India—there can be only one goal, the creation of independent nations linked economically, socially and culturally with the old mother-country, but

learning to stand firmly on their own feet. Towards the nations already confirmed and vindicated in their separate nationhood—India and China—the United Nations, and especially Britain, have to establish a new relationship, one of equality.

This should not be an impossible step. In China, for example, the official aim of British diplomacy for years past has been Chinese independence and equality. To confirm this, one has only to turn back to the British Memorandum on China of December 18, 1926—a time when, in the chaos preceding the victory of General Chiang Kai-shek, China had no central government at all. This document, commenting on the rise of Chiang, stated that "the political disintegration of China has... been accompanied by the growth of a powerful Nationalist movement which aims at getting for China an equal place among the nations and any failure to meet this movement with sympathy and understanding would not respond to the real intentions of the Powers towards China." And again, in the same memorandum: "They [the Powers] should abandon the idea that the economic and political development of China can only be secured under foreign tutelage."

The obstacles to this clearly established principle on the British side have been in part due to a paralysing inability to decide what policy to adopt towards Japan, in part, also, to a deeply ingrained sense of superiority over the "coloured" races. Both these obstacles have now been done away with. The only policy towards Japan is one of war now and occupation, disarmament and control for many years after victory. As for superiority, the last four months should have swept that away. The defenders of Free China can speak to any nation as brothers and equals.

But there have been obstacles on the Chinese side. It is not altogether the fault of the Western Powers that their impact on China was the prelude to a century of decay. The Japanese faced the same ordeal and emerged stronger and more united. The opening up of China only gave the *coup de grâce* to a system which was already dying away from within. It was not until after the Sun Yat Sen Revolution of 1911 and the coming to power of the Generalissimo in 1927 that the Chinese nation began to feel its way back to the political unity which is an essential condition of Great Powerhood.

This political disintegration made economic progress slow and halting. Industrialism has only begun in China in the last forty years and has grown up under all the crippling disadvantages of foreign concessions, enforced tariff arrangements, lack of capital, the mortgaging to foreign interests of taxes and revenues. Nevertheless, by the thirties, Chinese industry was beginning to take shape. In 1932 and 1933, over 47 million Chinese dollars' worth of cotton piece goods had been sold abroad.

The need to create stable political and economic conditions in China, to control Japan, to give the Japanese people a constructive lead, all point in the same direction. Britain and the United States must adopt a "Good Neighbour" policy of uncompromising equality and honesty. They must be prepared, if necessary at cost to themselves, to encourage in every way the economic and political integration of the 450 million people of China. This will mean Lend-Lease arrangements, loans and credits, technical advisers and experts, help in the establishment of heavy industry and in the building up of a workable transport system. But the investment cannot but give high political and economic dividends. With Good Neighbour principles victorious and in action, it may very well be only a short time before the Japanese people come to see that the militarists have "misled" their Emperor and that new advisers, whose will to peace is genuine, are the coming men.

And even if the conversion of Japan to the currently successful ideology were to prove slower than this, the peace-loving nations could hope to rely on the growing strength of China. There is, of course, no guarantee that the new giant will be inherently peaceful, though the 2,000 years of its civilisation have shown marked pacific tendencies. It is all the more important to adopt now a policy which will assist China into peaceful ways and ensure friendly relations with the West.

Given large scale economic help, the market created by 450 million people with a rising standard of living should set the machines not only of China but of Japan too and of the Western Powers working at full pitch. The greatest exchanges of goods are between industrialised communities and full Western aid—given in friendship where called for—could go far to building

up a China which would be a centre of "Co-prosperity" in a genuine sense.

There are powerful forces at work in the world to-day tending towards the creation of great power centres and the grouping round those centres of smaller states bound to them by economic and military ties. The "New Order" and "Co-prosperity" are debased forms of the new development. America's Good Neighbour policy and hemispheric defence and, though it lacks geographical unity, the British Commonwealth are examples of a higher community of interest. For obvious reasons, Japan cannot be the centre of Far Eastern "Co-prosperity." Nor can the Western Powers. China, the colossus of the future, is the key to that future and the only guarantee that it will be prosperous and peaceful.

NOTES OF THE WEEK

Deeds Done

On Wednesday night, Lord Halifax staged a counter-offensive over the air in Washington. In reply to the hostile propagandists who, in more countries than the United States, assiduously allege that Britain is still engaged in "phony war," leaving the other Allies to fight and work and suffer, he replied in the most effective way—by facts and figures. Too often British reticence has let the British case go by default. This time the trumpet was truly blown. Nearly three-quarters of the casualties suffered by the armies of the British Commonwealth and Empire up to the end of last year were troops from these islands; fully three-quarters of the air losses were United Kingdom losses, over 43,000 men, women and children have been killed and 50,000 seriously injured in air-raids over this country. Expenditure on defence and war purposes has risen from under a tenth of the national income in 1938 to about three-fifths last year; and four-fifths of total war output since last August, in a period when the production of tanks has been doubled, has been sent to overseas theatres. These details were perhaps hardly needed to prove that a country which stood alone against Hitler and Mussolini for a year and a half and destroyed half a million enemy troops in Africa, as well as keeping the long Atlantic and longer Indian Ocean supply routes open, was no skulking sluggard. But they make the truth impregnable. No one can deny that Britain has also had great failures, due to folly as well as weakness. But to accuse this country for not beating the totalitarian world single-handed, which is what these charges amount to, is so plainly enemy action that Lord Halifax had a duty to blast the indictment away.

Pacific Defence

The first arrangements for co-ordinating Allied strategy in the Pacific were blown apart by the Japanese. This was recognised on February 22nd—after Singapore fell, but before Java was lost—when General Wavell's South West Pacific Command, which had achieved nothing, was dissolved. General Alexander was appointed to hold Burma and General MacArthur was told to report to Australia. The heroic Dutch defence was then broken and the whole Indies lost. There remained only the task of the United States to keep open the seas to Australasia and to send reinforcements. From the outset, Mr Curtin, Australia's Prime Minister, had said that the Commonwealth must look to America, not to Britain. He was right, if only because 7,000 miles is only half 14,000; and the one relic of the earlier plans, the Pacific Council, which sits in London without any American representative, now looks merely whimsical and futile. The appointment of Mr R. G. Casey, Australian Minister in Washington, to be Minister of State in the British War Cabinet, to take Mr Lyttelton's place in concerting war measures in Cairo, is a much saner expression of the practical and geographical relations between Britain and Australia than this distant watch committee. The place for a Pacific Council is in Washington, as Mr Curtin always contended; and he has now taken the obvious step of sending his strongest Minister, Dr Evatt, to make direct contacts in the American capital. The "Anzac" area for which the United States

Less Clothing

A week of drastic renunciations of civilian comfort has included a reduction of just under a quarter in the amount of clothing each individual will be able to acquire from

Export
and
Import
Banking
on
Sweden

SKANDINAVISKA BANKEN

June 1st. An issue of 60 coupons will then be made, to last until August 1, 1943, compared with the 66 which were allowed for the first rationing period of twelve months. The reduction is gladly accepted, and the cut is reinforced by Mr Dalton's appeal not to use coupons except for necessary clothing. Unfortunately, standards of what is necessary vary, as do needs. Some people will receive supplementary allowances: about ten million workers in industry and children under 17 will receive ten additional coupons, valid from October 10th; and those in certain categories of work, and large children, who already receive extra allowances, will continue to do so. In spite of the special treatment accorded to growing children in the current period, many parents' coupons were spent on children's clothes. The aim of the cut is to release labour, plant, material and shipping space for war purposes, while ensuring that minimum needs are satisfied. These minimum needs should be met by the minimum use of labour and materials; and to this end the utility clothing scheme, started to ensure a supply of cheap clothing despite rising prices (the clothing component of the Ministry of Labour's cost of living index has risen by 94 per cent since war began), is, rightly, to dominate manufacture. With maddening inconsequence, the Board of Trade officials and the trades concerned deny that there is any intention of standardisation in the utility scheme. But the public will surely recognise that vital labour is saved by standard clothes as well as by standard cloth, and would accept a much greater degree of standardisation for the sake of utility and economy. Some technical questions involved in the saving of labour and material are considered on page 405. The desire of manufacturers—and tailors—to retain the different lines and varieties upon which they have built up their businesses is inveterate and stubborn. But, plainly, the more simple cloth and clothing are, the greater can be the number of workers freed by the textile and clothing manufacturers and the distributive trades for munition production; and there is also little reason why clothing workers, who still work appreciably shorter hours than those on munitions, should not increase their output, if need be, by longer hours—and free still more war workers.

Coal Rationing

The debate on coal on Tuesday was stimulating. Mr David Grenfell opened it by restating the problem, though with a greater degree of precision than before. The intake of coal by industry has risen above the pre-war level, and is still rising; and, in spite of exhortation, the former standard of household consumption has been maintained. Nevertheless, the stock position is somewhat better than a year ago, in spite of an exceptionally cold winter. There are two reasons for the absence of a serious shortage this winter. On the one hand, a further appreciable cut in exports has released productive capacity for the home market, and, on the other hand, the lull in air raids has been responsible for a more regular movement of coal than a year ago. Without the lull in air raids the difficulties of meeting demand would have been considerable. Mr Dalton, the President of the Board of Trade, was frank enough, for he admitted that "we have just scraped through so far without serious mishap." He grasped the nettle courageously. Production is grossly insufficient, consumption is excessive, and stocks are much too low. His remedy, an increase in output and a reduction in unessential consumption, is not new. But, in contrast to the half-hearted measures taken to apply it by previous Presidents of the Board of Trade, Mr Dalton appears to mean business. "His Majesty's Government," he said, "have decided that a comprehensive scheme of fuel rationing shall be introduced as soon as possible." The issue has thus been settled, and the arguments about administrative difficulties swept aside. Sir William Beveridge is to work out a rationing scheme for both coal and power.

New Methods in Burma?

The defence in Burma is taking shape. The main Allied forces are grouped in a large arc round Mandalay. Chinese troops seem to be predominant in the Shan States on the Siamese frontier. British forces, some of them evacuated from Rangoon, hold the Japanese in the Prome sector. The pace of the Japanese advance has slowed down considerably.

This must be partly due to reorganisation after the fall of Rangoon. But it also reflects a new vigour and intelligence in the conduct of British strategy. General Alexander has confirmed the impression made in the week immediately following on his appointment. The defence is showing a far more offensive spirit and there are encouraging signs that the General is basing his strategy on the campaign as fought by the Japanese, not as fought in the last war in Europe or according to Army manuals. At a recent press conference, he pointed out that far from being universally under-equipped, the British had in certain categories been handicapped by their own equipment. Motorised transport, essential for European *blitz* fighting, is proving a handicap in jungle warfare. Malaya was taken on bicycles; Java fell because the Japanese ran their munitions round on light handcars; while the Allies confined their operations to the very few good roads. If General Alexander can transform not only the spirit but the methods of resistance on the Mandalay front, the Burma bastion may well hold out.

The End of Winter

There is fierce fighting all along the Russian front. At Staraya Russa, the Sixteenth Army is still holding out, but at the cost of very heavy casualties. In the Smolensk sector, the gap has been narrowed by successful Russian attacks in the neighbourhood of Dorogobuzh and in the south, fighting has flared up in the Kharkov sector. The initiative everywhere remains with the Russians and the heaviness of their attacks is a measure of their urgent need to wring the last possible advantage out of the last weeks of winter weather. If the German armies cannot be disrupted and the strong points—springboards for the new offensive—reduced, the Russians will soon have to face an ordeal even graver than that of June, 1941—for now the enemy is at the gates of Leningrad, within 100 miles or so of Moscow and encamped on the shores of the Sea of Azov. Hitler's speech at the Zeughaus in Berlin, while it seems to have lacked the usual heroics and bombast, throws a rather uncomfortable light on the next stage in the Russian campaign. Hitler blamed the holding up of the German armies in Russia on the winter "which gave our enemy four months to attempt a reversal in this fateful struggle." This, Hitler declared, was the Russians' only hope of repeating their triumph over Napoleon. They had failed because "in a superhuman struggle the German and allied soldiers have survived this task." Now the ordeal was coming to an end, the summer offensive was in sight and the Bolsheviks would be the more easily wiped out on account of their waste of men and materials in fruitless winter battles. Hitler's speech may be dismissed as whistling in the dark, but the facts remain that the German Army has survived a winter campaign; its forward points have not been reduced, and the Russian advance has nowhere been decisive. Russia will need every ounce of support that can be sent her in the next few months.

India Waits

There is a hush over India, the calm before the storm. To the east, the Japanese are pausing to gather strength, and the people of India are very troubled; from the west, Sir Stafford Cripps is expected, hopefully. There is little yet to suggest the fate of his mission, and until the terms of the offer he is taking are known, nothing but generalities can be expected from any Indian group. In the Indian press, apart from the extremist papers which have been very reserved, there has been favourable comment and much talk of co-operation. It is almost certain that widespread support could be gained from moderate sections in all the parties for interim Indian governments in the provinces and at the centre on a coalition basis. But it did not need Sir Stafford Cripps to go to India to discover this. The immediate question is the attitude of Mr Nehru, Mr Jinnah—and Mr Gandhi—any one of whom could shipwreck a settlement. All three have reserved judgment, which is probably a good sign. The Chamber of Princes, however, has spoken. The princes welcome the mission; they hope it will strengthen India's defences; they are "not averse to ordered progress"; but their treaty rights must be protected. These very natural but very obvious pronouncements carry the matter little, if any, further than the silence of the politicians. The fact is that only Sir Stafford Cripps himself can do anything now.

Threat to Madagascar

There is no reason to doubt the sincerity of Marshal Pétain's guarantee to the United States that Madagascar will not fall under the control of any Axis Power. If the United States had asked a similar guarantee with regard to Indo-China in, say, July, 1940, it would undoubtedly have been given. The difficulty is that if the Japanese were to appear off the coast of Madagascar, the French would have no means of repelling the attack and that the authorities at Vichy have no means of controlling the behaviour of the officials on the spot, should they decide to throw in their lot with the Japanese. The shamelessness of Admiral Decoux's behaviour—it is even reported that he has accepted a Japanese decoration for "recent services"—may well be repeated by M Anet, Governor of Madagascar, for it is an odd fact about many minor Vichy figures that they are prepared to defend French territory to the last—but only against the democracies. If Indo-China is any analogy, they are also ready for "protective annexation"—but only by Axis Powers. What would the French reaction be to a repetition by American, South African and British forces of Japan's policy in Indo-China? Could they protest, when Japan's control of Indo-China has been accepted without demur? After all, the excuse of "protective annexation" is in this case overwhelming. The risk of losing Madagascar must, of course, be considered, and it would be very useful to know how far Allied plans have advanced in the creation of an alternative land route across Africa. Even without the new threat to Madagascar, it would seem reasonable, given the Allied shortage of shipping, to have hurried on with plans for saving thousands of miles of sea transport. There appear to be two possible routes across Central Africa—from Lagos through Fort Lamy, El Obeid and Khartoum to either Port Sudan or Massawa (with its American base) and again, from Douala, Bangui, Juba and Soroti to Mombassa. It is to be hoped that their potential value has not been overlooked.

How are the Mighty?

Hardly more than a few weeks ago, Lord Beaverbrook was a world figure. Then he vanished into silence, and not even the Prime Minister himself knew whether he would emerge. It was, to the member of the general public, the strangest episode of wartime politics. Few people will claim, in spite of Lord Beaverbrook's first-aid services to aircraft production in the summer of 1940, that he has shone as a departmental chief. Plainly he was not the right choice for Minister of Production; the difficulty, apparently, was that, with Lord Beaverbrook at hand, no other choice was politically possible, a situation which, happily, has now ended. But Lord Beaverbrook has had his triumphs, too, and his qualities are well known. In war as in peace, he is a publicist of energy and determination. He has worked ably and with success in Moscow and Washington and, at a time when men of decision and personality are not numerous, it would be a sad waste of manpower in high places if Lord Beaverbrook did not go on his travels again. It has now been announced that he will go to Washington, though not as a member of the Government, to do work on the pooling of resources, which will be done later by a special Under-Secretary. Lord Beaverbrook may then be given other duties. But the position remains obscure; and whether or not he regains his status is apparently Lord Beaverbrook's own choice. If his health permits, his duty is clear. The Germans are already saying that his departure marks the cutting of supplies to Russia. This is a complete perversion of the truth, and Lord Beaverbrook must make its falsity plain beyond a peradventure by taking up his itinerant task again.

Children's Rations

The simplified arrangements for the distribution to children of milk, cod liver oil and fruit juices, which come into effect on April 1st next, are a welcome improvement in the technique of food distribution. In future, one application form will cover all three schemes and renewal will only be necessary twice a year. The announcement draws attention to what has, so far, been the outstanding success of the Ministry of Food's administration, the immediate recognition that young children and expectant and nursing mothers constitute the most important priority classes in the country. The new arrangements bring the ration of cod liver oil into line with the national milk scheme by

extending its issue up to five years of age—the age up to which children are assured of 1 pint of liquid milk a day. Fruit juices are obtainable up to two years; a quart of liquid milk, when children are not breast fed, up to 12 months; while all holders of children's ration books obtain priority supplies of oranges and four times the basic egg ration. The scheme is impressive and will do very much to protect the health of the youngest members of society. The arrangements contain one inherent weakness—that the priority rations are in fact often used by adults. It is no secret that in some districts non-priority milk deliveries have practically disappeared or that marmalade is made from the children's oranges and cod liver oil fed to live stock. No administrative control can wholly remove this difficulty. For children of school age, the great safeguard is to push on with the provision of school meals and milk in schools; in day nurseries and nursery schools, too, there is also a great opportunity for seeing that the food goes down the right throat. For children in their own homes, exhortation and publicity are the only weapons which the Ministry of Food possesses. These should be used far more widely, at least on the scale adopted by the national savings campaign.

Determination of Needs

The Government sustained considerable criticism during last week's debate on the Assistance Board Report covering the administration of the Determination of Needs Act. Strictly within the Act's terms of reference there was little justification for the censures voiced. There is evidence that administration, within the framework of the Act, has been humane, intelligent and even enterprising; the Government's unwillingness to publish the instructions issued by the Board to its officials appears to create an unnecessarily unfortunate impression. The scope of the debate, however, was inevitably extended to criticism of the Act itself, a measure with which a considerable section of the Labour Party has never been satisfied. Apart from a general conviction that many old age pensioners are still permitted by the state to exist on an all-in income which is too low, there is much dissatisfaction with the maintenance of the means test, even in its present very modified form as a "needs test," and with the continued penalisation of thrift. The provision as regards war savings is clearly anomalous, and, as the Report itself points out, ineffective. The first £375 of war savings are neglected in the application of the personal needs test to claimants for supplementary old age pension allowances or unemployment assistance. Naturally, few persons who have made application since the outbreak of war for these allowances have been in a position to make considerable war savings; while those whose life's savings are held in other forms must be to some extent deprived of supplementary grants. This test has always penalised thrift; now it does so anomalously. As applied to the household, the needs test presumes a maximum contribution of 7s. weekly per head by each non-dependent member of the applicant's household or the grant of free board and lodging by the applicant's parents or children if their income amounts to £6 per week and he resides in their household. The Government's critics are appealing for no consideration of the contribution made by any of the applicant's relations, whether in cash or kind. Clearly, payments based on need do necessitate an investigation of need. The solution is probably to raise the old age pension itself, even if it is necessary to depart from the actuarial basis in doing so, and to retain supplementary allowances to provide for genuinely exceptional needs.

Economy of Labour

Men and women are now too scarce for the voluntary principle be allowed to prevent their most efficient and economical employment. In industry, it took a long time for the authorities to introduce, piecemeal, the ruling that a skilled man must go back to the work he is skilled in. In the Army, one of the War Office's answers to the Beveridge Committee's criticisms of the misuse of skilled engineers was that many of the men preferred not to do engineering work, a poor reply in total war. Last week, the first conscripts for the ATS were called up—and publicised. The publicity was inconsistent. On the one hand, the subtle selection tests to find what work the girls were fitted for were emphasised; on the other stress was laid on the fact that recruits were given the widest possible choice between the various jobs open. Stories were told of clerks opting work in driving or on gun sites to get the open air life they had never had. It may be true that the new tests prevent the grossest misfits from being committed; but it is equally true that to permit a trained and efficient clerk to seek training as a driver, in the cause of free choice, when good clerks are worth their weight in gold, is as wasteful as to permit good and experienced drivers, who are now very scarce, to go into other branches. The result tends to be to fill clerical vacancies with poor clerks and transport vacancies with poor drivers. It is true that, in the majority of cases, both men and women, the recruits have no special aptitude or experience to prevent a choice of work being offered them. But this fact, in the Services as in industry, makes it all the more important that those who have skill or experience should be placed to use it, and nowhere else. Skill is too scarce for any remnant of the cajoling "Join the Army and See the World" attitude to remain.

The New Gap

The opening of a Children's Club under the auspices of the Save the Children Fund in North Paddington draws attention to a serious gap in the various schemes and organisations covering the activities of young people. The need to free womanpower for the factories has put a sharp focus of interest on the under-fives, on nursery schools and child welfare centres. Similarly, the Youth Services for boys and girls over 14 are getting publicity, public support and governmental backing. It is assumed that the children between these two groups are fully covered by their schooling and that no further arrangements are necessary for their welfare. In time of peace, the contention is probably true. Between the school and the home, the child is fully provided with work, interests and affection, and many parents would resent attempts to encourage children of school age to spend their leisure time outside the home. But, in wartime, and particularly in London and other big cities, the problems presented by children of school age are grave and pressing. Many of them have lost all sense of an ordered existence through being constantly moved to the country and back again; many are living in bombed homes and streets with even fewer amenities than in time of peace; many homes have been broken up by mobilisation and the industrial call-up. The children when they get out

of school are apt to roam about the streets and shelters in unruly bands. If the children have lost all sense of discipline and decency before they become wage earners or come within the orbit of the Youth Services, the work done for them later may be quite useless. The Save the Children Fund, which has done pioneer work for the last twenty years and which unearthed this problem by its activities in shelters during the Blitz, has uncovered a real source of social disintegration. Its work is handicapped by the fact of dealing with children "in the gap"—neither under-fives nor over-fourteens. Premises, grants, trained helpers are not available. But now that they have made a gallant start, it is to be hoped that they will get the support, official and private, they deserve.

Dissident Tribesmen

The new Government of Persia has inherited a critical internal situation. The resignation of M Faroughi, the former Prime Minister who was, in any case, in ill health, was precipitated by his failure to control the rebellious tribesmen of the north and west. The task of his successor, M Ali Soheily, foreign minister in the former administration, is complicated by the fact that until the late spring it will be impossible to undertake military operations against them on a large scale. The problem was brought to a head by the collapse of the effective, if autocratic, government of Reza Shah and the subsequent demobilisation of the Persian army. The temporary removal of central authority has provoked a serious return to brigandage by the Kurdish and Khorasan tribes, always more or less disruptive forces in the Persian state, as well as agitation for greater autonomy by the Bakhtiari. The situation is further complicated by acute congestion of the transport system, which has impeded the distribution of wheat throughout the country and encouraged hoarding. The first necessity for the solution of the political problem is the reconstitution of the Persian army so that strong measures can be taken against the rebellious tribes. The future of the existing government will be seriously prejudiced if it is unable to restore law and order, in which enterprise Allied support may be indispensable.

Beveridge Report

On Wednesday, a Labour Member asked the President of the Board of Trade why Sir William Beveridge had been chosen to work out a scheme for coal rationing, and Dr Dalton replied that it was Sir William who worked out food rationing in the last war. Sir William Beveridge is ubiquitous; he is the Government's Jeeves. He surveyed manpower for Mr Bevin; he is still inquiring into the use of engineers by the Services; he is at work on plans to re-construct social insurance and the welfare services; and now he and his helpers will ration coal and power. An economist, he has had the flexibility of mind to use the experience of war economy in the last war as a starting-point towards the solution of economic problems in this one—as the first word and not the last. From the outset Sir William Beveridge was a spokesman of total mobilisation and total rationing. On the pivotal points of manpower and civilian consumption, his advice will have left a lasting mark on war policy when the war is over; and it is an oddity that his rôle has always been to advise, and not to administer. It is certainly true that armies which set out to fight the last war lose; but, in civilian war administration, some of the "last war men" have shown more insight and common sense than most of their colleagues.

Reorganising Political Warfare

The direction and administration of political warfare are to be simplified. In the place of the old triumvirate, Mr Eden is to exercise control over policy while Mr Bracken is to be in complete charge of the administration. This step is in the right direction. It may reduce the amount of inter-departmental confusion and introduce greater punch and effectiveness to the quality and transmission of British propaganda. But the new arrangements leave unsettled a large number of points, some of them of extreme importance. One of the pre-conditions of effective control over policy on Mr Eden's part is the emergence of a recognisable policy at the Foreign Office. At present, there is apparently none, and when Lord Vansittart complains of the influence refugee

Shorter Notes

There seems to be an unofficial competition to find a new slogan for National Savings. "Lend to Defend" is regarded, rightly perhaps, as dull and undynamic. "Back to Attack," which has been suggested, smacks of betting; and "Give to Attack" would be good, if it did not throw an unworthy doubt upon the Chancellor's intention to repay the money borrowed. Perhaps the Chancellor himself will, very sensibly, cut the knot by substituting "Your Money or Your Life" in April when he presents his Budget.

Germans are having on the formulation of propaganda for Germany, he should perhaps recognise that propagandists who are given no straightforward directives must in self-defence evolve some line. Again, it is a sign of the lack of clear sight and clear decisions at the centre that in the third year of war Lord Vansittart should still be able to debate whether or not the Government officially distinguishes between good and bad Germans. The faults are not only at the level of policy. Under the new arrangements, as under the old, there are obvious failings in co-ordination. What is now to become of the staff built up round the old triumvirate? The Political Warfare Executive is to come under the control of the Minister of Information. Is there anything to be said for not merging it completely in the Ministry? And even if there were a unified Ministry dealing with all propaganda services, it would still be a glaring anomaly that it had no effective control over the actual compilation and transmission of the major and most telling part of the propaganda. Will Mr Bracken's administrative control now extend to the foreign services of the BBC? If not, why not?

NAAFI and ENSA

In any discussion of the discrepancy between civilian and Service pay, it is always claimed that the fighting man receives additional benefits which bring his total remuneration much nearer the level of the factory worker. One of these is free board and lodging; and in the provision of food NAAFI plays an important part. As the Select Committee on National Expenditure points out in its fifth report of the session, before June, 1940, Army units used to receive a large part of their rations in cash, and were able to purchase that amount direct from NAAFI, which thus enabled messing officers to vary the diets of their men. This system is still followed by the RAF, but, since that date, the RASC is responsible for providing almost the whole of the army ration. NAAFI continued to supply the RASC with some of the goods, but they are issued at wholesale prices. Thus Army units have lost, not only the advantage of a more varied diet, but also the rebate of 6 per cent of the profits on the retail sales made to them. The Select Committee notes that a small cash element of 2½d. a day, to be spent at the NAAFI, has been re-introduced into the soldier's rations, but it regrets that the change was ever made. To-day, therefore, the only benefit a soldier obtains from the NAAFI is from his own individual purchases. On these, his unit gets 6 per cent rebate, which is used for welfare purposes and the provision of amenities, but it is personal benefits which alone can alleviate his sense of grievance that in money terms he is far worse off in the Army than outside. The Select Committee agrees that NAAFI's policy of charging multiple shop retail prices is the best in peacetime, but it considers that this policy may have to be reviewed. There is certainly a danger that goods sold at a lower price may be bought for resale elsewhere. Control of NAAFI supplies, too, has been almost culpably lax, to judge from recent revelations. But it is a risk worth taking in the interests of the individual soldier whose available pay for personal purchases is so small, and the argument that local tradesmen must be protected from cut-price competition should be ignored.

Among the amenities purchased by the profits of NAAFI is entertainment, which is provided by ENSA, a voluntary organisation formed six months before the war. In March, 1941, the net cost to NAAFI of providing entertainment for the forces and for munition workers, after allowing for the Ministry of Labour contributions and charges made to the forces, was about £800,000 per annum. This was more than NAAFI could afford, and the Treasury has proposed that the total expenditure, exclusive of sums provided for munition workers, should be limited to £1 million per annum, of which £600,000 should be borne by NAAFI and the remainder by the Exchequer, which already bears all wartime losses made by the Corporation in excess of £350,000. Nobody will question the amount of the expenditure on entertainment, or that a large part of it should come out of public funds. But it may well be asked whether something could not be done to provide better value for the money; it is frequently said that the forces themselves can provide, out of their own talent, better shows than those given by the average ENSA company.

The announcement that the Government is to clear up the question of food hoarding is welcome. For people who, on official instructions, began to store food after Munich, and have since then kept their stocks intact or add to them by perfectly legal purchases, it was somewhat alarming to read of prosecutions for food hoarding; if the Ministry of Food had wished to prevent large accumulations of food, it ought not to have been so dilatory in introducing and extending rationing. In any case, the existence of small and scattered food stocks throughout the country would be an advantage in the event of severe bombing or an invasion, and the Ministry might well take powers to requisition them in an emergency rather than to practise prudence and thrift.

A jarring note has crept into the press of the current "austerity" announcements: the import of about 450,000 gallons of wines is to be licensed by the Board of Trade. Though the quantity is small, it should have been possible to quieten the cries of wine producers simply by purchasing their products without using valuable shipping space to import them.

The Latin American republics are not sitting down under Axis attacks on their shipping. President Vargas of Brazil has ordered the confiscation of Axis funds; Uruguay has taken over the *Tacoma*, the supply ship of the *Von Spee*, and—a remarkable diplomatic gesture—Chile has sent a protest to Berlin over the sinking of Brazilian and Uruguayan ships.

The following table gives the number of civilian casualties in air raids since September, 1940:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept.-Dec., 1940.....	21,669	30,556	52,225
1941:—			
January-June.....	18,698	20,451	39,149
July.....	501	447	948
August.....	169	136	305
September.....	217	269	486
October.....	262	361	623
November.....	89	155	244
December.....	34	55	89
1942:—			
January.....	112	61	173
February.....	22	21	43
Totals to date.....	41,773	52,512	94,285

Of those killed in February, 4 were men, 14 were women and 4 were children under 16.

AMERICAN SURVEY

Retrofitting in Government

(From Our Washington Correspondent)

February 17th

VARIOUS other segments of the Washington war machinery seem due for the same kind of tightening up that formed the War Production Board from the Office of Production Management, the Supply, Priorities and Allocations Board and parts of the Office of Price Administration and Civilian Supply.

For the past weeks the papers and the Congress have been having a field day with the Office of Civilian Defence. There are at least three issues in the controversy. One is the inadequacy of current preparations for handling air raids. Vague direction, inaudible sirens, amateurish warden-ing ("If it's gas, go to the top floor; if it's high explosive, go to the basement") have caused a rising tide of irritation. Then there is the perennial issue of Mrs Roosevelt, of whether activity, no matter in how good a cause, is desirable if divorced from accountability. The third issue is the most far reaching. How much does civilian defence cover? Up to the war, the New Deal drive was a drive for the ill-housed, ill-clothed; ill-fed third of a nation. When the war came, its urge to conserve social gains took the form of insistence that America, with her vast productive capacity, could have guns *and* butter. As pressure of military requirements squeezed the butter, the mould in which it came out was a programme for civilian defence. The nutrition programmes of former years were related to the rejection statistics of the draftees. The health programmes were related to time lost by factory workers. (Comparison has been made between the man-days lost from strikes and the notably larger number of man-days lost from illness.) The recreation programmes were related to the rising venereal disease rate around camps where decent fun is not available, to the need for relaxation of factory workers, to the care and training of children whose mothers are drawn into industry. The housing programmes were related to the need for quick staffing of new plants, and for preventing epidemics in their neighbourhood arising from overcrowding, overstrained water supplies and inadequate sewage disposal systems. How much of what is being done under these heads is demonstrably furthering the war effort? How much is insupportable in a nation that is budgeting sixty per cent of its income to direct war production and maintenance of the armed forces? That is the line of demarcation that Mr Landis, the new Director of OCD, has been assigned to find; he has just announced that OCD's main function is to prepare the country against the danger of physical attack.

Mr Willkie, in his Lincoln Day speech, attacked the exercise, by a number of agencies, of functions which he feels to be those of the State Department. He referred specifically to the speech by Colonel Knox that gave such priority to the defeat of Hitler as to raise questions among our allies in the Pacific, to the recent arrangement whereby speeches by government officials are to be cleared through the Office of Facts and Figures, and to the establishment of the Board of Economic Warfare, and—though he did not name it specifically—to the work being done under Colonel Donovan in the Office of the Co-ordinator of Information.

The tribute paid by Mr Willkie to Mr Cordell Hull is one in which the country at large would join. But Mr Hull's health is not robust, and the rumours of resignation which circulate periodically are again cropping up. Should he not continue in office, the person of his successor would have much to do with public confidence in gathering too many aspects of foreign relations under the State Department's ornate roof—like other foreign offices, ours has included on its staff a group who, to the man in the street, have looked like bespattered appeasers. (The news release on St Pierre-Miquelon, which referred to "the so-called Free French," is said to have brought the Department a freshet of letters

addressed to "the so-called Secretary of State.") Where frank speaking is in order, clearance of speeches by the Government's formal diplomatic arm might so draw the teeth out of what was said as to reduce it to immaterial mumbling.

But unquestionably something will be done, on the one hand about the agencies for disseminating information on the war effort, and on the other, about the agencies for doing certain vital war jobs outside the field of production.

Telling the Nation

Currently in the information field, besides the press relations staffs of the various Cabinet departments and the War Production Board, are the Office of Facts and Figures, the Office of the Co-ordinator of Information, the Office of the Co-ordinator of Inter-American Affairs and the Office of Government Reports, all of which are part of the Executive Offices directly under the President. (Perhaps the Censor should also be included!) The Office of Government Reports has been in existence since 1939—it has been overshadowed by the other three, which have appeared since the defence programme. Allocations of function among them have been, roughly, as follows: domestic United States affairs belong to the Office of Facts and Figures, which among other things has sponsored Bill of Rights Day (with an explanatory nation-wide radio hook-up that produced Hollywood sound effects in the name of the Founding Fathers), and printed a "Report to the Nation" summarising the war effort through 1941. The world outside the Americas is in Colonel Donovan's bailiwick—his loosely co-ordinated staff includes groups whose jobs range from short-wave broadcasting to long-term research. The Nelson Rockefeller office covers Latin America; and the production side of the information job—printed matter, posters, exhibits—is centred in the publications unit of what has now been metamorphosed from OPM to WPB.

The source of this multiplicity is to be found in the variety of colourful persons who have come to Washington with an idea and caught the Executive eye. It has been a constant characteristic of the New Deal; it has made the kaleidoscope, with its successive rearrangement of the same particles, an accurate analogy of New Deal Administration. (A different analogy, dating from several years ago, is that "the executive proliferates arms like Hindu goddesses, until not only the left and the right but none of the lefts and none of the rights know what the others are doing.") Another turn of the kaleidoscope seems about due.

The Supply, Priorities and Allocations Board and the Economic Defence Board were set up simultaneously. But when SPAB was streamlined into the War Production Board with Mr Nelson running it, the EDB was merely rechristened Board of Economic Warfare by the briefest of executive orders; nothing else has been done about it.

It is natural that this should be so. The readily observable shortcomings in production, which over successive months built up so much pressure for reorganisation that Mr Nelson's appointment was greeted with a tremendous sigh of relief, have no counterpart in foreign operations. But reorganisation of this latter machinery is no less overdue. When the Lend-Lease administration was set up, it was assumed that initiative in placing orders would come from a variety of sources; when the Economic Defence Board was set up, the current shortage of neutrals was less acute; when the Office of the Co-ordinator of Inter-American Affairs was set up, the war programme was small enough to allow budgetary room for many activities only obliquely related to the immediate prosecution of hostilities.

Now we have a programme which gives full priority to the question, *will this thing help fight the war?* Now we have a total front where competition for rubber and tin and the rest has moved from economic to military lines.

Now we have a procurement situation to which complete priorities have been applied, through the joint committees set up as a result of the Churchill-Roosevelt visit. These changes have shifted the policy-making function to new points; but organisations which have now become technical supports of the new centres are not yet keyed to their new job.

Retail Sales in 1941

[FROM OUR NEW YORK CORRESPONDENT]

February 12th

It is not, of course, true that the sum of retail sales in a year is identical with civil consumer demand. But it is a fairly good quantitative and qualitative representation. Retail sales in 1941 were approximately \$54,000 millions; this figure is the highest in our records; it was 17 per cent above 1940 and 11 per cent above 1929. As far as one can make out from the price indices, and allowing for the increase in population, *per caput* sales must have been approximately equal to those of 1929.

These sales were tabulated as follows:—

RETAIL STORE SALES (\$000,000,000)	Percentage Increase	
	1940	1941
All retail stores.....	45.7	53.6
Durable goods stores.....	12.2	14.9
Non-durable goods stores.....	33.5	38.7
Food stores.....	10.8	12.4
Eating and drinking places.....	3.7	4.3
Apparel stores.....	3.4	4.1
Filling stations.....	3.0	3.5
Building materials, hardware, etc.....	3.0	3.7
Household furnishings, etc.....	1.9	2.4
Automobile dealers.....	6.8	8.2
Drug stores.....	1.7	1.9
General merchandise.....	6.8	7.6
Other retail stores.....	6.4	5.5

The most remarkable fact in this table is the relative uniformity of the increases. It is true that the largest increase (building material and hardware store sales) was double that of the smallest groups—drug stores and general stores—and that durable goods sales increased more than non-durable goods. But, generally speaking, it shows that a public with money in its pockets is not very eclectic—it wants more of everything.

Simplifying the groupings we get this subdivision:—

Food and drink.....	16.7
Clothing.....	4.1
Motor cars and their use.....	11.7
Houses and their contents.....	6.1
Undifferentiated.....	15.0

The Prospect for 1942

It is quite clear that the record for 1942 will not look much like that for 1941. The production and sale of passenger cars has virtually ceased. The use of existing cars is already limited by what is misnamed the "rationing" of tyres, which is actually a prohibition of the sale of new tyres—incidentally, even those idly on the dealer's shelves. Secondly, private building is already reduced by the non-availability of metallic fittings and by general shortages of all sorts of hardware. These two items—motor cars and their use, and houses and their building and maintenance—aggregated almost \$18 billions in 1941, or one-third of all retail trade. The proportion may have been larger, for the undifferentiated shops sell some items for cars and houses. While there will be retail sales in these lines, the volume this year must be much smaller than in 1941, even if no limitations should be imposed beyond those now visible.

Together, the items of food, drink and apparel ran only a little higher—about \$21 billions, or, say, another third. At this time, there is less reason to expect physical shortages in this category, although there are at the moment scattered scarcities, possibly caused in part (e.g., sugar) by a degree of anticipatory or excited forward buying, generically called hoarding.

The undifferentiated items—another third—include goods in which no shortage is predictable and goods now completely unavailable. To sum up, few predictions can be made with more assurance than that the volume of retail sales in 1942 will be substantially less than in 1941. There is neither the material, nor the labour, nor the plant capacity to supply the retail trade with a volume of goods equal to that actually sold over its counters in 1941.

Yet, at the present time, it appears that the money in the pockets of customers, or would-be customers, of retail shops is higher than at any time in 1941, and there is reason to expect that it will remain higher throughout the year. This demand is at present converging on the available supply, with a resulting impact on prices and also upon the distribution of this available supply. This impact is not, and probably cannot be, very accurately reduced to index numbers, as a reference of the groupings of retail trade to the components of a "cost-of-living" index shows.

American Notes

WPB on Trial

The satisfaction and relief which greeted the establishment of the War Production Board appear to be wearing thin. Mr Tolan, Chairman of the House Committee on Defence, has criticised the lack of a single all-inclusive purchasing agency, and more sensational charges were made by Robert Guthrie, when he resigned last week from his job as Chief of the WPB's Textile, Clothing, and Leather Goods branch. He laid responsibility for delay in conversion to war production, not on the industry, but on the "indecision, resistance, and procrastination" of industry representatives working within the WPB. Senator Truman, Chairman of the Senate Committee investigating war production, declared that the programme is "shot through with men interested primarily in serving their own interests." Mr Nelson himself, in a broadcast addressed primarily to labour and management, said "We, and you, are on trial . . . Unless production is brought to unprecedented levels neither management, labour nor the WPB can expect to survive the wrath of the public." Presumably the WPB would be the earlier victim; labour and management are not so easily dispensed with. Mr Nelson's concern was mainly with methods of increasing production sharply in the immediate future, by fuller utilisation of plant facilities, and the raising of efficiency within industries to the level of the most productive plants. He pointed out that 20 per cent of plants on war production work only a five or five and a-half day week, and turning to specific industries, estimated that machine tool production could be increased 45 per cent if all 153 plants operated as efficiently as the top three, and that aircraft production could be raised 25 per cent if all plants could equal the best production records in the industry. Mr Nelson also announced that integration of Army, Navy and Maritime Commission procurement into a unified supply system was to be the next step in speeding the war effort. The Guthrie charges, which are to be investigated both by the WPB and the Truman Committee, raise the persistent problem of how best to employ the technical and industrial brains of a democracy. It is not a problem peculiar to the United States, and the way in which it is handled will be watched with interest in this country.

Manpower Policy

Shortages are already developing in certain types of skilled labour, and consequently increasing attention is being directed to the question of a manpower policy programme. The shortage of tool and die workers in what was the automobile industry has been called the most serious obstacle to conversion by Mr Kanzler, and it has persisted in spite of an increase in wages over a month ago and attempts to upgrade and retrain workers. Official suggestions that an army of 7,000,000 to 8,000,000 men may have to be created have raised the problem of the broad allocation of labour, which the Administration is known to be considering. The demands of the forces may draw as many as 5,000,000 men from civilian occupations, and it is estimated that from 3,000,000 to 5,000,000 additional workers will be needed for war production. This call on the nation's manpower, amounting to possibly 10,000,000 in all, will have to be met from four sources: the unemployed, now numbering just under 4,000,000, but including many unemployables; those coming of age, who are estimated at about 1,500,000; civilian industries, including farming; and men and women not now in regular employment. The reserve of woman-power has been estimated by the National Industrial Conference Board at about 7,000,000, of whom 5,000,000 might be put to work. A bill now before the House proposes to give the President authority to draft men to perform essential civilian services, and the press has forecast the creation of a manpower board within the WPB to

take charge of the supply and training of labour and the fixing of industrial priorities. It is suggested that employers may have to secure all their labour through the US Employment Service, that priorities will be established for labour similar to those now existing for materials, and that the manpower board may be given powers to transfer workers from one employer to another. Recent Gallup polls indicate that the public is willing, if necessary, to sacrifice the right to work where it chooses. Far-reaching decisions on the allocation of manpower will soon be needed, and it is good news that neither the public nor the Administration is going to be caught unprepared.

* * *

The First Year of Lend-Lease

Figures presented to Congress by the President last week cover the first twelve months' working of Lend-Lease and throw light on what has been happening in the three months since the United States became a belligerent. Total direct Lend-Lease appropriations, which were \$12,972 millions on November 30th, are now \$18,400 millions, an increase of about 42 per cent; allocations have risen from \$9,186 millions to \$12,205 millions, or about 33 per cent; contracts placed total \$8,459 millions as against \$5,243 millions, an increase of 61 per cent. The amount actually spent has risen from \$1,202 millions to \$2,570 millions, or about 114 per cent, and shipments from \$595 millions to over \$1,000 millions. Articles produced under existing appropriations of \$20,596 millions for the Army, Navy, and Maritime Commission may also be transferred at the discretion of the President. Military missions are already in China and Russia with the purpose, among others, of giving instruction in the operation and care of American military equipment, and the North African Mission has established repair shops. Actual deliveries are still only a tiny fraction of what is promised, and what is necessary to turn defeat into victory. The slow start is due to the reorganisation and retooling of American industry, now well advanced, but in the future the shipping shortage will be the limiting factor. In his report President Roosevelt observed, "What we have done has not met the most urgent of our present needs. It will not even begin to satisfy the stern requirements of the future." This sombre assessment, combined with the steady increase in Lend-Lease figures, is reassuring; the administration is not guilty of underestimating the demands of the many fronts, and it shows no sign of succumbing to the natural temptation to reserve American production of weapons for the American forces. As long as there is no complacency over what has been achieved, the progress of the last three months gives good grounds for satisfaction.

* * *

Reactions to the Tax Programme

The most hotly debated tax issue at present is not any part of the Treasury's proposals, but the suggestion of an 8 per cent sales tax advanced by the National Association of Manufacturers in an alternative programme, and said to have considerable support in Congress. Besides the sales tax, of which 4 per cent would be levied on manufactures and 4 per cent at the retail stage, and which it estimates would raise \$4,400 millions, the Association recommends a cut in non-defence expenditures of \$2,000 millions; smaller increases in individual tax rates than those proposed by the Treasury; an increase in the excess profits levy and surtax "to take from industry every last dollar that can be taken consistent with the tremendous war production programme of the Government"—a condition susceptible of the most contradictory interpretations; and an excess profits tax of 90 per cent. Some of the support for a general sales tax rests on the argument that it is necessary to absorb purchasing power in the lower income groups where incomes have increased most and without incurring much liability to pay direct taxes. The proposal is being fiercely fought by organised labour; Mr Murray is reported to have called it "shocking" and the representative of the American Federation of Teachers testified before the House Ways and Means Committee that it would work great hardship. The Treasury supports this point of view, partly on the ground that the sales tax would stimulate demands for wage increases, partly on the ground that it is regressive. It will be some time before the shape of the final tax programme emerges from the rather unedifying struggle to shift the burden from the vocal and organised to those who are neither.

Further Controls?

The President has admitted that the control of wages is being considered, and farm prices and profits, over which control is ineffective or inadequate, may be included in a new programme to restrict rises in the price level. The Price Administrator has estimated that purchasing power during 1942 will be \$9,000 millions above 1942, while the supply of consumers' goods will drop by \$6,000 millions. The President's appeal for voluntary restraint on the part of economic groups, particularly the farmers, in order to avoid inflation, has been promptly flouted; the House has just attached to the Agriculture Department Appropriation Bill a rider forbidding the Commodity Credit Corporation to sell its stocks below parity. Wage increases have been announced in some sections of the converted automobile industry, and those granted earlier to railway labour are now coming home to roost in the form of higher freight charges, with inevitable repercussions on the price ceilings established for many commodities. The loop-holes in the price control bill daily become more glaring, as the cost of living continues its steady rise. The Canadian system of stabilising purchasing power by tying wages to the cost of living has received favourable attention in the press, and is being studied by the Administration. A number of recent AFL contracts have embodied such provisions, and this approach seems the only one likely to be at all acceptable to labour. Both the AFL and CIO are vigorously opposed to wage ceilings or the establishment of fixed rates. It is reduction rather than stabilisation of purchasing power that is necessary, but to do this by direct means seems politically impossible, and it will probably have to be accomplished by taxation, saving, and some rise in the price level. But these will not do the whole job, or spread the burden fairly, and it is time the Administration took a strong line over stricter and extended controls. The public would apparently welcome it, but it would have to be a very strong line indeed to overpower the stubborn self-interest of the lobbies.

* * *

National Income

An announcement by the Department of Commerce puts the National Income for 1941 at \$94.5 billions. This is a phenomenal increase, since the 1940 figure was only \$76.0 billions. The announcement states that the increase in the general price-level in 1941 was only 6 per cent, so there must have been an increase of no less than 17 per cent in the physical volume of the national output in a single year. The figure for 1942 is expected to reach \$113 billions. This will be a further increase of more than 19 per cent over 1941, but it is not possible from the cabled reports to tell whether it includes an allowance for expected price increases. The 1941 figure was the highest ever attained. The previous record was \$83.4 billions in 1929. From there the figure dropped to \$40.0 billions in 1932 and gradually rose to \$71.4 billions in 1937. There was a relapse to \$64.4 billions in 1938 and then a resumed rise to \$70.7 billions in 1939 and to \$76.0 billions in 1940. The jump to \$94.5 billions in 1941 was thus a far more violent movement in the curve than has ever before occurred in an upward direction.

* * *

Shorter Notes

A cut of 20 per cent in deliveries of petrol in seventeen eastern states, the district of Columbia, Washington and Oregon, has been ordered by the WPB. The cut is less drastic than that recommended by the industry, which favoured a 25 per cent reduction. There is as yet no formal rationing; distribution of the available supplies is left to service station operators.

The WPB has announced that approved funds to finance war industrial plant expansions totalled \$7,366 millions on December 31, 1941. Of this, 82 per cent represented commitments of public funds; the cost of private expansion is estimated at \$1,326 millions, and that financed by foreign governments at \$155 millions.

The Office of Civilian Defence is reported to have appointed 62 unpaid sports co-ordinators to be attached to its physical fitness division, including co-ordinators of basketball, football, volleyball, and tug-of-war.

THE WORLD OVERSEAS

A Plan for Irish Farming

[FROM OUR DUBLIN CORRESPONDENT]

February 23rd

In a lecture delivered in University College, Dublin, Dr Henry Kennedy, Secretary of the Irish Agricultural Organisation Society, made a reasoned reply to the speech of the Minister for Agriculture, recently referred to in this correspondence. Dr Kennedy prefaced his remarks by deploring the absence of reliable data on which to base conclusions regarding Irish agricultural policy. There are, he stated, no proper costings except those referring to a small sample of farms in Kerry and Cork, made by one of the staff of University College, Cork. Important decisions are taken on agricultural wages and the prices of crops without any proper enquiry. There has been no research into the possibilities of reducing costs by the introduction of agricultural machinery, in which such great progress has been made in Germany and Denmark. He urged that a committee similar to that recently appointed in Great Britain should be established to consider the mechanisation of agriculture. Dr Kennedy's second preliminary point, which will command unanimous agreement, was that an increase of profitable agricultural production would raise the standard of living, not only of the farmers, but of everybody else in Eire. The multiplier process would be best initiated in Eire by an increment of agricultural exports, the financial benefit of which percolates throughout the whole economic system. Compared with some of its competitors, Eire has lagged behind in almost every branch of agricultural production. Since the beginning of the present century, there has been no increase in tillage or in the animal population, and the average milk yield and butter fat content in the dairying industry are inexcusably low. After the war, a great increase of imports will be called for which will necessitate an expansion of agricultural exports. Now is the time when the production programme on which such an expansion must be based should be discussed and prepared.

Dr Kennedy drew attention to the great loss caused by animal diseases. The necessity for increased expenditure on veterinary research is generally admitted, and there is no reason why this important public service should not be provided forthwith. The losses through malnutrition are at the same time more serious in magnitude and more difficult to cure. During part of the year, Irish cows are condemned to live on their own fat, and the average wastage arising from this cause is estimated to amount to 150 gallons of milk per year. The outstanding problem of Irish agriculture is to make the production of milk more even throughout the year. In this respect Ireland stands in a striking and most unsatisfactory contrast to New Zealand and Denmark. Home-grown feeding stuffs are naturally to be preferred to imports, and of all the home-grown feeding stuffs grass must in the circumstances of Eire play the largest part. The present condition of Irish pastures is far from satisfactory. Some of our grass lands have been rightly described as "exercise grounds" for cattle. The immediate necessity is to improve the yield and quality of grass, and for this the ploughing of grass land and the use of abundant fertilisers are the appropriate means. Dr Kennedy referred to the "sham battle of plough versus grass" that has been waged in Irish agricultural political discussions, the fact being that good grass depends on the use of the plough.

Feeding the Pigs

The progress of the dairying industry would be productive of many profitable side-lines. The skim milk which is returned from the creamery to the farmers is a valuable feeding stuff for calves and pigs. While the principal livestock export of Eire must continue to be cattle, the pig industry is capable of considerable development. Pigs can be fed on potatoes, the production of which could be quite easily increased. The yield per acre of potatoes in Ireland

is already large, and could be made larger. The difficulty of cooking the potatoes could be surmounted by the use of portable boilers which are extensively used in Germany. Dr Kennedy referred to a new type of co-operative experiment in which the small farmer produces the young pig and the potato, and the latter is fed to the former by a co-operative society.

While all students of Irish agricultural policy would not agree with every detail of Dr Kennedy's programme, it would secure unanimous agreement in principle. Many foreign observers have been impressed in recent years by the comparatively low intensity of agricultural production in Ireland. The two outstanding needs in order that precept may be translated into practice are education and credit. As regards education, the Irish farmer has always shown himself adaptable to improved methods if they are demonstrated to be profitable. If the Government were firmly decided on their post-war agricultural policy, the farming population would certainly not refuse to co-operate in any programme that could be shown to be to their advantage. As regards credit, Eire is a creditor country with abundant idle money lying in the banks. There is no real shortage of agricultural credit such as is experienced in less fortunately situated countries. The real problem of agricultural credit in Ireland is to ensure that advances will be profitably employed, and that the credits of to-day will not become the unproductive debts of to-morrow. The experience of the years after the last war, when over-borrowing took place on an extensive scale, has not been forgotten by the Irish farmers or the Irish banks.

Finnish Political Feeling

[BY A CORRESPONDENT]

March 6th

FINLAND'S national coalition, which was so easily achieved in face of the "Russian danger," has not been broken now that the war has become more complex than was expected; that, however, does not mean that unanimity of purpose has been left quite unimpaired through recent developments. Left wing circles, that is, the Liberals and Social Democrats and their press, are still representing Finland's fight as a struggle for democracy, but they have to defend themselves against those who regard democratic institutions as an outworn tradition. Right wing coalition papers do not shrink from printing anti-Labour, and even anti-semitic, articles. Government circles accept the Prime Minister's formula that Finland is defending the cause of all Northern Europe, but while some of them are appar-

ently in favour of a New Order-Scandinavia, others pretend to defend Scandinavian democracy; the Minister for Social Affairs has recently addressed an open letter to the Norwegian Government in London, in which the latter point of view was apparent.

A serious blow to civil liberties was given by the Government when, late in 1941, six members of the Finnish Diet were put on trial for acts which were quite constitutional at the time they were committed; one of the accused men had been arrested, for instance, because he had translated the Webbs' book on Soviet Russia. Swedish newspapers assert that these trials have created many misgivings in Finland, especially among the rank and file of Labour.

The attitude towards Britain, as distinct from that towards Russia, varies considerably between the different political strata. A great Liberal paper pointed out, as recently as the middle of February, that though the British declaration of war on Finland was deplorable, it should be understood as born out of the more general implications of the world war; but this "strange attitude towards our enemy" has been strongly criticised by Right wing papers, in which among other things the "hatred of the Indian people against Britain" is often exploited with particular satisfaction. The BBC's Finnish programme is often mentioned in the newspapers, and a pro-German paper recently had to admit that "certain people consider the BBC broadcasts to be both reliable and friendly towards Finland."

Cold and Hunger

Apart from the disappointment about the Russian successes and the British declaration of war, the very severe living conditions are also contributing to the feeling of uneasiness. This winter has been the coldest one for the last 40 years, and the mortality among children is continually rising. The weekly bread ration has been raised by the insignificant amount of 1.8 ounces following the German promise to dispatch 75,000 tons of grain to Finland, and sugar is now more plentiful—the February ration was 3.3 lb.—but the fat ration was lowered from 21 ozs. to 17½ ozs. and meat is apparently in most cases unavailable; fish rationing has now been introduced. The Government's inability to secure a just distribution and to combat the black markets has created much dissatisfaction, which is partly reflected in editorials and letters in all kinds of newspapers; at other times, however, grumbling is represented as a most dangerous procedure in present circumstances. Friction between various sections of the population has recently become apparent; farmers, for instance, allege that they have been asked for greater sacrifices than anyone else in the country, but they are attacked by many others for withholding huge amounts of food which would help to alleviate the position. The severe timber shortage is said to be largely due to the unpatriotic attitude of forestry owners who only think of their own profits.

A certain amount of disintegration is also discernible among the comparatively small but influential Swedish minority. A parliamentary spokesman of this group has recently underlined the defensive character of Finland's present struggle, and he is probably backed in this view by the majority of his countrymen, though not by all of them; as many as 600 members of the minority, among them large numbers of landowners and industrialists, publicly dissociated themselves from these utterances.

Finland depends largely, in present circumstances, on the economic assistance of Germany and other New Order countries; she would hardly have survived this winter without food from Germany. A trade agreement has now been signed with Germany, and also with Norway, according to which the Finns are to receive coal, iron, food, artificial wool and other goods. Their own exports are at present smaller than what they receive, and the German deliveries will be made in part for cash and in part on a

credit basis. Finland also needs foreign labour, and Germany is said to have agreed to order women workers from the Ukraine to go to Finland; furthermore, the Finns have got into touch with Denmark and Sweden regarding the dispatch of unemployed workers.

The Finnish pro-Nazis have, of course, pointed out how generous the Germans are in sending goods which they themselves need so badly. However, it has been made clear in Social Democratic newspapers that Finland's present complete economic dependence on Germany is most undesirable, though even these papers do not suggest any other course than to accept the Nazis' gifts. Their economic supremacy is indeed the Nazis' strongest weapon against their ally.

Ceylon's Economic Importance

[BY A CORRESPONDENT]

March 16th.

IN this second world war, islands and outposts, especially those lying athwart world trade routes, assume an importance out of all proportion to their size or economic resources. But if such bases have an economic value as well they have an added attraction to aggressors. In the last sixty years, Ceylon has become an important producer and exporter of tea, exports rising from 2.4 million lb. in 1884 to over 236 millions in 1938. There has, too, been a remarkable growth in the plantation rubber industry; the acreage under rubber increased from 750 in 1898 to over 600,000 in 1938. Other economic products of the island include coconut palm and its products, cacao, cinnamon, citronella and areca nuts. Ceylon is also the chief producer of high-grade graphite in the British Empire, and the following table shows the island's exports of graphite in 1938-40:—

	(In cwt.s.)							
	U.S.A.	U.K.	Japan	Germany	Australia	India and Burma	Others	Total
1938	50,284	39,595	75,189	15,575	10,820	...	44,177	235,640
1939	103,506	67,655	210,600	10,899	?	?	55,461	449,121
1940	118,060	170,000	129,700	...	?	?	62,800	480,560

Thus in 1939 and 1940 there was a marked increase in shipments of graphite to Britain and America.

Ceylon's chief sources of supply in 1938 were as follows:—

	%		%
British India	21.77	Japan	6.54
Burma	14.82	Persia	3.24
United Kingdom	20.64	Siam	2.78

The principal imports are rice and paddy, cotton manufactures, sugar, fertilisers, spirits and coal and coke. The United Kingdom's exports to Ceylon were cotton piece-goods, iron and steel products and machinery. In 1938, the United Kingdom took 53.94 per cent of Ceylon's exports; 18.16 per cent went to other British territories, and 27.90 per cent to foreign countries. The United Kingdom's imports included 167 million lb. of tea and 271 million lb. of rubber as well as desiccated coconut and unrefined coconut oil. Ceylon's chief exports to all countries in 1939 were tea (228 million lb.), rubber (135 million lb.), coconut oil (1,257,637 cwt.s.), copra (1,061,384 cwt.s.), desiccated coco-nuts (672,635 cwt.s.) and graphite (449,121 cwt.s.).

In sum, after the loss of supplies from the south-west Pacific, Ceylon's exports of rubber, tea and coconut products have become even more important to the Allies. Last year the island exported 88,937 tons of crude rubber. The adoption of a more drastic tapping method is calculated to increase the output of crude rubber to a more satisfactory figure. Two factors in the country's economy call for special notice: its need for outside labour—there are nearly 683,000 Indian labourers on estates—and its dependence on British India, Burma, Siam and Indo-China for rice to supplement domestic production, of which the last two are under Japanese domination while Burma's normal economic activities are temporarily paralysed.

German Europe

Bourses in 1941

DIVIDEND stops and control of the bourses became almost universal in Europe during 1941. In Germany as well as in other countries, the dividend stop provided facilities for the adjustment of the capital of joint stock companies. German companies were said to be undercapitalised; in France, Belgium and Holland, German papers considered an adjustment necessary because of the inflation of the currency. From July, 1941, to the end of January, 1942, 529 German companies increased their capital by 58 per cent to Rm. 4,677 millions. In France, 160 companies raised their capital by 53 per cent to 14,398 million francs. In Belgium and Holland, the facilities were hardly used. In the Danubian countries, particularly in Hungary, capital increases were caused by the necessity of financing the expansion of industry, like the capital increases of German companies during the first months of the war.

During 1941, all continental bourses experienced a boom in share prices. In Germany, the peak was reached in September. In France and Belgium, the boom continued almost uninterrupted. Japanese successes in the Pacific, however, caused a slump in Amsterdam. From December, 1940, to the end of 1941, indices of share prices increased in Germany by 6.7 per cent, in France by 25.5 per cent, in Belgium by 75 per cent, and in Holland by 60 per cent. During the whole war period, the German share price index had increased by 46.5 per cent, and the French index by 181 per cent; the Dutch index had doubled, and the Belgian index trebled.

Actual control of the bourses varies. The first attempts at controlling the share markets were made in Germany and Italy long before the war. Wartime control of the share markets became an acute problem in Germany in the spring of 1941, after a simple price stop on the Vienna Bourse, attempted in October, 1940, had proved to be impracticable. The German policy of control is based on the admission that wartime liquidity, caused by the running down of stocks, the impossibility of replacing machinery and the increase in the national income, cannot be prevented. The demand for investments thus exceeds the supply, in spite of tremendous State loans, which in 1941 absorbed Rm. 14,750 millions against only Rm. 3,460 millions of private capital issues. The German authorities realised that it was not feasible to abolish the share market, although each new measure intended to curb speculation seemed to be a step towards its abolition. The first measures, the dividend stop and the speculation tax, achieved only a temporary check of the boom. The prohibition of buying shares on a credit basis, the restriction of all dealings to approved brokers and the exclusion of banks were not successful. The boom was not finally broken until the announcement that the registration of all dealings made after the beginning of the war would be introduced. But registration was not actually decreed until the beginning of March this year, five months after the announcement. All shares which were bought between September, 1939, and March 15, 1942, must be registered. There is still no indication whether these shares will be requisitioned or whether the owners will be compelled to sell them.

The conditions which make control of the capital markets a temporary success in Germany, that is, compulsory organisation, marketing and price and wage stops, are not present in the occupied countries. The bourses in occupied countries are almost free markets, and German interests demand that at least the black bourses in France, Belgium, and Holland should be abolished. In these countries, control measures tend to increase dealings outside the official bourses. Quotations outside the bourses exceed the official prices and the general feeling that the possession of shares means the possession of real values has denuded the markets. A great number of official quotations have become nominal. At the beginning of the boom, France introduced a speculation tax. At present, attempts are being made to control the market directly. But the problem of increasing the supply of shares is almost insoluble. The turnover stamp duty for purchases, for example, which was recently increased from 1.1 per 1,000 to 5 per thousand, remained unchanged for sales of shares. But no new material came on the market. The reduction of the speculation tax from 33 per cent to 20 per cent was also without success. The inflation boom, as the German papers call it, continues.

On the Amsterdam Bourse in December, the shares of Dutch colonial companies fell on an average by 30 per cent. During the second slump, beginning in February, Dutch East Indies' stocks fell to two-fifths, and sometimes to one-third, of their highest quotation before December 6, 1941. Rubber, tobacco and mining shares suffered the greatest losses; Billiton Mij, for example, was reduced from 550 to 184 at the end of February. Shares of companies operating in Holland were hardly affected. Some even continued the upward trend.

On the Brussels Bourse, boom conditions continued almost uninterrupted during the whole year. Official warnings against excessive speculation, interventions by the Bourse Committee and, finally, the introduction of a dividend stop were without any lasting success. The shares of banks and electricity holding companies increased five-fold compared with prices in May, 1940. The failure to arrest the trend by limiting dividends to 6 per cent is explained by the fact the dividends over the limit are kept as a loanstock instead of being requisitioned by the Treasury. In the future, in "New Order" Europe, Germany apparently intends to maintain restricted freedom for all bourses on the basis of closer inter-continental relations. The present reality, however, is the European war economy organised by Germany. Unrestricted speculation in the Reich itself had hardly been checked when the same problem arose in all these occupied countries, and restrictions had to be imposed under the control of Germany simply for the purpose of maintaining industrial collaboration.

Speer for Todt.—By a number of state and party decrees issued by Hitler and Goering, Professor Speer, the thirty-seven-year-old architect of a great number of party-buildings, constructed all over Germany, has been appointed successor to Dr Todt, and is now at the head of all the Ministries and organisations which were combined in Dr Todt's hands. Professor Speer, who was responsible for the plans for rebuilding Berlin before the war, has been responsible for several elements in the war organisation of the building and transport industry. The "Building Staff Speer," the "Transport Regiment Speer," a special detachment in the National Socialist Motor Corps, and the "Transport Fleet Speer," were closely allied to Dr Todt's office of Special Commissar for the building industry, and to the Todt Organisation, the shock-troops for building roads and fortifications. As Reich-Minister for Armaments and Munitions, Professor Speer's small Ministerial staff now virtually co-ordinates all offices and departments responsible for the production of munitions and weapons. The staff is described as a shock-troop in the planning of the munitions industry, with overriding administrative powers. Army departments, the departments of the Ministry of Economic Affairs, and the Ministry of Labour, in their central and regional organisations, are to be co-ordinated by the Minister. As Special Commissar for the building industry, as well as for the water, gas and electricity supply industries, Professor Speer is responsible for the organisation and expansion of all these complex industries—mainly for the elimination of bottle-necks.

The first action of the new Minister was the amalgamation of the "Building Staff Speer" and the Todt Organisation. In the Nazi party, Professor Speer is head of the department of technology, and is at the same time leader of the Nazi Union of German Technicians. Combining his great number of state and party offices, Professor Speer may be called a dictator for co-ordination in armaments, munitions, building, power and transport.

Agriculture in the Occupied East.—Alfred Rosenberg, Reich-Minister for the occupied territories in the East, has decreed in agreement with Goering a new agricultural constitution for all the occupied territories within the 1939 frontiers of the Soviet Union. The decree, issued on February 27th, formally abolished the collective system in agriculture. The *sovkhozes*, or state farms, will be continued under the administration of German experts without any change; the *kolkhozes*, or collective farms, change their name into *Landbau Genossenschaften* (land cultivation co-operatives); the private plot and livestock already ceded to the peasants under the collective system of *kolkhozes* are declared private property; but the rest of the land belonging to the collective farms will be cultivated under the ad-

The OCEAN

FOR ALL CLASSES OF INSURANCE

ministration of German experts—the so-called agricultural leaders.

The Machine Tractor Stations, the main feature of the mechanised farming in the Soviet Union, are taken over by the German civilian administration. Taxes have been abolished, that is to say, the Germans have re-introduced taxes in kind, i.e., requisitioning. Two points are of interest in the German comments. The first is the excuse that a return to full private ownership is impossible at

present, because of the lack of machinery and personnel. The second and more interesting point is that the final aim is the re-introduction of the old *Mir* system of communal agriculture, in a modified form, probably in combination with the hereditary farm principle practised in Germany. The decree itself and the comments suggest that the Germans are concerned about the political importance of this move. The practical results are discounted for the present in German papers.

Russia at War

Grain.—The preparations for spring sowing have been one of the main Soviet preoccupations during recent weeks. The Government has laid the greatest emphasis on the increase of the sown acreage to make up for the loss of the grain crops of the occupied territories, which is estimated to amount to about 34 per cent of the total Soviet grain yield; the Ukraine alone accounted for 22.7 per cent in 1940. The main expansion of the sown area has to take place in Eastern and Western Siberia, the Urals, the Volga regions and Kazakhstan, where the local Agricultural Commissariats have already fixed additional acreages to be sown by collective and state farms. During recent years, these provinces have considerably developed their grain cultivation. Compared with 1913, their crops have increased in Eastern Siberia by about 220 per cent; in Western Siberia by about 165 per cent; in the Urals by more than 85 per cent; in the upper Volga region by 68 per cent; and in the lower Volga region by 23 per cent. Over the same period, the Ukraine grain output was practically stationary, showing only an 0.1 per cent increase over that of 1913. The war has thus speeded up the long-term tendency which aims at turning the Eastern territories into the principal granaries as well as the main industrial regions of the Soviet Union.

The sowing starts under extremely difficult conditions. Hundreds of thousands of tractor and lorry drivers have joined the tank divisions of the Red Army. Soviet agriculture is nowadays entirely dependent on the efficient work of its motorised equipment, which consists of about 800,000 tractors, lorries and harvester combines. During the winter, mass training of women and juvenile drivers has been undertaken by the Machine Tractor Stations. Repair of tractors is another difficulty, as the technical staff of the MTS workshops has also been considerably depleted by the call-up. The authorities have warned the farmers and the Machine Tractor Stations to carry out their own repairs. Even under peace-time conditions, the proportion of tractors damaged or immobilised during work was very high; in some years—immediately after collectivisation—it reached 25 to 30 per cent of the total. This was due to lack of skill on the part of the MTS drivers and engineers. In the immediately pre-war years, the position improved owing to the fact that the technical cadres had gained more experience.

The introduction of a great mass of semi-skilled trainees will, no doubt, be a considerable handicap to the sowings. The shortage of agricultural labour—unskilled as well as skilled—is acute; exemption from military service has been widely applied to industrial but not to agricultural occupations. In many regions, the labour shortage has threatened to cause a fall in the sown acreage instead of the required increase. To counter this threat, a decree has been issued under which the workers of one collective farm may be used for tilling the land of neighbouring farms unable to carry out the work with their own.

The question is whether the war and the unavoidable dislocation of agricultural production it entails will cause a grain deficit. Statistically, no deficit should arise. The grain available for internal consumption is estimated to have been at least 45-50 per cent higher at the outbreak of the Soviet-German war than it was in 1914 (the corresponding increase in population has been 25 per cent). No doubt, also, a considerable war stock of grain was set aside by the Government. On the other hand, the discrepancies between various geographical regions are very great; and geographical factors may upset the statistical balance. The following provinces have had a normal grain deficit amounting to 50-60 per cent of their needs: the European North and North-West, the Far East, the Transcaucasus, and the Central Asiatic Republics. The Central Russian grain output has been 15 per cent below the minimum consumption of the area. Other regions—like the upper and lower Volga territories, the Northern Caucasus, the Urals, Siberia and Kazakhstan—normally have a grain surplus; in the lower

Volga region, this surplus exceeds the local consumption by about 350 per cent. But the crops of the fertile upper Volga province, which has become a battle-ground, must be written off. Given an even distribution of grain reserves, the supply of bread should cover the needs of the country. But proper distribution depends upon the carrying capacity of the strained railway system; and the transport priority for arms, munitions, coal and iron ore, which now have to be carried over enormous distances, can hardly leave much elbow-room for grain deliveries. The deficit regions may thus have to face difficulties which may only be partly mitigated by the fact that most of them are border territories, and can perhaps be supplied by imports from abroad.

In the main industrial and armament centres, especially in the Volga, Ural and Kuznetsk regions, a shortage of bread is unlikely to arise. Supply difficulties may affect the position in the Moscow region, but there substantial war reserves should be available. The grain position accounts for the authorities' insistence on kitchen garden cultivation by factories, industrial workers, and office employees. It is claimed that 3,000,000 families of industrial workers and clerks till "kitchen-garden" allotments.

Tanks.—Tank producing plants are working at full pressure, and record outputs are reported in the press. At the same time, however, there has appeared a shortage of spare parts for tanks under repair. The managers of tank plants seem to have concentrated upon obtaining the biggest possible output of complete tanks without leaving the necessary margin for the production of spare parts. The result has been that a great number of damaged tanks cannot be repaired at the proper speed. Factories are now being urged to stock spare parts, even if this causes a fall in the manufacture of new tanks. How urgent the problem of tank repairs has become can be seen from the fact that special prizes (from 100 to 800 roubles) have been officially fixed for tank repairs; for repairing one damaged tank a worker is frequently awarded with a sum that amounts to a two or three months' wage. Field tractor repair shops are being manned by workers in towns situated near the front. In Moscow factories, women have been recruited for mobile repair crews which work in the actual fighting zone or in its immediate rear.

Raw Materials.—The Geological Institute of the Soviet Academy of Sciences has sent 39 expeditions to explore new sources of raw materials of strategic importance in various parts of Asiatic Russia. In the Urals, new deposits of cobalt, niobium, tungsten and molybdenum have been found. Geological research has been intensified as a result of the heavy demand for raw materials on the part of the evacuated industries. From the lower Fergana valley in South Uzbekistan and from the Bukhara steppes, discoveries of new rich oil-wells have been reported; these permitted an increase in the regional plan for oil output in 1942 to 250 per cent of the 1941 figures.

Output in Regained Territories.—In view of the prevailing transport difficulties, the Government is pressing on with the resumption of industrial activity in the recaptured territories. The People's Commissar for Mining Industries has announced that over 60 coal mines have already resumed work in the Moscow and Donets Basins. More mines are to start production soon. The destruction of the mining equipment has been serious, and the restoration of industries has been impeded by lack of machinery. Besides coal-mines, 300 factories have been re-opened in various places of the Moscow region. In Kalinin, textile and leather works, as well as a railway truck plant, are operating again.

THE BUSINESS WORLD

Bricks in War

BRICKMAKING is one of those industries that cannot be adapted to the manufacture of war equipment, and its experience provides an interesting example of the problems facing such an industry in wartime. In order to secure the orderly adjustment of the industry to wartime conditions, and efficiency in its operation, the former Minister of Works and Buildings last September appointed a Committee to examine its problems and to suggest how they should be tackled. The Committee, which comprises representatives of the brickmaking and allied interests, as well as technical experts, has now issued its first report which contains a concise summary of the characteristics of the industry, of the various aspects of the problems confronting it, as well as recommendations for their solution. As Sir P. Malcolm Stewart, chairman of the London Brick Company, pointed out in his address to shareholders at the annual meeting of the company on Tuesday, "there is a great variety of widely scattered interests dealing with different types of raw materials and processes and producing bricks varying in nature and purpose." On the one hand, there are many small works, serving a purely local market, where operations are conducted by hand, often by seasonal labour otherwise engaged in agriculture; on the other hand, there are large, heavily capitalised plants using mass-production methods and serving the national market. Between these two extremes, there is a large number of moderately sized works differing widely in the raw materials and methods they employ. An analysis of brickworks by size is given below:—

SIZE OF BRICKWORKS, MAY, 1941

Monthly Output of Bricks	Proportion of total Number of Works	Proportion of total Output
Under 200,000	34.53	5.74
200,000-300,000	18.03	9.26
300,000-400,000	14.75	10.00
400,000-1,000,000	24.97	31.60
Over 1,000,000	7.70	43.40

Owing to the lack of uniformity in the industry and to the wide variations in output (the monthly production ranges from a few thousand bricks in the smallest works to 28,000,000 in the largest), costs differ widely. In the view of Sir P. Malcolm Stewart, there is "no industry in which there is so wide a variation in efficiency of production." On the whole, the large mechanised works have the lowest cost, and, in the years before the war, they steadily extended their marketing radius at the expense of the smaller units, in spite of the fact that costs of transport are an important factor in the total cost of bricks. In May last year, works with a monthly output of 400,000 bricks or more were responsible for three-quarters of the national output. This tendency, however, was arrested when the Ministry of War Transport limited the radius of delivery, first to 50 miles by road, and later to 75 miles by rail.

In contrast to the demand for cement, which last autumn was higher than in the corresponding period of any previous year, that for bricks has sharply declined as a result of the ban on the building of private houses. The extent of the decline in the demand for bricks is reflected in the fall of output from a monthly average of 578 millions in 1938 to 380 millions during the first five months of last year. There has been a corresponding adjustment in stocks which, including bricks in process, fell from a monthly average of 634 millions in 1938 to 415 millions in 1940. At the end of last October, stocks were equivalent to a little more than a month's output at the current rate of production. The

number of works in operation fell from 1,147 in December, 1938, to 781 in November, 1941.

The personnel of the industry has already been substantially reduced. Between 1938 and October, 1941, it declined by 37½ per cent, from 52,800 to 33,074. At the latter date it consisted of 29,539 men and 3,535 women. Despite the reduction already achieved, however, no fewer than 8,785 men, or 29.5 per cent of the total still employed in October, 1941, remained liable for service in the Armed Forces.

Although the demand for bricks has already fallen steeply, the industry is now faced with a further contraction in the call for its products. Indeed, the Committee envisages a progressive fall in demand during the war period. It therefore recommends an immediate contraction in output of 12½ per cent to bring production into line with estimated requirements, and of a further 4 per cent to reduce stocks to the equivalent of one month's output, except in the South-Eastern area. In considering how to secure the necessary adjustment in output, the Committee has decided that of the two possible methods—the spreading of the cut over the existing works and the closing down of entire plants—the latter was preferable on grounds of expediency. They therefore prepared a list of works which, in their view, should be closed by compulsion, subject to the right of appeal. The number of men that would thereby be released is estimated at 5,400.

As the Committee envisages a sharp recovery in the demand for bricks after the war, it felt that the closed works should be capable of resuming operations at short notice. They therefore recommended that the works closed by compulsory Order or with the approval of the Minister of Works and Buildings should be put on a care and maintenance basis. Since the Government has decided against the use of public funds for this purpose in connection with last year's concentration of industry scheme, the fund which is to bear the cost of care and maintenance is to be raised by a levy on the sales of the concerns which remain in production.

The Committee came to the conclusion that, apart from the list of plants whose closure is suggested, no further concentration should be undertaken for the time being, partly because of the difficulties in the way of the transfer of labour. But since the number of men likely to be released by the firms that are to be closed down is smaller than the number liable to be called up for service with the Armed Forces or for war work, the Committee recommend that, under specified conditions, men should be replaced by women in the ratio of two to three, but that, in the immediate future, the proportion of women to the total number of operatives should not exceed one-fifth.

Lastly, the Committee suggested that common bricks should be standardised. It discovered that bricks were being made in many different sizes. Although it will take some time for the industry to adjust its manufacturing processes, the standardisation of bricks throughout Great Britain will be of considerable ultimate advantage.

The brickmaking industry, in short, is one of the war casualties, for its production facilities cannot be adapted for other purposes. The return on its capital, variously estimated at sums upwards of £25 millions, is bound to suffer a temporary decline, and the tendency towards the displacement of the smaller by the larger and mechanised plants has been arrested by the need for economising transport. Pending a recovery in demand after the war, the owners of the plants that have to be closed down must be content with being provided with the funds necessary to maintain them in good condition. In the circumstances, it is difficult to envisage any other solution.

Finance and Banking

A Record Money Turnover

Next week is likely to create a record for the credit turnover of the country and of the London money market in which that turnover will as usual find its clearing centre. London's Warship Week will be in operation throughout, and it is already confidently assumed that the target figure of £125,000,000 will be easily surpassed. On Monday some £60,000,000 to £70,000,000 will be paid out in respect of the Canadian securities covered by the last Vesting Order. The credit turnover will, moreover, be affected by the large disbursements that normally occur towards the close of the financial year. The final transfers of tax moneys and the disbursements made to tidy up the Exchequer position will almost certainly be effected during the coming week. The money market and the new machinery of credit control may, therefore, expect a test of unprecedented magnitude. The disbursements of Canadian money will go some way towards offsetting the transfers of funds collected as subscriptions to Government loans and the final spurt in tax payments. Given the nature of the payments to Exchequer balances arising out of London's Warship Week, the banks will, moreover, find it possible to finance the bulk of such transfers by prior encashments of Treasury deposit receipts. The Treasury may also underallot the Treasury bills to be taken up next week and will also adjust the new payments of TDR's to be made by the banks. But, in spite of the equilibrating influences that will be at work, it would be too much to expect movements of funds of such magnitude to be made without causing some disturbance to credit and temporary unevenness in the money market position. If this occurs, the banks will no doubt call on their money market

assets to restore the position, and the discount market itself will have at its disposal the assistance of the agents for the Bank of England, who will, no doubt, be ready to buy bills in sufficient quantities to ease the situation. To make matters even more difficult, all the clearing banks but one will be making up next week. The banks have been preparing for the ordeal by building up their cash position. The latest Bank return shows bankers' deposits up by £19,319,000 to the high level of £136,944,000. This expansion in cash is explained by a £8,375,000 drop in Public Deposits, an increase of £8,790,000 in Government Securities, and a fall of £2,881,000 in Other Accounts. The circulation continues its steady climb at £754,223,000, the notes in circulation are at a new high record, and have risen by £648,000 over the week.

Currency of "Tap" Treasury Bills

Owing to an accident of the calendar, the three months' period, December-February, began on a Monday and ended on a Saturday. This provides a rare opportunity for dissecting the usual monthly debt return with greater precision than usual and extracting from it information which it normally refuses to yield. In particular, this coincidence enables us to determine exactly what proportion of Treasury bills issued over the three months to the end of February were made available through the weekly tender and, by deduction, through the "tap." Further, by relating the "tap" issues to the amount of tap bills shown to be

outstanding at the end of this period, we can get a close estimate of the average currency of the Treasury bills issued in this manner. The monthly debt returns show in a single total the amount raised by the issue of Treasury bills, whether through the tender or the tap. For the three months in question the tender issues can be exactly computed and, by deduction, the amount of bills issued through the tap can be ascertained. The data may be shown as follows:—

	(In £000's)	Total Issued	Issued by Tender	Issued through Tap
December, 1941	1,064,677	300,000	764,677	
January, 1942	1,086,352	345,000	741,352	
February, 1942	1,062,669	260,000	802,669	
Total Issued	3,213,698	905,000	2,308,698	
Total Outstanding on February 28, 1942 ..	2,517,690	905,000	1,612,690	

If the bills issued through the tap over this period had all been of three months' currency the total of such bills outstanding at the end of February would have amounted to £2,308,698,000. In fact the actual total of these bills at the end of last month was £1,612,690,000. This suggests that the average currency of the bill in question was just over two months. It seems probable that the tap bills vary in currency and that they are issued in the form which best suits the particular portfolio for which they are intended. Evidently bills held in the Issue Department of the Bank of England would not necessarily be of the same currency as those issued to employ public departments' resources of more transient nature. It is probable that all tap bills issued to quarters other than public departments (to Empire central banks, for example) are of three months' currency.

Financing India's Debt Repatriation

The return of the Reserve Bank of India for the week to March 6th last covers the substantial operation involved by the recent payments for Indian Government sterling securities and shows how that operation was financed in India. The payments made in London at the beginning of March are directly reflected in a reduction of Rs 7,970 lakhs—say £60,000,000—in the Reserve Bank's sterling securities, while at the same time the Bank's holding of Government of India rupee securities has risen by Rs 8,978 lakhs, or £67,000,000. The latter is more likely to be the measure of the debt actually repatriated at the beginning of this month, as the Reserve Bank's holding of sterling securities and other sterling assets is being influenced day by day by the balance of payments between India and the rest of the sterling area—a balance which still appears to be running fairly strongly in favour of India. Thus in the week to March 6th, not only did the sterling securities fall by some £7,000,000 less than the increase in the holding of rupee securities, but the balances held in London rose by some £16,000,000. It will be seen that the repayment of sterling securities was financed in the first instance from the Reserve Bank's sterling assets and by issuing to it a corresponding amount of

rupee securities. In time, no doubt, the Reserve Bank will tend to sell these securities in the open market, thus mopping up the additional purchasing power and inflationary potential created by the impact of the war on the economy of the country.

The note circulation in India continues its steeply upward trend, the increase in the week to March 6th amounting to Rs 1,010 lakhs and since February 6th to Rs 2,190 lakhs. This increased circulation of notes is probably due in part to the hoarding of silver coin. The combined result of the fall in sterling securities and of the increased circulation has been to reduce the reserve ratio from 81.8 per cent on February 27th to 59.8 per cent on March 6th last.

Irish Banks' Returns

The returns for the banks operating in Eire for the December quarter, published by the Currency Commission, are as follows:—

	(£000)	Dec. Quarter, 1940	Sept. Quarter, 1941	In Eire	Elsewhere	Total
Liabilities:—						
Capital reserves, etc.	17,582	17,616	10,390	7,225	17,615	
Notes in circulation	12,131	13,931	5,327	9,699	15,026	
Current deposit and other accounts	173,234	186,524	139,230	55,697	194,927	
Other liabilities	6,611	7,518	6,036	1,928	7,964	
Total	209,559	225,590	160,984	74,550	235,534	
Assets:—						
Cash and Balances with London	27,935	27,717	10,858	20,844	31,702	
Agents and other Banks	10,514	12,434	14,111	14,111	14,111	
Money at call and short notice ..	5,082	4,761	3,335	516	4,451	
Bills	72,185	67,485	45,975	21,540	67,515	
Loans and advances	74,630	93,145	6,905	91,168	98,073	
Investments: (a) Government	10,298	10,045	4,144	5,580	9,724	
(b) Others	8,913	10,003	5,414	4,542	9,956	
Other assets	209,559	225,590	77,231	158,303	235,534	
Excess of Assets outside Eire over Liabilities outside Eire	68,847	81,076	...	...	83,753	

The increase in the note circulation was confined to Northern Ireland, as the maximum circulation of banknotes in Eire is £6,000,000. The flexible part of the note issue in Eire is the legal tender issue, which increased from £22,825,783 in December, 1940, to £26,038,175 in December, 1941. This increase is the result of rising agricultural prices and the expansion of Government expenditure. There is no evidence of hoarding of notes. The banks continue to hold their assets in a highly liquid form, as they believe that a large part of their increased deposits are temporary and would be withdrawn if the importation of stocks and raw materials were to be resumed. The increase in the net sterling assets is reflected in the growing volume of British Government securities. The new trend in the distribution of assets is adverse to the earning of satisfactory profits, and, in fact, the profits of the banks have declined in spite of the increase of their resources.

Investment

The Cost of Dealing

Uncertainty about the next move by Japan has combined with the effect of past Warships Weeks and preparation for London's effort, which starts to-day, to reduce business in the stock market to a low ebb. Fixed interest prices have stood the strain well, but the announcement of the inevitable cuts in civilian expenditure has depressed equities further, and some recent dividend announcements have tended to accentuate the decline. In the circumstances, it is not surprising that the market is betraying more interest in the election of new members to the committee than in its normal functions. Actually, the threatened turnover there is small, but reconstruction is in the air, while some points of domestic politics give the contest an added importance. For the investor, however, the latter are of little interest. He is concerned with the views of new and existing members of the committee as to the question of service to the public, and on this point

there is some evidence that there exists a keen desire for continuance of reform. These reforms are, however, mainly aimed at improving service by raising the status of the broker, and only some members are agreed on the need for greater financial stability in stock exchange firms, for a system of qualifying examinations and for other measures which would bring stockbroking more in line with the other professions. These improvements are essential and those who favour them should have the fullest support, but they can only be made effective by a long term programme covering more than one generation of brokers and jobbers. They must be carried out with all possible speed, but in a changing world, there will also be more immediate demands on the inventive skill of the committee. It seems extremely probable that after this war, as after 1914-18, there will be an expansion in the holding of securities into layers of the population who will more and more require skilled guidance. At the same time, there will probably

be a further fall in the size of the average holding, and therefore of the average transaction, and the smaller business is notoriously unremunerative. Certainly, there will have to be a choice between better service and lower charges, but it is also the case that every effort must be made to find ways of cheapening the cost of dealing and this is a problem to which the new committee should certainly address a substantial part of its energies. It is clear that most reforms cannot be put into force under war conditions. But the need for a plan is pressing. There exists considerable dissatisfaction at what is regarded as the high cost of dealing, and, although the war emergency has been met without raising these costs, there is a danger that efforts to secure a higher general standard will be wrecked, unless economies can be effected which will ensure that the cost, in real terms, of doing small business is reduced. One means to economy, that of amalgamations among small firms, is favoured by war conditions. It is also, with proper safeguards, an instrument for raising the broker's status.

Alberta Committee's Statement

Unhappily, the decision of the Protective Committee to send a further letter to those holders of Province of Alberta bonds on which payments are in default since the end of 1934, indicates no improvement in the position. The letter is designed solely to point out to these unfortunate investors that there exists in Alberta a "Limitation of Actions Act" which appears to provide that, after the period named, no legal action can be taken to recover a debt between private individuals, and may mean that a similar immunity extends to the Government of the Province. They cannot, in existing circumstances, take any further action themselves. That must wait until a majority of the Provincial Government shows a disposition to reach a just settlement. They draw attention, however, to the statement of the Dominion Finance Minister, made nine months ago, that Alberta is in a position to meet its obligations in full, and on this and other grounds bondholders are advised to continue resistance to the 50 per cent offer. Holders who accept this advice must realise that they may be giving up the right, as from June 1st next, to any claim to the payment due December 1, 1936, and to further similar amounts at six-monthly intervals. It is not necessary at this stage to go back over the lamentable history of the Albertan default or to compare it with that of Montreal, concerning which there is, as yet, no decisive change in the position. It is, however, not without significance that one of the Provinces to resist the recommendations of the Sirois report, designed to hand over responsibility for Provincial finance to the Dominion Government, was Alberta. A small part of the suggestions of the Sirois Commission has been put into operation by the requirement that, during the year, provinces and cities should evacuate the field of individual income and corporation taxes. In return the province or city may receive either the yield of the surrendered taxes for the fiscal year nearest the calendar year 1940 or the cost of net debt interest for that period. It is to the point that, in the case of Alberta, the former option gives \$4 and the latter \$3.2 million. The former has been accepted. To switch to the latter, even if full payments were restored at the expense of the Dominion, would entail an annual loss of \$800,000 to the Province.

Canadian Pacific Disappointment

The decision to make no payment on the ordinary capital of the Canadian Pacific Railway came as a disappointment to holders and the price dropped from 11½ to 10. The directors' assurance that the money retained would inure to the benefit of the equity holders is doubtless, broadly speaking, true, but this is the tenth successive year without a dividend. Further, the argument that war profits may prove to be mere windfalls, which would justify the board's conservative policy, may well mean that dividends will be indefinitely postponed. The preliminary statement of earnings, compared below with those of 1939 and 1940, did nothing to improve the market, although it makes an excellent showing. The amount available for the ordinary capital, after all reserve appropriations, is not far short of 8 per cent. Apart from the known increase in net railway earnings, there is a sharp rise in net interest receipts, only a slight fall from the high 1940 level of shipping earnings and a decline in reserve allocations, in particular nothing is required to write down the "Soo" investment. The imme-

diated outlook is for further improvement. The post-war position is uncertain, but the chances that railways will retain a substantial part of their wartime expansion of business may be greater in Canada than in most countries.

Cunard Preference Arrears

The good effects of the repayments of debenture debt by both Cunard Steam Ship and the operating company, Cunard White Star, are beginning to accrue to the shareholders of the former concern. In December last, two years' arrears of first preference dividend were paid, and the directors have just announced a further eight and a half years' payment, bringing the dividend up to date. After deduction of tax, these payments call for some £393,750, which has presumably been found from the profits of 1941. There now remain 10½ years' arrears on the second preference, calling for £315,000 net up to December 31st last, and, when these are disposed of, the ordinary shareholder will be within sight of a return on his money. In his statement accompanying the accounts for 1940, Sir Percy Bates expressed the hope that he would be able to submit proposals for dealing with preference dividends when presenting the 1941 accounts, if not earlier. These accounts are to be available in a month's time, and shareholders must exercise their patience until their appearance. The second preference arrears and one year's payment on the first preference call for about the same amount as has been found for first preference arrears, so that there is some prospect of an ordinary payment for 1942, even if there is no contribution from 1941 earnings left over for these purposes. The development had been largely discounted by the market, but the ordinary shares of £1 improved a few pence to 15s. 3d. The first preference, on what is virtually a 5 per cent basis, seem fully priced.

Company Notes

Vickers and Dorman Long

Following on the shock of the *Dorman Long* preliminary statement, there now come figures of a much more important group, *Vickers*, which show a proportionately heavier fall in profit. It is true that, in this case, the disclosed amount is after tax, but a decline from £1,119,120 to £908,905, the lowest figure since 1934, is sufficiently striking to invite comment. In the absence of a statement as to the rate of tax, it is not possible to calculate exactly the amount of equity earnings, but they appear to be some 19.2 per cent compared with 21.9 for 1940. This permits of the 10 per cent dividend being maintained by a final of 6 per cent, while the allocation of £250,000 to contingencies is repeated, but only £38,965 is added to the carry forward, which last year received £171,633. Meanwhile, the full accounts of *Dorman Long* add little to the bald statement that the fall in earnings is due to interruption of normal sources of supply, but the actual decline is very similar to that of *Vickers*. The difference in the experience of equity holders lies almost entirely in the gearing of the two capital structures. Thus, while in *Vickers* the ratio of equity capital to classes ranking before it is roughly two to three, that of *Dorman Long* is approximately one to

five. The balance sheet of *Dorman Long* shows a rise in the excess of floating assets over creditors and tax provision of £31,484 to £42,599, but cash is drastically reduced by over £950,000 to £309,000 odd, while debtors are up by some £450,000 and stock in trade by £660,000. In his statement the chairman, Lord Greenwood, draws attention to the heavy charge for war damage, estimated to amount to £220,000, of which only £100,000 has been met out of the profits of 1940-41, and expresses the hope that some relief will be granted. The amount named is only for the first of five yearly contributions, in respect of the damage of one year, so that the relief will apply only to the future, and, it would seem, not until next year, even if the authorities decide to take an optimistic view of the prospect of further bombing. The ordinary shares of *Dorman Long* have recovered in the three weeks since the announcement from 14s. 9d. to 15s. 9d. *Vickers* 10s. ordinary at 16s. 1½d. yield some £6 6s. per cent.

Further Heavy Industrial Earnings

The preliminary statement of *Thomas Firth and John Brown*, the important subsidiary of *John Brown*, continues the story of lower earnings. Net profits are reduced from £390,822 to £307,236. It is possible to estimate that equity earnings amount to only £265,236, against £347,022, representing a tax free rate of 17.1 against 22.4 per cent, equivalent to 34.2, against 38.9 per cent, less tax. Ordinary shareholders receive a total tax-free dividend of 10, against 12½ per cent, equivalent, less tax, to 20, against 21.7 per cent. Further figures are not yet available, but it appears that the company could place the usual £100,000 to reserve, and make a small addition to the carry forward. These results are as good as could be expected in present operating conditions. The surprise of the season, in the heavy industrial group, is, however, the excellence of the results realised by *Lancashire Steel*, which has no investment interest for the general public, since it is controlled by the Bank of England. The accounts of this concern for 1941 show a rise in gross income from £1,216,274 to £1,246,796. After adjusting equity earnings in the previous year for a retrospective tax provision of £55,000, the amount earned is up from £155,001 to £201,309, representing 11.6 against 7.7 per cent. Ordinary shares again receive 7 per cent, and general reserve £25,000. After these payments, it is possible to raise the carry forward from £27,803, to which it was reduced by retrospective tax liability, to £82,933. It is, of course, possible that a rise in the standard rate of tax at the next budget will reduce earnings below the adjusted level for 1940. But, in any case, the results are outstandingly satisfactory, and indicate a difference in last year's industrial record from that of the general run of heavy industrial concerns which is not easy to explain. It presumably owes something to the fuller employment of original capital, and to the ploughing back of reserves, but this appears to be a minor factor. The £1 ordinary shares of *Firth Brown*, at 58s 9d., yield £3 8s. 8d. per cent, tax free.

Bradford Dyers Earn Less

The doubts expressed in *The Economist* of August 23, 1941, as to whether the Bradford Dyers' Association would be able to eliminate arrears of preference dividend during that year, proved to be justified. The accounts for the year 1941 show a fall in profit after tax from £534,193 to £376,497. The depreciation provision is cut from £160,336 to £136,473, and the charge for War Damage is down from £60,000 to £28,779. Even so, after meeting debenture interest, there is available for appropriation only £166,826 compared with £269,186. That is to say, the showing is rather inferior to that of 1939. The reduced amount is sufficient to provide 2½ years' arrears of preference dividend, compared with five years from the profits of 1940, and this brings the payment only up to July 1, 1940, while there is a very modest addition to the carry forward. This sharp fall in earnings does not reflect a similar decline in activity or even in profits before tax, but is due almost entirely to the fact that tax has this time had to be met in full from current earnings. In the two preceding years, the company was able to take advantage of arrears of certain allowances, such as wear and tear of plant and machinery, which reduced *pro tanto* the tax payable. As was stated in August last, these were no longer available in 1941, and the reduction in distributable earnings is the result. The decline is, therefore, likely to be permanent until such time as either civilian demand inside the country, or

exports, can be allowed to revive, and there is no immediate prospect of any recovery. Shareholders will indeed do well if the reduced figure is maintained under the growing restrictions of 1942. The 5 per cent cumulative preference, including 4½ years' arrears, stand at 15s. 6d. and the ordinary at 8s. The latter price seems unduly high since, on the basis of present earnings, it must be well over a year before any dividend can be received. Even should such a payment prove possible its continuance beyond the period of the post-war re-stocking boom is problematical.

Electrical Equipment Results

Results of *British Thomson-Houston* and *British Insulated Cables* for 1941 show remarkable stability of income after tax. That of the former, before fees, has fallen from £573,266 to £560,476; that of the latter has risen from £786,232 to £810,385. Since there is a decline of some £12,000 to £229,667 in the *BTH* depreciation provision and a rise of over £37,000 to £247,324 in the *BIC* depreciation provision, equity earnings are, however, up for *BTH* and steady for *BIC*. Both concerns reserve £100,000, as in the previous year; in the case of *British Insulated* the sum is again earmarked for war contingencies. The carry forward of *BIC* is some £10,000 lower at £478,547; that of *BTH* is more than £20,000 higher at £217,413. Both companies are maintaining the previous year's payments on ordinary capital, while the preliminary statement of *Associated Electrical Industries*, which controls *BTH*, reports that 10 per cent. will again be paid on the ordinary stock of that concern. Two years' results of *British Thomson-Houston*, as shown by the full accounts, and of *British Insulated Cable*, as shown by the preliminary statement, are analysed in the following table:—

Years ending December 31	British Insulated Cables		British Thomson-Houston	
	1940	1941	1940	1941
Profits after tax	786,232	810,385	573,266	560,476
Fees, etc.	18,333	15,713	750	700
Depreciation	209,622	247,324	242,895	229,667
Dep. and loan interest	383		84,495	86,506
Prof. dividends	57,500	57,500	60,374	52,500
Ordinary stock:				
<i>Carried forward</i>	500,394	489,848	184,752	191,103
Paid†	400,000	400,000	80,500	70,000
Earned %	28.7	28.6	16.0	19.1
Paid %	20	20	7	7
Reserve†	100,000	100,000	100,000	100,000
Carry forward	488,699	478,547	196,310	217,413

† Shown gross by BIC

‡ War contingencies in each year for BIC.

The balance sheet of *BTH* suggests a very considerable expansion in output and turnover last year. Capital expenditure, at £125,251, was approximately halved. There is a rise of £1,100,000 to £4,361,813 in debtors and of more than £1,300,000 in creditors, including reserves for contingencies. Moreover, the loan outstanding is up from £700,000 to £900,000. The assets side of the account shows a substantial increase in supplies and apparatus from £3,421,592 to £4,066,578 and a decline in cash holdings of £44,000 to £323,272. The electrical equipment industry occupies a key position in the war effort, and it is clear that, so far, rising gross profits have easily kept abreast of rising costs and taxation. It is probable that in the current year some further shortage of raw materials must be experienced. The £1 ordinary stock of *British Insulated Cables*, at 92s. 6d. xd., yields £4 6s. 6d. per cent, less tax at 9s. 7d. The 7 per cent cumulative preference *British Thomson-Houston*, whose dividend is more than four times covered, yields, at 33s. 9d., £4 2s. 11d. per cent.

International Nickel

The International Nickel accounts point to a further substantial increase in output last year. Net profits are reduced only from \$35,545,000 to \$34,356,000, despite a rise in total tax liability, inclusive of EPT, from \$21,131,000 to \$26,329,000. Moreover, net income has fallen only by some \$1,500,000 since 1939, although tax liability over the same period has risen by some \$15,000,000. Earnings per common share amount to \$2.22, against \$2.30 for 1940, so that the margin for the payment of \$2.00, made for the fourth year in succession, is still adequate, although again reduced. The earned surplus has risen from \$75,748,000 to \$79,014,000, before allowance for adjustments on profit and loss account in either year, and working capital was nearly \$8,000,000 higher at \$82,958,000 at December 31st last. The chairman, Mr Robert C. Stanley, points out that the company continues to work exclusively for the war programme of the Allied Governments. His statement that no operating time was lost last year, and that mines, smelters and refineries ran continuously, mainly on a twenty-four hour basis, is highly encouraging, as is the information that output of nickel reached a new high level. The company is putting through a programme of capital expenditure, calling for some 35 million dollars, of which 25 millions, incurred subsequent to July 31st last, will be amortised over the five years 1941-45. The report records highly satisfactory progress both from the standpoint of the investor and from that of the public. The common shares of no par value, at \$40 ex dividend, yield 5.0 per cent.

Kern Oil

Full accounts of Kern Oil in the year to May 31st last show a drop in income from £305,770 to £259,442. The transfer to depreciation is nearly £8,000 lower at £135,598, but there is a rise in liability for income-tax and EPT from £59,093 to £64,442. The ordinary dividend is two points lower at 6 per cent, and is covered by earnings of 10.5 against 17.2 per cent. General reserve receives £20,000 against £43,017, and there is, consequently, a small rise in the carry forward from £35,295 to £35,346. The setback is due, as the chairman, Mr George W. Ivey, points out in his statement, to substantially higher costs for material, transport and labour. He expresses the hope that a greater measure of Federal control will help to stabilise marketing conditions in the United States. The northern Trinidad concessions have proved unsatisfactory, and all the leases have been surrendered. This fact is not, however, apparent in the balance-sheet since the transaction took place after the close of the financial year. The consolidated statement shows £50,000 written off expenditure on northern Trinidad leases surrendered before May 31, 1941. An excess of liquid assets over current liabilities has risen from £95,971

to £113,482. Stocks, debtors and creditors are all moderately lower, but there is a rise in cash from £115,087 to £138,524. Prospects in the current year must largely depend on the extent to which legislation in the United States affects the trading conditions in which the Californian oilfields operate. The 3s. 4d. stock, at 3s. 10½d. ex dividend, yields £5 3s. 2d. per cent.

Rubber Trust Accounts

The full accounts of Rubber Trust, whose preliminary statement was discussed in *The Economist* of February 28th, show a decline in total income from £189,798 to £173,383. As was to be expected, tax liability was higher, at £76,141 against £65,883, and equity earnings declined from £106,389 to £84,317, representing 6.6 against 8.1 per cent. As already announced, no final dividend is being paid in view of the situation in Malaya and Netherlands India, so that the interim of 3 per cent remains the total payment for the year. Dividend equalisation fund is, however, raised to a total of £50,000, after the transfer of £45,000 from profits, against the withdrawal of £15,000 a year ago, and the carry forward is £733 higher at £96,744. The dividend received from Sumatra Tea Estates declined from £60,000 to £13,000. The total book value of investments is virtually stable at some £3,171,000, but market value—£2,812,398 a year before—had at December 31st last fallen to £2,336,357, a depreciation of £834,644, which is covered by reserves and carry forward to the extent of £646,744. A further considerable depreciation has, of course, taken place since the close of the financial year. The analysis of the company's investments shows that 77.7 per cent are in Malaya, British Borneo or the Netherlands East Indies, and another 12.8 per cent in India and Ceylon. The immediate prospects of the company are, of course, exclusively governed by military events in the Far East. But as the chairman, Mr H. J. Welch, points out, the question of the extent to which use of synthetic and reclaimed rubber is likely to be prolonged after the war, may well be decisive in the longer run. He believes that the future of the crude rubber industry depends on the extent to which productive capacity for synthetic output is installed, to which productive capacity for synthetic output is installed, with costs are reduced and quality eventually compares with natural output. It is probable that the various specialised will replace plantation rubber for some highly specialised purposes, but it is difficult to believe that they will compete with it in general applicability, and costs should be lower on the efficient plantation than in the factory. Whether or not reclaimed rubber has an inferior durability to crude rubber, it is clear that its use in the present crisis must be extended up to the limit and should have been forecast by those in authority. The £1 ordinary stock, at 9s. 6d., yields £6 6s. 3d. per cent.

Industry and Trade

No More Pleasure Motoring

In view of the urgent need to save petrol, lubricating oil and rubber, the Government's decision to eliminate pleasure motoring will be generally welcomed as a belated measure of economy. After June 30th the basic petrol ration for private cars will be abolished—as it has already been in the case of public service and goods vehicles; the 50 per cent cut in the April allowance, announced last month, will be continued during May and June. For the time being, motor cycles will not be affected, but supplementary allocations will also be scaled down. Originally ranging from 4 to 10 gallons a month—designed to permit a theoretical 200 miles of motoring for all cars—the basic ration was first reduced by about one-sixth in the quarter ended last October. After this reduction, which was continued in subsequent months, it ranged from 4 or 5 gallons a month for cars up to 9 h.p. to 8 gallons for vehicles of 20 h.p. and over. Ignoring the fresh cut introduced in April, and assuming an average of 6 gallons a month for, say, 1,000,000 cars, this would mean a consumption of over 70,000,000 gallons, or about 240,000 tons of "basic" petrol a year—and would, of course, have begun to show its effect correspondingly earlier if the abolition had been made at the end of March instead of June. The actual economy will

depend upon whether the special allowance granted to those—e.g. persons living in rural areas with inadequate transport facilities—who can give proof of genuine need offsets the proposed reduction in supplementary rations. But, in the conjunction with the promised measures to secure the utmost economy of petrol in the Services and in its use for other public purposes, the saving will be considerable; and the strain on the Allies' tanker tonnage will be to that extent relieved. Needless to say, motorists who have to lay up their cars will be able to claim a refund in respect of any unexpired portion of their licence.

Besides saving petrol the abolition of all pleasure motoring will appreciably reduce the consumption of rubber, for tyres represent by far the most important outlet for this product. Until last December there were no restrictions on tyre sales to private motorists; but the standstill Order then issued in effect prohibited the sale of any tyre that could be used on a private car, save under a direct instruction from the Ministry of Supply. "Giant" tyres for commercial vehicles and those for cycles and motor cycles were not affected. Tubes were not specifically mentioned, but the trade has elected to treat them in the same way as

outer covers. This Order, intended originally to run for two months, was extended, pending the promulgation of a new Order. Now that all non-essential cars are to be banned from the roads, some relaxation in the existing regulations will presumably have to be made to permit the acquisition of new tyres where necessary. But second-hand tyres from laid-up cars should be available in sufficient quantities to ease a tight supply position.

Production Committees

The proposals for the statutory appointment of joint production committees in all scheduled undertakings have now gone forward from the Joint Consultative Committee to the Minister of Labour to the representatives of the employers. They will probably be modelled on the agreement governing such committees in the Royal Ordnance factories. Their object, as stated in the agreement, is to provide for the regular exchange of views between the management and the workers "on matters relating to the improvement of production, to increase efficiency for this purpose, and to make recommendations thereon." Illustrative of the questions to be considered and discussed are: maximum utilisation of existing machinery, upkeep of fixtures, jigs, tools and gauges, improvement in methods of production, efficient use of the maximum number of productive hours, elimination of defective work and waste, efficient use of materials and supplies, and efficient use of safety precautions and devices. The committees, however, are not to discuss matters such as wages, which are covered by agreements with trade unions or are normally dealt with by the approved machinery of negotiation and discussion through shop stewards, staff associations, or Whitley committees. The membership of the committees is not to exceed ten representatives of management, to be nominated by the Superintendent, and an equal number from the workers, to be elected by ballot conducted by the trade unions concerned, "covering, as far as possible, the various shops, departments, or sections of the factory, including local inspectorates." The Superintendents of the establishments are to act as chairmen of the committees, and their secretariat is to consist of one of the representatives of management and one of those of the workers. So far as the representatives of the workers are concerned, membership is restricted to those who have served for a period of not less than twelve months at the Royal Ordnance factory concerned, but all workers employed at the date of the election are entitled to vote.

Control of Prices

There are indications that the control of prices of civilian goods is not as effective as the public was led to expect at the time of the passing of the Goods and Services (Price Control) Act, 1941, which was designed to strengthen the provisions of the Prices of Goods Act, 1939. For this neither the Central Price Regulation Committee nor the regional committees can be blamed. On the one hand, the difficulties of price control have tended to increase with the reduction in the supply of goods, and, on the other hand, the price regulation committees do not appear to have the powers needed to deal with them. In a statement made on March 14th, Sir Douglas McCraith, chairman of the price regulation committee of the North Midland Region, suggested that the present method of limiting profits, should be succeeded by a policy designed to limit prices. Under Section I of the Goods and Services (Price Control) Act, 1941, the Board of Trade already has the requisite powers to make Orders determining the method of arriving at maximum prices. In the view of Sir Douglas McCraith, the Board of Trade can therefore fix profits which are fair both to the trader and to the purchaser without need of further legislation. In consequence, his committee has decided to recommend to the President of the Board of Trade that immediate consideration should be given to the issue of Orders under the Acts fixing maximum prices and profits on sales of all goods and commodities at each stage from manufacturer to public. It is surprising that this request should come from the chairman of one of the regional committees. The Acts were passed for the specific purpose of preventing profiteering and unreasonable price advances, and as they give the Board of Trade the power to issue the requisite Orders, the public cannot be blamed for holding the view that they are just another example of legislation ostensibly passed to meet an urgent need, but never properly enforced.

The operation of a comprehensive system of price control at each stage from manufacturer to public no doubt presents many practical difficulties. But there is no reason why more drastic steps should not be taken immediately. And in proportion as the supply of consumption goods is reduced and standardised, price control should become easier to enforce.

Cutting the Cloth

The cut in the clothing ration as a measure to release labour for more essential work goes hand in hand with the need to make the most of the labour remaining in the textile and clothing trades. To this end, it is necessary to give manufacturers in every branch of the trades concerned the longest possible run. In textiles it is more economical of labour, raw materials and costs, to run off one hundred thousand yards of a particular cloth than it is to produce several different types which involve changes in the setting of looms. There need be no fear on the score of standardisation, for the number of cloths available could be much reduced without entirely eliminating variety. The pre-war stress of competition led the manufacturer to use every device to make his products "different." Manufacturers and merchants built reputations for the types of cloth and clothing they put on the market; the goodwill of some depended on the length of their ranges. Unfortunately, many members of the textile trades cannot forget the anxieties they suffered in the fight for variety. An example of this attitude is found in the list of utility cloths which are being submitted to the Board of Trade. Some of the numerous cloths vary by nothing more than small numbers of threads to the inch. It falls to the Board of Trade to guide production into the type of cloth and clothing which is best in the national interest. The old jealousies between manufacturers and between the textile trades must be set aside. Orthodox uses of the different textiles must be forgotten. Those in relatively short supply, like cotton and wool, should be used only when rayon cannot be substituted for them. None the less, the best materials that can be produced are the most economical in the long run, and as far as possible, "shoddy" clothing should not be produced. The crux of the matter is the willingness of every branch of this vital industry to assist the Board of Trade in achieving the economy dictated by the war.

Cotton Spinners Margins

The Minister of Supply has made the Control of the Cotton Industry (No. 30) Order, which came into force on March 16th, increasing margins for spinners of both American and Egyptian type yarns by 7½ per cent. The margins were fixed for the first time in April, 1940, and American type yarn margins were raised in February, 1941. Lancashire spinners have pressed for many months for the concession, in view of increased costs of production. The decision of the authorities is a result of an investigation into spinners' costs made by the committee of accountants which was appointed to advise the Controller and the Cotton Board on the operation of price control in relation to costs. Raw cotton prices were reduced by ½d. per lb., in order to prevent the change in spinners' margins leading to an increase in the general price level of cotton goods to the public. The fresh margins work out somewhat irregularly and the increase for spinners of coarse counts has been less than for producers of finer numbers.

Malting Barley Prices

The promised announcement of maximum prices for malting barley was made at the end of last week by the Ministries of Food and Agriculture. Great concern had been occasioned by the exceptionally high prices at which malting barley has recently been sold. In 1939, the average price was 6s 9d per cwt, but lately it has risen as high as 75s. The maximum price to the grower for this year's barley harvest sold for malting, milling and other uses for human consumption, is to be 35s. per cwt at the farm. The Ministry of Agriculture realises that this price is still high compared with other cereals (feeding barley will be 14s 6d per cwt and millable wheat 16s), but it is stated that barley is in a special position. Only home-grown barley can now be used for making beer, whisky, malt extract and other articles. It is considered unlikely that farmers will reduce their 1941 barley acreage, and probable that a sufficient quantity will be sold to meet requirements.

COMPANY MEETINGS

LONDON BRICK COMPANY, LIMITED

INCREASED TOTAL REVENUE

The forty-second annual ordinary general meeting of the London Brick Company, Limited, was held on 17th instant in London.

Sir P. Malcolm Stewart, Bt., O.B.E., LL.D., D.L., J.P. (chairman and one of the managing directors) said that the profit on trading amounted to £365,565, an increase on that of the previous year of £28,246. The actual relative profits earned showed a substantial decrease, since in the year 1940 £60,250 had been specifically written off their fleet of motor vehicles, whereas in the year under review it had not been deemed necessary to make any provision for its depreciation. Interest and income from investments at £20,435 were up by £3,623. The total revenue at £366,210 showed an increase of £31,885.

The year 1941 had opened under favourable conditions, good deliveries being made in the early months. The improved demand was well maintained until towards the end of September. Prior to that their unrivalled facilities for prompt despatch of pressed bricks had been freely availed of over a wide area. Those facilities were an essential contribution to securing the completion of urgently needed constructional war-work.

About the same time that the decline in demand set in, the Minister of Transport had found it necessary to limit the transportation of bricks. It had hit them hard. However, they had all to recognise that the Government requirements for the successful prosecution of the war should take precedence to the interest of individuals or companies, whatever hardship might be inflicted. He feared that that need for the limitation of transport was causing the advantages arising from the very low fuel consumption and man-power employed in the production of pressed bricks to be overlooked—those, too, were factors of national importance at a time when fuel was scarce and more men were needed for the Forces.

REGULATION OF PRODUCTION

They had been hardened to adversity by the experience of the last war, when their industry had been regarded as non-essential. In this war the Ministry of Works and Buildings was making a determined effort to secure that degree of co-ordination and regulation of production needed to meet the exceptional circumstances arising from the war. The Ministry's committee, under the chairmanship of Mr. Oliver Simmonds, M.P., had worked hard and produced its report promptly. The committee had been faced with a difficult task.

Thus it had come about from various causes that the past year had closed with a much diminished demand; bricks were being heavily stacked at most of the works, the closure of some of which was threatened. Despite the many difficulties encountered, production had not only been well maintained, but had exceeded that of the previous year. Their works generally had been well maintained, bearing in mind the shortage of labour and materials, but it was hoped it would prove possible to take advantage of the slackening of demand to effect some essential repair work which could not easily be undertaken while they were busier. It was of the utmost importance that the productive capacity of efficient works should be maintained so that the post-war demand would be promptly satisfied.

CURRENT YEAR'S OUTLOOK

With regard to the current year, it was clear that the prospects were far from encouraging. They had made a poor start. The climatic conditions prevailing had proved unfavourable. It was difficult to visualise any improvement unless a much increased demand were to spring up for Government requirements, and that certainly was not in sight at the moment.

Finally, to summarise the position, he could at this juncture only indicate that the present prospects were poor for the manufacturers of bricks, apart from those exceptionally favoured by war circumstances and regulations. Indeed, it was desirable for him to say frankly that shareholders should expect a falling off of the profits earned during the current year. It was anticipated that a number of works would shortly have to be closed. However, the day would come when their proven efficiency and organisation would once again play its full part in the national programme of reconstruction which was looked for.

The report was unanimously adopted.

DORMAN LONG AND COMPANY, LIMITED

VISCOUNT GREENWOOD'S STATEMENT

The following is the statement by the chairman, the Right Hon. the Viscount Greenwood, P.C., circulated with the report and accounts for the year to September 30, 1941, in place of the customary speech at the annual general meeting of Dorman Long and Co., Limited.

It was found impracticable owing to certain important matters outstanding with Government departments to complete the report and accounts and to hold our annual general meeting as usual in December, 1941. When the necessary information became available, no time was lost by our officials and staff in finalising the accounts for submission to the shareholders.

The trading profits are not commensurate with the volume and value of the work done by the various departments of the company owing to the continuation during the whole of the year of the adverse conditions outside the company's control which prevailed during the last four months of the previous year. In the result the directors regret they are unable to recommend dividends either on the preferred ordinary or the ordinary share capital aggregating £2,094,334. In accordance with our usual practice, we have provided for all taxation based on the profits for the year. The profits are reduced but the rate of income-tax is increased, and the charge for taxation in the accounts remains about the same.

Commencing in 1936 there has been allocated out of profits a total of £70,000, of which £45,000 has been devoted to augmenting the staff pension scheme. Owing to the further reduction in profits resulting in your directors being unable to recommend dividends on two classes of the company's share capital, they cannot recommend an allocation to the pension fund this year. This is especially regretted by the directors in view of the outstanding services rendered by officials and staff during the past year.

The further reduction in cash at bankers is a consequence of reduced profits, payments under the War Damage Act, 1941, and increases in stocks and book debts. Substantial payments have been made since the date of the balance-sheet in respect of debenture interest and taxation.

It is estimated that as matters now stand, the total cost to the company to September 30, 1941, under the provisions of the War Damage Act, 1941, may amount to as much as £220,000, but it is hoped that the Government may see their way to give the iron and steel industry more equitable treatment. Iron and steel producers are required, under the legislation passed in March, 1941, to make payments on a very different footing from public utility companies, and if the experience now available is taken into consideration, together with the effect of such large payments on the liquid position of concerns in the iron and steel industry, suitable adjustments may be provided for in the War Damage (Amendment) Bill now being drafted. In the meantime, your directors have transferred from profit and loss account to general reserve £100,000 to cover the cash withdrawn from the company's working capital in payments of war damage contributions and premiums during the past year.

Additions to capital expenditure amount to £56,117 and realisations aggregate £15,284. The provision for depreciation is again £275,000, which is approximately equal to the wear and tear allowance for taxation purposes. We have continued, so far as possible under the circumstances, to make improvements to our plant and equipment and to maintain the whole of it in a proper state of repair.

There is an increase in the provision for renewals, relinings and repairs of blast furnaces and steel plants to cover uncompleted expenditures and repairs deferred by reason of war-time conditions.

Wherever there is a response by the employees we provide facilities for the national savings movement. Additional staff and employees have joined savings groups during the past year.

It is not permissible for me to give particulars of production figures for our various departments, but I can assure you they are satisfactory.

Under the difficult conditions with which they have had to contend, all those concerned, including the management, the staff and all employees, have given of their best, and our thanks are due to them for their services during a harsh and trying year.

(The adjourned fifty-second ordinary general meeting of the company will be held at Winchester House, Old Broad Street, London E.C., on the 26th instant, at 12 o'clock noon.)

MIDLAND COUNTIES ELECTRIC SUPPLY COMPANY, LIMITED

MR WILLIAM SHEARER'S REVIEW

The twenty-ninth ordinary general meeting of the Midland Counties Electric Supply Company, Limited, was held on the 18th instant in London.

Mr William Shearer, the chairman, commenced by paying a tribute to the services of the late chairman, Mr George Balfour, under whose inspiring leadership, he said, a great expansion of the company's activities had taken place, and its influence and standing in the electricity supply industry had become assured. The members joined with the directors in expressing their deep sorrow at the death of their chairman who had rendered such distinguished service to the company.

The record of another year's successful operations, despite the many difficulties which had had to be met and overcome, fully justified the claim that no effort had been spared to maintain the highest possible standard of service to their many industrial and domestic consumers of electricity and in their transport undertakings to the travelling public, and in doing so to contribute their utmost to the all-important war effort. There had been a moderate increase in the number of new consumers and in the total load. Their electricity tariffs were constantly under review and a further measure of standardisation in the charges to industrial consumers, whose tariff fell to be adjusted in relation to coal prices, had been introduced during the year. The smaller domestic user was obtaining a reduction in charges for supplies through slot meters and a new tariff had been instituted for the small power consumer.

HOLDING COMPANIES

This company, like several others, had been created for the purpose of co-ordinating the struggling activities and accelerating the development of the separate entities which had powers for the supply of electricity and to a smaller extent of road passenger transport. He could not conceive any unbiased person disputing the claim that the progress reported every year afforded ample evidence of the successful achievement of their purpose, nor could the need for maintaining the holding-company system be lightly set aside.

While much had been done through central management and the provision of adequate financial resources towards improved technical planning and intensive development of the areas, much remained to be done, and that, in his view, could best be achieved through the flexibility afforded by that type of financial structure.

After reviewing the balance-sheet, which showed no major change, except in the increased liquid resources of the company, the chairman said that the gross trading profits of the operating subsidiaries amounted to £1,221,304, but that taxation had increased by no less than £215,217, trading profits thus showing a decrease of £54,152. There was retained in the subsidiary companies for depreciation, renewals and reserves £450,634 compared with £468,966, and the balance of the trading profits £327,383 compared with £363,203 last year, but the dividend declarations of the subsidiaries had been well maintained, the difference of £35,820 being largely due to the higher rate of tax deduction.

TAXATION, RESERVES AND DIVIDENDS

The total contribution for the year to the revenues of National and Local Government by direct taxation exceeded £657,000, equal to 22 per cent. on the ordinary share capital. The National Exchequer and certain Local Authorities were therefore substantial partners in the business, a fact possibly not always fully appreciated by the public and conveniently overlooked by those who suggested that the nationalisation or public ownership of all utility services would be a never-failing panacea.

The total amount of depreciation and other reserves in the subsidiary companies was £4,302,816, including provision for any War Damage contribution for the electricity undertakings under a special scheme now under the consideration of the Government. The balance on revenue account of £306,182, compared with £343,061 and, after appropriations there remained a balance of £105,494. They recommended a final dividend of 5½ per cent. (following an interim dividend of 2½ per cent.) on the ordinary stock.

The report was adopted.

THE BANK OF AUSTRALASIA

DIVIDEND MAINTAINED

MR DAVID ROBERTS'S REVIEW

The 108th annual general meeting of the Bank of Australasia will be held in London on the 26th instant.

The following are extracts from the statement by the chairman, Mr David J. Roberts, on the report of the directors and balance-sheet for the year to October 13, 1941:—

During the year under review, the expansion in the figures of the balance-sheet, noted a year ago, has continued and the total has risen by £3,153,309 to the record figure of £62,519,266.

The following aspect of the balance-sheet should be of interest:

Cash balances are 16.54 per cent., or 3s. 3½d. in the £, of total deposits—much the same figure as last year—but if we add our investments, which are shown at below market value, the percentage is raised to 48.88 per cent., or 9s. 9d. in the £, of total deposits, as against 9s. 1d. last year. Advances are 75.35 per cent. of total deposits.

EFFECTS OF TAXATION

The gross profit for the year is shown to be better by over £27,000, the net result is a reduction of £29,094. This, of course, is due to ever increasing cost of management and rates and taxes, the latter figure being up by just on £63,000, and this increase has more than offset any extra profit we have been able to earn through the employment of the additional deposits at our disposal. It will be observed how difficult it is becoming for banks to make sufficient profits in these times to maintain dividends at the present rate.

In the report it will have been noticed that an adjustment in the rate of income-tax deducted from the dividends paid in respect of the past year is referred to. This matter calls for an explanation. Each year an estimate is made of the amount of relief in respect of Dominion income-tax which is due to shareholders and the rate at which income-tax is deducted from the dividends paid is adjusted in accordance with this estimate. The final agreement of the figures which determine the amount of this relief is not possible for a considerable period after the close of the year. In respect of the years 1938 and 1939 the final agreement with the Inland Revenue has disclosed that a further amount of relief is due to our shareholders for each of these years. This has been passed on to our shareholders this year by reducing the amount of income-tax deducted from the interim and final dividends. The result of this adjustment has been that approximately £20,000 more is required to pay the year's dividends.

The payment of the dividends for the year has involved a reduction in the carry forward of approximately £26,000, of which £20,000 is attributable to the above-mentioned income-tax adjustment. As, however, the carry forward has increased since the beginning of 1938 by approximately £36,000, of which some £20,000 arose from the insufficient payment to shareholders, explained above, your directors have felt justified in maintaining the rate of dividend paid last year.

WOOL AND WHEAT PRODUCTS

In Australia the 1940-41 season produced 3,611,900 bales of wool, which is 57,500 bales less than the 1939-40 clip, though the number of sheep there had increased by 2,546,000 to 121,364,000. In New Zealand the sheep numbers in 1940-41 increased by 709,000 to 31,771,000, and the wool production by 60,000 bales to 948,000 bales.

The estimated production of wheat for Australia for the season 1941-42 is 160,842,000 bushels against 82,654,000 for the previous season. The average yield for the ten years ended 1941 is officially given as 164,720,000 bushels.

The latest weather news is contained in the following cable recently received from our superintendent:—

February rains relieved to some extent previous very dry conditions in New South Wales and Queensland, but further rain badly needed Central and West New South Wales. In other States and New Zealand seasonal conditions generally regarded as satisfactory.

There have recently been introduced in Australia "National Security (War-Time Banking Control) Regulations," as a result of which the trading banks in that country are licensed and operate henceforth under authority to carry on in Australia the

business of banking. Although it is perhaps early to judge, these should not, in the opinion of the directors, seriously interfere with our business. Amongst other things, the regulations provide that in making advances the trading banks shall comply with the policy laid down by the Commonwealth Bank from time to time; also that every trading bank shall lodge in a special account with the Commonwealth Bank such part of its surplus investible funds as is directed by the Commonwealth Bank in accordance with a plan approved by the Treasurer, the rate of interest on such accounts to be determined from time to time by the Commonwealth Bank.

A few weeks ago Mr Curtin, Prime Minister of Australia, announced war-time finance measures stabilising the prices of goods and services and wages. They also include the limitation of profits, the control of interest rates for different classes of investments and of the sale or investment of capital.

Your chairmen have in the past referred to the unfair basis of arbitrarily assessing the banks for income-tax in New Zealand, and have expressed the hope that, as promised by the Authorities there, the method if considered after investigation to be inequitable would be remedied. You will be pleased to know that the New Zealand Government has made good that promise and that the banks are now taxed on profits earned as in the case of ordinary companies.

Proprietors will be glad to know that at the time of the outbreak of war with Japan we had no financial commitments with that country.

BORAX CONSOLIDATED, LIMITED

INCREASED DEMAND FOR PRODUCTS

FAVOURABLE AGRICULTURAL PROSPECTS

The annual general meeting of Borax Consolidated, Limited, was held, on the 17th instant, at Winchester House, London, Mr D. Abel Smith (the chairman) presiding.

The following is an extract from the chairman's address which was circulated with the report and accounts:—

Reviewing the main features of the balance-sheet and accounts for the year ending September 30, 1941, the net profit for the year under review amounts to £354,171, representing an increase of £88,348 over last year. Adding to the above profit the amount brought forward from 1940 the total to be dealt with is £613,841. From this we have to deduct provision for British taxation £215,000, consisting of an appropriation of £126,250 from profits, together with the sum of £88,750 to be deducted from the dividends paid and proposed. This leaves a balance of £398,841.

We have already paid the sum of £44,000, less income-tax, on the 5½ per cent. cumulative preference stock. Also an interim dividend of 3 per cent. on the preferred ordinary stock was declared on November 11, 1941, and paid on December 5, 1941, absorbing £18,000, less income-tax, and we now propose the payment of a final dividend of 3 per cent. on the preferred ordinary stock, which will absorb a further £18,000, and to pay a dividend of 7½ per cent. on the deferred ordinary stock, representing the sum of £97,500, less income-tax. These dividends, subject to the resolution being passed, will be paid to the stockholders on March 27th. After providing for these payments amounting, less income-tax, to £88,750, and deducting £50,000 for war contingency reserve, the balance to be carried forward is £260,091, a decrease of £4,579 on the previous year.

SUCCESSFUL RESULTS

In common with all firms engaged in international trade our road has been strewn with difficulties, but thanks to mutual consideration and goodwill between our customers and ourselves we have succeeded in meeting trade requirements. The results, as

I think you will recognise, furnish the best proof of the success attending our efforts to which our interests in the United States have contributed their full share.

Wherever practicable we have taken advantage of our facilities to ship direct from our factory on the Pacific Coast, and from warehouses on the Atlantic Coast to our buyers abroad, in order to relieve the pressure on British shipping space.

A most encouraging feature of our business is its resiliency and the way in which outlets are constantly arising. This is well illustrated by the increased demand for borax and boric acid for metallurgical processes, metal fabrication, fire-proofing of textiles and timber and the treatment of timber against attack from certain wood-boring insects, etc.

When the activities of peace can be directed to repair the havoc of war these outlets provide encouraging scope for research and further development. In addition, we expect the probable exhaustion of stocks in the Axis and Axis-occupied countries will provide a ready market as soon as trading can be resumed.

In the field of agriculture my remarks are necessarily limited to the British Empire and the United States, where the prospects continue most encouraging. Consumption of borax and boric acid in the United States for such purpose has almost doubled for the second year in succession. The need for more scientific approach to boron-deficiency problems is becoming more widely realised, and the outlook for the future is promising.

UNITED STATES POTASH COMPANY

Our investment in the United States Potash Company continues to yield lucrative results. As stated in the report, that business under its present excellent management now plays a prominent part in the production of a product of primary importance in the development of agriculture and also plays its part in war requirements.

By agreement between the United States Government and the representatives of H.M. Treasury, the list of British-owned shares of companies incorporated in the United States (which were requisitioned by the British Government in July last, to be pledged to the Reconstruction Finance Corporation as part security for a loan from that Corporation to the British Government) included our holding of common stock in the United States Potash Company. These shares have accordingly been turned over to the British Government and deposited with the agents appointed by the United States Government on the terms specified in the Agreement dated July 21, 1941. Subject to the conditions for redemption of the loan being carried out at maturity the shares so deposited as collateral will be freed and returned to us. The conduct of the business will therefore not be interfered with in any way, and the equivalent of any dividends received by the Reconstruction Finance Corporation will be transmitted by the Bank of England to our company in due course, so that our interests are unlikely to be prejudiced in the slightest. We regard this procedure as infinitely more satisfactory than a sale of this important revenue-returning asset, which already represents a far higher market value than that at which it stands in our books, and in our opinion has every prospect of steadily increasing in value.

In regard to the future, so much depends on the course of the war and the time it will take before peace-time trading can be resumed, that I can only confine my remarks to present conditions, but am pleased to report that for the five months of the new trading year up to date, conditions are holding up quite well. One thing we have to envisage, namely, the enormous contribution which the United States is making in every way to the war effort is bound to be reflected in increased taxation in that country, and in which our interests there will have to bear their share.

The report and accounts were adopted.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

With the temporary lull in hostilities in the Far East, influences affecting the markets have been domestic rather than

external, and interest has centred on the course of industrial profits as portrayed by recent results. Price movements have been determined by factors affecting individual securities, and although the trend of equities is still downward, the gilt-edged market and fixed interest securities continue firm. There can, however, be little doubt that with the advent of better news, prices in all sections will again resume their upward

trend. The current Warships Weeks, and particularly the prospective London Week, have led to some reduction of activity in the gilt-edged market, and prices in consequence have shown little net change. The relatively few movements in the foreign bond market reflected the small volume of business. Brazilian issues enjoyed quiet support in the current week, while Japanese bonds were offered on Monday, when

among Chinese issues, the Boxer loan fell 4 points. Conditions in the home rail market were quiet, but prices of junior stocks showed in general little change, although GW ordinary improved ½ on Tuesday. A steady demand was apparent for senior issues, although prices were unaffected, but on Tuesday the LMS First and 1923 4 per cent preference issues both advanced ½, while the Berwick 4 per cent First preference stock gained ½. The foreign rail market, however, was particularly dull, and in the absence of any support, Argentine issues were persistently weak. Elsewhere, the announcement that no payment would be made on the ordinary stock of Canadian Pacific, occasioned a sharp marking down of 14 points for the equity, while both the debenture and preference issues eased in sympathy. In midweek some irredeemables were fractionally lower, with few changes elsewhere.

Although the current week witnessed the announcement of numerous important company results, activity in the industrial market was slight, and generally restricted to the affected shares, with price movements narrow, but irregular. Brewery shares were dull at the end of the previous week, although Guinness was prominent with a rise of 2s. on Friday, and on the relaxation of the ban by Eire on exports to Northern Ireland repeated the gain at the reopening. Later, however, prices became steady. Rolls Royce was prominent in an otherwise quiet motor section, while in the heavy industrial group quiet dealing barely affected prices, although Vickers eased slightly on the preliminary statement. Cunard shares generally provided the chief interest in the shipping decision, especially on Tuesday, when the cent preference stock was announced. A general improvement ensued in which Union Castle advanced 1s. 7½d. The tone in the textile group was irregular, but movements were narrow, although Bradford Dyers preference issues rose 9d. on the proposal further to reduce the dividend arrears. Dealings in the Fine Cotton Spinners 5 per cent preference issues less the cash and scrip distributions were begun on Monday.

Building material shares were weak on the recommendation to cut brick production, while among miscellaneous issues, Cable & Wireless issues declined a point

further on Tuesday, when Turner & Newall and United Molasses lost 2s. and 1s. respectively. International Nickel and Brazilian Traction were also marked down in sympathy on the Canadian Pacific dividend statement. Later the weakness of building material, and the strength of shipping shares continued, while Cable and Wireless preference and ordinary rallied.

In the absence of any support from the Cape the kaffir market suffered an all-round reduction in prices. Dividend payers were particularly affected, East Geduld and Geduld losing ½ at the reopening and Crown Mines the same amount the next day. In general, however, declines were restricted, ranging from ½ to 1½. Little business passed in the rubber market, although there are indications that the fall has now ended, and where available, cheap stock is being bought. Similar conditions prevail in the tea market, although prices of Ceylon stocks were lowered on the news of the evacuation of civilians from Ceylon. The moderate turnover in the oil market hardly affected prices, although Shell improved ½ at the reopening, but Anglo-Iranian lost the same amount the next day.

New York

WHILE the war and domestic news was not particularly inspiring, the early part of the current week witnessed the continuation of the improvement which marked the close of the previous week, after prices had fallen to the lowest levels since 1938. Encouraged by the belief that the fall had been overdone, leading issues registered numerous gains at the reopening, and the next day, under the lead of rail issues, prices advanced up to 2 points. Later the market closed barely steady after a few small rises.

COMMODITY AND INDUSTRY NEWS

Rubber Requisitioning.—A letter from the Rubber Controller to the Rubber Trade Association contains the news that rubber is to be requisitioned. The requisitioning Order will apply to all stocks held in this country, except those in the possession of manufacturers.

Rubber Control.—Three new Orders affecting the use of rubber and liquid latex came into force on March 16th. The quality of rubber from which conveyor and elevator belting may be made is limited; and the thickness of the rubber covering of the following articles from Order: sponges, table top coverings, straps and carriers, curtain rails and hair shaving and nail brushes. The use of any liquid latex is made subject to licence. Maximum prices are fixed for liquid latex.

Tin.—All standard contracts for tin opened on December 8, 1941, are to be closed by a direction of the Metal Exchange Committee on March 23rd next. The price for settlement is: December 8 to 14, 1941, £259 10s. per ton, with a contango of 5s. a week, which makes the price for March 2 to 8, £262 10s.

Cotton Spinning Overtime.—When the four hours per week overtime began in the cotton spinning mills at the end of January, the Controller (Mr Frank Platt) announced that it was his intention to publish a chart of yarn production, the target figure being 100, which represented the quantity of yarn needed for the minimum requirements of the industry as a whole. Of this quantity, only 78.4 per cent was being spun at the end of Janu-

Raw Cotton.—Some difficulties have arisen in connection with the changes in arrangements for the importation and distribution of raw cotton. Though the directors of the Liverpool Cotton Association have recommended their members not to accept the terms offered by the Controller, the Manchester Association has accepted the scheme. The Liverpool merchants take exception to the proposed commission of 1½ per cent on the selling price of cotton sold by merchants disposing of cargoes, and 1 per cent to merchants selling stocks released from Control stores. It is not yet known whether further negotiations will take place, but it is understood that the Controller has made all his plans for taking full responsibility for importation and distribution of raw cotton from the end of this month when Cotton Importers and Distributors, Ltd., is to be liquidated.

Finance

GOVERNMENT RETURNS

For the week ended March 14, 1942, total ordinary revenue was £53,278,000, against ordinary expenditure of £103,448,000, and issues to sinking funds of £245,000. Thus, including sinking fund allocations of £11,746,795, the deficit accrued since April 1st is £2,559,470,000 against £2,319,063,000 for the corresponding period a year ago.

needed) is to ensure "a complete fusion between military plans and thought and production plans and thought," not only in the realm of strategy, but also in the realm of battle tactics.

To accomplish this last purpose, there is to be a body which the Minister referred to as a "General Staff of War Production," but whose formal title is apparently to be the Joint War Production Staff. This body is designed to be an exact parallel to the Chiefs of Staff Committee on the military side. It will consist, in addition to the Minister of Production, of his Chief Adviser on Programmes and Planning, Sir Walter Layton, of the three Assistant Chiefs of Staff of the fighting services, and of the highest technical officers of the three Production Ministries. The new Staff (again in parallel with the military organisation) will be served by a Joint War Production Planning Group, whose members, though they will be drawn from the same sources as the Staff, will work together in a single office. The Minister explained that this plan had been suggested to him on his arrival by Sir Walter Layton, and that it "accorded in almost every aspect with the broad conclusions which I myself had reached." *The Economist* takes no small pride in finding its former editor in charge of arrangements which it has itself frequently advocated.

The arrangements for integration of British with American production are still somewhat indefinite. The structure of Combined Boards arranged by the Prime Minister in Washington at Christmas time had one obvious gap. There are boards to correlate strategy, to control raw materials and to assign to the different combatants the weapons that they jointly produce—but there are as yet no formal arrangements to co-ordinate the production of these weapons. This gap, it now appears, is to be filled. The changes that have been made, both in Washington and in London, in the past three months make the necessary arrangements much simpler. What is, in effect, needed is a representative of Mr Lyttelton to sit with Mr Nelson in Washington and a representative of Mr Nelson to sit with Mr Lyttelton in London. It is apparently not intended that Lord Beaverbrook shall remain in America very long and "it is intended to send someone, perhaps of Ministerial rank, to preside over the

various British bodies and to concert with our American Allies all the measures necessary." It is very much to be hoped that the man chosen for this most important post will not only have the technical qualifications but will also be the type of man who is appreciated in America. Generally speaking, the qualities that make for success in British party politics do not make for easy co-operation with Americans.

Apart from these problems of integration and liaison, whether with the fighting services in this country, or with the United Nations, Mr Lyttelton has the internal task of giving cohesion and leadership to the domestic production programme. For this, his staff is to be divided into four main Divisions. One is to be the Programmes and Planning Division under Sir Walter Layton; its functions are adequately conveyed by its title. Another is the Production Division, which will deal with all matters, common to the three Production Ministries, which concern the actual production of arms, as distinct from the construction of programmes and the placing of orders. A third Division will deal with Raw Material matters, including general policy, imports and allocations. The Regional Division is to be the fourth. It is proposed to expand the existing capacity clearing centres and to organise all small firms (of which there are 26,000) in groups attached to local organisations which "would have as their main function that of exercising a general supervision of the allocation of orders to firms so as to avoid overloading, wastage of capacity and things of that sort."

This is the administrative machinery which, after several false starts and hesitations, has at last been set up. As Mr Lyttelton himself said, administrative measures cannot cause immediate improvement. The next task, after many weeks spent on machinery, is to use it to tackle the problems. Many of these were implied in the Minister's speech or drawn to his attention in subsequent speeches. Perhaps the most important of them all, as was suggested in *The Economist* last week, is to devise means of making the most economical use of the management skill of the country. This is an even scarcer ingredient of production than the three that Mr Lyttelton already controls, and one of his first tasks should be to subject it also to close allocation.

Balkan Base

WHETHER Hitler's spring offensive falls to the north or the south of the Black Sea—or both—the lands which lie between the frontiers of Austria and the Dardanelles will be the main base for the attack. Disorder, breakdown, opposition here would hamper military operations seriously. There are few areas in Europe where it is more essential that the "new order" should work.

It is not only a matter of easy communications and an undisturbed base line. South Eastern Europe is to make its contribution in manpower and in materials. A quota of a million men has been allotted to Hungary, 300,000 to Roumania, smaller groups of "volunteers" to the Slovaks and the Croats. No publicity has been given to Bulgaria's quota, but unofficial reports put it in the neighbourhood of 200,000. Apart from Roumanian oil and a few metals from Yugoslavia and Hungary, food-stuffs are the materials in chief demand. The Germans are trying to increase the output of wheat and maize throughout South Eastern Europe. In Hungary, the introduction of more mechanised methods in agriculture is to double the yield. In Yugoslavia, the papers are full of appeals to farmers to increase the acreage under grain. The peoples of Roumania and Bulgaria, formerly self-sufficient, have bread cards, yet are still being urged to meet the insatiable requisitioning by more production.

These are no small demands to make on conquered countries, and as they stand on their Balkan base, the Germans cannot but feel how thin is the crust and how great the disturbances that surge below. In each country

they have to face the passive and sometimes active opposition of the peoples. If they could have stopped short at unobtrusive occupation, all might have been well. The anti-German feeling is weakest in Hungary, whose troops have on the whole seen little fighting in Russia, and whose Government was able to bargain for a more or less complete control in internal affairs at the cost of complete submission to Germany in the foreign field. But the Germans cannot stop short at a heavily camouflaged investment of these territories. For one thing, they have fierce physical opposition to put down. This is strongest, naturally, in Yugoslavia, which alone of the states north of Greece fought to keep the Germans out. General Neditch, the Serb puppet ruler, has just issued an appeal for peace on the grounds that, after the war in the spring of 1941 and Mihailovitch's campaign in the autumn of the same year, the Germans will exact a terrible, indeed an annihilating, punishment on the Serbs if they revolt again. The timing of this warning is significant. In a few weeks, the snow—with its betrayal of tracks and footmarks—will have gone. The cold which made life in the open barely possible has gone already. The Serbs are taking to the forests and the mountains. The guerilla war is about to begin again.

Even where the Germans entered "by invitation," and the people watched the process with passivity, or indifference, a year of the "new order" has altered the general attitude. The losses on the Russian front—Roumania's casualties are over 200,000—were enough to embitter the people. Economic disaster has increased the discontent.

Gone are the days when Germany was the great stable market and the biggest single factor in peasant security. It is no longer the market but the open gullet. Into that hungry maw, the surpluses and the necessities of South Eastern Europe have largely disappeared. While all the countries have meatless days and bread cards, the grain and the livestock roll off up the Danube, and in return comes—virtually nothing. Germany's debt to Roumania is something like 40 thousand million lei. Some estimates put the debt to Bulgaria as high as the total national budget for one year.

However, except in Serbia, popular discontent is not a serious military problem. The Germans can rely on their own soldiers and Gestapo officials. For the policing of the people, they can also count without exception on the support of the governments. In other spheres, however, the quiescent or puppet rulers are giving trouble. Their front with Germany against Russia, against Britain or against their own people, may be united, but it is anything but united between themselves. One Vienna Award does not wipe out the political enmity of centuries. Underneath the façade of Tri-partite Pact and Axis collaboration, the old splits have reappeared. The most serious cleavage is the question of Transylvania. The tension between Hungary and Roumania has not for one moment subsided since October, 1940. The loss of Transylvania, the heavy casualties suffered by the Roumanian army fighting on the Russian front, Hitler's new demands on Roumania, the obvious fact that Hungary had suffered far less in Russia and was doing far less for the next campaign have combined to provoke the Roumanians into a very excitable state. What may be the last straw was the recent report—passed on by the Bulgarians and probably correct—that Hungary had proposed to Bulgaria a new partition of Roumania. This led to a bitter outburst from Michael Antonescu, the Roumanian Foreign Minister, and a threatening reminder that Roumania had not abandoned its claim on Transylvania.

There are also points of friction between Hungary and Italy. As a bait to secure greater collaboration the Germans are offering the Magyars a position of predominance in the Northern Balkans. There has been talk of the "return" of the Banat and of the creation of a free port at Fiume. But this is direct trespassing upon Italy's preserve, Croatia. The Italians have countered Germany's support of Hungary by stirring up further trouble among the Croats, using the disturbances to send in more troops and then pointing to the need for police work in the Balkans as a reason for cutting down the consignments of Italian manpower to the Russian front. And Hungary is not the only power at loggerheads with Italy. A fine dispute is brewing between Italy and Bulgaria over control of Salonika. The Bulgarians, not content with Macedonia, Morava and Thrace, wish to round off their conquests with one of the chief ports of the Aegean. The Italians claim it as part of their "pro-

tection" over Greece—possibly with an eye to its inclusion later in a "Greater Albania." Finally King Boris of Bulgaria, playing every card he can to keep his country from fighting Russia—a move which might drive his pro-Slav people to open revolt—has gone to Hitler to plead that Turkey's attentions are so aggressive that the Bulgarian army must be left in Thrace.

The German military straitwaistcoat is firm enough to contain all these lunatics. It is doubtful whether even the Hungarian-Roumanian tension will resolve itself into fighting, so long as German troops and German Gestapo provide a framework of "order." Politically, the Balkan base is rickety but still secure. Economically, its plight is less certain. After a year of the new order, standards are everywhere in headlong deterioration. Because of Germany's requisitioning and inability to send in goods in exchange, nearly everything is in short supply. In Bulgaria prices have risen between 100 and 300 per cent. The coming spring and summer will aggravate the economic problem. It is not possible to drain away millions of men from the Balkans, where mechanisation of agriculture is at a very primitive stage, and expect at the same time to double and treble the yield of the harvests. This year's output must be lower if Hitler gets his quota of men; and it does not look at present as though any of the governments will refuse. Yet if standards are lowered still further in the Balkans, the appalling tragedy of Greece may be repeated. There is typhus in Croatia, in Roumania, and Hungary. It is not far from there to the German frontiers.

The situation in the Balkan base is deteriorating, of that there can be no doubt. It has not yet deteriorated far enough to be anything more than an inconvenience when the spring offensive is launched. Its really dangerous implications are for the future. At the first sign of a definite military breakdown in Germany, the only element of cohesion in the Balkan situation will vanish. The region will fall apart into an anarchy of national and civil war, with an inevitable accompaniment of famine, plunder and disease. Possibly the Germans still feel sufficiently confident of victory to scout this possibility. But is it certain that victory will exorcise the spectre of anarchy and collapse? Even if the Germans win a campaign in Russia, they will be more exhausted, their stocks will be lower, more of their subject peoples and their labour force will have been lost in the holocaust. On what reserves will they draw to shore up the shaking Balkan structure? Can the peoples of South Eastern Europe—or indeed of Europe generally—bear much longer the hideous load their masters have laid upon them? The end may come not by riot and revolt, but by a crumbling away of the social order in disease and famine and exhaustion. If the fields are not tilled and the wheels no longer turn, even the proudest conqueror cannot march. The ground beneath the Germans' feet is not so much mined as hollow. Under the weight of yet another campaign, will the crust hold?

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

The Merchant Marine

LAST week, Mr A. P. Herbert succeeded in raising, on the adjournment, the delayed controversy over conditions in the merchant marine. The debate, which was by no means a full-dress affair, arose out of the discussion aroused by the tabling of motions, some six months ago, by Lord Marchwood in the Lords and by Mr Herbert in the Commons, suggesting the setting up of a Royal Commission to enquire into the affairs and future of the merchant navy. Merchant seamen are among the sections of the community which find the value of their services to the nation quite exceptionally increased by war-time conditions. While in peace they performed useful work, they now perform a service vital to the prosecution of the war and as dangerous as any carried out by the fighting services. Yet there is no guarantee that after the war recent improvements in seafaring conditions can be maintained or even that continuous employment can be provided. To-day, when the importance of the merchant navy is plain to all, there is an opportunity to examine the conditions which govern its future with some possibility that due consideration will be attached to its claims.

The most remarkable features of the Commons debate were unanimity on the aim and lack of appreciation of the conditions under which it could be realised. There are, of course, two main issues: what can be done to improve conditions while the war is on?; and what can be done to build up and maintain a large and efficient merchant navy after the war? The first is a question of practical possibilities; the second of high policy.

So far as immediate improvements are concerned, the limiting factor is, of course, the necessity of preventing humanitarian considerations from impeding the war. Mr Noel Baker, replying for the Government in his new rôle as Joint Parliamentary Secretary to the Ministry of War Transport, pointed out with justice that all seaworthy ships must be sent to sea, irrespective of the living quarters which they provide for officers or men. This is unavoidable. Moreover, with the awakening of public interest in the merchant navy, several important reforms have already been introduced during the war. Most important of all, the seaman is now assured of continuous employment. There has been an increase in the basic rates of pay for all ranks; compensation is provided for loss of kit, whether through marine or war risk; pensions are given to the dependants of men killed as the result of a war risk; and four free travel warrants a year are allowed, as for the fighting services.

There is a good case for rejecting a plea for the immediate setting up of a Royal Commission purely on grounds of expediency, although there appears to be evidence that the notion is acceptable to considerable numbers of actual seamen. The machinery which already exists in the form of the National Maritime Board (on which ship owners, officers and crews are represented), the Officers' Association and the Seamen's Union, has in the past proved capable of working with the Government for the betterment of conditions. Recent correspondence suggests that the limited nature of the results which they have obtained has prevented them from obtaining the full confidence of the seagoing community. But the inevitable delays associated with the work of a Royal Commission, and the fact that day-to-day improvements would be prejudiced until its findings were known, could not fail to impede immediate progress. Mr Shinwell summed up the complaints of the moment as relating to "food scales; crews' quarters; the training of seamen; manning on deck and below; the long hours during which men in the catering department labour; and matters of that sort." There was no disagreement that the Government and the shipowners must go to the limits of possibility in removing grounds for complaint on these issues and there is no doubt that

progress can best be made by pressure of public opinion—which the debate has helped to arouse—on the parties immediately concerned.

But the larger issue is infinitely more important and more complicated. Heroism, and its recognition to-day, provide no guarantee that improvements in conditions won during the war can even be maintained, much less advanced, when peace is gained. There is no general realisation that improved conditions depend essentially on the post-war prosperity of British shipping, which itself depends on the resurrection of international trade and on the share of it which is carried under the red ensign. Yet, even this almost self-evident proposition conceals many problems of great importance. The first is that the improvement of seafaring conditions; the construction of ships with better quarters; the maintenance of continuous employment; and the provision of a uniform system of entrance, training, advancement and pension rights would substantially raise the costs of British shipping and worsen its competitive position in comparison with the merchant navies of other nations. If more ideal conditions are imposed on the industry in the interest of the merchant seaman, the merchant marine will either be smaller than if its costs were unregulated, or its cost to the nation in the form of subsidies will be raised. If conditions of entry, employment and retirement of merchant crews are regulated by the state and a substantial portion of the cost is borne by the Government, it is by no means clear whether such assistance can, or should, be divorced from more or less complete state control of the shipping industry as a whole. It is clearly impossible to discuss seafaring conditions in the post-war world in isolation either from the question of international trade or from the more circumscribed question of the future of the shipping industry.

There is indeed a good case for concluding that the cost of maintaining a large merchant marine with steadily improving conditions for all its crews should be borne by the State. The shipping industry, as is abundantly clear to-day, is not merely a commercial asset; it is vital to the safety of the nation. The essential difficulty arises from the fact that the merchant navy combines some of the features of a commercial venture, a public utility and a fighting service. If its size and character are left to be determined by purely competitive forces, there is good reason to suppose that its working conditions will be far from ideal. If working conditions are regulated to an extent which public recognition of the value of the services of the merchant seaman requires, the merchant navy may well be too small for national safety. The issue must be faced that the achievement of both aims may well require the shipping industry to be subject to a far greater degree of public control, and supported to a far greater extent by public money, than is generally contemplated to-day. The utmost restoration of international trade is of basic importance, but this would not in itself secure an adequate share for the British merchant navy.

There is a further complication which was hardly hinted at in the Commons. The widespread ambition to foster a powerful merchant navy is scarcely compatible with high farming in Britain. Both are advocated on security grounds, but it is not generally realised that they are, in the last resort, alternative solutions. The champions of security through maximum production of food at home imply a minimisation of food imports and consequently of the total trade which Great Britain can do with the Dominions and the world at large. The champions of security through the maintenance of an ability to import, and to keep the sea lanes open even in the thick of war, postulate a strong navy, a strong air force, a strong mercantile marine and international trade at the maximum. It is obvious that food production at home can never provide a complete answer to enemy blockade and

that security demands that, where the two solutions compete, preference must be given to merchant shipping. It is not possible to promise the moon both to the farmer and to the merchant seaman.

The future of the merchant marine, and the problems which it raises, must form an integral part of any reconstruction programme. If the case in the short run against

reference to a Royal Commission rests on the necessity for speed, in the long run it rests on the virtual impossibility of considering the question of the merchant navy in isolation. This is no argument for postponement of the issue; it is a plea that it should be considered in its setting, both by the parties concerned and by the general public.

The Controllers

THE table on the next page lists the names and the previous business affiliations of the persons who are generically referred to as "the Controllers." In actuality, the description is not universally applicable, nor does it mean exactly the same thing in its various applications. In the Ministry of Food, for example, the persons listed are the active heads of the sections of the Ministry; their status is, in effect, that of civil servants. The Controller of Light Metals is much more directly subject to his departmental superior in the Ministry of Aircraft Production than any of the Ministry of Supply controllers are to their bureaucratic counterparts. The Controller in the full sense is, in fact, a phenomenon almost confined to the Raw Materials Department of the Ministry of Supply. The Controller deals directly with the trade he controls. He derives his legal powers from the Minister, who alone can issue orders and regulations. But the administrative jurisdiction of the Controller is considerable, and his position is one of substantial power within his trade. In very many cases—perhaps most—the administrative expenses of the control are either levied from the trade or defrayed by the trade association.

A glance down the list will show that the consistent policy has been followed of appointing as Controller a prominent personality from the trade to be controlled. There are, it is true, exceptions to this rule. The four names given under the Ministry of Works and Buildings, for example, are of independent men. This was not always so; until a few weeks ago the Cement Controller was Lord Wolmer (now, as Lord Selborne, translated to the Ministry of Economic Warfare), who had been chairman of the Cement Makers' Federation. Two of these four Directors have been appointed since Lord Portal's advent to the Ministry, and it is perhaps not fanciful to suggest that the choice of independent persons has something to do with Lord Portal's experience at the Raw Materials Department, where the opposite policy has been so deliberately pursued.

With a very few exceptions, the policy is consistent—though no other controls are in the position of the Steel Control, where the Controller is the chairman of Baldwin's; his superior, the Parliamentary Secretary, is a partner in the firm of chartered accountants which for many years has managed most of the price-fixing associations in the trade; and the Minister himself was, in peacetime, the chairman of the Iron and Steel Federation. Another remarkable case is the Petroleum Board, a body which, when it was incorporated in the apparatus of control, was wholly self-appointed. Other cases are not so spectacular as these, but in their different ways they tell the same story. The deliberate theory underlying the whole structure has been that industries should control themselves. Other instances of the same tendency of thought could be quoted from many parts of the economic legislation and administration of the past decade. For example, the Mines Department, when it had decided, as part of its organisation for the wartime control of coal production, to appoint a Coal Supplies Officer for each of the 17 mining districts, approached the trade association of each district with the offer to appoint the association's nominee, if it would pay his salary.

The system of self-control has certain advantages from the Government's point of view. It certainly makes for the quiet life, since there will be few objections except from persistent weekly journals and perhaps, occasionally, from a minority in each trade which values independence above the fruits of "co-ordination." The

system is also undoubtedly useful in setting up a complex machinery of control in a hurry, as at the outbreak of war, since delay in finding suitable controllers and acquainting them with the facts of their industries is avoided. Indeed, the usual official defence of the system alleges that the appointment of "indigenous" controllers (as they may be called) is necessary in order that the control may operate with skill and experience. But, if this is so, then *à fortiori* nobody but a financier should ever be appointed Chancellor of the Exchequer, nobody but a soldier to the War Office, nobody but a farmer to the Ministry of Agriculture. There is no reason why a controller, like a Minister, should not have a skilled and expert staff. The contention of those who criticise the official policy is that the man who takes the responsibility for making decisions should be independent.

For this contention there are three main reasons. The first and by far the least important is what may be called the moral argument. A controller is in a position of very considerable power to influence, not only the relations between his trade and the consumers of its products, but also the relative position of different firms in the trade and of different consumers. Even with the closest supervision by the Ministry that is responsible for him, he could use his power in his own interest. Of actual dishonesty—that is, the lining of private pockets—it should be said at once that there has been no trace. On the contrary, the controllers are men of the highest probity, who are determined to do their duty with scrupulous care. Of a certain—doubtless subconscious—tilting of the scales there is rather more evidence. There are few producers who do not, in greater or less degree, believe that they get rather less than their full deserts in a free market. In many trades there is a dissident minority which the majority believes to be disturbers of the commercial peace. These beliefs are perfectly sincere and honest; what more natural than that they should affect the decisions of perfectly sincere and honest controllers?

This, however, as has been stated, is not the most serious count in the indictment, since there is no reason whatever to suppose that such impropriety is widespread. The second reason for objecting to the policy of indigenous controllers lies in the effect it is almost certain to have on the economic structure of the country. As has frequently been pointed out in these columns, the British economy was already, before the war, moving with ominous rapidity towards a state of monopoly or near-monopoly. This was the solution found by the dominant section of the Tory party for the problem of discovering a middle course between *laissez faire* and socialism. Indeed, it was only natural that what had become a businessman's party should turn to businessman's economics. What is more surprising is that so few voices have been raised to protest against the damage done to the public interest by a policy which parcelled out the national economy into a number of exclusive baronies. The Brummagem system that has grown up since 1931 might almost be called that of the Corporative state, save that it has lacked the firm supervision of an energetic state administration. It is a system that is intended to be strong in its parts, weak at the centre; the best name for it is Economic Feudalism.

This system was already enough of a threat to the roots of British prosperity before the wartime controls gave it an obvious and immense impetus. Even a wholly self-supporting economy will produce less wealth for its citizens to consume if its producers are allowed to follow

the slogan of High Profits and Small Turnover than it some external force, either of competition or of state control, forces them to maximise output. But in the case of the British economy, the effects may well be disastrous. This island, with its present population, depends absolutely on being able to import raw materials and food-stuffs. In paying for these imports, it now has no natural advantages except the ability of its industrial population to turn raw materials into manufactures that can sell in competition. Now it is a silly delusion to suppose that producers, either individually or collectively, can be put into the position of monopolists without acting as monopolists and there is a great deal of evidence from the 1930's that this was, in fact, the consequence of the policy pursued. As it happened, however, the effects were hidden by the accident that the decade coincided with a substantial movement of the terms of trade in Great Britain's favour. The relative movement of prices made it possible for the necessary quantity of imports to be paid for by a smaller quantity of exports and a veil was drawn over the uncomfortable fact that, if more had had to be paid for the imports, it would probably have been impossible to do so. The worldwide crisis of the primary producers fostered, in Great Britain, the delusion that a deliberate high-cost policy would not impede the progress of the standard of living. This temporary and accidental good fortune will, in all probability, desert the country after the war. The British economy, deprived of its foreign assets and reserves, will be exposed to the cold winds of a world in which primary producers will be organised, while innumerable competing manufacturers will have sprung up. And to face this situation the country will be bequeathed by the wartime controls an industry which will have almost forgotten what low costs or competing prices are, an industry entirely wedded to high-cost "stability." The prospect is frightening.

The third reason is more important still, because more urgent. The wartime necessities of the community and the peacetime interests of specific industries are frequently in conflict. It is in the community's interest that many sorts of industrial capacity should be increased as rapidly as possible; it is in industry's peacetime interest that capacity should be kept in close relation to normal

demand. It is in the community's interest that all unnecessary consumption of scarce materials should be promptly and drastically restricted; it is in industry's interest to leave normal channels of trade intact as long as possible. It is not suggested that indigenous controllers cannot see the public interest; they can, and they act upon it. But in most of these cases, the necessity is not clear from the start, it appears gradually. The emergency, against which steps should be taken, develops very slowly from the possible to the probable to the certain to the imminent to the urgent, and at all stages there is room for differences of judgment on the quantitative extent of the steps that should be taken. It is only human nature that the man whose whole life has been and will be in the trade should hesitate and hang back, that in a painful necessity he should see the pain more clearly than the necessity. In wartime, no emotion is stronger than the patriotism that leads men into the army. Yet there are always so many men who can give themselves perfectly honest reasons for not doing what the manifest public interest requires that the voluntary system has to be abandoned. Why should the clarity of human thought, when in conflict with human interests, be rated any higher in commercial matters, where the public interest is not reinforced by any so powerful patriotic emotion? "No man hath quickened his own soul," and the result of the policy of allowing industries to control themselves has been a consistent record of Too Little and Too Late.

This is not a matter of small importance; it lies at the very centre both of the productive war effort and of the post-war national economy. It is not, of course, suggested that the controls be abolished, or that their functions be performed by the Civil Service, with all the imperfections of a bureaucracy in business matters. Nor is it suggested that the controllers should not be recruited from the ranks of businessmen. But it is seriously suggested that they should be businessmen without any connections whatsoever with the trades they are to control. And it is seriously suggested that, even at this late hour, there are few changes in administrative machinery that would do more either to improve the productive effort of the country or to increase the confidence of the people that nothing was being allowed to stand in the way of victory.

THE CONTROLLERS

CONTROL	CONTROLLER	MAIN PREVIOUS BUSINESS CONNECTION
Ministry of Supply		
Steel	Col. Sir Charles Wright	Baldwin's.
Non-Ferrous Metals	A. M. Baer	British Metal Corporation.
Alcohol	T. A. Board	United Molasses; family connections with Distillers Co.
Plastics	L. P. B. Morriam	British Associated Plastics; British Xylonite Co.
Diamond Dies and Tools	R. L. Prain	Anglo-Metal Co.; Mufulira; Roan Antelope; Rhodesian Selection Trust.
Chemicals	F. W. Bain (Chairman of Central Board)	Imperial Chemical Industries.
Fertilisers	H. Cunningham	Fertiliser Manufacturing Association; Scottish Agricultural Industries (I.C.I.).
Sulphuric Acid	N. Garrod Thomas	National Sulphuric Acid Manufacturers' Association.
Sulphate of Ammonia	F. C. O. Speyer	Imperial Chemical Industries.
Timber	Major A. I. Harris	Past President, Timber Trades' Federation.
Wool	Sir Harry Shackleton	Taylor & Shackleton, Spinners; Chairman, Woollen and Worsted Trades' Association.
Cotton	Frank Platt	Lancashire Cotton Corporation.
Flax	J. S. Ferrier	Wm. F. Malcolm & Co.
Hemp	A. Landauer	A. Landauer & Co. (Hemp and Fibre Merchants).
Jute	H. S. Sharp	J. Sharp & Sons, Dundee; Association of Jute Spinners and Manufacturers.
Silk and Rayon	H. O. Hambleton	Hambleton & Co., Silk Weavers.
Paper	A. R. Reed	Albert H. Reed & Co. (linked with Associated Newspapers); London Paper Mill Co.
Industrial Diamonds	Sir Cecil Rodwell	Consolidated Gold Fields of South Africa; Roan Antelope, etc.
Leather	Dr. E. C. Snow	Chairman, United Tanners' Federation.
Rubber	F. D. Ascoli	Dunlop Plantations, Ltd.
Ministry of Aircraft Production		
Light Metals	G. W. Lacey	British Aluminium Co.
Board of Trade		
Tobacco	A. H. Maxwell	Macmillan, Maxwell & Co. (Tobacco Leaf Merchants).
Petroleum	Sir Andrew Agnew (Chairman of Petroleum Board)	Shell Transport & Trading.
Ministry of Works and Buildings (Directors)		
Building Materials	Sir Harold Howitt (Chairman of Board)	Peat, Marwick, Mitchell & Co. (Chartered Accountants).
Cement	J. Norman Daynes	King's Counsel; Chairman of Appeals Tribunal under Coal Act, 1938.
Ministry of Food (Directors)		
Bricks	L. W. Hutson	Cullen, Lockhead & Brown (Architects).
Roofing Materials	R. G. Cromwell	Hall & Co., Ltd. (Builders and Coal Merchants).
Ministry of Food (Directors)		
Manufactured Foods	F. W. Aldridge	Co-operative Wholesale Society.
Chocolate and Sugar Confectionery	W. Wallace	Rowntree & Co., Ltd.
Bacon and Ham	J. Loudon	John Loudon & Co., Ltd. (Produce Importers).
Tea and Coffee	Sir Hubert Carr	Retired Tea Grower.
Cocoa	J. Cadbury	Cadbury Brothers, Ltd.
Rice	H. L. Sanderson	Chas. Winble, Sons & Co. (Produce Brokers).
Dried Fruits and Edible Nuts	A. E. Gough	Overseas Farmers' Co-operative Federation, Ltd. (marketing organisation for Empire Co-operative Producers).
Imported Cereals	J. V. Rank	Joseph Rank, Ltd., & Ranks, Ltd.
Home-Grown Cereals	C. D. B. Ellis	Ellis & Everard, Ltd., and Joseph Ellis & Sons, Ltd.
Cereal Products	C. A. Loombe	Reckitt & Colman, Ltd.
Bread	J. N. Frears	Frears & Blacks, Ltd.
Emergency Bread Supplies	W. S. Duthie	Allied Bakeries, Ltd.
Oatmeal and Pearl Barley Milling	I. Maclean	Thomas Borthwick (Glasgow), Ltd.
Cakes and Biscuits	Howard Hughes	Alfred Hughes & Sons, Ltd.
Edible Pulses	L. T. Houlding	Sanday & Co., Inc.
Meat and Livestock	H. S. E. Turner	New Zealand Refrigerating Co.
Canned Fish	F. Wilkinson	Co-operative Wholesale Society.
Fish	J. Adamson	McClelland, Ker & Co. (Chartered Accountants).
Animal Feeding Stuffs	Sir Bryce Burt	Indian Agricultural Service.
Starch	J. Roberts	Reckitt & Colman, Ltd.
Cold Stores	E. F. Farrow	Hay's Wharf, Ltd.
Eggs	J. A. Peacock	Nurdin & Peacock, Ltd. (Wholesale Produce Importers).
Fresh Fruit and Vegetables	C. H. Lewis	National Federation of Fruit & Potato Trades, Ltd.
Potatoes	Capt. J. Mollett	Potato Marketing Board.
Fruit Juices and Pectin	G. T. Shipston	California Fruit Growers' Exchange, Ltd.
Canned Fruit and Vegetables	B. E. Payne	J. Travers & Sons, Ltd.
Wholesale Co-ordination and Unrationed Foods	C. E. Davies	H. H. & S. Budgett & Co., Ltd.
Milk Products	H. E. Davis	Dominion of New Zealand Dairy Sales Division (London Manager).
Milk	S. Foster	Milk Marketing Board.
Oils and Fats	H. Davis	Lever Bros. & Unilever, Ltd.
Transport	A. G. Marsden	Cadbury Brothers, Ltd.
Warehousing	S. Whibley	Clarke, Nickolls & Coombs, Ltd.

NOTES OF THE WEEK

Threat to Calcutta?

The fighting in Burma has taken a turn for the worse. Japanese troops have succeeded in cutting the Mandalay-Toungoo road and it is doubtful whether they can be dislodged. Yet it is possible that the chief danger does not lie in the Japanese advance up the Sittang. The immediate aim of the Burma campaign is to cut off China from India; a proximate aim, to prepare a springboard for an attack on the Indian coast. For both these ends, an advance deep into the interior to Mandalay and beyond would be costly and wasteful. The Burma Road is cut if the ports that feed it are cut off. So would be the new Assam Road. India will be attacked not from the interior of Burma but from the coasts, across the Bay of Bengal. The most

ominous news of the week is therefore the report of a Japanese penetration of the Yoma hills which lie between the Irrawaddy and the coast. The objective is control of the coastal province of Arakan. At Kyaukpyu, 75 miles south of Akyab, there is a sheltered natural harbour. Akyab itself—only some 400 miles from Calcutta—has a harbour that can take big ships at high tide and is an important air and seaplane base. Complete Japanese control here would immediately menace Calcutta and hence the gateway to the Assam Road. Coupled with the capture of the Andaman Islands, only 700 miles south of Calcutta, it may close the Bay of Bengal to Allied shipping.

The Daily Mirror

Amid all the controversy regarding the threatened suppression of the *Daily Mirror*, one point stands out with reasonable certainty: Mr Morrison's warning to the paper and his subsequent denunciation of its policy could not have been undertaken lightly. Contrary to a fairly widespread belief, the present Home Secretary is no dictator who seizes every opportunity of exercising his emergency powers; he is not a man who wilfully courts unpopularity but is rather one who is over-anxious lest his popularity should suffer. It is most unlikely that, in view of the buffeting he recently suffered over 18B and the perpetual heckling he receives over the *Daily Worker*, he would have attempted a fresh hurdle unless he—or much more likely the War Cabinet—had been really afraid that the *Daily Mirror* was having a harmful effect on the nation's war effort. Whether there is just cause for this fear is a question which cannot readily be answered. The *Daily Mirror* claims that, so far from its policy being harmful to the war effort, it has consistently urged stronger measures for mobilising the nation—which have eventually been adopted. And yet—

though the *Daily Mirror* would probably be surprised to learn of it—other papers have urged the same reforms even earlier and even more vigorously and have not been threatened with suppression. Clearly there is a distinction between the substance of criticisms and the methods chosen to present them. In what, therefore, does the offence of the *Daily Mirror* consist? What sort of criticism is it that the Government, which has shown a quite remarkable tolerance to Press criticism throughout the war, considers harmful? The only official clue to an answer lies in Mr Morrison's statement—"general, violent denunciation, manifestly tending to undermine the Army and depress the whole population..." It is also important to notice that intent to undermine or to depress is not a point at issue—publication of harmful matter does not excuse the paper if it is done "with a reckless and unpatriotic indifference to its harmful effect rather than with a deliberate intention to produce such an effect." This may perhaps be interpreted as meaning that when criticism is regarded as an end in itself instead of as a means to a more vigorous war effort, it becomes intolerable.

But ought the Government's intolerance to be carried to such lengths that the paper concerned is suppressed out of hand, without warning and without appeal? Fleet Street's all-but-unanimous negative is not, by itself, convincing; since it seems to be an article of faith in many parts of Fleet Street that no paper should ever be suppressed in any circumstances. But this is certainly not true. It is possible for a newspaper's editorial policy to endanger the safety of the community; and when it does so, the newspaper deserves to be suppressed. In fact, the question cannot be decided on the lofty planes of high principle, since the high principles are in conflict. It must be decided as a matter of particular fact. Has the editorial policy of the *Daily Mirror* in fact been damaging to the national cause? That is a matter of opinion, and in the long run there is only one opinion that counts, that of the House of Commons. In spite of the general preference for judicial rather than executive procedure, this necessity of bringing the matter before Parliament is the strongest argument for proceeding under Regulation 2D rather than under 2C, which would bring it before the courts. There is still another consideration in this complex matter. Even though the *Daily Mirror* may have caused depression and despondency? Among the suppression excite alarm and despondency? Among the *Daily Mirror's* very numerous and varied readers there must be a great many who disregard or discount its editorial columns and are mainly concerned with its other features.

Taking the Offensive

There is an air of expectancy the length of the Eastern Front—from Leningrad right down to the sands of Libya. Somewhere along this vast line the spring offensive will soon be launched, and just as the movement of troops and materials behind the Russian front presages new activity, so the Mediterranean zone has flared up into action in the last week. The Axis Powers are attempting to run more and more supplies into Libya. For some time past Britain has appeared to be able to retaliate only in the air. This week, however, has brought news of successful naval engagements. Eleven enemy ships have been sunk by submarines and an important British convoy has got safely into Malta, losing only one merchantman—a brilliant action, for Admiral Vian's light screening forces had to stand up to cruisers and battleships of the Italian Navy. They were driven off and at least one torpedo struck the battleship *Littorio*. The Axis concentrations are not confined to Libya. Reinforcements have reached all the Greek islands and although they are being used to put the screws on Turkey, a frontal attack on Alexandria and Suez is a far more likely objective. Given the imminence of the attack, it is fortunate that both Sir Stafford Cripps and General Nye have been able to hold conferences in Cairo and that changes in the Middle Eastern High Command—in the direction of youth and energy—are in the wind. It is perhaps too much to be hoped that the Allied forces should not wait for the attack but, should take the initiative. The unexpected blow gains treble strength and there is all too little evidence to suggest

that British plans are worked out on the basis of finding what the enemy least expects and then performing the impossible. There are two ways of making plans: the German and Russian way, which is to determine the scheme and then consult experts on the execution thereof, and the British way, which is to concoct a plan and then find out from the experts why it is impossible. Perhaps the passage through Cairo of Sir Stafford Cripps and General Nye—both men who represent the new sense of urgency in British political life—will leave its mark. In this war the hazardous, the unexpected, the impossible has so often succeeded. Even if full success were not achieved, it would be worth while risking partial failure in order to disrupt the smooth working of the enemy's timetable of offence.

Soviet Russia is showing some anxiety on the score of its Allies' readiness to take the offensive this year. M. Litvinov, in the United States, has appealed for greater activity on several occasions, M. Maisky used the presentation of the Order of Lenin to four British airmen as the occasion of an urgent appeal. The Russians have obviously analysed British habits of thought with remarkable precision. There was hardly a fallacy—official and unofficial, which M. Maisky did not touch on—the old "assurance of victory" talk: "No figures of potential human, industrial and natural resources will help the allies if these are not mobilised"; the fixation of 1943 as the Anglo-Saxon zero hour: "the decisive moment is the year of 1942. The decisive place is the front of the USSR. We have to start from this if the allies really desire to achieve victory"; the defensive outlook: "on all other fronts the allies should take the initiative into their own hands, and for this to be achieved they must outwit the enemy. These are the undoubted lessons of the war. They have been true for Britain—and for Russia—for the last three years. How many of them are still to be learnt?"

Mr Casey

The British and Australian Governments—and Parliaments—have apparently decided to let the affair of Mr Casey drop. Mr Churchill will have his way, and Mr Casey will go to Cairo to replace Mr Lyttelton. No contretemps should ever have arisen. No one, in either country, it seems, doubts Mr Casey's fitness for this post at the joint between the western and eastern war zones. He has been chosen as the best man available, not as an Australian representative; but the fact that he is an Australian is an added merit, both for the Cairo appointment and for the membership of the British War Cabinet that goes with it. It was equally for his qualities and experience that Mr Curtin wished him to remain in Washington. The text of the Churchill-Curtin telegrams has been published as a White Paper. In his first reply, on March 13th, to Mr Churchill's suggestion, the Australian Prime Minister made it quite clear that Mr Casey would be difficult to replace in Washington and that, in his view, "no approach should be made at this juncture." On the other hand, in his cable of March 14th—after Mr Churchill had urged that Ministers and Chiefs of Staff wanted Mr Casey in Cairo, that Mr Casey himself was known to want a change and that Mr Menzies might be suitable to replace him—Mr Curtin made it equally clear that, in the circumstances, the full extent of his demurrer was that Mr Casey should remain to meet Mr Evatt, Australian Foreign Minister, who was going to Washington. Mr Churchill was fully entitled after this message to cable his offer to Mr Casey—and to be surprised at the tone and substance of a later public statement by Mr Curtin suggesting that his wishes had been over-riden. It is true, as Mr Curtin cabled on March 20th, after Mr Churchill had expressed this surprise, that Mr Curtin had never disguised from the outset that he preferred no approach to Mr Casey and no change at Washington. Mr Churchill's persistence after the cable of March 13th, his reference to Mr Casey's wish to move and his suggestion of Mr Menzies as a substitute were perhaps not very tactful—though, even so, he had the powerful support of Ministers and Chiefs of Staff for his importunity. But Mr Curtin's further cable on March 14th was an unmistakable signal for Mr Churchill to go ahead, which he did at once. Mr Curtin apparently did not receive Mr Churchill's cable of March 14th saying that he was approaching Mr Casey immediately, and the first intimation he received that the offer had been made and accepted was from the BBC broadcast over the Aus-

tralian system—which was annoying. But the fact remains that his permission had been very properly sought and very specifically given, however grudgingly.

The Will to Death

The week's fighting in Russia has brought no marked changes. The Germans are still holding out at Staraya Russa, at Rzhev and at Vyazma. There is no change on the Orel-Kursk sector and no decision in the fighting round Kharkov. Meanwhile, the first signs of a definite spring thaw are slowing down the Russian attacks, and the evident relief of the Germans suggests that they are hoping for some respite during the weeks of mud and immobility. The time will be used to gear up to its utmost striking pitch the whole of the terrific German army machine on Russian soil. There seems little doubt now that the heaviest of the German blows will fall eastwards, and it is significant that there is something like a closing of the ranks in the German High Command. Von Rundstedt has been put back on active service, and a recent German propaganda film has made much of a visit of von Brauchitsch to Hitler. This is probably a preface to his reinstatement. Hitler's reasons for calling back his generals are obvious. He took over supreme command at a moment, not of great military, but of great moral danger. The Russians were certainly not going to break up the German armies, but there was a real question whether the German people could face the ordeal of a winter war. It looks now as though Hitler's political flair again served him well, for morale has not broken. It is rather a Dunkirk spirit that has prevailed. The Germans have been rallied, not by the thought of easy success, but by the ideal of total sacrifice and death, accepted unquestioningly in the service of Germany. To the propaganda, both British and Russian, which accused the German authorities of halving casualties and concealing the horrors of the front, Goebbels has made the reply—the psychological technique faintly resembles his adoption of the V-sign—of rubbing in the tragedy and underlining the holocaust, and whipping up patriotic fervour by sacrifice, not success. The number of the *Völkischer Beobachter* which appeared on March 15th, the German Day of Remembrance (*Heldengedenktage*), was a gruesome example of the new technique. On the front pages, there were four leading articles; on "Our Dead Comrades"; on the memory of a dead staff member of the newspaper; on the theme "Every dead man for Germany," described as a cry coming from the *Invalidenfriedhof*—the cemetery for the higher German officers; on "Comradeship" achieved only through comradeship in death—together with a poem to a dead soldier. The back page went even further—a four-column leader was devoted to "Thoughts on the Death of a Soldier," and a letter was reproduced from a blinded soldier writing to tell the mother of one of his comrades that her son was dead. How long a loyalty bolstered up by such stimulants can survive, only the trained mass-psychologist can say. But there is a strength in this will to death and will to destruction with which the United Nations are still spiritually unequipped to deal.

Agricultural Priorities

Last week the Minister of Agriculture reported progress. In the war, the ploughed acreage has increased by about half, and the output of potatoes, other vegetables and oats has in each case risen by three-fifths. Measured by the number of tractors per acre, British agriculture is now the most mechanised in Europe. Mr Hudson's account was impressive. But it is still possible to argue that the effort that is being made might be rendered more effective in terms of human food—its only object. Though complete figures of production are not published, there is some reason to believe that the larger part of the increase in output from the extended acreage has gone to replace imported feeding stuffs. That is to say, there has been an undue bias towards the growing of crops to be converted into animal food rather than towards foodstuffs for direct human consumption, which under siege conditions would be the best use of the land and its resources. The output of animal feeding stuffs is said to have doubled, while the output of wheat has increased by little more than a quarter. Moreover, it is claimed, the bias within the policy of producing animal feeding stuffs has been too much towards food for meat cattle, the most wasteful converters of feeding stuffs, and too little towards food for milk cattle, the most valuable

converters in terms of human food. It is very doubtful, in war conditions, whether the numbers of meat cattle should have been maintained, as they seem to have been from official statements, while dairy herds have been increased very slightly, and the numbers of sheep, pigs and poultry have fallen very considerably. It is a problem of priorities. The Government's policy is shown in the ratio between the respective prices fixed for the different kinds of agricultural produce, which give too little incentive, relatively, to the growth of food for direct human consumption and, in the case of indirect human foods, too little to milk, and possibly eggs, as against meat. It is an attitude which reflects, to no small extent, the balance of influence in British farming and farming traditions. In war economy, it is wasteful.

Co-operation in Farming

Just as the determinant of wartime agricultural programmes is the shortage of shipping space, the determinant of wartime agricultural methods is the scarcity of labour. Lack of manpower is the reason given why, say, another five million acres, in addition to the extra six million acres already brought in, cannot be ploughed up; and this is the main motive which has caused the remarkable increase in the numbers of tractors used since 1939. Plainly the problem is to make the maximum use of the limited human and mechanical resources available. The test is the volume—and balanced dietetic value—of foodstuffs produced. To decide upon the best foods to produce (which is still unfortunately a matter of dispute and political manoeuvre) is only the first step. No less important are the methods and organisation of food production, and there is a growing opinion that, in agriculture as in industry, there is room for considerable improvements in the direction of local and regional co-operation. In industry small firms are the problem, in agriculture small farms. Mr Hudson pointed out last week that four-fifths of Britain's farms are under 150 acres in size; and obviously the maximum pooling of machinery and labour over regions is required to achieve the maximum output. It is not enough to have more tractors per acre than any other country; it is also necessary to use them to the full, regardless of the financial resources of individual farmers. And the same is true of labour and fertilisers. Smallness of acreage, bank balance—or outlook—should not be permitted to be a bar to efficient standards of production. Much has, admittedly, been done to meet the overheads of efficient production, for small and large farms alike, by drainage and other schemes; and ploughing-up and other subsidies are designed to prevent expansion from being impeded by the limited resources of individual farmers. But these, again, are only first steps. Most subsidies are based on acreage, ploughed-up or used for this or that purpose, and not on results in terms of output. Mr Hudson has spoken emphatically of the need for higher standards and, rightly, of the work which county war agricultural committees are doing to achieve these. There is little doubt that the proposals made, among other people by the Communist Party at a conference some weeks ago, for the pooling of all agricultural machinery under the direction of the war agricultural committees, and for the extension of the hiring out of machinery to small farms, together with the labour needed to work it, are proposals of the right kind; or that the demand for an increase in the Women's Land Army very much above the present total of 25,000, to be used largely in mobile regional detachments, is well-founded. The analogy between industry and agriculture in this matter of regional co-operation is, admittedly, very imperfect. But, in both cases, the needed margin of extra output must depend upon collective action locally by small units; and in at least one county, Hertfordshire, the war agricultural committee has accepted proposals from the workers in their area to set up a production committee (analogous to those set up in war factories) to assist in the stepping-up of output.

Collective Responsibility

In the House of Lords on Wednesday, Lord Hankey drew attention to what he believes to be defects in the machinery of Cabinet Government. No other man living has had a longer first-hand acquaintance with British Cabinets than Lord Hankey. Except for a brief retirement just before the war, he has been a part of the Cabinet machinery, as a

Cabinet official or, from 1939 until a few weeks ago, as a Minister, ever since the last war. He spans the gap from Lloyd George to Churchill. It is perhaps not easy to agree with his opinion that the Defence Committee of the Cabinet and the office of Defence Minister should be abolished. As Lord Hankey himself emphasised, the Prime Minister must use the machine and the methods that suit him. Mr Churchill, too, has a long and varied experience of Cabinets, going back to Lloyd George—and beyond. And the personal office of Defence Minister would presumably be the cornerstone of the Great General Staff that many people are calling for to unify the three Defence Forces. But the reasons which Lord Hankey gave for his proposals were shrewd and sound. "Members of the War Cabinet would be fully informed, which is not really the case today." "It would create a larger cadre of potential Prime Ministers, familiar with all aspects of the war." "It would improve the collective responsibility of the Cabinet, which has been somewhat weakened by the establishment of the Defence Committee." These views are no less wise for being old-fashioned. It is also Lord Hankey's opinion that the position of Ministers of Cabinet rank outside the actual War Cabinet should be improved. Contact between Mr Churchill and his lesser colleagues is not easy in wartime, but it is none the less essential; and, as Lord Hankey claimed, every step that will make for "better team work" would be an aid both to the war effort and to its undisputed leader.

Turkey Under Pressure

With the spring offensive on the horizon, the pace of diplomatic preparations in the potential zones of battle is increasing. One of the chief obstacles to a German advance into the Middle East is the determined neutrality of Turkey; yet it seems as though Hitler were unwilling to force war on the Turkish people. Anatolia is unpromising campaigning country, and the Turks, whose equipment is steadily increasing under Lend-Lease arrangements, are tough fighters. Moreover, to open a front in Turkey would be to bring Russia's allies on to the southern coasts of the Black Sea. Yet if the Caucasus is to be taken from the rear, some means has to be found to prevent Turkey from being a serious military obstacle or from developing into an enemy base, and the Germans are back at their old game of mixing bribery and threats. New negotiations have opened between the two Governments. Husrev Gerede, the Turkish Ambassador in Berlin, has gone to Ankara and von Papen has followed all the German Service Attachés back to Germany for consultations. What the Germans are offering is open to speculation—parts of Syria, perhaps, possibly the Dodecanese, probably the Vilayet of Mosul and possession of Iraq's oil supplies. What they are asking in return is probably neutrality of the Swedish kind—that is to say, a neutrality which is not actively co-operative but which permits certain privileges to the Axis—for example, passage of Axis ships through the Dardanelles and even of German troops across the Turkish railways. To reinforce their demands the Germans are, of course, playing on the Russian bog. The handing over of the Straits by Britain to Russia has been one of the most plugged themes since Mr Eden's

December visit to Moscow. The recent bomb attack on von Papen was attributed to Communists—and the Turks did in fact detain some Soviet officials and raided Hachettes for Russian books and publications. Yet, in spite of the pressure and provocation, there seems little doubt that Turkey's neutrality will be maintained against all comers. M. Yalchin, discussing Germany's policy towards Turkey in *Yeni Sabah* this week, recalled the Turco-German alliance of 1914, which he declared was directed against Czarist imperialism, and continued: "This time, however, we saw the danger coming from Germany, and we therefore secured the friendship of the Western democracies; that was a measure of defence, and remains such, but if we realised that we had made a mistake, or understood that Germany was not menacing Europe and Turkey, we should be delighted. Judging the situation openly and candidly, however, we declare that we are very far from observing that the German danger has disappeared and has been replaced by an English danger or a Russian danger." M. Yalchin generally reflects the views of the Turkish Government, and it does not look as though the Nazis are likely to secure any modifications of neutrality in their favour.

The Civilian in Invasion

Once again, the civil population has been given invasion instructions, and once again it is clear that the prevailing thought in the minds of those responsible for the country's defence is that at all costs there must be no refugee movements. The wording of the original instruction, however, has been changed for the better. "Stay put" was translated by Sir John Anderson this week into "stand firm"—which has a much more encouraging and martial ring. "Stay put" implied that civilians were to do nothing to repel the invader, whereas Sir John said that they were not intended to adopt a purely passive role. The difficulty, of course, for the civilian is to decide what active part he can play, and it has been the lack of official guidance in this respect that has been the chief cause of uneasiness. So far as most men are concerned, their obvious duty—if they wish to help to fight the invader—is to join the Home Guard now. But Sir John Anderson recognised that there may be some men who cannot find the time for training and he referred to the possibility at a later stage of including them in the Home Guard under special conditions. The other development mentioned in his statement was the establishment of local invasion committees in many parts of the country. Their duty will be to survey their probable needs if fighting reaches their districts, how these needs can be met, and how the civil and military authorities can best help each other. They will allot specific jobs to particular individuals, and Sir John outlined the sort of jobs he had in mind—cooking and distributing food, filling craters and shell-holes, digging trenches, providing billets. If the invasion committees really set themselves to their tasks, a big gap in the invasion plans will have been filled. But presumably the new committees will be the same, in personnel at least, as the civil defence emergency committees, not all of whom, by any means, proved equal to their responsibilities. It is to be hoped that there will be active supervision and guidance by the Regional Commissioners to set a highest common standard in respect of invasion, as well as air-raid, preparations.

Army Airmen

The formation of an Army Air Corps, announced this week, does not mean that an Army Air Arm is being established. The change is administrative; and the Army Co-operation Unit of the RAF is unaffected and remains under the RAF's direction. The troops affected are the Army's airborne units, whose personnel have up to now remained attached to their various regiments for administrative purposes, such as records and pay. They will now be brought together into a single Corps for the purposes of filling in forms; they are already together, of course, for operational purposes. The only pilots concerned in the change are glider pilots. The change is interesting because it marks another move to cut across the old traditional sectionalism of the British Army, which tends to impede or complicate the development of new branches; it is in the same category as the recent setting up of a separate Corps of Mechanical Engineers—though very much less important in its actual consequences. Inevitably, in spite of its merely administrative character, this change will

rouse new discussions about land-air co-operation. In the Army Co-operation branch of the RAF, there are pilots and ground staff who were trained soldiers before they were seconded to be airmen, and it would be folly to lose any of the value of this dual training. Tactically and technically, here are the men needed in modern warfare, neither soldiers nor airmen, but both; and the evidence which exists that, neither in equipment nor in operational training, is this fact turned to effective use, is disturbing. The problem is not whether the Army or the RAF should control the whole corpus of aircraft and personnel for Army co-operation and Army use. It does not matter. The separate control of either would almost certainly be a mistake. The problem is rather to establish some single general control at the top and joint training below; and the present solution, which divides the air accessories of the Army between the two separate Services, seems to the layman to make the worst of both worlds. And in equipment Army Co-operation remains a Cinderella.

Part-time Workers

One of the big bottlenecks in industry is due to the lack of adequate opportunities for would-be part-time workers. The number of women with domestic responsibilities who cannot put in a full day in a factory but could put in a morning or an afternoon is difficult to assess, but it must be large; yet only a fraction are being utilised. Industry appears to have shown a lack of adaptability in this matter. Managements have shown insufficient interest and workers have shown some fear of a new form of dilution. The firms which have successfully tackled the problem of part-time work have found that most of the objections raised were not valid. The losses anticipated from taking on inexperienced labour have been appreciably offset by increased productivity per head because of the short hours of employment. The objections of full-time workers that they were in danger of being undercut have been overcome by tactful handling and by insuring, through slight increases in bonus if necessary, that average earnings were not reduced by the new arrangements. Since success seems to have attended the efforts of those who have handled the problem with determination, it may be asked why such attempts have not been more widespread. Apart from the reluctance of industry to introduce schemes for part-time workers, the Government does not appear to have pressed manufacturers to study each other's experience—though it did encourage them to pool their knowledge through the Mutual Aid Groups and the Capacity Clearing Centres when it was a matter of engineering. Another obstacle is that part-time work is often most practicable in the daytime, and if part-time workers are to be absorbed in large numbers, more full-time workers may have to go permanently on to night shift, or take on night shift work much more frequently.

Ruling on Hoarding

It cannot be said that the Ministry of Food's latest hoarding order completely clears up the position. In one respect, there is certainly an improvement. Rationed food, or food which a householder has grown or made himself, is exempt from the order, and a person may, therefore, possess any amount of sugar which he has saved out of his ration on jams and home made chutney. This was clearly the only course to take in order not to penalise the thrifty housewife, though it also means that the greedy housewife who bought up large quantities of jam or soap on rumours of rationing gets away with it. In the case of unrationed food the new ruling is more dubious. No one may hold stocks which would exceed "an amount reasonably necessary for consumption over a period of four weeks"—to quote from Major Lloyd George's statement in the House. This will obviously raise considerable difficulties in the case of such foods as pepper and other spices, salt, marmite and a host of similar foodstuffs of which a very small quantity lasts some households a year or more. It is probably true that in practice there would be no prosecution in such cases, and it is also true that the court has the right to decide that a longer period may be justified if exceptional circumstances exist. But in the case of such foodstuffs as condensed milk and cocoa, which are semi-necessaries to some households but the housewife's last recourse in others, difficulties may well arise. In the one household, a few tins would apparently represent legal hoarding, whereas in the other the same amount

may only be the consumption of a week or two. No doubt the new order will be used sparingly in gross cases, but it might be as well if the housewife were told that she need not turn over her stocks of unrationed foods every month and start again with a fresh lot.

Back to Capitulations

The succession of Nicholas Kallay to Laszlo Bardossy as Prime Minister of Hungary does not mark any change in Hungarian policy. Bardossy is a really sick man and probably feels that he cannot face the stern tasks that lie ahead this summer, when it seems likely that a very large Hungarian army—the Germans have asked for a million men, the Hungarians say there is equipment for 300,000—will be fighting beside the Germans on the Russian front. Kallay has had a quiet and undistinguished political career and has no connection with any of the extremist parties. His choice does not, however, imply any opposition to the Germans. Throughout the Balkans they have largely abandoned their habit of making use of extremist groups. In Hungary there is the particular reason that the system of parliamentary authoritarianism commands the support of nearly all of the political groups. But the tendency to transfer support from indigenous politicians to the *Volksdeutsche*, or local German racial communities, is apparent throughout South-Eastern Europe and may well be due to a change of policy which in the event of a German victory would have very far-reaching implications. All over the Balkans live small groups of Germans whose standards of wealth and education are, on the whole, higher than those of the peoples they live among, but who, for the last two or three centuries, have been content to preserve their racial difference while accepting foreign citizenship. Since the advent of Nazism, these groups have first been converted to fanatical National Socialism, and now they are being moulded into something more. In Roumania and Croatia they are well on the way to complete autonomy. They have their own schools and cultural associations. In any village where they form more than a 10 per cent minority, double language regulations have been introduced. Before long they may well get complete extra-territoriality in the sphere of justice and economic activity. In Hungary, the *Volksbund* is not so well developed, but the Germans are sponsoring it, and a new development is a linking together of all the local national groups by means of liaison officers. The final outcome of this system is obvious—a German organisation of "capitulations" (on the model of the former special protections of foreign rights in countries like Egypt) throughout South-Eastern Europe, islands of prosperity and capitalistic development in the surrounding agrarian wilderness, a *Herrenvolk* in active practice and physical presence.

Advertising in Wartime

The Advertising Association has recently issued a pamphlet* in defence of sales publicity in war. This apologia makes a good case for the continued publication of advertisements in the press for the sound reason that advertising revenue—which forms an essential element of the income of all newspapers—obviates reliance on secret subsidies from Government or other sources. In helping to secure the freedom of the press, advertising performs a vitally important social function in war and peace alike. It is, of course, inevitable that advertising space should be diminished as newspapers are reduced in size, and there is a good case for reducing advertisements relatively to editorial matter as well as absolutely. *Advertising in Wartime*, however, seeks to prove a social function on other less defensible grounds. It claims that sales publicity is more than ever necessary for the housewife in days when choice is restricted; that to remove the instructive advice on household management which the advertiser so often conveys would be a serious deprivation. The pamphlet defends goodwill advertising on the score that only if this is kept alive in the home market during the war, can the nation rely on a successful post-war export drive and the manufacturer cut loose from the fear of losing his place in the sun. Lastly, it suggests that advertising provokes a sense of corporate pride and responsibility in the labour force of the industry concerned. These arguments are so pompously foolish as to come near to spoiling a sound case. There is, of course, no justification for the advertisement of con-

* *Advertising in Wartime*. Issued by The Advertising Association, Ludgate House, 110, Fleet Street, London, E.C. 4.

sumption goods on the score that the housewife relies on this information. The possibility of buying goods off the basic ration is governed by the state of stock at the shopper's favourite emporium and the attitude of the assistant behind the counter. It is a gross disservice to stimulate the desire to spend or to foster shop crawling. On the score of goodwill, it is true that, in the few remaining neutral countries, it is important to continue to advertise British goods. In the home market, the issue lies between competing British manufacturers, who can more easily be prevented from encroaching on each others' intangible assets by cutting down advertisements than by fostering them. There is no case, as the pamphlet suggests, for maintaining poster advertising simply in order to prevent the bankruptcy of the 800 firms engaged in the poster industry. Total war is a ruthless business and this form of enterprise would appear to be a clear case for drastic concentration. In newspaper advertising, pride of place should obviously be given to official announcements and charitable advertisements; the remainder of the space should be devoted to advertising goods and services which can still be provided, and provided without encroaching on scarce resources; and the limiting factor to all advertisements, apologia or no apologia, is the scarcity of paper itself.

Shorter Notes

The attack made by the United States Pacific fleet under Admiral Halsey on the Japanese-occupied islands, Wake and Marcus, stands out as the week's good deed in the Far East's naughty world of defensive fighting and retreat.

Since the Saadist and Liberal Parties officially abstained from the general election in Egypt, the Wafdists' sweeping victory is hardly surprising. Nevertheless, it reflects popular opinion faithfully, and Nahas Pasha is at liberty to interpret the voting as a fair plebiscite in his favour.

The United Nations will give a wholehearted welcome to the news that General MacArthur has been awarded the Congressional Medal of Honour, the highest decoration given by the United States.

A printer's error occurred in a Shorter Note on food hoarding on page 391 of *The Economist* last week, and the last sentence should have read . . . "the Ministry might well take powers to requisition them [food stocks] in an emergency rather than to penalise prudence and thrift."

According to a written parliamentary reply, the number of illegitimate births in England and Wales last year was 30,453, compared with 25,942 in 1939. In London alone the number was 1,931 and 3,105 respectively.

AMERICAN SURVEY

Industrial Mobilisation

(From An Industrial Correspondent)

Cleveland, Ohio, February 15th

INCREASING requirements of war material for the vastly extended fronts have been speeding up the rate at which America's industrial capacity has been turning to the purposes of war.

The few weeks in which the public has been able to observe the work of Donald M. Nelson as chairman of the new War Production Board have been very reassuring. The charts kept in Washington which record the thermometer of public and editorial opinion show a sudden and extreme subsidence of criticism of production, a change which is, however, sometimes merely the inverse of criticism of other phases of the war effort. Unhampered any longer by uncertainties and conflicts in authority, Mr Nelson has been bringing an end to many an old debate and placing upon non-essential trades the responsibility for obtaining munitions orders—not merely being receptive to them—if they are to continue running.

The shutting down of the assembly lines of Michigan's enormous automobile industry will probably be regarded as the point where American industrial mobilisation entered its second and swiftest stage. The steel industry had already become engaged almost entirely upon orders for military and ancillary needs, but the final cessation of the manufacture of civilian cars, a spectacular event in itself, was followed shortly afterward by orders to a number of other manufacturing groups to taper off, concentrate the small remaining civilian production (if any) in a few plants and turn their facilities to the hardware of war. The electrical refrigerator industry, like the radio industry, is to cease altogether.

The actual conversions of American industries yet to be accomplished are expected to require more than a year. The full tide of output from these transformed plants will probably be reached early in 1943. Thus four great streams of munitions production are now rising: the output of the original and enlarged plants, such as the arsenals and the aeroplane factories; the output of a string of new Government-owned arsenals, mostly completed in the summer of 1941; of a group of specialised factories built by the automobile industry for the making of bombers and now just coming into production; and of innumerable small and large works whose facilities have been gradually moving over into Government work but which are now to swing even more heavily and exclusively into it. The earliest of these streams is probably near its peak, but the latest will not reach it for many months.

The controversy is now subsiding over the question of what interests or inertias were responsible for putting off the conversion of the remaining industrial capacity in the manufacturing trades, but the problems incident to the gigantic operation are only beginning to be generally apprehended. In the steel industry, for example, the elaborate series of preference ratings is causing congestion in the upper ranges. In the automobile industry, unemployment is expected by some to reach a peak of more than 200,000 before it begins to subside. The assembly plants themselves must be completely rearranged and every usable tool reset, the great specialised machines greased up and walled off, and a series of new products introduced, tooled and learned by the workers.

In general, the automobile plants will become producers of parts for a series of new and larger aeroplane plants now under construction or recently completed. The industry had a peacetime out-turn of under \$4,000,000,000 of automotive products in good years and has assumed orders for \$8,000,000,000 of Government work annually. It will draw on an even larger number of sub-contracting plants, consisting in the main of about 100 plants scattered through the central manufacturing region which formerly supplied automobile parts.

New Construction Work

The construction of new plant, as projected in the original defence programme (dating from May, 1940), was to have been well completed by this time, but a new wave of factory building has been imposed upon the old. Plans for this second series of plants are in general the blueprints of the old—the constructional forces merely continuing with their work—but included in them are several buildings of a sort almost unknown even to American industry. Decisions to build these works were reached last autumn in the so-called "victory programme," of which only the outlines reached the public before it was absorbed into the immense imperatives which followed Pearl Harbour. Details of the projects began to be released to the various manufacturers in that same week and are now beginning to materialise in excavation work in the snow and frozen ground of prairie sites in the central west. Works for the manufacture of aeroplanes and tanks lead in size, and, including their parts, almost in numbers, for the reason that existing factory space is unsuitable for such very large work. The whole amount of new plant capacity to be started this year comes to \$6,000,000,000, of which all but a billion is subscribed by the Government. This volume exceeds everything started between May, 1940, and Pearl Harbour.

The supplying of materials, equipment and labour for the construction of the new plants and the conversion and operation of the older plants is already testing to the limit the resources of many an industry. The strains are being met by voluntary transfers of men from non-essential employment to the new work, by training of specialist machine operators on a grand scale, by suppressing almost all private construction save small houses, and by squeezing down the use of essential materials in civilian trades.

Appropriations of federal funds for defence and war purposes since May, 1940, plus those proposed by the President, now approximate \$139,000,000,000. Of this enormous sum, about \$100,000,000,000 has been written into contracts of all types and about \$17,000,000,000 paid out. Disbursements of about \$20,000,000,000 have been made for defence purposes in the last 20 months, but this sum includes the subsistence and pay of the forces, as well as payments on much work yet to be delivered, such as ships. The rate at which orders have been placed is already beginning to turn upwards, responding to the sharp acceleration in appropriations after America's entry into the war. The rate of deliveries, however, cannot be expected to change for some months.

The absorption of productive plant into munitions and other work for the American, British and other Governments is expected to reach a point near the end of the year where about half the national manufacturing capacity is devoted to war. The proportion was recently about one-tenth, but the saturation of the steel industry and the closing of automobile production has considerably raised it.

The Transport Problem

The decline of civilian goods will make many and important changes in the retail and other trades and in the manner of American life, but as yet the economic landscape is scarcely altered. Though new tyres and automobiles are obtainable by only a few, the amount of traffic in most American cities has not declined enough to be observed by other than statistical methods, such as the receipts of the parking meters along the pavements. The consumption of petrol, indeed, has risen, but this is apparently due to the increase in the movement of freight by motor trucks. Owners of approximately 30,000,000 motor cars, including delivery vehicles, have been told they will have no new tyres when their present sets are worn out, and it is expected that next summer's hot weather will result in many cars being laid

up. So serious, however, would be the effects upon normal American living if any considerable number of merchandise deliveries had to be given up suddenly, or if suburban millions turned to the use of public conveyances, that the rationing of petrol is almost certain to be undertaken as a means of conserving rubber and enabling the necessary changes to be made gradually.

One aspect of this problem is that of moving the industrial workers to the new factories now being finished. The sites of all of these works were selected before anyone in the United States had calculated the chances of the rubber supply being cut off. A bomber plant now being completed by Henry Ford in Michigan had expected to draw its working force from a radius of as much as 30 miles. A northern Ohio shell-loading plant was built by workmen who drove daily for distances equally great, and now finds itself unable to get enough operatives to man it. Proposals for meeting these emergencies range from rushing through the construction of many publicly-owned small houses of wood-frame construction to the requisitioning of enough automobiles from families which do not themselves require cars for essential uses.

The reality of the declining American standard of living has scarcely been comprehended save in a somewhat academic way. The measure of its decline has been stated in figures by Leon Henderson, head of the Office of Price Administration—\$65,000,000,000 of civilian goods this year will have to satisfy a national income of around \$95,000,000,000—and the usual measures to drain off this "consumption gap" were also suggested by him. The bearing of this decline upon the expectations of organised labour is yet to be worked out, when the new War Labour Board considers the demands of the steel and automotive unions for increases of \$1 a day and other concessions.

The Tides of Special Interests

[FROM OUR WASHINGTON CORRESPONDENT]

February 28th

THIS past week-end the Price Administrator, Leon Henderson, has been making an identical speech before a variety of audiences, underlining the statistics of our incipient inflation as a prelude to the new Tax Bill. His theme is simple—seven-eighths of the recent increase in national income payments has been in the form of salaries and wages. Present federal taxation will draw off about thirteen billions of the anticipated hundred billion dollar total; federal borrowings may run between eighteen and nineteen billions more. That will leave around seventy billions available for other uses. But the proportion of the national productive effort currently earmarked for war purposes will not provide enough goods and services at present price levels to meet the demand represented by available income. Mr Henderson estimates the gap at around fifteen billion dollars. The relation to the new Tax Bill is obvious.

These speeches have a somewhat Canute-like sound in view of the tides moving in the opposite direction. One place where the administrator made his case was before the National Farm Institute in Des Moines, whose annual discussion of the state of the union attracts some 1,200 farmers and cattlemen, many of them heads of farm organisations and leaders in commodity groups in the Midwest-Great Plains area. Six days later the Senate passed a Bill, introduced and supported by the members constituting the farm bloc, prohibiting the Commodity Credit Corporation from selling farm products owned or held by the Government at less than "parity" prices. The products referred to represent transactions of the past few years on the "ever-normal granary" principle whereby excess stocks were taken off the market through the mechanism of Government loans supporting prices at 85 per cent of parity. Sales of these stocks (in which the Government has 1-1/4 million dollars invested) would stabilise farm prices, holding down incipient rises in corn and wheat.

The Farm Programme

These particular commodities have a special relation to current price movements and to the disposition of the farm economy. The expanded production goals recently set by the Secretary of Agriculture emphasise dairy products, livestock and poultry—cheese, milk, eggs and pork are primary

items under lend-lease. Production of all of these is highly sensitive to feed costs—the hog population at any given season directly reflects the corn-hog price ratio. In addition, in order to increase domestic oil supplies and offset losses of imports from the Orient, the goal of soy-bean acreage has been raised from 5,855,000 acres for 1941 to 9,000,000 for 1942. A rise in the price of corn would be highly disturbing to the relative profitability of an acre that could alternatively be used for soy-beans.

In view of these critical considerations, President Roosevelt followed a somewhat unusual procedure in addressing a letter to the President of the Senate in which he said: "I believe that irreparable damage to the war effort and to the farmers of this country would result from enactment of this legislation . . . Food production is playing a vital part in the conduct of the war. Not only this country but all of the United Nations are relying upon abundant production of food by the farmers of America . . . The curtailment of the production of livestock products would, of course, be followed by higher prices for livestock products and substantial increases in the cost of living, which in turn would lead to more inflation and demands for higher wages . . . The goodwill of the consuming public should not be shattered by grasping for a few extra dollars in the name of farmers." Yet the Bill was passed by 50 to 23. (Whether the House will take similar action in the light of an almost certain veto remains to be seen.)

Parallel to the column in which the morning papers carried this news was a column reporting the delivery to the President of a united front statement by the Labour War Board—a six-man board on which the AFL and the CIO both have members—urging him to resist the establishment of any policy restricting general wage increases. The statement acquired additional pertinence from the fact that it was issued just before the National War Labour Board began consideration of the Steel Workers' Organising Committee's demand for a dollar-a-day rise as part of its forthcoming contract with "Little Steel" (the by-no-means-little steel companies outside the US Steel and Bethlehem groups). This decision will be an important bench mark in labour policy—shall wages of organised workers be stabilised at their present levels, with future increases limited to adjustment of the scales of under-privileged workers, or not? If not, how can the resulting income be kept from competing for goods and services which are already behind demand to the magnitude of fifteen billion dollars?

War Profits

A third item of interest in connection with the new Tax Bill is the profits of the companies engaged in war enterprises. Figures of the earnings of fourteen aircraft companies holding \$2,101 millions of defence contracts show that the profits in relation to stockholders' equity, at the beginning of the period, jumped from 26.3 per cent in 1939 to 44.3 per cent in 1940. Corresponding figures for four shipbuilding companies with \$1,189 millions of defence contracts show that the profits in relation to stockholders' equity, at the beginning of the period, jumped from 17.9 per cent in 1939 to 35.3 per cent in 1940. The Todd Shipbuilding Company has made history by calling public attention to its unavoidably excessive current rate of return. Other companies may be less inclined to take this attitude toward their gains. In this connection there is a cycle of events that is worth remembering—and not worth repeating. The profits of World War I formed a large part of the factual basis for the cynicism of the inter-war years. That cynicism found public expression in the Congressional investigations, of which the Nye Committee was typical. The companies called to testify felt exposed, even—or perhaps particularly—in cases where the facts did not justify their exposure. The likelihood of a similar accounting after World War II figured along with anxiety as to postwar excess plant capacity in industry's reluctance to get into war production in the summer of 1940. Adequate taxes on profits in the new Bill could break this cycle.

Meanwhile, farm prices, wages and profits are all doing nicely. In his speech on Monday night the President stated that a current check indicates the country will meet the production schedules called for in his January message on the state of the nation. That means the civilian slice of the economy will be reduced to a point where we shall live as lean as we did at the pit of the depression. Higher prices will only bid up this quantity of goods without increasing it; Mr Henderson is unquestionably on solid ground. But the tides of special interest, lapping at his feet, threaten to cut the ground from under him.

American Notes

Partnership in Production

Mr Nelson's imaginative and level-headed approach to the problem of securing the fullest co-operation from organised labour for the production drive is one of the outstanding achievements of his short tenure of office. It is particularly striking in view of the current rash of anti-labour bills, which express the persistent hostility of certain Congressional groups toward the unions, and the ignorance and unsympathetic mood of the general public, with its periodic demands for "cracking down" on labour. Mr Nelson obviously attaches great importance to securing labour's confidence and support. A large proportion of his recent broadcasts have been addressed to labour; he has introduced a plan for labour-management production committees which are being rapidly established throughout the defence industries; and his speech this week to CIO leaders, while frank, made a good impression. He assured them that the need for production would not be used as an excuse to whittle down labour's hard-won rights, and he opposed the abolition of the 40-hour week at present as possibly harmful to production. The only concession he requested was the abolition of double pay for Sunday as the defence industries go on to three-shift, seven-day operation. This has already been conceded by the Automobile Workers Union; the Glass Workers have withdrawn their demands for time and a half for Sunday work; a number of unions have offered their Sundays to the war effort without pay; and Mr Murray and Mr Green have pledged themselves not to resort to strikes. This retreat from extremist positions is partly a calculated counter to the Congressional demand for abolition of the limitation of hours, as well as a response to Mr Nelson's conciliatory policy. Mr Nelson, Mr Knudsen, and the President have all attempted to head off the movement for such legislation by making public the hours actually worked in defence industries, which in some cases are as high as 60 a week, and a Department of Labour survey which showed that in only 2 out of 650 cases did the necessity of paying overtime interfere with the fullest utilisation of plant facilities. The Administration's policy is to secure labour's co-operation in production and in stabilising wages by the grant of fuller partnership in production and by defending its privileges wherever possible. Its success depends largely on the Administration's ability to restrain anti-labour elements from passing drastic legislation, such as that suspending all union contracts for the duration, which would embitter labour and destroy all hopes for industrial peace and co-operation.

Financing Plant Expansion

One of the sharpest contrasts between this war and the last is provided by the degree to which the present expansion of industrial plant is being financed by the Government. "This war," says the *Nation*, "is clearly public property." From 1917-1919 the federal government spent in all only \$500 millions on new plant; on December 31, 1941, federal commitments amounted to \$7,366 millions and were being increased rapidly. Private financing of new plant on the same date totalled only \$1,326 millions, exclusive of that provided by foreign governments, which was a mere \$155 millions. The coyness of private capital—wary of being saddled with useless facilities after the war—has withstood every inducement devised by the Government. Defence contracts have been assignable for bank loans; and companies building new plant for defence work have been given the right to amortize the cost completely over a five-year period, deducting up to one-fifth of the total cost from income in any one tax year for both normal and excess profits taxes. The RFC offered loans to defence manufacturers at 1½ per cent, but only about \$300 millions have been borrowed. In July and August, 1941, the Government entered the field directly in two ways: by agreeing to reimburse manufacturers completely for the cost of any new facilities over a five year period (Emergency Plant Facilities Contracts), and by establishing the Defence Plant Corporation, a subsidiary of the Reconstruction Finance Corporation, to advance funds to private enterprise to build new plant, to be owned by the DFC, but leased to the companies and operated by them. The RFC itself also has almost unlimited powers to build plant and operate it if necessary, in fact to "take any action necessary to expedite the defence programme."

A manufacturer availing himself of the Emergency Plant Facilities contract may provide the funds for expansion or use the contract as security for a loan; he holds the title to the property until the contract is completed, and then has the right to retain the facilities by paying the Government the cost price less depreciation, obsolescence, and other loss of value. Aircraft and shipbuilding companies have been the largest users of this scheme of financing—the Ford Company is erecting an aircraft engine plant costing about \$30 millions on an Emergency Facilities Contract—but total commitments at the end of October were still only about \$300 millions. By far the greatest expansion of plant has been financed by the Defence Plant Corporation, which on November 15th had commitments of about \$2,300 millions. All the facilities which it has financed are leased to private companies and operated by them, though the corporation has the right to engage in manufacture itself. Leases are either at the nominal rate of \$1 a year, in which case the price of the product to the Government does not include any allowance for the cost of the facilities, or at a figure to cover depreciation, in which case the cost of the product includes the rental of the facilities. This latter method is used when part of the product is sold to private customers. The manufacturer has the right to buy the new plant at the end of the emergency period on the same basis as that applied to Emergency Plant facilities. The great preponderance of Defence Plant expansion over both private financing and that accomplished under the Emergency Plant Facilities Contracts means that private capital has been unwilling, in the main, to accept any liabilities extending even over a five-year period, and that this time the cost of expanding facilities for the war effort is to be borne directly and immediately by the community. This is probably more satisfactory to both parties; what is less so is the influence of industry over what facilities shall be erected and where. As the war progresses it seems likely that the Government will have to extend its responsibility beyond that of financing pure and simple, in order to eliminate the possibility that plant expansion is being dictated partly by short or long-term private interests instead of being governed by the necessity for the most efficient and speedy production of war material.

Selective Service

Brigadier-General Hershey, Director of Selective Service, has stated that, as the demands for manpower grow, the present provisions for deferment of calling-up will have to be changed, with greater emphasis on retaining men of special skills in industry and less on exempting those with dependants. He forecast that manpower reserves would be badly strained in the next twelve months, and that if the nation delayed the most effective distribution of manpower, the Government may be forced to use compulsory powers. Use is already being made of Selective Service machinery to seek out men with special skills and qualifications. A 4-page questionnaire is being sent out to the 9,000,000 men between 35 and 44 who registered on February 16th, and the information obtained will form the basis for a national roster of men of scientific or other professional qualifications and those with skills needed in the defence industries. An amendment to the Selective Service Act has also been introduced in the House of Representatives, which provides for the compulsory registration of all women from the age of 18 to 65 and the securing of information on their capacities and skills. American reserves of manpower and womanpower are very great; there are, for example, 28,000,000 men between the ages of 20 and 44. These vast resources are, however, being steadily reduced by the requirements of the forces and of industry. The information on all available skills cannot be collected too quickly, and exemption from military service on the ground of dependants, so deeply ingrained in American thinking, can hardly be maintained for long in the face of the requirements of total war.

Industrial Hoards

The War Production Board is moving gradually toward a stricter policy in dealing with excessive stocks of scarce metals held by private industry. Steel plate producers have been warned not to make further shipments to three railroads whose stocks are declared to be far in excess of the working minimum, and earlier this month the WPB ordered 200,000 lb. of metal scrap to be requisitioned from an owner who had persistently refused to sell at the rates established by the Office of Price Administration. Although

it has possessed the necessary powers since October, 1941, the WPB and its predecessors have in general avoided requisitioning, and have depended, instead, upon drives to buy up private stocks of aluminium, copper, and other critical materials. The inventory and requisitions branch has so far bought up 3 million of the 20 million lbs. of aluminium lying idle in private stocks, and has launched a similar campaign to collect copper. The drive to collect iron and steel scrap has so far only produced about 68,000 tons. If further efforts do not result in substantial transference of these stocks from private to public ownership in the near future, the WPB may be expected to use its power to requisition much more drastically.

Toledo, Peoria and Western

The seizure by the government of the Toledo, Peoria, and Western Railway is the first case where action has been taken because the war effort was endangered by the recalcitrance of management. Two aircraft works and a shipbuilding company were taken over by the Government for short periods because strikes were impeding production, but in this latest instance it was the refusal of the President, Mr George McNear, to submit to arbitration which prompted the step. Six requests by the Government, including a personal appeal from President Roosevelt, were turned down by Mr McNear, who "respectfully questioned the right of the Government to order arbitration." The case had been handled by five different Government authorities, and proposals for arbitration had been accepted by the two Railway Brotherhoods concerned. The railway itself is a small one, and as the strike had not stopped operation, the importance of the incident lies largely in its effect upon the conduct of future disputes and upon morale. Such defiance of Government, in the Ford tradition, will not occur often, and the present Administration was unlikely to be more tender in its treatment of capital than of labour. However, it is just as well for labour to have concrete assurance that compulsion is being applied equally to both sides; and for management to understand that the Government does not intend to tolerate obstruction from any source.

Copper Requirements and Supplies

American requirements of copper in 1942, estimated by the War Production Board at 2,000,000 short tons of 2,000 lbs, are twice the country's consumption in 1929 and higher than the average annual world copper output in the ten years before the war. About one third of the total will be needed in the form of brass, one fifth in the shape of rolled products, and the greater part of the remainder in the form of electrical equipment. Possibly as much as a third will go into new plant. Although the United States is the world's largest copper producer, domestic production, which is expected to be about 1,000,000 tons in 1942, will satisfy only half its requirements. There is a small production of secondary copper, but most of the remaining million tons will have to be provided by Latin America and from production in Canada, Northern Rhodesia, and the Belgian Congo which is in excess of British war needs. Figures are not available for imports of Latin American copper into the United States during the last three months of 1941, but it was probably close to 500,000 tons and about 650,000 tons are expected during 1942 from these countries. Chile alone will probably provide about 500,000 tons. Production in Canada, Northern Rhodesia, and the Belgian Congo probably exceeds 700,000 tons and the great Nchanga deposits in Rhodesia, which are only partly developed, will almost certainly be exploited further. Essential requirements will thus be met, but there will be little margin for other needs, and the priority system will have to be administered with great strictness.

Information and Censorship

Contradictory explanations by the Army and Navy of a recent air raid alarm in Los Angeles appear to have brought to a head demands for an overhaul of the government information services. The established practice of most departments of holding press conferences means that there are innumerable sources of news and views beside such specialised agencies as the Office of Facts and Figures, the Office of Government Reports, and the Office of the Co-

ordinator of Information, and arrangements for co-operation between them seems almost non-existent. For instance, in this case, the Navy declared it had been a false alarm, while the Army suggested that commercial planes, flown by fifth columnists and possibly based on Mexican soil, had caused the alert. Other recurring complaints concern the scantiness of information, its "patchiness," unequal treatment of correspondents, and overoptimism in communiques and official statements. The Navy has been under fire, for example, for emphasizing a local success against Japanese bombers and remaining silent on losses around Java. Responsibility for the passing of censorable information is also diffused and journalists have not always been able to secure confirmation of their stories and to find an "appropriate authority" to release them. The other side of the picture was indicated by Byron Price, the Director of Censorship, when he pointed out that if voluntary censorship was a failure, "dark days were ahead for free speech." The demand for more news in wartime is probably unreasonable, but there is room for a great deal of improvement in the handling of information. It is to be hoped that the departments—notably the Army and Navy—will not allow their natural desire to control their own press releases to obstruct agreement on policy and the creation of an efficient central organisation to co-ordinate both the distribution of information and necessary censorship.

Shorter Notes

The Department of Labour has announced that in the year ended January 31st average weekly earnings for all manufacturing industries increased 25.4 per cent.

The Defence Plant Corporation and the Metals Reserve Company have announced agreements with a large American sulphur company under which \$20 millions will be made available for the production of nickel in Cuba.

Plans for the construction of an additional 350,000 dormitory units for workers in war industries more than doubles the original defence housing programme announced in September.

Only about half as many people as expected have become unemployed in Detroit through the conversion of the automobile industry, and re-employment is taking place much more rapidly than had been forecast.

The Interstate Commerce Commission has refused a request from the Office of Price Administration for the postponement of freight rate increases on ten groups of commodities. Increases had been granted of 6 per cent in rates for most industrial products and of 3 per cent for farm commodities and some ores.

Mr Wilson, President of General Motors and Mr Reuther, head of the United Automobile Workers Union, have agreed to negotiate in the presence of press representatives on questions relating to a new contract and methods of increasing production in the company's plants.

Mr Nelson has announced that aircraft production has increased 50 per cent since December 7th, the date of America's entry into the war.

Mr Palmer, Co-ordinator of Defence Housing is leaving for England to study housing under war conditions and post-war housing planning.

THE WORLD OVERSEAS

The Riom Trials

(By a French Correspondent)

AT the National Assembly of July, 1940, immediately after the Armistice, M. Pierre Laval promised that the persons responsible for the outbreak of war and for the defeat would be punished. A Supreme Court of Justice was set up by law on July 30th. On August 2nd, a decree laid down its composition and assigned to it the function of

examining and sitting in judgment on all persons who, over an undefined period, have been guilty of crimes or omissions, or have betrayed the duties of office with which they were charged, in connection with the events which occurred during the transition from peace to war before September 4, 1939, and in connection with those events which later aggravated the consequences of the situation so created.

Thus the trial which was projected in the autumn of 1940 was at least as much a trial of war guilt as a trial of responsibility for defeat. None the less, the question of the origin of the war has disappeared as the trial has proceeded. M. Daladier is reproached with having lost the war, and no longer, as in August, 1940, with having declared war without an express mandate from Parliament.

The determination of the Vichy Government to "punish the guilty" and to impeach, in the persons of M. Blum and M. Daladier, the Republican regime itself, is illustrated by the indictment of the accused by the Head of the State himself. A Council of Political Justice was set up in August, 1941. It consisted exclusively of members whose political views were opposed to those of the defendants. On October 10th, M. Daladier, M. Blum and General Gamelin were condemned by Marshal Pétain, on the recommendation of this Council, to fortress confinement. Eighteen months passed between the issue of the instructions and the opening of the hearings. Moreover, between September, 1940, and February, 1942, circumstances and the men in power changed. At the beginning of the period, M. Laval and his team of politicians believed in a rapid victory for Germany; they thought that the trial would take place after the signature of the peace. Now, this political team is no longer in power at Vichy. M. Laval continues to intrigue behind the scene; M. Déat is in Paris and has become a common German agent; M. Bergery, after having been ambassador in Moscow, is out of a job. Power is divided between the upholders of collaboration with Germany, attracted by the ideology and methods of National Socialism, such as MM. Pucheu, Le Hideux, Benoist-Méchin and Marion, and certain notables, chiefly traditionalists, among whom are the royalists. The latter section, that of the revolutionaries of the Right, who favour a policy of neutrality and wait and see in foreign affairs and are reactionary and Catholic in internal politics, is dominant in the entourage of Marshal Pétain for the moment, and has succeeded in restraining the activities of the collaborationists. This party would have found it difficult to consent to a trial which would have thrown back on France the responsibility for the war—a trial which would have aroused an indignant revolt among the French people. On the very day when the trial opened, a disciple of M. Maurras, M. Thierry Maulnier, proclaimed in a very outspoken article that France was not the defendant. France had the complete right, he wrote, morally, politically and historically, to take up arms to defend what remained to her of the victory so dearly won in 1918. If she committed a crime in September, 1939, it was a crime against herself, not a crime against foreign countries.

The Riom trial is to be deplored when the enemy occupies two-thirds of the national territory. It is absurd since the vital questions are not asked. It irritates the Germans, who are interested solely in pinning responsibility for the war on to France and England. It is a partisan trial which enrages circles on the Left and dis-

satisfies the great majority of French opinion, which is more concerned about the chances of liberating France than the reasons for her misfortunes. It is characteristic of the Vichy method of Government which, caught between German pressure and the force of French public opinion, shows sufficient resistance to ensure that the Germans are not satisfied, but agrees to too many concessions to avoid alienating the French. Partiality is apparent at every turn. It was decided to go back only as far as 1936, because M. Blum and the *Front Populaire* came into power in 1936, and Marshal Pétain was Minister of War in 1934. But it was in 1933 that Hitler seized power and Germany left the League of Nations and started to rearm on a large scale.

Defendants' Forum

It is clear that the Vichy Government is anxious not to implicate the generals because Marshal Pétain himself is in the front row—Minister of War in 1934 and a member of the Supreme National Defence Council without interruption throughout the period between the two wars. In order to clear the high command, an attempt has been made to load all military responsibility on to General Gamelin alone. Examination of the conduct of operations or strategic theories is forbidden. But this manoeuvre has already recoiled upon its authors, for the two principal defendants have spoken, not as accused, but as accusers. M. Blum used the only possible language, the language of politics, while M. Daladier denounced Germany as solely responsible for the war. The main charge against M. Blum is the social legislation of 1936. M. Blum replied that it was desired by the country and unanimously adopted by both Chambers. Reproached with having tolerated sit-down strikes, he replied that, if he had had the factories evacuated by force, there would have been riots, blood would have been shed and the country weakened still further.

Thus, against its will, the Vichy Government is providing the defenders of the Republic, who have been imprisoned for eight months, with a forum. The French people are to-day once more aware of them; and they are now the more attracted by free institutions because they suffer increasingly from the yoke of the occupier and the police state of Vichy. MM. Blum and Daladier have displayed high civic courage during the hearings, and the affair has every chance of turning out to the confusion of the Vichy Government. It is not impossible that the trial, which has been adjourned for Easter, will be stopped, under German pressure.

It is too early to analyse in detail either the proceedings or the reactions of French opinion. But a few provisional points need to be made:

- (1) There is no doubt that the army was not supplied in sufficient quantity with new weapons; anti-tank guns, anti-aircraft guns, planes and tanks.
- (2) Essentially, this lack was due, not to inability to organise and produce, but to the fact that the necessary production was started too late.
- (3) Existing armaments—for in spite of everything the French Army in May, 1940, possessed 3,500 tanks—were misemployed, not because the generals were fifth columnists, but because they had not grasped the essence of modern strategy.
- (4) An impartial enquiry after victory may establish individual responsibility for delayed output. But if the magnitude of German armament is measured, it provides some indication of the immensity of the task which the democracies laid on France. Taking figures given by the current issue of *La France Libre*,

Hitler has spoken of an expenditure on war preparations of Rm. 90 milliards in six years; M. Daladier at the trial spoke of Fr. 62 milliards in two years, that is only Rm. 5 milliards (at a rate of Rm. 1 to Fr. 12). Neither France nor any of the democracies understood the implications of total war, and France was in the most exposed position.

Singapore and Canada

[FROM OUR OTTAWA CORRESPONDENT]

February 23rd

The fall of Singapore has provoked the most sombre comment in Canadian newspapers since the start of the war; it reflects the general realisation that Canada, facing a two-front war, is now exposed to raiding, perhaps to powerful attacks. Pressure has grown upon the King Government to revise its war plans in order to provide greater home defence facilities. For the first time, military plans, based upon maintaining a strong army in Britain, are under serious challenge.

The Canadian Parliament's first secret session was held to allow members to discuss coastal defences, chiefly of the British Columbia region. Canadian military thinking has been conditioned since the last war, and without sign of change so far in this war, to regard Britain as the first line of Canadian defence. Approximately half—much the best half—of the Canadian army is in Britain. The axiom of Canada has been that if England falls, Canada is next. But declarations of this kind have become rarer, and a drive for stronger home defences is in full swing in Parliament and outside. Howard C. Green, Vancouver MP, told the House: "Canada is in deadly peril. . . I am convinced that sooner or later our coastal cities and hamlets will be bombed."

There is no disposition to ask for the recall of Canadian troops in England, but to build up substantial coast defences and garrisons as separate forces. This would possibly delay the completion of plans to transform the Canadian Corps in Britain into a two-corps army, to which the Canadian General Staff committed the Government in January.

A second consequence of Singapore is found in plans to raise the sights on Canada's munitions programme, which, in dollar values, reached an output of \$1,000,000,000 in 1941. Like snow fading before the spring sunshine, the claims of munitions officials (including the Minister, Mr Howe) that the stage of full production was at hand, have vanished. Mr Howe announced a new objective for 1942; munitions production at "two and a-third times" the 1941 output. Factories will be asked to make two or three tanks for every tank produced last year. Where 1,000 Bren guns were delivered, 2,300 Bren guns must be made now. For every million rounds of ammunition, there must be 2,300,000 rounds in the coming months. Production problems are well in hand after an eighteen-month battle of industrial transformation, and Canadian munition makers will probably attain the new objectives.

These developments are a victory, such as could not be foreseen a few months ago, for those who regard the production of equipment as Canada's foremost job, since this country, along with Britain and the United States, possesses a capacity for surplus war production beyond the needs of its own armed forces. The lesson of Singapore, as a lesson in the need of equipment, restored the balance in favour of restraining the competition of excessive military demands for manpower in order to assure maximum production.

Political Currents

Political consequences are different. At no previous stage in the war has the King Government faced a greater threat, despite the lull gained in the February by-elections. The Government's policy in seeking, through a national plebiscite, release from pledges not to introduce conscription for overseas service is designed to free the Government's hands against future emergencies. But the rise of sentiment for greater home defences will make the plebiscite campaign more difficult.

The elements of political crisis in Canada lie in the re-appearance of Mr Meighen, the return of the Quebec Nationalist, Henri Bourassa, to the limelight, and the renewal of Premier Mitchell Hepburn's feud with Mr Mackenzie King. Prospects of a working agreement between Ontario imperialist Conservatives and Quebec Nationalists were described in Parliament by a prairie member, D. A.

McNiven, KC, as a "cloud in the political horizon reminiscent of the most sinister political alliance that ever darkened the pages of Canadian history." Events of 1911 are being recalled, when the Navy issue brought the Bourassa Nationalists out in force against contributing to the British Navy, and the reciprocity issue carried the Conservatives to power. Echoes of the old campaign are heard, as Mr Bourassa predicts that Canada will be annexed by the United States within ten years, and as he charges that Canadian policy is being dictated in Washington, not London.

The defeat of Mr Meighen in South York (Toronto) on February 9th, exceeded the fondest hopes of the Government. The defeat of Paul Bouchard, Nationalist and former Rhodes scholar, in Quebec East, when he ran against the new Minister of Justice, the Hon. Louis St Laurent, strengthened the King Liberals in French-speaking Canada. The election of the Hon. Humphrey Mitchell, the new Minister of Labour, in Welland, provided a reverse for the CCF, for the Conservatives and Hepburn Liberals alike. But Mr Hepburn definitely aligned himself with Mr Meighen, and he himself remains as the unpredictable factor. He captured the headlines on both sides of the border by remarking that "the proud US fleet is in hiding." He alleged that the Japanese were making captured United States marines pull rickshaws in Shanghai.

The governing factors in Mr Hepburn's conduct at present are his enmity for Mr Mackenzie King, and the fact that he faces an election owing to the expiry of his tenure of office. The point at which he crossed the line—between useful gadfly to official complacency and national nuisance no longer to be tolerated—is a subject of popular discussion. He seems firmly entrenched in Ontario, the most powerful province, though many of his former friends have repudiated him. Unless his legislature extends its term to avoid an election campaign in war-time, defections in his voting strength may provide a Waterloo. But no one in Canada could be sure of that.

Discontent in Roumania

[BY A CORRESPONDENT]

March 14th

RECENT reports about mounting discontent in Roumania are too persistent and specific to be ignored. During the last few weeks alone there have been unmistakable signs, such as a new wave of arrests, the sentencing of a well-known Transylvanian leader to five years' hard labour for criticising Antonescu and, more significant still, the resignation of General Iacobici, Chief of the Roumanian General Staff.

It appears that articulate—though necessarily underground—opposition is centred in the nuclei of the former political parties now dissolved and, more especially, in the person of M. Maniu, the veteran peasant leader. After having fought King Carol's reactionary rule and opposed the acceptance of the Vienna award, M. Maniu remained in opposition after the change of regime. He opposes Antonescu's policy on two main grounds. He looks on the restoration of Transylvania as *the* national objective, realising that collaboration with the Axis can never secure that aim. Secondly, he is opposed ideologically to the anti-democratic and essentially anti-peasant doctrines of National Socialism. He is believed to be in favour of active collaboration with Russia, especially since the new Anglo-Russian alignment.

Public opinion, too, has undergone important changes since last June. From a state of bewilderment, public feeling passed first into war weariness, which is now giving place to active hatred against the Nazi overlords. The Roumanians, a nation of village-minded peasants, nurse no imperialistic ambitions, nor do they feel any urge for "holy crusades." They refused to be taken in by the new slogans, feeling instinctively that they were being used as tools and were, moreover, being pushed eastward with a view to drawing them away from their western national strongholds.

The wide support originally enjoyed by Antonescu—he was brought into power, it will be recalled, by the wave of dissatisfaction that swept over the country after King Carol's surrender—soon melted away. His complete sell-out to the Germans and his left-handed association with the extremist Iron Guard, who after the clash in January, 1941, became his fiercest enemies—and, ironically enough, are now said to be held by Hitler as a trump card in reserve for exerting pressure should other means fail—rapidly weakened his internal position. So when Antonescu was issued with his marching orders in June, 1941, he no doubt thought that his big chance had come—a war with limited liability and with rich yields, consisting of territorial gains, military glory and the consolidation of his regime.

Events, however, turned out differently. The war did not end, either in time or in space, as Antonescu had expected, and his miscalculation has brought appalling calamities for Roumania. Roumanian casualties, suffered mostly beyond Bessarabia, have been staggering. The army was not equipped for winter warfare; desertion became widespread.

But prolongation of the war, for which the country had been obviously unprepared, has struck a still heavier blow, not only on morale, but on the whole life of the nation. Roumania is facing an acute shortage of essential foodstuffs, beginning with bread—which is the staple food and in which present rations are more than 50 per cent below normal consumption—and extending over a wide range of necessities. These shortages have long passed the stage where price regulation, black market penalties or organisation can bring a relief. The governing facts are a greatly increased demand owing to the war, a greatly decreased production, owing to the mobilisation and, perhaps most important of all, to the peasant's retrenchment behind self-sufficiency. As the market can no longer supply him with his requirements, the peasant, never too closely connected with the market, is simply withdrawing from it.

As it is the Roumanian peasant who also provides the fighting force, it is easy to see that he is becoming once again the dominating factor in the Roumanian situation. Very little is known about the purpose of Antonescu's recent visit to Hitler's headquarters, but the Swedish report, according to which the two have agreed that Roumania will send for the spring campaign "as much help as her general situation allows", may well provide a clue, with the stress on the word "allows."

The Oil Position

For nearly two years the Roumanian oil industry has been completely under German control. Nominally, control is exercised by a Roumanian government department, which

works in conjunction with a government-owned prospecting company. In practice, however, both are in close "collaboration" with the *Continental Oel Gesellschaft*, of Berlin, which provides expert advice, working capital and, to some extent, drilling equipment.

Germany's real difficulties lay elsewhere. For one thing, there was the transport problem, after the severance of the sea route which normally carries the bulk of Roumanian oil exports. The inadequacy of alternative means of transport not only held up deliveries even within the 1940 quota of 1.5 million tons, but imposed a check on output at the wells for lack of storage facilities. It appears that the transport question has in the meantime been largely solved by pipeline improvements, increasing the loading capacity at the Danube ports, increasing the Danube tanker fleet, quicker turn-rounds and the reorganisation of railway deliveries. Moreover, since the beginning of the Russian war, a substantial part of the deliveries go directly to the east, and whether this simplifies the transport problem as a whole or not, it certainly relieves congestion on the west-bound traffic.

Germany had to contend, however, with a second difficulty—declining production. In the early months of the war British and French interests were blamed for deliberately slowing up production, and Germany's first act, almost when gaining economic control over Roumania was to raise the export quota for Germany to three million tons, double the previous figure, while German experts were to steep up production. However, these efforts have proved fruitless; not only could output not be raised, but it continued to dwindle. The truth is that the yield of the wells has been declining ever since the peak output of 1936, for the simple reason that the oil reserves are beginning to give out. Various estimates published before the war put the known reserves at between 30 and 60 million tons; these have since been drawn upon to the extent of four years' output.

Production, export and home consumption in the last three years were as follows:—

	(In thousand tons)		
	Production	Export	Internal Consumption
1939	6,240	4,175	1,785
1940	5,750	3,530	1,850
1941	5,250	3,100	1,700

With the present reduced crude output, the refining industry is working considerably below capacity. Last year's refinery production was 4.8 million tons (crude), compared with an average of eight million tons in 1934-38 and a total capacity of about 11 million tons. Refinery yields are considerably below those obtained in the American industry, so is the quality of Roumanian aviation fuels and lubricating oils.

Land of Electricity?

[FROM OUR GENEVA CORRESPONDENT]

February 24th

SWITZERLAND, "the land of electricity," is a slogan which sounds odd nowadays when, owing to the lack of water, the general consumption of electric force has had to be reduced by about 30 per cent., and the situation is becoming worse every day. Last summer was not warm enough to melt the snows on the higher mountains and rainfalls were abnormally scarce in autumn, so that when winter began the lakes and artificial lakes level was at least 50 per cent under the average. Cold arrived early and, owing to the frost which has not ceased since Christmas, the water reserves are dwindling to such an extent that drastic measures had to be taken to assure the necessary force to industry. The Government had to curtail street lighting during the hours before and after the blackout, to limit to 48 hours a week the use of electric boilers, to prohibit the use of heating appliances, to reduce the train and tram-car services, and even to urge industrialists to save at least 25 per cent of the force they usually employed. Swiss radio stations have even cut down the length of their broadcasts. As wintry weather continues unbroken and is likely to last for some time longer, no improvement in the situation can be expected before the middle or end of March.

It is easy to realize what that means for Switzerland where, with a population of 4 million, there are 900,000 electric engines of all types, 14 million lamps, 160,000 electric cookers, 590,000 wireless sets, 500,000 electric

CROOKES'

HALIBUT LIVER

OIL

THE SUPPLY POSITION

The Crookes Laboratories regret that Crookes' Halibut Liver Oil will no longer be readily obtainable in capsules, but only in liquid form. This is due to priority demands of national importance.

In the interests of national health the Crookes Laboratories have taken every precaution in their power to ensure adequate supplies of Crookes' Halibut Oil in all parts of the country. Thus the public may rest assured that their needs of this vital source of Vitamins A and D are being safeguarded as far as circumstances permit.

German Europe

Basic Industries

THE annual reports of leading German industrial concerns suggest that the greater part of the programme of expanding capacity was completed during 1941. For the second year in succession, reports almost generally indicate that the replacement of machinery had to be postponed. Output in the coal-mining and iron and steel industries was probably maintained at the level of 1940. The output of lignite, largely used in the generation of electricity and as raw material for synthetic petrol, increased. The production of synthetic rubber, textile fibres, plastics and light metals probably exceeded the record figures of the previous year. Further expansion depends on the necessarily slow construction of electric power stations. Germany's basic industries thus seem to have reached virtually the limit of expansion under present conditions. It may, however, be possible that the administrative unification of the German and Polish Silesian coal area, of the Saar territory and French Lorraine, and of the lignite area in central Germany and the Sudetenland, which was completed during 1941, will result in some increase in the output of coal, iron and steel during the early months of 1942.

The main difficulty in Germany's basic industries is the shortage of labour, particularly of skilled labour. There is hardly any coal-mining report which does not point out difficulties in the supply of labour. Skilled German miners were called to the colours in increasing numbers last year, and were replaced by foreign workers, mainly from eastern Europe. The iron and steel industry, on the other hand, laid stress on difficulties in the supply of coke. The actual output of coke increased considerably; but one of the main objects of the Four Year Plan was self-sufficiency in the production of pig iron from German low-grade iron ore, which requires considerably greater quantities of coke. Iron and steel concerns report that during 1941 the percentage of German low-grade iron ore used in blast furnaces was still increasing; new capacity which had been built for the use of German ores came into operation. Costs of production were thus still rising.

The coal and iron industries in German-occupied countries returned to more normal conditions during 1941. But not one of the occupied countries reached pre-war output figures. It can be roughly estimated that, at present, Greater Germany, including the Polish provinces, Lorraine and Luxemburg, produces two-thirds of the steel output of the entire continent and three-quarters of the total coal output. In other words, Germany now holds a virtual monopoly. "Industrial collaboration" largely depends on German supplies of coal and iron and steel to manufacturing industries in occupied countries.

The limits on the capacity of the basic industries of German Europe are obvious. By conquest, Germany succeeded in concentrating Europe's coal and iron and steel industries within her new boundaries. This new concentration of industries, however, was drained of manpower last year by the prolonged war against the Soviet Union. Germany was forced to import workers from occupied and dependent countries, which inevitably impeded the full exploitation of the capacities of the countries they are taken from. Scattered figures published in France, Belgium, Holland, Hungary and Roumania show that the basic industries of all these countries have experienced difficulties in the supply of labour. More workers are needed if output is to be maintained.

It has frequently been suggested that the location of industries in Germany has been drastically changed since the beginning of the war. Germany is credited with the successful transfer of whole industries from the west to the east. But there is no evidence to support this. The facts which can be gathered from German publications, particularly from the formation of new concerns, suggests a different conclusion. It is the new capacity which has been constructed since the beginning of the war that has been located in central and eastern Germany—synthetic oil plants and chemical works in the Sudeten area and Silesia; and aircraft and tank factories in Austria. The important manufacturing industries in the Ruhr area and in Southern Germany have not been moved. In fact, after the collapse of France, the evacuated industries of the frontier zones at once moved back to their old sites. Upper Silesia,

the Olsa territory and Dombrowa, a huge industrial area now under unified German administration, is still largely a coal, iron and steel producing area, which the Germans intend to develop into a second Ruhr area. After some reluctance, the leading German concerns are now setting up subsidiary companies in Silesia. Krupp, for example, has founded the *F. Krupp Schlesiische Industrie GmbH*. But the wartime development of this area is almost exclusively in the hands of the state-owned concerns, particularly the H. Goering works.

There are many signs that Germany's main interest in the Danubian countries is the forced establishment of substitute industries. Cellulose and artificial textile fibre plants are being constructed in Hungary and Roumania. In Roumania, preparations have been made for the manufacture of synthetic rubber from natural gas. The *Otto Wolff* concern founded the *Ferro-Wolff AG* in Agram; imports of machinery for Croatia and exports of agricultural produce are the main objects of the company. The concerns controlling the foundation of substitute industries in the east collaborate at the same time with French and Belgian groups for the expansion or construction of substitute capacity in western Europe.

It may safely be assumed that some of these plans will remain on paper. Two main obstacles, the shortage of labour and inadequate transport communications, will prevent their completion during the war. At present, industrial activity has chiefly been concentrated within the boundaries of Greater Germany. The occupied countries have become accessories, or sub-contractors. A glance at the economic map of the continent, however, shows that the administration of the most important industrial areas of occupied Europe has been profoundly changed. Some areas are now under direct German administration; others are controlled by German cartels or continental companies; German state companies, such as the H. Goering Works, and semi-state organisations, such as the numerous firms owned by the German Labour Front, are leading in the control of foreign industries.

Concentration and Rationalisation.—Recently there has been some opposition to the extreme concentration of industries as well as to rationalisation. Indeed, German industry would seem to have reached the limit of concentration. Any further concentration of armament orders in the most efficient factories would mean a further transfer of workers to places where housing conditions are already in quite inadequate. The only appreciable possibilities are in another direction. Successful industrial collaboration with occupied countries enabled Germany to keep a considerable part of its civilian industries going. Now the needs of the production programme demand the use of every available worker and all available capacity; the problem is no longer to comb out civilian industries for workers, but to convert a considerable part of these industries bodily to war production, which has the advantages of leaving the workers *situ* and bringing into military use machinery that was formerly used for non-military purposes or thrown idle. The Order Bourses, which have been instrumental in the sub-contracting of war orders, initiated this new move. At the same time, the smaller firms, having lost orders since the new concentration began, are trying to combine in such a way that they will be able to take on war orders again; it seems that so-called "manufacturer rings" are the favourite method whereby the resources of several firms are combined by founding a new firm, and this new "head firm" is able to take large orders, which can then be distributed among the member firms.

Fixed Prices.—It is estimated that roughly 30,000 different articles are supplied to the German *Wehrmacht*; fixed prices have been established for 300, and this number will be increased to 1,000 by July 1st. The "working staff" established in the High Command of the *Wehrmacht* is now the sole arbiter for fixed prices; it decides to which price group a factory belongs. Difficulties have been encountered in fixing prices for manufactures in whose production sub-contractors participate. The German press reports that firms are eager to belong to the lowest price group. This may be true, because a firm which is placed in the lowest price group is entitled to the whole profit.

THE BUSINESS WORLD

Oil Company Shares

SINCE Japan occupied some of the world's richest primary producing areas in the Far East, there have been two diametrically opposed schools of thought on the question of the appropriate Stock Exchange valuation for the shares of "blitzed" companies and industries. The first is, broadly, that prices should be highly selective, on the basis of the facts of war geography. For example, where a product as indispensable as oil and petroleum is concerned, supporters of this view maintain that, while the securities of companies physically in the war zone should be valued somewhere near a break-up figure till the end of the war or the reconquest of their territories (whichever is the earlier), the shares of other producers situated well away from the scene of hostilities should, if anything, be written up, because the demand for their product will be even more urgent than before. The opposite school maintains that, in the last resort, companies all over the world are in much the same boat so long as the main issue of the war remains undecided. There are no "safe areas" to-day. Only a few months ago, the markets were valuing Eastern rubber, tin and oil shares on the basis of ample distance from the scene of operations. But given the rapidity with which the war is engulfing one area after another, the only place likely to be 100 per cent immune is (inappropriately) Mars. On this reasoning, the shares of oil companies operating in the Americas may command a limited—but only a limited—premium over those whose fields are actually in or near enemy hands. Investors with the courage of their convictions should, it is argued, regard "submerged" Eastern producers and, say, electrical undertakings in Birmingham as being almost equally bad risks if the war is lost, while the former will be the more promising "recovery equity" on an Allied victory.

In fact, the market, quite properly, has steered a middle course between these two extreme views. With a few exceptions, oil company shares have fallen in price since Japan entered the war, but those of companies nearest hostilities have fallen most. Until Axis progress is halted, the oilfields of the South Pacific and Burma are obviously outside the Allied orbit, and those of Persia and Iraq are war-threatened. But the Americas still maintain a relative isolation, and the war would have to be going ill indeed if they were brought into the first line of operations. Whether shares in oil-producing concerns, even there, however, are, at this juncture, appropriate media for investment, unless it is frankly speculative, is another question. It is one of the minor ironies of this most baffling of all wars that the status of the producers of the most indispensable of its raw materials should almost invariably be a function, at this time, of conditions which have little or no direct relationship to world demand. The conditions making for uncertainty, from the investor's viewpoint, vary with almost every company, but their effect in each case is to make a conservative dividend policy highly probable.

To take the largest British undertaking first, it is hardly to the point to argue that the properties of the Royal Dutch-Shell group, lost or threatened in the East, produced about one-quarter of the group's peacetime output, whereas the market price of Shell £1 units have dropped by more than 40 per cent since Japan came into the war. Measurement in terms of any historical price figure is fallacious; estimation must be based on the group's prospects, pure and simple. Even in prosperous days, conservatism was the hallmark of Royal Dutch-Shell finance. To-day, the group is faced with the prospect, not only of a substantial immediate loss of earning power, but of the necessity of undertaking heavy capital expenditure to restore its properties after the war. Even then, there will be a considerable time lag before anything like full pre-war earning power can be reinstated. Already, Shell ordinary dividends have been cut to 5 per cent free of tax from a pre-war figure of 20 per cent free of tax. If the directors decided to conserve their wartime liquid resources entirely, and suspended dividends, who could criticise them?

Among other large British producers, Burmah Oil,

supplier of the Indian market, has lost its refinery at Rangoon and its oil-bearing areas farther north are threatened by the enemy's advance. In these circumstances, the directors may deem the retention of all available cash resources imperative. Anglo-Iranian Oil, whose profits have been halved since the war and whose dividend has been reduced from 20 per cent to 5 per cent, is farther from the scene of immediate hostilities, and its political environment has been improved by the Anglo-Russian occupation of Persia. But the shares of any producer in the Near East must inevitably carry a considerable war risk, given the present position and reputed intentions of the German armies.

If investors turn their attention to the New World, the United States is, so far as they are concerned, a closed market. Mexico, represented on the London Stock Exchange by the traditionally speculative shares of Mexican Eagle, affords an opportunity for those who wish to gamble on the possibilities of whole or partial restoration of the expropriated foreign ownerships. That "risk," however, is for the specialist, not the ordinary investor. The most important area where British companies are well established and actively producing is Trinidad. Here, a number of producers are paying satisfactory dividends, and, for obvious reasons, they are being pressed to increase their output to the utmost. Little, if any, of the financial fruits of their increased activity and the more rapid depletion of their oil resources, however, is likely to be passed on to shareholders. The extent of the burden of taxation is exemplified by the experience of one of the most progressive of these companies, Trinidad Petroleum Development, which out of current earnings is first required to pay the Trinidad Government a special wartime "cess" based on production. The residual profits bear local income tax, British excess profits tax at 100 per cent of a pre-war standard which, after all adjustments, remains highly unfavourable, and, finally, income tax at 10s. in the £, subject to Dominion tax relief.

In Central and South America, the Canadian-registered British Controlled Oilfield has important and extensive rights, *inter alia*, in Venezuela. The company, however, has paid no dividend, and neither its preferred shares nor its common voting trust certificates come within the present range of the general investor to whom near-income prospects are a consideration. Venezuelan Oil Concessions is the most important British-owned producer in Venezuela, and its

YOUR WILL

Have you thought of the anxiety which may be caused to your dependants if for any reason your affairs have not been satisfactorily arranged?

In these days when life is so uncertain, the advisability of appointing a corporation rather than an individual as the Executor of your Will or in the capacity of Trustee needs little emphasis. By so doing, continuity is preserved and you are assured of efficient administration.

Full details can be obtained from any Branch of Lloyds Bank Limited or from its Executor and Trustee Offices.

output, under Royal Dutch-Shell management, has been increasing through the past decade. Taxation, however, is an important factor, and any substantial increase in the dividend, which was reduced from 22½ per cent to 16½ per cent four years ago, seems improbable in present circumstances. Another Venezuelan company, Ultramar, is in the development stage, and, until a profit and loss account is forthcoming, investors cannot be certain whether the rapid increase in the price of its shares in a relatively narrow market has left them dear or cheap, on a long view. Finally, Anglo-Ecuadorian Oil and, in Peru, Lobitos are well-established and progressive concerns, but the yield on their shares, at current prices, can scarcely be called generous for an extractive industry carried on overseas.

The table opposite suggests that, having regard to the limitations discussed in preceding paragraphs, the present level of prices for oil shares as a whole, even after the falls of the last three and a half months, appears to be discounting future possibilities rather than current income prospects.

With few exceptions, the oil share market would seem to have only limited attractions at the present level of values for investors proper so long as the war lasts. Regarded as "recovery equities," the shares of many of the largest concerns may well eventually hold out interesting prospects. The difficulty is that one is hardly able to assess those prospects now. Investors without inside knowledge may well deem it prudent to wait until the outlook is a

little clearer before substantially increasing their stake in a market which may have further vicissitudes to endure before the day of Allied victory.

Finance and Banking

Warships Week Imperturbability

Despite its smashing of records, riddling of bullseyes and passing of targets, London's Warships Week has left the banking position and the money market curiously undisturbed. At no time has the disturbance to credit been sufficient to force the market to seek special assistance from the Bank of England—and this despite the fact that most of the clearing banks have been making up during the week. The authorities, no doubt stung by the memory of the difficulties experienced by the money market during London's War Weapons Week, decided that there should be no cause for complaints on the score of stringency this time, and throughout the week the credit position has been kept in a state of almost abnormal ease. The payment of some £60 millions in respect of vested Canadian securities at the beginning of this week helped the position greatly. In addition, the banks had no Treasury deposit receipt payments to make this week, while the maturities, after allowing for £10 millions of prior encashments, amounted to £40 millions. Most important of all as an equilibrating factor in this week's exceptional disturbances of the credit position, was the further prior encashment of TDR's by the clearing banks. Some measure of these encashments should be provided next week, with the publication of the national debt return covering the month of March. It is probable that the greater part of the huge total subscribed to Government loans during the past week will be found to have been financed by the maturity and encashment of TDR's. If to this be added the contribution to the Warships Week total provided by the reinvestment of funds liberated by the last Vesting Order on Canadian securities, the achievement of this week, commendable though it may be, will be seen in somewhat truer perspective than is provided by the mere totals.

The Bank Return

The surprising ease with which Warships Week has passed is well reflected in the Bank return showing the position on Wednesday afternoon—by which time some £100 millions had been subscribed towards London's target figure of £125 millions. Despite the drain on bank cash which this would suggest, the banks' deposits at the Bank of England stood at the exceptionally high level of £156,824,000 at that moment. This represented an increase of £19,880,000 on the figure for the previous week and readily explains the abundance of credit in the money market and the readiness of all the clearing banks to buy bills freely from the market even on their making-up days. The market, in fact, reports that, despite the heavy 50 per cent allotment which it obtained at last week's tender for Treasury bills, it has been unable to satisfy the banks'

demand for bills. Most discount houses have allowed their portfolios to run off appreciably during the week, and their cash position has been so comfortable that balances have been occasionally offered by them. The main factor in easing the position has been the increase of £19,615,000 in the Bank of England's holding of Government securities. This probably represents ways and means borrowing, and suggests that the clearing of balances due from the banks to the Exchequer in respect of their own and their customers' subscriptions to Government loans has been either staggered or delayed. No other explanation would satisfactorily explain the manner in which the huge amounts subscribed during Warships Week have been ignored and have had to be supplemented by Ways and Means borrowing. The note circulation continues its steady climb. It gained £844,000 during the past week, thus reaching the new high record of £755,067,000.

Silver and Rupee Exchange

The Bombay silver price, which last week reached a peak of Rs 80½ per 100 tolas, broke sharply to Rs 76 13a at the end of the week, but has since been climbing again and has touched Rs 78½, which is the equivalent of a London and has touched Rs 78½, which is the equivalent of a London quotation of nearly 35d. per standard ounce. The Government of India continues to hold its hand in the Bombay market, but has again sold in London in the minute quantities required to satisfy genuine industrial demand in this market. The London quotations for both spot and forward have remained unchanged at 23½d. The renewed rise in the Bombay price has reawakened some apprehension about the possible consequences of the continuance of this movement on the rupee exchange. It is true that, if the Indian price for silver reaches about Rs 109 per 100 tolas, the point will have been reached at which the bullion contents of the 11/12ths fine rupee coinage will be worth more than their nominal value. But it does not follow that, even if this high price is reached, the exchange rate of the rupee will have to be adjusted as it was in the early 1920's, when the rupee appreciated to over 2s. in the wake of the rising price of silver. The position is fundamentally different to-day. In the first place, the whole rupee coinage is in process of being reminted to a fineness of 500/1,000, which means that the open market price would have to rise to Rs 200 per 100 tolas before reaching melting point for this part of the currency. Even more convincing is the fact that the Reserve Bank now has the right to issue notes of small denominations. If, therefore, the Bombay silver price were to rise to the bullion parity of rupee coins such coins would undoubtedly tend to disappear into hoards. But they could be readily replaced by paper currency, and the rupee rate of exchange would not on that account have to be moved from its present anchorage of 18d.

It will, however, be wise to bear in mind the monetary aspects of the change in India's status which is at present being discussed. Although the basis of the rupee ratio controversy disappeared when sterling left the gold standard, it must not be assumed that the intensively vocal and active school of thought in India which has clamoured for a return to the traditional parity of 16d. is dead. The issue, involved as it is with important vested interests and carrying with it memories of bitter politico-financial contention, may flare up into prominence again. It is very much to be hoped that the interests and activities of Indian politicians, even if they are to be given free play with currency matters, will find more constructive scope than any such arbitrary tampering with the rupee exchange; but one should be prepared for some intensive lobbying by the "16d. traditionalists."

Bank of England Profits

The considerable increases in the turnover of business handled by the Bank of England and in the investments held by the banking department hardly affect the even tenor of the Bank's profits. At the half yearly general Court, held towards the end of last week, it was announced that the profit for the half year amounted to £438,768, compared with £437,199 for the previous half year. After deducting tax at 10s. in the £, £436,590 is required to meet the net outlay of the traditional 6 per cent actual half yearly dividend. The declared profits of the Bank have over a long period of years been kept close to the amount required to meet the 6 per cent half yearly dividends, after payment of tax. There is evidently a considerable measure of management in this stability, given the considerable fluctuations that have occurred—especially since the war—in the earning assets and the expenditure of the Bank.

Far East Bank Dividends

After the recent statement from the Hongkong and Shanghai Banking Corporation that no announcement re-

garding a final dividend for 1941 could be made in view of the prevailing uncertainties, four other Eastern banks have cut their dividends. They are the National Bank of India, which has reduced its interim from 8 to 6 per cent, and the Mercantile Bank of India, whose second interim of 3 per cent is to be the last distribution for 1941, making 9 per cent for the year against 12 per cent paid for 1940, the Chartered Bank, whose distribution has fallen from 10 to 7½ per cent, and the Eastern Bank, which is paying 4½ per cent for 1941 against 6 per cent for 1940. All these banks are in an exceptionally strong position. For many years past they have ploughed back into reserves—both hidden and published—far more profits than they have distributed. Their profits for 1941 would have easily sufficed to repeat the previous year's distributions. Yet the cuts in their dividends must be deemed a wise and conservative move. For the time being, some of their earning power has disappeared, while some of it is in danger. In the circumstances the standing of the banks in question can only be strengthened by the dividend policy which they are pursuing.

British Insurance Looks Ahead

An important address was delivered before the Insurance Institute of London on March 16th by Mr Arthur E. Morgan, the President of the Institute. Mr Morgan's speech falls into two parts—the first a record of some of the work which British insurance is doing in the furtherance of the war effort, the second a plea for pre-planning its part in post-war reconstruction; and in both the emphasis is on co-operation—co-operation within the market, with the Government and with the American insurance industry. The war has brought the various sections of the British market together for common effort in many directions, and numerous committees composed of representatives of the tariff companies, the independent companies, and Lloyd's have been established. Most important of these is the Trading with the Enemy Joint Insurance Committee, which, through the Ship Warrant Scheme and

otherwise, has been a considerable factor in the denial of comfort to the King's Enemies; because of its high standing abroad it has been possible for British insurance, by withholding facilities, to hamper the transport of materials required by the enemy, and in this a unified market has collaborated wholeheartedly with the Ministry of Economic Warfare; it has also assisted in securing support from United States insurance interests, a special mission, of which Mr Morgan was a member, having visited Washington last October. Another matter in which the industry has given aid to the Government has been the administration of the various schemes of insurance against war risks; the Government, for its part, has reciprocated by placing with the market its fire and marine insurances on food and supplies, thus avoiding a heavy fall in premium income, which could have been utilised by the enemy as a peg on which to hang prejudicial propaganda. Looking to the post-war period, Mr Morgan expressed the view that British insurance could no longer afford the extravagance of two voices, and that the companies and Lloyd's should form a committee which in matters affecting the industry as a whole—not, however, such questions as rates or commissions—could speak with authority. And, as a further step, he advocated the creation of an Inter-Allied Economic Council embracing all interests, on which insurance should be represented, so that "in the planned economy to which we all look forward, those countries able to serve, and in whatever direction they are able to serve having the qualities essential to that service, shall have their place in their special spheres." Mr Morgan's words will no doubt be closely studied in insurance circles.

Motor Insurance Refunds

Following the decision to abolish the basic petrol ration, insurance companies and underwriters at Lloyd's have announced that motorists who lay up their cars at any time will receive a *pro rata* refund of premium; similarly, any policy which expires before the ration is withdrawn can be extended *pro rata* for any further period to suit the require-

ments of the policyholder. No doubt the majority of policyholders who take their cars out of commission will wish to cover fire and theft risks, the premiums for which are quite modest and can be taken into account in the adjustment between insurer and insured. The refunds, coupled with reduced renewal premiums, will naturally involve considerable reductions in income for motor insurers in the current year. Hitherto, lower premiums on private car insurances have been largely offset by increased commercial vehicle business, but this position cannot be maintained in face of the abolition of the basic ration.

US Film Companies' Sterling

Reports have reached this country from New York that American film companies expect the complete unfreezing of their sterling holdings by the time the present agreement regulating the conversion of their sterling earnings expires next November. These messages should be treated with the greatest reserve. There can be no doubt that the American film companies would like to be allowed to convert the whole of their sterling balances into dollars, and there is equally no doubt that before the negotiations begin for the renewal of the agreement, a certain amount of lobbying and kite-flying of varying shades of tactfulness and subtlety is to be expected. The New York messages are the opening shots of this campaign. The reports, which evidently emanate from the American film interests, suggest that by next November, when the present agreement comes up for renewal, the eight companies concerned will, between them, hold sterling to the amount of about £11,000,000. At present, the film companies are allowed to convert into dollars at the official rate half their earnings in this country. Whether these terms will be relaxed in favour of the American companies in eight months' time must depend upon many factors bearing on our dollar position which it would be unwise to anticipate so long in advance.

Investment

Warships and the Market

Whether it was the military bands, which miraculously appeared to stimulate the Londoner to greater saving, or the efforts of spring to assert itself, the tone of the stock market has been a good deal brighter than most people dared to hope. It is true that the accepted indices show very small movements and that turnover has been moderate, but it is a surprising fact that the number of bargains marked in the first half of the week is rather above the average for the preceding two months. A good deal of this business has occurred in the more speculative sections, such as foreign rails and oil shares, while the pause in the Far East has encouraged some bargain hunting in tea, rubber and tin shares. This move is probably due as much to the more aggressive policy adopted by the Allies in the Pacific as to the rather quieter conditions prevailing over a large part of that field, which probably mean reorganisation for a fresh series of efforts on the part of Japan. Actually, these movements in speculative stocks, like the slump and recovery in tobacco shares, are matters of minor moment. What is really interesting is the very moderate effect on the stock market of the huge money movements which are taking place. Literally, almost the sole reflection of them appears to be a modest demand for long-dated gilt-edged stocks which are, presumably, being bought out of the proceeds of the Canada vesting money. It is futile to attempt any comment on how the huge total of London Warships Week is composed until the floating debt figures are made public, but it is clear that the necessary transfers are being arranged with even less friction than in the past market. Incidentally, it is interesting to note that the Stock Exchange, having set itself a total of £6,000,000, looks like passing double that figure. It seems impossible sense contributions of members. Almost the only other development of the week is a slightly increased heaviness in "shorts," probably a reflection of an anticipated excess of supply in the near future. This heaviness helps to account for the fact that the ex dividend minimum price of 5 per cent Conversion loan has been dropped from the previous figure of 104 to 102. The fall is, however, mainly a reflec-

tion of the inevitable fact that, at its approaching redemption date, this stock cannot stand above par plus accrued interest.

Informative Accounts

The 1941 accounts of Harding, Tilton and Hartley, makers of the "Van Heusen" products, are sufficiently outstanding in their method of presentation to warrant special mention. The profit and loss account is a very full statement, and it differentiates between provision for tax payable in the year 1942-43 and further provision for the previous period, while the meaning of these appropriations is explained in the report. The balance sheet shows each class of fixed asset at its value on the registration of the company and the depreciation since provided. It also states the provision for future bad debts and the fraction of its total cash held abroad. On the other side of the account, current liabilities are dissected according to their nature, and include the final dividend provision. The principal classes of assets are also grouped into totals, clearly extended, so that it is possible to take in the situation at a glance. It need hardly be said that the showing is a very strong one. Nor is this all, for there are comparative statements of both assets and liabilities, and profits and their distribution, for the seven years since the company became public. The former tabulation shows for each year total fixed assets as a percentage of total net assets, after deducting current liabilities and provisions. This percentage has fallen from 35 in 1935 to 16 in 1941. Meanwhile, reserves and surplus, including income tax reserve, have risen from 20 to 43 per cent of total net assets. The analysis of profits shows, *inter alia*, average figures for the seven years; the percentage obtained from various exceptional sources and the percentages in which the total available has been paid out in taxes or dividends, devoted to writing down assets, or placed to reserves. The presentation of these accounts appears to be technically excellent in almost every particular, a fact which is doubtless due to the circumstance that Mr F. R. M. de Paula, an eminent authority on accounting, last year became joint managing director of the company. If there is one criticism of them, it is that, while

profits rose year by year—until wartime restrictions reversed the trend—the valuation of fixed assets fell as steadily. This seems to indicate growing secret reserves due to an under-estimation of published profits. If this is the case, it is in accordance with the best practice of the past; but there are growing doubts as to whether a more liberal interpretation of published earnings would not be in the public interest, and in the long run in that of the proprietors. That any undervaluation which may have occurred has been slight arises from the nature of the business, and does not alter the fact that a similar procedure would in some cases considerably distort the true position.

Tobacco Scare

The market has this year been singularly free of pre-Budget influences, so far, but one of the principal movements of recent weeks has been a sudden fall in the prices of some of the leading tobacco shares, on the rumour that supplies were to be cut as part of plan for saving shipping. The fall has to a large extent been made good on the announcement by the Control that nothing was known of any such intention, but uncertainty remains. It is, of course, the fact that the import of tobacco takes up shipping space, and, although the amount involved is relatively small, no possible saving ought to be neglected in the present situation. The Government has, however, hitherto always argued that certain luxuries, including beer and tobacco, should be supplied in ample amounts, and this policy has had the enthusiastic support of the Exchequer, since these two commodities furnish one of the easiest means of "painless" collection of large amounts of revenue. There is, thus, no need to look for a curtailment of supplies unless the

* On present capital.

authorities see, in the present straitened circumstances, a sufficient reason for a drastic revision of policy. As to the possible effects of additional taxation on tobacco, the facts are that rising consumption has gone hand in hand with rising prices. With the wage bill still mounting, and many forms of expenditure curtailed, or threatened with reduction, it seems very probable that the demand for tobacco will remain very inelastic. This is the more probable since the smoking public is prepared to accept substantial variations in the character of the goods supplied as well as in their cost. The accounts of the larger concerns, up to last autumn, showed on the whole that profits had been well maintained. Statements of Gallaher and Godfrey Phillips for the calendar year tell a similar story and stress the rise in turnover. Gallaher, who have suffered severely from enemy action, show only a modest decline in earnings. The table shows the position of the leading companies operating at home and also of BAT and United Tobacco South. It will be seen that the dividends still show an improvement over the ten-year average in most cases and that the yields discount further progress.

Company Notes

Cammell Laird and Baldwins

It is unfortunate that the accounts of many leading heavy industrial companies have become significantly less informative since the outbreak of war. The moderate fall in profits after tax for Baldwins, and after tax, depreciation and contingencies for Cammell Laird, shown in the full accounts of both concerns for 1941, provides little indication of the movement of gross earnings. After provision of £40,000 against nil for retrospective repairs, available earnings of Cammell Laird, whose preliminary statement was discussed in *The Economist* of March 7th, are down from £241,852 to £186,548, representing 21.0 against 23.7 per cent. General reserve receives £100,000 as before and the carry forward is

reduced from £104,813 to £102,611. The 10 per cent dividend on ordinary capital is repeated by both Cammell Laird and Baldwins, and in the latter case the cover is raised from 10.1 to 10.8 per cent. As in the previous year, there is no transfer by the latter concern to reserve and the carry forward is some £10,000 higher at £54,272. With an improvement in profits after tax from £602,502 to £676,950, *Guest Keen Baldwins*, controlled jointly by Baldwins and *Guest Keen and Nettlefolds*, is able to restore the payment of 5 per cent on ordinary shares, which received nothing in

* Also after depreciation and contingencies for Cammell Laird.
† Provision for deferred repairs.

1940, the rate of equity earnings amounting to 4.7 against 0.3 per cent. *English Steel Corporation*, in which Cammell Laird owns a substantial interest, shows earnings for preferred and deferred shares of £280,024 against £430,246, after an increase in depreciation provision of £100,000 to £500,000. There is, however, a small rise in the less tax rate of payment on deferred shares, which receive 17½ against 20 per cent tax free, equivalent to 35 against 34.7 per cent less tax. Balance sheets generally show a moderate rise in liquid assets, higher turnover being reflected in sub-

BRANCHES THROUGHOUT THE COUNTRY

LARGEST IN THE WORLD

stantial increases in debtors and creditors. In the accounts of *Thomas Firth and John Brown*, whose profits were discussed in *The Economist* of March 21st, there is a rise in debtors of some £900,000 to £2,362,564 and in creditors, including taxation, of nearly £1,400,000 to £4,415,700. The 4s. shares of *Baldwins*, at 4s. 9d., yield 8s. 5d. per cent; the *Cammell Laird* 5s. stock, at 7s. 4½d., offers £6 15s. 7d.

Hadfields' Profits

Profits of Hadfields, after tax, declined in 1941 from £297,496 to £259,457. The fall in equity earnings from £251,859 to £192,154, representing 35.5 against 40.6 per cent, is rather steeper owing to the necessity of providing £32,030 against nil for war damage insurance. Ordinary stock receive 22½ per cent, as in the four previous years, and the carry forward is raised from £588,167 to £659,022, there being again no transfer to reserve. The company is primarily engaged on production of special steels, and it is satisfactory to find that it was fully employed last year and that output again reached a new high level. The balance sheet shows a rise in the surplus of liquid assets from £1,461,116 to £1,540,860, while the total of reserves is unchanged at £516,413. The most striking change is the jump in debtors from £495,859 to £981,040, while stores and work in progress are moderately increased to £2,239,067. These rises are partially financed by a reduction of the total of Government securities and cash by £167,251 to £540,699, and partially by a rise in creditors of some £117,000 to £485,678. Bank overdraft is slightly lower at £369,126, against £390,651. The accounts suggest that last year's trading was highly satisfactory and show that a comfortable margin remains for the ordinary stockholder after all charges have been met. The record, prior to 1935, was a poor one, and the 10s. ordinary stock, at 26s. ex dividend, yields £8 13s. 1d. per cent.

Electric Power Results

In view of the prohibition on the publication of accounts by public utility companies, made last year under Statutory Rules and Orders, no 1941 accounts for electric power operating companies are available. It is, however, still legal to publish the accounts of holding companies which provide shareholders with some indication of the trend of net profits. The most striking feature of the accounts is the similarity of the movement in the rate of profit. In three cases out of four, the rate of equity earnings was higher last year, while for the fourth, *Lancashire Electric Light and Power*, the rate is only 0.1 per cent lower at 7.4 per cent. In no case has the ordinary dividend been reduced during the year. A rise in gross profits has been realised by both *British Power and Light* and *Scottish Power*, but the most substantial increase in the rate of surplus earnings is achieved by the latter concern with a rise of 3.9 points to 25.7 per cent. Mr William Shearer, speaking at the meeting of *Midland Counties Electric*, stated that there had been a moderate increase both in the number

of new consumers last year and in total load. At the meeting of *Scottish Power*, he pointed out that the Glen Affric scheme must be regarded as *sub judice*, but was still receiving the attention of the directors. The following table analyses the results of four leading concerns with a wide geographical spread:—

Company (Years ending December 31)	Total Disclosed Profits	Earned for Ordinary		Dividend	March 18	
		Amount	Rate		Price*	Yield
British Power & Light:						
1939	260,376	104,215	7.7	7	28/3	4 4 7
1940	271,390	85,768	7.3	6		
1941	335,124	80,678	8.0	6		
Lancashire Electric Light:						
1939	289,098	141,042	7.2	7½	34/4½	4 7 3
1940	256,549	125,655	7.5	7½		
1941	225,537	107,473	7.4	7½		
Midland Counties Electric:						
1939	396,976	228,627	11.7	8	38/9	4 2 7
1940	365,400	212,343	12.3	8		
1941	329,927	192,298	12.8	8		
Scottish Power:						
1939	657,393	489,605	19.8	8	38/9½	4 5 1
1940	634,399	475,267	21.8	8		
1941	642,265	489,039	25.7	8		

* £1 ordinary stock.

† Cum. dividend.

The statement of the chairman of *British Power and Light* points out that output increased last year, consolidated revenue from sales of energy rising from £1,299,742 to £1,690,649, while the profit margin between sales and the cost of generation and purchase rose by 12 per cent. There has as yet been no final decision on the rate of war damage contribution. Of four operating concerns, *North-Eastern Electric Supply*, *Northmet Power*, *Electrical Distribution of Yorkshire*, and *Yorkshire Electric Power*, all have maintained dividends on ordinary capital at 7, 7, 9 and 8 per cent respectively. Sir Robert Geoffrey Ellis, chairman of the last-named company, states that depreciation was maintained at the customary level. It is clear from these results that, despite enemy bombing, electrical output was generally well maintained last year. Yields are conservative, not exceeding £4 7s. 3d. per cent for the holding companies.

Courage Accounts

The 1941 accounts of *Courage*, leading Hampshire brewers, show that the decline in income after tax and depreciation, which took place during the three previous years, has been arrested. Total revenue is shown at £404,133 against £403,035 and remaining expenses are strictly controlled, there being no transfer to staff funds, against £5,054. Consequently, equity earnings are up from £216,830 to £225,872, representing 22.1 against 19.8 per cent, while the payment on ordinary stock is maintained at a total of 14 per cent. The directors have doubled the transfer to contingencies fund, at £30,000, and reduced the transfer to rebuilding fund, at £20,425, bringing these funds to £130,000 and £80,000 respectively. General reserve remains at £500,000. The value of freehold and leasehold properties is up from £3,107,904 to £3,126,085, but the accounts contain a warning that, owing to the war, adjustments of the valuation of certain items may be necessary at a later date, and it is possible that the latest property figures require amendment in the light of estimated bomb damage. Liquid items are all moderately higher, the rise in cash from £184,417 to £321,540 exceeding the rise in stocks from £252,025 to £293,974. The breweries have successfully survived the effects of higher taxation on profits and on incomes. In the current year, the main difficulty must be maintenance of supplies of malting barley, but there is as yet no evidence that this is to be drastically reduced. The £1 ordinary stock, at 54s. 9d. ex dividend, yields £5 2s. 3d. per cent.

British Ropes

The full accounts of *British Ropes* for 1941 show remarkable stability of earnings, the reduction in disclosed profits after EPT from £549,336 to £517,185 being explained by the necessity of paying excess profits tax at 100 per cent throughout the year. Charges for income tax, other than tax on interest and dividends, and war damage insurance were £20,000 and £5,000 lower, respectively, so that equity earnings declined only from £169,595 to £154,882, representing 22.8 against 24.4 per cent. The 12½ per cent dividend

dend on ordinary shares is repeated and the carry forward raised from £181,525 to £201,877, after transferring £25,000 against £41,553 to general reserve. The future outlook, as the chairman, Mr Herbert Smith, points out, is largely governed by the possibility of continuing to secure adequate supplies of raw material. The company's balance sheet shows a decline in stocks from £598,828 to £361,495, but Mr. Smith states that there is a rise in the total stocks held by the group as a whole, while those of raw material are maintained at a high level. In this connection, the lack of a consolidated statement is particularly unfortunate. Debtors are some £4,000 lower on the year at £1,133,491, and it appears probable that turnover was not expanded last year. Creditors are up from £1,125,011 to £1,449,022, but there is no shortage of liquid resources, the company having invested £100,000 in a company with allied interests, lent £100,000 free of interest to the Treasury and raised cash holdings from £338,277 to £350,851. The 2s. 6d. shares, at 5s. 10½d. ex dividend, yield £5 6s. 4d. per cent.

British Aluminium

The accounts of *British Aluminium* for 1941 show an improvement in gross income from £912,211 to £973,582. Despite a rise in tax liability from £150,000 to £200,000 and the maintenance of the depreciation transfer at £50,000, equity earnings have risen from £418,156 to £427,332. Ordinary capital again receives 10 per cent, covered by earnings of 18.5 against 16.9 per cent, and, after reserving £100,000 as in the previous year, the carry

forward is up from £194,796 to £222,128. Three years' earnings and allocations are analysed below:—

	Years ended December 31		
	1939	1940	1941
Total profits	1,075,796	912,211	973,582
Taxation	175,000	150,000	200,000

Preference dividend	90,000	90,000	90,000
Ordinary stock:—			
Earnings	557,546	418,156	427,332
Paid	375,000	300,000	300,000
Earnings %	21.9	16.9	18.5
Paid %	12½	10	10

Reserve 150,000 *100,000 100,000
Carry forward 176,640 194,796 222,128

* £500,000 taken from reserve to cover losses in France and Norway.

The balance sheet shows an increase in the total of 4 per cent mortgage debenture stock redeemed from £89,468 to £108,993, leaving £3,391,007 outstanding. Reserves total £4,600,000, of which £500,000 is earmarked to cover losses in Norway and France. Creditors, including taxation, are more than £800,000 higher at £2,807,883, while debtors are some £10,000 lower at £1,266,084. Cash holdings remain almost stable, but £210,000 has been invested in Govern-

REPORT OF THE AUDITORS TO THE SHAREHOLDERS.

We have audited the above Balance Sheet and Profit and Loss Account with the Books, Vouchers and Securities in Head Office, and with the information received by cable or the signed Returns from the Branches. No direct verification or valuation of assets at Branches in enemy-occupied territories can, under present conditions, be obtained. Subject to these remarks, in our opinion, such Balance Sheet is properly drawn up so as to exhibit a true and correct view of the Bank's affairs, according to the best of our information and the explanations given to us and as shown by the Books of the Bank.

TOWARDS THE FUTURE

"When the war comes to an end there will be 8,000,000 or 9,000,000 people, the mainspring of whose existence will have snapped overnight, and it is essential that we should have an ordered scheme of what we mean to do."—Graham White, M.P., in the House of Commons, 10/3/42.

What are the essentials of this 'ordered scheme' of the future?

ment securities, while stocks are nearly £215,000 higher at £959,772. Additions to fixed plant during the year amounted to £175,008 against £224,091, while an additional £365,000 has been lent to or invested in allied and subsidiary concerns. The chairman, Mr R. W. Cooper, points out that much new plant came into use last year and that the concern was working to capacity. The £1 ordinary stock, at 43s. ex dividend, yields £4 13s. per cent.

* * *

Associated Electrical Industries

Full accounts of Associated Electrical Industries for 1941 unfortunately fail to disclose the company's tax provision which has been consistently shown in previous accounts and, in 1940, amounted to £992,900. Total profits after tax are revealed as £681,536 against £716,795 and there is no direct indication whether the gross figure exceeded the £1,709,695 earned in the previous period. After raising the depreciation provision from £261,283 to £263,296, there is, however, only a moderate decline in the amount of equity earnings from £395,360 to £365,934, while the rate is up from 14.0 to 14.9 per cent. There is, therefore, a presumption that earnings before tax were higher last year. Ordinary capital receives the customary 10 per cent; £100,000, as before, is transferred to dividend

equalisation reserve and the carry-forward is increased from £265,472 to £285,314. The company's balance sheet and the consolidated statement both indicate a certain shortage of liquid capital and suggest a very substantial increase in turnover last year. The consolidated accounts show a rise in creditors of some £4,000,000 and in debtors of nearly £3,000,000. Cash holdings are reduced from £1,342,543 to £812,565 and there is a reduction of some £90,000 in holdings of British Government securities. There is a highly satisfactory increase in stocks from £9,003,496 to £11,621,725. The company's balance-sheet shows that a bank overdraft of £800,000 has been incurred. No such stringency is apparent in the balance-sheet of *The Insulated Cables*—the profits were discussed in *The Economist* of March 21—where the surplus of liquid assets has risen from £1,306,136 to £1,389,181. Here, however, rises in creditors and debtors are less marked and stocks are up only from £2,108,731 to £2,274,743. The chairman, Mr Alexander Roger, raises the vital question of who should bear the ultimate cost of extensions undertaken in the cause of war production. There can be no doubt that some part of this charge must fall on the company and its shareholders, but what proportion this should be cannot in all probability be determined until later. The £1 ordinary stock of *Associated Electrical Industries*, at 44s. 6d., yields £4 9s. 11d. per cent; that of *British Insulated Cables*, at 94s., offers £4 5s. 1d. per cent.

Industry and Trade

Concentration of Industry

Within its limited scope, the concentration of industry scheme, announced on March 9, 1941, by Mr Oliver Lyttelton, then President of the Board of Trade, had been substantially carried out by the end of last year. It covered the majority of the industries included in the Limitation of Supplies (Miscellaneous) Orders and some, such as cotton and wool textiles, footwear and paper, then affected by the rationing of raw materials. Firms employing less than twenty persons were excluded from the scope of the scheme. Its purpose was not to curtail production but to concentrate it into the smallest number of factories. The time has now come, however, when the output of consumption goods must be further curtailed and when the process of concentration will have to be taken a stage further. The clothing ration for the period beginning June 1, 1942, will be about 25 per cent smaller than the current year's, and new supplies to retailers of many of the household and personal goods covered by the Limitation of Supplies (Miscellaneous) Orders will presumably also be reduced at the end of the current quota period on May 30th.

* * *

Unemployment in February

The absorption into employment of some of the children who left school at the end of last year was one of the causes of the reduction in the number of unemployed persons on the registers of employment exchanges in Great Britain on February 16th. The total number was 188,417, compared with 194,484 on January 12th, and 188,354 on December 8, 1941. It is probable that the February figures would have been lower, but for the fact that severe weather conditions prevailed on the day the count was taken, which made some outdoor work impossible. The 162,175 wholly unemployed included 89,443 men, 10,485 boys, 50,728 women and 11,519 girls. In the category of the temporarily stopped, numbering 17,267, the numbers were 10,426, 238, 6,255 and 348 respectively. Among those normally in casual employment, of whom 8,975 were unemployed on February 16th, there were 8,654 men, 9 boys, 311 women and one girl. On January 12th there were 170,862 wholly unemployed, 14,736 temporarily stopped and 9,250 unemployed casual workers. Some men and boys who had been classified by interviewing panels as being unsuitable for ordinary industrial employment, did, nevertheless, cease to appear on the unemployment registers. The number thus graded was reduced by 654 between January 12th and February 16th, when the figure stood at 26,508. For women and girls, the corresponding classification is "unsuitable for normal full-time employment," and this figure, too, decreased during the month; on February 16th there were 2,065 women so

classified, a reduction of 409. There was also a reduction of 328 women and girls in the classification of those "unable for good cause to transfer to another area," bringing the figure on February 16th to 1,997.

Cars and Bicycles

The probable effect of the abolition of the basic petrol ration at the end of June on the market in second-hand cars and on the demand for other forms of transport cannot be estimated with any degree of accuracy. Much will depend on the number of private cars that will be affected by the decision. Obviously, if, when the basic ration has gone, supplementary allowances are given leniently, its abolition will be ineffective in terms of petrol saved and prove to have been no more than a piece of window-dressing. While the publication of statistics relating to the number of cars licensed has been suspended, current estimates suggest that it still exceeds 1,000,000 and may be as high as 1,250,000. The number of cars that will be taken off the road will depend very largely on the degree of ruthlessness with which the needs test is applied to applications. It has even been suggested that the number of cars likely to disappear from the road will not exceed 100,000; but this would be a derisory result. A reduction by 100,000 in the number of private cars on the road would not be likely to cause a slump in the second-hand car market, especially as the output of new cars for civilian use has almost ceased, and something like one-eighth of the existing number of cars will no longer be able to secure petrol may refrain from selling them in the hope of being able to run them again in the future. If the number of cars in use were halved, on the other hand, there would probably be a sharp temporary fall in prices. The Government's decision to abolish the basic petrol ration and to reduce supplementary rations is no doubt partly responsible for the increased demand for bicycles. But a serious shortage of bicycles for essential purposes is unlikely; although output for the pre-war market has been substantially reduced from the pre-war level of about 1,500,000 per annum, no less than 500,000 will apparently be produced this year. If current supplies should prove inadequate for all demands, it should not be impossible to devise a scheme designed to meet the most essential needs.

* * *

Cotton Exports

In Lancashire trade circles there has been little surprise at the statement of the Cotton Board that the export system is being revised, in order to safeguard the essential needs of countries directly associated with Great Britain in the war effort. It has been pointed out that direct war needs,

whether for home or export, must have first claim on the output, which is still below the target figure. Export allocations for many markets are, therefore, to be reduced for the next period, beginning on April 1st. The new policy is explained by the statement that, where goods are needed for urgent war use by Dominion and Colonial markets, the problem is less a matter of selling than of organising supplies. It may not be practicable to issue export allocations for the next period by April 1st, but the Cotton Board will notify merchants as soon as possible. Action is also being taken by the Cotton Board to deal with goods produced for markets which are now inaccessible. It is reasonable to restrict the number of hands through which these goods pass, and approval will accordingly only be given to transactions in which the exporter either ships the goods to other British markets in which he himself has a basic allocation or sells them directly to an exporter with a basic allocation. It is apparent that henceforward official control over exports will be more drastic than in the past. The whole industry is rapidly reaching a point where practically all supplies from the producer to the distributor are controlled. As Lancashire's production is limited, the utmost care must be taken to see that the output is distributed according to need.

* * *

Lead Supplies

The fall of Rangoon and the growing difficulties of shipping from Australia have opened a new phase in Allied lead supplies. Burma produces annually between 80,000 and 90,000 long tons of lead, all of which comes from the Burma Corporation's mines not far from Lashio, which is not threatened so far. Since the fall of Rangoon, however, shipments have been stopped. This means an important loss to this country, for, since the outbreak of war, the whole of the Burmese lead has been acquired by the Ministry of Supply. Australia is the Empire's largest lead-producing area and supplies up to 250,000 tons of the metal per annum. The great bulk of this is produced in the Broken Hill area of New South Wales. Besides the Burmese and Australian supplies, the British Empire produces roughly 300,000 tons of lead per year in the United Kingdom, Canada, Newfoundland and South-West Africa, so that until recently the Empire had annually something like 635,000 tons of lead at its disposal. Before the war, the United Kingdom, the largest extra-United States lead-consuming country, absorbed not more than 350,000 tons per year. As more than half of this total went into buildings, an outlet which has been largely stopped, current consumption cannot be much larger than in pre-war years, although lead plays an important part in the production of small arms munitions, battery plates, bearing metals and other similarly important war materials. In fact, hitherto, British lead supplies have exceeded defence requirements, so that the Ministry of Supply was able to allocate lead for certain civilian uses, which are not necessarily essential to the war. The loss of the Burmese lead and reduced shipments from Australia would suffice to enforce a strict lead economy in this country. In addition, however, it is probable that under the Allied pooling arrangement substantial quantities of Empire lead will in future be diverted to the United States. That country is the world's largest producer and in 1941 supplied as much as 460,000 tons from domestic ore. Further, the Metal Reserve Co. acquired some 320,000 tons of lead per annum from Mexico, Peru and Bolivia. This total of 780,000 tons, however, remains short of the United States defence programme and has to be supplemented by supplies from the British Empire, and especially from Canada. Lead is likely, therefore, to enter as a result of the Japanese southwards drive Australian shipments should stop altogether. Even this extreme event, however, would not threaten Allied superiority in lead supplies. Japan produces only 10,000 tons of lead per annum. Germany mines 100,000 tons per annum within its own frontiers, while Italy's domestic production is limited to about 35,000 tons. In addition Germany obtains some 80,000 tons from Yugoslavia and another 75,000 tons from France, Greece, Poland, Czechoslovakia, Spain and Sweden. At present Axis supplies can thus be no more than about 300,000 tons per year.

Liverpool Steam Ship Owners

Not unnaturally, a large part of the annual report of the Liverpool Steam Ship Owners' Association, issued last

week, deals with the future of world trade and with the position of the British shipping industry in the post-war economy; but it also contains a succinct review of the factors which have shaped the fortunes of the industry since 1850. If post-war plans for peace recognise that the principles of the Atlantic Charter are essential to the re-establishment of a prosperous world trade, then, in the opinion of the Association, the first step will have been taken towards the re-establishment of prosperity to the shipping industry in this and other countries. The Association is convinced that "any attempt to convert the British shipping industry into a national service, by placing its management in the hands of State officials, must prejudice most seriously the chances of that industry retaining its position as the greatest sea carrier of world's trade, on the merits of the services it can place, as an industry, at the disposal of the trade of the world." But it admits that the change-over from war to peace conditions will take time, and that during the transitional period the Government will have to retain a large measure of control over the use of ships.

* * *

Ship Repairs

In its annual report the Liverpool Steam Ship Owners' Association draws attention to the marked rise in the cost of repairs to ships that have suffered war damage. Reports it has received from the committee of the Liverpool and London War Risks Insurance Association, and from the technical experts employed by its own members, suggest, in fact, that costs have advanced far beyond what might have been expected. It appears to attribute the excessive increase largely to the arrangement between the Ministry of War Transport and the ship repairers which has as its basis the "cost plus" system. This has been condemned by the Select Committee on National Expenditure; the Association "finds difficulty in understanding the wisdom or economy of a system the essence of which is that the profit element in it is linked up with the expenditure on time, labour and materials." It has therefore asked the General Council of British Shipping to investigate the matter in consultation with the committees of the War Risks Insurance Association and with experts.

* * *

Release of Coal Miners

Coal mining is one of the industries that has suffered most from the loss of labour to the Armed Forces. Hitherto the suggestion that a limited number of miners should be released from the army has met with refusal on the part of the War Office, but according to a statement made by Lord Templemore in the House of Lords on Tuesday, the Government has now decided to release a certain number of men from a limited number of army establishments. He added that the whole question of releasing miners was under consideration and that a decision would be announced as soon as possible. The case for the release of miners from the Armed Forces is undoubtedly a strong one, for current output is inadequate. Nevertheless, it has not yet been proved conclusively. As Mr Dalton stated in the House of Commons last week, there is scope for a reduction in the consumption of coal for unessential purposes. Moreover, given efficient management and good will among workers, there is no reason why output could not be increased with the industry's present labour force. Compared with 1939, it is understood that on the basis of the industry's total personnel, the output per man shift worked last year showed a reduction. In principle, no member of the Armed Forces should be released unless it is proved conclusively that he is absolutely essential to industry. The present arrangement whereby the final decision rests with the Services is unsatisfactory, and should be replaced by a system of independent panels whose decision will be based on an impartial consideration of the facts.

FAMOUS SINCE 1795

OTARD'S

COGNAC BRANDY

CHARTERED BANK OF INDIA, AUSTRALIA
AND CHINA

FINANCIAL POSITION SOUND AND LIQUID

MR V. A. GRANTHAM'S STATEMENT

The eighty-eighth ordinary general meeting of the Chartered Bank of India, Australia and China will be held at the head office, 38 Bishopsgate, E.C., on April 1st.

The following statement by the chairman (Mr Vincent Alpe Grantham) has been circulated with the report and accounts:

The year 1941 proved to be one of constant and increasing difficulty. When we last met, we did so under the shadow of the threat of extended hostilities in the Far East. Since then the entry of Japan into the war has resulted in the falling into enemy hands of our branches in China, Japan, the Philippines, French Indo-China, Siam, Malaya, Sarawak and Java. Our branch at Rangoon has been evacuated to Mandalay and we still have our business in India and Ceylon, which represents an important part of the bank's total undertaking, together with our interest in the Allahabad Bank, Limited.

The work of the staff, both at home and abroad, has been exemplary. Our European foreign staff, much reduced in numbers, as almost all the younger members have joined His Majesty's Forces, have had to cope with exceptional difficulties.

I am glad to be able to put on record how fortunate we are in our chief manager. We are greatly indebted to Mr Cockburn for his foresight and the manner in which he has guided the affairs of the bank through difficulties such as we have never before had to face.

THE BALANCE SHEET

In view of the position in the Far East, where so many of our branches are situated, I am sure that the shareholders would like to have a rather closer appreciation of how the bank stands today than is, perhaps, disclosed by the figures now before you.

Last year I told you that because of the extreme delay in the delivery of mails from our agencies we had had to rely upon telegraphic information in respect of certain figures when preparing our balance-sheet, with a consequent variation in the auditors' certificate. As regards those of our agencies which were still under our control on December 31, 1941, we have repeated this procedure, but as regards those of our agencies which were then in enemy-occupied territory we have been compelled to utilise the last figures which were despatched to us by mail prior to enemy occupation.

Further, we have had to qualify in our report this year the statement that the profits are shown after providing for all bad and doubtful debts. In the case of agencies still under our control, where we have access to all the information which we require, these have been provided for as usual, but you will appreciate that in the case of agencies in enemy hands we now have no up-to-date information to work upon.

The balance-sheet again shows considerable expansion, the total at £90,925,552 being an increase of £14,811,324 over last year's total of £76,114,228, the previous highest in the bank's history. The increase is largely confined to current and other accounts, which, with an increase of £14,465,559, stand at £67,844,490. Fixed deposits, on the other hand, show a further decrease of £1,980,251 at £10,146,113, and these two diverse movements again reveal the desire for liquidity on the part of our clients, which is so prominent a feature today. The only other changes of note in our liabilities are an increase in acceptances on account of customers of £1,394,877, reflecting a greater demand for this form of finance by our clients, and an increase of some £972,500 in loans payable against security, taken at various branches to finance current requirements.

ASSETS

Turning now to the assets side of the balance-sheet, and bearing in mind my previous remarks, I think you will agree that it shows the bank to be in an extremely strong and liquid position. Cash in hand at £14,787,422 is £3,208,905 higher than a year ago, and comprises 21.8 per cent. of our liabilities on current accounts, or

20.7 per cent. of all our sight liabilities. We again show a large increase, amounting to £9,714,158, in our Government and other securities, the actual total being £37,435,924.

This increase is mainly the result of purchases of British Government securities, chiefly tap issues of a short-dated character. Bills of exchange, including Treasury bills, show a decrease of £2,233,636, but as the balance of head office and inter-branch remittances, drafts, etc., in transit, also showing a decrease or last year's figure, should be added for purposes of comparison it is probable that the real decrease exceeds the amount stated. Bills discounted and loans at £23,733,338 show a welcome increase from the profit-earning point of view of £3,092,402, and I am pleased to say that this increase has not occurred at points in the occupation of the enemy at December 31, 1941.

The liquidity of the bank's position is clearly shown by the balance-sheet figures, and fortunately the bulk of our cash and investments has for some time past been concentrated in the country. The bank is, of course, liable in the various local currencies for its liabilities, but until the end of the war the position in enemy-occupied countries must remain more or less static in so far as we on this side are concerned, and we cannot know with certainty whether our debtors in these territories can meet all their obligations, for under ruling conditions it is impossible to assess the value of the security we hold against them. Nor can we assess the position as regards our own bank premises, although so far as we know at present only small damage has been done.

We have, however, been able to add to our internal funds with a view to these contingencies.

PROFIT AND LOSS ACCOUNT

I now come to the profit and loss account. Up to the time of the entry of Japan into the war we had a good year; a year, in fact, in which our gross profits compared favourably with those of 1940. Since then we have lost the earning power of those branches which are situated in enemy-occupied territory, but the result of the full year's working still shows a profit of £352,865 6s. 10d., after providing for all ascertainable losses and for taxation. No profits for the second half of the year of branches in enemy occupation at December 31, 1941, are included in this figure, although our latest information is that profits were being earned by all these branches.

Adding the balance brought forward from last year of £182,602 9s. 11d., a total of £535,467 16s. 9d. is available, out of which an interim dividend at the rate of 10 per cent. per annum costing £150,000, was paid last October.

In view of all I have said above and the many uncertainties which have yet to be faced, the shareholders will not be surprised that the directors propose that the final dividend be reduced to 5 per cent. per annum for the half-year to December 31st last, costing £75,000. They recommend that £50,000 be transferred to the officers' pension fund, leaving £260,467 16s. 9d. to be carried forward.

FUTURE PROSPECTS

While you will naturally wish me to deal with the effect of the war upon the profits of this and future years, I am confident you will not expect me to make any sort of forecast. We still have a large and thriving business in India, which will, we hope, continue to yield good results, although, of course, it may be affected by the course of hostilities in the East, but it is obvious that the temporary loss of so many of our branches in the Far East, the expenses of which must largely continue while the earning power is absent, must bring about a heavy fall in profits.

No general improvement can be hoped for until a successful termination of hostilities has been achieved, but I want to conclude by saying how encouraging it is that at a time when serious difficulties have to be faced the financial position of the bank should be on such a sound and liquid basis.

EQUITY AND LAW LIFE ASSURANCE SOCIETY

IMPORTANCE OF LIFE ASSURANCE AS METHOD OF SAVING

BOARD'S SOUND INVESTMENT POLICY

SIR GEOFFREY ELLIS'S SPEECH

RATE OF INTEREST

You will observe that the gross rate of interest shown in the report is £5 os. 2d. per cent., as compared with the rate of £5 2s. per cent. indicated in my speech last year. Various factors combined to cause this reduction, but I do not think that any of them are sufficiently important to merit individual comment. I shall return to this subject later.

SURRENDER FIGURES

Before passing to the balance-sheet I should refer to the surrenders shown in the revenue accounts. From the life assurance and annuity fund the sums paid out by way of surrender amounted to £69,599. This is about the amount paid out in an average peace-time year, and shows a considerable reduction on the sums paid out during each of the first two years of the war. In the capital redemption fund, surrenders amounted to the very large figure of £427,881. This was due to three cases where large policies were surrendered for special reasons.

I do not propose to deal with the various items of the balance-sheet in detail. The only change in form is that our three minor subsidiaries now appear under the one heading "other subsidiary companies"; no material change has taken place in our interests in these companies.

INVESTMENTS

I now draw your attention to the broad changes which have taken place in the society's Stock Exchange investments during the year under review. The principal change is a further increase of over £700,000 in British Government securities. Against this must be set decreases of £350,000 in Dominion, Colonial, Indian and foreign stocks, £300,000 in debentures, £100,000 in preference, and £250,000 in ordinaries. You will observe that the total amount of our Stock Exchange securities has been reduced by £300,000.

The above changes give a real picture of the investment policy which has been pursued by the society during the year. The result is a position strengthened in view of the trend of world events, and, most important, a position which has been strengthened without sacrificing, to anything but a minor extent, the prospects of participating in eventual general recovery. This policy we intend to continue.

Here I would mention the possibility of some decrease during the next year or two in the rate of interest earned on the society's funds. This is one corollary to a policy which involves the placing for the time being of a rather larger portion of the funds in British Government securities than might be considered suitable in more normal times. I need hardly point out the broad common sense of this policy when you reflect on present world conditions and on possible future developments.

VALUATION RESULTS

As you are aware, a triennial valuation of the society's assets and liabilities was made as at December 31, 1940. The next triennial valuation falls to be made at the end of 1943. For purposes of our own information and guidance, a valuation is made at the end of each year, and the valuation made as at December 31, 1941, disclosed a very satisfactory trend in the position. In the directors' report last year reference was made to "a release of valuation reserve resulting from a modification of the basis employed." I am pleased to be able to tell you that the recovery in Stock Exchange values during the year under review was equal to a very substantial proportion of that release of reserve.

Much will happen between now and December 31, 1943. Much has happened since the close of the year, and no man can say what values will exist in two years' time. I wish to remind you, however, of what I said last year—namely, that any improvement in asset values will first be used to increase the stringency of the actuarial valuation basis.

As directors of this life assurance society we have a dual responsibility—towards our shareholders, and towards our policyholders

The annual general meeting of the Equity and Law Life Assurance Society was held, on the 26th instant, in London. Sir Geoffrey Ellis, Bart., MP (the chairman), presided.

The chairman, in moving the adoption of the report and accounts, said:

Gentlemen,—I rise to move: "That the report and accounts for the year ending December 31, 1941, be received and adopted and entered on the minutes." These have been in your hands for some days and I assume may be taken as read.

During the year the society has suffered a severe loss in the death of Sir Reginald Poole. Sir Reginald was elected a director in January, 1934, and is greatly missed by his colleagues on the board. I should like to place on record our appreciation of the outstanding service which he rendered to the society and our regret at the severance of a warm friendship. To succeed Sir Reginald Poole on the board your directors have appointed Mr Arthur F. B. Forde, a partner in the firm of Messrs. Linklaters and Paines.

I have to report with great regret the death of Mr W. P. Phelps, whose association with the society extended over a period of more than 50 years. Mr Phelps, who was a man of exceptional ability, was chief official of the society from 1904 to 1930 and, on retiring from that position, joined the board, where he served as a director until the end of 1940. His old colleagues mourn his loss.

Last year I dwelt mainly on the financial aspect of the society's affairs. This was only natural and proper on an occasion dealing with the results of the triennial valuation. This year I propose to speak mainly about the fundamental business of the society—life assurances and annuities. I think it advisable that all institutions such as ours should keep clearly before them the fact that while finance necessarily occupies much of their time, they are primarily life assurance offices.

NEW SUMS ASSURED

You will see from the report in your hands that the new sums assured for the year 1941 amounted to £552,161, as compared with £597,471 for 1940. The reduction is more than accounted for by the virtual cessation of single premium business, which the society has discouraged for some time past and has now practically ceased to transact. The sums completed during 1941 under ordinary whole-life and endowment assurances effected by annual premium showed a small increase over the corresponding figures for 1940—a fact which indicates the quality of the business being placed on the books of the society.

USEFUL PURPOSES OF WAR WEAPONS AND WARSHIP WEEKS

During the year we have made special efforts in connection with many War Weapons and Warship Weeks. These special efforts have served three—very useful purposes.

First, they have helped to keep before a section of the public the importance of saving as opposed to spending. This distinction is vital to the nation, and is likely to remain so for some time to come—I wish to stress the urgent need for some years to come for people to save and not to spend. A life assurance contract forms the best means of regular saving.

Secondly, as I said last year, these efforts have been the means of extending the connections of the society in a most desirable manner.

Thirdly, they have resulted in the placing of a good quality of business on our books.

The only other comment which I wish to make on the new business figures concerns the fall that has taken place during the last few years in the considerations for annuities granted; this fall has been a feature common to most offices transacting any large quantity of annuity business.

The mortality experience of the society for the year was rather less favourable than that expected according to the valuation basis used; this was due to the death of a certain number of men serving with HM Forces.

and annuitants. We are shareholders, but we are also trustees for our policyholders and annuitants.

Throughout the long years in the life of an assurance or an annuity, and during the long years in the existence of a life assurance office, many storms occur, and it is the duty of those who control such institutions so to order their affairs that they are able to weather these storms. This leads to a general policy for the mutual benefit of policyholders, annuitants and shareholders, a policy which aims at conserving strength and at a steady return both to with-profit policyholders and to shareholders. This policy aims in general at stability and avoids spectacular fluctuations.

DIVIDEND

From the report in your hands you will see that the dividend recommended is at the same rate as that for last year, 1s. per share; last year the interest earned by the proprietors' fund covered the dividend paid, and this year the position is the same. You will see also that at the present time it is not proposed to declare any interim bonus in respect of with-profit policies. I do not think that under present conditions either of these items calls for comment.

CIVILIAN WAR RISK COVER

Before concluding, I return to the subject at first discussed—the fact that our business is to grant life assurances and annuities. We hold that it is our duty to provide life assurance in all cases where we may reasonably assess the risk run, and this being so, we have provided civilian war risk cover in all normal cases without extra premium. In March, 1940, the chief officials of your society considered very carefully this question of covering war risks, and as a result advised your directors that it was a proper cover to grant. I think I may say that the society has taken a lead in the granting of civilian war risk cover under non-profit policies without extra premium.

So far deaths from war risks in this country have happily been fewer than generally expected. What the future may hold we cannot tell, and I wish to draw attention to the valuable cover granted by the society's policies.

I close on a domestic note. Our new building in Lincoln's Inn Fields has been requisitioned by the Government, and we now operate a portion of our head office from Connaught House in the Strand and the remainder from Langleybury in Hertfordshire. We are very glad that our head office premises should be of use to the nation in the present time.

TRIBUTE TO STAFF

Very many of our staff are serving with HM Forces, and I wish to express to them the board's appreciation of the services which they are rendering to their country and to send them our very good wishes. I wish also to thank those members of our permanent staff who are still with us, and those members of the staff who have joined us temporarily for the war, for a very good year's work. Our special thanks are due to our general manager and his two principal associates; their work has been well and truly done and they are laying a firm foundation for the future.

The report and accounts were adopted.

ASSAM RAILWAYS AND TRADING COMPANY, LIMITED

The adjourned sixty-first ordinary general meeting of the Assam Railways and Trading Company, Limited, was held, on the 25th instant, in London.

In the course of his review of the year's working which was circulated with the report and accounts, and was taken as read, Mr E. A. A. Joseph, the chairman of the company, stated: The railway revenue is better than last year, and it is encouraging to note a progressive increase in each of the last four years. Passenger earnings were stable, and goods earnings showed a definite improvement. Unfortunately expenses were higher, largely owing to the dearness allowance granted to the Indian staff to help them to meet the increased cost of living. Consequently there is a slight decrease in the net earnings.

The returns of the current year received up to the present suggest an improvement on the results of 1940/41. It must, however, be realised that the war in the East (which has already led to a great reduction in our staff) is casting its shadow on all our operations, and that precautionary measures may involve us in expenditure that cannot yet be calculated.

The report and accounts were adopted.

THE SCOTTISH LIFE ASSURANCE COMPANY, LIMITED

IMPROVED BALANCE SHEET POSITION

SIR JOHN MacLEOD'S SPEECH

Sir John Lorne MacLeod, chairman of the board of directors presided at the annual meeting of The Scottish Life Assurance Company, Limited, held, on the 25th instant, in Edinburgh.

In moving the adoption of the report and accounts, the chairman, after referring to the lamented death of the president, His Grace the Duke of Atholl, KT, went on to say:—

During 1941 we issued 734 new policies for £566,000 after deduction of a small amount reassured. The restriction in business under present conditions is very substantial, but not surprising. This is the general experience among offices which confine their main activities to life assurance only. Field work has now been cut to an absolute minimum, for not only have we been deprived for the time being of the services of most of our staff, but the young insurable lives who usually form a large proportion of our clients are also serving with HM Forces.

SATISFACTORY PREMIUM INCOME

The premium income is being very satisfactorily sustained and stands in the revenue account at £612,000. While claims by death or maturity accounted for an outgo of £688,000, which is practically the same as in the previous year, surrenders were on a much smaller scale, being only £41,000, as against £78,000. Commission and expenses of management have fallen in the past year from 14.4 per cent. to 13.8 per cent. of the premium income.

The loss of interest income as compared with pre-war years is now very heavy. The gross and net yields on the company's funds for the past year were £4 11s. 1d. and £3 6s. 10d. per cent. respectively, compared with £4 15s. 3d. and £3 13s. 1d. per cent. for the previous year. The ability of the Government to borrow as cheaply as it is now doing is, of course, entirely advantageous to the national interests as tending to keep down taxation and is therefore to be welcomed, but its significance cannot but affect adversely the prospects of undertakings whose prosperity is so largely bound up with the maintenance of a satisfactory interest revenue.

BONUS DECISION JUSTIFIED

A statutory quinquennial valuation of the assets and liabilities was made twelve months ago, and it was then decided to declare a war-time bonus to policyholders and to carry forward a large proportion of the surplus. Looking back now, this step seems to have been entirely appropriate, for nothing that has happened in the past twelve months would lead us to suggest that some other course of action should have been taken. Marketable securities as a whole are at considerably higher levels than they were twelve months ago, so that our balance-sheet is in an improved position so far as the standards of value currently in use can be relied on.

I would like to commend to you the work of the officials and staff of the company, both at head office and branches, during the past year, and am sure you would like me, on your behalf, to acknowledge such zealous work with an expression of warm appreciation.

The motion having been seconded by Mr R. M. Guild, Wt. the report was adopted.

HOOVER LIMITED

ORDINARY GENERAL MEETING

The fifth ordinary general meeting of Hoover Limited was held, on 27th instant, at Perivale, Greenford, Middlesex. Mr C. B. Colston (chairman) presided, supported by Mr E. L. Colston and Mr J. A. Wykes.

The report and accounts were unanimously adopted and a final dividend of 11½ per cent. (less income-tax) was declared. The retiring director, Mr J. A. Wykes, was re-elected, and Messrs Williams, Stoker, Worssam and Holland, were reappointed.

The company's net profit for the year ended December 31, 1941, amounted to £274,480 (against £290,486 last year). The final dividend of 11½ per cent. made a total distribution of 15 per cent. for the year. (Last year same.)

UNITED KINGDOM PROVIDENT INSTITUTION

HIGHLY SATISFACTORY POSITION

STRONGER RESERVES

SIR ERNEST BENN'S STATEMENT

The annual general meeting of the members of the United Kingdom Temperance and General Provident Institution will be held at the head office, 196 Strand, London, W.C., on April 8th.

The following is the statement of the chairman, Sir Ernest J. P. Benn, Bt., circulated with the report and accounts.

To the Members of the United Kingdom Temperance and General Provident Institution.

The one hundred and first statement of accounts and the report of the directors, with the results of the triennial valuation, disclose, in the exceptional circumstances of the times, a position which can only be regarded as highly satisfactory.

The business of the Institution in 1941, as in the previous year, has been directed perhaps as much to winning the war as to its normal purposes. Last year I expressed the view that the losing of the war would be the end of the Institution. Ukapians have maintained the highest standards of personal National Service in all its many forms, and on the financial front we have continued to apply every shilling of available money to the support of Government Loans at rates of interest too low to provide the benefits to which members of the Institution have by long experience become accustomed.

NEW BUSINESS

A still larger proportion of our field force of branch secretaries and inspectors has been transferred to the Forces of the King. For similar reasons the new business market itself, as shown by the figures of comparable offices, has shrunk to small proportions. We continue to regard the civilian war risk as a speculation out of keeping with the spirit and practice of mutual life assurance, and accordingly policies issued since June, 1940, do not provide for such risks. In these quite exceptional circumstances nearly 2,000,000 of new business has been offered to and accepted by us, constituting a very striking tribute to the confidence and esteem in which the Institution and its policy are held.

EXPENSE RATIO AND RATE OF INTEREST

There has been a further drop in the expense ratio from 14 per cent. to 13.6 per cent.

The rate of interest has been adversely affected by the low return upon Government funds and the loss of rents due to war conditions. Nevertheless, the directors feel that members will find satisfaction in the figures secured—£4 15s. 5d. per cent. gross and £3 7s. 7d. per cent. net.

THE VALUATION

Members will remember that the Institution exists to provide security. That first and essential purpose is never absent from our minds.

In valuing our assets for the purpose of our balance-sheet and in making the triennial actuarial valuation, the board and actuary have the experience of the Institution in the last great war to help and guide them. We declared a bonus while the war was in progress and ran into trouble so soon as peace was signed. In 1920 we had to pass our bonus and dip into our reserves, and we abandoned our stringent 2½ per cent. basis of valuation in 1915. In 1923 the payment of a bonus and the safer basis of valuation were resumed. It should be remembered that in the last war Government loans were issued at higher rates of interest, and to that extent our situation has worsened on the present occasion.

VALUATION VAGARIES

Soon after the outbreak of war the proposal was made to retain 1938 values in assurance accounts where disclosure of heavy temporary depreciation might affect stability and confidence. The Institution is taking advantage of this suggestion, but for exactly the opposite reason. We retain 1938 values to avoid the disclosure of substantial appreciation, which we are bound to regard with as much doubt as was applied two years ago to a movement in the opposite direction.

Stock Exchange prices have, as a rule, served as a barometer

to show the state of the economic weather. In prosperous times the price of stocks and shares has been high and the yield low; in times of adversity prices have fallen and the yield tended to increase. Now, however, a new experimental order is on trial under which the barometer works the other way. The insurance man is thus faced with problems the solutions to which are not for the time being available. Insurance properly so called is firmly based upon past experience, the ascertained figures of markets and mortality. We can, today, rely upon neither. Total war presents mortality risks that cannot be calculated, and no past experience of normal free market movements can help us in the present unprecedented circumstances.

Some £10,000,000 of our money is invested on the security of bricks and mortar, and I have yet to meet the expert who will venture an opinion on future values in this field. We have suffered from bombing, but the vagaries of Government policy in the matter of compensation throw doubt upon the value of any calculations of our claims. Putting these considerations together, we have kept our freeholds, leaseholds and mortgages at the figures of the 1938 valuation, adjusted only by our automatic contributions to reserves, by new purchases, and by actual realised profits. For the reasons I have given you we have applied the same principle to our Stock Exchange securities, although on the assumption that official prices as at December 31, 1941, could be obtained, we have a substantial hidden reserve in addition to the figure shown on the accounts.

BETTER SECURITY

Fifty years ago the Institution led the way in establishing the safest basis of insurance valuation. We were one of the pioneers of 2½ per cent. Apart from the lapse in 1915-20, to which I have referred, the 2½ per cent. standard has been maintained since 1891; 2½ per cent. was adopted at a time when there was a prospect of a fall in the rate of interest below the 4 per cent. which had previously prevailed. Seeing, therefore, that the net earning capacity of the fund at the present time is lower than it has been during the whole of that period, your directors have deemed it wise to strengthen still further the basis of valuation. We are now adopting a rate of 2½ per cent. for all with-profit policies, which comprise the bulk of our business, and once again taking the lead in a movement towards greater security.

THE QUESTION OF BONUS

Last year I expressed the view that wars and bonuses were incompatible, an opinion which many hold to be applicable in a far more general way. With the explanations I have given it will be seen that a moderate bonus in respect of the last triennium might have been declared if the experience of 1915 and 1920 had not been available as a guide and a warning. While the deferment of a bonus decision until the next valuation is undoubtedly in the best interest of the members as a whole, it is necessary that justice should be done to those whose policies become claims by maturity or by death in the meantime. It has therefore been decided, until further notice, to pay to such cases interim bonuses calculated upon the sums assured, increased by the total of previous bonuses attaching to each policy, and dating back to 1939. In the general section these interim bonuses will be at the rate of 20s. and in the temperance section whole life and long term endowment assurances will receive 21s. per £100 insured.

OUR FIRE AND ACCIDENT COMPANY

The figures for 1941 contain no revenue from our new subsidiary, the United Kingdom Fire and Accident Insurance Company, Limited. The first year's accounts, dated April last, disclosed a thoroughly satisfactory position, and the board, with the full approval of the directors of the Institution, after writing off all preliminary expenses, carried the balance of profit to the credit of the current year. Present appearances indicate excellent progress in the second year, and your directors are satisfied that the foundations of a powerful and profitable sister concern are being well and truly laid by the Rt. Hon. Isaac Foot and his colleagues.

SCOTTISH POWER COMPANY,
LIMITED

MR WILLIAM SHEARER'S REVIEW

The thirty-second annual ordinary general meeting of the Scottish Power Company, Limited, was held, on 20th instant, in Edinburgh.

Mr William Shearer (the chairman) said that he must refer to the grievous loss which the directors and the company had sustained by the untimely death of their chairman, Mr George Balfour, which took place on September 26th last. Possessed of unbounded energy and enthusiasm and with a vision which was all too rare in the early days of electrical development in this country, he had foreseen in a remarkable manner the potentialities of electricity as applied to industrial and domestic purposes. Others there were in those early days who had similar faith in the future of this form of energy, but with few exceptions they lacked the somewhat unique combination of attributes which George Balfour possessed—technical skill, a commercial flair and sound financial instinct. These, coupled with a dominating personality, commanded and deserved success, and success he certainly achieved.

THE GLEN AFFRIC SCHEME

Dealing with the Glen Affric Scheme, he said that four years ago the late chairman had pointed out that the striking growth in development of the demand in the company's areas of supply was rapidly absorbing their existing output capacity, and had emphasised the necessity of planning in advance for an additional source of supply in the North. His forecast had proved accurate, and it had become evident two years ago that, notwithstanding war conditions, the company would not be justified in postponing further an application to Parliament for powers to develop additional water resources.

After describing how the Bill dealing with the matter had been rejected by the House of Commons with the promoters' assent and stating that a committee was now sitting to consider the practicability and desirability of further developments in the use of water-power resources in Scotland, he said that the whole question must be regarded as *sub judice*.

They heard from time to time, he said, criticism of holding companies which, in his view, emanated from ill-informed quarters or was set in motion for political purposes. There was, in his opinion, no doubt that in the absence of that type of financial structure the development of many large areas could not have been undertaken or successfully carried out except under special legislation involving subsidies from the Government, i.e., the taxpayer.

This company and its subsidiaries furnished an excellent example of the benefits which had been obtained from the co-ordination and direction provided through the association of a group of undertakings with a strong holding company. He could cite many instances up and down the country, particularly in widespread rural or semi-rural areas, where in his experience high quality of management, sound technical planning, intensive development and, not least important, financial facilities had only been made available by collaboration with a strong and stable holding company such as the Scottish Power Company.

DEBT TO PRIVATE ENTERPRISE

Some of the critics of holding companies and other forms of private enterprise no doubt performed useful and necessary functions in a cloistered atmosphere within their own spheres of activity but had not had the opportunity of going through the hurly-burly of building up a large business or of facing the difficulties and anxieties inevitably experienced in so doing. The country owed much of its great heritage to personal initiative and private enterprise.

The trading profits of the undertakings owned and operated by the company, together with miscellaneous receipts, amounted to £977,046, and after provision for taxation to £642,265, compared with £634,399 in the previous year's accounts. An aggregate amount of £302,030 had been appropriated for depreciation, reserves, contingencies, etc., in the operating companies' accounts. Those appropriations were, in their view, adequate. The net revenue amounted to £338,925, and the total available was £340,234.

The report and accounts were adopted and a final dividend for the year of 5½ per cent. was declared on the ordinary stock, making 8 per cent. for the year.

METROPOLITAN ELECTRIC SUPPLY
COMPANY, LIMITED

ALL DEMANDS MET

The annual general meeting of this company was held, on the 24th instant, in London, Major H. Richardson, MC, JP (chairman and managing director), presiding.

The chairman, in the course of his speech, after paying a tribute to the late chairman, Mr George Balfour, MP, said: "Plant has been maintained in good order, and I am glad to be able to say that all demands on your company and its subsidiary companies have been satisfactorily met, and supply has been fully maintained during the year."

Interest on debenture stocks, loans and dividend on preference stock have, of course, been duly paid, and provision has been made for depreciation and contingencies, including provision for any war damage contributions which may become payable under a scheme which is now being considered by the Government and the industry. The redemption of the balance of the 7½ per cent. extension debenture stock (1921) outstanding has now been effected.

While keeping clearly before us the primary necessity of contributing every effort towards winning the war, we are not unmindful of the desirability of keeping well in touch with responsible post-war schemes of reconstruction, and we fully appreciate the important part which electricity supply undertakings should take in all such future planning.

It is still necessary that the general public should be informed of the particularly valuable work which the company-controlled electricity supply undertakings have done in the country. The availability of electricity supply in thousands of square miles of sparsely populated and rural areas has been almost entirely due to the enterprise of the supply companies, and every year (subject always, of course, to war conditions) these companies are making still greater efforts to take the supply of electricity further afield, to the undoubted advantage of the country.

The report and accounts were unanimously adopted, and a final dividend of 5 per cent., less income-tax, making, with the interim dividend already paid, a dividend of 8 per cent., less income-tax for the year was approved.

LANCASHIRE STEEL CORPORATION
LIMITED

DIVIDEND OF 7 PER CENT

The twelfth ordinary general meeting of the Lancashire Steel Corporation, Limited, was held, on the 25th instant, at Warrington.

Mr John E. James (chairman and managing director) said that the board had laid aside £15,000 to the reserve for increased cost of plant replacement, while £25,000 had been transferred to general reserve. The directors had decided to recommend the payment of a dividend of 2½ per cent., less tax, on the 5½ per cent. non-cumulative redeemable second preference shares, making 5½ per cent. for the year, and 7 per cent., less tax, on the "A" and "B" ordinary shares.

During the year consideration was given to the policy which it might seem desirable for the corporation to follow in relation to interim dividends on the second preference shares. Some years ago the board decided to discontinue interim dividends on the ordinary shares, and following that policy they had now decided to discontinue such dividends on the second preference shares. It would be appreciated that that decision in no way affected the dividends on the 5 per cent. cumulative redeemable first preference shares.

The directors had elected the Rt. Hon. Earl Peel, Mr L. E. Mather and Mr Geoffrey K. Rylands to seats on the board. For some time past the board had considered it desirable to add to the directorate of their important Lancashire Steel Company one or two members representative of industry in the county, and he was glad to welcome that day in that capacity Lord Peel and Mr Mather. Those gentlemen were, he was sure, well known to them all, and the directors looked forward with pleasure to availing themselves of the experience they had gained in other branches of industry. Mr Geoffrey K. Rylands controlled the works organisation of Rylands Brothers, Limited, one of the large, wholly owned subsidiary companies of the corporation. The board had appointed Mr Robert Crichton, CBE, one of the directors whose whole time was engaged in the affairs of the corporation, a vice chairman.

The report was adopted.

BRITISH INSULATED CABLES LIMITED

INCREASED TRADING PROFITS

The annual general meeting of British Insulated Cables, Limited, will be held on April 1st at Liverpool.

The following statement by the chairman, Sir Alexander Roger, was circulated with the report and accounts for the year to December 31, 1941:—

The profit on trading, dividends on investments, etc., after making provision for taxation and for contingent reserves adjustment, amounts to £810,385—an increase of £24,153. The profit, as in 1940, is after charging war damage insurance, as although this expenditure is a premium payable on our capital assets, it is essentially a revenue charge. "Depreciation of fixed assets" amounts to £247,324, or £37,702 more than in 1940. Since the outbreak of war additional wear and tear has occurred.

The further £100,000 transferred to "war contingencies reserve account" brings it up to £300,000. After another year of war, in which we have witnessed its extension to practically the whole world, it is more than ever necessary to build up a substantial "war contingencies reserve account." It is proposed to pay a final dividend of 10 per cent. (less tax) on the ordinary stock, making, with the interim already paid, a total of 15 per cent. (less tax). A cash bonus of 5 per cent. (less tax) will also be paid, leaving a balance of £478,547—a decrease of £10,152 of the amount brought forward from 1940.

EFFORT TO MAINTAIN PRODUCTION

The short review I have made gives a wholly inadequate idea of the manufacturing activities of the company and the strain and effort necessary to maintain production. There is criticism in the country that manufacturers and machines are not working to the limit, and, if this is so, I wonder whether it is owing to apprehension about post-war conditions. Personally, my interest lies at present in current problems and not in post-war plans; but the latter cannot be ignored altogether, and boards, managements and workers would be lacking in their duty if they did not pay some regard to the problem.

There may be instances where some hesitation has been, and still is, displayed by managements to shoulder financial responsibility for extensions which, while urgently essential for war, cannot be described as ordinary financial or trading risks. On the other hand, one knows of numerous cases where these risks have already been taken, with the result that substantial increase in production has been achieved.

Manufacturers are fully alive to the urgent necessity of meeting the country's needs, and are more than anxious to make the maximum contribution to the war effort. But further impetus might be given to production by an inspiring statement from the Government containing a promise that when victory is won there will be awaiting a "fair deal" not only for labour, which is rightly asked and expected to go "all out," but also for the investing public, which is also rightly asked and expected to put "all in."

Production must be encouraged by every legitimate means, and nothing that ought to be said, and can be said, to promote production should be left unsaid, and no undertaking which the Government can implement at the proper time should be withheld today, if by such means a greater productive effort can be attained.

UTMOST CONFIDENCE REQUIRED

The utmost confidence between Government, industrialists and labour was never more urgently required than at the present time. If this is lacking in any direction the war effort is hampered. The Government and the people must be indissolubly linked; they are inter-dependent and buttress each other. United and in complete harmony, we can attack or defend with certain success. Separated by lack of confidence or of team work, or any other cause, we can do neither.

I unhesitatingly ask you to join with me in acknowledging our gratitude for the devotion to the company's and to the country's interest during a year of heavy work and responsibility displayed by our managing directors—Mr T. H. Martin-Harvey and Mr W. Travis. I want you also to send a message of grateful thanks to our managers, superintendents, foremen and to all our employees. One and all they deserve it.

BOVRIL, LIMITED

FINANCIAL POSITION IS SATISFACTORY

Presiding at the forty-fifth annual general meeting of Bovril, Limited, held in London on the 26th instant, the Lord Luke, KBE (chairman), said that since the issue of their report they had suffered a sad loss in the death of their vice-chairman, the Duke of Atholl.

Turning to the balance-sheet, the freehold and leasehold properties were £9,544 down. This was due to depreciation.

Plant, etc., on the other hand, owing to certain additions, and after allowing for depreciation, was up to the extent of £9,879.

The interest in subsidiaries, including indebtedness, at £327,311 had been increased by some £28,000.

Investments in associated companies, etc., at £793,399, were up £83,438. Three-fourths of this had been due to the purchase of National War Bonds.

Stocks of cattle and raw materials, at £900,907, showed an increase of £16,251. This was due to increases in raw material and finished stocks, the cattle interest having been down.

Sundry debtors was one of the few items which had shown a considerable change, at £472,542, against £232,982, an increase of £239,560. This was due to increases in the amounts owing by Estates Control Limited and Argentine Estates of Bovril Limited.

Sundry creditors and provision for taxation was up by some £260,000, a large part of which was an increase in the reserve for taxation.

RESERVE REACHES £1,000,000

The reserve, at £1,070,000, showed the appropriation added last year, and the addition of another £30,000 this year would bring it up to £1,100,000.

In the profit and loss account, the net profit showed £275,628 as against £263,860 in 1940. Of course, these two figures were by no means representative of the actual trading profits of the two years, but they were as adjusted after making allowances for excess profits tax.

The excess profits tax standard was, of course, their ceiling, and under the present Budget, improvement in their final net profit could only show itself if additional capital were employed in the business and raised their standard, or Bovril received larger dividends from its investments.

A company's position as regarding its excess profits tax standard was simply a matter of luck. No doubt the standard years selected had been in their wisdom wisely chosen by the Inland Revenue as years that on the whole would provide the largest possible revenue in the scheme of taxation. The years may have suited some companies, but certainly, on the whole, they had caught many of them at their very worst period. He did not think there had ever been any suggestion that EPT was an equitable scheme as between various taxpayers, but it was a scheme of taxation that had produced a very large revenue and, in quite a few cases, had prevented those in what might have been called war industries making excessive profits.

They would have seen from the report that the profits were sufficient to provide their usual fixed dividends, £30,000 to reserve and 9 per cent. on the Deferred.

INCREASE ON DEFERRED DIVIDEND

There had been no class more hardly hit than those who out of savings had bought shares that today provided an income after deduction of tax of almost half what they had received in 1938, and, therefore, the board was very pleased to see its way to recommend a small increase on the Deferred dividend.

The Bovril organisation, which had been built up during all these years, showed considerable elasticity at a period like this, not only in the production of Bovril, but particularly emergency rations and other food products, and by intensive work by day and night, etc., their output of all these was at least three times what it had been in 1939. The factories were indeed to be complimented on their efforts.

During the period under review, they had taken considerable trouble to distribute the supplies of Bovril as evenly as possible throughout the country. He believed their friends, the retail trade, had been receiving at least as much Bovril as they did on the average of 1938/39/40—unless they lived in an area where the population had been much reduced.

The report and accounts were adopted.

AUTOMATIC TELEPHONE AND ELECTRIC COMPANY, LIMITED

A SATISFACTORY OUTPUT

The annual general meeting of Automatic Telephone and Electric Company, Limited, will be held on 1st proximo, at Liverpool.

The following is an extract from the statement by the chairman, Sir Alexander Roger, KCIE, circulated with the report and accounts:

Factory orders and output reached a satisfactory level. The profit on trading, dividends on investments, etc., at £261,548 compares with £238,052 and is after reserving for EPT, ordinary taxation and contingency reserves adjustment. The directors recommend transfer of £60,000 to war contingencies and taxation reserve, a dividend of 7 per cent. on the ordinary stock (making 10 per cent. for the year) plus a cash bonus of 2½ per cent., both subject to tax, and a dividend of 10 per cent. on the deferred stock and shares plus a cash bonus of 2½ per cent., both subject to tax.

No one in industry wants "concessions," but it is surely unwise to permit excess profits tax to bankrupt factories. An example of this possibly happening is to be found in a subsidiary company with an EPT "loss" standard. This "loss" must be paid annually plus 100 per cent. of profits earned, even if it bankrupts the subsidiary.

I wish also to emphasise the vital need for more and more production. This great concern, against strong world competition, has multiplied its output six times in the last 20 years. Employees of all ranks, male and female, are comfortable and work under as congenial and sympathetic conditions as we can devise. The shareholders who have ventured their savings have had safety and a reasonable return. All this and all we enjoy—our work, our homes and our lives—are at stake on this question of production. Men in the field or on the water, however brave, cannot win the war without equipment. They must have the war products of the factories without stint, and in abundance. This lies more in the hands of the people than the Government.

RUBBER PLANTATIONS INVESTMENT TRUST, LIMITED

PROSPEROUS CAREER INTERRUPTED

The thirty-third ordinary general meeting of the Rubber Plantations Investment Trust, Limited, was held, on 25th instant, in London, Mr H. J. Welch (the chairman) presiding.

The following are extracts from the chairman's address circulated with the report and accounts:

During the year there was little change in the total invested, which at December 31st last amounted to £3,171,001. The valuation as at December 31st last was less than the book cost

by £834,644, but against that deficiency can be set general dividend reserves and the "carry forward," aggregating £646,741 in all.

Our gross income of £173,383 was approximately £16,500 less than in the preceding year, and after providing for increase taxation and allowing for the interim dividend of 3 per cent., the board has decided, with regret, not to recommend any further dividend at present. It is proposed, however, to transfer £45,000 to dividend equalisation reserve, leaving £96,744 to carry forward. The board will recommence the payment of dividends as soon as it considers it would be in your interests to do so.

I can say little this year of any value as to our future prospects. The prosperous career of the Trust has been rudely interrupted by the war. It is obvious that we must expect a diminution of income this year, although as it will be derived principally from dividends paid by companies in respect of the working of last year, such diminution is likely to be less in 1942 than in 1941.

Until the military situation in the Far East becomes more stabilised it is impossible to make any forecast of the quantities of rubber likely to be available during 1942. Fortunately the stocks in the Allied countries at the end of 1941, together with quantities afloat to them at that date, should be sufficient to supply the essential military and civilian requirements of those countries for well over a year, if vigorous conservation arrangements are promptly undertaken.

The report was adopted.

CONSOLIDATED MINES SELECTION COMPANY, LIMITED

The forty-sixth annual general meeting of this company was held, on the 24th instant, in London.

The following are extracts from the statement by the chairman, Mr S. S. Taylor, CMG, DSO, circulated with the report and accounts:—Our investments at cost, less amounts written off, £736,481, show a slight increase over the corresponding figure of £712,255 of the previous year. The market value as at December 31, 1941, was £1,225,405.

Our income from interest and dividends was £63,283, which is only approximately £1,900 less than last year, while our net profit on share dealing was £17,660, as compared with £1,200 in the corresponding period.

Our interest in diamond mining is derived through our holding of Anglo American Corporation shares, and I would refer you to the published dividends of De Beers Consolidated Mines, the Consolidated Diamond Mines of South-West Africa, and the Premier (Transvaal) Diamond Mining Company as evidence of the continued prosperity of that industry.

Our interests in copper are held through Rhodesian Anglo American, and Rhokana Corporation has again been compelled to reduce its dividend, and this reduction was reflected in the reduced distribution by Rhodesian Anglo American.

New York

DOMESTIC problems and the generally uninspiring war reports kept business on Wall Street at a low ebb before the week-end, prices fluctuating narrowly without trend. A slight improvement in sentiment in the early part of the current week induced some expansion of turnover, while prices became steadier.

COMMODITY AND INDUSTRY NEWS

Food Price Notices.—From April 7th, retailers need not exhibit price posters or tickets for certain foods, and instead are required to have a maximum price list available for inspection by customers. A notice must be displayed prominently in the shop stating that such a list is available for reference and indicating where it is kept. A printed list has been prepared by the Ministry of Food, for sale at 6d. a copy. Supplement sheets will be issued each month to keep the list up to date.

Woven Wool Utility Cloth.—In order to assist designated clothing manufacturers to obtain the woven wool utility cloth which they require for the execution of their programmes, the Board of Trade has made a direction dated March 17, 1942, limiting the quantity of such cloth which any registered cloth supplier (i.e., a manufacturer or a merchant converter) may supply to any individual firm in the restriction period, ending May 31, 1942. This quantity must not exceed 30 per cent. of the quantity of woven wool cloth which the registered supplier actually supplied to that firm during the standard period. If by March 23rd the registered supplier had already supplied more than this percentage to a particular firm during the present restriction period he must not supply any more woven wool utility cloth to that firm until June 1st. The Board will issue licences in appropriate cases, allowing supplies above 30 per cent. to particular designated firms. In general, licences will not be entertained in respect of utility cloth of which they hold stocks representing more than ten weeks' garment production.

Export Control.—Utility cloth and apparel may not be exported to any destination abroad without licence, and applications for permission to export them will not normally be entertained. The existing licensing requirements in respect of woven piece goods wholly or mainly of cotton or cover such goods cut to a width of 18 inches or less, whether or not coated, impregnated, or in any other way treated or operated upon, but not including oilskin fabric, carpeting and machine belting. These provisions are made in the Export of Goods (Control) (No. 13) Order, which came into force on March 24th.

Molasses Control.—The Minister of Supply has made the Control of Molasses and Industrial Alcohol (No. 15) Order, 1942, which comes into operation on March 30th, and by which the national maximum

prices of molasses are fixed on a delivered basis. Further, in the case of material sold in containers and not in bulk, maximum prices are now fixed on a basis of gross weights including the weight of the molasses and the container. The amounts included for carriage in the present prices have been based on the average cost of delivery. Provision is made for reduction in the maximum price in cases where sellers take delivery at a control depot or at a sugar factory.

London Retail Delivery Scheme.—The Transport Commissioner for the London Region has announced that the retail delivery scheme, adopted by London shopkeepers to save fuel, vehicles, tyres and manpower, will be brought into operation on Monday, March 30th. Under this scheme, no goods purchased, except bread, milk, furniture, coal and medicines, will be delivered more than a mile from the shop except by pooled vehicles. There will be only one delivery a week to each customer, except newspaper deliveries, and separate calls for orders will be discontinued. The scheme applies to deliveries by all forms of transport—motor, horse, electric and hand vehicles and cycles.

New Potato Sales.—The Ministry of Food has issued an Order prohibiting all sales of new potatoes of the 1942 crop, including potatoes in the ground. This prohibition will remain in force until a plan is introduced by the Ministry for marketing new potatoes during the early weeks of the season, when supplies are

RECORDS and STATISTICS

STOCK EXCHANGES London

Note: all dealings are for cash

INTEREST in the current week was centred largely on the London Warships Week, and markets showed few large movements, although long-term factors such as the impending Budget and the course of the war were not without their effect on prices. The disbursement of the Canadian moneys served to assist business in gilt-edged and senior railway stocks. The downward tendency in the gilt-edged market, which had been in evidence before the week-end, was reversed at the reopening, when, on moderate demand, Old Consols rose ¼ and undated securities enjoyed a small but general advance. While the volume of business was not maintained the next day, price movements were generally upward. Activity in the foreign bond market was

slight, with interest generally centred on Brazilian issues, although prices failed to continue their advance after the week-end. Chilean bonds became weaker on Tuesday when the 5 per cent China loan of 1913 fell a point. The end of the previous week in the home rail market witnessed an expansion of demand for the senior stocks into the junior issues, LMS and GW ordinary stocks both rising ¼. Later, however, interest in the latter subsided, although GW ordinary gained a further ¼ on Tuesday. Steady buying of high-yielding preference issues, especially LMS 4 per cent first preference, continued, but failed to affect prices. A small but general improvement in the foreign rail market was reflected in small but persistent advances for Argentine issues, while on Tuesday San Paulo ordinary advanced 2 points. Elsewhere, after the dividend disappointment, Canadian Pacific showed persistent gains. Earlier dullness in the industrial market gave way to a better tone in the beginning

of this week, although there was no corresponding expansion in the volume of business. Brewery shares fell back on fear of further taxation and restrictions in the coming Budget, but losses were partly recovered in Tuesday's improvement. Few and narrow price movements reflected the lack of interest in the motor and aviation group, while heavy industrial issues suffered small losses before the week-end, although the downward trend was late reversed. Cunard issues continue to dominate the shipping market, where small advances for Union Castle and other issues reflect the generally improved sentiment. The small turnover in textile shares bore affected prices, but in contrast to other sections prices weakened on Tuesday, when Patons & Baldwins lost ½. Prices of leading chain store issues remained firm, quiet conditions, but tobacco shares, falling sharply on fears of curtailed production, recovered at the reopening. Imps and BAT both gaining ½ and Carreras ¼.

Finance

GOVERNMENT RETURNS

For the week ended March 21, 1942, total ordinary revenue was £41,041,000, against ordinary expenditure of £38,527,000, and issues to sinking funds of £155,000. Thus, including sinking fund allocations of £11,901,795, the deficit accrued since April 1st is £2,617,112,000 against £2,382,461,000 for the corresponding period a year ago.

reconciling these claims as wit could contrive. It will be possible for the Moslem provinces in North-Western and North-Eastern India to stand out of the scheme, to retain their present status vis à vis the British Government and, at a later date, to seek Dominion status on their own account by separate treaty with Britain. In terms of the Canadian precedent, they will be able to follow the example of Newfoundland—*absit omen*.

It is indeed an outstanding merit of the Government's proposals that they finally place the responsibility for India's future upon the shoulders of the Indian peoples themselves. There may be some who will wonder whether the plan has not perhaps gone too far in its concessions to the Moslem demand for partition. In the event of Moslem non-accession the plan provides no joint organs for handling the many problems that are, and must be, common to Hindustan and Pakistan; and it is very hard to say at this stage how two separate and distinct Unions, each with Dominion status, would be able to live inter-mixed on the same sub-continent with common social, economic, political, diplomatic and military problems. But this will be for the legislatures of the mainly Moslem provinces—and, in the last resort, the populations in a popular vote—to decide for themselves. There are many who believe that Mr Jinnah's scheme for partition, or Pakistan, does not reflect the majority wish of the Moslems, and, if the plan is accepted, this will now be tested by Moslem votes. It is certainly true that the trend of the future in every part of the world must inevitably be, for every reason of government, towards collaboration in political units larger than small sovereign states—although this trend can perfectly well be combined with the devolution of regional administrative duties to provincial communities with independent character.

India, no less than any other country, will surely tread this road; in the longest run, it is difficult to conceive of India except as a unity. But to say this is not to dispute the wisdom which has offered to Moslem provinces the chance of non-accession to the proposed Union. The first and most pressing charge upon the British Cabinet was to draft proposals which Hindus and Moslems alike could accept at once. To confront Mr Jinnah with what might have seemed a purely Congress plan would have been to court certain failure. It is true, as Mr Churchill himself has said, that no minority, however large, can be allowed to stand in the way of India's development towards freedom. But it is equally true that no minority of so many millions as India's Moslems, with a majority position in many wide areas of the sub-continent, could be overridden, without an attempt to fit in its wishes with those of its Hindu neighbours and without its chance to say yes or no to the plan proposed.

The ingenuity of this programme for Indian post-war freedom is matched by its generosity, which is in no way lessened by the hard fact that it would have been fatal folly to have been other than generous. All specifically British interests are set on one side. Not one of the reservations, qualifications or special provisions has anything to do with specifically British interests—unless, indeed, the repelling of the Japanese is so regarded. This is a complete answer to those who have claimed that British selfishness is the bar to Indian freedom. Immediately the war ends, the Lower Houses of the Provincial Legislatures of British India would, according to the plan, meet together as a single electoral college and proceed to the election of a Constituent Assembly with numbers in proportion to the populations of the various provinces. The Indian States, which constitute in population one-third of all India, would be invited to appoint representatives, in proportion to their population, to this Constituent Assembly, which would then make a constitution for a free and independent Indian Dominion. All this would be done by Indians of their own freedom and their own responsibility. The British Government would make a Treaty with this Constituent Assembly, transferring its responsibilities to a free Indian Government and making provision for the protection of minorities, such as the depressed classes and the smaller creeds. It is emphasised that this Treaty would not impose any restric-

tion on the power of the Dominion of India to decide its relations to other Member States of the British Commonwealth—which has been interpreted by Sir Stafford Cripps to mean that the Dominion would be completely free either to remain within the Commonwealth or to secede. What the sanction of the Treaty would be, within the framework of international law, is not yet said.

In short, the plan is a good plan. It contains the two essentials—it makes perfectly plain that the obstacles to immediate attainment of complete and unified Dominion status lie in India, not in Britain; and it makes an honest and ingenious attempt to surmount the chief of those obstacles, the communal hostility of Hindus and Moslems. But the ultimate test of the plan will be its acceptability, and on that score the news, at the moment of writing, is not favourable. The Working Committee of the Congress is reported to have rejected the proposals by unanimous vote, and though no indication has yet been given of the Moslem League's views, they are unlikely, if only for tactical reasons, to be favourable if Congress rejects the plan. The Working Committee appears to have few objections to the extent of the transfer of power that is offered for after the war. But they dislike the possibility of partition. And they are completely unwilling to accept the interim arrangements. This part of the Cabinet proposals was, admittedly, left in vague terms; the political leaders of India were invited to co-operate with the British Government and with the Government of India in organising the Indian war effort, but there was to be no transfer of ultimate responsibility. The Congress leaders apparently will be content with nothing less than the appointment of an Indian Defence Member of the Government, with full authority. This Sir Stafford Cripps will not concede; he insists that responsibility for operations and strategy must remain in the hands of the Commander-in-Chief—that is, General Wavell.

On this point, the negotiations seem likely, at the moment, to break down. Whether, on reflection, the Congress leaders will persist in their refusal remains to be seen. Sir Stafford Cripps was entirely right to fix a short time-limit for his stay in India—otherwise the process of negotiation might have been endless. But though the delay before the final Yes or No must be very short, it is perhaps not necessary to limit it to Sir Stafford's brief visit, and Congress may well be given another week or two to reconsider. In that week or two, they will surely reflect that their condition is an impossible one. With the Japanese advancing in Burma and in occupation of the Andaman Islands, it would be utterly unreasonable to transfer the highest military control to an untried and inexperienced civil administration, of any nationality and colour. It will be made plain in the next few days that no responsible section of British opinion is ready to agree to such a demand. American commentators will probably recall that their own policy in the Philippines, which has so often in recent weeks been held up as a model, retained military control in the hands of General MacArthur and the Government in Washington. It will be borne in upon them that they are jeopardising the success of all their hopes because of a demand which the world will deem impatient, unrealistic and unreasonable. Hope must continue that with this realisation will come a change of mind. If so, it must come quickly. There is very little time, and if this opportunity is let slip, there will be few to question Sir Stafford Cripps's judgment that it will not be possible to make another offer to India in wartime.

One thing at least is clear. The British Government have made their record clear. A bolder and more audacious experiment in human freedom can never before have been offered. Proof has been given of what has so often been said—that the only anxiety of Great Britain is to find means by which India can become a sovereign, self-governing nation at the earliest possible date. Succeed or fail, the free peoples of the world owe a debt of gratitude both to Sir Stafford Cripps for the faith and courage of his personal intervention and to Mr Churchill for the statesmanship with which he has put his authority behind a plan so little in accordance with his previous views. The rest lies with the politicians and the peoples of India.

The Future of Politics

AN isolated by-election is rarely as important as it seems to be on the day the poll is declared and the experienced politician learns to take these temporary successes or failures with an equal shrug of the shoulders. Nevertheless, there are the exceptions. The by-election at Fulham in October, 1933, played its part in the history of Europe; and though last week's contest at Grantham cannot be given this importance, no more can it be waved away as one of those unaccountable accidents that occur from time to time in the best regulated political systems. It is something of a portent. For the first time since the war began, the official candidate, nominated by the party in possession and not opposed by the other of the two great parties, was beaten. The successful Independent was a strong, local candidate, but Sir Arthur Longmore, who was defeated, is also a local man, with all the prestige that the rank of Air Chief Marshal carries in wartime. The result cannot be explained away in this fashion.

What, then, does it mean? One thing at least is clear: it does not portend any weakening of the Cabinet's position. Mr Kendall, the new member, has defined his task as "to help Churchill" and his election cannot be taken, even with Goebbelsian distortion, as a success for any opposition to the Prime Minister. It must rather be taken as one more proof—if one were wanted—that there is nothing that the Government can ask of the people that will not be given, that the people feel themselves to be too little governed, rather than too much. Mr Kendall's slogan was "More Production" and it is undoubtedly true that the mood of the people is strongly in favour of devoting still more effort and sacrifice and audacity to the war, on all its fronts. The recent instalments of "austerity" have been met with gratitude rather than reluctance, and the one desire of the people seems to be to "get on with it." The electors of Grantham did not wish to stay the Cabinet's arm, but to strengthen its hand, to hasten its policy, to encourage its plans. They were asking to be treated ruthlessly—and for others to be treated ruthlessly—in the pursuit of efficiency and effectiveness.

But how does it come about that the electors have to show their desire to strengthen the Cabinet by voting against the official candidate? The answer sheds a light on the present peculiar state of public affairs. It is because, interposed between the Cabinet and the electors, there is a political machinery for which the country as a whole has come to feel profound distrust. Some confirmatory evidence has recently become available in the latest figures of the Gallup poll taken in this country, which were printed in the *News Chronicle* last week. The reservations that have to be made in basing any argument

on such evidence are well known; but when they have been fully made, the figures preserve an approximate validity that cannot be gainsaid. The latest results show that 81 per cent of the sample are supporters of Mr Churchill, but only 35 per cent approve of the Government. "The Government" is a vague phrase. From such indications as are available, it seems probable that the War Cabinet, as now constituted, ranks in the public mind more with Mr Churchill than with "the Government"; at least, all of the figures who command public support—Mr Eden, Sir Stafford Cripps and Mr Bevin—are now included. When the public expresses its distrust of "the Government," it is using the expression in the wide sense that is current, for example, in America, to include the whole hierarchy from Ministers of the Crown down to the lowest rank of officials who have any influence on public policy. The present Ministers, outside the War Cabinet, with a very few exceptions, are not an impressive group, and the public is not impressed. The Under-Secretaries inspire even less confidence, and the general public is convinced that the higher ranks of the bureaucracy, permanent and temporary, are still choked by timidity and incompetence.

Now what is it that distinguishes the War Cabinet from the rest of "the Government" (in this wider sense)? Surely, it is the imprint of party. As was pointed out in these columns when the present Government was formed, there is only one member of the War Cabinet who was a party leader three years ago—and that one exception, Mr Attlee, proves the rule. The War Cabinet has emancipated itself—or has been emancipated by popular pressure—from the parties. But outside the War Cabinet, the Government is still almost wholly recruited from the parties, its balance is determined by the results of the General Election of 1935, its members are (with few exceptions) nominated by their party eminence rather than by their personal competence. And the higher ranks of the Civil Service are still dominated by the sort of men and the sort of minds that were appropriate to public affairs as run by the parties in the 1920's and the 1930's. In any real or true sense, the present parties are dead. They no longer inspire the minds of men or command their enthusiasm. Where, anywhere in the country, can there be found any body of men or women who sincerely and passionately believe that salvation lies through the Conservative, Labour or Liberal parties—except, of course, among those who have some vested interest in the various machines? Yet the parties, assisted by the party truce, still lie bodily across the machinery of the state and monopolise all its offices, save only those few on which popular pressure can bear with concentration

enough to effect a change. And that is why the public tries to support the War Cabinet by defeating the official candidate. That is why the Cabinet seems so often to be groping for the people, and the people for its leaders.

This is, of course, a very peculiar situation. It should be said at once that there need be nothing alarming about it, and in particular that it is not a fatal weakness for waging war. On the contrary, the driving force is the determination of the British people to win the war; their conviction that the world can be made safe, not only for democracy, but by democracy; their belief that they see the necessities more clearly—not indeed than Mr Churchill or Sir Stafford Cripps or Mr Bevin sees them—but much more clearly than the mass of men who won Parliamentary seats in 1935. What disqualifies the parties to-day is very similar to what defeated the barons when the medieval society was collapsing. The major parties of to-day, Conservative and Labour, both have the dominant characteristics of feudalism: they have become more interested in the special interests of sectional groupings than in the commonwealth.

It would be foolish in the extreme to prophesy about the future development of the forces now at work. If politics were an exact science, an impressive structure of probabilities could be built up. It could be pointed out that the old controversy, which has been the substance of British politics for at least one generation, revolving round the question of whether the state should make itself responsible for the economic environment of

politics, is now as dead as a door-knocker—that is, useful for making a noise but for nothing else. That question is decided; but a new one is coming up: by what methods and in whose interest shall the state discharge its responsibility? Shall it consider itself as the presiding magistrate in a system of semi-sovereign guilds and fiefs, or shall it actively and positively advance the common interest? And if that were to be the alignment, it is easy to see how the political groups of to-day would line up: the "Big Business Conservatives" and the trade union machine on the one side; the Socialists, the Liberals, the "national Conservatives" or "Tory Democrats" on the other.

But politics is not an exact science. The evolution of parties does not follow neat and tidy rules. Much depends on the accidents of events and persons. At the moment, for example, very much indeed depends upon the attitude of Mr Churchill, who gives little sign of being aware of what is afoot—who, in any event, has just rededicated himself to the Conservative party in language of rather more than formal warmth. So it would be idle to prophesy in any detail. But perhaps three statements of a more general character can be hazarded. First, the existing parties will never, at least without radical reconstruction, be able to recapture the imagination and enthusiasm of the people. Secondly, there is a large block of opinion, with a fairly solid core of agreement on the main outlines of political faith, waiting only for the fire of leadership. And thirdly, nature abhors a vacuum such as that into which British political life has degenerated.

Millions Without End

THE financial year 1941-42 ended on Tuesday evening. The total ordinary expenditure amounted to £4,775,694,355, and total ordinary revenue to £2,074,057,310. In addition, £12,168,985 was borrowed to meet statutory sinking funds, leaving a deficit of £2,713,806,030. These are enormous figures; but even so they do not by any means cover the whole of the financial operations of the state, or even those on income account. The large trading departments, the Post Office and the Ministries of Food and Supply, appear only for their net balances, and there are other activities which are carried "below the line" or which do not appear at all.

Both revenue and expenditure have very greatly exceeded the Budget estimates. Revenue was put last April at £1,786.4 millions, and has therefore produced no less than £287.7 millions more than was expected. Expenditure was estimated in the Budget at £4,207.0 millions, and has come out at £568.7 millions more. Both of these increases, however, are partly explainable on accounting grounds. On the revenue side, the figures have been swollen by the effect of the War Damage Act. As contributions under the Act are paid, they are entered "below the line." But if there is expenditure under the Act, the expenditure is debited to the Vote of Credit and an equal amount is brought in as revenue above the line, credited to Miscellaneous Receipts. This item has produced £72.2 millions more than the estimate, and if the whole of this is due to the cause mentioned, the figures have been swollen to the same extent. On the expenditure side, the Chancellor's Budget estimates expressly

excluded all expenditure in North America, but the sums actually expended have, of course, been entered on the account; in December, Sir Kingsley Wood estimated them at about £300 millions. If deduction is made for both these items, the "uncovenanted" excess of revenue is about £215 millions, and of expenditure about £196 millions.

The *Economist* may here be permitted a brief digression of self-justification. In a series of articles in February, 1941, the attempt was made to form a rough view of the probable dimensions of the financial problem in the year that is now over, but was then still in prospect. An admittedly rough estimate of the expenditure in 1941-42 was put at £5,130 millions. This, it will be remembered, was before the passage of the Lend-Lease Act, and the figure therefore assumed the continuance of expenditure in the United States on approximately the scale then existing. It is hard to know what allowance to make for this factor, but it can hardly be put at less than £300 millions. Had our estimate of February, 1941, been adjusted to the basis on which the accounts are now presented, it would thus have been £4,830 millions or less. The figure actually realised is £4,776 millions. The same article estimated that the gross deficit before increases in taxation might be as high as £3,400 millions. If it were not for (a) the omission of Lend-Lease goods from the expenditure, and (b) the increase in the yield of revenue over the estimate for the old taxes, the realised deficit this year would have been at least £3,440 millions. Finally, another article in the series suggested that "it might serve as an immediate objective of tax policy to . . . bring the figure [of revenue]

REVENUE (£ millions)

* Including Supplementaries.

up to £2,000 millions." If allowance is made for the War Damage factor mentioned, the actual yield in the year just closed would be £2,002 millions.

These facts are not recalled merely to indulge in the pleasure of saying "We told you so," but because the figures, at the time they were published, were subjected to criticism from official quarters of a kind which is rarely directed to private estimates. In a debate in the House of Lords, Lord Simon, after referring specifically to *The Economist*, went so far as to say that the estimates "rather belong to the class of warning immortalised when the fat boy said to the old lady of Dingley Dell 'I want to make your flesh creep.'" At the time, no reply was possible; but the passage of time has brought its justification. There is little enough attempt at serious commentary on public finance in this country, and the materials available to the outsider for estimation are sufficiently scanty, without the burden of undeserved official criticism being added.

To return to the figures of revenue realised, some of them badly require explanation. Of the old-line Inland Revenue duties, income-tax and surtax, in combination, have exceeded the estimate by £8.6 millions—which represents very close estimation when the total is over £800 millions. Death duties have brought in £8.9 millions more than expected, and Stamps almost exactly the estimated amount. Motor Vehicle Duties have fallen very slightly short of the estimate, but are actually slightly higher than a year ago. The excess on Miscellaneous Receipts has already been explained. The big discrepancies are in EPT and NDC, which have together produced £269.0 millions instead of an expected £210 millions. Customs (£378.4 millions instead of £310.7 millions), Excise (£325.7 millions instead of £266.7 millions) and Post Office net receipt (£13.7 millions instead of £3.3 millions). In a purely financial sense, these very large excesses may be wholly satisfactory. But all of them reflect a volume of private business and consumption which was not expected and should not have been allowed. The excess on EPT may perhaps be excused on the score of the difficulty of making an estimate. The same defence might be pleaded, though with much less justification, in the case of the Purchase Tax. But not all of the increase in the yield of Excise duties can be attributed to that cause. And what is to be deduced from an excess of almost one-third in the yield of Customs duties, when the import programme is supposed to be controlled down to the last ton? Is it entirely due to releases of tobacco from bond and to heavy imports of petrol? By and large, these figures do not speak well for the Government's general economic policy. On a

strictly theoretical plane, increases in revenue serve to narrow the "gap" and reduce the volume of inflation. But in this particular case, there is more reason to believe that the buoyancy of the revenue is a direct consequence of the existence of a "gap" which is steadily inflating the turnover of those forms of activity still remaining outside the purview of rationing and limitation.

What of the prospects for 1942-43? Some of the materials for guesswork are shown in the two following tables. The first gives the figures of total expenditure in the last war and in this:—

	1913-14		1938-39	
	1913-14	1914-15	1938-39	1939-40
Last complete year of peace	1913-14	1914-15	1938-39	1939-40
Half peace, half war	1915-16	1916-17	1940-41	1941-42
First full year of war	1917-18	1918-19	...	...
Second full year of war	...	...	...	...
Third full year of war	...	...	...	...
Armistice year	...	...	...	...

The parallel may, of course, be very misleading. Prices were rising more rapidly in 1917 and 1918 than they are at present, and it may be that the peak of production has been reached earlier in this war. Nevertheless, it would be very foolish to assume no further increase in expenditure, or only a negligible increase. The second table shows the total expenditure, by quarters, during the last two years:—

	1940-41		1941-42	
	Total	Per diem	Total	Per diem
April-June	694.8	7.6	1,074.3	11.8
July-September	915.3	10.0	1,161.6	12.6
October-December	1,098.0	12.0	1,259.9	13.7
January-March	1,159.1	12.9	1,279.9	14.2
Year	3,867.2	10.6	4,775.7	13.1

In comparing the two years, it must be remembered that the Lend-Lease Act came right at the end of the first and affected the whole of the second. This element will be lacking in moving forward from 1941-42 to 1942-43; but on the other hand it is more reasonable this year than it was last to assume that the peak of physical production is near. Perhaps it is legitimate to set the lower limit of expenditure at slightly above the rate of the last quarter—say at £5,200 millions, with the range of probability rising to £5,500 millions.

In the conditions of war, it is the expenditure side of the account that almost monopolises the interest. But revenue cannot be entirely forgotten; and there will be an opportunity next week to examine the part that it can play in the framework of a sound wartime economy.

Betting in Wartime

AUSTERITY has been adopted as the nation's resolution for 1942. Already food, clothing, travel and entertainment have been additionally curtailed; and at first glance betting, which adds nothing tangible to the war stock and engages great sums of money, is peculiarly out of place in a regime of spartan living. Even so, every pursuit is entitled to a hearing before outright condemnation. Cinemas and theatres, for instance, can be discharged without any further restriction because they give immense pleasure to large numbers of war workers with only minimum use of scarce resources. This, in a war economy, is the test—the use of real or physical resources. Austerity is not an exercise in pietism; and neither sackcloth nor ashes will help much to win the war.

The money turnover of betting is still large, though nothing but the broadest estimates are possible. The view that betting must be disappearing because the sporting occasions upon which bets are placed are fewer appears incorrect. Horse racing has, it is true, been much restricted and the volume of betting connected with it has probably been reduced. Bets put through the totalisator

in 1941 amounted to £2,250,000, which, though double the figure for 1940, was very much below the £9,000,000 recorded in 1938. It would be erroneous, however, to suppose that the total betting on horse racing has fallen in this proportion. Totalisator betting has fallen with peculiar sharpness, because many racecourses are out of use and attendance at race meetings has fallen off very considerably; but off-the-course betting has almost certainly increased in many cases, particularly among working people, who under rationing and with full employment often have more money to spend than in recent years. Anyone who has worked in a war factory or engineering works can bear witness to the great volume of betting that goes on in these places. In 1936, it was estimated by *The Economist* that the turnover of horse-race betting amounted to £250 to £300 millions; it is possible that this turnover has not been reduced by much more than one-third in all.

Betting on horse races is only one part of the total volume of betting. There has been a cut of 50 per cent in dog-track meetings; but it is not improbable that an appreciable part of the reduction of horse-race betting

has been made up by betting on dogs. In 1938, the value of bets paid through the totalisator on seventy-five of the principal dog tracks was £35 millions, and this figure has probably been substantially increased since, up to and including the war years. The trend is illustrated by figures of the Bradford totalisator which have been made available: in 1938, the total was £494,000; in 1939, it was £523,000; in 1940, when meetings were held once a week instead of twice, the turnover jumped to £684,000. If *The Economist's* five-year-old estimate is right, that totalisator betting represents about one-half, the betting on greyhound tracks, it is not unreasonable to suppose that the further estimate made then of £50 millions as the actual total of all dog-race betting may to-day fall far short of the actual figure.

The third main branch of betting is on football matches. During the war this has been restrained by various measures. It is prohibited to send coupons for football pools through the post. The pool companies are short of staff, which curtails their business; as a result of staff shortage, for instance, the Unity Pool (which combines the activities of a number of pool companies) now accepts only one coupon per client. Nevertheless, the prizes distributed indicate that the volume of transactions in football pools is still considerable. In 1936, *The Economist* calculated that the total turnover in this form of betting was not much less than £30 millions a year; and an estimate given in the House of Commons on behalf of the Home Office shortly afterwards gave £20 millions as the likely figure. From returns published by the Postmaster General, it seems clear that between 1936 and 1939, the number of football pool circulars posted nearly doubled, which suggests that the total turnover of the pool companies on the outbreak of war was between £40 and £45 millions. It may still be half that amount. Taking all the forms of betting into consideration, *The Economist* estimated that in 1936 the total turnover of all three was "£350 to £400 millions, and possibly more than £500 millions"; and it may perhaps be rash to deduct very much more than £100 millions from this total to arrive at the probable present figure.

These are very large sums of money. They come into the same category of calculation as the sums spent by the Government on the various branches of the war effort. They compare significantly with the totals of voluntary savings. Offhand, it would seem that the diversion of these sums from the stream of direct war payments was a plain waste. On the other hand, it is important to ask the only relevant question—do these sums of money represent consumption which is wasteful of real resources needed for the war effort? It is the function of betting to transfer money from the pockets of the many who lose to the pockets of the few who win, and even though the total number of persons who win, on isolated occasions in the course of the year, is not small, it is probably true that winnings result in less consumption than is prevented by bets placed. If so, it can be argued that betting actually restrains rather than encourages consumption. In a sense, of course, this is very similar to the old disingenuous argument, which was once even canvassed in the pages of *The Economist*, that burglars perform a useful social and economic function by increasing the velocity of money and of available properties. There is no doubt at all that money lost and won in betting represents consumption more than, say, money paid into the banks or directly into the coffers of the National Savings Movement. The propensity of winning gamblers to spend is well-known. Moreover, one of the chief signs of inflationary tendencies under present controlled conditions is the fashion for speculation in all sorts of ways—traffic in landed properties, or buying to sell again in black markets. Betting is surrounded by a penumbra of individuals whose business it is to make money grow quickly by all available means; and the growth of illegal street and workplace betting is part and parcel of the same psychological tendencies. Nevertheless, it remains a fact that money wagered is not money spent on the consumption of real resources, and money won cannot easily be used *in toto* at once for consumption purposes. The argument that betting diverts large sums of

money from more wasteful purposes—that is, purposes which consume more real resources—contains an element of truth.

Actually, the most obvious waste, in terms of war economy, which is attached to betting comes not in the betting itself, but in the events upon which the bets are placed. Sporting occasions involve the consumption of travel facilities. Horses and dogs eat—compared with poultry—prodigiously. All kinds of sporting events have the tendency of taking war workers from their work. It is in these terms that the problem should be judged—in terms of transport, coal, paper, feeding-stuffs and working time. There is still obvious room for an enactment to forbid the holding of sporting events which involve the transport of players, animals or spectators over more than a mile or so. It is astonishing that it is still possible, even very occasionally, for special race trains to be run and special vans for the carriage of horses and dogs to be provided. There is obvious wisdom in the proposal to limit such horse-racing or dog-racing as may be permitted to remain, after all these considerations have been taken into account, to days in the week and in the year when workers may in any case be taking holidays. Football matches which draw a high proportion of their crowds locally and on foot to cheap standing places do not perhaps invite the same waste as the more sophisticated racing occasions—though it should be ruthlessly laid down that inter-regional competition should be forbidden because of the travel involved. But football pools are peculiarly wasteful. There are still great wastages of paper, and certain periodicals still rely appreciably upon the revenue from pool advertising which occupies space. Pools plainly waste manpower, too, though their staffs have been reduced, and are treated, of course, by the Ministry of Labour as being in non-essential work; they must still be fairly numerous and could presumably be more usefully employed elsewhere—which is, admittedly, no less true of the attendants who minister to horse and dog racing.

Indeed, it would be unfair to fix the waste of paper or manpower upon any particular form of betting. Millions of papers are still bought daily and solely for racing tips and racing news. It would in fact be a valuable economy to delete these items compulsorily from the Press and allow the BBC to resume its service of reporting race results. At the same time, admittedly, the newspapers, except in certain editions, have cut down their sporting service (for betting purposes) to the barest minimum; but it is no reflection on the value of the BBC to assess shipping space more highly than ether time.

In conclusion, then, it can be said that, while the dis-economy of betting can be much exaggerated by reference to the large sums of money involved, it is nevertheless part and parcel of a peacetime structure which, in so far as it remains in wartime, involves considerable direct and indirect waste of real resources. It is not a function of war policy to make moral judgments, but to make the maximum use of the nation's physical resources. The line of action is to abolish every activity which does in fact involve the misuse of fuel, shipping space or manpower; and the effect of such a programme, drastically applied, might well be to knock the bottom out of betting by removing its occasion and its mechanism. Nevertheless, the argument that British workers must and will bet has its place in the less tangible but important question of national morale. It should be emphasised that the problem is not to make people sad or to plunge them into unrelieved gloom. The attitude of the state towards betting has always been negative. It is not forbidden, except in certain forms and in certain places, but it has never been officially sponsored, and if it were to disappear in wartime, the state should be neither pleased nor sorry. The problem is not easy to solve. On the one hand, waste of physical resources must be prevented. On the other hand, it is important to preserve all the sporting occasions possible which do not eat up resources needed for the war. What happens to betting should be a consideration secondary to these. It would be as wrong, in the emergency of war, to abolish sporting occasions because of their betting attractions as it would be to preserve them for the same reason.

NOTES OF THE WEEK

St. Nazaire

The brilliant Commando raid on St. Nazaire is a welcome sign that the training of shock troops and the working out of the strategy of combined operations are developing very fast and very well. If such an action had been possible three or six months ago, the *Gneisenau* and *Scharnhorst* would surely not have escaped unscathed. Now the Germans have received grim warning that none of their Atlantic bases is safe from attack. Each base no doubt requires a different technique, but the variety of method and skill in execution shown in the St. Nazaire raid give assurance that every objective—base or airfield or radio location station or manufacturing centre—will be soundly dealt with when the Commandos go to work. The ramming of the dock gate by the *Campbeltown*, the engineers setting the destroyer at its target at 20 knots, was an intensely dramatic episode. The leadership of Colonel Newman—not a regular soldier, incidentally—and Commander Ryder was obviously inspiring and inspired, and the German Press has paid its tribute to the toughness and tenacity of the British troops. The raid proves what the people of this country know—but had, after Singapore, begun to question—that, given new men and new methods, the fighting capacity of this odd, excessively unmilitary and unferocious nation is second to none.

Dilemma in France

The raids on St. Nazaire and Bruneval and the increased bombing of French factories have put the Germans in a quandary. If the British attack is steadily to increase in weight until it develops into something like a major offensive, the Nazis will need all the active support—political, economic and military—they can get to prevent France from being drawn back into the war. They know that there is nothing to be hoped from Vichy, for the more successful the Allies—and hence the greater the German need—the more hesitant will become Pétain's desire for collaboration. Now that the possibility of effective counter-attack by the British and the Americans is on the horizon, the basic split between the collaborationists *faute de mieux* and the collaborationists *à l'outrance* is becoming clearer. It is only on people like Laval, Doriot, Déat and the other fanatical "new orderers" of Paris that Hitler can rely in the event of successful Allied action. The tendency of the honest elements at Vichy would be to give first surreptitious and then more and more open help to the democracies. Hence the German desire to get Laval reinstated before raiding begins in good earnest. But here they are firmly impaled on the horns of the dilemma. If Laval is forced on France, the reaction may be even more dangerously pro-Ally. Pétain—who got rid of Laval on personal as well as political grounds—may turn nasty. In which case French North Africa would no longer be a secure hinterland for Rommel's offensive. The Allies face no such difficulties. The more they raid, the better things will be. Political and military interests for once coincide.

The Fighting in the Far East

The fight continues on Japan's two flanks, in Burma and on the approaches to Australia. The stake is enormous, for if Free China can be cut off from India and Australia from the United States, the Japanese will have virtually complete freedom of action throughout East Asia and can then decide unhampered whether their next goal is to be Suez or Siberia—or both. In Burma, the Japanese are pushing steadily up the Sittang and the Irrawaddy. Toungoo has fallen, although the Chinese are fighting back, and the position before Prome is not very healthy. A disturbing feature here is the number of Burmans fighting with the Japanese. But it should be remembered that Tharrawaddy was the area in which the principal disturbances occurred in 1931, and there is little evidence to suggest that the Burmans in general are following U Saw's example. In New Guinea the military situation shows some signs of improvement. Very heavy Allied raids, coupled with local floods, are holding up the invaders behind Port Moresby. In the meantime, the Australians are

strengthening their position. War production has soared. American troops and war material have arrived, seasoned fighters from the AIF in the Middle East have returned and General Blamey is to be in command of the land forces in Australia. At the same time, the establishment of a Pacific War Council in Washington for "consultative" purposes should help to keep Australia's struggle in perspective with the wider war.

The Daily Mirror Debate

The debate on the warning to the *Daily Mirror* contributed little that was useful to the question of when criticism becomes harmful and intolerable. Those who opposed the Home Secretary's action for the most part either took their stand on the ground of high principle—that the freedom of the press was at stake—or else used the debate as a means of showing their personal dislike of Mr. Morrison. On the high principle there is, of course, unanimity of opinion; but it is difficult, as Mr. A. P. Herbert pointed out, to believe that the freedom of the press is endangered by a warning given to a newspaper for whose editorial policy not one member could provide a defence. Moreover, freedom of the press itself is less important than freedom of opinion, which is most effectively exercised through the press; and the press, both in London and the provinces, would greatly strengthen its claim to be the organ of independent opinion if there were less secrecy about the ownership of individual newspapers. It is significant that in the case of both the papers whose editorial policy has recently come up for discussion in Parliament the effective ownership is unknown. The rumour that Mr. Hearst is a proprietor of the *Daily Mirror* is untrue, and, unlike *Truth*, the paper has no large nominee shareholders; but a press which claims to support the principle of the open forum should be a bit franker about itself. Since, however, there is no disagreement on the question of principle, the case resolves itself into one of expediency. The Government may be convinced that the *Daily Mirror* has been having a harmful effect on the war effort. But it should also remember that it has always shown itself extremely sensitive to criticism, and the hint of suppression of a paper on the grounds of criticism must strengthen the widely held view that Ministers will not tolerate criticism of any kind. This might cause as much uneasiness and distrust of those in high places as the *Daily Mirror* is alleged to have inculcated in its readers.

Stricter Censorship

On the same day that the debate on the freedom of the press took place, the Minister of Information announced an important change in censorship policy. Hitherto, as Mr

Bracken said, censorship on press messages going abroad has been of a security nature and has been confined to stopping information likely to have a military value to the enemy. Correspondents in this country have been free to send abroad anything that has been published over here. This freedom is now at an end. Censors will henceforward be able to stop "any press message calculated to create ill-feeling between the United Nations," and "extracts from home publications which are submitted for cabling abroad will in future be subject to the same rules of censorship as are now to be applied in the case of original material." Evidently, therefore, the new procedure is only to apply to press cables. Mr Bracken stated that it will not affect the home press in any way, and though extracts from an English newspaper will be censored before they are cabled abroad, there is apparently to be no ban on the export of the paper itself. This illogicality proves that the Government is anxious to prevent only a distortion of facts and opinions from reaching foreign countries rather than the facts and opinions themselves. To show that such distortion takes place, it is enough to recall the use made by the Isolationists last summer of the demands in the English press for a further restriction in the civilian consumption of petrol. More recently, correspondents of Dominion newspapers in this country have cabled out material which Mr Bracken declared had done "appalling harm to the war effort." It is quite true that, so far as German propaganda is concerned, the new censorship will make little difference, because nothing can stop Dr Goebbels from misrepresenting statements in the English press. But misrepresentation by Allied correspondents obviously has a far more serious effect, and there can be no reason why they should be allowed to do Goebbels' work for him. Nobody likes this first intrusion of the censorship into matters which are not of a strictly security nature, and Mr Bracken's assurance that the censors will use their new powers sparingly is welcome; but deliberate misrepresentation of British views abroad is far more dangerous than the *Daily Mirror's* sin of misrepresentation of the Government's case at home.

Warships Weeks

London's Warships Week duly brought in several millions more than the target figure of £125 millions. The final total has not yet been announced, but it will be over £145 millions. Now that the long series of these weeks is over, it is permissible once again to ask whether all the elaborate pantomime is really necessary. Local patriotism and local rivalry are very powerful forces, and it is entirely proper to play upon them as part of the propaganda for saving. If, in so doing, the sordid facts of war economics are treated somewhat imaginatively, it would perhaps be curmudgeonly to complain. For example, it may be that no great harm is done by the attempts to persuade the public that Warships Weeks really make a difference to the size of the Navy. At least, no harm would be done if the false doctrine did not obscure the true—and that is precisely what is beginning to happen. The man in the street is beginning to be persuaded that warships are built by processions and speeches and large donations from insurance companies rather than by his own abstinence and hard work. Then there is the very vexed question of corporate subscriptions. What is the effect on the ordinary man when he is told that London's Warships Week is expected to yield £25 or £30 for every man, woman and child, or when he reads of a single insurance company handing over a cheque for £10,000,000? Surely the effect is to make him conclude that the whole business is not for the likes of him—the very opposite of the effect intended, since the only merit of these corporate subscriptions (which would, of course, have found their way to the Exchequer in any case) is if they serve to stimulate private subscriptions.

The urge to pile up enormous money sums, irrespective of their real economic purpose, is being pushed altogether too far. Private citizens are being openly urged by zealous local committees to sell their existing investments in order to reinvest the proceeds—which confers precisely no benefit on the community. Business firms are being approached by the banks to borrow money in order to participate in Warships Weeks; in some circumstances, owing to the workings of EPT, it is possible for both the bank and the business firm to benefit from such a transaction at the expense of the Exchequer. And what is the net product of the whole cam-

paign? In March the banks appear to have encashed some £95 millions of Treasury deposit receipts in order that their customers might buy War Loan; net effect—an increased interest charge on the state and a somewhat more formally funded form of debt. A further £60 millions of the money that has gone into Warships Weeks also came from the Exchequer itself in the amounts disbursed for the Canadian vesting order. How much of the March "savings" total of £381 millions came from similar purely financial operations it is impossible to say. No praise is too high for the energy and devotion with which the National Savings Committee and its helpers have set about their task. But is their propaganda really such a blunt instrument that it cannot distinguish between what is and what is not of real benefit to the community? The theme of abstinence has now almost disappeared from the publicity. Could it not be given first place? Why not a meatless week, or a "no transport week," or even a Total Abstinence Week? The amounts per head yielded in these ways would be measured in shillings rather than in pounds. But the real benefit might well be greater.

Bulgaria on the Verge

King Boris rarely makes the journey to Germany without some disaster following for his unhappy land. It was he who, in November, 1940, arranged for the unopposed occupation of Bulgaria by German troops. As a result of his most recent visit, the country, must now, after serving as a passive base for the attack on Yugoslavia and Greece, be drawn actively into the new spring offensive. The Bulgarian Prime Minister has made a strong attack on Russia, serving up Goebbels neat in the process, and there are reports of troop movements northwards. King Boris's reasons for abandoning his people to war are those of the dishonest trader yielding to gangster pressure. With the aid of the Hitler-Goering-Himmler gang, Boris got the possession of Moravia, Macedonia, and Thrace in the course of 1941. Now if he is to keep the swag, he has to take a more active part in the gang's activities. Otherwise it will be his turn to be put on the spot, while other stooges—Mussolini, Pavelic, Antonescu—got his share. It is not only a question of threats. The map published—highly tactlessly—by *Yeni Dunya*, a Turkish broadsheet produced by the Propaganda Department of the *Wehrmacht*, gives Boris Turkish Thrace and Istanbul to Bulgaria. King Boris would probably prefer to fight the Turks rather than the big Russian brother. But it seems possible that the Germans do not want to bring in the Turks, and under the Hitler regime, satellites can choose neither their friends nor their enemies.

Japan and the Vatican

The Vatican has agreed to exchange Ambassadors with Japan, and Mr Ken Harada, the Japanese Ambassador to Vichy, is to be attached to the Holy See on a "special mission." The incident is bound to create the worst possible impression among the United Nations, coming, as it does, on top of Japanese aggressions and atrocities in the Far East. It is no doubt true that the diplomatic exchange does not entail recognition of Japanese conquests—it would have been even clearer, had the Vatican made a statement to that effect. The Church authorities are concerned about the future and status of the Catholic missions the Japanese have overrun, and they prefer to rely on direct representation rather than on some neutral diplomat. But the Japanese motives in seeking representation are simply concerned with propaganda—to persuade the world that the Vatican supports the "winning side," aggressor or no. This propaganda will be all too successful unless the Holy See takes the obvious and necessary course of recognising Chungking at the same time. The Chinese have been pressing for some time for representation. Now the occasion for it has clearly arisen.

The Woman Shortage

As the registration of women proceeds, fewer and fewer are found to be available for transfer to war work in any part of the country. Of the 280,000 in the 1909 age group, as many as 220,000 are married and only 52,700 are in full-time employment. This means that, on the Ministry of Labour's present definition of mobility, the mobile woman is becoming scarce, and employers will

more and more have to tap local sources of labour. The Control of Engagement Order controls the employment of all women between the ages of 20 and 30; the Order was not extended to women over 30 because it was thought it would place too great a strain on the exchanges. But under the earlier Restriction on Engagement Order, certain industries—such as engineering and building—can only engage workers, whether men or women, through the exchanges. This has placed these firms at a disadvantage in recruiting the older women as against firms which are not so controlled, and a direction has now been made enabling them to make direct engagements of women over 30. Under the circumstances, if it is really impossible to control the employment of all women through the exchanges, this step, which allows the old evil of bidding for labour to re-emerge, may be unavoidable; and it is true that in practice the employers will only be able to recruit immobile labour direct—the Ministry of Labour is to keep a firm hand on the mobile woman of whatever age. Moreover, the direction is intended to encourage part-time work by immobile women. The Ministry of Labour has so far not compelled women to undertake part-time employment, but it is hoped that, by enabling employers in the engineering industries to engage local women over 30 direct, part-time work for married women will be greatly extended. What is doubtful, however, is whether the Ministry is right to assume that married women are *ipso facto* immobile without a full consideration of the circumstances of each case. And it should not hesitate to compel at least part-time employment in cases where domestic responsibilities are small, instead of leaving the initiative to the employer and the woman herself.

It is certainly true that there is no solution to the man-power problem without general employment of married women. The transfer of mobile women to the new industrial areas, which lack an adequate indigenous labour force, is only feasible if immobile women—in the great majority of cases married women—can take their places. Nor is it enough to direct childless married women into war production. It is already necessary to tempt married women with children into war work, and the need will grow. Consequently it is highly important to obviate some of the major inconveniences to which the married woman in industry is subject, if compulsion is not to be stultified by illness and absenteeism. The new concessions which Mr Bevin enjoin on employers are all in the right direction, although they still rely too much on the discretion of the management. In the absence of day nurseries, part-time work may well be the only form of work which mothers can generally perform. For the housekeeper, whether married or single, time for shopping is a first necessity and should be guaranteed as an absolute right. The news that women married to members of the forces are entitled to joint leave when their husbands are free, in addition to the normal industrial holidays, is welcome. But the concession which provides for a maximum of fourteen days for wives of men serving at home and a minimum of fourteen days for wives of men on leave from overseas—in each case without pay—is not generous enough. These women should be guaranteed holidays whenever their husbands are on leave, one week of which should rank as their normal holiday. Men serving at home are not likely to get less than twenty-eight days a year. It must be realised that there is a very definite upper limit to the output which can be extracted from any worker. Many women put in a good day's work outside factory hours, even in homes from which husbands are absent. War production is likely actually to profit from a generous leave policy. But this should not be left to the discretion of the individual employer.

Absenteeism

Much of the criticism about excessive absenteeism and unpunctuality in the munition factories and other essential industries is no doubt exaggerated. Longer hours and unaccustomed work inevitably tend to make for less regularity in attendance. Some of the new women workers are physically incapable of standing the strain of regular attendance; shopping difficulties and household responsibilities often increase the strain. In short, a good deal of the absenteeism and lateness is due to exceptional circumstances rather than to lack of good will on the part of the workers. But there does appear to be a small minority of workers whose irregularity cannot be justified. To bring these to heel sanctions

are necessary. The procedure laid down by the Essential Work Order to deal with this minority has proved to be too cumbersome. Hitherto cases of irregular attendance could be reported to a National Service officer, who, after investigation, could issue a direction, against which the worker had the right of appeal to a local Appeal Board. If the direction was sustained, non-compliance with it became an offence under the Defence Regulations. An amendment to the Essential Work (General Provisions) Order, 1942, which came into force last Thursday, provides for a more speedy and effective method of dealing with slackers. It will make it an offence for workers in industries subject to the Essential Work Order either to absent themselves from work or to turn up late without reasonable excuse. Proceedings can now be taken against offenders without a specific direction from a National Service officer upheld by an Appeal Board. It is provided that in factories which have set up a production committee considered appropriate to deal with such cases by a National Service officer, they must be referred to it. The tightening-up procedure has been necessary to remove the temptation to slackness among the few; it is no reflection upon the many who contribute to the war effort to the limit of their physical strength.

Mobilisation

The process of stating the facts about the British war effort goes on. At Bristol last week-end Mr Bevin made plain the immensity of the mobilisation of manpower that has been carried through since war broke out. His Ministry has registered the nation's men and women as they have been earmarked; and twenty out of forty million men and women, he said, have been mobilised for national service, for the Forces, civil defence or war work, "the most admirable venture of any belligerent." The mobilisation of women is not equalled in any other country. The reserve of labour, idle or in luxury or semi-luxury work, has almost wholly gone. Every further drain must be from the standard of living. The tangible result in industry of this effort is that parity with the enemy, Germany and German Europe, has been achieved, despite the disparity of numbers, in many forms of war production. It is the disadvantage of enforced autarky in blockaded Europe that it permits a much lower output per head than in specialised, trading Britain. Conquered countries, moreover, are not easy workers; and the main addition of Europe to Germany in actual technical war manufactures is from certain, relatively few, specialised plants, such as those near Paris, in Silesia or Bohemia. But to match the enemy will win nothing. Mr Bevin's statement of sound progress after many delays merely shows how the strain of numerical inferiority is now being taken. To win the war we must do much better than the enemy. There is Russia to be helped. There are fronts to maintain; and United States aid will go mainly east until next year. It removes none of the need to make mobilisation complete; to strip away from civilian industries,

More than a century's accumulated business experience and conservative progress form the background of the comprehensive service which the Westminster Bank is able to place at its customers' disposal.

The Bank's vast resources, its constant touch with current affairs and its extensive system of branch offices in England and Wales and agents elsewhere, combine to enable it to offer a wide range of facilities, details of which will gladly be given on request by the manager of any branch.

WESTMINSTER BANK

essential ones, and from distribution the last hundreds of thousands of men and women that they can spare in supporting no more than a minimum standard of life; and to make work in essential civilian employment as arduous, continuous and economical of time and labour as work in war factories.

Kenya Labour

Misgivings about the adoption of forced labour for Africans in Kenya have not been dispelled by the debate which took place in the House of Commons last week. It is quite true that certain safeguards have now been announced, and it appears that a minimum age of 16 was, after all, laid down, though there was no mention of it in the original statement in Parliament. There is to be provision for repatriating the labour at the end of the term of service; the Colonial Office is determined that there will be an adequate inspectorate; and the number of natives to be conscripted will not raise the proportion of Africans who will have left the reserves to more than 55 per cent, the maximum figure considered desirable. Moreover, the establishment of a Central Wages Board, which will fix the wages both of compulsory and voluntary labour, is, as Mr Macmillan said, a great advance. Unfortunately, in the speech in which he announced these concessions, he appeared so hostile to any criticism of the plan or of colonial policy in general that he quite spoiled their effect; it was an unhappy start to his new office. Nor did he give any guarantee that there is to be adequate supervision of the management of the European farms to see that production is efficient; instead, he devoted a large part of his speech to defending the characters of their owners. It is not doubted for a moment that the increased production of certain commodities in Kenya is essential to the Empire's war effort—incidentally, if Mr Macmillan wanted to quote *The Economist* on this point, it is a pity he could not quote accurately—but it is doubted whether imposing forced labour on Africans is the best way to achieve it. It is difficult to see why the suggestion made by Archdeacon Owen, one of the members of the committee which investigated the labour shortage, that voluntary labour should be encouraged by a higher wage-rate, was not first tried out. Moreover, the new policy will raise problems in other parts of Africa where British rule aims at preventing the imposition of forced labour on Africans by their own countrymen. If the principle is conceded for the Kenya settlers, even though in the interests of the war effort, it will be difficult to deny it elsewhere.

Tightening the German Belt

The Germans are to face the new spring offensive with tightened belts. Further food rationing is to be introduced this month and although the details have not yet been announced, it will probably fall on bread and meat. This announcement follows on the introduction of new rationing schemes in a number of the occupied territories, and the fact that bread is to be short must cause particular anxiety, for it has always been the German boast that their grain reserves were equal to any crisis. Potatoes too are scarce, and this week a correspondent of the Swedish paper *Social Demokraten* has given a bleak picture of Berlin: potatoes and alcohol have almost entirely disappeared from the shops and unofficial potato rationing schemes are in existence; fish and game can be had neither in shops nor restaurants; the beer is deteriorating, and exorbitant prices have to be paid for wine and spirits. These new shortages are partly due to the severe frosts which damaged the potato crop, but it is also due to the extent to which the Germans have had to provision their new conquests after the devastation of war had swept over them. Nevertheless, it would be unwise to assume that the difficulties are as great as in, say, March, 1918. Given another year in which all the fighting is carried on outside the frontiers of Europe, the problem of provisioning the occupied territories will solve itself. It is estimated, for example, that the Polish grain harvest ought to be back to normal this year. Another factor making for strength is the extent to which the German people have been taken into the confidence of the authorities about the difficulties of the situation. The tactic of not disguising bad news, which has been practised successfully on the military front, is being applied in the sphere of civilian life as well. The new rationing has been used as a warning that the war is a struggle for bare

existence, and there is reason to suppose that this "Dunkirk spirit" provides a more effective soldering of morale than the earlier giddy rejoicing in victory.

Work for the Forgotten Men

Any society, however stable and prosperous, has its fringe of "forgotten men." Their number is inevitably increased by the catastrophe of total war, which first creates new categories of distress and then mobilises into the war effort the resources and the energy which might otherwise have been used in relieving that distress. After the widespread air raids of last winter, families and individuals were to be found all over the country who have lost their belongings, their homes, their relations—and their bearings too. Yet they presented a challenge which most of their fellow citizens were simply too busy to take up. It is primarily to their needs that the work of the Friends Ambulance Unit and the Friends War Victims Relief Fund has been devoted in 1941. The Report published this week of their activities gives a measure of the need they had to meet. At first, in the blitzes in London and elsewhere, it was a question of makeshift first-aid work in shelters, in rest-centres, in hastily improvised hostels for evacuees. But the lull in air-raiding has not put an end to the work. It has only altered its character. There are now 41 permanent hostels and Friends' workers are established in a number of isolated camps and settlements. Further workers are to be trained and as an inevitable extension of the original shelter and rest centre activity, a great variety of work is being done to restore some community life to bombed areas. In the words of the Report: "Shelter welfare and shelter club work remained necessary . . . but its emphasis was different. The main point now was that in many districts the social amenities, such as they were, had themselves become 'war victims' in the raids . . . The shelters and shelter clubs alone remained to serve as substitute social centres." Since February this year, the Friends War Victims Relief Committee and Friends Ambulance Unit have been amalgamated into the Friends War Relief Service and a full programme lies before the new organisation. Unhappily much of it will have to be curtailed unless the effort—which depends entirely on voluntary support—is more generously backed. For the last year, a third of the expenditure of some £53,000 has been met by the British War Relief Society of New York. Now the coming of war to America means that its monthly contribution of £2,000 will cease. It is very much to be hoped that it can be made good from other sources.

Shorter Notes

The first food rationing has been imposed in Australia with the restriction of Ceylon tea to 1 oz. a week per person. The Commonwealth is now dependent for its tea supplies on imports from Ceylon, and this drastic rationing, which will be a serious hardship to such heavy tea drinkers as the Australians, shows that only small quantities are likely to be imported.

The powers of compulsory enrolment for the Home Guard, at present in force in an area approximately south of a line from the Wash to the Severn, have been extended to the west of the country. In certain districts, for instance London, the Home Guard is up to the present requisite strength, and compulsory enrolment will therefore be unnecessary for the time being. Where, however, the numbers are below the military operational needs of the district, compulsory enrolment will take place as soon as possible, and a man will not be exempt merely because he is already doing compulsory fire guard duties.

A concession in the soap ration for mothers has at last been announced, and after April 6th they will be able to buy an extra three ounces a week for the washing of baby linen. This concession is very niggardly, however, for the extra ration can be obtained only until the baby is a year old, and it would have been more sensible if the Ministry of Food had made it available in respect of children up to six years of age.

AMERICAN SURVEY

Detroit versus The Axis

[The following article is reprinted, by permission, in somewhat shortened form, from the issue of TIME, dated March 23, 1942.]

A YEAR ago Willow Run was a lazy little creek west of Detroit, surrounded by woodlands, a few farmhouses, a few country schools. Today Willow Run is the most enormous room in the history of man: more than a half-mile long, nearly a quarter of a mile wide. In this great room errands are run by automobile; through the flash of moving machinery and the dust of construction, no man can see from one end to the other.

The plant contains 25,000 tons of structural steel. By summer, 70,000 men will work in this room; by December, 90,000. In planning the building, Ford Motor Company's drafting room used five miles of blueprint paper a day, seven days a week, for six months.

In this enormous workroom Ford hopes eventually to turn out a four-motored Consolidated bomber every hour. The raw materials will go in at one end; from the other will emerge the 30-ton machines, coughing with life. The bombers will be torn from half-mile assembly lines so fast that Ford will not try to store them. The deadly infants will be ranked on a great new airfield, stretching out from the assembly end of the plant, with enough white concrete runways to make a highway 22 miles long.

Detroit has other enormous rooms, and out of them armies will roll and fleets will fly. Endlessly the lines will send tanks, jeeps, machine guns, cannon, air torpedoes, armoured cars. Ford's River Rouge plant, where Ford steamships dump coal and iron ore and limestone to be magicked into steel and glass and machinery, has turned its two square miles of self-contained industrial empire to the tools of war.

Chrysler already has three assembly lines of olive-drab tanks moving through its tank arsenal (soon it hopes to ship a trainload of tanks a day). Guns, shells and motors are at last in mass production. General Motors, once biggest of all auto-makers, is already producing arms of all kinds at the rate of a billion dollars a year. Packard and Studebaker are making airplane engines; Hudson makes anti-aircraft guns; Nash is at work on engines and propellers.

Once Detroit's conversion to war is complete, when the lines are all moving with the precision of timing and economy of motion that Detroit borrowed from the morning stars, they will pour out such a flood of war machines as no man has ever imagined. The onetime auto industry will employ a million men and women, twice as many as it ever did, will make a billion dollars' worth of armaments a month. If Armageddon is to be decided in Detroit, Armageddon is won.

Bombers on the Line

Detroit is not alone. The United States could look at the vast Consolidated Aircraft plant, on the curving shore of San Diego Bay in California. There, for the first time in aeronautical history, heavy bombers were put together last week on a continuously moving assembly line.

A bull-tongued horn blasted through the echoing, vaulted reaches of the Consolidated plant. Slowly, laboriously the line began to move. At one end, a new bomber assembly was fed on to the line. At the other, a B-24 rolled off, ready for flight. The new era in aviation had dawned.

As proud of his achievement as if he had just created Man was Consolidated's new board chairman, round-headed, profane Steelman Tom Girdler. Tom Girdler, who took over Consolidated two weeks after Pearl Harbour, had two great plants at San Diego. The parts plant makes Consolidated's bits and pieces, from engines down to tiny hydraulic pumps. In the assembly plant they grow into planes—the famed B-24 with more than 3,000 mile range, its four-ton bomb load; the long-range, hard-working PBV-5 flying boat; the massive, four-motored PB2Y2, whose range and bomb load are military secrets.

Well might Tom Girdler be proud. Mass-producing bombers is as much more complicated than building autos as the growth of the human body is more complex than the growth of an amoeba. The average car has

15,000 parts. The bomber that rolled off Consolidated's line last week had 101,650 parts, laced together by more than 400,000 rivets.

Tom Girdler had set the first bomber assembly line in motion—no mean feat even for a company rich in aircraft experience. Detroit will draw on his experience. Its feat will be that, having started from scratch a few months ago, it will soon duplicate and reduplicate the deeds of the aircraft industry—if—the Great If—the US maintains a steady flow of materials into the enormous rooms.

Many of the world's smartest manufacturing brains are concentrated in Detroit; so is much of the world's smartest machinery. Many a machine is no good for making anything but autos; that was why conversion was not the simple, button-pushing job that some people thought it should be. The great body and fender presses, half-embedded in concrete, are useless now; the great halls that held them are being walled off. The massive, complex, special-purpose machinery has been ripped out, carted to parking lots; there the machines stand now, coated with grease against the rains of nobody knows how many springs.

The Unknown Battalion

Detroit has more than machinery, more than the manufacturing brains of Henry Ford's generation. The industry's front line is manned by a little battalion of unknown men in battered felt hats, sitting shirt-sleeved in cubbyhole factory offices, darting out among the machines, spitting tobacco juice, profanity and ideas. These are Detroit's production men, fresh up from the ranks, a trace of grease still under their stubby fingernails. They know machines as only men can who have handled them. With dog-earned notebooks, pencil stubs and know-how they work out production problems that no textbook could solve.

These production men have the same tactile sensitivity to machinery as a surgeon has for muscle and nerve; they can make the machinery and blueprints come alive as a Toscanini brings notes off paper. They do not come ready-made, they have to grow up with machines.

Henry Ford was such a man.

Henry Ford is 78 and a great-grandfather, but he is still lively, curious and productive. His shoulders are stooped by his years, his neat salt-and-pepper suits hang loosely on his spare limbs. But his body is still tough, his bright eyes dart restlessly as the fingers of a machine. The Ford Motor Company is, as ever, a one-man show.

He wanders as the spirit moves him through the great River Rouge plant or greater Willow Run, talking, looking in on experiments, watching the Ford empire hum.

In 1932, when early attempts at casting the V-8 engine were a failure, Ford showed up one day at the foundry with a bundle under his arm, took out a pair of overalls and went to work until the job was done. He still pops up at trouble spots. "You can't solve these things by paper work," he says, "you have got to see them."

When World War II began, autocratic, headstrong, pacifistic Henry Ford looked like the least helpful of US citizens. He hated war; he hated the New Deal's labour and foreign policies.

Henry Ford was an America Firster; he called Appeaser Neville Chamberlain "one of the greatest men who ever lived"; after war began he hoped that England and the Axis would club each other into a coma. In the summer of 1940 he refused to make Rolls-Royce airplane engines, when he learned that some of them were destined for Britain. (As usual, he had a good mechanic's reason: later, grief and headaches in other plants making English-designed munitions proved what he knew or had guessed—that the British blueprints were informal to the point of helter-skelter, had to be completely worked over, causing costly rejections, delays, waste.)

In Canada, Henry Ford was assailed as a "menace to democracy"; a boycott of his cars was threatened. Matter-of-fact old Henry Ford was unmoved. Said he, firmly: "Anyone who would do that is a sugar tit."

But even the most whole-souled mechanic takes some time off, and Henry Ford, the lean Midwesterner with a farmer's flair for opinionating and a mechanic's scorn for words, was always two men. He was a cantankerous, stubborn, cracker-box philosopher who could not bear to be contradicted; and he was a maker, a maker of machines that work.

At the start of World War I, Ford had been the cracker-box philosopher; he was agin it. But as soon as the US got into the war, Ford the mechanic got to work: he built tractors and tanks, put up a mammoth plant for Eagle anti-submarine boats. When the Government offered 30 cents apiece for steel helmets, Ford made 3,000,000 of them for 7 cents. When the war ended, he turned back every cent of profit to the Government.

This time Ford did not wait for the declaration of war. Making cars had become routine; all the problems were licked. As an automaker he was an old hand, getting kind of tired of it. Mass-producing tanks and bombers was new and exciting. The gigantic engineering and production problems took him back to his bicycle-shop days, when mass production was just a bright gleam in his eye. His "1,000 airplanes a day" was neither an idle boast nor a positive promise; it was just good American cockiness—the kind it took to make the first million Model T's.

Ford was always three jumps ahead of old OPM's red-tapeworm. While OPM was conferring and writing inter-office memos, Ford was proving his old theory of one-man control. He had no stockholders; he was more interested in making things than making money, all he had to do, to get a new plant built, was call in Production Boss Charles E. Sorensen and say: "All right, Charlie, let's go ahead."

Ford and Charlie Sorensen started making Pratt and Whitney airplane engines before they even had an order. When the Government finally asked Ford to put up a Pratt and Whitney plant, he figured that OPM had set its sights too low, left one end of the building open for extensions. Without any nod from Washington, he turned an engineer loose on a V-12 liquid-cooled engine of his own. He started putting up Willow Run on the sole basis of a relatively small order for sub-assemblies.

"We ought to make the whole plane, and that way there can be no buck-passing if it isn't right," Ford told Sorensen. "Go ahead and start the plant . . . but leave it so we can expand it quickly to handle the whole job. They are going to need a lot more bombers than they think." He had thousands of men at work long before the Government told him to shoot the works.

Any lingering America-Firstism in Henry Ford's soul was bombed away at Pearl Harbour. Like any good Midwesterner, Henry Ford hit the roof when the US was attacked. He called in his executives and said (weeks before the new War Production Board ordered auto production stopped): "We might as well quit making cars now." The same week he piled some of his aides into an automobile, made a tour of the whole Dearborn empire. At each building he discussed what was made there, at each building ordered: "Get a defence job going in there quick."

Henry Ford is happier and younger than he was two years ago. He lost his fight against New Deal labour policies; after a strike and a court decision that he had violated the Wagner Act, he signed a contract with the United Automobile Workers last year. But he lost in his own peculiar way: once he had made up his mind, he called in his labour-herder, Harry Bennett, asked what the union wanted. He knew what he wanted. Said Henry Ford: "Why in the hell don't we give it [the union shop and check-off] to them now and save all that trouble? We've got to get ahead with some work around here."

Twice in one lifetime he lost his fight against war. He lost that in his own peculiar way, too. All Henry Ford's talents, all the empire he has built in his 78 years, all his acres and masonry, locomotives and ships are dedicated to winning it.

Prices and Parities

[FROM OUR NEW YORK CORRESPONDENT]

February 3rd

AFTER an extensive, but not very illuminating, debate the Price Control Act has been passed and signed. It provides, in general terms, broad powers of price-fixing with severe penalties for violation. But the criteria of pricing are by no means clear. Prices are to be based upon levels prevailing in the first half of 1941, adjusted to various factors. But as most prices are now substantially higher than they were a

year ago, this provision carries little information to the public.

The debate, as would be expected, centred in the fixing of farm prices. The Bill provided that no price ceiling was to be fixed on a farm product at less than 110 per cent of parity. To the statistician, to whom "parity" has become the modern mathematical version of the mediaeval "fair price," the concept of a 10 per cent premium (a 20 per cent premium as proposed in the defeated O'Mahoney amendment) over the "just" price is something of an anomaly. To the market, the permissive premium was interpreted as mandatory on the Department of Agriculture, and there has been fairly heavy speculation in farm commodities on the theory that the Commodity Credit Corporation would peg the prices at the legal limit of tolerance. It appears, however, that the intent of the Act is (a) to provide floors for farm prices a little below parity, and (b) not to intervene in markets, in case demand lifts the price above parity, until it has exceeded parity by 10 per cent. This interpretation may prove wrong, as the President spoke with some misgivings about the implications of this clause, while the more fervent "friends of the farmer" are outspoken in their conviction that the farmer has been betrayed by the Act. As a matter of fact, as the reference to the base of the first half of 1941 shows, Congress has granted an administrative official comprehensive powers of price fixing, but has not provided him with any clear directive or criterion for the exercise of those powers.

The Party Doctrine

The debate, as well as such discussion as appeared in the press, illustrates how completely the concept of "parity" as a doctrine of price has replaced other considerations. As everyone knows, the parity price of a farm product is that price which will give a unit of the product the same purchasing power over "what the farmer buys" as it would have had in 1909-14. Yet in the intervening generation the content of "what the farmer buys" has completely changed, for this intervening generation has brought the nearly complete mechanisation of farm operations, partial but extensive farm electrification, and the nearly complete substitution of the truck and the car for horse-drawn farm transportation. Furthermore, the "farmer" himself has changed. A generation ago, a good deal of specialisation had developed in agriculture; now it is highly specialised. The expenditures of a dairy farmer in the industrialised north-east are radically different from those of a grain farmer in the north-west, or a cotton farmer in the south. An index of "what the farmer bought" in 1914 can be revised to what he putatively buys in 1941 only by an almost complete set of extrapolation. Hence, for example, the arguments of the dairy farmers that "labour" as an element in the cost of dairying has risen in the last twenty-five years, while as an element in the cost of wheat growing it has fallen, and the logical conclusion that a true index of what the dairyman buys would weight labour more heavily, and so arrive at a "just price" of milk which would be some 20 per cent above its present parity. In the mazes of statistical oratory, the real issues get scant attention. It is desired to increase agricultural production by a substantial percentage in most lines. To an extent this involves invoking a marginal supply. The question is whether or not a given price will, under the circumstances, produce the output desired. In spite of the fantastic types of arguments advanced, it seems likely that the formula hit upon in the Act is as promising as could have been devised.

Finally, this Act now makes our entire price system a function of the industrial wage level rather than the wage level a function of the price system. Wages are completely outside of the controls. A ceiling is provided for every other form of price; but all these ceilings are subject to elevation, either by administrative action or (as with farm products) by legislative mandate, under the impact of wage policy. The arguments against wage fixing are numerous and persuasive; but it remains to be seen what can be done with a price control that specifically ignores the principal element of prices.

American Notes

Shipments to Russia

President Roosevelt's vigorous reminder that supplies for Russia are to be given priority and that shipments must be expedited by every possible means follows reports that American aid has been gravely behind schedule since December. The President's Order has gone to all five

agencies concerned: The War Shipping Administration, the War Production Board, the Lend-Lease Administration, and the War and Navy Departments. Production figures are said to be exceeding all expectations, and there is such a vast margin of Lend-Lease appropriations and commitments that the bottleneck is probably either in shipping or in the disinclination of the services to put aid for Russia before the equipment of the American Army and Navy. The fact that Admiral Land, the War Shipping Administrator, has recently been given broad powers over the allocation of shipping and cargo space, and that he has felt impelled to propose ten "must commandments" to shipyard and dockyard workers suggest that shipping has in the past been an outstanding difficulty. The new controls, if firmly applied, will provide the ships; what is harder to eliminate is the lingering hostility to Russia in certain quarters and the unwillingness to admit that the United States may be defeated—or victorious—on the Eastern Front this spring. It was to this obstinate remnant of Isolationism in certain key positions that the President's Order was addressed primarily. Priority to Russia, in view of American preoccupations with Japan, is not altogether an easy pill to swallow, but the President's insistence should produce a speedy improvement.

Standard Oil's Patents

"Approaching treason" was the harsh verdict of Senator Truman on the withholding from the US Government of the chemical patents of the Standard Oil Company of New Jersey, particularly that for the production of butyl. The most sensational allegation to emerge from the testimony of the Assistant Attorney-General is that in January, a month after Pearl Harbour, Standard Oil refused to submit samples of butyl to other American and British companies, and that it has only done so now in accordance with a consent decree of the courts, while full information about butyl had been delivered to the IG Farbenindustrie and to the Pirelli Corporation of Italy, with which Standard had made cartel agreements. Arrangements with the Japanese firm of Mitsui, outlining a plan of action in case of Japanese-American hostilities, an attempt in 1941 by Standard to sell its Hungarian properties to German interests, and the sale of gas and oil to Lati, the Italian air line between Rome and Brazil, were also mentioned by Mr Arnold, whose testimony is not yet complete. (Standard Oil's answer is also yet to come.) The case of Standard Oil is not unique; Mr Arnold stated that there was no essential difference between its policy and that of other companies which have restricted the production of critical war materials such as tungsten, aluminium, magnesium and carbide. But it presents in its most extreme form the conflict between the community's interests and those of private enterprise where agreements on processes and markets stretch beyond national boundaries. Mr Arnold has stated: "We should lose the point of this hearing if the committee simply denounced the Standard Oil Company. We need the Standard Oil Company with its technicians and its organisation to help us to win the war." Indignation and denunciation are natural, but this is sensible doctrine. The most surprising and discouraging aspect of the whole story is the fact that the Government's action was in the sorry tradition of too little and too late; Standard's patents should have been made available to the United States months ago when a shortage of rubber appeared imminent. It was the responsibility of the Government—not of Standard Oil—to take every step to provide alternative sources of rubber; not only to press the production of artificial rubber, but to encourage production in South America, to accumulate rubber stocks and to investigate other sources of rubber. In all these respects its policy was inadequate, and the war effort is faced with additional and avoidable difficulties. These facts have now come to light in America; but is there any reason to believe that the practices they reveal are confined to that country?

Overtime Pay

Concessions by the unions on the subject of overtime pay, which coincided with the startling disclosures about Standard Oil's relations with German, Italian and Japanese industry, have decreased the tension over labour policy. The 40-hour week becomes slightly less outrageous when com-

pared with profits of several hundred per cent on war contracts. The labour concessions are not very great: the AF of L has agreed to give up premium pay for Saturdays, Sundays and holidays, but still insists on time and a half for the sixth consecutive day of work and for over eight hours work in any given day; agreements have already been reached in construction and shipbuilding. The CIO is still holding out for double pay on the seventh consecutive day of work, but has recommended its affiliated unions to give up demands for double pay for work on Saturday, Sunday and holidays provided it comes within the forty-hour limit. The United Electrical Workers at Westinghouse, the world's largest local, have already acted on this advice, but only on the condition that the money saved be turned over to the Treasury, a provision which is unlikely to appeal to the Westinghouse management. A CIO shipbuilding union has voted to accept 25 per cent of all overtime pay in defence savings stamps or bonds, and two AF of L unions have sacrificed wage agreements of fifty years' standing in relinquishing double pay for Sunday and holiday work. The obligation to pay overtime for more than 40 hours' work in any one week is still the centre of controversy, but President Roosevelt's reliance on voluntary concessions by the unions appears to stand a very much better chance of success in the easier atmosphere which now prevails.

Anti-Trust Relaxation

Authority has been granted to the Attorney-General and the War and Navy Secretaries to postpone investigations and prosecutions under the anti-trust laws if in their opinion they are interfering with war production. If there is a difference of opinion between the heads of the Services and the Attorney-General, the decision of the former will prevail. President Roosevelt, in approving the step—rather reluctantly, it would seem—insisted that deferment of prosecutions would not mean exoneration, and that they might be taken up again at the end of the emergency. The policy now formally expressed is one which has been followed in practice since early in 1941; businessmen have been able to obtain sanction for concerted action from the War Production Board, and its predecessor, the Office of Production Management, and no anti-trust actions have been filed where such sanction has been granted. The combination of small firms, in order to undertake a contract too large for any one of them, has been looked upon with particular favour. The relaxation of the anti-trust laws is comparable with the abandonment of competitive bidding; production is to be obtained at any price. Whether, in fact, production will be increased substantially depends upon the individual decisions of the Services on what constitutes genuine interference with war production. It is to be hoped that they will be fully alive to the importance of their rulings, both as they affect efficiency of production now and the structure of American industry after the war. The fact that the Attorney-General's advice, based on intimate experience with the techniques of combination, may be overruled, is not altogether reassuring, and the threat of renewed prosecutions after the war is hardly likely to act as a vigorous deterrent. Every possible means of increasing production must be employed, but an indiscriminating abandonment of the anti-trust laws may prove a double-edged weapon.

Sugar and States Rights

The rationing of sugar—the thin end of the wedge—is not proving the easy and straightforward job it appeared at first. It has been delayed by rumours that after all it might not be necessary, and the machinery is so cumbersome that taking a sledge-hammer to an ant is the comparison that leaps to mind. The sale of sugar is to be suspended, and the schools closed for a week while the nation's school teachers distribute ration-cards and supervise the filling-in of statements as to the amount of sugar consumers already possess. The employment of the school teachers, who are state, not federal employees, is necessary because the federal civil service operates only within very narrow limits; many of the functions discharged by the British Civil Service are, in the United States, the province of the state governments. States rights have been increasingly whittled away, and the most recent legal decisions have extended the conception of interstate commerce to cover activities which at first glance appear almost entirely internal to the states.

But the growth of a Federal civil service throughout the country has not kept pace with the extension of Federal functions and if the development of war restrictions is to approach those already in force in the other belligerent countries, serious difficulties may be encountered. The two federal organisations which might fill the gap while the civil service is built up, are the Post Office and the Social Security establishment. Since a large proportion of the working population is covered by social security legislation, and holds social security cards, this would seem the more likely medium to employ, if the demands of total war are not to bring American education to a standstill every few weeks.

Distribution of Steel Consumption

The output of finished steel in 1941 was 23 per cent higher than in 1940 and 30 per cent higher than in 1929. An analysis of changes in the distribution of consumption, published by the *Iron Age*, is given below:—

	1940		1941 (a)	
	Thous. short tons	Per Cent	Thous. short tons	Per Cent
Agriculture	1,630	3.3	1,722	2.4
Aircraft	51	0.2	532	0.9
Automobile	7,965	16.4	9,501	15.9
Construction	6,935	14.3	9,870	16.4
Containers	3,068	6.3	4,430	7.4
Machinery, tools	2,330	4.8	3,265	5.4
Oil, gas, water, mining	1,900	3.9	2,814	4.7
Pressing, forming, stamping (b)	2,296	4.7	3,573	5.7
Railways	4,019	8.3	5,814	9.7
Shipbuilding	1,000	2.1	2,809	4.7
Exports	8,099	16.6	5,864	9.8
Other outlets	9,366	19.1	10,119	16.8
Total Consumption ...	48,660	100	60,313	100

(a) Provisional. (b) Mainly furniture and hardware.

With the exception of exports, which showed a sharp decline, the consumption of steel increased under every heading, a reflection of the widespread expansion in business activity last year. Proportionally, the increase in consumption was most marked in shipbuilding, in aircraft manufacture and in the construction of munition plants.

THE WORLD OVERSEAS

Estimating Canada's War Effort

(From Our Ottawa Correspondent)

March 4th

THE present mood of Canada is illustrated in steady demands that the country be placed upon a total war footing, and this in its turn is leading Ottawa to a complete re-examination of the economic position. Rosy hopes that were raised a year ago at budget time that the diversion into war effort would reach in this fiscal year the level of 44 per cent of the national income, and predictions made then and later that the stage of full employment was near, are now being reviewed in the light of a year's experience that shows, despite evidence on every hand that Canada has achieved a substantial war production, that the transformation to a complete war footing has not been complete. The point raised in *The Economist* on November 8th last (page 555), that the Canadian national income has been under-estimated, assisted in inquiries into the whole subject, with the result that a new appraisal of Canada's economic position is beginning to emerge. It will, no doubt, be reflected in the new budget for 1942-43, and it is already beginning to effect a change in Canadian thinking on the subject of transformation to a war status.

National income figures used a year ago as the yardstick by which to measure war expenditure were in the neighbourhood of six billion dollars. In March, 1941, Mr MacKenzie King gave a figure of \$5.95 billions. In June, the

During the current year, defence requirements will involve a substantial cut in the use of steel for unessential purposes. As the table shows, the virtual suspension of the production of cars and lorries for civilian use will release a large quantity of steel for war purposes. A reduction in the output of furniture, hardware and containers, and in private building will set free additional quantities. A pruning of unessential consumption will thus provide many millions of tons of steel for the war effort. Moreover, it should be possible to secure a further expansion in the total output of steel; scrap supplies, for example, are coming forward more readily than was expected at the end of last year.

Shorter Notes

An advisory committee composed of representatives of the major rubber companies has been created to work with the Rubber Reserve Company in stimulating the production of natural rubber in South and Central America and Africa.

Temporary retail price ceilings have been established by the Office of Price Administration for new typewriters, domestic washing and ironing machines, radios, phonographs, and domestic cookers at the levels prevailing in March. Permanent retail prices have been established for household vacuum cleaners and mechanical refrigerators.

It is reported that Charles A. Lindbergh has accepted Henry Ford's offer of a position in the Ford organisation.

More than 100,000 new typewriters are to be released for sale on April 13th to the Army, Navy and Treasury Departments, some defence plants, newspapers, radio stations and all civilian defence stations.

A civilian defence school—the fifth of its kind—will be established at the University of Florida. The course will cover the organisation and operation of control centres and defence measures against gas and incendiary bombs.

European Economic Front

[BY A CENTRAL EUROPEAN CORRESPONDENT]

THE false legend of a "European front" engaged in an intra-continental political struggle for revision of the *status quo* against America and under Hitler's command has been dealt with in a previous article (*The Economist*, January 17, 1942). The economic issue is more complex. The German monopoly control and organisation of the economic resources of Europe have a dual purpose; the establishment of lasting dominion over the continent of Europe, with the aid that total wartime mobilisation of its collective means provides, and the establishment of a lead in international economy on the basis of this position in Europe—both of which imply, of necessity, the destruction of dominating American and British influence in world markets.

No doubt is possible about this aim and about the fact that it has been a constituent of Hitlerism since its early days. It became manifest at least eight years before Mr Roosevelt's first election as President of the United States. It originated in Hitler's demand for treaty revision, and in the psychological reaction of the German people to the inflation of 1922-23 and to the part played by the United States in the reparation settlement. Pre-war economic relations between the European States, other than Germany, and America were not antagonistic; neither the problem of inter-Allied war debts nor even the tendency towards closer economic attachment between European countries and their overseas territories fundamentally disrupted Europe's financial and trade contacts with America. From 1934 onwards these relations were improving, since many States actually strengthened their business connection with the United States as a counterweight to the growing continental strength of the Nazi Reich.

Europe's economic antagonism to America, in fact, is a Nazi phenomenon—developed by the Nazis, so to say, from a kind of financial inferiority complex, which prompted Hitler's determination to destroy "liberal economy" and (in the words of Nonnenbruch in 1924) "to prepare for the real world war which will decide who is to be master of the world and who a business man only." This demand was re-printed in 1940 as the textbook of the "new order," which called for German leadership in Europe in a war against the alleged American attempt at the economic invasion of Europe and against the threat of "American economic domination of the world."

The "New Order" policy has followed these lines. It has succeeded in eliminating American economic activities from Europe, in building up large vested interests in a German victory and in changing the structure of European economy in many respects. This is more than a transitory phenomenon. From the military point of view, Hitler's economic command over Europe is a serious matter. War economy and its effective organisation have come to play a vital part in military operations, and Hitler has economically mobilised an entire continent for war purposes. The theory that the enemy is essentially weak in the economic field, where he can easily be beaten by blockade and pressure, has always been wrong. The joint economic potential of continental Europe (excluding the United Kingdom, Ireland and the USSR, but not Switzerland, Sweden or Spain, whose output is largely at Hitler's disposal) is immense; its resources of manpower, productive capacity and raw materials are formidable. Its pre-war share in international trade totals was 37.5 per cent; its population represents 16.3 per cent of the world total, with the highest percentage of skilled workers; its agricultural and mineral wealth is considerable, even

odd jobs, activities of housewives, unpaid family services, rent of durable goods used by families, changes in the value of inventory stocks, unorganised charity, and casual payments by firms to individuals aside from wages and salaries.

There is as yet little evidence of strain on the Canadian economy, though the substance of war production is formidable. Consumption has not been reduced, but has obviously increased. The war boom has not slackened. There are no authoritative estimates of consumption, but the indices of retail and production activity indicate the position. The index of production of consumers' goods stood at 122.3 in December, 1941, compared with 112.4 a year before. It rose consistently month by month in 1941. Employment in certain lines related to consumption has steadily increased, according to seasonally adjusted indices of the Dominion Bureau of Statistics:—

INDICES OF EMPLOYMENT (1926=100)

	Nov., 1940	Nov., 1941
Leather and products ..	122.4	145.2
Furniture	97.6	109.9
Musical instruments ...	62.1	68.5
Printing	118.1	127.7
Hotels and restaurants	143.1	169.7
Retail trade	154.6	171.5

Letting Out the Belt

Increases reflected in these items have proceeded side by side with increases in employment related closely to war production. The fact that is receiving attention is that no declines in purely consumers' items have occurred. In viewing the evidence that consumption has not yet begun to suffer wartime curtailment, one important exception is made in favour of persons in the higher income brackets, who have been hard hit by war taxation. But in general Canada has not been tightening its belt so much as letting it out.

In seeking to appraise the extent by which the Canadian war account has been over-estimated, inquiry is taking several directions. The Government collects wage and income taxes, corporation and excess profits taxes on income earned in war production. In this connection, what occurs is merely a transfer from one department to another. The munitions and supply department, footing vast war production costs, is providing the incomes on which the department of national revenue levies its taxes. This might be merely a book-keeping entry for all the war production it represents.

Again, on dutiable imports entering into war production, one department collects customs duty, which becomes a cost item on the book of the munitions and supply department and represents no war production. On Canada's billion-dollar import business with the United States in 1941-42, how much is represented as customs duty? It would add up to a substantial sum. It is merely a ledger transaction between the finance department's receivable account with national revenue and payable account with munitions and supply.

The same analysis applied to the 8 per cent sales tax shows that a substantial item is included in the estimates of war costs which are not war costs at all.

Again, Canada is running a deficit on its United States account. In April, 1941, it was estimated as likely to be \$400 millions, but the Hyde Park agreement in August, 1941, was designed to reduce this amount. At the present time, it appears that the balance will run against Canada to the extent of about \$200 millions. This represents a cost carried by American, not Canadian, industry and labour, until paid in Canadian production. It represents a proper deduction to make from the Canadian war account when it is measured against the Canadian national income. Further, to the extent to which current Canadian war production is drawn from stocks accumulated in a previous period of national income measurement, a deduction should properly be made. When the Government purchases a factory already in existence, to use in war production, the cost of that factory can hardly be charged to current manpower and resources.

What is called for is a new accounting of war expenditures in terms of national income and a new accounting of the national income itself. Recently, war materials have begun to cross the Canada-US border free of duty. This will help to make war expenditures accounts in both countries more realistic. In seeking a new balance between war expenditures and national capacity, Canadian thinking is rapidly coming around to the view that last year's estimates of full production need to be scrapped and the sights raised far higher for 1942.

though demands for various materials can only be satisfied overseas. Europe controls, for instance, 33.2 per cent of the world's pig-iron and ferro alloys, 37.9 per cent of the world's iron ore, 37.9 per cent of steel, 44.7 per cent of zinc, 28.3 per cent of zinc ore, 26.8 per cent of lead, 17 per cent of lead ore, 12.2 per cent of copper, 7.7 per cent of copper ore, 51.1 per cent of aluminium, 27.6 per cent of bituminous coal, but less than 3 per cent of the world's petrol total (synthetic petrol excluded). But the weakening economic implications of the war in Russia may become decisive to Hitler's supply situation. The peak of Germany's use of European resources has probably been reached.

Offensive Against America

The attempts to repeat in Europe Schacht's policy against American interests in Germany were foiled by the vigilance of Washington and the timely application of "freezing control" to European assets in the States. According to official figures at the end of 1939, American investments in continental Europe totalled \$1,655 millions against \$3,897 millions of continental European funds in the United States. The discrepancy increased further during 1940 and the first half of 1941. A publication of the Treasury Department, referring to the funds of a limited number of countries at the end of 1940, mentioned the figure of \$4,369 millions as the United States' debtor balance on investment account; and about \$6,500 millions as the sum total of all European funds in the United States by the end of 1941 would perhaps be a fair estimate. This exceptional volume of European holdings in America, and the control to which they are subjected, reduces the effect of German moves against American investments in Europe to small dimensions. American investors are well covered against losses.

Moreover, in the context of their world aims, the Germans have conspicuously failed to hold the economic bridgehead in the Western Hemisphere established in Latin American markets before 1939. The British blockade dealt a fatal blow to that, and Washington's policy of economic Pan-American solidarity has made good use of the opportunity. Germany's trade with the 20 Latin American republics amounted in 1938 to \$430 millions; in 1939 to \$290.8 millions; and in 1940 to \$20.1 millions, less than 5 per cent of its value in 1938. During the same period, United States trade with these countries increased from \$562.3 millions in 1938 to \$646.6 millions in 1939 and \$839.8 millions in 1940—or to 51 per cent of their total foreign trade in 1940, against 38 per cent in 1938 and about 65 per cent in 1941.

Post-War Economy

The Nazis' economic war against America has not been effective. But there are more tangible and more permanent aspects of the "New Order's" impact on European production and trade—and possibly on Europe's future business relations with the Americas. The movement of most European countries towards policies of autarky and self-sufficiency in the thirties had already affected the composition of European food imports and reduced their volume. Now, the "New Order" drive for self-sufficiency in food and raw materials has led to a substantial increase in the harvested acreage in all Continental countries and to a rise in the production of cereals, oleaginous plants and textile fibres beyond the pre-war level. A cut after the war in Europe's agricultural imports—which accounted for more than 70 per cent of European imports before the war—seems almost inevitable, after the preliminary period of dislocation, famine and shortage. The German policy of expanding Europe's mineral production, and the large investments made to this end, will also bear on the continent's future demands from overseas. Any substantial reduction of Europe's present increased industrial capacity is unlikely, because initial transport and foreign exchange difficulties after the war will work against it. In short, the possibility cannot be excluded that Europe's excess of imports over exports, amounting to \$1.32 billions in 1938, will be reduced after the war to the detriment of overseas exporters—while the European export drive may grow.

For many reasons, the United States would be more affected by such a development than Great Britain. Her pre-war trade balance with Continental Europe was highly active; 19.5 per cent of her exports went to these countries, and 26.4 per cent of these exports consisted of raw materials, 20 per cent of foodstuffs and beverages, and 17.5 per cent of semi-manufactures. Not less than one-

third of all United States agricultural exports and 40 per cent of her raw cotton exports (in the cotton year 1937-38) were sold there.* Food, textiles and machinery are the very goods the output of which (or of their substitutes) Hitler's Europe is endeavouring to increase.

The French Labour Charter

[BY A FRENCH CORRESPONDENT]

March 17th

THE Vichy Government has recently published its Labour Charter. To appreciate the significance of the Charter, it must be considered in the context of the new political and social organisation. The new state is characterised by the unlimited power of the chief. In order that this power may be exercised without opposition, the citizens must be integrated in as many different groupings as possible, the masses must be divided and interests mutually opposed. It is not surprising, therefore, that the principle of the Labour Charter is "divide and rule," and that its object is to replace the independent trade unions by an organisation designed to facilitate the control of the workers.

Details of the new Labour Charter, given in the November and January issues of *La France Libre*, show that it is modelled on the Italian rather than on the German labour organisations, which has evoked violent criticism from the collaborationists in Paris. It does not envisage the creation of a joint organisation of workers and employers, but of a series of corporations in which workers' and employers' unions remain separate. There are five unions in each district, for employers, workers, technicians, foremen and clerks. These unions are the only legal bodies representing the five categories of persons, and membership is compulsory. The representatives of the five unions (the workers and clerks elect their representatives together and the technicians and foremen theirs) form a social committee. The district organisation is part of a regional organisation, including regional unions for the five categories of persons on regional social committees. On the national scale there are national unions and national social committees.

The chief characteristics of the new professional organisation may be briefly summarised. First, it is a pure state system. The fact that nothing has been published, showing by what method the officials of the unions are selected reveals the Government's dislike of the system of elected representatives. Secondly, it ensures dispersal by prohibiting the various unions from conferring on matters of mutual interest. Thirdly, the unions are not allowed to engage in political activities; they can only discuss professional matters. Fourthly, the unions are of secondary importance, for all authority and prerogatives are vested in the social committees, which are to be the central organs of the corporation. They settle wage questions (in certain limits), professional training, engagement and dismissal of workers, safety in factories, and so on.

The intention of the Vichy Government is, in fact, to evolve a corporative organisation from its Labour Charter and gradually to endow the social committees with economic attributes. At present they have none, for industry continues to be administered by organising committees on which employers alone are represented.

The objects of the Labour Charter are clear. It has been worked out for the specific purpose of preventing any organised resistance on the part of the workers, by dividing them on a professional basis, and of scorching any possibility of political pressure. In sum, it has been designed to prevent the workers from securing, in the economic sphere, the equivalent of universal suffrage—of which they have already been deprived in the sphere of politics. No wonder that the Labour Charter has had a hostile reception from the former unions of the CGT. To them it means the disappearance of independent trade unions, the subordination of the unions to social committees, the loss of their financial independence (they can only raise funds for the purposes laid down in the Charter, and they are dependent for part of their needs on the social committees), and the elimination of the whole of the pre-war workers' organisations. The Charter provides, moreover, that membership of the

* The figures and calculations in this article are quoted from a book (by R. H. M. Worsley) shortly to be published by Jonathan Cape.

governing bodies of the unions must be restricted to persons who have exercised the trade or profession concerned for at least five years, and that no individual can hold office for more than two consecutive periods for which they are nominated.

The Christian unions have voiced opposition to the principle of the single union, which will involve the disappearance of their denominational and cultural characteristics.

Russia at War

Soviet Railways

"THE Soviet Union depends upon its railway system to the same extent as Great Britain depends on the Navy"—this has recently become a favourite comparison in Russia, frequently reiterated by railway managers and by the Press. The main problems and difficulties of the Russian railways show a striking similarity to those which this country has to solve in the sphere of shipping. Inadequate expansion of transport in pre-war years; unexpected losses; shortage of rolling stock; long and thin lines of communication—these are the weaknesses; and similar methods are used to overcome them: the intensive exploitation of available transport capacity; the endeavours to obtain the quickest possible turn-round and the cutting down of all non-essential traffic.

The position of the Soviet railways is very roughly illustrated by the following figures:—

	1913	1940
Length of line (in km.)	58,500	93,000
Freight (in millions of tons)	132.4	536.6
Freight per km. of track (in tons) . .	1,126	4,160*

* This figure relates to 1937.

Since 1913, the length of railroads has increased by no more than about 60 per cent, and the number of wagons by about the same amount. The number of locomotives has risen by only 40 per cent, though this is claimed to be made up by a 50 per cent increase in average pulling power. Thus the increase in all three factors—length of line, number of wagons and pulling power—is in each case only roughly one-fifth of the actual increase in freight, which has grown by more than 300 per cent; and the average freight load per kilometre of track has risen by about 270 per cent. This means very intensive wear and tear on the Soviet rolling stock as well as abnormally long intervals in their actual circulation. According to official figures, in 1940 a goods truck was on the average in actual movement only 19 per cent of its turn-round time; 49 per cent of the time was taken up in marshalling and repair operations.

The lack of balance between industrialisation and the development of the railways can hardly be ascribed to any neglect. Two restricting factors dominated the whole position: the large demand of the nascent heavy and armament industries on a relatively limited steel output; and a weakness in rail-building plants. The third Five Year Plan was expected to relieve the position to a considerable extent. The budgetary allocation for railway construction was set at 37 milliard roubles against 20 milliards in the second Five Year Plan; 7,000 miles of new lines as well as 5,000 miles of double track were to be built. It seems that only a smaller part of that investment has actually been made (about 4.5 milliard roubles were spent in 1940 and 6.5 milliards were planned for 1941). The XVIII Party Conference in February, 1941, showed great anxiety about the failure to fulfil the railway plan for the Urals. But the laying of a second track on the Trans-Siberian railway seems to have been nearly completed, which may be of the greatest importance now that the main weight of goods traffic has shifted to the east.

The loss in railways due to loss of territory and to destruction in the fighting zone may be estimated at about 35-40 per cent of the total. But the actual loss in transport capacity has been much slighter. The bulk of the rolling stock of the western territories was saved; the evacuation of the endangered industries was in fact an automatic evacuation of the railway stock. The addition of a large number of locomotives and wagons to the rolling stock of the eastern railways enormously increases their loading capacity—though this does not imply a proportionate rise in their actual carrying capacity. On the eastern railroads, the density of traffic (freight per km) was normally much higher than in the west, a circumstance which reduces the margin available for further intensification of traffic.

Indeed, there is not a single union, not omitting Colonel de la Rocque's organisation, which has not found the new Labour Charter too reactionary. In view of this opposition, the Government may accept modifications and, in particular, may allow the unions to elect their own officials. Nevertheless, among the whole organisation set up by the Government of Vichy, the Labour Charter is the most precarious and the one that should disappear most rapidly.

It is only against this background of an under-developed railway network that the work of Soviet transport during the second half of 1941 can be properly appraised. Even a much stronger and more efficient transport system might have broken down under such tremendous pressure as was experienced by the Soviet railways between July and December, 1941. For months, an avalanche of evacuees, machines, raw materials and cattle moved eastwards along the fragile spokes of the Russian railway system, while a steady stream of soldiers, arms and munitions was being carried in the opposite direction towards the front. In spite of interminable delays and constant congestion, particularly on single track lines, transport managed to reach its destination—an achievement which went far beyond the limits of endurance indicated by the statistics of the Soviet railway system.

The beginning of 1942 saw the ebb. Evacuation stopped, and railways were able to resume relatively normal working. But the position remains strained, and the shortage of carrying capacity determines the whole of Soviet industrial policy. It also affects the transport of foodstuffs. In normal times, about 42 per cent of total goods traffic was coal, iron, steel and oil, and a ton of freight was carried over 500 miles distance on the average. This was so, in spite of the fact that, in the west, the interdependent industrial centres (e.g., the iron-ore of Krivoirog, the coal of the Donetz and the metallurgical plants of Kharkov and Dnepropetrovsk) were situated at short distances from one another. With the transfer of industries to the east, the share of iron and coal in

The Yorkshire Post

the North

Ask to see it at your Club, Library or Newsagent

the total, as well as the average, length of haul per ton, will show an enormous increase.

Much depends under the circumstances on the work and endurance of Russian railwaymen. The technical skill of personnel has very much improved during recent years, and intensive training of railwaymen is still going on. A decree issued on March 16, 1942, made important adjustments in wages. The wages of the so-called "manœuvre brigades," as well as those of drivers and conductors, have been increased. Before the war, the wages of each train's working personnel were calculated mainly on the basis of the mileage run by the train; this was intended to stimulate better work on the part of railwaymen, and to prevent trains from running behind schedule. Under the new decree, a minimum time rate has been set, as well as additional mileage premiums; time lost due to delays or to damage and repairs in the interior of the country will cause a 20 per cent deduction in the time rate; 100 per cent wages will be paid to railwaymen working in the fighting zone or in its immediate vicinity, irrespective of delays.

*

Japanese Fishing Agreement.—On March 20, 1942, Vice-Commissar Vyshinsky and the Japanese Ambassador Tatakava signed at Kuibyshev a "protocol on the prolongation of the Fisheries Convention of 1928 for 1942." The 1928 agreement expired in 1936, and since then no new agreement has been concluded; instead a prolongation of the convention was agreed upon at about the beginning of every year. The terms of the latest prolongation provide for some reduction in the number of fisheries to be rented to Japanese nationals at this year's auctions. Besides this, the Soviets have raised by 20 per cent the rates of rents, taxes and duties to be paid by Japanese fishery owners. The conditions demand payment in gold or foreign currency, according to the wishes of the Soviet State Bank. The payments have to be made at Vladivostok, and the Japanese have to pay 4 per cent to cover the expenses of gold transportation.

German Experiments in Organisation

SOME twelve months after the foundation of the Reich Coal Co-operative (see *The Economist*, May 3, 1941) the manufacturers of artificial textile fibres have been compulsorily combined into the Reich Co-operative Chemical Fibres (*Reichsvereinigung Chemische Fasern*). This is the second time that the deadlock between State control and private initiative has seemingly been resolved by a new hybrid organisation. The Reich Coal Co-operative ended the office of the Coal Commissar, and private industry was said to have scored some success over direct State control—though the State, owning more than one third of the coal mining industry, could well afford this change, whose main purpose was to give the coal-mining industry a new incentive for increasing efficiency. The new Reich Co-operative Chemical Fibres is even wider in scope. It will be responsible for production and import plans, for "steering" sales in Germany and in foreign countries, for marketing agreements with spinners, weavers and textile merchants. It will also conclude agreements with manufacturers outside Germany. It will regulate prices and encourage efficiency and the exchange of patents and manufacturing experiences. In Germany, the organisation takes over the controlling activity of the Reich Control Boards; and, outside Germany, it is empowered to conclude "collaboration" agreements with manufacturers of artificial textile fibres. The industry is given a greater measure of self government for the purpose of avoiding rigid cartelisation.

The tremendous increase in the manufacture of artificial textile fibres in Germany has created a number of difficult problems. According to German publications, production has increased as follows:—

(In 1,000 metric tons)		
	Rayon	Cellulose
1932	28.2	2.0
1938	65.8	154.0
1939	73.6	192.0
1940	80.0	250.0

The economic importance of the agreement is negligible. Neither in the Soviet nor in the Japanese trade balance do these Kamchatka fisheries play any significant part. Their whole catch during recent years was estimated at about 100,000 tons. But, by the force perhaps of some strange eastern symbolism, Kamchatka fish has figured as a very important item in the balance of political relations between Japan and Soviet Russia. In any possible clash between the two powers, it is most likely to provide the first visible bone of contention. Any delays and procrastinations in bringing about the yearly prolongation of the agreement have usually reflected the degree of diplomatic tension. In 1940, during the first Soviet-Finnish war, the agreement was announced on January 1st; in 1939, in the period of the Soviet-Japanese frontier clashes, a prolongation was not agreed before April. The difference between January, April and, this year, March, may perhaps indicate the movements of the diplomatic barometer; neither in Moscow nor in Tokyo has it yet gone down to "freezing point."

*

Sugar.—The occupied territories of the Ukraine usually produced 85-90 per cent of Soviet sugar. The prospects of sugar supplies this year are therefore precarious and the Commissariat of Food Industries has worked out a plan for transferring sugar beet cultivation to new territories. Uzbekistan has increased its sugar beet area by 300 per cent; the Saratov province by 250 per cent; Kirgizia by 200 per cent; and the Altai region by 150 per cent. It can be seen from these figures that the maximum replacement of the lost sugar beet output can be put at only 20-30 per cent.

The Chief Sugar Administration has announced that all the Ukrainian sugar refineries were evacuated in time. The main difficulty in sugar beet sowing is the lack of proper sowing machines, which seem not to have been successfully evacuated; and the Sugar Administration has been urging the regional machine tractor stations workshops to adapt their grain and cotton sowing machines for beet sowing.

No figures have been published for 1941; output of rayon may be estimated at 100,000 tons and cellulose at 330,000 tons. World output of rayon increased from 243,000 tons in 1932 to 522,000 tons in 1940, and the output of cellulose from 10,000 tons to 612,000 respectively. In 1940, Germany and Italy accounted for 43 per cent of the total world output of artificial textile fibres. In Germany, the manufacturers of rayon were organised in a strong cartel. The manufacturers of cellulose, however, were without adequate cartels. The majority of the factories were financed co-operatively by the old established cotton and wool industry, and remained for a long time on a regional basis combined in loose Rings. State control exercised by the Reich Control Boards and the influence of the old rayon industry, both cotton and wool industry, and the chemical industry, prevented clear cut responsibility on the part of the manufacturers, and State control developed into a cumbersome bureaucracy. The defects of this haphazard growth of an essential industry, working with relatively high costs of production, became obvious after the conquest of Europe. The rayon cartel developed an expansionist policy, and the different groups of the cellulose industry tried to collaborate with industries in occupied countries. The "Phrix Group" concluded agreements for the expansion in Scandinavian countries, and the "Cellulose Ring" entered into agreements with the Belgian and French manufacturers of artificial textile fibres. During 1940, the old cotton and wool industry were relatively well supplied with raw material from requisitioned stocks in occupied countries. In 1941, however, stocks ran short and a further expansion of the manufacture of artificial textile fibres became imperative. Naturally the attempt at expansion was also made in occupied countries, but so far actual expansion there has been disappointing. This is one of the main reasons for a comprehensive re-organisation of the German manufacturers of artificial textile fibres, which is thought to be the foundation of a future German monopoly of the manufacture of artificial fibres on the entire continent. It is now expected that other industries will also be organised in Reich Co-operatives, largely for the purpose of relieving the State Control Board's, whose place is to be taken by sectional organisations with greater self-government.

THE BUSINESS WORLD

Ships, More Ships

IN relation to present needs, the shortage of merchant and naval ships is greater than ever. The United Nations need more fighting ships to give better protection to their transport vessels on some routes and to assist in re-opening others that have become impassable, and they need more transport ships to mass their economic resources and to concentrate their growing striking power at the weakest spots of the enemy. A good deal has been done to mitigate the difficulties by closer Anglo-American collaboration in the disposition of existing shipping resources. But the problem can only be solved by the rapid construction of new vessels in the numbers and proportions in which they are needed to achieve the dual purpose of increased safety and transport capacity, and by the speeding-up of repairs to damaged ships. To this end Anglo-American collaboration in the building and repairing of ships is as vital as it is in the use of available vessels.

There has been much criticism lately concerning the policy and magnitude of shipbuilding in this country, which must contribute a large proportion of the new vessels needed by the United Nations. Some of the adverse comments concern matters of high policy such as the ratio between naval and merchant ships; others relate to the extent to which existing facilities are employed, to methods of construction, and to the design of merchant ships. It is not for the layman to adjudicate on these questions; some of them are highly technical, and the facts on others are shrouded in secrecy. But there are a number of general economic considerations which are germane to the problem and can be briefly stated without entering the field of technical controversy, or knowledge of official secrets.

The decision concerning the numbers and proportions in which merchant and naval vessels must be constructed is a matter of high policy. But economic considerations must have an important influence in the distribution of their construction between this country and the United States. Within limits, the two countries must build the ships that they can build best with the facilities and resources at their disposal. Unlike the United Kingdom, which, in the main, must rely on existing building facilities, the United States is providing an immense volume of new capacity which can be specially designed for mass-production methods. Since mass-production methods can be applied better to the straightforward task of building standardised transport ships than to the construction of highly complicated fighting vessels, it is logical for the bulk of the merchant shipbuilding programme to be located in America, while the United Kingdom continues to provide the bulk of its own naval requirements. This policy may mean that the United States emerges as the biggest owner of merchant ships after the war; but post-war considerations must not be allowed to influence the allocation of shipbuilding work between the two countries during the present emergency.

Shipyard Capacity

What matters most is that both countries and the Dominions should produce ships to the limit of their capacity. It is of no benefit to unearth the stale controversy concerning the justification or otherwise of the closing down of many British yards during the economic depression by National Shipbuilders Security, Ltd., a company formed by the shipbuilding industry to eliminate capacity which was then redundant. Even in 1929, when 1,523,000 gross tons of merchant ships, or 54½ per cent of the world's total, were launched in this country, only 54 per cent of the shipbuilding berths, and 76 per cent of the workers in the industry, were occupied. On economic grounds, the reduction of surplus capacity was fully justified, and if strategic needs should have been taken into account, the responsibility for doing so did not lie on the industry. At the outbreak of war, the industry still had facilities for constructing merchant ships at the annual rate of 2,000,000 gross tons and naval vessels at the rate of 500,000 tons in private

yards. One of the main difficulties since then has been the shortage of labour rather than the lack of yards.

Criticism has been levelled at the industry and at the Admiralty, which is responsible for the construction and repair of both naval and merchant ships, on the ground that present building capacity is not fully employed. In so far as criticism is based on estimates of the rate of merchant ship construction, it is not necessarily justified, for it does not allow for the increase in repair work and in naval construction to which many of the yards normally engaged in the building of merchantmen have been adapted. According to an article in the *Shipping World* of January 14th, the output of merchant ships amounted to about 1,750,000 gross tons between September, 1939 and December, 1941, and is estimated to reach 1,200,000 gross tons this year. On March 22nd Mr Attlee stated in Liverpool that production in the last quarter of 1941 was double the output in the last quarter before the war. During April-June, 1939, the last quarter for which figures were published, the merchant tonnage launched was 137,000 gross. If the rate of output was of the same order of magnitude during the three months ended August, 1939, the volume of shipping produced during the last quarter of 1941 must have been at the rate of over 1,000,000 gross tons. True, this is comparatively small in relation to pre-war building facilities. But there has been a very considerable increase in repair work and in naval construction. According to Mr Attlee, the volume of naval tonnage completed during October-December, 1941, was four times as large as during the last quarter preceding the war. There are no figures of output for June-August, 1939, to which his statement can be related. But the rate of naval construction before the war was far from small; on December 6, 1939, Mr Churchill stated that there were then 1,000,000 tons (displacement) of naval vessels under construction in British yards. In fact, although the volume of shipbuilding and repairing in this country is far from adequate to meet present needs, it is of massive dimensions.

Nevertheless there are indications that production could be increased still further with the facilities and labour at the disposal of the industry. There are persistent reports that output is being lost by faulty organisation, mal-distribution of labour and through other causes within the control of management. Some of the charges of inefficiency are no doubt exaggerated, but they must be examined and, in so far as they have substance, the remedy must be applied without hesitation, for no waste of shipbuilding resources can be tolerated at this stage of the war.

Some of the adverse comment is directed against existing methods of production and, in particular, against the

RIISING VALUES.

All Fire Insurances effected on a pre-war or pre-Purchase Tax basis should now be increased.

failure to introduce mass-production methods, to extend the system of pre-fabrication and the application of the process of welding in place of riveting. The critics usually point to the success achieved by the introduction of mass-production methods in the United States. While this criticism does not lack some substance, the extent to which American methods can be introduced in this country is limited. After the war the British shipyards may have to be largely re-equipped; but during the war they must make the best of existing facilities, though a further measure of adaptation is no doubt both possible and advantageous. The employment of welding in place of riveting, which saves steel and time, has made some progress, but the layout of the yards and lack of sufficient trained welders and equipment renders its large-scale adoption impracticable during the war.

Lastly, there is the controversy about the design and speed of merchant ships. There is only one test that is valid at present: the facilities engaged in the production of merchant ships must be made to yield the biggest volume of carrying capacity without regard to post-war considerations. This is not necessarily an argument for concentrating on the construction of fast ships. The problem is highly complicated and can only be solved by balancing a number

of considerations whose relative importance can only be measured by the authorities. For example, fast ships take longer to build than the slow vessels, and the manufacture of their machinery requires a higher degree of skill which, in view of the heavy naval construction programme, is scarce. Moreover, speed might be wasted in convoy, whose pace is that of the slowest vessel. It is significant that even the United States with its much greater freedom of choice has found it advantageous to design its "ugly ducklings" to the moderate speed of about 11 knots. There may be a need for a bigger proportion of the faster vessels; a need which appears to have found consideration in the present building programme of this country.

Close collaboration between the United States and Great Britain is vital to ensure the requisite balance between, and within, the categories of naval and merchant shipbuilding and the most advantageous utilisation of building facilities. The integrated building programme of the two countries must be geared to their capacity. And any defects of organisation or technique which have been brought to light by the recent criticism of the industry in this country must be rectified forthwith, for the course of the war will be vitally affected by the volume of new fighting and transport ships that will be completed this year.

Finance and Banking

Turn of the Quarter

The turn of the quarter and of the financial year has passed amid exceptional ease in the money market. Normally pressure on credit is at an appreciable seasonal peak at this period, but this year no serious evidence of strain has been apparent. To some extent the credit position was still affected this week by the measures taken in the previous week to provide an ample cushion on which the impact of Warships Week subscriptions to Government loans could be taken without disturbance. These measures included heavy Ways and Means borrowing at the Bank of England incurred in the first instance to finance the payments on vested Canadian securities. The funds raised for this purpose were rapidly repaid out of receipts from public subscriptions to Government loans, and by Tuesday of this week all Ways and Means borrowing from the Bank had been repaid. It is now clear that assistance to the market was also given last week by arrangements between the Bank and the clearing banks for holding up the clearing of large cheques due from the latter to the former. No official admission of such arrangements has been made, but their presence emerges not only from the evidence of last week's Bank return, but from the experience of many city houses which found themselves with unexpectedly large balances at their clearing banks as a result of the non-clearing of cheques drawn in favour of the Bank. This particular factor should, however, have spent its force by the beginning of this week.

June 30 Bills

The discount market bid keenly for the end-of-June Treasury bills which were tendered for on Friday of last week and raised its price to £99 15s. both for these and for the July bills, which were taken up this week. As a result the average rate of discount on the £75,000,000 of bills issued fell to 19s. 11.69d., and the syndicate obtained the heavy allotment of 60 per cent of its applications. Though the bulk of these bills were taken up on Tuesday of this week, the effort involved proved well within the capacity of the market and of the banks, which continued to buy bills up to the last day of the quarter. The position this week is also being eased by net repayments of Treasury deposits. New payments of £20,000,000 in TDR's were required from the banks this week, but as against this the amount maturing was slightly under £35,000,000. Nominal maturities were £70,000,000, but heavy prior encashments had reduced this figure by rather more than half. Some of these encashments occurred in the previous week in connection with the financing of the banks' payments for their customers' and their own subscriptions to Government loans. In deciding which of their TDR's to call in, the banks follow no rule of thumb, such as concentrating on those deposits having the shortest currency. They are guided by the specific maturity dates and choose those which

suit them best. They would, for example, avoid encashing TDR's maturing on June 30. But in general, it would be true to say that the tendency is to encash the shorter rather than the longer dated deposits.

Treasury Deposit Encashments

The national debt return showing the amount raised during March and the position of the floating debt at the end of the financial year is of particular interest for its revelation of the extent of the banks' prior encashments of Treasury deposit receipts during the month, which included the climax of the Warships Weeks campaign. This calculation is made possible by the fact that the previous debt statement was dated February 28th and that the period covered by the last statement thus begins on the first working day of a week. The only assumption which has to be made is reasonably safe—namely, that all the remaining TDR maturities in the past week fell due in March and that the new TDR payments were made in April. On this basis, the new TDR payments in March amounted to £80,000,000, while the true maturities (nominal maturities less prior encashments) amounted to about £165,500,000. Thus there was an excess of maturities over payments amounting to some £85,500,000 during the month. The debt returns, however, reveal a drop of £181,000,000 in the outstanding total of TDR's, and it follows that prior encashments during March amounted to about £95,500,000. The bulk of these encashments no doubt occurred during London's Warships Week, and their magnitude goes a long way to explain the exceptional ease with which the banking system withstood the shock of financing the huge payments made to Exchequer accounts last week in respect of subscriptions to Government loans. The large receipts from Government issues also made it convenient for the Treasury to repay ways and means advances from public departments over the month, these being £20,265,000 down at £195,135,000. Ways and means advances from the Bank of England, which were outstanding to the amount of £21,750,000 at the end of February had been wholly repaid by the end of March. The usual table showing the respective shares of revenue and borrowing in meeting expenditure will be given in the Budget Supplement next week.

The Banks and Coupon Accounts

The final touches have now been given to the scheme which is to entrust to the banks the task of handling and transferring the millions of coupons which clothes rationing is putting into circulation. Coupon accounts will be opened for all businesses dealing in rationed clothing, whether as manufacturers, retailers or intermediaries, and for firms which receive periodical allotments of coupons from the Board of Trade for the purchase of rationed

goods. The accounts will be fed in the first place through payments by retailers. These will be in the form of envelopes of three standard sizes containing not less than 98, 490, and 980 coupons, and credited to the accounts concerned at the rate of 100, 500 and 1,000 respectively. The 2 per cent discount is intended to make good the losses of rationed goods through pilferage and other causes. From this point, the coupons themselves will disappear from circulation. The envelopes will go from the banks to the Board of Trade, there to be subjected to some form of check. All subsequent dealings in coupons will be made through coupon accounts which are to be operated by "transfer vouchers." In essence, therefore, the scheme will be compulsory. The banks will act as agents of the Board of Trade; they will make no charge to the traders for whom coupon accounts are opened; they will be remunerated by a pro-rata commission paid by the Board of Trade; they will undertake none of the responsibilities which attach to the paying or collecting banker in the handling of cheques. The scheme, though it must involve a great deal of complicated procedure and will certainly burden the banks with additional labour which they can ill afford to undertake with their depleted staffs, has much to commend it. Its alternative would have been the setting up of an altogether new control machinery at the Board of Trade. It will certainly be a great advance on the present machinery by which coupons have been exchanged for vouchers at the Post Offices. That scheme has lent itself to abuse by unscrupulous persons who have acquired vouchers for envelopes purporting to contain coupons, but,

in effect, filled with waste paper. The scheme is discussed from the traders' point of view in a note on page 477.

Lloyd's Air Raid Insurance

As from the beginning of April all benefits under Lloyd's "1,000 to 1 Air Raid Insurance" have been doubled. The decision follows the now considerable period of relative freedom from air raids during which a substantial reserve of premiums has been built up. The scheme was launched in the early months of the heavy air attacks on this country. It provides cover against death or personal injury caused by bombing, and during the early phases of the scheme heavy claims were paid out. The premium income has recently settled down at about half the figure which obtained when air raids were at their height. Since the scheme was started over £100,000,000 has been insured under it. Large industrial firms, taking out policies to cover their staffs, have been among its most important subscribers. The underwriters retain the right to vary the terms of the insurance month by month. The recent doubling of the benefits is the first occasion on which that right has been exercised. The scheme at its inception was fraught with a risk for which no actuarial calculation of premiums could be made and was launched with no little apprehension and head-shaking. The response and the success which has attended it are the reward of that courage allied to the foresight for which Lloyd's underwriters have ever been renowned.

THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

CAPITAL - - £3,000,000
RESERVE FUND - £3,000,000

Head Office: 38 BISHOPSGATE, LONDON, E.C.2

London 117/122 LEADENHALL STREET, E.C.3

Investment

Awaiting the Offensive

The few weeks before the opening of the Budget usually bring a number of erratic movements to the stock market, as one theory or another of the Chancellor's intentions gains the upper hand. This year this factor has, so far, been singularly lacking in importance. It is generally felt that tax changes will not be large, and that they will probably include minor adjustments to income and surtax, and additions to sumptuary taxes. The latter are not likely to affect profits of the concerns providing the goods, since the few remaining "luxuries" are in scarce supply, and the demand for them appears to be inelastic. Even so, uncertainties as to the possibility of further discriminatory taxation remain, and this is one factor promoting the quietness which has now descended on the market, after the very satisfactory showing of the first half of Warships Week. The Easter holiday is another factor, but of even less importance, and there can be little doubt that the overriding considerations are the problem of India, and the tension as to the much-advertised spring offensive. The attached chart of indices compiled by *The Financial News* shows that

FIXED INTEREST AND EQUITY SECURITY MOVEMENTS (July 1, 1935=100)

Financial News indices of 20 fixed-interest securities (converted to new base) and 30 ordinary shares

equity prices have continued to fluctuate with a downward trend since early December, and that the latest movement was a recovery. This is doubtless to be associated with the new approach to the Indian problem, and the modest evidence that this country is prepared to take the offensive itself whenever it is conceived to be feasible. The fall, although much less severe and uniform, has lasted more than twice as long as that which followed the collapse of France, and there can be little doubt that the absence of any clear cut victory, such as that achieved in the battle of Britain, is the explanation. A contributory factor is, however, the greater stability of fixed interest stocks on this occasion, which seems to indicate that the investor now realises that the sharp advance in equities, as compared with fixed interest stocks, between April and December, 1941, was overdone. The margin in the chart is still less than it was a year before. Whether it widens or narrows will depend largely on the extent to which the country is convinced that a new spirit and a new determination are abroad at home and overseas.

Cable and Wireless Changes

The recently announced decision of Sir Edward Wilshaw to abandon the position of managing director, which he has hitherto held jointly with Lord Pender, to a number of the companies of the Cable and Wireless group is causing a good deal of speculation. Although Sir Edward retains directorships in all these companies, the effect is to leave Lord Pender in sole charge of finance, while Sir Edward retains command of operation. The only explanation provided is the statement that Sir Edward does not believe in dual control, but he has been practising it for a number of years and it is not surprising if people look for some further explanation. Interest has been increased by the news that those directors of Marconi International Marine who are not on the boards of other Cable and Wireless concerns have also resigned. Is this also designed to centralise control in one hand? In addition to the business of telecommunications, the group controls numerous manufacturing ventures on the Marconi side of the undertaking, while the security holdings of the old cable companies constitute an investment trust business. The debentures and preference capital of the cable companies have a first call on their earnings, the remainder going to Cable and Wireless (Holding), and thus to the private investor. It has long been felt by many observers that this very complicated structure could, and should, be simplified. No doubt substantial investments are necessary to the company, but holdings which have to earn prior charge dividends for outside interests do nothing to strengthen its position. It is possible that the present moment is not ideal for liquidating some of the investments concerned, but the hope is again being expressed that an early opportunity will be taken of winding up the old cable companies. It would then be possible to simplify the structure of the group to the extent of amalgamating the operating and holding companies into one body. Recent developments might possibly be read as the beginning of a move in this direction.

Holding Companies

In more than one case recently, chairmen of holding companies have gone out of their way to stress the benefits which their particular enterprises have secured for the community and to advance this, without qualification, as the answer to the criticism of this form of enterprise. The holding company is, of course, a piece of financial machinery, and, like any other, it is valuable or the reverse according to the use made of it. The objections to it are that it facilitates pyramiding and the divorce of control from the ownership of capital. Moreover, as the law now stands, it also facilitates the concealment of information as to the position of operating companies which it is plainly the intention of the Companies Act to disclose. Both these features have the overwhelming disadvantage that they encourage monopoly. It is sometimes suggested that the holding company can overcome the hindrances to progress imposed by antiquated laws, and this argument is frequently applied in the case of public utilities. This may be so, but clearly the question arises as to who is to say when a law is out of date, and there will be general agreement that the decision cannot be left to those who are proposing to circumvent it. Another claim made is that occasionally joint holdings are one way of making possible a development which would normally be delayed, as not in itself economic. Here again it is open to question whether, if a subsidy is desirable, it would not be better for the state to provide it—by taxation graduated according to capacity to pay—rather than to impose it arbitrarily upon a section of the community chosen by the controlling company. In any case, so long as full disclosure is not made there are no means of checking the very natural assumption of those responsible that the development has been effected as cheaply as possible. No doubt holding companies have proved beneficial in certain instances. But one swallow does not make a summer, and if this particular piece of finance machinery is to continue in operation, it must be under very different legal safeguards from those operating hitherto.

Another Montreal Default

The announcement that the City of Montreal does not propose to repay its 3½ per cent sterling debenture stock, due May 1, 1942, is evidence that no great progress has so far been made by the Committee representing British holders of Montreal bonds. Apparently, some hopes had been entertained that default on a sterling issue—the previous defaults have been on dollar bonds—might be avoided, for the stock fell 5½ points on the announcement. Since, however, its previous price was only 88, it is clear that the chances of redemption at par in May were thought to be slight. The default can only accentuate the distrust felt in this country for Canadian municipal loans, and it has to be admitted that the behaviour of the Montreal authorities is distinctly unhelpful. Although an exchange of correspondence has been proceeding for some months between representatives of British bondholders and Canadian authorities, it still appears to be the case that no means has been found of effecting a rapid exchange of views—rapid, that is, even in the context of wartime delays. This attitude is in sharp contrast with the action of the Dominion, which grudges nothing to help forward the war effort. The whole attitude of Montreal is characterised by irresponsibility, and it is quite evident that, whatever the feelings of the individual bondholder, London cannot afford to encourage the City in its rake's progress. The British Committee is continuing its labours in the face of all difficulties, and it is understood to be due to its efforts that the Montreal authorities consented to make their first direct communication to British holders, the notice of the impending default.

21.9 to 19.3 per cent. The accounts of *Vickers-Armstrongs*, one of the largest operating companies, show a smaller fall in income after tax from £1,963,527 to £1,931,023, but depreciation is £160,000 higher at £1,160,000. Consequently, there is decline in the rate of earnings from 7.6 to 5.75 per cent tax free, equivalent to 11.5 against 13.2 per cent less tax. The tax free ordinary dividend is reduced from 7 to 5 per cent, equivalent to 10 against 12.1 per cent less tax. There is an addition to the carry forward of nearly £60,000, bringing the total to £268,896. The accounts of *English Steel*, owned jointly by *Vickers* and *Cammell Laird*, show an even more severe contraction in net income, the tax free rate of earnings for deferred shares falling from 31.0 to 17.9 per cent. The balance sheet of *Vickers* shows a fall in the surplus of liquid assets, excluding inter-company items, from £4,389,285 to £2,261,642. Cash and gilt-edged holdings are more than £1,400,000 lower at £4,997,577. The loan to *Vickers-Armstrongs* has jumped from £3,997,123 to £6,395,155. The most significant change in the balance sheet of the latter company is the striking rise in stocks from £46,382,267 to £50,939,458. Both creditors and debtors are lower, a fact which suggests that, since the concern was undoubtedly working to full capacity, there was some improvement in the matter of prompt payment. Cash is up by some £500,000 to £2,176,770. Under war conditions, the accounts of the group, which lack a consolidated statement, are less than ever able to convey a complete picture of its activities, and the chairman, Mr A. A. Jamieson, points out that no indication is given of the work in progress in the shadow factories managed by the group or of its subsidiaries, other than *Vickers-Armstrongs* and *English Steel*. The *Vickers* 10s. stock, at 16s. 3d., offers £6 3s. per cent.

Company Notes

The Vickers Group

The full accounts for 1941 reveal total disclosed profits of *Vickers, Ltd.*, at £977,755 against £1,188,651. As was estimated in the note on the preliminary statement in *The Economist* of March 21st, equity earnings are down from

South Durham Improvement

Accounts of *South Durham Steel and Iron* show a substantial recovery for the year to September 30th last, with profits of £281,134 against £188,576. Since there is a liability for taxation of £41,000 against nil, excluding tax on dividends, and of £25,933 against nil for war damage

REFUGE ASSURANCE COMPANY LIMITED.

CHIEF OFFICE: OXFORD STREET, MANCHESTER, 1.

Summary of Directors' Report for the year ended 31st December, 1941.

Total Income for the year, £13,496,154.

Total Assets at end of the year, £77,726,104.

Total Claims Paid in the year, £7,130,844. The Company has paid £140,468,475, in claims since its establishment.

The Total Assurances existing on December 31st, 1941, amounted to £83,065,446 in the Ordinary Branch and £122,775,708 in the Industrial Branch.

Ordinary Branch: Bonus of £1 per cent. for 1939, 1940 and 1941 declared on participating policies which become claims during the ensuing year. Surplus carried forward is £1,838,284.

Industrial Branch: £419,926 Profits allocated to Policyholders.

J. WILCOCK HOLGATE, Chairman.

insurance, the rise in equity earnings is less marked. It is, however, possible, after repeating the transfer of £100,000 for depreciation, to raise the dividend on ordinary capital from 6 to 8 per cent and to pay 2 per cent on "B" ordinary shares. These payments are covered by rates of 8.03 against 6.1 per cent and 2.03 against 0.1 per cent, respectively and there is a small increase in the carry forward from £122,717 to £122,865. *Cargo Fleet*, which is controlled by *South Durham*, shows a recovery in profits from £118,415 to £170,743, but here the combined incidence of taxation and war damage insurance is sufficient to cause a decline in equity earnings from £526 to £501 and no dividend is paid for the second year in succession. The *South Durham* balance sheet shows a substantial rise in stocks from £490,722 to £617,942; debtors are some £45,000 higher at £485,568, and creditors some £40,505 lower at £531,435. Net loans to a subsidiary are reduced from £112,215 to £21,436. An important feature of the accounts is the initiation of the redemption of 4 per cent mortgage debenture stock with the purchase and cancellation of £7,990. Net additions to fixed capital were reduced from £168,019 to £19,719. It is clear that the record of the *South Durham* group has been affected by a number of special circumstances, and affords little clue to the conditions governing heavy industrial profits in general. Last year's recovery most probably denotes the end of the period of acute shortage of certain raw materials which was responsible for the earlier setback. The £1 ordinary shares jumped 2s. 3d. on the publication of the results. At the current price of 26s. 6d., they yield £6 4s. 3d. per cent, a return which appears to discount further considerable progress.

London Store Accounts

The full accounts of *John Barker* and the *Harrods* group for the year to January 31, 1942, both indicate that last year's revival in the London general retail trade was considerable. Total profits of *Harrods*, with a lower dividend from D. H. Evans and no payment from *Dickins and Jones*, rose from £1,951,760 to £2,029,877, while those of *John Barker* are up from £1,398,672 to £1,433,699. Profits of *Harrods* were discussed in *The Economist* of February 28th; those of *John Barker* on March 7th. Of the *Harrods* subsidiaries, *Dickins and Jones* realised an increase in net profits from £21,933 to £41,374. There is, however, no payment on preference stock, the service stock for the whole year being met from the Preference Stockholders Reserve Fund. Total income of D. H. Evans is reduced from £345,372 to £307,552, but substantial economies in general expenses have raised net profits from £85,883 to £94,355. As Sir Woodman Burbidge points out in his speech, the main cause of the improvement is the cessation of enemy bombing. Increasing limitation of supplies and stricter rationing are to be expected in the current year and there is little possibility that the improvement can be sustained for the rest of the war. The *Harrods* group has suffered through the curtailment of its important mail order business, which followed the restriction on the issue of catalogues. It is possible that the Kensington group will con-

tinue to attract custom from its competitors, as appears to have been the case in the last few years, and so may be, to some extent, sheltered from the general effects of wartime curtailment of the retail trade. On the other hand, the balance sheet of *John Barker* shows a reduction in stock—the figure most vitally influencing potential profits—from £1,002,010 to £914,573, accompanied by a rise in cash from £303,939 to £515,961, while *Harrods'* balance sheet shows a rise in stock from £1,116,165 to £1,245,405 accompanied by an increase in cash only from £124,465 to £221,556. The increased stock figure is due solely to higher prices, but the company believes it can meet all reasonable demands for six months at least. The *John Barker*, £1 ordinary shares, at 37s. 6d., yield £5 6s. 8d. per cent, those of *Harrods*, at 30s., offer £3 6s. 8d. per cent, implying considerable confidence in recovery.

Ellerman Lines

The publication of the long-delayed accounts of Ellerman Lines for 1940 reveals an improvement in profits and an increase in activity. Total disclosed earnings, after taxation, rose from £1,360,403 to £1,429,004, while the depreciation provision is rather higher at £745,890 against £725,000. The allocation from profits for replacement of steamers is £500,000 against the £450,000 in 1939. Thus, after meeting service on preference and preferred ordinary capital, the surplus for deferred stock is slightly lower at £107,464 against £109,753, but is equivalent to 16.9 against 16.5 per cent. The equity receives 10 per cent, as before, and the carry forward receives an addition of £27,464. The directors have decided to transfer £1,250,000 from the carry forward for replacement of steamers, for which inadequate provision is made under the requisition terms of the Ministry of War Transport, and the total of undistributed profit is consequently reduced from £1,940,920 to £718,384. This prudent transfer partially explains the jump in the total of creditors, including tax and replacement reserve, from £1,633,541 to £5,230,079. The bulk of the rise is, however, presumably due to the difference between written-down value of lost steamers and the compensation received. There is, moreover, a rise in the debtors of nearly £2,500,000 to £2,702,701, while the total of cash and British Government securities is some £2,000,000 higher at £2,885,387. The book value of fleet is reduced from £2,226,359 to £1,743,147, and payment on account of steamer building is £50,000 lower at £155,365. The accounts indicate that, from the income standpoint, trading under Government contract was profitable in 1940, and that the management takes a realist view of the weight of future replacement costs. The absence of a profit and loss account, and the combination of creditors with replacement reserve, make it impossible to assess the true position. It is to be hoped that the publication of the 1941 accounts will not be long delayed.

Ashanti Goldfields Results

The reports of Ashanti Goldfields and the companion concern, Bibiani (1927), show that despite the maintenance of dividends at 80 and 25 per cent respectively for the year to September 30th last, profits were in both cases rather lower. In the case of the former concern, a fall in total revenue from £2,388,613 to £2,291,426 was due to a reduction in tonnage milled from 242,865 to 228,300 tons, which was not fully offset by a slight improvement in yield. Expenses rose by 23d. per ton owing to higher costs of materials, while the usual 10 per cent depreciation on increased amounts of plant called for an additional £15,000 odd. The effect is that, after maintaining the dividend and the £300,000 transfer to tax reserve, the carry forward is increased by some £18,000 compared with a rise of some £133,600 a year before. The figures of Bibiani are less satisfactory so far as output is concerned for both tonnage and yield fell, but, owing to restricted development, the rise in costs is only 2d. per ton, and total expenses are down on the year. Thus, while gross revenue fell from £851,635 to £752,433, the net figure was £305,544 against £376,509. The tax reserve appropriation is cut from £210,000 to £180,000, but there is only a draft of £4,456 on the carry-forward compared with £18,488. Despite further curtailment of work, owing to uncertainty of supply at Ashanti, it has been possible to add 140,700 tons to the ore reserve, raising it to 2,076,516 tons, but the grade is reduced from

21.8 to 21.6 dwts. At Bibiani, there was a further fall from 2,747,205 to 2,548,204 tons, and in value from 7.20 to 7.17 dwts. In both, however, the reserve position is so strong that the minor decline has little immediate importance. A much more serious question is the ability to maintain supplies of essential stores. In his comments, the chairman of both companies, Mr. James H. Batty, points out that, in the case of Bibiani, the target has been reduced to 21,000 tons a month to yield 6,400 ounces. In the case of Ashanti, he hopes to maintain present figures, but points out that this is dependent upon shipping facilities. The prices of the shares, of 4s. nominal in each case, stand at 19s. 4½d. for Ashanti and at 16s. 6d. for Bibiani.

United Glass Bottle

Total profits of United Glass Bottle for 1941 are shown after EPT so that income is reduced only from £457,769, and not from £537,769, to £415,530. Income tax claims £168,000 against £160,000, and the company is liable for war damage insurance contribution of £14,080 against nil. Despite a reduction of £10,000 to £15,000 in

the transfer to staff funds, there is a fall in equity earnings from £125,347 to £93,575, equivalent to 16.7 against 19.4 per cent. The usual 12 per cent dividend is distributed on ordinary shares. Contingencies receive £25,000 as before and the carry forward is slightly higher at £65,922 against £64,369. The balance sheet shows a rise of some £100,000 in stocks, while cash holdings are up from £170,951 to £205,999. Investments in Government securities are unchanged, but the chairman, Sir Max J. Bonn, points out that substantial increases in the holdings of subsidiary companies have taken place during the year and that the total now exceeds £350,000. In this connection, the absence of a consolidated balance sheet leaves the picture particularly incomplete. The chairman states that there has been no general increase in prices and that profits have been maintained through reliance on a high volume of output and rapid turnover. Whether this can be maintained depends on a number of circumstances outside the control of the group. Sales in the north, for instance, are closely linked to the future of the distilling industry. Shareholders enjoy a strong probability that dividends can be maintained in the current year, even if a further decline in net earnings is inevitable. The £1 ordinary shares, at 55s. ex dividend, yield £4 7s. 3d. per cent.

Industry and Trade

Future of Road Transport

Like the railways, the principal road transport interests have decided to set up a post-war reconstruction committee. The purpose of the committee, as stated by Mr S. D. Wilson, chairman of the British Road Federation, on March 25th, is "to evolve a statement of principles, in the light of what we can see at present which will be of use to the Government as indicating the considered and agreed opinion of the great majority of all those interests which are concerned with the use of commercial mechanical transport on the roads, and all the vast ancillary industries which are linked up with that essential industry." The committee is broadly based. Apart from the chairman of the British Road Federation, and of representatives of the public haulage industry, of public service vehicle operators, and of ancillary users, it includes representatives of the motor and road construction industries and of the petroleum distributors. Mr F. S. Bristow, secretary to the British Road Federation, is to act in a similar capacity to the committee. The need for a set of principles to guide the post-war development of transport in accordance with the national interest is unquestionable. The composition of the new committee suggests that the case for the road transport industry will be stated with vigour.

War Damage Commission

On the occasion of the first anniversary of the War Damage Commission, which was appointed on March 27, 1941, the day after the War Damage Bill became law, Mr Trustram Eve, K.C., its chairman, issued a statement about its activities. The work of the Commission during the first year of its existence has fallen into two divisions. First, it has had the administrative task of meeting the claims lodged with it for immediate payment. Secondly, it has had the task of considering many difficult points of interpretation and the practical problem of converting a complicated Act into an administrative code. As an illustration of the kind of problems facing the Commission, Mr Eve mentioned the difficulty of finding a proper basis of compensation for Wren's lost masterpieces, a crater in a field, a gravestone in an old churchyard. So far the Commission has been concerned chiefly with claims for payment in respect of temporary, partial or permanent repairs already executed, for in a considerable proportion of the cases notified work must be postponed until after the war. Of the claims subject to immediate payment some 60 per cent have been passed and 118,000 cheques have been paid since the beginning of this year. Cheques are now being issued by the Commission at the rate of 15,000 each week. Its task is far from easy and its administrative difficulties are legion; but on the whole the Commission has tackled them

courageously and it has achieved a fair measure of success during the first year of its existence.

Coupon Banking Accounts

The scheme for the handling of traders' clothing coupons by the banks has now been published in detail, and is expected to begin to operate in the middle of June. From the traders' point of view, much time and trouble will be saved: after the first counting of coupons for deposit in the bank all transactions with other traders will be by transfer-voucher, which will be written out much in the same way as a cheque. But before transfer-vouchers can be passed on in settlement of coupon debts, they must be confirmed by the banks. This provision is made because overdrafts on accounts are, not unnaturally, ruled out. Traders will be required to keep a pass-book for themselves, but the banks will give verbally the number of coupons in credit. In transactions which involve the exchange of more than fifty coupons, the banking system must be used, though transfer-vouchers may be written for any number of coupons. Loose coupons may still be passed on, where less than fifty are required, but in these cases provision is made for a check by the Board of Trade of a sample of the actual coupons presented, presumably so that forgeries may be detected. Coupon-equivalent documents of the kind which carry rights to quota-free supplies will continue to be passed from trader to trader. Special envelopes are to be issued in which the coupons will be deposited. These are for 98, 490 and 980 coupons each, but the accounts will be credited with 100, 500 and 1,000 respectively; the 2 per cent discount is intended to make good losses of rationed articles through pilfering and other causes. The envelopes, which are signed by the firms depositing them, will be checked by the Board of Trade, which stated that if too many are put into any envelope the excess will not be returned. Traders will continue to be permitted to keep deposits of coupons with their suppliers, which will be made by transfer-vouchers in the usual way. The services of the banks and all relevant documents are to be free to traders. The scheme is discussed from the banks' point of view in a note on page 472.

Wartime Ship Repairs

The cost of ship repairs and the contract system at present in force are causing concern among shipowners. The national interest demands that repairs are executed with a minimum of delay and that no labour is wasted by reason of the contract conditions. Provided extravagances are avoided, the question of cost is less important. It is difficult to estimate the average rise in the cost of repairs since

TOWARDS THE FUTURE

"When the war comes to an end there will be 8,000,000 or 9,000,000 people, the mainspring of whose existence will have snapped overnight, and it is essential that we should have an ordered scheme of what we mean to do."—Graham White, M.P., in the House of Commons, 10/3/42.

What are the essentials of this 'ordered scheme' of the future?

the outbreak of war, partly because many jobs require exceptional treatment, justified by the saving in time, but uneconomical by peace-time standards. An increase of 40 to 50 per cent over pre-war charges, has been mentioned by repairers as a fair average for normal work, but ship-owners would probably regard this as an underestimate. War damage repairs are priced according to the Emergency Repairs Agreement between the Admiralty and the ship repairers, the basis of which is the cost of labour and materials, plus a percentage for profit. More than once the Select Committee on National Expenditure has called for a reversion to the fixed price contract wherever possible, but the Admiralty has defended the present system as being the only means of avoiding delay. As was recorded in a note on page 441 of *The Economist* of March 28th, the annual report of the Liverpool Steam Ship Owners' Association expressed concern at the trend of ship repairing costs and questioned the wisdom or economy of the "cost plus" system. At the annual meeting of the Chamber of Shipping a few weeks ago, it was suggested that the wider use of the fixed price contract would mean speedier work, even if more costly, and it was added that repairers, though often willing to adopt this basis, were not allowed to do so. Technical considerations are involved in this controversy. It is certain that in many cases precious time would be wasted if repairers had to open up a vessel thoroughly and discuss financial matters before getting to work. On the

other hand, it is evidently the opinion of some of those who have had practical experience that the fixed price contract could be used more often. The problem might usefully be re-examined with a view to the adoption of arrangements that would satisfy more effectively the different requirements, of which speed is the most important.

Control of Industrial Diamonds

On March 25th, the Ministry of Supply announced the appointment of Sir Cecil Rodwell as Controller of Diamonds. The official announcement added that the new controller "will deal with questions relating to rough diamonds." The control of polished gem diamonds and of the gem cutting trade will remain with the Board of Trade, while the diamond tool trade remains under the supervision of the Controller of Diamond Dies and Tools. As the supply of rough stones constitutes the basis of all sections of the diamond trade, Sir Cecil Rodwell will occupy a key position which can be effectively used to direct the flow of diamonds to the requirements of the Allied war industries. Though not connected with the diamond trade, the new controller has for many years been in close touch with diamond interests. He started his public career in the

South African civil service and from 1928 to 1934 he was Governor of Southern Rhodesia, a territory in which the De Beers concern held exclusive prospecting rights for diamonds. Moreover, as a director of leading gold and copper mines, Sir Cecil is acquainted with practical mining problems. The appointment of a British Diamond Controller coincided with a report from Washington early this week according to which the War Production Board is planning a survey of all rough diamonds at present held in the United States. It is, therefore, not unreasonable to assume that the appointment of a controller reflects a decision of the Allied raw material pooling organisation.

Such a decision has, in fact, been expected since last December. The requirements of industrial diamonds for war purposes in the United States, Great Britain, and Russia have reached a rate which would have been regarded as fantastic before the war. Although the employment of industrial diamonds had been more extensively developed before the war in the United States than elsewhere, demand in that country has doubled during the last few months. Apart from the fact that the volume and speed of war production, as well as the hardness of armament alloys, has greatly increased replacement requirements, industrial diamonds are employed for a rapidly expanding range of purposes. The diamond producers and their sole selling agency, the Diamond Trading Company, have made an effort to keep the Allied war industries supplied with industrial diamonds. They have, moreover, abstained from using the record demand for their own ends, and have kept prices for industrial diamonds at pre-war levels. Demand, however, has now reached a rate at which careful planning of future supplies becomes vital, especially as the trend of demand is still upwards. This planning can, of course, only be done by a Government department acquainted with all the relevant facts. Fortunately, almost the whole of the world's output of diamonds is at the disposal of the United Nations. World production, which, according to the United States Bureau of Mines, reached 9,570,400 metric carats in 1937, advanced to 14,140,200 carats in 1940. A further substantial improvement took place last year. At present the Belgian Congo (the Beceka Mines) and British West Africa (the Consolidated African Selection Trust), quantitatively the world's largest producing areas, are making determined efforts to establish production records in 1942 and 1943. As a result there is every prospect that, despite the idleness of the South African mines which produce mainly gem diamonds, world production will reach 20,000,000 carats by next year.

Britain and the United States for collapsible tubes and foil, which absorbed 5,000 tons last year, has been virtually eliminated. In addition, the use of tin in solder and bearing metals has substantially declined. If the use of tin in tinplate is also restricted, there is a fair chance that consumption in the two countries will be reduced to a level, at which current needs can be met by supplies from Bolivia, Nigeria, the Belgian Congo, South Africa, Argentina and Cornwall.

Meat Prices and Ration

Meat is allocated to retail butchers on a money basis, to cover the ration for their registered customers, with an extra allowance to compensate for wastage, and to provide for contingencies, such as rations for the Armed Forces on leave, travellers and emergency ration cards and new registrations. Adjustments are made for changes in the number of registrations. The Ministry of Food recently made an investigation into the rate of allocation of meat to butchers, which showed that the present scale of allocation yielded a margin over the ration more than enough to cover contingencies comfortably, with the inevitable result that, if meat was not to be wasted, some customers were able to buy more than their ration. Indeed, this was a wise and even patriotic action, in spite of the Ministry

of Food's exhortations to the housewife, in their advertisement last November and at other times, never to accept more than their rations. The amount of meat the butcher can buy on his permit has now been reduced by the expedient of a slight increase in wholesale prices, shown in the accompanying table. The effect of the price rise will also be to lower the butcher's gross profit, which has been higher than was estimated. The full ration will continue to be available from the butchers' allocations; the choice of meat in any shop is likely to be more restricted and the most favoured customer may find herself with a smaller amount of meat than she has been receiving. The Ministry has been considering a reduction in the meat ration, but this has been postponed. Meanwhile, some economy will be secured as a result of the raising of the wholesale price.

OFFER TO NEW READERS

Any reader who makes his first acquaintance with this journal with this week's issue is invited to fill up the attached:

To The Publisher, Economist Newspaper Ltd.,

Brettenham House, Lancaster Place, W.C.2

In order to test the value of your publication I should like you to forward it to me by post for the next four weeks. If I then decide to become a subscriber, it is understood that there will be no charge for the copies thus received, but otherwise I shall be willing to pay 4s. to cover their cost.

Substitutes for Tin

On April 14th a new Ministry of Supply Order prohibiting the cutting of plain tinplate for the manufacture of packages and crown corks for civilian use will come into force. Amongst the products affected by the Order are biscuits, confectionery, coffee, syrup, dried milk and milk foods, tobacco, oils, polishes and many pharmaceutical and toilet articles. In announcing the new Order the Ministry of Supply pointed out that lacquered steelplate will in future be used for the purposes concerned. Until last year the manufacture of tinplate absorbed roughly half the tin consumed in Great Britain and the United States. Although the new Order affects only a comparatively small part of the British tinplate consumption—probably less than one-fifth—it prepares the way for further measures designed to economise tin by the substitution of other materials. Last year Germany was able to replace virtually the whole of its tinplate consumption by lacquered steelplate. In a few exceptional uses for which lacquered steelplate proved an inadequate substitute—amongst these the conservation of foodstuffs containing acids is the most important—thin aluminium plate was used instead of tinplate. As the aluminium production of the United Nations outstripped that of the Axis last year and will show a steep rise in 1942, they should be in a position to follow the German example in case of need. A new instruction has been issued this week under which milk bottle caps are in future to be produced from aluminium instead of tin. Actually it is most unlikely that the Allies will run short of tin for essential purposes. Since December last the use of tin in Great

COMPANY MEETINGS

REFUGE ASSURANCE COMPANY LIMITED

LARGE INVESTMENTS IN NEW WAR LOANS

STRENGTHENING OF VALUATION BASES: PROFITS TO POLICYHOLDERS

ASSETS £77,700,000. INCOME EXCEEDS £13,400,000

The seventy-eighth annual ordinary general meeting of the Refuge Assurance Company, Limited, was held on the 31st ultimo at the chief office of the Company, Oxford Street, Manchester.

Mr. J. Wilcock Holgate (chairman of the company) presided.

The secretary (Mr J. W. Moss), having read the notice convening the meeting and the auditors' report,

The chairman, in moving the adoption of the report and accounts, said:

Gentlemen.—I am glad to-day to be in a position to give you a favourable report on the operations of the company during the past year. Despite all the problems with which we have had to cope, and the difficulties we have had to overcome, arising out of the disturbance to the ordinary life of the country created by the war, we have not only carried on our work but also increased the scope of our activities. I refer to this progress with particular emphasis because success in our work means also effective assistance to our country in one aspect of its war endeavour. We are urged to-day to refrain from unnecessary spending, and it is a characteristic feature of life assurance that money laid out by way of premiums is not money spent, but money saved. You will see from the balance sheet how large a proportion of our funds is invested in Government securities; and our ability to do this is entirely the product of the united thrift and foresight of our policyholders, who may regard their life assurance premium payments as a direct compliance with the wishes of the Government in this connection.

In securing this progress we have had to make many adjustments to meet the constantly changing conditions affecting our work, notably, of course, as regards our staff. At the present time the number of our employees serving in the Forces, or on whole time national service, is 2,462, and a large proportion of the agency work is now conducted by women, who are giving evidence, in the excellence of their work, of the adaptability and resource of their sex. In chief office where, as I remarked last year, the work is constantly under review with the object of eliminating all non-essential operations, increasing use is made of the services of married women, who now represent 12 per cent of the female staff.

STAFFING DIFFICULTIES

The position as a whole will become increasingly difficult as the call-up of both men and women proceeds, though we are hopeful that the authorities, with the co-operation of the Life Offices organisations, will continue to recognise the essential needs of the insurance industry in this respect. It is of course upon our trained staff that we rely for the training of the numerous recruits to the business, and for the carrying out of technical and administrative duties which cannot be handled by persons without long experience in the service.

As you are aware the company, in addition to maintaining their pension rights, is making allowances to members of the staff called up into the Forces. We are happy to be in a position at the present time to provide this measure of financial assistance to the households affected; and I know you will share my earnest hopes for the continued well-being and safe return of those members of our staff of whose services we are temporarily deprived.

I have, however, the sad task of recording the deaths of seventeen members of our staff on active service and through enemy action in this country, and I wish now to express to their relatives the sympathy of the company. There are also four members of the staff who are prisoners of war, and in their case I would say that we all hope for their safe and speedy return to their families and friends. Two are at present reported as missing, and here again we hope that news of them may be forthcoming.

LIFE ASSURANCE IN THE WAR

During the year the circumstances affecting the progress of the business were not entirely, by pre-war standards, unfavourable.

As regards interest and expenses, of course, the trend of events was definitely and generally adverse; but our mortality experience for the year was favourable, and in addition to a considerable increase of new business in the ordinary branch it was encouraging to observe the evident determination of our policyholders in both branches to keep their policies on foot. It is in such days as these that the true value of the protection which life assurance affords is brought home to many who, under other conditions, might be apt to regard it as merely desirable rather than necessary, as it nearly always is; and it is, I think, due in part at least to this realisation that the rate of discontinuance in each branch, from whatever cause, is remarkably low.

In both branches we make special provision to meet those pre-war policyholders who, through financial hardship due to the war, are unable to continue the payment of their premiums; and although during the year comparatively little recourse was had to the assistance we are prepared to make in such cases, a number of instances occurred where the help we were able to render has proved most opportune.

I may here mention that from the outbreak of war to the end of 1941, the company has paid the sum of £342,993 in death claims under policies upon the lives of members of His Majesty's Forces and of civilians, due to enemy action.

INTEREST

Perhaps our major concern at the present time has relation to the rate of interest, where circumstances may be said to have simplified somewhat our investment problems by restricting so closely the possible fields for the investment of our funds. The yield it is possible to obtain on the majority of such securities as it is proper for a life assurance office to purchase is low in itself, and is rendered still lower through the operation of the gradual tax: and the effect is, of course, a continuance of the gradual reduction in net yields which has been a feature of life assurance operations for some time. The effect of recent developments may perhaps bring to the front the original conception of life assurance as a means of providing financial protection to a man's dependants in the event of his premature death, the investment element assuming a lesser importance than it has been possible to attach to it, quite fortuitously, in the past.

EXPENSE RATIOS

As regards expenses, we have to face expenditure which, in pre-war days, either was not required, or was on a lower scale, major items being allowances to our called-up employees, war-time additions to the normal earnings of our staff, and the additional cost of materials, taken in conjunction with such other extraordinary expenditure as Civil Defence and Fire Protection expenses. These special war-time charges have naturally modified the steady and unbroken reductions in expense ratios in both branches recorded over a number of years preceding 1941, but despite these additional burdens the expense ratio in the industrial branch increased by only .95, whilst that in the ordinary branch showed a slight reduction.

MORTALITY

Whilst in total the percentage of actual deaths to those anticipated by the mortality tables employed in the valuation remained practically unaltered in the ordinary branch, the mortality in the industrial branch was more favourable than for many years; but taking the age groups separately both branches were alike in recording an increase in the percentage for the under 50 group and a decrease for the over 50 section. A significant increase in each branch was in respect of the age group 20-29, a result which might perhaps have been anticipated as the result of war conditions but even more significant is the considerable reduction in mortality

INVESTMENTS

Turning to the balance sheets, I have already referred to the fact that the assets of the company now amount to £77,726,104, showing an increase of £3,119,552. Again, as last year, perhaps the outstanding feature in this connection is the increase during the year in our holding of British Government securities. These securities now amount to £33,971,646, having increased during the year by £3,778,324 and represent 43.71 per cent. of our total assets and 54.28 per cent. of our Stock Exchange securities. You will be interested to know that of the above total the new War Loans held by the company at the end of last year amounted to £6,249,300, the amount invested in this respect during 1941 being £3,550,500.

The aggregate value of our Stock Exchange securities very materially appreciated during the year, and exceeded considerably the value at which they appear in the balance-sheets, the investments reserve funds being retained intact.

As regards the interest yields per cent on our assurance funds, in the industrial branch the gross yield has fallen from £4 11s. 5d. to £4 8s. 3d., and the net yield from £4 3s. 4d. to £4 2s. 2d. In the ordinary branch the gross yield is £4 11s. 2d., against £4 13s. 1d. in 1940, and the corresponding net yield £3 6s. 9d., compared with £3 7s. 8d. In the circumstances I think you will agree that these decreases, though unavoidable, are at least well within the limits which might fairly have been anticipated.

The geographical distribution of our investments differs little from that of the preceding year: the trend, however, has been in the same direction for a number of years, with the cumulative effect indicated by the following figures:

	1932	1941
	Per cent.	
Great Britain	77.46	88.53
Indian and Colonial	14.59	8.47
Foreign	7.95	3.00
	100.00	100.00

NATIONAL HEALTH INSURANCE

Turning now to another branch of the company's activities, I have to report that on behalf of the National Amalgamated Approved Society we administer the National Health Insurance of a membership of 766,000, an increase of 21,000 over the corresponding figure for 1940. During the year payments of benefit were made amounting to £636,887, including £70,792 in respect of maternity benefits. In addition, the further considerable sum of £35,378 was received by "Refuge" members by way of non-cash benefits. The number of new members of the Society obtained during the year by "Refuge" representatives was 65,492.

TRIBUTE TO STAFF

In conclusion, let me once again acknowledge the services rendered by the company's staff, both in the field and at Chief Office, under the exacting conditions imposed by yet another year of war. Many have worked in circumstances of actual danger, and all have had to face and overcome difficulties not met with in times of peace; but our employees, men and women alike, have once again risen to the occasion, and played their parts in securing that the company they represent should continue to function in all parts of this Kingdom. I am also pleased to say that the relations between the company and the Refuge Field Staff Association and the Chief Office Staff Council continue to be on a most friendly basis.

Gentlemen, I have now much pleasure in moving the adoption of the annual report and accounts.

The report and accounts were adopted.

Messrs Francis H. Thornton and J. Proctor Green were re-appointed directors.

Messrs Walton Watts and Company were reappointed auditors.

The meeting closed with a vote of thanks to the chairman.

RESULTS OF YEAR'S WORKING

Turning now to the results of the year's working you will see from the accounts before you that our total premium income increased by £268,008 to £10,934,622. Our total claims were £7,130,844, which included £4,021,577 by way of maturities alone. The aggregate surplus in both branches amounted to £2,907,560, and the total assets now stand at £77,726,104, having increased by £3,119,552 during the year.

In the industrial branch our premium income amounted to £6,275,383, showing an increase of £134,564 over that of the previous year. The net interest income was £1,245,853, and the life assurance fund increased by £1,770,140, after the transfer of £200,000 to the investments reserve fund, which now amounts to £2,650,000. The expense ratio was 32.58 as against 31.63 in respect of 1940.

In the ordinary branch the number of new policies issued was 35,385 as compared with 32,038 issued during the previous year. The new sums assured amounted to £6,192,115, a sum greater by 27 per cent. than the corresponding figure for 1940. In this branch the premium income for the year was £4,659,239, a figure greater by £133,443 than that of the previous year, and the net interest amounted to £1,294,246. The expense ratio was 12.43 as compared with 12.60 in 1940: and the life assurance fund now amounts to £40,076,401, in addition to which there is an investments reserve fund of £2,250,000.

VALUATIONS

Twelve months ago I referred to the probability of a diminishing yield on our funds, and stated that it had been thought desirable to strengthen the basis of valuation in the ordinary branch to meet the altered conditions. The industrial branch, as you are aware, was already on an interest basis of 2½ per cent., and we have on this occasion strengthened our ordinary branch valuation in order to put it upon a similar basis.

In the industrial branch additional provision has been embodied to meet prospective adverse mortality due to the war, and the resulting surplus, which includes £143,094 brought forward from the previous year, is £924,112. As I have already stated, the sum of £200,000 has been transferred to the investments reserve fund, and it is proposed to allocate to shareholders £97,984, to carry forward £206,202, and to set aside £419,926 for allocation to policyholders.

In the ordinary branch the liability brought out by the method adopted is not less than that which would have emerged from a net premium valuation using the A24-29 ultimate table of mortality with interest at 2½ per cent. The resulting surplus is £1,983,447, which includes £1,273,235 brought forward from the previous year. It is proposed to allocate to the shareholders £14,516, to set aside £130,647 for allocation to policyholders, and to carry forward the materially increased sum of £1,838,284 to meet any contingencies which may arise out of the present world situation or to be dealt with subsequently as the Board may determine.

ALLOCATIONS TO POLICYHOLDERS

In the industrial branch, the amount set aside for policyholders is allocated by way of permanently increasing the sums assured by certain policies, and by making the payment of claims arising by death or survival of endowment terms during the ensuing year on the basis of the latest and most favourable scale of benefits as regards those policies which have not been placed permanently upon this latest scale by this or previous allocations of surplus, together with an addition of 2½ per cent. in respect of policies, with certain exceptions, dated prior to January 1, 1937.

Having regard to the continued uncertainty of the times, we propose to continue the modified form of bonus distribution in the ordinary branch adopted since the outbreak of war. The distribution to policyholders takes the form of a bonus on participating policies which become claims by death or survival within the twelve months commencing March 20, 1942, at the rate of £1 per cent. on the sum assured in respect of each full year's premium due and paid in 1939, 1940, and 1941 respectively. It is proposed also until further notice to allow an interim bonus on policies becoming claims by death or survival at the rate of £1 per cent. on the sum assured.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes. In time of war the value of this practice is greatly enhanced because *The Economist* provides valuable information which is not otherwise available to investors, who therefore read it more carefully than ever. Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, Brettenham House, Lancaster Place, London, W.C.2.

BRITANNIC ASSURANCE COMPANY, LIMITED

FINANCIAL POSITION STRENGTHENED

£364,000 ALLOCATED TO POLICYHOLDERS

MR J. A. JEFFERSON'S STATEMENT

The 76th annual general meeting of the Britannic Assurance Company, Limited, was held on Friday, the 27th ultimo, at the chief office, Broad Street Corner, Birmingham, Mr J. A. Jefferson, FIA, chairman and general manager, presiding. His statement to the stockholders was as follows:—

The results disclosed in the report are highly satisfactory and reflect the greatest credit on the staff, particularly when one bears in mind that there are now over 1,600 members of the indoor and outdoor staffs serving in His Majesty's Forces or engaged on other work of national importance. I would like to pay a special tribute to the lady agents who have come fresh into the business and who now number 1,572, nearly half our agency staff. They have done splendid work during the past year.

In common with other life offices, we are still experiencing the adverse effects of war, including war claims, increased expenses, heavy taxation and low rates of interest on new investments, to which I directed your attention last year. The most serious adverse factor at the moment is, of course, the low rate of interest, as you will realise that practically all our available money is being invested with the Government, yielding us a rate of 3 per cent. gross, compared with 3 to 3½ per cent. net assumed in calculating the premiums for the bulk of the business in force. The strong position we are in to-day is the result of the frugal and conservative policy which we have pursued for very many years.

THE REVENUE ACCOUNTS

The premium income of the life branches at £5,893,000 shows an increase of £365,000, which reflects the larger amount of money in circulation, particularly among the working classes. We claim that we are performing a most valuable function in attracting these sums to channels of thrift, enabling us to invest large sums in Government securities, helping to prevent inflation and at the same time promoting the prosperity of the policyholder. We also claim, and I believe justly, that a very large percentage of the money we collect by way of life assurance premiums would not be otherwise saved and would not therefore become available for investment with the Government. While much emphasis has rightly been laid on the saving of money and its investment in Government securities, it might also be stressed that a further important purpose of this saving is to cut down personal spending and set free materials and labour for the war effort. In other words the advice "Don't spend a penny more than is strictly necessary" is as much to the point as "Save all you can."

Lapses and surrenders have again fallen. Mortality, in spite of increased war claims, was more favourable in 1941 than in 1940; war claims in the life branches amounted to £104,644, making a total since the outbreak of war of £177,552. Large payments were made under maturing policies in 1941, although the total of £1,291,000 was less than in the previous year.

The company provided for income-tax, national defence contribution and war damage contribution in 1941 no less than £463,000. The total income increased by £392,000 to £7,478,000, and as a result of the year's operations the funds increased by £2,239,000 and now amount to £37,479,000.

ORDINARY BRANCH

The new business, in 1941 increased by over £2,000,000 to £4,143,000, a result largely due to our scheme for enabling policyholders to acquire 3 per cent. Savings Bonds by instalments spread over a period of 15 years by means of endowment assurance policies sharing in the profits of the company. Thousands of policyholders have embarked on a course of systematic saving which will help the war effort this year and next year, and will also help the country through the post-war period.

The premium income rose by £176,000 to £1,598,000, while the funds increased by £729,000 to £13,421,000. Net interest rose by £4,000 to £444,000, which represents a yield of £3 9s. 2d. per cent. on the mean fund, compared with £3 11s. 3d. per cent. in 1940.

Death claims at £238,000 were £29,000 less than in 1940. Expenses rose from 10.76 per cent. of the premium income to 12.37 per cent., a result due almost entirely to the large increase in new business.

INDUSTRIAL BRANCH

An outstanding milestone has been passed in regard to our funds, which now exceed twenty million pounds and show an increase during the year of £1,413,000. The premium income at £4,295,000 was £189,000 in excess of last year's total. Premium collections were maintained at a higher level than ever before and represented 19s. 11½d. in the £1 of all premiums falling due. The net rate of interest earned was £3 15s. 5d. per cent., which was 4s. 3d. per cent. below that of a year ago. Death claims amounted to £1,318,000, including £70,000 paid in bonuses, and represented a drop of £93,000 as compared with the previous year. The expense rate was 32.54 per cent., an increase of .78 per cent.

VALUATION OF ASSETS

There is only one item on the assets side of the balance-sheet to which I need draw your attention, and that is an increase of £2,220,000 in our holdings of British Government securities, which now amount to over ten and a half million pounds, representing 27 per cent. of our total assets. Since the last pre-war balance-sheet we have increased our holdings in this class of security by over four million pounds. This is a contribution to the country's war savings of which the company may be justly proud, and it is a policy which we are continuing as far as it lies within our means. Last year we were able to certify that our assets were fully of the value stated in the balance-sheet, and that the investment reserve funds were intact. There has been an appreciable rise in values during the year, making the position even more satisfactory than on December 31, 1940. Nevertheless, we have still continued to build up the investment reserve funds, which now amount to £2,350,000.

VALUATION OF LIABILITIES

The bases adopted in the valuation of the liabilities were very stringent. The Britannic contracts in the ordinary and industrial branches were valued by the net premium method at 2½ per cent. interest, whereas last year ordinary branch without-profit contracts and annuities were valued at 3 per cent. The mortality tables used were the same as those employed last year and are the latest available. Having provided for all foreseeable contingencies, the directors feel fully justified in making a distribution of surplus.

ALLOCATION OF SURPLUS

In the Britannic ordinary branch the surplus disclosed is £425,599. After transferring £30,000 to the ordinary branch investment reserve fund, the directors have allocated £184,298 to provide a reversionary bonus on all with-profit policies in force on December 31, 1941, at the rate of £1 per cent. on the sum assured. The surplus carried forward undivided to 1942 is £185,823. In the Britannic industrial branch the surplus disclosed is £709,621. Allocations have been made of £160,000 to policyholders, £140,000 to profit and loss account, £90,000 to staff pension fund and £70,000 to industrial branch investment reserve fund. The balance of surplus carried forward undivided to 1942 is £249,621. The directors have been able to repeat the bonus scheme without modification for a further period of one year from April 1, 1942. The allocations from the life branches for policyholders' bonuses amount to £364,416, while the surpluses carried forward undivided in these branches totalled £451,279.

GENERAL BRANCH

Despite the restricted opportunities at the present time for the transaction of certain classes of business, the premium income at

£201,000 shows an increase of over £30,000, which brings the income back to the 1939 level. The claims experience was again satisfactory, and after all necessary reserve adjustments had been made there was a net profit of £7,565.

STAFF PENSION SCHEME

The transfers to the staff pension fund this year again amount to £100,000. This scheme is non-contributory and we are continuing service with HM Forces as pensionable service with the

company. The directors express their warm appreciation of the good work done during the year by all members of the indoor and outdoor staffs. Relations with all sections of the staff have continued to be excellent, and the directors will spare no pains to maintain this happy state of affairs.

The resolution moving the adoption of the report and accounts was proposed by the chairman, seconded by Mr J. Murray Laing, and carried unanimously. Mr W. Roscoe, the retiring director, was unanimously re-elected.

THE UNITED GLASS BOTTLE MANUFACTURERS LIMITED

MAXIMUM CAPACITY OUTPUT

DIVIDEND AND BONUS MAINTAINED

SIR MAX J. BONN'S STATEMENT

Your Directors feel they are meeting a general convenience by adhering to their recent practice of issuing the Chairman's Speech together with the Annual Report and Accounts.

The Annual General Meeting, to be held on the 16th instant, will, therefore, be to transact formal business only.

The following is the statement by the Chairman, Sir Max J. Bonn:

Considering the increasing difficulties under which both production and distribution are carried on, the results for the financial year ended December 31, 1941, will be regarded as highly satisfactory. They are entirely due to the fact that we have been working to maximum capacity.

BALANCE SHEET ITEMS

On the asset side of the balance-sheet it will be seen that the net additions during the year to land and buildings amount to £17,772. Plant and machinery (after writing off £98,437, which represents our normal rate of depreciation and special allocation for mould depreciation) stand at £533,595, as compared with last year, £558,450. Air raid precaution expenditure has been eliminated by the transfer to land and buildings of items of a permanent nature amounting to £5,000, and the balance of £8,562 to profit and loss appropriation account. Stocks, stores, packages, etc., at £889,500 show an increase of £105,655. Debtors, including dividends from subsidiary companies (since received), at £720,136 compare with £701,380. Cash at bankers and in hand at £205,999 shows an increase of £35,048.

You will observe that the item "Investment in British Government securities" remains unchanged. I should explain that investments made subsequent to December 31, 1940, were allocated to various subsidiary companies, and the total holding at the end of the year under review was well over £350,000. With each successive year of the war the incidence of EPT, levied at 100 per cent. and without any increase in the allowances for depreciation, constitutes a progressive strain. The need for carrying heavy stocks of raw materials whenever they can be accumulated by way of replenishment, at rising prices, tends in the same direction.

On the liability side of the account, sundry creditors, etc., at £905,223 show an increase of £146,224, due chiefly to increased provision for excess profits tax and contingencies.

PROFIT AND LOSS ACCOUNT

Trading profit at £359,049 is shown this year after provision for EPT and compares with a corresponding figure of £383,909 in the previous year. Full provision has been made for amounts due from territories at present occupied by the enemy. In accordance with the Finance Act, 1941, the directors' fixed remuneration has been adjusted—the liability for income-tax in excess of 5s. 6d. in the £ being borne by the individual. It is only fair to my colleagues if I say that, prior to the Chancellor of the Exchequer's pronouncement, the Board had already passed a resolution for an adjustment practically on these lines.

The net profit for the year, including interest and dividends shown in the accounts, is £196,317 (against the previous year £236,345), to which is added the balance from last year, £64,368.

After making appropriations to debenture redemption reserve, £20,050, contingency reserve, £25,000, staff benevolent fund,

£15,000, air raid precaution expenditure, £8,562, and war damage contribution, £14,080, there remains £177,993 available for distribution. The dividend for the year, less income-tax, on the Preference shares, £45,951, and an interim dividend, less income-tax, on the Ordinary shares, £19,547, have been paid, and it is proposed to pay a final dividend on the Ordinary shares of 6 per cent., less income-tax, making 9½ per cent. for the year (same as last year), and a cash bonus of 2½ per cent., less income-tax (same as last year), £47,473, leaving a balance of £65,922 to be carried forward.

SUBSIDIARY COMPANIES

The dividends from subsidiary companies consist mainly of the dividends received from British Bottles, Ltd., and Kork-N-Seal, Ltd. In the case of the latter company the rate of dividend is unchanged, though the incidence of taxation reduces the net amount received. In the case of British Bottles, Ltd., there has been a reduction in the dividend declared, though the actual results would have warranted the maintenance at the former rate. But you will readily appreciate that our northern factories are largely dependent on the activity of the distilling industry, more particularly on the export side.

COSTS AND SELLING PRICES

With the exception of some readjustment in the price of a few "low sellers" which have been unremunerative for many years past and have now been placed on a more economic price basis, there has been no general price increase throughout the year. This is no mean achievement in view of rising costs of every kind—the incidence of some of which will be more markedly felt in 1942. I cannot sufficiently emphasise the importance of the high volume of output and the velocity of the turnover which we have been enjoying; any substantial drop would quickly affect the good results of the last few years.

Shareholders, as well as all members of the UGB organisation—whether in factories, warehouses or offices—will take pride in the fact that the glass container industry has been proving more and more a national asset and enjoying a greater measure of recognition by Government. It was a particular satisfaction to your Board to be able to respond to a suggestion by the Board of Trade and to help meet an acute shortage of essential glassware, which we had not hitherto produced. To this purpose an entire furnace has been reserved, and I feel we are doing a good job well.

GREAT STRAIN ON ORGANISATION

It is not possible for me to go into greater detail as to the manner in which the entire UGB organisation has responded to the heavy calls. Those who have temporarily left our service to join the armed forces, civil defence, etc., are much missed, both for their own sake and the efficiency they represented. We should like to pay our tribute to the way newcomers have fallen into step and more particularly the splendid way in which the "weaker sex" have taken on heavy tasks.

In asking Mr Moorshead to convey our thanks and good wishes to all concerned we wish to take this opportunity of expressing to him and Mr Judd our appreciation of their untiring exertion and the results attained.

THE BRITISH ALUMINIUM COMPANY, LIMITED

MR. R. W. COOPER'S STATEMENT

The annual meeting of stockholders of the British Aluminium Company, Limited, was held, on the 31st ultimo, at Shrewsbury, Mr R. W. Cooper, MC (chairman of the company), presiding.

In moving the adoption of the report and accounts for the year ended December 31, 1941, the chairman presented the following statement:—

The works of the company continued to be employed to the fullest possible extent during the year, and much additional plant came into production.

Comparing the balance sheet figures with those of the previous year, the main differences are as follows:—

The application of the mortgage debenture stock sinking fund for the year 1940 has further reduced the outstanding amount of the stock to £3,391,007, and has raised the debenture stock redemption account to £108,993. To this falls to be added the sinking fund for 1941, amounting to £39,359, for which cash was deposited with the debenture stock trustees, and that sum was applied by them in redemption of stock on January 1st of this year under the terms of the trust deed.

Sundry creditors at £2,807,882 are increased by £807,339, mainly due to reserves for taxation in its various forms, the incidence of which bears heavily on all industrial concerns.

The amounts owing to subsidiary companies have been reduced by £2,393, and stand at £65,081.

SUBSTANTIAL RESERVES

We have added £50,000 to the depreciation reserve account, raising it to £1,550,000, and, as has been pointed out on a previous occasion, the setting up of a debenture stock redemption account, and the annual increments thereto, may be regarded as an additional contribution towards depreciation, adequate provision for which is increasingly necessary considering the exceptionally heavy duty which plant and machinery are called upon to perform.

From the profits of the year we have allocated £100,000 to the reserve account, which now stands at £3,050,000, out of which sum £500,000 remains earmarked as a provision to cover fully our assets in the enemy-controlled territories of Norway and France.

Capital expenditure during the year amounted to £175,008, whilst our investments, less reserves, in subsidiary companies have expanded by £163,858 to £6,349,374, and in allied companies by £201,234 to £1,484,890.

Government and other securities at cost stand at £371,011, or an increase of £210,000, being the cost of additional Government stock purchased during the year.

Debtors amount to £1,266,084, a decrease of £10,647, but stocks are up by £214,563 and stand at £959,772.

Cash at £928,521 represents an increase of £27,869.

PROFIT AND DIVIDEND

The total profit for the year amounts to £973,582, an increase of £61,371 over the previous year. Deducting directors' fees, debenture stock service fund, the reserves for depreciation and general reserve already mentioned, and an increased allocation from £150,000 to £200,000 as a provision for income tax, the balance is £417,332. Dividend on the preference stock requires £90,000. We paid an interim dividend of 3 per cent. on the ordinary stock, and now recommend a final dividend of 7 per cent., making 10 per cent. for the year, requiring together £300,000. There remains a balance of £27,332, making the amount carried forward £222,127.

An increasing number of our male staff and employees are serving with the armed Forces, and we are employing women wherever possible. The high pressure at which our remaining staff and employees are working demands the most strenuous efforts from all, and our sincere appreciation of the energy and perseverance which they are devoting to their vitally important tasks will undoubtedly be endorsed by the stockholders. Apart from their duties in factory or office, they are taking their part in the many extraneous activities which have to be undertaken by civilians in these times.

The motion was seconded by Mr W. Murray Morrison, MInstCE, MIEE (deputy-chairman and managing director), and unanimously adopted, and the payment, less income-tax, on April 1, 1942, of a final dividend of 7 per cent. on the ordinary stock (making, with the interim dividend already paid, 10 per cent. for the year) was approved.

ASSOCIATED ELECTRICAL INDUSTRIES LIMITED

DIVIDEND OF 10 PER CENT.

The forty-second annual general meeting of Associated Electrical Industries, Limited, was held on the 31st ultimo, in London.

Sir Felix J. C. Pole (the chairman) said that the profit for the year was £681,536 compared with £716,795 for the previous year, a decrease of 4.9 per cent. After charging £263,296 against a decrease of £37,272. The depreciation provision just mentioned was in respect of the Metropolitan-Vickers Electrical Company only. Depreciation provided by all the companies in the Associated group totalled £573,428. To the net profit of £418,240 had to be added £265,472, being the balance brought forward from the previous year, making a total profit available for distribution of £683,712. They had again appropriated £100,000 to the dividend equalisation reserve account, increasing it to £500,000. The object of the reserve was to keep dividends on an even basis, and it represented over 20 per cent. gross on their ordinary issued stock.

After providing for dividends on preference stock, £52,306, there remained £531,406, and the directors recommended a dividend on the ordinary stock of 10 per cent. per annum, less tax, leaving a balance to be carried forward of £285,314 compared with £265,472 brought in from the previous year.

CALL FOR EFFICIENCY

The knowledge and skill of the company's technicians and manufacturing staffs had been in constant demand in making improvements in designs and in accommodating factory areas and manufacturing programmes to secure the highest degree of workshop efficiency and the most speedy flow of output. Their desire—and it was the desire of everybody connected with the company—was to do their utmost to win the war speedily, and all ranks of their employees were rendering outstanding services. Once again he asked shareholders to join him in expressing their sincere thanks to their executive directors, officers and all ranks and grades of employees, who had rendered splendid service. Work had been well and cheerfully done, often in trying circumstances. He could not overstress their appreciation.

It was interesting to recall that at a time when the Minister of Labour was urging all companies to establish works committees the Metropolitan-Vickers Electrical Company's Works Committee was already 25 years old. That committee had performed most useful service. The chairman was Mr Sam Ratcliffe, who was also a member of their Long Service Association, and he was particularly pleased that in the New Year Honours Mr. Ratcliffe had had the distinction of being awarded the MBE by HM The King.

In addition to the Works Committee, it had been the practice for many years for each department to hold efficiency meetings to which the Shop Stewards were invited. All those who attended took part in the discussions, and many useful suggestions were made and much good work was done.

The extension of the war into Far East zones had naturally affected their export turnover, and that curtailment they deplored, for they placed great weight on their export turnover, which in peace-time was a very material part of their business.

RESEARCH FACILITIES EXPANDED

The company's research facilities had been expanded during the year. The provision of new and substitute materials had involved urgent and continuous enquiry and effort. Close co-operation was maintained with the various scientific departments of the Government.

The work of the Education Department had increased by reason of the replacement of those called to the Fighting Services, and the substitute labour had required specialised and intensive training. The management was very appreciative of the voluntary work undertaken by those employees who had given unstintingly of their spare time to various ARP services.

The company were making grants to the dependants of employees who were serving with the Forces, and there was a War Assistance Fund for organised distribution of comforts to their people who were on active service. Last, but by no means least, he would tell shareholders that they had done much to encourage and develop the National Savings Scheme, and they would continue to do so.

The report was adopted.

BRITISH ROPES LIMITED

MR. HERBERT SMITH'S STATEMENT

The annual general meeting was held, on the 31st ultimo, in London.

The following are extracts from the chairman's statement circulated with the report and accounts:

The profit for the year after making a reserve for taxation, but before appropriations, is £251,608, as against £271,321. The small decrease may be explained by the heavier charge for excess profits tax in 1941, i.e., at the rate of 100 per cent., as compared with only 60 per cent. for the first three months up to March 31, 1940, and also the provision for taxation on expenditure, which the Inland Revenue regard as disallowable for tax purposes, and variations in investment income, which is not subject to EPT, in our hands.

A sum of £25,000 has been transferred to general reserve, bringing it up to £75,000.

We recommend a final payment of 7½ per cent. to the ordinary shareholders, which, with the interim already paid, makes a total of 12½ per cent. for the year. After giving effect to the above recommendations, the carry-forward is increased from £181,525 to £201,877.

Stocks on hand are greater in the aggregate than a year ago, and, in particular, stocks of raw materials have been maintained at a high level. At this time, in view of the Far Eastern situation, we must face up to the sombre fact that for the moment one of our main sources of supply has been cut off, and be thankful that largely due to the efforts of the Hemp Control, our raw material stocks are as high as they are.

The reports from our subsidiary companies, both at home and abroad, continue to be most encouraging. Rand Ropes (Pty.) Limited has had another satisfactory year's trading. The profit of our Canadian subsidiary has also been maintained, and both have proved of particular assistance in executing export orders, which could not be sent from this country.

Home trade has been well maintained, and our plants have been very fully engaged.

The report was unanimously adopted.

MITCHELL COTTS AND COMPANY, LIMITED

INCREASED DIVIDEND

The ordinary general meeting of Mitchell Cotts and Co., Limited, will be held on the 8th instant in London.

The following is an extract from the statement by the chairman (Mr Alexander Hamilton) circulated with the report and accounts:

The trading profit amounts to £176,236, from which is deducted directors' fees £870 and provision for income-tax £80,000, leaving a net profit for the year of £95,366. The directors have declared and paid the preference dividend for the year and a first interim ordinary dividend of 5 per cent., less tax, and a second interim ordinary dividend of 10 per cent., less tax. At the time the second interim ordinary dividend was paid the directors explained that this took the place of the usual final ordinary dividend and that it was not proposed to recommend any further distribution. Accordingly, the total ordinary dividend for the year is 15 per cent., less tax, against 13 per cent., less tax, for the previous year. £40,000 has been transferred to general reserve, and £5,000 to staff provident fund.

The provision for taxation is again higher, this being due to a further increase in profits. However, it is estimated that the present provision for taxation should be ample to cover your company's liabilities in this country, and, of course, our subsidiaries have made their own reserves.

As regards the current year, any forecast can only be made with considerable reservations, but the present indications are that the accounts for the year to June 30, 1942, should disclose that the year has not been less favourable than 1940-41. I am again glad to record that relations with our numerous connections at home and overseas continue to be very cordial.

I decided, after nearly 37 years of continuous work for this company and its predecessors, to relinquish at December 31, 1941, the managing directorship, but at the request of my colleagues, I have retained the chairmanship. Mr Leonard Aldridge, who has been a member of the board and very closely associated with our business since it became a public company, has been appointed managing director.

CLYDE VALLEY ELECTRICAL POWER COMPANY

ANNUAL GENERAL MEETING

MR R. ROBERTSON'S SPEECH

Presiding at the annual general meeting of the Clyde Valley Electrical Power Company in Glasgow, on the 31st ultimo, Mr R. Robertson, LLD, the chairman, said:

Ladies and Gentlemen,

Before proceeding with the business of this meeting, I wish to refer to the great loss the company and the board have sustained by the death of Mr J. H. Maurice Clark. Mr Clark joined the board in 1932 and took a very keen interest in all the affairs of the company until, at the outbreak of war, he went into active service as Captain in the Royal Naval Volunteer Reserve, in which he was fully engaged up to the time of his death. His active participation in the work of the board was much appreciated by his colleagues.

The further restrictions on the form of the report of the directors this year is due to new prohibitions imposed upon the company by Government. These restrictions also apply to anything I might otherwise have had to say to you on this occasion.

SUPPLYING CHEAP POWER IN SUBURBAN AND RURAL AREAS

Like other electrical power companies, this company has played an important part in the electrical development of the country, including the provision of supply over large areas of sparsely populated districts. When circumstances permit, a recital of the services it has afforded to the community will make impressive reading. Rural development and the supply of energy to industry commencing in new districts have, in the main, been the work of the companies, which renders them capable of taking an important part in post-war development. Their great experience, both in suburban and in rural areas in affording large blocks of power on terms which enable their consumers to compete with industry in the densely populated areas will be of immense value in schemes concerned with the re-distribution of industry after the war.

With regard to the resolution declaring a dividend on the ordinary stock of the company, I think it right to say that, before deciding to recommend this dividend, the board have made provision for war damage insurance, contingency fund and taxation.

TRIBUTE TO STAFF

There have been no important changes in the personnel of our staff during the year but, as in the previous year, the majority of them have been working under difficult conditions. I again welcome this opportunity of expressing on behalf of the board our appreciation of their loyalty to the interests of the company.

I now have pleasure in moving that provision be made for the dividend on the six per cent. cumulative first preference stock for six months to April 30, 1942, and that a final dividend of 5 per cent. on the ordinary stock be paid, which, together with the interim dividend of 3 per cent. paid in September, 1941, makes a total of 8 per cent. for the year.

The report and accounts were adopted.

THE ANGLO-FRENCH EXPLORATION COMPANY, LIMITED

The following are extracts from the statement by the chairman, Mr F. A. Robinson, in place of his speech at the forthcoming ordinary general meeting to be held on the 8th instant.

The results for the year 1941 may be considered satisfactory considering that we are now in the third year of the war.

Our cash position has improved, net cash assets at December 31st amounting to £92,331 compared with £53,675 the previous year.

The net profit for the year is practically the same, viz., £47,452 as against £47,266.

We have continued to reduce expenditure, total expenses having fallen by over £3,000, making a reduction of more than £8,000 since 1938. The amount shown for taxation in the profit and loss account, viz., £8,767, arises as a result of the alteration in the method of presenting the revenue from dividends and interest.

The sum of £7,573 is written off on account of depreciation of certain holdings, and after providing for the dividend recommended of 5 per cent. there is £21,146 to be carried forward.

The total net valuation of our assets at December 31, 1941, amounts to £924,021 or a surplus of £174,021, showing a satisfactory increase of £64,638 over 1940.

Finance

GOVERNMENT RETURNS

For the 10 days ended March 31, 1942, total ordinary revenue was £77,572,000, against ordinary expenditure of £173,999,000 and issues to sinking funds of £267,190. Thus, including sinking fund allocations of £12,168,985, the deficit accrued since April 1st is £2,713,806,000 against £2,475,421,000 for the corresponding period a year ago.

fallen by 14 per cent. This is the chief reason for the decline in output per man-shift of all employees. Output per shift at the coal face is not badly down, in spite of the sharp increase in the average age of the men employed.

It would be wrong to lay the major share of blame for what has happened on the workers. Of all those connected with the industry they were least able to foresee the trend of events. But the men can hardly be fully acquitted. Their attitude, ever since it became apparent that higher output per man was essential in the nation's interest, has not been so helpful as it might have been. Absenteeism has increased just when it should have been reduced to a minimum. Avoidable absenteeism is considerably larger than before the war—in some coalfields it has doubled. Moreover, when an attendance bonus scheme was introduced to meet this problem, the intervention of the unions so amended the scheme that its effect in reducing absenteeism was negated. This paradoxical result has followed from the schedule of excusable absences that was drawn up. These cover incapacity for work as a result of accidents to workmen at the mine or while travelling to or from the mine; treatment for the after-effects of an accident; sickness; absence as official delegate on trade union business; absence for attendance as member of a local authority; absence for Civil Defence duties; absence for which permission has been given by the management. The list is reasonable enough; but the fact remains that, under its influence, "unavoidable" absenteeism in many districts has almost doubled. If the truth were known, it might well be that the attendance bonus scheme has increased absenteeism rather than diminished it. The Joint Pit Committees which were expected to help in reducing absenteeism have been disappointing; the chief reason for this is probably the reluctance of the workmen's representatives, usually chosen from lodge officials, to shoulder responsibility for effective disciplinary action. It is also complained that the Essential Work Order has undermined the authority of colliery managers, and in other ways diminished discipline above as well as below ground.

But, if the chief reason for the decline in output is to be found on the side of the labour force, the owners and the Mines Department must share responsibility for the lack of effective measures to remedy the position. The colliery owners are a group whose industrial attitudes are by now familiar to the public. It is perhaps enough to say that they have not changed. It would be difficult to find fiercer individualists anywhere in the world. They accepted with a bad grace even the gift of monopoly selling powers pressed on them by Mr Shinwell's Act of 1930 and the subsequent Conservative legislation. Their dominant passion is to preserve the right of each pit to run its business in its own way. They have steadily, and successfully, fought the workers' demand for national wage negotiations, and they are equally adamant in refusing to treat with any organisation of merchants. If it is true of the men that they are the only group of workers in any important industry who are working no harder and producing no more per head than before the war, it is equally true of the owners that no other industry of equal importance has abandoned so little of its peacetime methods of doing business. There is an elaborate priority scheme in existence, by which owners are supposed to be guided in choosing which of their customers shall have first call. But it has been the general experience, throughout industry, that priority directions are very ineffective when supplies are short. In the coal industry, where prices, transport costs and other conditions vary so greatly from transaction to transaction, and where individual mines are always most jealous of their established contacts, the effect of the priority scheme has been small. One concession, and one only, have the owners made to the needs of the time. A scheme was set on foot in 1940, after very long and difficult negotiations, for providing compensation for closed-down mines and for those that are running at a loss. The cost of the compensation, it is hardly necessary to add, came from the consumer in the form of a levy added to the price of coal.

It is impossible not to feel a certain sympathy for the Mines Department, caught in the cross-fire of these bitter

antagonists. But the timidity of the Department—or, rather, of the Government as a whole, since a single subsidiary Department has limited powers in a matter so charged with political dynamite—has amounted almost to cowardice. It has imposed only the loosest possible form of control; it has retreated at every growl from either side; it is almost inconceivable that it could have done less than it has. Before the war, provision was made for the appointment by the Department, in each of the 17 districts, of a Coal Supplies Officer who was to represent the Department in all matters relating to the production of coal. But, in order to make certain that this machinery of control should be ineffective, the offer was made to appoint the nominee of the Executive Board of the district (i.e., the body set up, representing the owners only, to operate the Act of 1930), provided the Executive Board relieved the Government from all financial liability on account of the official or his office. In virtually every case the independent chairman (i.e., independent as regards any one owner) was appointed and while acting as Coal Supplies Officer, he has retained his position under the district selling scheme, and has been wholly remunerated by the owners. The Coal Supplies Officer have powers to give instructions to individual mine about the disposal of their coal, and even to requisition coal if need be, but it is hardly surprising, in the circumstances, that these powers have been only rarely and ineffectively used.

On the distribution side, the organisation has been equally weak. The Department evolved a scheme early in 1940 for a complete organisation of the merchant throughout the country, with a Controller and district officials whose duty it would be to see that the supply of coal was distributed in the most economical possible way. That this scheme would have been very effective if it had ever been put into operation may be doubted, since it would have left distribution as fully under the control of the merchants and their Federation as production was just as much efficiency and economy as was possible with the existing organisation of a notoriously inefficient trade, and no more. But even this was too much for the colliery owners, who presumably feared that any greater cohesion on the merchants' part would diminish the bargaining advantage that the Act of 1930 had conferred on the collieries. Their opposition was loud and bitter; the Department retreated; and the scheme fell into the discard, to be replaced by an even weaker set of proposals. These make an attempt to introduce an element of organisation into the distribution of supplies from the individual local depot, and Regional House Coal officer have been appointed (they are the merchants' nominees in each of the twelve Civil Defence Regions, where there were already Divisional Coal officers and Coal Export officers).

It would be wrong to begrudge the Mines Department the measure of success they have had in restraining the rise in the price of coal, which might otherwise have soared to very high levels. But both on the production side and on the distribution side, the coal industry at wartime is still substantially the same as in peacetime. The dominant consideration in the operation of the industry, and of each individual pit and merchant business, is still the financial one. To say this is not to impute either any particular selfishness or lack of patriotism, either to mine owners or to coal merchants. Their industry has been bitterly depressed for almost a generation, and is hardly prosperous to-day; the anxiety is not to make fortunes out of the community's need but to make sure, now and in the future, of avoiding losses that the industry cannot bear. Nevertheless, the fact that the industry—and each pit—is still manifestly run for the profit of the owners reacts directly upon the attitude of the men, who use it to excuse the fact that they too continue to seek their self-interest by their familiar methods. But whatever the motives and whatever the rights and wrongs, the net effect is the same: the industry is not equipped to play its part in a war economy and is not in fact pulling its weight in a desperate race. (A second article will appear in a forthcoming issue.)

Finance in War

IT may be assumed that the Chancellor of the Exchequer, in opening his forthcoming Budget, will follow his own precedent of last year. His task will not be merely to present a set of financial accounts, but to pass in review the whole of the Government's financial policy in relation to the structure of a war economy. The estimates of revenue and expenditure and the proportions they bear to each other are a part, but only a part, and perhaps not the most important part, of the picture that the Chancellor will present. It seems to be very probable that another admirable precedent from last year will also be followed, and that the Budget will be accompanied by a White Paper giving estimates of the size of the national income, its distribution and the sources from which the finances of the war have been drawn. It is an inestimable gain that, for the first time in British history, and probably for the first time in any country, public finance is now openly regarded, not as an independent mystery, but merely as part of the wider whole of social and economic policy. Perhaps the best-founded hope for sounder and more successful economic policy after this war than after the last rests on this departure.

In some quarters, however, the enthusiasm for treating the economic problem as a whole is so great that there is a tendency to cry down any discussion at all of its parts. An article in the *Financial News* a few weeks ago, for example, bore the engaging title "The Gap? Forget It," and the Chancellor of the Exchequer has been subjected to some criticism for laying renewed emphasis on the necessity for avoiding inflation. This is carrying zeal too far. It is true that winning the war ranks, as an aim of policy, far ahead of avoiding inflation, and the minor objective must yield to the major whenever they come into conflict. But inflation can have very real and immediate repercussions on the war effort. That many people nowadays have more and more money in their pockets, while others—and in particular members of the Forces—have not, is a gravely upsetting social fact. The shortage of fuel—to take a particular example of the administrative disorder caused—is at least in part due to the fact that wide sections of the public have money to burn, and the Government is now being forced to spend time and energy on devising most complicated and cumbersome rationing schemes which will be very costly in administrative manpower. It would be foolish to suppose that a tight control of purchasing power would be enough by itself to avoid the wasteful use of resources, or that taxation policy can undo all the harm that is done by the continued inflation of cash earnings. But it is the Chancellor of the Exchequer's duty to provide the maximum assistance that is in his power.

How much is in his power is difficult to say. The prospective expenditure, as was argued last week, will

be at least £5,200 and perhaps £5,500 millions. Revenue on the basis of the existing taxes, should be somewhere between £2,300 and £2,400 millions. The deficit, in other words, will be in the neighbourhood of £3,000 millions. How much of this can be reckoned as the true inflationary "gap" it is difficult to say, but it is worth recalling that the Chancellor's estimate a year ago of what could be raised from non-inflationary sources (genuine savings, drafts on capital, etc.) was £1,522 millions, to which should be added the subsequent increase in the yield of taxation, amounting to about £440 millions. It seems likely that, with a deficit of £3,000 millions, the true "gap" will be not very far short of £1,000 millions.

It can be said at once that revenue, in the ordinary meaning of the word, cannot possibly be increased by anything like this amount. All that can in practice be done is that every practical possibility of increasing taxation without unbearable inequity should be taken. Even after the last two Budgets, the Chancellor still has some expedients left. The surtax limit can be brought down to £1,500. The Purchase Tax, since it has failed to restrict purchasing, can be increased; there is no reason why the maximum rate on many of the goods that can still be bought should not be higher than 24 per cent. A Services Tax, regularly propounded in these columns, could be imposed. The liquor duties are not reducing consumption, and can therefore be set still higher; the same is even more true of tobacco. The income tax, so long as its basic structure remains untouched, has perhaps reached the limit. It would probably be harmful to raise the "standard rate" to more than 50 per cent, while a reduction in allowances would either penalise the large family as against the small or else impose the burden of coping with still more millions of forms on a machine that is already creaking. But a radical reconstruction of the income tax has become a matter of urgency and, as one of its by-products, an increase in the actual yield might still be secured while the psychological effect is diminished. In these and other ways, revenue can still be increased. As an aim of practical policy, the Chancellor might set himself the object of raising £2,500 millions in revenue. That would not close the "gap"; but it is probably about as much as is possible along the lines of existing taxes. The only way of raising a substantially larger sum would be by an adoption of the principle of deferred pay. If, for example, it were possible to defer until after the war the payment of all overtime wages, a total of over £3,000 millions could be brought into the Exchequer and the gap could be completely closed. The present consumption of the wage-earners would not suffer to any material extent, and their future security would be greatly enhanced. Nevertheless, there seems to be no

BUDGET FIGURES

It has been the custom of The Economist for many years to collect together, shortly before the Budget is presented to Parliament, facts and figures relating to the national finances. At present paper rationing compels severe cuts in the explanatory matter. Where possible, however, the tables which have appeared in former years are given below, although some have had to be omitted because the sources of the figures are no longer published.

Revenue

TABLE 1.—REVENUE (EXCHEQUER RECEIPTS)

	(£ millions)					
	1913-14	1929-30	1938-39	1939-40	1940-41	1941-42
Income Tax	43.9	237.4	335.9	390.1	523.9	769.7

* £40,000.

† Including Road Fund revenue self-balancing until 1936-37 inclusive.

TABLE 2. CUSTOMS AND EXCISE DUTIES—NET RECEIPTS.

Details of the yield of customs and excise duties in recent years are given in the following table. The biggest increases in 1940-41, compared with the previous year, are in the beer and tobacco duties, which were again increased in both the April and July Budgets of 1940. A new item in the table is the purchase tax, which yielded £26 millions in 1940-41, against an estimate of £40 millions. The only change in customs and excise duties made in the Budget for 1941-42 was the repeal of the medicine stamp duties, estimated to cost the Exchequer £840,000 in a full year.

	(£ thousands)

TABLE 7.—FINANCING EXPENDITURE

The following table summarises the Exchequer returns for the financial year and shows the respective shares of revenue and borrowing in meeting expenditure. It will be noted that the difference, amounting to £2,715 millions, between ordinary revenue on the one hand, and total expenditure (including sinking funds and debt repayments) on the other, was met as to nearly £500 millions by borrowing from the money market (i.e., by additions to floating debt), compared with £1,329 millions in 1940-41; nearly £410 millions by small savings (3 per cent defence bonds and national savings certificates), compared with £360 millions, £1,779 millions by other borrowing, compared with £995 millions; and £27 millions by miscellaneous receipts, in which is included contributions received under the War Damage Act:—

£000		£000	
Total ordinary expenditure	4,775,694	Total ordinary revenue	2,074,057
New Sinking Funds	12,169	Loans raised—	
Loans repaid—		3% Funding 1959-69	120,825
4% Conversion Loan	45	3% Def. Loan 1954-58	45,731
Nat. Savings Bonds	850	3% Def. Bonds (net)	182,075
1% Treasury Bonds	50	3% Savings Bonds	577,416

The items shown as net are given after allowing for repayments and receipts.

TABLE 8.—THE COST OF SOCIAL SERVICES

The latest available figure for expenditure on public social services by central and local authorities appeared in Hansard of March 24, 1942, from which the following table has been compiled. The expenditure figures include payments out of taxes and rates, and also contributions by the persons benefiting in the case of the contributory schemes. Many persons shown in the last two columns as receiving benefits do so under two or more of the Acts mentioned in the first column, and are, therefore, accounted for more than once.

Service	Great Britain		Total Number of Persons directly benefiting from the Expenditure	
	1938-39	1939-40	1938-39	1939-40
Unemployment Insurance and Assistance Acts—	£000	£000		
Unemployment Benefit (a)...	64,328	45,903	14,352,000*	14,541,000*
Unemployment Allowances (b)...	39,643	32,218	19,086,000*	Not available
National Health Insurance Acts (c)...	40,554†	40,067†	21,446,300*	Not available
Old Age Pensions Acts (d)...	96,195	97,842	4,293,000	4,409,088
War Pensions Acts, &c. (d)...	37,460	36,961	8,008,551	Not available
Education Acts...	122,398	121,083	Not available	Not available
Public Health Acts (e)...	25,005	27,544	1,432,624	1,424,894
Housing Acts...	47,683	51,135	Not available	Not available

Other (f)...	10,093	10,298	Not available	Not available
	530,954	512,346		

* Numbers given are of insured persons. † Calendar years 1939 and 1940 respectively. (a) Including agricultural scheme. (b) Including prevention and relief of distress. (c) Including Contributory Pensions Acts. (d) Including Personal Injuries (Emergency Provisions) Act, 1939. (e) Relating to hospitals and to treatment of diseases, and to maternity and child welfare work and midwives. (f) i.e., Physical Training and Recreation Act, Approved Schools Acts, and Lunacy and Mental Deficiency Acts.

TABLE 9.—CIVIL AND REVENUE DEPARTMENTS NET EXPENDITURE† EXCLUDING CIVIL DEFENCE

This table gives estimates of purely civil expenditure for 1941-42 and 1942-43, compared with the amounts actually spent in the two previous years. The biggest change since the war is in unemployment assistance, which has shown a big fall. The pensions item, on the other hand, has increased owing to the assumption by the state of the responsibility for paying supplementary pensions to needy pensioners. Details of the amounts actually spent in 1941-42 are not available, but, as Table 6 shows, the total for civil and revenue departments and roads came to £416½ millions, a saving on the estimate of over £21 millions.

SOURCES OF THE TABLES

A great many of the official sources of material relating to the national finances are now no longer published. Among those which still appear are the Finance Accounts of the United Kingdom, the Civil Appropriation Accounts, the Revenue Departments Appropriation Accounts and the Civil Estimates.

(Continued from page 491)
hope of securing such a radical concession to common-sense.

But what of the major problem? What opportunities are there for finance to contribute some assistance to the winning of the war? It has frequently been argued in *The Economist* that the mobilisation of the resources of the country could have been achieved much more speedily and with far less human misery if there had been a wider extension of the principle of compensation—to be paid after the war. The suffering caused, haphazardly and without discrimination, by mobilisation measures has been a persistent brake on the war effort. There should have been an extended application of the basic formula of the War Damage Act. Wherever a section of the public can be clearly identified, in which some individuals, through no fault of their own, suffer much heavier losses than others, a scheme of compensation should have been drawn up, with the financial burden divided equally between the state and the group in question. It may not be too late even now for something to be done on these lines.

But, in the main, the phase of mobilisation in this country is now over. The people of Britain are at their battle stations and the displacements of persons and property that are still to come will be comparatively minor. The chief problem now is to secure the maximum efficiency of the resources mobilised. What can finance contribute to this end? Here the region of controversy is entered. There is one school of thought which argues with great cogency that the way to secure maximum efficiency is to provide cash incentives both to manager and to worker. Excess Profits Tax, in this view, should be reduced, and all restrictions should be removed from the increase in earnings. It is certainly true, as a general proposition, that no means of increasing output that is normally available is as potent as piece-work for the workers and the possibility of increased profits for the owners. But these are not normal times, and the argument, as generally presented, is far too sweeping. It is to the managers of industry, not to the owners, that incentives need to be provided, and a system of individual bonuses for those directly concerned would be far cheaper and far more effective than a relaxation of the controls on profits in general. Similarly with labour, an increase in general wages might lower the incentive to added effort. Moreover, there is the moral issue involved in any general removal of the restraints on earnings and profits. It is more than doubtful whether the community could be persuaded to tolerate the encouragement of profiteers in the ranks either of capital or of labour. It cannot be too strongly stated that large and widening discrepancies in spending power—even though the larger part of the

increased cash earnings cannot in fact be translated into increased consumption, because of rationing and limited supplies—are seriously upsetting to national morale.

There is at least as much force in the opposite set of contentions. So long as the mainspring of society is the money incentive, that incentive must be left free to operate. But when, as in wartime, it cannot be left free (at least without the gravest social and moral disturbance), the only thing to do is to try to remove it completely. This is the school of thought which would, at the beginning of the war, have incorporated the whole population in the services, assigned ranks and rates of pay and divorced income completely from functions. The argument would be that, so long as an industrialist acts within a profit system he must seek a profit for fear of making a loss, and that the way to free him for the task of maximum production is not to dangle the carrot of excess profits in front of his nose but to relieve him of all fear of loss by acquitting him of financial responsibility. With the wage-earner, the insistence on higher earnings would disappear, it is argued, once it was clear that everybody's remuneration was fixed. Now that the nation is virtually mobilised the need for adjustments of pay to give war workers a relatively higher reward than those not yet at their battle stations has largely passed away. There may be some truth in the paradox that the best way to increase incentive at this stage is to abolish it completely.

It would be rash to pontificate upon these questions. But it is becoming reasonably clear that the present compromise is unsatisfactory—economically, socially and morally. At present, the greater part of the nation's activities is formally motivated by money incentives, but taxation is so high that it blunts the edge of incentive. Should the incentive be liberated and financial moderation allowed to go hang, with all the inflationary consequences of such an act? Or should the Government take over more and more of the financial responsibility of the community, fixing wages and profits, regarding both as a direct charge on the Exchequer, and relying on the incentives of patriotism, emulation and command? Or perhaps the two are not complete opposites. It is possible to envisage a system in which the labour force received, directly from the Government, standard earnings irrespective of the hours worked, in which profits at a fixed rate (e.g., the EPT standard) were similarly paid out of the Exchequer and in which contract prices made no allowance for either factor—but in which provision was made for cash bonuses to individuals for proved efficiency in excess of the standard.

These are abstract questions. But they are also becoming real questions. It is very much to be hoped that some discussion of them will find a place in the Budget speech.

Oaths and the Man

IN 1745, the year of the Rising, the air of England was full of invasion, and Parliament, as one of its war measures, passed an Act to prevent profane cursing and swearing. It is not at first sight clear how an Act to punish bad language aided the war effort of a Hanoverian King, but the preamble to the Act gives the clue:

Forasmuch [it says] as the horrid, impious and execrable vices of profane cursing and swearing (so highly displeasing to Almighty God and loathsome and offensive to every Christian) are becoming so frequent and notorious that they may justly provoke the divine vengeance to increase the many calamities these nations now labour under. . . .

Having cleared the ground and made plain the connection between cursing and the loss of the war, the Act lays down the course to be pursued if any man shall be heard cursing or swearing, the action to be taken by the justices, constables and tythingmen, and the penalties to be imposed when the crime is proved. If a constable overhears an oath, he is to lay information against the offender, and, if the man be a stranger, to drag him forth-with before a justice. The justice, when the case is proved, will inflict the appropriate punishment, and if

the justice himself should catch the sound of bad language he is not to wait for a formal trial but convict and sentence the criminal on the spot. He shall then sign a certificate as follows:

Be it remembered that A. B. was convicted before me of swearing one or more profane oath or oaths, or of cursing one or more profane curse or curses as the case shall be.

The clerk of the justices will then receive a shilling for the conviction, and another name will have been added to the history of crime.

As the young Pretender's schemes went wrong, and George II kept the throne safe for the statesmanlike George III and the virtuous George IV, the Act was no doubt a success; the horrid, impious and execrable vice was stamped out, and the divine vengeance was not provoked to increase the calamities under which the Realm laboured. But, alas, the cure was not permanent. The habit, though checked, was not exterminated, and 197 years after this law received the Royal assent, men may still be heard to sprinkle oaths into their conversation and relieve their irritation with an occasional explosive

curse. A few weeks ago, for example, Mr Fred Walker (a War Reserve constable who ought to have known better) so far forgot his sacred calling as to make a profane comment. He had been summoned for his rates and he went to the council office to pay. Asked if he wished to pay 4s. costs, he made his profane comment and threw the money at the clerk who gave him a receipt.

So gross an infraction of the Act of George II could not be overlooked, and he was charged before the justices, found guilty, certified doubtless as having sworn one or more profane oath or oaths or (as the case was) having cursed one or more profane curse or curses, and then—then came the moment of real delicacy, the moment when the justices had to make their difficult decision, the moment on which Mr Fred Walker, if he is a snob, will look back with shame for the rest of his life.

To appreciate the real delicacy of the justices' dilemma we must go back to the Act under which Mr Walker was convicted. The fact is that the Act lays down a scale of fines to be inflicted on the convicted criminals:

(a) For a day labourer, a common soldier or a common seaman, one shilling.

(b) For a gentleman, five shillings.

(c) For a man who is not a day labourer or common soldier or a common seaman, but, on the other hand, is no gentleman, two shillings.

It was admitted both by the prosecution and by the defence that Mr Walker was not a labourer or soldier or a seaman. He was a War Reserve constable. But was he a gentleman? Should the justices temper their justice with mercy and hold him to be no gentleman, so that they might fine him only two shillings, or should they boost his social standing and fine him five? It would be nice to know how they approached the problem. Did they put it to him and ask him where his preference lay—whether he would rather pay an extra three bob and be certified a gentleman or (taking the cash and letting the credit go) get off with two bob and sink or swim with the canaille? We do not know. All the reporters tell us is that he was put into the no gentleman class and fined two shillings, and to-day he stands convicted of having made a profane comment and of not being a gentleman.

It looks like bad luck for Mr Walker, but actually he was rather lucky, because the justices, if they had done their duty to the full, would have fined him another £2—eight times the gentlemanly fine. You see he was a

constable, and the Act says that if a constable should hear a profane oath sworn and fail to take the criminal into custody he is to be fined forty shillings; and as Mr Walker must have heard his own comment and appreciated its profanity, it was his duty to lodge information against himself. So really he seems to have been guilty of two crimes, the first (2s.) when he swore, and the second (40s.) when he failed to take himself into custody. Gentleman or no gentleman, he got off lightly.

This is one of the most promising expedients for wasting time and effort that the war has so far produced. Mr Walker's time was obviously occupied by the case when he might have been digging for victory or been on duty. The police must have given a good deal of time and thought to it when they might have been hunting spies and investigating the black market. Mr Walker's solicitor had to mug up the Act of 1745 and prepare the defence; and the justices had to hear the case and ponder their judgment, when they might have been carrying on their own works of national importance. Altogether a capital waste of valuable time, and one capable of great development. Wherever men gather there are oaths and curses to be heard, and a small army of Home Office snoopers could reap a rich harvest of prosecutions under this law—and endless hours could be wasted on the trials. How easy it is to picture one such trial. The darkening courthouse as the trial draws to its end. The haggard figure in the dock, the tense silence as Sir Patrick Hastings, counsel for the prisoner, makes his last appeal to the jury.

My task, Sir Patrick says, is almost done. I ask you to say that my client did not use the phrase of which he is accused. If you do, he leaves the court blameless. If you do not he will be branded for life as a man who called a fellow-countryman a damn fool and told him to get to hell out of here. But his monetary punishment will also rest with you, for if you find that he is a gentleman his fine will be 150 per cent greater than if you find the opposite. It is a matter of fact for you to decide, and, in deciding, I implore you to remember the evidence. You have been told his trade. He is a Fleet Street hack who writes so-called light leaders for *The Economist*. Is that the occupation of a gentleman? Above all, you have seen the man himself—his face, his clothes, his bearing and, having seen them, I defy you to put him in the 5s. class. I say you must decide in accordance with this overwhelming evidence and fine him only 2s.

NOTES OF THE WEEK

Agreement?

At the time of writing, though his self-set time limit has expired, Sir Stafford Cripps has neither failed nor succeeded in his mission to India. Three times he has promised a public announcement on the state of the negotiations, and three times it has been postponed. For most of the past two weeks, the odds have seemed against agreement. The battle of words has mostly been around the Indian demand to control defence during the interim war period before the post-war stage of Dominion status, offered in the British plan, is reached; and the British Cabinet is reported to have conceded an Indian Defence Minister, while reserving its own responsibility, and that of General Wavell, for defence of the Indian link in the chain of United Nations. But disagreement has obviously gone much deeper than this urgent and immediate issue. The British plan itself has not found favour, as it stands, from any major Indian group. The Hindu Mahasabha has openly protested against the "vivisection" of India by the proposed right of provinces to stand out of the United Dominion of India. The Moslem League, on the other hand, is dissatisfied because the opportunity for Moslem independence by partition is not taken far enough. Congress, to judge from the *obiter dicta* of various spokesmen, including Pandit Nehru—neither Congress nor the League has put out any official statement yet—still believes that the right solution is to set up a National Government

now, with the power after the war to settle differences between Hindus and Moslems without conditions imposed by Britain; and the proposed right of the Indian States to send nominated, and not elected, representatives to the Union assembly is opposed. On the face of it, the deadlock is unbroken. But the discussions have gone on. No outright rejection has been published. There have been proposals and counter-proposals behind the scenes; and hopes in New Delhi were higher on Wednesday and Thursday than at the week-end. It is hard to believe that some of the Indian bargainers are not trying to play "heads I win, tails you lose," knowing that Britain cannot divest itself of responsibility for the defence and administration of India, whatever the fate of these negotiations. This interpretation has been strongly voiced in the United States, where up to now the Indian Nationalists have been accustomed to look for indiscriminate support and sympathy, practically as a matter of routine; and there is little doubt that the frankness of these American comments, and the personal counsel of Colonel Johnson, President Roosevelt's envoy in India, have given the Indian leaders cause to think again. Until now, with no official statement from either side, they have appeared to be asking for more powers in defence than the British Parliament itself possesses, and, on the wider question of Indian independence, to be on the brink of throwing away the best chance of freedom that India will ever have. It is a matter of deep concern for the whole free world that second thoughts should prevail.

A Controller-General

The Minister of Supply has appointed Sir George Beharrell as Director-General of Controls. The office thus created is one that has been very badly needed from the beginning of the war. One of the most urgent criticisms that can be directed against the Raw Materials Department is that it has not been able to see the wood for the trees, and a Director-General, who will presumably not concern himself with the details of the day-to-day policy to be pursued in each commodity, but with larger matters of organisation and long-term policy common to all controls, may be able to exercise a good influence. At the same time it is impossible not to express regret over the appointment to such a key post of the chairman of the Dunlop Rubber Company, one of those semi-monopolies whose staffing of the Controls is by far the largest defect of their structure. It was known that Sir Andrew Duncan (as was perhaps natural) saw no objection in the great State-fostered growth of private monopolies. Now he has chosen to re-emphasise his belief in it. Henceforward, Sir Andrew will be known as the professed champion of monopoly.

Free French Recognition

The United States Government has recognised General de Gaulle's authority over French Equatorial Africa. The step, which is the same in substance as the earlier American recognition of the Free French in the Pacific, springs from Washington's realisation of the vital military importance of the Free French Colonies in Africa, an importance which would be enormously enhanced if Madagascar were to fall to the Japanese. The Administration may have felt more inclined to take the step now that Admiral Muselier, who led the St. Pierre and Miquelon expedition, has resigned from the command of the Free French Navy. This limited recognition raises once again the problem of more general recognition for the Free French. General de Gaulle has pressed for it, and has called, too, for the breaking-off of relations with Vichy. On the latter question, only the American Government can decide, but there is reason to suppose that Admiral Leahy's presence in Vichy strengthens the non-collaborationist wing. As for the former question, it would be difficult for the British Government to move to general recognition while the United States still maintained relations with Vichy. The issue must surely be decided on the basis of its military significance. If breaking with Vichy now would ensure a speedier victory for Britain, America, and the Free French, then it would be folly to delay it an hour. But would it do so? Neither the Governments nor the experts are agreed.

Plans and Programmes

The latest reports of the Select Committee on National Expenditure, the seventh and eighth of this Parliamentary session, will serve as useful directives for Mr Lyttelton. One deals with the use of manpower, and the other with the organisation of production, but both have the same message—the need for “a programme at all times planned sufficiently far ahead.” Mr Lyttelton's Production and Planning Staffs are now in a position, with the Minister's Cabinet authority, to give the “unified” direction to a “balanced” national plan that the Committee calls for; and there is reason to hope that, at last, the production programme will be sufficiently “informed,” on the one hand, of the relevant data about supplies and capacity, and, on the other hand, of the strategic requirements of the Services. Moreover, there should now be the reverse process—that is, the strategists will be informed, as they make their programmes, of the material resources available, so that they can cut the coat according to the cloth, and in the best style. But, conceivably, there may be one gap in this overdue dovetailing. The Select Committee asks for a permanent body to deal with the allocation of manpower between the Services and industry, and among the industries. For too long the manpower requirements of the Services were taken as a datum and immutable, when the only datum, obviously, is the total manpower available for all purposes, fighting and producing weapons. The question is whether Mr Lyttelton and Mr Bevin “in co-ordination” can give the same unified direction and balance to this problem that Mr. Lyttelton “in authority” will now be able to give to the distribution of material factors in the national programme.

Trouble in the North

The collective resignation of practically all the clergy of Norway is another big step in the relentless struggle the Norwegian people are waging against their quisling Government. It was not at first certain whether the rank and file of the clergy would follow the lead given by the Norwegian Bishops some weeks ago. Now the authorities are faced with a revolt at a level of national life which intimately touches every Norwegian family. The teaching profession and the Pastors of the Church are on strike against the dictator state, in defence of one of the most fundamental of the rights of man—the right of parents to determine the education of their children—and resistance here cannot but prove a rallying ground for resistance everywhere. It is not the most revolutionary but in a sense the most conservative elements among the Norwegian people who are taking up the fight for human freedom. If their stand is maintained—and there is every reason to believe that it will be maintained—then Quisling will have to rule against a united front of the people he has betrayed. The struggle is being watched with eager anxiety and sympathy from Sweden. In February, the Swedish bishops associated themselves with the action of the Norwegian Bishops and Bishop Aulen preached a vigorous sermon on the sufferings of the Norwegian people. In the course of it he said: “One day the plea for help coming from the West may rise to a cry which we cannot refuse to hear.” Towards the end of March, the Central Board of the Swedish Public and Elementary School Teachers' Association issued the following statement:—

“The teachers of Sweden have noted with regret and dismay, the measures taken against the Norwegian teachers, and with warm sympathy have followed their struggle against the attempt to convert Norwegian education into an instrument for rearing people with a philosophy of life foreign to the Nordic mentality.”

Comment on Quisling in the Swedish press has been free and often violent, in spite of some much-criticised efforts on the part of the Swedish Minister of Justice to ban reports of tortures and brutality in the Quisling camps and prisons. But the Norwegian people cannot hope for much beyond sympathy. Swedish policy remains one of rigid and absolute neutrality which will be defended against all comers, and there is no doubt that the great majority of the people are wholeheartedly behind this attitude. Although opinion is at one in condemning the Nazi occupation of Norway—as the *Dagens Nyheter* put it on April 2nd: “What the Nasjonal Samling is doing in Norway is aimed at converting the occupation into a conquest”—it is equally united in supporting the Finns in their struggle against Russia. In fact, the British alliance with Russia has upset Sweden considerably, particularly the Swedish Left, which is strongly anti-Communist. Sweden's desire for neutrality is thus reinforced by the country's inability to get straight its ideological sympathies. It is anti-German as far as Norway is concerned, anti-Russian in Finland. One remarkable result of this divided attitude is a further rationalisation of the desire to maintain neutrality. “We must remain outside the conflict (argue the Swedes) so that after the war, committed to neither side, we can act as a bridge between Norway—fighting against the Germans—and Finland—fighting with them.”

Part-Time Workers

A further encouragement has been given to part-time work by a new regulation relieving employers and workers from paying unemployment contributions in the case of employment begun after September 3, 1939, where not more than 30 hours of work in a week are involved. This is an obvious and welcome concession, for since this part-time work is, or should be, additional work—either to a person's normal employment or to domestic duties—the question of compensation for loss of the part-time job does not arise; it is the State that is receiving benefit at the hands of these part-time workers, not the other way round, and unemployment contribution merely seems to these workers an additional tax. It is not quite clear, in fact, why the same concession has not been applied to national health and pensions insurance. There are the same considerations—many of the women will not trouble to apply for the medical benefits, which are the only ones immediately available, and, except on the poorest prognosis of the

duration of the war, will not be able to qualify for pensions. There ought surely to be some means of enabling part-time workers to become voluntary contributors either for health or pensions or both, as is already done for workers who overstep the income limit for compulsory insurance, instead of imposing a compulsory payment upon them. A corollary to the concession in respect of unemployment insurance is the exclusion of these part-time workers from the operation of the Essential Work Orders. Some people are undoubtedly held back from volunteering for part-time work by the fear that they may not be able to leave if their circumstances change. On the other hand, it is difficult for employers to make arrangements for such work if they cannot count on workers being there.

The Church Within “Co-Prosperity”

There seems little doubt now that the Vatican is to follow up its acceptance of diplomatic relations with Japan by exchanging ambassadors with Free China. This helps to rectify the anomalous position into which the foreign policy of the Holy See had fallen. At the same time, it is a fit recognition of the extent to which the Catholic Church is growing in China. Converts in the last twenty years are variously estimated at between a million and two million. Many of these, of course, do not live under the authority of the Generalissimo; at the same time, the victory of Free China is the only guarantee that the widespread missionary work will continue. No amount of diplomatic representation would help the Catholic Church if “Co-prosperity” were to be triumphant. The Japanese press is already giving its own gloss on the new agreement. Tokio newspapers have pointed out that the new relations with the Vatican have nothing to do with freedom of action for Catholics. Religion within the sphere of Co-prosperity will be tolerated only if it keeps in step with the Way of the Emperor. Religious liberty can never mean liberty to obstruct any Japanese policy or action. Under the circumstances, it is difficult to see what any Church can gain by accepting formal relations with so totalitarian a partner.

Stirrings at the Board of Trade

There are signs of increased activity at the Board of Trade. The new President, Mr Hugh Dalton, has already shown his eagerness to discover what has been left in the pigeon-holes and to take decisions on some of the many problems that he found unsolved. Coal and the clothes ration are two of these problems which have been taken in hand. Price control is another. The criticism of the administration of the Goods and Services (Price Control) Act, 1941, voiced recently by the chairman of the North Midland Price Regulation Committee, has not fallen on deaf ears. At a recent meeting of the chairmen of the Central and local price regulation committees, Mr Dalton expressed his determination to act. Urgent consideration is to be given to the revision of the Acts on the initiative of the Central Price Regulation Committee; there is to be closer liaison between the Central Committee and officials of the Board of Trade; machinery is to be introduced for expediting decisions on prosecutions. A tightening up of price control is necessary if it is to be effective. But there are a host of other problems to be tackled at the Board of Trade. There is the need for further cutting down supplies under the Limitation of Supplies (Miscellaneous) Orders. And there is the thorny, but very pressing, problem of concentrating the non-food section of retail trade.

The Health of the Women's Forces

A strong Committee is at present investigating conditions in the women's Services, primarily from the welfare standpoint. In the meantime, part of the ground has been covered by the Select Committee on National Expenditure in its sixth report of the session, which deals with the medical services of the WRNS, the ATS and the WAAF. Now that the recruitment of women to the Forces has passed from the stage of grudging acceptance to one of urgent national importance, their health and welfare have become a national responsibility. The fact that women are now doing men's jobs does not mean that they can put up with the same conditions as men, or stand the same strain; indeed, Service life is to most women a far greater upheaval than it is to men. The Select Committee considers that the existing medical examination is not adequate, and suggests that it

should be investigated by a body of gynaecologists. It further suggests that a psychiatrist should be appointed to the Medical Advisory Committee of the Ministry of Labour with the ultimate object of eliminating the temperamentally unfit who so often have to be discharged. The Committee realises that this question of temperament is a difficult problem—which is, in this case, not confined to women. The trouble is that many of these psychopathic cases are border-line ones—some break down under service conditions, others do not—and a country which may depend for its survival on the use it makes of every marginal man and woman can hardly afford to take the generous course of eliminating both sheep and goats. Nevertheless, the occurrence of anxiety neurosis, to which women in Service conditions are especially prone, should receive more attention than it does at present, and there seems no reason why there should not be a psychiatric centre for the women's Forces where such cases could be treated. But perhaps the most serious omission in the health services of the women's Forces is the shortage of real welfare officers such as exist in factories. Too often the officers are young and totally inexperienced in any sort of welfare work. Allegations of immorality in the women's services have been stupidly exaggerated. But it would be equally silly to deny that a sex problem exists, or to pretend that illegitimate babies are not born to members of the women's Forces. This subject is now being fully investigated by the welfare committee, but it is not necessary to wait until it reports for the Ministry of Labour to appoint experienced welfare officers to all large women's units, who could give the elementary guidance in such matters which is at present so often lacking.

The Future of Education

Easter conferences were not so thick on the ground this year. At one, of schoolmistresses, the future of education was canvassed, with two main themes, the parity of women teachers with men and the protection of young people against bad books and bad films. From the scanty reports, there is little evidence that the real issues involved in the next stage of democratic education came up at all—the overriding need to make schooling and leadership in all walks open to all talent, for the sake of society no less than the individual (stressed by the president of the National Union of Teachers); and the need to extend education into active and adult life. These two changes—the widening of the nation's field of choice and the broadening of its modes of training—must come before all purely professional and technical preoccupations. If the spirit of equal citizenship, national service and individual duty can be carried forward from war to peace by means of a practical, working programme of educational reform, the schoolmistresses will scarcely need to license their pupils' pastimes.

Shorter Notes

The restrictions on visits to the coast between the Wash and the Thames and between Hastings and Littlehampton, which were lifted during the close season for invasion, will be reimposed on April 15th.

A misprint occurred in a Shorter Note on page 462 of *The Economist* last week. Compulsory enrolment for the Home Guard, which formerly applied only in an area approximately south of a line from the Wash to the Severn, has been extended to the rest of the country, not, as stated, to the west of the country.

The quarterly return of the Registrar-General for the three months ended December 31st last shows a birth-rate per 1,000 of the population of 13.9, the highest in the fourth quarter of the year since 1936. On the other hand, over the whole of 1941, the rate was 14.2, compared with 14.6 in 1940 and 14.9 in 1939. Absolutely, the number of births last year—586,778—was the lowest since 1933.

An Extraordinary Advisory Council, composed of delegates from the Dutch Empire, Dutchmen who escaped from occupied territory and Dutchmen resident abroad, will be set up in London for the duration to help the Dutch Government. As a representative body, it is intended to fill the gap caused by the absence of a Parliament.

AMERICAN SURVEY

Manning the Farm Front

(From Our Washington Correspondent)

"I GAVE him a \$5 raise two months ago, and every time I see him he talks about another \$5." That is how the farm labour situation is currently reported by many a farm operator with one or more hired men.

Production goals for this year have been stepped up, in the case of all of the chief commodities except wheat. The percentages of increase run from five to ten per cent over last year's high totals on most crops. They strike highs of from 57 to 155 per cent on crops like soya beans and peanuts that can be used to replace former imports of oils. And in agriculture, particularly in such departments as livestock and dairying, rapid expansion is a far more difficult process than in the industrial world.

And the same war effort that is behind the farmer's attempt to make his output plentiful is making his help scarce.

For years, the country's farms have—without recompense—supplied the cities with a major resource—people. The majority of young people in the factories at any time are boys and girls from the country. (Before the social security legislation of recent years, the farms not only bore the agricultural share of depression, but served as a major refuge for displaced factory workers who came back home for the duration.)

These young people are to-day being drawn off the farms by a double drain. Many of the boys are of the right age for selective service. More of them, and many of their sisters, have left for war production jobs. (Chapter and verse on these movements is currently available in the first interim Report of the House of Representatives' Select Committee investigating National Defence Migration.)

Actual figures on the extent and nature of current shortages are difficult to assemble; one estimate forecasts as many as a million fewer workers for this harvest than for last year's. There are several distinguishable categories of farm labour.

There is the unpaid labour contributed to the farm by members of the operator's family. This is the category where readjustments due to the draft and the attraction of factory wages are most pronounced.

There is the "hired-man" group, workers who are steadily employed around—or nearly around—the calendar. In this group, there have been a number of measurable changes. By what appears to be an anomaly, the number of hired workers employed on February 1, 1942—close on to 2,000,000—was the highest since February 1, 1930. What this actually means is that the layoffs during what in many states are practically idle months did not take place, or rehiring took place at an earlier date than usual, because operators feared the men could not be had later on. (The Agricultural Marketing Service reports show that wages per month without board averaged \$36.61, \$40.44, \$44.95, and \$45.47 for the respective months of January, April, July and October, 1941, as contrasted with \$35.27, \$36.41, \$37.18 and \$36.84 for the same months of 1940.)

The men actually hired are also different from the usual group—there are more very young boys and more persons above draft age. This change has acutely affected the housing situation. Where the single man formerly got his keep at the farm where he was employed, or boarded with a neighbour, the older man is likely to have a family. And there is likely to be no place to put it. The difficult problem of finding a way to relate agriculture to the federal housing programme, on which some work had been done before the programme was turned to the war effort, currently becomes more pressing.

A special case in this connection is the sharecropper system of labour in the South. For almost a decade, stimulated in part by the AAA programmes which made owners eager to obtain sole right to the benefit payments, in part by mechanisation, and in part by the new availability of relief funds as a means of keeping workers going during periods when they would otherwise have to be "furnished" by the landlord, the trend has been away from sharecrop-

ping to day labour. At the peak seasons of work, the chopping and the picking of the cotton have been handled by hauling casual workers out in trucks from city centres.

This trend has now been reversed. The tyres on the trucks used for this purpose have always been frail; now they are irreplaceable. And the people, many of them, are not there to be hauled; they have found their way to a less precarious living.

So sharecropping is on its way back again—the landlord thinks he would feel better if he had quite a few people right there on the place. But it is sharecropping with a difference. Instances are cited of landlords leaving cheques with employment agencies to pay moving costs for a tenant willing to take the job. More instances are cited of landlords making improvements in the shacks where they have previously housed their croppers, to provide inducement to move in. Once there, the very considerable recent advance in farm commodity prices means that the tenant's cash return for his part of the crop will give him a better income than in past seasons.

Migratory Labour

The greatest uncertainty in the farm labour situation relates to the migratory workers, who, until now, have gathered the speciality crops that require enormous quantities of hand labour for short periods at ripening time. Before World War I, the wheat crop was the main crop thus handled; it was done by single men, bindlestiffs who rode the rails to the Great Plains and worked at such occupations as lumbering in the winter. But the post-war development of refrigerator cars, quick truck transportation, domestic refrigerators and frozen foods, plus ideas about vitamins that made people add many more fresh fruits and vegetables to their diet, induced an expansion of specialised truck crops adequate to supply nationally distributed demand. Most of these crops can be grown with relatively few workers up to the time of harvesting. Then the requirements rise into the thousands overnight. In California, about 200,000 seasonal workers are needed to harvest 200 different commercial products. In Texas, chiefly for cotton and winter vegetables like spinach and onions, nearly 350,000 are required. Florida's population of floating workers numbers from 40,000 to 60,000 each winter and spring. These states are the pivots of three north-south migrations, up and down the Pacific coast from the Imperial Valley to the Washington apple country and back, up and down the Mississippi from cotton to sugar beets, to cherries in Northern Michigan and back through onions, peaches, tomatoes to cotton again, up and down the Atlantic coast, berries in the Carolinas, truck in New Jersey, fruit in upstate New York, back to cranberry bogs and oyster packing. Where will the families that have done this work be this summer? And in what state are the jalopies—none of them better than the Joads' truck in "The Grapes of Wrath"—which are their sole means of getting about?

Mobilising the Labour Supply

Various attempts to rationalise the farm labour situation are now at some stage of organisation. They take two main forms—mechanisation, and the more efficient use of available labour.

During the last war, the development of the combine revolutionised the wheat harvest. Last fall, when the sugar cane was cut in Louisiana, a certain number of machines were used, each of which did the work of 450 men, with the additional advantage of cutting closer to the ground than is possible for a person swinging a knife, and thereby conserving valuable inches of the part of the cane with the highest sugar content. Work on the mechanical cotton pickers now in experimental production by the Rust Brothers and other firms will undoubtedly be pushed. Dairies are making increased use of milking machines. In the Great Plains, there is demand for a one-man outfit to

cut and bale alfalfa in a single operation. Production per worker is now about 30 per cent higher than during World War I, and more than 50 per cent higher than during the five years before that war. The only limiting factor on a further projection of this trend during World War II is the availability of materials—even before the industrial war programme got going, farm machinery consumed 19.5 per cent of the country's cast iron.

It has been estimated that the production goals for 1942 will require 102,819,000 more man-days of labour than was used in 1939. One approach to this total is to hold workers on the farm. Besides the incentives in cash and in kind—especially housing—that are being offered, a formula is being worked out with the selective service system to keep certain key skilled workers on the farms. (Until recently, selective service boards in many areas have accepted the assumption that farming is something any one can learn overnight and troubled very little about the effect of the draft on the production of individual farms in their areas; at the same time, few farmers asked for exemption for any of their help on the grounds of being irreplaceable.)

Numerically more important than these efforts are those being made to use available labour efficiently. Cases exist where members of producers' co-operatives have pooled their labour, so that hiring and assignment is now done by the co-op rather than by the individual farmer; the system has provided a steady flow of work and thereby attracted workers to the steady income afforded.

Where outright pooling is not resorted to, many areas are extending the old threshing ring idea to include a variety of other occupations.

Along the lines of the big migrations, the Farm Security Administration is extending its system of mobile camps. These camps were originally started to meet some of the worst of the health and housing situations of the depression-migration years. They are communities on wheels—many of their gadgets for quick, inexpensive overnight breaking of camp and setting up in a new area are borrowed from the circus. Each camp has an office, community tent, clinic trailer, laundry tent, trailer equipped with showers, and accommodations for some 200 families. To-day, they offer a better living to migrants than the hovels-by-the-side-of-ditches which are too often the alternative.

Most generally significant of the efforts to keep available man-hours from going to waste, is the collaboration just arranged between the Department of Agriculture and the US Employment Service, whereby nation-wide clearance of farm labour supply and demand is to be provided this season. In the 1,600 most important agricultural counties, the USES is to have a full-time office; in the other counties part-time representation is being arranged. This integrated approach to the problem of manpower—the USES has previously been chiefly concerned with urban placement and the workings of unemployment compensation laws from which agriculture is excepted—affords public recognition of the close relationship between city and county production problems at the present time.

These various devices have been set up to make use of labour already accustomed to work on farms. Urban sources of rural recruitment also being considered: community mobilisation, use of school and college students during the summer months; organisation of a woman's land army. The first has already occurred in Oregon in the interest of the strawberry crop. Under the Food-For-Freedom slogan, many persons may be willing to work in the fields who would otherwise refrain as a matter of social status. The effect of such mobilisation may be particularly interesting in the South, where the original identity between field worker and slavery has left its mark. The change may be approached from both sides of the racial barrier. Recently, a cotton-picking contest in Arkansas was won by a white man; a negro schoolteacher in Tennessee put his class to work in the fields and had them use their work as the basis for English themes, arithmetic problems, botany lessons. Both facts and attitudes on farm labour are currently on the move—and so is the labour itself!

American Notes

War Transport

Mr. Nelson has forecast that toward the end of 1942 war production will be so great that the problem will be how to provide for its transport. Other prophecies of a transport crisis have not been lacking; but up to the present, at least, the transport system has borne the additional strains imposed by the war effort with considerable

success. During 1941, the railways carried the largest amount of freight in history, in spite of having in use 600,000 fewer freight cars than in 1929, the next largest year. This has been achieved by the establishment of vigilance committees to assure the promptest possible loading and unloading and most efficient use of cars. The withdrawal of much coastal shipping and the U-boat attacks along the Atlantic coast have thrown a new burden on the railways; oil which was formerly sent by tanker from Gulf ports has now to be sent by rail. In this respect, the railways have exceeded all anticipations, and the Petroleum Co-ordinator has expressed his surprise and satisfaction that they have been able to move eastward daily more than 200,000 barrels. Financially, the railways are doing well, despite their disappointment at the rate increases granted by the ICC. Class I roads reported a combined net income in January more than 25 per cent above that of January, 1941. The railroads are now working at near-capacity. Their ability to handle the increasing volume of traffic depends upon further co-ordination of all forms of internal transport; the supply of freight cars; and the avoidance of a labour shortage. The production of new freight cars has been held up by material shortages, particularly of steel plates, but it is now thought that the necessary goal of 1,692,000 cars in service will be attained by October, 1942. The Office of Defence Transportation has begun a detailed survey of prospective manpower needs and shortages in transport, including pipe-line companies, bus and lorry services, Great Lakes carriers and air-transport lines. The greatest opportunity for improvement lies in increased co-ordination between the various forms of transport, which in peace-time were bitterly competitive. The Federal Government has recently assumed control over motor and inland water carriers equal to that which it exercises over the rails, in order to ensure that co-operation is carried as far as possible.

India

The British offer to India and the fact that the United States is no longer a spectator, but a supremely interested

party, have brought about a striking change in opinion on the Indian problem. The British Government's proposals have been very favourably received in America; opinion seems unanimous that they are fair and should be accepted. Indian demands for control of Indian defence have not received much sympathy; the position is seen as similar to that in the Philippines, where defence was kept in American hands. *The New York Times*, long a supporter of the Congress position, points out that "The real choice for the Indian people is not on what terms they will settle for their independence. The real question is whether they will have a chance to achieve independence on any terms." There is a general feeling that "haggling over formulas" should not be allowed to imperil the security of the United Nations or increase the cost of the war in American lives. Whether the plan is accepted or rejected, it has at least succeeded in making it clear to the American people that the "Indian problem" is not entirely of Great Britain's making, and will have helped to remove one of the most fruitful sources of misunderstanding between the two countries.

Standard Oil Replies

The denial by the President of the Standard Oil Company of some of the accusations made by Mr Thurman Arnold do not affect the broad issue of control of international patent agreements, but the new information casts a somewhat kinder light on the activities of the company. The allegations that Standard assisted German interests by building a hydrogenation plant in occupied France, and that arrangements with Japanese interests were sought in view of possible hostilities between the two countries, have been flatly denied. The State Department has revealed that Standard's sale of aviation petrol to Lati, the Italian air-line to South America and Condor, a German-controlled line, was in accordance with the Department's policy of not paralysing Brazilian communications until substitute services could be provided. Sales were restricted, so that the Axis lines could not accumulate stocks, and, shortly after Pearl Harbour, both lines were forced to suspend operations and American planes made available to fly the routes. It seems a pity that the true picture only emerges from a series of charges and counter-charges and denials, and that the Senate Committee was not in complete possession of all the relevant facts, particularly those concerning the activities of the State Department, before its proceedings were made public. The main charge, however, appears to stand: the company's patents were withheld from the community—even after the entry of the US into the war—until a suit instituted by the Department of Justice was successful in forcing the company to disclose them. This is a state of affairs which no country at war can afford to tolerate, and legislation requiring the registration of all patent agreements, national or international, and empowering the Government to release for the duration all patents useful to the war effort, is now being drawn up. The conflict between private and public interests, which has been so strikingly revealed in this case, is, however, not confined to war-time.

Let it Roll

Encouraging news about the production drive has been made public by Mr Nelson. In a report on the steel industry published last week by the War Production Board, Mr Nelson declared that the record of American war production was "as remarkable as anything in our history"; that the aircraft industry had been ahead of the President's schedule in February, and had not fallen below it in March; that the production of tanks was ahead of schedule; and that the production of merchant ships was rising rapidly and would make possible the achievement of the 8,000,000 tons of shipping which the President demanded. March reports from the steel companies show record-breaking production, which in some cases exceeded the February figures by as much as 10 per cent. Labour management committees, to consider all means of increasing production, have been established in more than 300 companies already, at the Government's insistence, and are expected soon to cover most plants engaged in the war effort. Good as the record is, criticism has not been lacking, and Mr Nelson admitted the existence of bottlenecks, particularly in the smooth supply of materials to the aircraft industry. The scrap shortage continues to cause worry; the improvement in steel deliveries follows several months of bad feeling be-

tween the industry and the WPB, centring on the priorities system; and charges continue to be made that the WPB has delayed necessary conversions and allowed industries to continue manufacturing large quotas and even expand their spare parts departments. Small firms have complained that they cannot secure war contracts, but steps have been taken to assist them. There has been a shake-up in the Iron and Steel Branch of the WPB. The system of priorities, which has caused confusion and delay, is said to be being reconsidered. Regional Offices of the WPB are being established, to give local businessmen better advisory service on contracts and priorities than was possible when all information and authority was centralised in Washington. In the new War Powers Bill, which the President will sign shortly, the WPB is given further powers to allocate tools and machinery, and to requisition them from civilian industry. The conversion to a war footing could hardly have been expected to proceed without difficulties or delays; what is important is that they are being dealt with energetically and that American production of war materials is beginning to roll out of the plants.

Iron Rations

Substantial increases in the canning of meat, fish, vegetables, and milk are anticipated in 1942, to supply the Army and Navy, Lease-Lend requirements and school meals. It has been estimated that there will be a resulting increase of 16.5 per cent in tinplate consumption, in spite of conservation measures adopted in view of the loss of tin supplies in the Pacific. These include drastic reduction in the number of sizes of cans, the banning of the use of cans for dog-food, beer, coffee, and other luxury items (a "dog-food crisis" is said to be impending), and the reduction of the amount of tin used in each can. This has been fixed by the War Production Board at 1.25 lb per base box, from the prevailing figure of 1.35 lb. Quotas for tinplate, *terne* plate and long *terne* are being established by the Board, although the actual figures are not yet available. The glass container industry is being expanded to take the place of cans wherever possible. The greatest increase is to take place in canned meats, which in 1942 will be about 54 per cent greater than in 1941. The expansion of tinned fish will amount to 29 per cent and of milk to 27 per cent. The Department of Agriculture is conducting a vigorous drive for increased production and canning of seasonal vegetables such as tomatoes, peas, beans, and corn. Prices have been announced at which the Department will buy tinned vegetables; canners must pay minimum prices to growers in order to have their goods bought by the Department; and help is to be made available to growers in obtaining fair contracts with the canners, and to both producers and canners in obtaining necessary materials and facilities.

Shorter Notes

The registration of consumers for sugar rationing will take place from May 4th-7th. All sales of sugar will cease temporarily from April 27th.

The Supreme Court has held that strikes by seamen on board a ship away from its home port are mutinous and therefore not protected by the Labour Relations Act.

The WPB has ordered that production of electrical appliances such as toasters, percolators, and permanent wave equipment be halted on May 31st, preparatory to the conversion of the industry to war work.

Two rival AF of L and CIO unions in the electrical wiring industry have jointly begun negotiations for uniform contracts with nine employers in New York.

A 40,000,000 dollar reduction in the price of its ordnance and aircraft contracts has been accepted by a middle western manufacturing concern at the instigation of a price adjustment board established to review contracts awarded at the beginning of the war.

THE WORLD OVERSEAS

The Churches of Europe—I

(By a Correspondent)

ON Easter Day most of Norway's clergy announced the resignation of their State offices and emoluments. It was the latest protest of European churchmen against the degradation of society by totalitarian means.

This is only the latest case of resistance by religious men to the Nazification of European life. The position of the churches in German-dominated Europe presents a very complicated picture. It varies from country to country. In Germany itself, though the churches have tried hard to adapt themselves to the demands of the Third Reich, they have not been able to avoid an open conflict with the totalitarian state. In most of the occupied countries, the pulpit has become the last open platform of national resistance to the invader. Over the whole range of varying circumstances and problems, one overwhelming factor seems to dominate: the deep dramatic conflict between the churches, fighting for their independence and sometimes even for their very existence, and the conquering state, with its unlimited ambition to control all the spheres of European life, material as well as spiritual.

The policy of National Socialism in matters of religion has never been clearly defined. A certain measure of vagueness has been deliberately maintained for reasons of political expediency. There has been the famous experiment in paganism initiated and encouraged by Alfred Rosenberg. The mysticism of blood and soil has been pushed to its uttermost limits. Prehistoric symbols and ancient customs *aus dem teutschen Urwalde* have been revived and pieced together into a sort of an *ersatz* religion, which has had its influence upon German youth. It is the creed of the German Warrior, who finds in ruthlessness his perfect harmony with nature and whose mind is free from the humanising influence of Bible and Gospel. It has contributed towards shaping the mind of those youngsters of the German shock troops whose uninhibited ferocity has horrified liberal Europe in recent years. But neither state nor party has so far formally committed itself to proclaiming this as the German religion. The semi-official party creed is that of the so-called National Socialist God Believers, a strange mixture of crude pantheism, exaltation of physical force and worship of the Fuehrer; and, while encouraging all these novelties, the state has avoided any open and definite break with the Christian churches, whose age-long influence is too deeply rooted in the mind of the people. Nothing is more alien to the Nazi method than to start a theological struggle for which a heavy political price would have to be paid. The ancient Germanic gods may be put on new pedestals by the fanatical sectarians of paganism; the state still prefers to pose sometimes as the defender of Christianity. Catholic Bavaria and Protestant Prussia can better be rallied for various political purposes, such as the anti-Bolshevik crusade, by a state which has not cut off its last bonds with Christianity.

Even so, it is precisely for political reasons that the antagonism between the Third Reich and the churches has been growing apace. The totalitarian state cannot tolerate the existence of any independent organisation within its framework. The old political parties and institutions have been crushed, but the churches are still there as independent bodies, spectres of a past which did not bow to the supreme state. The sufferings of the war have caused an upsurge of religious feelings, and brought the people closer to the churches. The state has retorted by forbidding the sending of Christian literature to the troops at the front. Ecclesiastical publications have been banned. The most innocent papers of provincial churches have been refused any allocation of paper. Priests have frequently been prevented from caring for the wounded in military hospitals. Religious education has been restricted, and private Catholic schools suppressed. A number of convents and religious bodies have been closed down.

In some Nazi circles, there did arise the notion of unifying the Evangelical Church under the control of the state. To this, Martin Bormann, the successor to Hess, has given an interesting reply:

The idea of building up an Evangelical Church of the Reich should be rejected. Any strengthening of the Evangelical Church would work out badly for us. We are not going to repeat the historical blunder of the Hohenstaufens, who always aimed at uniting the Church instead of splitting it up.

Partly, at least, the policy of a state Evangelical Church has defeated its own end, for the political antagonism between Catholicism and Protestantism in Germany has now almost faded away. Never perhaps since before the Reformation has the political solidarity of all the confessions been so close as it has become in recent years.

The Churches' Attitude

In practice, the attitude of the German churches has on the whole been confined to passive resistance to the interference of the State in their internal life. Protests against interference have been the keynotes of the pastoral letters of Catholic bishops and the sermons of the Bishop of Münster, as well as of the preachings of the Protestant Bishop of Württemberg. But, as the struggle assumes a more violent character, the spokesmen of the churches leave their strictly confessional ground, and strike broader political notes. "In wartime (says Bishop Wurm of Württemberg) in other lands and among other peoples, they try to bridge over gaps on the home front. In Germany, it is the opposite that seems to be the goal." The demand for freedom of conscience and freedom of speech is being voiced from the pulpits, a demand that assumes a highly political eloquence under a totalitarian regime. The sermons of Bishop van Gallen, of Münster) marked a climax; they contained the most courageous challenge to the rule of the Gestapo that has been uttered in public in Germany since the Dimitrov trial. The Gestapo silenced the Bishop by placing him under "house arrest."

The significance of this opposition by the German churches has been questioned. The generally patriotic tenor of their sermons has been cited. Equally, on the other hand, the immediate political effect of the conflict between the party and the churches has been exaggerated. The German churches have naturally enough given their blessing to German arms, which merely reflects the fact that, for the time being, the German war effort has the support even of the nonconformist elements in the nation. But sermons, like those of Count von Gallen, which very distinctly limit the duty of national solidarity to the struggle against the "external enemy," and stigmatise the regime as the nation's "internal enemy," are an unmistakable crack in the totalitarian edifice. Hitler himself had no illusions when he hurled at the churches his menacing words—

THE COMMERCIAL BANK OF SCOTLAND LIMITED

Incorporated by Royal Charter and Act of Parliament

PAID-UP CAPITAL . . . £2,250,000

RESERVE FUND . . . £3,150,000

ESTABLISHED 1810

If there should be anyone that thinks he can break our front . . . I am watching him silently in accordance with my practice and when the moment comes I shall strike him like lightning; then he will have no chance even with the camouflage of religion.

The churches stand as the last spiritual link between the old and the new Germany, between the old Europe and the New Order. To the régime, they therefore present an asset as well as a liability—an asset because, willingly or unwillingly, they help to maintain a measure of unity between the régime and the nonconformist parts of the nation; a liability because they have become the refuge and the potential rallying ground for centrifugal forces in the Third Reich. It would perhaps be futile to hope that they could assume the leadership in the resistance to the régime. The issue will ultimately be decided by military and political factors. At some critical juncture, the dissension between state, party and churches may contribute towards weakening the moral coherence of the Reich. The struggle will have either to break out of the walls of the churches or to become stifled within them. The German pulpit may prove to be the last free platform of a bygone epoch, or it may become the first one of a new era; but it is on the battlefields of this war that the fate of the German churches will be determined.

Portugal's Fuel Problems

[FROM OUR LISBON CORRESPONDENT]

March 19th

THERE is some coal mined in Portugal, low in grade measured by its calorific value; there is also an abundance of wood for fuel. Industry, transport and central electric stations have, however, relied chiefly upon imported coal. The steady diminution in arrivals has, therefore, caused much inconvenience, which the restricted supplies of petroleum products accentuates. Private pleasure motoring has been stopped, and the use of cars for necessary purposes must be definitely established before their owners can obtain petrol. In Lisbon itself, the taxi owners have been reasonably dealt with—an important matter for urban transport, inasmuch as the only other means of public conveyance is by electric tram. Lisbon has one of the best services imaginable, carried on under conditions of unusual difficulty, owing to innumerable steep gradients and streets of a mediæval narrowness. The enforced reduction in the consumption of electrical energy will, therefore, mean fewer trams, while public lighting is to be cut by 50 per cent and the private use of electricity by 25 per cent—a reduction which also includes Government offices and commercial houses. Railway services have been cut considerably during the past six months, and though efforts are made to keep the various long-distance bus services running, both they and heavy lorries are to be turned over to gasogene-driven motors as soon as the individual owners can make the necessary arrangements. This does not, however, solve the problem of tyre covers and inner tubes, both of which are in short supply. Despite her determination to abide by an uncompromising neutrality, Portugal is becoming more and more directly affected by the consequences of the war.

Switzerland Keeps Going

[FROM OUR GENEVA CORRESPONDENT]

February 26th

ALTHOUGH Switzerland has up to now been spared the horrors of battle, her economic situation has been deeply influenced by war conditions. This is primarily due to the fact that Switzerland, the centre of a continent at war, has no outlet to the sea; secondly, the country lacks natural resources and is consequently greatly dependent on foreign trade. This means that for Switzerland the duration of the war will necessarily be a period of transition during which she must strive to keep going. From this point of view, last year was fairly satisfactory. The Swiss authorities had to exert strenuous efforts to maintain foreign trade, and the results were not so bad as had been feared. Imports totalled 2,026 million francs, compared with 1,853 millions in 1940 and 1,889 millions in 1939. Nevertheless, imports were not

maintained at the same level as in previous years, for allowing for the rise in prices—which is considerable for certain classes of goods—imports decreased by 25 per cent to 30 per cent in volume. Exports in 1941 aggregated 1,463 million francs, against 1,315 millions in 1940 and 1,297 millions in 1939. As prices of export goods rose only very slightly, last year's figures show an increase in value corresponding to a small rise in volume.

Because of the level of foreign trade and to the heavy demands of the home market, Swiss industry was active on the whole in 1941, though there were great differences between one branch of industry and another. The building industry was relatively busy, partly owing to the extension of public utility works, principally for national defence. The machine industry worked full time, and in certain branches there was a heavy demand for skilled labour. The watch-making industry also showed encouraging results, and there was a demand for its products in foreign markets. As regards textiles, the position of wool and cotton was moderately good owing to increasing import difficulties, but there is now little demand for embroidery. Silk and rayon, on the other hand, fared excellently, as these products are more and more used as substitutes for other textiles of which there is a shortage. The chemical industry had difficulty in maintaining its activity at a satisfactory level, but some good results have been achieved, especially by firms which have been able to make substitutes for products no longer obtainable abroad. Difficulties were particularly great in the aniline dye plants which require imported raw materials.

Switzerland's main economic concern was to find raw materials and transport. Export trade is being directed in order to obtain in return raw materials and food-stuffs. To help to solve the transport problem, a mercantile marine flying the Swiss flag was created in the spring of 1941, and despite its small tonnage it did valuable service in linking Switzerland with distant countries via Lisbon and New York. Another innovation was the transport of goods from Lisbon through Spain by means of a Swiss motor lorry service, which counteracted to a certain extent the shortage of shipping and rolling stock.

Although there are many shortages, it is surprising that after two and a half years of war and eighteen months of "siege" there is sufficient food and clothing, though at high prices, as the cost of living has risen by roughly 39 per cent since August, 1939. This sufficiency is due on the one hand to the foresight of the Government, which began making reserves as early as 1938, and, on the other hand, to rationing, which was imposed as early as September, 1939. The only real hardship endured by the Swiss at present is cold; owing to the scarcity of coal imports, heating had to be reduced, and there is hardly a house in which, during this long and severe winter, temperature was over 45 degrees Fahrenheit.

The rise in the cost of living has necessitated an increase in wages, while the Federal Government began last January to raise by about 15 per cent the salaries of Government officials and Federal services' employees. The Canton Governments, on the other hand, have not all followed that example or have only allowed an inadequate increase in salaries, and many industrial and commercial concerns—despite the Government's appeal—have not yet readjusted the salaries of their staffs.

German Europe

The Totalitarian Scene

GAULEITER SAUKEL, a leading member of the Nazi party, without either a distinguished career or any expert economic experience, was recently appointed Labour Dictator. He replaced Secretary of State Mansfeld, who a few weeks before had taken over from Dr Syrup. Gauleiter Saukel was apparently called in to solve difficulties in the supply of labour which were obviously beyond the ability and limited powers of Dr Mansfeld. There are a good many examples in the short history of Germany's planned economy where the peculiar failures of planning have forced the Nazi Government to create new offices with overriding powers.

These constant changes in the economic command and in economic organisation are frequently interpreted as evidence of the growing influence of divergent groups in Nazi Germany's political and economic life. The new price commissar, for example, was said to be the representative of big finance and industry, whose most influential members had raised objections to the more radical policy of the old and "idealistic" party member, Dr. Wagner. In the same way it is usually taken for granted that there is in the *Wehrmacht* a group of generals whose views are different from those of the Nazi party, and the Nazi party itself is usually said to be influenced, on the one hand, by moderate groups which represent industry, and, on the other, by radical groups which express Nazi doctrines pure and simple. The impression is given by these interpretations that various separate social groups have been able to retain a degree of independent cohesion not very different from the organised party connections in a democratic system.

This view is almost certainly a misunderstanding; and it has caused the economic and political power of the Nazi regime—which is probably as formidable now as it was at the beginning of the war, in spite of the reverses in the war against the Soviet Union—to be underestimated. If there really were any opportunity for different social groups to act as separate organised forces, the Nazi regime would have disappeared long ago. The old generals are still there as military experts, it is true; but their economic position as big land owners no longer gives them an independent economic influence. Industry and finance are no longer independently organised. The largest single social group, the workers, has been split up into small groups made up by the employees of single factories: the Labour Front has no more power in politics than the State Sickness Insurance, that is, it is nothing but an administrative organ for a special purpose. Politics as understood in democratic countries, that is, the movement and interaction of economic, social, religious, and ideological groups, are not possible in Nazi Germany. The only political party in being cuts right through all the different social groups. Economic policy has been resolved into planning on the basis of compulsory organisation and marketing. Bureaucratic administration has replaced economic initiative and competition. Individual initiative is still possible, but only as the soldier in an army is trained to use initiative within the compass of the order given to him. Politics, in the sense of the policy of the administration, are taken right into the factory by *Werk-schemata* or "political shock troops," with special departments for public health, vocational education, "strength through joy," housing and propaganda. The trade unions have thus been replaced by a great number of different organisations acting in one factory only. Employers' associations have not been abolished, but they have been changed into mere administrative bodies for the execution of production plans. Actual party members are still a very small minority, it is true, but children, the professions and civil servants are compulsorily organised. In each block of dwellings a great number of semi-party organisations have hold of almost every man and woman. The centralised power of the party, the police and the administration, is used to keep the population split up in small groups.

This rough outline of the organisation of the German people explains the hold the Nazi party is able to maintain over them. Theoretically, the regime could not collapse without some shock from outside, such as a war which ended in plain defeat. It has been proved before and during the war that the regime is able to exact from the people almost every sacrifice by organisation and centralised propaganda, because there is no organised opposition, and there cannot be any. The totalitarian unification

of state and party organisation, of which the regular and the secret police are an integral part, prevents any latent opposition from being formed into an organisation. Military and economic affairs are left to experts; but, in times of acute danger or great difficulties, such as the failure of the first onslaught against Russia or the labour shortage, Hitler himself or some leading party member takes over military or economic offices until the situation is restored. Grumbling under a one party regime is not necessarily a sign of positive political dissatisfaction; and difficulties have been frankly put before the people to encourage greater efforts and greater sacrifices.

* * *

Food and Agriculture.—The third winter of war has again been bad for the crops. German farmers and peasants are daily warned by wireless slogans to speed up delayed work in the fields. After the spring sowing is completed, damaged winter crops must be resown. The shortage of labour has grown to dangerous proportions. Goering has decreed compulsory work on the land; all persons who can be expected, because of their place of residence, age, health and occupation, to be able to do agricultural work, may be conscribed. Local agricultural leaders will distribute the conscripts over the farms.

The long-expected cut in food rations was decreed at the same time; the main reason is that stocks have been consumed because of two bad harvests and the possibility of a third poor harvest in 1942. The protracted war against the Soviet Union has depleted man power on the farms and at the same time increased food consumption because of the larger army. No surplus can be expected from the occupied provinces of the Soviet Union. The rations of certain foods have fallen as follows since the outbreak of war:—

(Ounces per week for normal consumers)

	Aug. 28, 1939	April 1942	Decrease in %
Bread	88.2	70.5	21
Total meat	24.7	10.6	57
Total fats	14.8	7.3	51

The optimistic rations of August 28, 1939, remained in force for only a short time; but the first serious cut in the meat ration was not decreed until the summer of 1941. The complicated differentiation in German rations is shown by the following table:—

(Ounces per week)

	Before April 6	After April 6	Decrease in %
Children up to the age of 6 yrs.	8.8	5.3	39.8
Aged 6 to 18 yrs.	14.1	12.3	12.8
Normal consumers	14.1	10.6	24.8
Overtime and nightworkers . .	21.2	15.9	25.0
"Heavy" workers	28.2	21.2	24.8
"Heaviest" workers	35.3	30.0	15.0

TOWARDS THE FUTURE

"When the war comes to an end there will be 8,000,000 or 9,000,000 people, the mainspring of whose existence will have snapped overnight, and it is essential that we should have an ordered scheme of what we mean to do."—Graham White, M.P., in the House of Commons, 10/3/42

What are the essentials of this 'ordered scheme' of the future?

Roughly 40 per cent of the population is classed as normal consumers. In percentages of the rations of 1917-18 normal consumers now receive 166 per cent of the then bread ration, 151 per cent meat and 159 per cent fats.

Big towns have been experiencing a shortage of potatoes, which is partly explained by the long winter and transport difficulties. The 1941 potato crop was 7 per cent smaller than in 1940. Human and industrial consumption of potatoes increased during the year. The food situation has thus deteriorated, but is still far better than in 1917-18.

Price Control.—The power of the regional price control boards has been extended as a result of the decentralisation of price control. Regional price control boards have been given power to close down firms for a maximum period of three years if offences against price regulations have been proved. The price commissar declared that prices have a key position on the home front; the policy of lowering prices for armaments must be enforced, but the mopping up of excessive purchasing power can only be successful if the Minister of Finance takes care of excessive profits and the public continues to save as much as possible.

Russia at War

Iron and Steel

THE war has pushed down the technique of the Soviet industries to a lower level than that reached as a result of the Five-Year Plans. The whole of industrial policy is now, by dint of necessity, concentrated on keeping, and where possible expanding, the actual volume of vital war production. The loss of the Ukrainian pig iron and steel has been the most important handicap. The Government has encouraged every possible effort to make good this loss; an energetic search for new iron ore resources has been going on in the Urals and in Siberia. But all the eastern territories accounted for no more than about 35 per cent of Russia's iron ore at the outbreak of the war. The main method used to overcome the shortage has been the economising of iron and steel; and the industrial rationing of metal has been pushed to a degree of strictness for which there has been no parallel in any belligerent country. This has most affected the evacuated industries. New factory buildings and sheds had to be constructed on a very wide scale; but the industrial commissariats have been compelled to refuse metal allocations for that purpose. Nearly all the new works had to be carried out almost exclusively with timber. New electro-stations, for instance, are being built as open-air stations. The lack of factory buildings has certainly caused some wastage of machinery.

Replacement of machinery has been cut down to the lowest possible minimum. The most striking illustration is in the oil industries, where the wear and tear of equipment has always been very high. A report of the Molotov Naphtha Trust says that, in the second half of 1941, the normal replacement of its metal equipment was cut down by about 65 per cent, and a further reduction for 1942 has been envisaged. In some oil establishments, the reduction in replacement has reached 70-75 per cent. The delivery of new pipes has been stopped almost entirely. The Asnept Combine has beaten a record by extracting 35,000 metres of pipes from old oil wells.

Steel rationing has even been applied with severity to the last stages of war production in the output of munitions. Press reports speak of the elimination of steel in the manufacture of some shells and bombs and its replacement by cast iron. Many iron works have switched over in great haste to steel production. A number of steel mills had to start production of special high grade steel for which they had not been fully supplied with technical equipment. Metallurgical plants in the Kusnetsk Basin started to produce armour-plate steel without making any substantial changes in their Martens furnaces. (The Kusnetsk works have become a very important source of steel supply for the production of tanks.) Some reports suggest that an intensive technical rationalisation has taken place in the output of armour-plate steel. It is claimed that the metallurgical plants of Gorki (another very important centre for tank-steel supplies) have achieved great success in improving the quality of armoured steel and speeding up its production by introducing a new semi-automatic plate-cutting machine.

Transport is the other limiting factor. The distances over which iron ore has to be carried from the Magnitogorsk region, now the main output centre, to Kusnetsk, Siberia, or to the Volga region and the Moscow Basin are enormous. In iron—perhaps more than in any other branch—the principle of exploiting to the utmost local resources has been insisted upon very categorically. This has meant not only the collection of scrap-iron (compulsory for factories, schools, etc.) and putting old machinery back to work, but also that managers who usually relied on iron

ore deliveries from outside have been asked to look for local iron ore resources themselves and to start exploiting them on the spot. Transport shortages have, generally speaking, imposed upon the Government a policy of industrial decentralisation, which aims at keeping separate regions as self-sufficient in industrial and agricultural production as possible, though any achievements in this direction can only partially make up for the losses inflicted by the war-time disruption of the national division of labour and of normal distribution.

One feature of this decentralisation, with the concomitant return to more primitive methods of production, is the wide use which is being made of small artisan workshops for war production. These are, in most cases, small co-operative workshops, and they work either independently or as sub-contractors for the great factories. The small artisan workshop, the Cinderella of Soviet industries, has recently earned much praise in the Press for its contribution towards exploiting local resources and increasing the output of munitions.

Aircraft Production.—Figures relating to a number of aircraft plants in the Volga region show the following increases in production. In August, 1941, most of these factories produced 130 per cent of their pre-war plans. In September new plans were worked out with a view to raising production up to 200-300 per cent above the previous programmes, and it is claimed that the new plans were carried out by the end of 1941. A part of the factories evacuated to the Volga region had not yet managed to reassemble all their departments by that time; but those that had been reassembled immediately started to produce spare parts without waiting for the other departments.

The search for bauxite has been very intensive. The bauxite ores of the Tikhvin region have had to be temporarily written off. Some 10 years ago this was the only centre for aluminium supplies, but in the meantime bauxite ore and aluminium output has been developed in the Urals.

Agricultural Evacuation.—Masses of Ukrainian collective farmers have been evacuated and transferred to the Soviet Far East. Compact settlements, consisting of Russian farmers from the regions of Kursk, Orel, Voronezh, Ryazan, etc., have also emerged to the east of the Baikal, in the Chita region. The evacuees obtained land and started farming; a *kolkhoz* (collective farm) consisting of about 90-100 families gets 10-11 thousand hectares. Whereas in the Kursk region the average land per one farming family was 10 hectares, in the Far East it is no fewer than 120 hectares. The main difficulty is in getting used to the climate. In the Chita region only a special kind of a frost-proof seed can be sown. The region is, however, rich in fodder, and is therefore suitable for evacuated cattle-breeding farms. The new farming settlements have every chance to become more than temporary arrangements. The war has speeded up those great internal migration movements that the Government had initiated and fostered.

War Lottery.—One of the channels of Soviet war financing is the State lottery organised by the People's Commissariat for Finance. The most recent lottery brought in one milliard roubles. The prizes amounted to 200 millions, thus the net profit was 800 million roubles. The prizes are in money or kind; money prizes range from 10 to 50,000 roubles. The prizes in kind are fur coats, watches, shoes, etc. The demand for lottery tickets (per 10 roubles) has never failed in Russia.

THE BUSINESS WORLD

Directors and Auditors

THE demand for reform, for new methods and, most of all, for a fresh outlook, are the order of the day, and while these are—or were—most urgently needed in the highest spheres, there are humbler fields where they are equally desirable. Of these, one is the whole matter of the presentation of the accounts of joint stock companies and the general attitude of company directors and auditors to their responsibilities. There is nothing new in the plea for reform in this matter. It has been pressed, with a very modest degree of success, ever since the habit of investment spread from the wealthy few to a considerable portion of the population. What is, perhaps, new is that, while in the past it was urged primarily as a duty to the shareholder, now it is apparent that the duty is no less due to the other partners in industry, both labour and the actual management, and indeed to the whole community. The last is entitled to ask at least this in return for the privilege of limited liability which it grants to business enterprise. The need for reform does not stop short at the presentation of intelligible and truthful accounts, but to secure a real improvement in this field would go some way both to facilitate other reforms and to remove many misconceptions.

The minimum information which must be given by any public joint stock company is governed by the Companies Acts. The methods of presentation and, to some extent, the actual amount of information given, are decided by the company's auditors in consultation with the directors. Substantial improvements in the Acts have been secured in the past twenty years, and in the same period the profession of accountancy has grown in stature. It remains the case, however, that legislative action has lagged behind the demands presented, while it is axiomatic that, even had these been fully incorporated in the new provisions, public opinion would have moved ahead so far as to leave them behind by the time the changes became law. In an attempt to overcome this disability of legislation, the New Issues Committee of the Stock Exchange has made its requirements for granting permission to deal in new issues much more stringent, but this excellent reform has been rendered temporarily nugatory by the decision of the Government itself to provide the financial backing necessary for wartime extensions of physical capital. Meanwhile, the ukase against the disclosure of EPT provisions and the necessary ban on the publication of the actual nature and extent of operations have often been used by directors still further to curtail the information given, either in the accounts or in their statements.

It is not necessary to postulate the increased secrecy of wartime accounting to find ample evidence that the normal company statement tells something which is far less than the whole truth even to those who understand it. To extract the maximum from accounts it is necessary for the figures to be interpreted in the light of some expert knowledge of the peculiar conventions of the profession and to make adjustments in the light of external evidence. Even the improvements in law and practice have for the most part been designed to ensure that the picture was not painted in too roseate hues rather than to secure an exact statement of the true position. The broad outlines of this convention have long ago filtered down to the workers. They are, perhaps, even less equipped than the shareholders to disentangle the truth, and it is small wonder if the worker tends to regard the necessary adjustments and explanations of the more instructed as "wangling" designed to deceive rather than as attempts to enlighten. Surprising or not, that is the case; and the misconception is so complete that many of those who are engaged in doing their share to earn the profits of industry believe that the absolute amount going to the owners of capital is proportionate to their labours, although all too often there is a tendency for the reverse to be the case. Such an attitude is good neither for morale at the present time nor for good relations between capital and

labour, either now or in the critical years of reconstruction.

Past experience shows that normal legislative machinery is too dilatory to provide a remedy. Here, as elsewhere, what is required is a change of attitude on the part of company directorates, assisted by an alteration of the status of the auditor. It is perhaps inevitable that "absentee" ownership—the normal accompaniment of joint-stock finance to-day—should mean an inability to exercise control over policy, and thus to encourage the belief among directors—in all but a few notable exceptions—that the business is theirs to do with as they will and that their duties are discharged by the payment of a reasonable dividend. It is quite clear that the Companies Acts envisaged neither such remoteness of control nor the apathy of investors as to the conduct of their affairs. It is a somewhat ironical position that it is quite likely to be the demands of labour which will persuade the director to give that accurate account of his stewardship which, in theory, the law has always guaranteed to those who risk their capital in the enterprise. The law never appears even to have contemplated that there was any such duty to the employee, though it is only fair to say that in some cases both management and directorate have realised the existence of this duty, and have fulfilled it—with highly gratifying results. It is also only fair to state that there are companies which give much more information than the prescribed minimum, just as there are others which adopt every legal expedient to withhold information which the law intended to be disclosed.

The few company directorates who publish full and reasonably truthful accounts and who explain them in some detail both to shareholders and to their workpeople, with a brief survey of the main conditions affecting the past and future operations of the company, set an example which should be universally followed. It is not proposed for the

General Manager: Vernon E. Boys

moment to set out in detail the reforms which are requisite, but leaving on one side balance sheets, the figures of profit should be given in such a form as to provide a test of the relative efficiency of the management, and the net amount available for the proprietors should be disclosed, without concealing adventitious aids or rucking away secret reserves against a rainy day. Further, the nature of the appropriations from this figure, and in particular the extent to which they are provisions for past liabilities or future possibilities, should be clearly stated. This would, of course, entail revealing information about the company which directorates have in the past considered it essential to conceal from their competitors. But the intelligent competitor can, if he thinks it worth while, secure, without much expense, more information than the most intransigent workman or shareholder is likely to demand.

In the execution of such reforms the auditor has a crucial part to play. Legally, he is the servant of the shareholders, who appoint him yearly. A famous judicial dictum defined his position as that of a watchdog, not that of a bloodhound. These canine metaphors are out of date. It is even rarer for auditors to be changed at the request of the shareholders than for directors to be unseated. The auditor does his duty as he sees it, but he tends to see it rather from the standpoint of the board, or at least, relying on the dictum, to leave with the directors responsibility for imperfections which offend neither the law nor the canons of accurate accounting.

If the duty of the directors is to render an account of their conduct of the company's business, that of the auditor is to make clear the financial results of operations. These should be stated in language which demands only the minimum of special training for its interpretation, and they should be neither so voluminous as to be difficult to assimilate nor so imperfect as to leave undisclosed matters of any considerable moment to those concerned. Finally, it would seem desirable to abandon the practice, usually considered sound hitherto, of understating the true profit

position. The published profit figure should be one which comes as near the truth as is possible, having regard for the fact that valuations of most assets and liabilities are matters of estimation rather than of mathematics.

As the law at present stands, the auditors are servants of the proprietors. It might be that if they were asked to put their duty to the public first, this would conflict with their legal obligation to the shareholder. There is in consequence a not unnatural desire on the part of some sections of the profession that accountants should be given *de jure* the status of public servants. That is, perhaps, a desirable objective. It is less clear that it is desirable to confer official standing upon a body of people who have still to show, in many cases, that they appreciate the nature and extent of duties, very different from those hitherto performed. It is, in fact, doubtful whether any change from without can do much to assist—it certainly cannot replace—a determination on the part of the profession to view their duties in a broader light.

It is, however, virtually certain that some directorates will see real damage to their shareholders' interests in the fuller publicity demanded, and it would be unfair to put the whole responsibility for enforcing reform on the shoulders of the auditor. He should see that the spirit, not the mere letter, of the law is fulfilled, but the law should insist on much fuller information. It is not too early to start planning what these reforms should be, and there would seem to be no reason why the relevant authority should not now enforce the publication of full profits, before "secret" reserves, as an earnest of its readiness to assist. This would, presumably, have to be subject to the existing ban on the publication of figures before EPT, although the utility of this provision in the national interest is open to doubt. Pending these reforms, the difference between the "best" accounts and the least informative is already so great that an insistence on a closing of the gap by improving the latter would, in itself, be something of a revolution. This is a matter for co-operation between directors and auditors.

Finance and Banking

Return to Abundance

With the turn of the financial year, and the passing of Warships Weeks climax, the position in the money market has again settled down to its accustomed ease and uneventfulness. This week the banks have had the benefit of substantial maturities of Treasury Deposit Receipts. New TDR payments amounted to £20,000,000, as against nominal maturities of £70,000,000. A substantial proportion of these maturities were previously encashed—mainly during the London Warships Week—but the balance remaining was sufficient to provide the banks with an appreciable excess of cash over and above the amount required from them in new TDR's. The Bank return reflects the abundance of credit in a rise of £18,823,000 in bankers' deposits. This is offset to the extent of £11,661,000 by the draining of public deposits, but an increase of £19,385,000 in Government securities provides additional explanation of the expansion in bank cash. The circulation has risen by £5,121,000 over the week, representing the final spurt in the Easter currency demand.

Bank of England Directorate

The election for Governor and Deputy Governor of the Bank of England will be held next Tuesday, and for Directors on the following day. It was announced as long ago as last September that Mr Montagu Norman and Mr B. G. Catterns would offer themselves for re-election as Governor and Deputy Governor respectively. The list of directors elect differs in one respect from the existing members of the Court. Mr Cecil Lubbock, who was elected to the Court in 1909 and was Deputy Governor for the years 1923, 1924, 1927 and 1928, is not offering himself for re-election. In his place the Court of Directors have recommended Mr Josiah Wedgwood, managing director of the old family business of Josiah Wedgwood and Sons, the Staffordshire potters. Mr Wedgwood is 42 years of age. His election to the Court in place of Mr Lubbock will further tilt the balance of representation on that body away from banking and in favour of industry. It is not generally realised how far the policy of extending the sphere of experience of the directorate, initiated by the present Governor,

has proceeded. With the departure of Mr Lubbock there will remain only seven directors out of a total of 26 drawn from the circle of bankers which up to the 1920's provided almost exclusively the candidates from whom the directors were chosen. Of the balance, six members of the Court, including the Governor and Deputy Governor, now give their time exclusively to the Bank. There remain twelve directors, who represent a wide variety of industrial, commercial and shipping interests, and Mr J. M. Keynes who, perhaps, is best left unclassified.

March Clearing Bank Returns

The clearing bank returns for March reveal the wide movements that were to be expected from the coincidence of the final period of the financial year with London's Warships Week. Deposits show little change, namely, a drop of

	(In £ millions)

Total assets	3,006.4	3,458.5	3,582.0	3,470.5	3,327.9	3,315.7

£12,747,000, but this relative stability of the total credit structure veils exceptional changes in assets. TDR's have fallen by £170,000,000, this being by no means the full measure of the March changes since some of the banks

made up in the early part of the Warships Week. Some of these encashments were made to finance customers' subscriptions to Tax Reserve Certificates. Part of the banks' own participation in the Warships Week total is shown by the rise of £33,213,000 in investments. Advances are up by £12,078,000, this being the third successive rise in this item. The exceptional ease in credit conditions created during the latter part of the month is reflected in a rise of £29,468,000 in cash and in the steep increase of £51,481,000 in bills discounted.

The Blackout Spreads

The banks which subscribe to the weekly quota of Treasury deposit receipts have been requested by the authorities to divulge no information to the Press on the subject of TDR maturities. For some months past it has been possible to discover each Friday what were the true TDR maturities in the ensuing week compared with the nominal maturities of TDRs issued in the corresponding week six months previously. This information gave the required clue to pre-encashments of TDRs and was obviously valuable for the guidance of the money market and for any informed comment on public finances. It was information which could by no stretch of the imagination be deemed of the slightest value to the enemy. The only fault to be found with it was in the manner of its dissemination; it was a leakage in one particular quarter and not a formal announcement made to the Press as a whole. The abrupt discontinuance of this information is a matter for genuine regret. It represents a diminution in the already scanty statistical material available for the intelligent study of Government finances. The decision may acquire significance from its incidence on the morrow of London's Warships week when the information, previously imparted had made it possible to gauge with reasonable accuracy how far the huge subscriptions to Government loans had, in effect, been financed by the encashment of TDRs. This ill-advised ban on valuable information should be lifted.

The Egyptian Money Market

A combination of circumstances has for the first time brought to Egypt a short term money market of considerable size and elasticity. These factors are the influx of

British capital consequent on the Government's bulk purchases of Egyptian cotton, the widespread industrial and commercial prosperity, which has followed the local expenditure of Allied armed forces, and the exchange control which Egypt, as a member of the sterling area, has applied with considerable rigour and success. The volume of available liquid capital has thus been seeking employment in a market which is not only well insulated from external competition, but in which the demands for longer term capital have been kept down to abnormally small dimensions as a result of the war. So much for the supply of liquid capital seeking investment in the Egyptian money market. The demand for that capital, as was explained at the recent general meeting of the National Bank of Egypt, has, in large part, been provided by the Egyptian Government in connection with the finance of the cotton purchases. The 1941-42 crop is being purchased on a joint fifty-fifty basis by the British and Egyptian Governments. The previous year's crop had been purchased as to 75 per cent by the British Government (involving an outlay of £25,000,000) and the balance by local exporters and spinners. The Egyptian Government is financing its share of the current year's crop by issuing short-dated bills. These are offered in fortnightly tenders of £500,000 each, and the general rule has been for applications to amount to between two and three times this figure. The rate of discount has been falling progressively and is now down to 1.45 per cent. This, for Egypt, is an astonishingly low rate.

The note circulation in Egypt is rising at an appreciable pace. Over the year 1941 the notes of the National Bank expanded from £39,500,000 to £52,700,000. The National Bank is required by its statutes to keep a 50 per cent gold reserve, but by authority of the Egyptian Government, British Treasury Bills may be substituted for the gold. At the end of 1940 there were still £6,240,000 held in gold. The metallic cover had disappeared by the end of 1941, when the assets of the Issue Department consisted of £51,200,000 of British Government securities and £1,500,000 of Egyptian Government securities. The increase in the circulation is explained by the National Bank as due first to the presence in the country of a large Allied army, secondly to the increased activity of trade and industry, and thirdly to hoarding. As evidence of the strength of the last of these factors it may be noted that the rate of expansion in the circulation was greatest in the early months of 1941 when the military reverses in Libya caused understandable apprehension in Egypt.

Lower Equity Yields Once More

The outline of the movement in share values during March, given last week, and based on the figures of *The Financial News*, can now be filled in from *The Actuaries' Investment Index*. This, covering a somewhat longer period, the five weeks to March 31st, shows a fall of less than 1 per cent in 159 industrial equities, and against this has to be set a further improvement in bank shares and the recovery of the losses of the preceding quarter in insurance shares. Although the latter movement is due to satisfaction with the results disclosed, it is not, in the main, the result of higher dividends, for the yield has fallen by almost the same proportion as the price has risen. Among industrials the only heavy falls are in aircraft manufacturing and building material shares, the former on the rather lower payments and the latter on the further restriction of output and the definite ban on long distance transport of such heavy goods. There is one substantial rise, which goes some way to account for the relatively favourable showing, namely in brewery shares. The point of greatest interest is the tendency for the yield obtainable on any representative selection to remain low if not to fall. So far as this index is concerned,

all fixed interest sub-groups have shown a decline in yield except Government stock, represented by 2½ per cent Consols. The long-standing tendency for the margin between yields on equities and fixed interest to narrow, interrupted by the inception of the Far Eastern conflict, was re-established last month, if only by a narrow margin. This is a rather better showing than one would have supposed from actual experience of the market during the month. It is possible that the "weight" given by the index to aircraft and building material shares is less than it should be, and that the inclusion of more companies in these sections would make the general showing rather less favourable. It is, however, evident that a widely cast net gives a result indicating that the fall in the total of industrial and financial equities is approaching exhaustion, and this may even be the case if specifically Pacific equities are included, for many of these have reached a point where no one is likely to sell except under the pressure of need for money.

Australasian Stocks Unfreezing

The improvement in fixed interest stocks over the past week or two has not been restricted to those of this country. Under the influence of the arrival of United States troops and materials in Australia, and of the initiative which these arrivals have made possible, there is gradually developing a demand for both Australian and New Zealand stocks. It is not easy to show this in terms of prices, since minima have been fixed for the securities of both countries, and quotations are still barely above these. A sale, however, now occasionally takes place without giving a *quid pro quo*, and some weeks back that was not possible. It is, of course, still far from certain what the future holds for Australasia,

but the moment is opportune to take stock of the effect, so far, of Japan's successes upon the shares of companies operating in the antipodes. It is reasonably certain that if Government stocks improve other securities will not be unaffected, but, in making any calculation it is necessary to bear in mind that, quite apart from the war risk, there is a considerable political risk. This is in all probability greater in the case of industrial and commercial enterprises, and according to some authorities, greatest of all in the case of banks, than it is in the Government's own bonds. Subject to this caution, the figures given in the accompanying table for a representative selection of Australasian undertakings, seem to suggest that a considerable period of severe inter-

Security	1941 High	1942 High	Mar. 9, 1942	April 8, 1942

ruption to trade has already been discounted. Should it prove possible to keep the Japanese out of the sub-continent, and to regain the initiative in the Eurasian theatre, there may be a rapid change in the trading outlook. If that occurs the political risk will be the principal new factor in the situation, and it is one which it is not easy to assess. The fall in value from the highest of last year is of the order of one-third to one-half for shares and some 15 per cent for stocks with no minima, and last year's high was by no means a peak, for the political risk was then already in being, while the possibility of an extension of war to the Pacific was not altogether neglected.

Nominee Holdings

Hand in hand with the concentration of the control of industry in fewer hands, which was a feature of the period 1920-39, there has gone a growth in the practice of hiding real ownership behind nominees. This practice, which has admitted advantages, has great demerits from more than one point of view. In the first place, it is desirable—if seldom admitted—that, as an offset to a great deal of rather irresponsible propaganda, important facts about public companies, and particularly large public companies, should be public property. In particular, it is expedient that dealings by directors and other officers in the shares of companies with which they are associated should be disclosed. Again, it is in the public interest that the company directorate itself should be informed if there is an attempt on foot to obtain voting control. In the particular case of directors dealing in shares, it might well do more harm than good if word immediately got about that such business was in progress. It is clearly undesirable that directors and other high company officials should "operate" in a technical sense, in shares of their own companies, and to avoid this but permit normal dealings the use of a nominee might be insisted upon, coupled with the obligation to publish any such transaction after a delay of, say, three months. There are possibly other cases in which secrecy, more or less protected, would be justified. It seems, however, highly desirable that in all cases where it is desired to conceal the real ownership of property, the onus of proof that such secrecy is in the public interest should be laid upon the buyer, and that, failing proof, the facts should be disclosed. A necessary corollary would be to ensure that the true ownership of private, as well as public, companies was disclosed and that companies made public the names of subsidiary and associated concerns, whether public or private, and the extent of their holdings.

THE PRUDENTIAL ASSURANCE CO. LTD.

Points from the Directors' Report and the Statement issued to the Shareholders by the Chairman, Sir George Lewis Barstow, K.C.B.

The 93rd Annual General Meeting was held on 2nd April, 1942, at Holborn Bars, London, E.C.1.

ASSETS AND INCOME The assets of the Company are now **£375,413,502**, of which **94** per cent. are invested in the United Kingdom and the Empire. The income during 1941 was **£56,643,498**.

ORDINARY BRANCH The net new sums assured were **£24,803,928**. On participating Policies a bonus of **£1** per cent. will be paid on claims arising by death or maturity of endowment during 1942 for each 31st December on which the policy was in force subsequent to 31st December 1939.

INDUSTRIAL BRANCH The revenue premiums were **£24,858,403**. On participating Policies a bonus of **16s.** per cent. will be paid on claims arising by death or maturity of endowment during 1942 for each 31st December subsequent to 31st December, 1939.

GENERAL BRANCH The revenue premiums were **£2,620,651** arising from Fire, Sickness and Accident, Employers' Liability, Marine, Motor Insurance, etc.

APPROVED SOCIETIES The total amount expended on benefits was nearly **£4,150,000**.

SECURITY and SERVICE

The First Quarter's Capital

As in the first quarter of 1941, Government borrowing during the first quarter of the current year relied exclusively on the proceeds of small savings and of "tap" issues. There was a very substantial increase in yield during the later period, from £327,344,300 to £493,120,000, for which the warships weeks must be held largely responsible. Of total Government borrowing, the largest sum was raised by 3 per cent Savings Bonds, whose sale yielded £193,194,506 and the lowest by 3 per cent Defence Bonds, which brought in no more than £52,195,825. The total of non-Government borrowing, calculated in both cases on the "new basis" which includes issues by permission to deal, was at £2,134,300 against £2,909,900, even lower than in the first quarter of 1941. The bulk of this is accounted for by the fact that Donaldson Line and Anchor Line made available for public dealings £1,181,800 of ordinary capital privately held. Small sums were issued by a number of miscellaneous manufacturing concerns by which group no capital was raised a year ago and, among stores and traders, OK Bazaars issued £178,300. The total raised by the coal, iron and steel group was lower at £197,900 against £255,000 and the single issues in the mining and oil categories, by Associated Manganese Mines and Ultramar, were insignificant in dimension. Certain important municipal conversions took place during the period, including those of Bradford and Portsmouth. From the standpoint of Government policy, the figures, which are analysed below, show more plainly than ever before the extent to which the resources of the new issue market have been reserved for official borrowing. The only question which they raise is whether the total subscribed in Government loans is yet on a scale adequate to the war effort.

Company Notes

General Accident Shares

The General Accident Fire and Life Assurance Corporation, Ltd., announces a proposal to add 5s. to the paid-up value of the ordinary shares by transfer for this purpose from the balance of profit and loss account. The present capitalisation of the company takes the form of 250,000 5 per cent accumulative preference shares of £1 each, fully paid, and 2,000,000 ordinary shares of £1 each, 5s. paid, so that the total authorised and subscribed capital is £2,250,000 and the paid-up capital £750,000; with the addition of 5s. to the amount paid on the ordinary shares the latter figure will become £1,250,000. Profit and loss account, which provides the required sum of £500,000, stood at £888,758 at the end of 1940, after provision for the dividend for that year; besides this free reserve, the balance sheet included a general reserve of £2,000,000, and an additional reserve of £575,000 in the fire and accident funds, over and above the technical reserve. The company's position is thus very strong. The principal effect of the proposal under consideration should be to increase the marketability of the ordinary shares by reducing the amount of callable capital. They have in fact risen during the past week from 84s. 6d. to 87s. 6d. Accompanying the announcement, the directors also publish preliminary figures of profits for the year 1941, and the dividend, which is unchanged at 3s. 6d. per share.

"Chartered" Earnings

The full accounts of the British South Africa Company for the year to September 30th last show that, behind the maintenance of dividend at 1s. 3d. per share, less tax, there were a number of changes of importance. The principal source of income, dividends and interest, rose from £391,909 to £443,205, but mining revenue fell from £283,121 to £261,884, while, owing to inability to export, there was a loss of £11,907 on estates, mainly devoted to citrus crops, against a profit of £17,107. This leaves a very small net increase, against which income-tax and NDC called for £275,288, compared with £181,399. After minor adjustments the amount available for dividend is £326,768, against £403,307, and the carry forward receives an addition of £17,641, compared with £42,195, earnings being at the rate of 8.81 per cent on the ordinary capital, against 9.30 per cent for 1939-40, and the rates of tax 8s. 8½d. and 6s. 9.7135d. respectively. This calculation takes no account of the fact that during the year £143,565 was lost on the sale of investments, of which £142,412 was charged against reserves. These investments were mostly foreign bonds, and doubtless the loss had accrued over a period of years. Actually, investments stand in the balance-sheet at £7,943,235, compared with £7,885,831 a year before, while the depreciation against market value was only £475,509, against £1,792,996 at that time. Apart from the sale mentioned above, the only important movement is an increase of some £237,000 in the holding of gilt-edged stocks. Other changes in the balance-sheet, apart from the fall in the reserve, are of little moment. In his statement the chairman, Sir Dougal Malcolm, points out that legislation is being passed to amend the regulations governing the distribution of the profits of Rhodesia Railways. The statutory reserve having reached its prescribed limit, the company was in the position where it could increase its payment to "Chartered" from £125,000 to £150,000, but must use any surplus in reducing rates. It has been decided to maintain the "Chartered" payment at the lower figure, and to place the surplus to reserve for rates stabilisation. This arrangement is to run until September 30th following the end of the war, or that date in 1943, whichever is earlier. It means that shareholders forgo a possible slight increase in dividend now in return for greater security against a later decline. The 15s. shares stand at 19s. 9d. ex dividend, yielding some £6 6s. 6d., subject to tax, at 8s. 8½d.

Selfridge Profits

Preliminary statements of earnings of *Selfridge, Limited*, and *Selfridge (Holdings)* for the year to January 31st last, appear to indicate a material expansion in trading profit, before debenture service and income-tax. It will be recalled that the old company was split in two, the new operating

company, *Selfridge, Limited*, taking over the trading assets and the main building, and the *Holdings* company, which owns the whole capital of the former, taking the remaining assets, and liabilities which exceeded them by some £1,700,000. Owing to the fact that the reconstruction was not completed until after the end of the company year 1940-41, the accounts presented a year ago are not comparable with the figures now given. All that appears at all clear at this stage is that, whereas a year ago there remained £25,417, after meeting debenture charges and taxation, on this occasion the operating company has been able to create a carry forward of £24,970, and the *Holdings* company to realise a net surplus of £11,339. The latter figure is what remains out of the total income of the *Holdings* company, most of which was derived from a dividend of 6 per cent on its investment in *Selfridges, Limited*. It is also possible

to deduce that taxation, excluding tax on debenture interest in each case, has absorbed about £140,000, as compared with £89,032 in the earlier year. The trading profit of the operating company for 1941-42 is given as £296,758, while that of the joint concern in the previous accounting period was £173,333. It is clear that these figures are not strictly comparable, but the rise in the tax provision suggests a material expansion in real earnings before tax. It is to be hoped that the full accounts and chairman's statement will help to clear up the position, which is at present extremely tangled. No class of capital in the *Holdings* company is within sight of a dividend of any sort, and it is, of course, evident that, after meeting prior charges, only the 6 per cent cumulative preference stock, now valued by the market at around 6s. 9d. for a share of £1, is likely to survive the inevitable reconstruction of capital without a severe cut.

Industry and Trade

Nazi Oil Supplies

The question whether Germany has sufficient oil for large-scale and sustained military operations this year is exercising many minds. In an article in the current issue of *Petroleum Press Service*, an attempt has been made to assess the supply position. The effort to expand the production of synthetic oil and to improve the quality of the products can be assumed to have been intensified, but the measure of success achieved cannot be estimated with precision. There can be little doubt that progress has been made in both directions, and the *Petroleum Press Service's* conclusion that Germany's coal-oil capacity may now be of the order of 5,000,000 tons per annum does not seem unreasonable. There are indications of a further shrinkage in Roumania's crude oil output, but, taking into account all the factors capable of assessment, the supplies of Continental Europe as a whole may be at the rate of 12-13 million tons per annum. Moreover, non-military consumption of oil products has been drastically reduced and further headway appears to have been made with the use of producer-gas and other substitute fuels. The proportion of the total output of oil products available for military purposes may therefore be quite appreciable, though there is no basis for calculating its size. But while information concerning supplies, and especially the supplies of individual products, such as lubricating oil, is meagre, there is no basis for calculating military demand. If it had been at the rate of one to two million tons per month in Russia alone during the offensive last summer and autumn, as was estimated by some at the time, a breakdown would have been inevitable. But while these estimates were probably a good deal off the mark, military requirements for a large-scale and sustained offensive this year must be very large; the bombing of Germany's coal-oil plants may still be one of the most effective methods of disorganising her military machine.

Retail Trade in February

The retail trade returns for February, published in last week's *Board of Trade Journal*, reflects the smoothing that is taking place in the fluctuations of sales from month to month. Normally, there is a marked fall in non-food turnover after the January clearance sales, but this year the decline in the average daily value of sales between January and February was only 8 per cent. Food sales, as usual, showed a slight increase during this period. Compared with the corresponding month a year ago, the average daily value of food sales shows little change, but turnover in other goods was 11.3 per cent higher. The increase in non-food sales is due mainly to the rise in prices and to the fact that a year ago trade was restricted by air raids. It was most marked in the furnishing departments, in footwear, men's and boys' wear, and household piece-goods. Apart from an increase of 26.9 per cent in central London,

FAMOUS SINCE 1795

OTARD'S

COGNAC BRANDY

there was no outstanding regional change in the value of total sales between February, 1941, and February, 1942. The value (at cost) of food stocks held by retailers at the end of February was 4.1 per cent, and that of other goods

PERCENTAGE CHANGE IN VALUE OF RETAIL SALES
FROM CORRESPONDING MONTH A YEAR AGO

	Food and Perishables	Other Merchandise
1941 February	+ 3.5	+ 1.8
March	- 2.1	- 2.1
April	+ 0.9	+ 2.9
May	- 4.3	- 2.4
June	- 3.1	+ 6.8
July	- 6.7	- 15.9
August	- 1.9	- 10.8
September	- 0.8	- 8.2
October	+ 0.2	- 23.5
November	- 0.4	- 2.3
December	- 1.9	- 7.4
1942 January	- 1.1	+ 12.0
February	+ 1.8	+ 11.3

3.7 per cent, higher than a year ago. There has been no further news concerning the concentration of the non-food section of retail trade, a problem whose solution becomes daily more urgent.

Milk Prices

When the new prices for farm products, based on the higher minimum wages, were announced on February 20th, negotiations on milk prices had not been completed. Producers' prices for the forthcoming twelve months were announced on April 1st. They will be at the rate of 2d. per gallon above the prices originally announced for the year ended March 31, 1942. The schedule of prices is complicated, since the increase of 2d. is to be spread unevenly over the year to encourage winter milk production. Thus, for the six summer months as a whole, for England and Wales, the increase will be at the rate of 1.37d. per gallon, which brings the average price to 17.35d. During the winter months the price will be 29.21d. per gallon, an increase of 2.78d. The actual prices vary month by month and region by region, but the maximum regional price differential has been reduced, according to the wishes of producers, from 1d. to ½d. Last year an assurance was given that prices would be reviewed and retrospective adjustments made if costs justified an increase. As a result, farmers were granted an additional ½d. per gallon for six summer months, and an extra 1½d. per gallon for January, February and March, 1942. The increase of 2d. now includes these extra payments, so that the increase over what farmers have recently been receiving is smaller than might appear. It has been recognised that the system of extra retrospective payments, which might be compared to the "cost plus" contract system, may leave room for misuse. No provision has, therefore, been made in the new schedule for retrospective review of costs, but, nevertheless, an assurance has been given, that if costs change as a result of events entirely outside the control of producers, claims for an increase in price will be sympathetically considered; or the allocation of the increase between summer and winter prices may be changed. It is probable that the increase of 2d. per gallon is reasonably in line with the other new farm prices. The County War Agricultural Committees are to watch over the production of milk and there is every hope that output will be larger this year than in the earlier war years.

Tea Rationing

The Ministry of Food has issued a Press communiqué under the somewhat equivocal title of "Stricter Rationing of Tea." The method of obtaining tea has been by the cancellation of coupons at any shop, and without registering for supplies. Tea rationing has fallen between the two stools of goods for which registration is required (e.g., bacon and sugar), and goods for which points coupons have to be surrendered. There has been no registration and no check on the retailer on the amount of tea sold. The number of his customers registered for other goods can only be the roughest guide to sales of tea. Unlike most other groceries, there are firms which specialise in the sale of tea, and it is impossible to calculate the number of ration books which pass through their hands. In fact, the rationing scheme for tea has been capable of misuse with impunity. Appreciably more tea has been consumed than the public was entitled to according to its rations. The news that the scheme has been revised is, therefore,

welcome, particularly now that anxiety exists on the question of future supplies. Since last Monday, retailers have been required to cut out tea coupons from the ration book. Four coupons must be surrendered together for any four-weekly period, and purchases of tea on each ration book must be made only once in each period. It is to be hoped that the next step will be that retailers will be allocated supplies on the basis of the number of coupons they produce, on the model of the points rationing scheme.

Co-operative Dividend Increase

The Co-operative Wholesale Society turnover for the year ended January 10th totalled £144,307,408, £47,098,301 of which came from the society's own productive works. These amounts represent increases of 0.8 per cent and 4½ per cent respectively, over the returns for the previous year. After meeting all expenses, and making provision for taxation, interest, and depreciation, the net profit for 1941 was £3,823,533. From this the usual dividend of 4d in the £ on purchases is recommended by the directors, who are adding a special bonus of 2½d in the £ as well as an extra dividend of 3d in the £ on purchases of CWS products. These dividends and bonuses will distribute £3,723,533 of the surplus to the retail societies, leaving £100,000 for the reserve fund. The share and loan capital of the federation is now £92,208,874; the investments in British Government and municipal stocks stand at £115,916,935. Deposits and withdrawals from the CWS Bank during the past year totalled £925,107,241, an increase of £3,798,565. Of the total sales, £104,637,509 were of groceries and provisions which rose 2½ per cent above the turnover of 1940. Drapery turnover (£5,507,200) decreased 16 per cent; men's wear (£3,078,280) 17 per cent, and furnishings and hardware (£4,146,720) 27 per cent. Sales to the Ministry of Food rose to £3,938,502. The value of flour from the society's mills advanced 5 per cent to £8,424,670 but the weight receded by 1½ per cent to 824,214 tons. There was a surplus of £493,528. The product of the creameries practically doubled to £7,206,344; so, too, did the turnover of the milk department which rose to £10,882,273. The farms owned and cultivated by the CWS covered 18,613 acres and produced wheat, barley, potatoes, root crops, fruit and live stock to the amount of £591,559, making a surplus of £167,040. Turnover in the agricultural department was £3,276,745. Most of the society's textile, footwear, cabinet and dry goods factories decreased their output. The decrease ranged from 12 per cent in the tanneries to 56 per cent in the CWS potteries. The Health Insurance Section of the CWS reached a membership of 600,000 and is admitting new members at an average rate of 1,120 per week. Continuing its policy of local federations for special services, the CWS is admitting into membership the newly formed West Wales Co-operative Funeral Furnishing Society, which comprises societies in and around Glamorganshire. This idea of local federations is being encouraged in several parts of the country in connection with laundries, boot and shoe repairs, and funeral furnishing—with the trading assistance of the CWS.

Aluminium Costs and Prices

On April 1st the prices of a number of semi-finished aluminium products (rods and sections, strip, tube and wire made of aluminium and aluminium alloys) are reduced by 5 per cent, but the price of crude aluminium (ingots and bars) remained unchanged at £110 per ton delivered at consumer's premises, against £94 before the war. As a substantial proportion of Great Britain's requirements are imported, the reduction in the price of semi-finished materials is presumably due to lower import costs. The reduction in prices focuses attention on the steady fall in costs of production resulting from the expansion in output in North America and in Germany. In the United States the price of the metal was reduced by stages from an average of 20 cents per lb in 1939 to 15 cents in October, 1941. In Germany, its price fell from 160 marks for 100 kilos in 1933 to 144 marks in November, 1934, 133 marks in July, 1937 and 127 marks in June, 1941. Both in North America and in Germany the downward trend in costs and prices is likely to continue as a result of the prospective further increase in production. Owing to the heavy war demand for aluminium, the rate of world production of the metal, which has already passed the 1,000,000 ton mark, against an output of less than 500,000 tons in 1937, may reach 1,500,000 tons this year if production schedules are fulfilled. The downward trend in prices should assist producers in expanding the use of aluminium for civilian purposes after the war.

SATISFACTORY RESULTS

STRONG LIQUID POSITION

LORD ELPHINSTONE'S ADDRESS

The annual general meeting of the proprietors of the Bank of Scotland was held within the head office, Edinburgh, on the 7th instant. The Right Honourable Lord Elphinstone, KT, Governor of the Bank, presided.

In submitting the directors' report, the chairman said: My Lord, Ladies and Gentlemen,—I assume that, as usual, we may hold as read the report by the court of directors of the affairs of the bank as at February 28th last, a copy of which you have all no doubt received.

The conditions during the past year have been difficult and strenuous for everyone, and as a bank we have taken our full share of the common burdens imposed by war and in contributing to the national effort by the essential banking services we have rendered to the community. It is probable we may meet even more difficult days ahead but like everyone else in the country I would like to emphasise that in our personal as well as in our business affairs we are ready with cheerfulness and courage to accept and carry out whatever tasks, services and sacrifices may be necessary to bring us through to victory.

THE BANK'S BALANCE SHEET

The balance-sheet figures continue to reflect the changes due to war conditions which are familiar to those who keep closely in touch with banking trends in these days. Our deposits at £50,593,844 again show an expansion over last year's figures, this time to the extent of £2,997,738. The expansion is largely due, as you are aware, to the increasing Government expenditure for war purposes and to the contraction and restriction of commodity stocks and supplies in many trades which war conditions have brought about. For the greater part of the bank's year the expansion was a growing one and our deposit figures reached a total considerably higher than that of February 28th. But in the last month or two of our year in addition to the usual seasonal withdrawals by our customers for payment of taxes—an increased amount no doubt under present conditions—there were further considerable withdrawals to take up the new Treasury issue of tax reserve certificates. Both factors combined to make us share in the substantial drain upon deposits—for the time being—at any rate—common to all the banks.

The note circulation shows an increase of £1,104,646 due doubtless in the main to the reason which has led to larger bank deposits, viz., the increasing Government war disbursements. Possibly, however, to some extent the increase is the result of a wartime habit acquired by many people of carrying about with them or holding in their homes a greater quantity of notes than they would normally do. The practice is an unwise one in every way and such holders of bank notes of whatever sort are urged to return them to their bank accounts so that they may be available there as deposits for lending to the Government for the war effort.

The fluctuations in the items drafts issued and acceptances represent day-to-day changes in customers' requirements.

LIQUID ASSETS

A strong liquid position is very necessary in present times and our liquid assets are consequently well maintained. Cash, bank balances, cheques in transit, money at call and short notice, and bills discounted (including £525,000 of Treasury bills) amount to £14,870,053, as against our liabilities to the public of £61,942,452. There is in addition the further liquid asset of £5,500,000 Treasury deposit receipts available for discount at any time to cover any emergency needs, and there are as well our investments of £32,431,738 which show a surplus of over £2,000,000, giving

a total of £52,801,792 in liquid assets against our liabilities to the public.

ADVANCES

Our advances show a decrease of £555,115 at £9,062,132. A decrease was to be expected on account of wartime conditions. While accommodation is being given by us liberally in directions where this is required for the production of war supplies and food, the extent to which the Government itself finances war production and has restricted the supply of goods of all sorts for home consumption limits the needs of many of our customers for advances. That the decrease should be in the circumstances a comparatively small one is satisfactory. All bad and doubtful debts have been fully provided for. Looking to the increase in our deposits and the decrease in our advances, an increase in our investments is a natural result. The value of our investments is considerably more than the figure of £32,431,738 at which they stand in our books.

BANK'S PREMISES AND HERITABLE PROPERTY

The bank's property all over the country has been maintained in good condition. The damage sustained by our properties from air raids as a whole has not been great. The properties stand in our books at £483,900 which we regard as much below the actual value.

RESULTS FOR THE YEAR

The net profits are £21,260 down at £232,645. A decrease in profits was to be expected from the fact that our expenses have increased considerably, particularly in staff remuneration and taxation. A contributing factor, too, is the small rate of interest earned on our more liquid assets.

The net profits are	£232,645
Add the balance from last year	155,572
	388,217

Deduct:—	
Applied to reserve for contingencies	£70,000
Transferred to trustees for officers' pension fund	30,000
Dividend at 11 per cent. per annum, less income-tax	132,000
	232,000

Leaving to be carried forward	£156,217
-------------------------------------	----------

BANK STAFF

Of the men on the staff of the bank 546 have left for military service and at the moment a further call upon us is being made under which we shall be left with 45 per cent. only of the number of men on our pre-war staff. As time goes on still further calls are likely to be made upon us. It is with regret that we record that of the men who have gone on service eleven have made the supreme sacrifice and we pay a tribute of honour to their memory. Ten are prisoners of war. Fourteen have been discharged from the Forces as unfit for further service on account of wounds and other causes. They have been reinstated in the bank's service. One member who, as I mentioned last year, had received the Military Cross for bravery in action has since been appointed to a spell of duty as personal aide-de-camp to his commander-in-chief. We offer him our further congratulations upon this additional honour.

To all of our staff, both men and women on national service, we send greetings from this meeting.

Our remaining permanent staff and our temporary staff have continued to respond in an admirable manner to the task of carrying on the essential services the bank affords to the public under difficult conditions and to them we express our thanks and appreciation. Most of these in addition to their bank duties are engaged in their spare time in voluntary work with one or other of the branches of national service, and we appreciate with gratitude their devotion to duty and their service to the country.

I have now pleasure in moving that the report and balance-sheet, as submitted, be adopted, and that a dividend for the past half-year at the rate of 12 per cent. per annum, less income-tax, be now declared payable on 15th current, making with the dividend paid in October last, 11 per cent. for the year, less income-tax. The motion was agreed to.

The Lord Elphinstone, KT, and The Lord Henry Scott were unanimously re-elected Governor and Deputy-Governor respectively for the current year.

Mr James Gourlay, BSc, Colonel Norman Kennedy, CBE, DSO, TD, and Mr Archibald Gray Robertson Brown, FFA, FRSE, were re-elected ordinary directors.

Mr H. L. Usher, CA, and Mr R. Arthur Morrison, CA, were reappointed to conduct the audit of the bank's books for the current year, and a vote of thanks to the chairman terminated the meeting.

WESLEYAN AND GENERAL ASSURANCE SOCIETY

The one hundred and first annual general meeting of this Society was held, on the 7th instant, in Birmingham.

Mr Arthur L. Hunt, FSS, FCII (chairman and managing director), said that the Government rightly insisted that every man and woman in the country should save as much as possible and lend for the war effort. It was also true that every premium for any of the usual types of life policy was to a large extent an indirect loan to the Government for the simple reason that the insurance offices were giving the maximum support to Government new issues.

He was able to report greatly improved new business figures. In the ordinary department 6,828 policies had been issued for a total sum of £1,041,594, compared with 3,480 policies in 1940 for £528,482. In the industrial department 117,354 policies had been issued for a total sum assured of £2,826,894, compared with 132,575 policies in 1940 for £2,796,927. A feature of the year, however, was the relatively small number of policies given up. In consequence the total of premiums collectable had increased by £54,260 per annum, a greater increase than had been recorded in any year since 1920. In the Fire and General Department the premium income increased by £4,901 to £51,406. The total premium income for all departments amounted to £2,330,066.

The total assets stood at £17,987,542. They had increased in market value during the year.

The report was unanimously adopted.

JOHN BARKER AND COMPANY, LIMITED

The forty-ninth ordinary general meeting of John Barker & Company, Limited, was held, on the 9th instant, in London.

Mr Trevor A. Bowen, DL, JP (chairman and joint managing director), said that the net profit of £253,748 compared with £196,897 for the previous year, an increase of £56,850, a result which the directors considered a satisfactory conclusion to a most difficult trading year.

The problems confronting them at the beginning of the financial year had been rationing, registration and quotas, Limitation of Supplies Order, and the Purchase Tax. To those there had since been added further obligations such as clothes rationing by the coupon system, followed by points rationing for foods, and more recently the complicated classification of utility goods with prices fixed at a level which barely covered expenses. If one added to those the constant flow of control orders from the various Ministries, the difficulty of obtaining supplies even up to their quota, drastic packing and now transport restrictions and the increasing shortage of staff, he thought shareholders would agree that trading to-day was no easy matter. They were not in any way daunted by the threatening prospect, but it would be folly on his part to express undue optimism in view of present conditions.

The report was unanimously adopted and a final dividend of 10 per cent. on the ordinary shares, making 10 per cent. for the year, was approved.

NATIONAL PROVIDENT INSTITUTION

INTERIM BONUS RATES MAINTAINED

The following is a summary of the address submitted by the chairman, Mr Robert E. Dickinson, at the annual meeting of the National Provident Institution held, on the 7th instant, in London.

The report now before you shows a further falling off in our new business activities, and this is due chiefly to the fact that our new business organisation consisted of a comparatively young staff, and it has suffered unduly by the demands of national service.

Perhaps the chief point in which you will be interested is the valuation of our assets, and here I can report a very healthy position. In the case of our Stock Exchange securities, at the end of the year there was a substantial margin in our favour between the book values and the market values. Our other assets cannot be valued so readily, but you will remember that we have a contingency reserve of £200,000 to meet any losses or depreciation due to the war or other causes, and this we believe is at present sufficient for the purpose.

Our total holding of British Government securities stands in the books at nearly £2,500,000, and since the outbreak of the war our total investments in war loans have exceeded £800,000.

The investment of such large sums at comparatively low rates of interest, often in place of money previously earning a higher rate of interest, must, apart from other causes, result in a reduction in our interest yield. For 1941 the gross rate earned on our funds was £4 18s. 7d. per cent., as compared with £5 1s. 6d. per cent. for 1940, and our net rate of interest after deduction of income-tax fell similarly from £3 11s. 5d. per cent. in 1940 to £3 9s. 2d. per cent. in 1941.

We have decided to continue to allow interim bonuses for the present on full profit policies becoming claims by death or on maturity by survival at the same rates as last year. In the case of whole life policies the rate of interim bonus is £2 per cent. per annum in respect of premiums paid for the years 1937-39, and £1 10s. per cent. per annum in respect of subsequent premiums. In the case of endowment assurances the rates vary with the maturity age of the policy.

UNITED SERDANG (SUMATRA) RUBBER PLANTATIONS, LIMITED

MR H. ERIC MILLER'S STATEMENT

The thirty-fourth ordinary general meeting of this company will be held in London on the 16th instant.

The following is an extract from the statement by the chairman, Mr H. Eric Miller, which was circulated with the report and accounts for the year ended August 31, 1941:—

The rubber crop accounted for, over 14,500,000 lbs., is easily the largest in the company's history, and is evidence that we pulled our full weight in the endeavours made by the rubber-producing industry to place at the disposal of this country and its Allies the largest possible quantity of one of the primary war requirements.

The credit balance on profit and loss account brought in from 1939-40 is £97,587, to which has to be added the profit for the year 1940-41 of £147,233, making a total of £244,820 which, subject to provision for British income tax, the directors recommend should be carried forward.

The United Serdang Company, in its 35th year, from the point of view both of its agricultural condition and its earning capacity, was just in its prime. It is sad to think of its orderly progress being so ruthlessly disturbed by the Japanese invasion.

We have no knowledge as to what has actually happened in NEI since communication with the outside world ceased.

Cash on deposit and in hand in London now amount in round figures to £550,000. Although the directors might perhaps have recommended the distribution of a dividend, they were reluctantly forced to the conclusion that the interests of the stockholders would best be served by retaining the company's funds till better times.

The establishment of capacity for large-scale production of synthetic substitutes for natural rubber will have to be reckoned with when steps are being taken after the war to rehabilitate the rubber producing industry, but if the spirit underlying the Atlantic Charter prevails in those discussions, as it certainly should, there will be no difficulty in evolving a *modus vivendi* which should be acceptable to all interests.

THE NATIONAL BANK OF EGYPT

DIVIDEND AGAIN 14 PER CENT

EGYPT'S EVER-GROWING EFFORT

ALY SHAMSY PASHA'S REVIEW

The forty-second ordinary general meeting of the National Bank of Egypt was held at the head office of the bank in Cairo, on the 18th ultimo, Aly Shamsy Pasha (the president) was in the chair.

DIRECTORS' REPORT AND ACCOUNTS

The gross profit for the year, after providing for depreciation on the bank's buildings and furniture, for rebate of discount and for doubtful debts, amounts to L.E.905,060. After deducting from this sum L.E.19,676 for directors' fees and L.E.448,154 for current expenses there remains L.E.437,228. In conformity with Article 49 of the bank's Statutes a dividend of 4 per cent. is payable on the share capital, L.E.117,000, and after this distribution there remains L.E.320,228. Adding to this the balance brought forward from last year of L.E.210,229 the amount available is L.E.530,458. From this amount the directors recommend the payment of an additional dividend of 10 per cent. on the share capital, which will absorb L.E.292,500, and to carry forward the balance of L.E.237,958. The total dividend for the year will thus be at the rate of 14 per cent., equivalent to £1 8s. per share. An interim dividend of 8s. having been paid on September 1, 1941, there remains to be distributed the balance of £1 per share, which will be paid less taxation in accordance with existing laws.

			52,700,000	000

* By authority of the Egyptian Government these Treasury Bills are deposited in lieu of gold.

THE PRESIDENT'S STATEMENT

Once again it is pleasing to record that the State finances have been maintained in a very satisfactory condition. Revenue from direct taxes, Customs and Excise have shown a marked increase, and State railway receipts are also considerably higher than last year. Expenditure, on the other hand, has been subject to close control and in many cases reduced.

It may be that the coming Budget will see a higher level of expenditure owing to the many new calls on the Treasury, but, with every indication of a continued expansion in revenue, the additional expenditure should be met without difficulty.

Evidence of the country's growing independence in financial affairs is to be found in the ready response to the Government's offer of Treasury bills.

The Government decided to issue short-dated bills as part of their borrowing programme in connection with the cotton purchase scheme, in order to meet the needs of banks and other financial institutions and provide an outlet for the large accumulated funds which, owing to wartime conditions, these institutions are compelled to hold in liquid form.

The influx of capital into Egypt as a result of the British Government's purchases of cotton during the past two seasons and the local expenditure of the Allied Armed Forces have created a considerable degree of prosperity in various branches of industry and commerce.

Turning to our own accounts, the balance-sheet gives impressive evidence of the bank's strength and ability to play its part in the war-time economic life of the country. Our resources have increased considerably during the year and, although this is most manifest in the Government balances, the increase of over L.E.7 million in the deposits of the general public affords striking testimony of the continued esteem and confidence which we enjoy.

Current deposit and other accounts have reached the record figure of L.E.33,408,552, compared with L.E.26,366,772 a year ago, while the various accounts of the Governments of Egypt and the Sudan together aggregated L.E.21,297,258 at the end of the year, against L.E.4,766,311 last year.

The reduction in our gross profit figure is somewhat misleading, as the fall is not due to a decline in earnings but to a change in the accounting procedure of the note issue department.

The profit and loss figures show a fall of L.E.16,442 in gross earnings and of L.E.52,061 in current expenses; there is thus an improvement of over L.E.35,000 in the final result of the year. Last year it was necessary to make a draft of L.E.7,913 on the carry-forward in order to maintain the dividend, and on this occasion we propose to add to the carry-forward the sum of L.E.27,729 and to make a distribution at the same rate as for the past two years—viz., 14 per cent.

The report and accounts were adopted.

ASHANTI GOLDFIELDS CORPORATION, LIMITED

STRONG POSITION OF ORE RESERVES

MR. J. H. BATTY'S STATEMENT

At the annual meeting of the Ashanti Goldfields Corporation, Limited, held in London on the 9th instant, Mr J. H. Batty (chairman), presiding, stated that for the convenience of the shareholders (who had already received copies of the chairman's statement) the business of the meeting would be of a purely formal character.

The chairman's statement, which was taken as read, was as follows:—

In referring first to the balance sheet and profit and loss account, I should mention that although, at the urgent request of the Government, we have had to exercise the strictest economy in the use of paper, I think the figures in the condensed form are sufficient to give you a full review of the financial position of the Corporation. If there are any additional figures shareholders would like to have, the secretary will be only too pleased to supply them.

It will be seen from the balance sheet that there is no change in either the issued capital at £1,248,557 or the share premium at £677,464. The general reserve remains at £25,000 and the reserve for taxation, after appropriating £300,000 out of this year's profits, stands at £482,835.

I have nothing to add to the remarks I made last year in respect of the excess profits tax, except to say that negotiations are still pending with the income tax authorities, and it is still hoped that it may be possible to obtain some relief.

DIVIDEND

After making provision of £111,727 for depreciation, £300,000 for taxation, placing £10,000 to the pension fund, and the payment of the first and second interim dividends of £561,850, there is available to the credit of the profit and loss account (including £304,652 brought forward from last year) the sum of £759,497. It is recommended that a final dividend of 35 per cent., less income tax, be paid to the shareholders on April 10th, which will absorb the sum of £436,995, leaving a balance of £322,502 to be carried forward to next year's account.

Sundry creditors, exploring account and investments reserve at £327,219 is somewhat larger than for the previous year. Plant, machinery, works and buildings stand at £1,021,737, including expenditure during the year amounting to £137,189. Of this sum, £56,195 was in connection with new treatment plant and £30,139 was spent on the new aerial ropeway which is being erected to connect the new treatment plant, by way of the present mill and main shaft, with the south shaft. Expenditure on the main shafts amounted to £11,083.

The investments in British Government securities at £233,838 show a reduction of £149,000 due to the repayment during the year of Treasury bonds. The share investments in other companies stand at £639,227. The market value of both these investments is considerably higher than the figure at which they stand in the balance sheet. Cash and bullion total £727,480, being £31,480 higher than last year.

The royalty and export duty on gold premium payable to the Gold Coast Government amount to £110,982 and £247,634 respectively. These sums do not take into account the amount payable by the Corporation in this country in respect of income tax and excess profits tax.

MAIN FEATURES OF YEAR'S WORK

For reasons of economy already mentioned, the annual report of the general mines manager is not being circulated to the shareholders this year. This report can be seen at the Corporation's offices at St. Hilda's, Bushey, Herts, on application to the manager and secretary.

The main features of the year's work can be summarised as follows:—

Tons treated	228,300
Gold content per ton dwts.	23.86
Yield in fine ounces	264,079.20
Extraction per cent.	96.93
Working costs (less development)	32s.
Development footage	21,882
" cost per ton	5s. 3d.

ORE RESERVE:

Ashanti Mine	1,834,735 tons at 23.3 dwts.
Ayeinm	241,781 " 8.4 dwts.
Totals	2,076,516 " 21.6 dwts.

I trust the following comments on the work, though brief, will prove sufficient to enable shareholders to keep in touch with what is being done.

BUDGETED MONTHLY OUTPUT MAINTAINED

The monthly output programme budgeted for in last year's report was, on the whole, maintained, and the total for the year of 228,300 tons and 264,079 ounces was a satisfactory accomplishment under the circumstances. Working costs, as anticipated, were affected by the rising cost of supplies and services, and were some 1s. 11d. per ton higher than in the previous year.

There was a further curtailment of development, owing to some uncertainty as to the supply of explosives and other essential stores and spare parts; consequently the monthly footage was reduced and the total of 21,882 feet driven was some 5,500 feet less than in the year before.

Thanks, however, to the strong ore reserve position which was built up prior to the war, this curtailment of development need cause us no concern. In point of fact, the reduced footage last year exposed sufficient ore to add some 140,700 tons to the reserve, after deducting 228,300 tons, which were mined and treated. It so happens that the greater portion of the work done was on the less rich Obuasi south shoot, but some higher grade ore was also developed on the lower levels, so that the net result on the value of the whole reserve was to lower it only a fraction below the average value for the previous year.

During the current year we hope at least to open up sufficient ore to replace the current output. It is possible, however, that it will be more convenient for the management to again do most of the work on the lower grade Obuasi shoot, though the reef at the bottom of the mine will also receive attention.

REPORT ON LOWER LEVELS OF MINE

It may be of interest to record here the position on the lower levels of the mine. In his report the manager writes as follows:—

"No. 28 LEVEL: Advanced 210 feet to crosscut 8 south and 293 feet to crosscut 6 north. Development incomplete, but to date net length is 665 feet, 30.8 feet wide and 19.8 dwts. The total net

"No. 29 LEVEL: Advanced north to crosscut 3. Development incomplete. length to date of ore is 740 feet, 20.9 feet wide and 37.2 dwts.

"No. 30 LEVEL: Advanced 71 feet north to No. 7 crosscut and 249 feet south to crosscut 9 south. The net length of ore shoot exposed to date is 790 feet, 19.2 feet wide and 35.6 dwts. Development incomplete.

"No. 31 LEVEL: The total net length of the ore shoot is 500 feet, width 17.3 feet and 33.2 dwts. Development north and south incomplete.

"On all four levels further development is required before the final dimensions of the ore shoot will be known. To date, the average of the ore exposed on these four levels is:—

Length	674.0 feet.
Width	22.2 feet.
Value	30.25 dwts."

Since the above was written, additional crosscuts have already been reported on Nos. 28 and 29 levels, as follows:—

No. 28 LEVEL: No. 9 crosscut S., 16 ft. wide, value 39.8 dwts. No. 29 " No. 4 crosscut N., 24 ft. wide, value 45.7 dwts.

The ore reserves at September 30th stood at 2,076,516 tons of a value of 21.6 dwts. per ton, as compared with 1,935,808 tons of 21.8 dwts. per ton in the previous year.

The present ore reserves are about double in quantity and nearly 2 dwts. per ton higher in value than they were six years ago, which gives you a fair idea of the satisfactory progress which has been made during that period, in spite of the fact that we have progressively, year by year, increased tonnage and output. The present ore reserve is sufficient for about 9 years, at the present monthly throughput, and it would therefore be uneconomical to continue to develop new ore to any great extent and so increase our standing charges for maintenance of the workings.

During the year the south shaft was carried down 167 feet to No. 20 level at a total depth from the surface of 1,948 feet, whilst

the west shaft was sunk 225 feet to a total of 751 feet. All sinking has now been suspended. Stopping operations have been normal, and the manager reports that the plant and workings are all in good working order and that the ventilation system has been further improved.

The metallurgical department shows further improvement. The central treatment plant, reinforced by the retreatment plant, obtained a very satisfactory over-all recovery of 96.93 per cent., which is slightly better than in the previous year. The pilot flotation plant, having served its immediate purpose, was shut down towards the end of the year to economise in power and the use of stores, etc. It remains as a standby plant or for further bulk trials as may be required.

PROGRESS OF CONSTRUCTION WORK

The construction work on the surface was hampered by difficulties in obtaining delivery of material. Some progress was made with the new wet treatment plant, but no date can be given for its completion, as this work is being carried on spasmodically, depending on the arrival of the material at the mine.

Among other improvements, a new domestic water supply system was completed, with sand filters and large tank storage.

We have made substantial progress in the reforestation programme, and during the year we have cleared and planted some 726 acres.

You will naturally understand that our operations in the ensuing year will be governed largely by our ability to secure essential stores. You may be sure, however, that the directors are watching the position very closely, and every effort will be made to maintain the monthly returns somewhere near the present figures, although it may be necessary from time to time to make some modifications, depending on the progress of the war and the facilities for shipping.

In conclusion, it gives me pleasure to refer to the excellent work done by the management and staff, both at home and abroad, during a difficult year, and to especially record our appreciation of their services, which I am sure the shareholders will wish to endorse.

Lord Luke seconded the resolution adopting the report and accounts, which was carried.

BIBIANI (1927), LIMITED

RESULTS OF YEAR'S WORK

MR. J. H. BATTY'S STATEMENT

Presiding at the fifteenth annual general meeting of Bibiani (1927), Limited, held in London, on the 9th instant, Mr J. H. Batty (chairman) stated that with the shareholders' permission, and for their convenience, his usual statement would be taken as read, copies of it already being in the shareholders' hands. The business of the meeting was accordingly of a purely formal character.

The following is the text of the chairman's statement:— As already mentioned in the directors' report, in order to economise in the use of paper, the accounts on this occasion have been issued in a more condensed form, but it is thought that the information furnished will enable shareholders to compare the figures with the previous year.

Dealing with the balance sheet, it will be noted that the issued capital remains at £500,000, and there is no change in the share premium account, which stands at £436,318.

Reserve for taxes, after appropriating £180,000 out of this year's profits, amounts to £296,255. I shall be referring to this matter again later on.

RESTRICTED PROGRAMME OF DEVELOPMENT

No shaft sinking was undertaken during the year, and the figure of £25,265 is arrived at after making the usual provision for depreciation.

The expenditure on plant and machinery during the year amounted to £41,234. The chief items making up this sum were:—The provision of a new drill sharpening shop; the installation of 100,000 cubic feet per minute ventilating fan at No. 1 shaft north; and the completion of the African Hospital and its equipment.

Owing to the restricted programme of mine development, expenditure on this account only amounted to £9,786.

Stores and plant in stock amounted to £196,579, and every endeavour has again been made to maintain adequate supplies, both of stores and spares, in face of the increasing difficulties in placing orders and obtaining delivery.

Cash and bullion in transit amount to £291,698, which is about £40,000 more than last year.

PROFITS AND EPT

The profit for the year amounts to £305,544 after writing off £73,424 for depreciation on plant, machinery and buildings and main shafts. Out of this sum, £180,000 has been appropriated, principally to meet our estimated liabilities in respect of excess profits tax. As you will remember, I dealt at length with this matter in my speech last year, and I have only to add that it is hoped that our continued efforts to obtain relief from this inequitable taxation will meet with some success.

For reasons already stated, we have decided not to publish the report of the general manager on the year's work. We will, of course, be pleased to show this to any shareholder who wishes to see it, at the company's offices, St. Hilda's, Bushey, Herts, if he will write to the secretary.

I trust, however, that the following general account of operations will be found sufficiently informative.

A table showing the results of the year's work was included in the manager's report, and is given below:—

Tons milled	293,900
Head value (dwt.)	6.91
Yield—fine ounces	89,011
Actual extraction per cent.	87.67
Working costs (including development)	19s. 9d.
Development footage	5,747
Ore reserves—tons	2,548,204
Ore reserves value—dwt.	7.17

It will be seen that during the past year throughput reached 293,900 tons, with a yield of 89,011 ounces. The plant is, of course, capable of an output of 30,000 tons per month, as was demonstrated in the months of March, April and May in 1940, but with the declaration of war by Italy it became necessary to modify our programme, in order to ease the strain upon our European staff and the maintenance of supplies.

The manager reports that the development he has been able to accomplish has had to be devoted, for the most part, to furthering the ventilation and sand filling schemes, but that some 1,200 feet of exploration on No. 10 level has resulted in opening up some good grade ore north of the central shaft on that level, and some low grade ore south of the south shaft. Details of this work, as given in the manager's report, are:—

NO. 10 LEVEL NORTH OF CENTRAL SHAFT:

No. 18 crosscut east ...	Width 10 ft. Average assay value 10.1 dwt. per ton.
No. 20 crosscut east ...	Width 10 ft. Average assay value 14.7 dwt. per ton.
No. 21 crosscut west ...	Width 10 ft. Average assay value 5.5 dwt. per ton.
No. 22 crosscut west ...	Width 15 ft. Average assay value 40.2 dwt. per ton.

No. 10 LEVEL SOUTH OF SOUTH SHAFT: The ore body cut between Nos. 24 and 25 crosscuts east was of low grade, averaging 4.1 dwt. over a width of 5 feet.

On the surface a certain amount of useful construction work was carried out, though here, too, owing to war conditions, the programme was limited. A new and efficient drill sharpening shop, designed to serve the mine when working at full capacity, has been completed, and the capacity of the foundry, which becomes of increasing importance in view of the scarcity of spare parts for renewals, was enlarged. The new African Hospital, for which elaborate and full equipment has been sent out, was practically completed, and it has since been opened for general use. It is unfortunate that the proposed extension to our new African township has had to be slowed down, but it is encouraging to record that the late Governor, on his farewell visit to Bibiani, expressed the opinion that our village, and arrangements for our African employees generally, reflected great credit on the company.

TEN YEARS RESERVE OF ORE

ORE RESERVES.—These have been recalculated, and the ore reserve is now estimated to contain 2,548,204 tons, of an average

value of 7.17 dwt. per ton. The total is about 200,000 tons less than last year's estimate, and fractionally lower in value, but the position, which was built up prior to the war, is so strong—representing over ten years' output at our present rate of working—that no concern need be felt about the temporary curtailment of productive development, due to present world conditions. With the considerable widths which characterise the Bibiani ore body, we can look forward, with confidence, to making speedy and important additions to the reserve when the resumption of development becomes possible and desirable.

The problem of maintenance of supply of essential stores will continue to give us some anxiety, and, though we had built up our stocks even before war was declared, certain commodities are

now more difficult to replace. The entry of Japan into the war has increased these difficulties, and, as a necessary precaution, from the beginning of the present financial year the monthly output aimed at has been about 21,000 tons, to yield some 6,400 ounces. We are hoping there may be no occasion to make any further modification on these figures.

In conclusion, I should like to take this opportunity of recording the keen appreciation of my colleagues and myself, which I am sure will be endorsed by the shareholders, of the excellent results achieved by the manager and staff, both at home and abroad, under trying conditions.

Lord Luke seconded the resolution adopting the report and accounts, which was carried.

RECORDS and STATISTICS

STOCK EXCHANGES London

Note: all dealings are for cash

DESPITE the general uncertainty regarding the future course of events in the various theatres of war, interest at present is mainly centred on the coming Budget. In addition, the Easter holiday and the disappointing developments in India all contributed to the prevailing general uncertainty in the markets. The actual volume of business has in consequence been restricted, but the undertone, despite small irregular price movements, has been distinctly firm throughout. Few changes were witnessed in the *gilt-edged* market, although lack of demand before the holiday occasioned several small declines, prices later remaining steady. Interest in the *foreign bond* market was reduced to quiet support for South American issues, business generally failing to affect quotations. As elsewhere, the *home rail* market suffered a decline in turnover, but although *GW* ordinary weakened on some selling, losses were in general slight. Senior issues, in particular *LMS* 4 per cent 1923 and *LNE* 4 per cent First preference issues, received quiet support, but prices were barely affected. A slightly weaker tendency developed in the *foreign rail* market in the absence of buyers, but declines were few and did not exceed $\frac{1}{2}$ point. Later there were slight improvements in the *Funds*, while South American bonds were firm, but there was weakness in the *home rail* market.

Although interest was well spread throughout the various sections, actual activity in the *industrial* market had no marked effect on prices, which moved narrowly and without trend. Despite doubts regarding the Budget, brewery shares continued firm and numerous small improvements were registered before the holiday. Tobacco issues were more subdued, but prices in general remained steady. Some enquiry for leading issues occasioned a slight improvement in the motor and aircraft group, with *Raleigh Cycle Holdings* and *Austin* in particular request. Changes among heavy industrial shares were few, but prices were changed were generally better. *Colvilles* jumped rs. 7 $\frac{1}{2}$ d. on Good Friday on the maintenance of the dividend, while *Vickers* and *Ruston & Hornsby* both improved. Modest buying of textile issues occasioned some small advances, although the largest movement was a fall of $\frac{1}{8}$ for *Patons & Baldwins* on Tuesday. After remaining unchanged before the holiday, shipping issues weakened on Tuesday, although *Indo-China* deferred gained $\frac{1}{8}$ against the trend. The miscellaneous section reflected the general tone of the market and changes were generally small, with *Murex*, *Turner & Newall*, *Spillers* and *Ranks* all showing improvement. Building material shares were dull, and the repetition of last year's payments by *Pinchin*, *Johnson* and *Indestructible Paint* left prices unchanged.

The general tendency to await events was

particularly marked in the *kaffir* market, where, with little business coming from the Cape, interest remained at a low ebb. Although the returns for *Grootvlei* and *East Geduld* occasioned gains of $\frac{1}{8}$ and $\frac{1}{16}$ respectively on Good Friday, small losses predominated. While the actual turnover in the rubber market was slight, numerous small improvements reflected the persistent enquiry for low-priced shares. The tin market, however, was without interest. Activity in the oil market was restricted to the few leading issues, and in view of the events in *Burma*, *Anglo-Iranian*, *Burmah* and *Shell* all displayed weakness. Although *Anglo-Iranian* lost $\frac{3}{8}$ in the previous week, changes were generally slight. *Ultramar*, however, advanced 2s. 6d. over the same period, after the completion of the sale of a large holding.

New York

THROUGHOUT the past week conditions on Wall Street have been quiet. With traders holding off pending decisive military developments and a clarification of the tax position, turnover failed to expand. Apart from a slight rally immediately before the Easter recess, prices fluctuated narrowly without trend. Later, some light selective buying occasioned a firmer tendency.

CONVERSIONS AND REPAYMENTS
Lisbon Electric Tramways.—The £263,600 outstanding 5 per cent Mortgage Debentures will be repaid at 110 per cent on September 30, 1942.

London Passenger Transport Board.—The Treasury has agreed to the replacement on January 1, 1943, of £12,583,000 of 4½ per cent Trade Facilities Acts Stock with a security bearing a lower rate of interest having the same ranking and similar guarantee as to principal and interest by the Government. This approval is subject to the necessary Parliamentary Powers being granted to the Board.

Madeira-Mamore Railway.—The Trustees of this Railway propose to make an immediate further repayment of £8 ros. per cent on the 6 per cent and 5½ per cent First Mortgage Cumulative Income Bonds.

Yardley and Company, Limited.—This company will redeem its £168,630 6 per cent Second Cumulative Preference shares at 24s. per £1 share on July 1, 1942. A full half-year's dividend is to be paid on July 1st for the half-year ending June 30, 1942.

Pretoria (City of).—The City of Pretoria is to redeem at par on July 1, 1942, the £504,118 outstanding 4½ per cent inscribed stock.

Food Control.—The Ministry of Food will allow consumers to buy one lb. of sugar for jam making, instead of the preserves ration of one lb. for any or all of the three four-weekly periods from April 6th to June 28th. Condensed milk and cereal breakfast foods were included in the points rationing scheme from April 6th. The pointing for condensed milk varies according to the type, but is roughly 4 points for just under the equivalent of a pint of milk. For the cereal breakfast foods, containers of 8 oz. and under require 2 points; 8 oz. to 12 oz., 3 points, and over 12 oz., 4 points. For the current period, April 6th to May 3rd, the number of points on each ration book has been raised from 29 to 24.

Export Control.—Under the Export of Goods (Control) (No. 15) Order (S.R. & O. 1942, No. 578), made by the Board of Trade, collapsible containers of lead or tin, manufactures of cork, clock movements for recording instruments, woollen woven tissues cut to a width of 18 inches or less, and a number of additional chemicals, including butyric acid, diethanolamine, gas detector paint, iron oxides, monoethanolamine, tin oxides and triethanolamine will be subject to export control. The existing licence requirements in respect of woollen woven tissues, chromium compounds and various lead compounds are superseded by new provisions. Exports of all kinds of hosiery and hose made wholly or mainly of wool will be subject to licence under the Export of Goods (Control) (No. 16) Order (S.R. & O. 1942, No. 602). This Order has been made to safeguard essential supplies for the home market and, for the present, applications to export these goods will not normally be entertained. Both Orders come into force on April 21st.

"Utility."—The Board of Trade has restricted the use to which the word "utility" may be put when applied to clothing. By the Order (S.R. & O. 1942, No. 556), the word "utility," or any word resembling it, must not be employed in trade descriptions or advertisements relating to cloth and apparel which is not utility cloth and apparel as defined in Orders made by the Board of Trade—unless it is made clear that the cloth or apparel in question is not a Board of Trade utility article. The purpose of the Order is to protect customers who wish to buy official utility marked cloth and clothing from being misled.

Fewer Boots and Shoes.—Boot and shoe supply licences for the period April to May, 1942, have been reduced from those of the previous period of December, 1941, to March, 1942. The following cuts have been made in boot and shoe production: men's, ordinary, 20 per cent (no cut is made in men's heavy boots and shoes or in boys' and youths' boots and shoes); women's, 11.5 per cent; girls' and maids', 10 per cent; fabric and slippers and house shoes, 27 per cent; infants' supplementary licences are to be cut by one half.

Civilian Hosiery Directorate.—The Board of Trade has appointed Mr. L. Foyster Director of Civilian Hosiery. He will have the task of guiding production in the hosiery industry to obtain from the reduced resources the maximum output of garments most essential to the civil population, especially utility garments. Mr. Foyster was formerly with Marks and Spencer, Ltd.

Fertiliser Control.—The Minister of Supply has made the Control of Fertilisers (No. 20) Order, 1942, which until June 15th, 1942, limits forward sales of triple or other superphosphates, potash or basic slag or a compound fertiliser containing these materials. Retail distributors may only sell for application to the land by the buyer before June 30th, while manufacturers and wholesale distributors may not sell for delivery after that date. The object of the Order is to encourage the use this season of all available stocks of the fertilisers in question.

friendly words which reveal this lack of confidence—in addition to some uneasiness about the part they themselves have played.

There is no need to regard this failure as final or disastrous. On the British side, there will be no going back in the future upon the offer which has just been turned down: this country and its people will have neither the will nor the means to act vengefully. Expediency requires that no step should now be neglected to dissolve the distrust of British institutions and personalities which continues to clog Indian thinking. The suggestion that, at an appropriate moment, the India Office might be brought within the ambit of the Dominions Office, and that the next Viceroy should be chosen with a special view to Indian confidence, comes from sober and fair-minded British observers. On the Indian side, their leaders must come to an agreement in the task which is theirs, and theirs alone, or split their peoples from within. Meanwhile, the task, for all parties, is to see that India is not slain from without. Pandit Nehru has proclaimed in unmeasured terms that India will fight and spare no expedient to repel the invader. Mr Gandhi has counselled his followers to resist the Japanese, non-violently; and there has never been any doubt about the readiness of India's Moslems to catch at their martial past in a new resistance. Sir Stafford Cripps is hopeful, both about the long-term chance of the Indians taking up their political burden with due responsibility and about the short-term certainty that no appreciable section of the Indians will wish to seek peace with the aggressor.

In short, the will to defend India will not be lacking simply because this bid for fuller co-operation has not succeeded. Success in the negotiations would undoubtedly have aided the cause of India and the Allies by rallying the fearful and winning over the doubtful; but failure need not be a fatal hindrance. Now, as before, it is the means of defence, and not the readiness to fight, that counts most. Are the resources available to drive off the Japanese? India is an enormous sub-continent with many riches; but, per head of the population, it is outstandingly poor. There is only a small margin of labour and materials and equipment to spare for the needs of war from the bare task of subsistence. India's strength cannot be measured by its manpower. The great justification for the refusal of the British Government—and Allied opinion—to hand over the direction of Indian defence, is that the means of defending India, the weapons, the aircraft and the fighting ships, must mainly come, not from India, but from India's friends across the oceans. There

is no lack of recruits in India itself for the fighting forces. The lack is of means to equip them; and, as in every other theatre of Eastern war, the issue will turn upon the ability of the United Nations to marshal and deploy forces of the right size and the right composition in the right place at the right time. In this sense, it is true to say that India will be saved, not in Delhi, but in London and Washington.

To say this is not to minimise the great part that the Indian people themselves can play, and must play, in their self-defence. If they were actively hostile to Britain and the United Nations, it would open up the gravest of perils. But there is every sign that the exact contrary will be the case. The individual Indian peasant can do very little indeed to turn the tide of war. But what he can do, he will do: and it would be as hard for Japan to arm and make effective scattered quislings as it will be for Britain to equip the vast loyal majority—loyal not so much to Britain as to their own country, their own countryside, their own homes and their own families. The British Government did not make its offer in the belief that the peoples of India could meet and throw back the Japanese by their own resources. The hope was that responsible Indians would be prepared to take on the duty and privilege of sharing in the conduct of this great battle for the world's and India's future; primarily, the offer sprang from the conscience of the British people—and the whole free world.

Mr Gandhi called the offer a post-dated cheque. If it was post-dated, it was also blank. It imposed no forms of government upon the Indians which they would not work out and accept for themselves. It was honest, generous, and backed by the whole British people. In time, if Indian Nationalism is built on more than sand, they will discover the chance they are spurning. The cheque will be cashed: and it may be that, when they come to spend their new political assets in their own way, the leaders of India will find that the model of the American constitution, with its federated states, its elected executive and its checks and balances, is more appropriate to the peculiar problems of their country than the parliamentary models which, too often perhaps, have been exhibited as exemplars by well-wishers in this country. It will be for them to choose. Meanwhile, as they think again after the departure of Sir Stafford Cripps, they will discover, and no doubt take up, the heavy burden of guiding, calming and aiding the vast millions who look to them for leadership in the harsh ordeal which lies ahead of them all.

Crisis in the Coal Industry—II

Plan for Coal

AN article last week discussed the reasons for the present sorry state of affairs, in which, for the first time in modern history, Great Britain is unable to supply its own requirements of coal. The basic reason for the shortage was found to lie in the shrinkage and deterioration of the industry's labour force. But it was also shown that neither the mine owners nor the Mines Department had taken sufficiently effective steps to mobilise the industry for its wartime responsibilities. This second article is concerned with the form that the mobilisation should take.

Since the main cause of the shortage is the reduced number of miners and their lower output per man-shift, it is obvious that an increase in numbers and in output per head must take a central place in the remedy. An increase of no more than one hundredweight per person per shift (the present figure ranges from about 20 cwt to nearly 30 cwt per man shift) would add between 9 and 10 million tons per annum to output. The addition to the labour force of between 30,000 and 40,000 men would have the same effect. Either measure separately would

probably—and the two together would certainly—solve the difficulty, at least for the time being. But it would be futile to ask the men for the extra effort (probably involving longer hours) and equally futile to ask the Army for the release of so many men, until every reasonable proof had been given that the industry was operating at maximum efficiency. Proposals are therefore required under three heads. First, there must be such an organisation of the producing side as will make the most of existing resources. Secondly, there must be such an organisation of the distributing side as will ensure that demand is not wastefully inflated, and that the most important needs are met first. And only when these two requirements have been achieved can proposals properly be made affecting the labour force. As is obvious, no more than the barest outline can be given here; the details would be manifold and obstinate.

On the production side, it is difficult to resist the conclusion that the main line of action should be towards the integration of production in each district or sub-district. The amalgamation of mines has been a part of Govern-

ment policy, at least since the Act of 1930, even though it has been successively deferred hitherto; and it seems probable that, at least in the circumstances of wartime, something even more drastic than the merging of individual undertakings is required. If, in each district, the Coal Supplies Officer were given full executive powers and instructed to regard the labour force, the collieries, the managers, the equipment, the transport and the supplies of the whole district as being pooled and at his disposal, to be used for the sole purpose of raising production to the maximum, it is almost certain that an increased output could be obtained. Before this could be done, it would, of course, be necessary to remove the connection between any one owner's income and the output of his colliery. Some sort of financial pooling—at the least—would have to be set up, so that it would become a matter of indifference to each owner whether or not his mine was prejudiced in the interests of the whole district. This, however, should not be an impossible condition to achieve, once the obstacle of the owners' resistance were overcome. If the district were regarded as a technical unit, it would be possible to concentrate production in the mines where output is highest, to distribute the available labour where it can be used most economically (bearing in mind the necessity of providing transport if miners are put to work away from their homes) and to promote the most competent managers. It goes almost without saying that an organisation of this type could not be entrusted to a representative board or committee, such as the Mineworkers' Federation has just once more proposed. Disinterested efficiency would require administration by a single responsible and competent officer, and one of the few pieces of good fortune that the industry enjoys is the existence of a substantial number of highly qualified professional mining engineers from whom a satisfactory selection could be made.

On the distribution side also, there would seem to be a necessity of a substantial degree of pooling of operations. The prescription is the same as has been applied in many other industries with success—standardisation of grades; fixing of margins; strict apportionment of supplies; equalisation of transport costs. There is no reason to believe that the task is any more difficult than the organisation of, say, the meat trade. But only when the whole trade is thus brought under control will it be possible to ensure that the proper priorities are observed with the maximum economy of transport.

When these two tasks have been put in hand, there will be an overwhelming case for returning to the charge in respect of the labour force. If there were still difficulty in meeting the demand, the Army could then be required to release a few thousand skilled coal-getters. With the removal of any suspicion that increased effort on the miners' part merely accrued to the owners' profit, the

unions and their members could be asked to assume real responsibility for reducing absenteeism. If all else failed, the taboo might be lifted from the question of longer hours. In short, the often repeated assertion that labour would work far more efficiently if the profit motive were removed could be put to the test.

Would this policy amount to nationalisation of the industry? If nationalisation is to be interpreted literally, it would not; the policy here sketched would bear little resemblance to the plans for consolidation of the whole industry under a single political or syndicalist control which have so often been put forward by the Labour Party. But if "nationalisation" is interpreted in the wider sense as meaning merely "public ownership," then it must be answered that the policy outlined above comes very close to temporary socialisation of the industry by districts for the duration of the war. There is no reason whatever to be frightened of such words. It is over twenty years since nationalisation of the industry was recommended by the chairman of a Royal Commission, and everyone who has ever committed himself to the belief that some extension of public ownership and control was either desirable or inevitable must have placed the mining industry near the top of his mental list. Indeed, the more appropriate question is not whether it is necessary to shy away from the temporary assumption by the Government of technical and financial responsibility for the conduct of the industry, but whether it would not be better to finish the job now and carry through a permanent socialisation. If the mineowners are to be bought out at any time in the next decade or two, it would be an economy of effort to have to tackle the fear-some problems of valuation only once, instead of twice, once for determining wartime income, and the second time for assessing permanent compensation. On the other hand, to attempt nationalisation now would assuredly raise accusations of a breach of the political truce, not all of which could be stilled by parading the technical arguments. The matter must probably turn on an estimate of the views that the public is likely to hold towards the industry after the war. To most observers it would seem almost certain that the coming years will see an extension of public control over industry in general, and equally certain that, not merely coal, but the whole complex of fuel and power, will be one of the first of the problems that the state will feel impelled to tackle. But, in the nature of the case, these cannot be matters of certainty.

On balance, the conclusion would seem to be that there is a very substantial case for the permanent socialisation of the industry in the near future. But far more important and urgent is the present necessity of losing no more time in giving the whole industry a wartime organisation in which every other consideration can be subordinated to that of producing enough coal for the nation's war industries.

EQUITY & LAW LIFE ASSURANCE SOCIETY

Established 1844

PROTECTION IN WARTIME

● Civilian War Risk Cover without additional charge is normally granted under new Whole Life and Endowment Assurances—whether With-Profit or Without-Profit.

● A Guaranteed Bonus each year until 1946 inclusive is provided under all new With-Profit Policies—thereafter Bonuses are dependent upon Profits.

City Office: 30, COLEMAN STREET, E.C.2

WAR FINANCE

Sir Kingsley Wood's Budget speech, and the documents issued with it, provide the opportunity for a detailed review of an area far larger than is usually comprehended within the Budget. The following pages present an attempt to cover this wide field. Four articles deal—with the speech as a whole; with the Budget accounts; with the national income; and with the sources of war finance. The tables of the White Paper and figures of revenue and expenditure are reprinted on pages 531 and 532. It has not been possible, in the time, to include a review of the additional White Paper entitled "The Taxation of Wage Earners."

I.—An "Orthodox" Budget

THE review of Sir Kingsley Wood's first war Budget in these columns a year ago concluded with the judgment that it was "one which, in its qualitative aspects, can be greeted with almost unqualified enthusiasm... even if scepticism about its quantitative details still obstinately lingers." A year later, the judgment on Sir Kingsley's second Budget must be substantially the same—though with some modification of the emphasis. The "enthusiasm" of a year ago was engendered by the spectacle of a Chancellor fitting his budgetary proposals into a coherent framework of the war economy as a whole, and backing up his opinions with an unexampled wealth of statistical detail. This year, it no longer seems quite so miraculous that Chancellors of the Exchequer should follow commonsense procedures, and the gratitude that is felt for the second (enlarged and improved) edition of the White Paper is very much less than the disappointment that would have been created if Sir Kingsley had failed to follow his own admirable precedent. Doubtless this is unjust to the Chancellor, but it is only natural. Among those who had never known anything but jerry-building, the appearance of architect-designed houses would, in the first year, excite a certain amount of gratitude and enthusiasm. But in the second year, it might become apparent that even architects can design houses that are less than perfect.

The criticisms of the Budget will fall under three main heads. First, there are signs in its make-up of the old and familiar sin of under-estimation. Some reasons are given in the fourth article of this group for suspecting the existence of a substantial inflationary "gap" in the year just ended. For the forthcoming year, the Chancellor has built his proposals on the assumption that supply service expenditure will be a few millions below the annual rate actually achieved in the quarter January

to March, 1942. Moreover, he has assumed that domestic disinvestment will be as large in 1942 as in 1941, in spite of the heavy depletion of private stocks already accomplished and the small amount still remaining. Both assumptions err on the side of optimism, and if either of them proves to be unjustified, the "gap" will be widened. Secondly, the Chancellor's omission to undertake any far-reaching reform of the income tax is already attracting criticism, although it remains to be seen whether the critics will modify their position when they have had an opportunity of studying the Inland Revenue's case, as presented in a special White Paper. Thirdly, there will be those who regret that the Chancellor did not announce some sweeping and dramatic plan for placing finance at the service of production. But, as was suggested in *The Economist* last week, it would be easier to pronounce a judgment on this view if it were made clearer precisely what, other than the remission of taxation, is involved in it.

These criticisms do not deal with unimportant matters. But neither do they substantially detract from the favourable verdict that must be pronounced on the conduct of the nation's finances. Basically, the position is as sound as can reasonably be expected in the middle of such an upheaval. It is far sounder, with far more excuse for failure, than at this period of the last war. There are, moreover, detailed grounds for satisfaction in the Budget proposals—in the careful and deliberate distinction between the subsidised necessities and the very heavily taxed luxuries, in the formalisation of the post-war rebate on and EPT, in the concession to married women's earnings.

This has been an orthodox and unexciting Budget. And if Sir Kingsley Wood finds that judgment disappointing, he must console himself that the new orthodoxy is only twelve months old and is of his own creating.

2.—The Budget Accounts

THE shortage of space and the wealth of more important information contained in the official documents issued with the Budget combine to prevent the usual detailed summary of the Budget accounts. The following notes, however, record the salient details:

Lend-Lease Supplies.—The assistance given to all countries up to the end of February amounted to not far short of £650 millions. More recent returns indicate that Lend-Lease is now running at £100 millions per month and that assistance to the United Kingdom up to March 31st was likely to reach £600 millions.

Subsidies cost the Exchequer £125 millions in 1941. The cost must be expected to be higher in 1942 owing to higher agricultural prices and a rising tendency in overseas markets.

Income Tax.—Several minor changes were announced. (1) The concession given to wage-earners in last year's Finance Act allowing up to £10 for travelling expenses "where it could be established that, owing to the war, their place of residence had changed and their travelling expenses increased" is to be extended to all earned

incomes. (2) The method of charging farmers' profits on Schedule D (i.e., on the actual profits) is to be extended from those occupying land of an annual value of over £300 to those over £100. For those under £100 the assessment under Schedule B is to be three times the annual value unless it can be proved that actual profits are lower. This will bring in £3 millions this year and £7 millions in a full year. (3) The minimum amounts of weekly income which are exempt from collection of tax at the source are to be raised to £2 for the single taxpayer, £3 for a married man, £4 with one child and £5 with two or more children. (4) In seasonal industries the five summer months are to rank as one-half of the year for tax purposes and the seven winter months as the other half (or vice versa). (5) The interval between the end of the period of assessment and the beginning of the period of payment is to be extended from three months to four, causing a non-recurring "tax holiday" in July, 1942. (6) The maximum figure of the additional allowance for married women's earnings (nine-tenths of the earnings) is raised from £45 to £80. This will cost £5 millions this year and £25 millions in a full year. (7) There is to be a simpler form for wage-earners' returns. (8) Certificates will be issued for post-war credits.

EPT.—The post-war credit is to be made statutory "subject only to its not being used for dividends or for the issue of bonus shares." It will presumably still be subject to income tax at the rate then prevailing.

1942-43 Prospects.—Expenditure is estimated at £5,286 millions. Votes of credit are put at £4,500 millions. The assistance being given by Canada will be brought in as a cash receipt. The grand aggregate of resources at our disposal (including Lend-Lease supplies) will probably exceed £6,500 millions, compared with £4,000 millions in 1940-41 and not less than £5,500 millions in 1941-42. The amount requiring domestic financing will be £4,500 millions, of which £2,400 millions should be provided from domestic revenue and £2,100 millions from other sources.

Prospective Deficit.—On the existing basis of taxation, the yield of Customs and Excise would be £59 millions down. Total revenue would be £2,244 millions, leaving a deficit of £156 millions below the target. Utility clothing and boots and shoes would, at a later date, be exempted from Purchase Tax, costing another £10 millions this year and £15 millions in a full year. No further increases in direct taxation were practicable this year; to take the whole of the excess of incomes over £2,000 would yield only £30 millions.

Increased Duties.—On beer (expenditure on which is £330 millions a year) the duty is increased by an amount equivalent to 2d. per pint of average gravity. On spirits, the increase is £2 per proof gallon, equivalent to 4s. 8d.

per bottle of whisky. The basic duties on wine of 8s. per gallon on foreign and 6s. per gallon on Empire light wines are both increased by 6s.; on heavy or sweet wines the corresponding figures are 16s., 12s. and 12s. respectively. On tobacco, the increase is 10s. per lb., equivalent to 6½d.-7½d. per ounce and to 3d. per packet of 10 standard cigarettes. Expenditure on tobacco is now £340 millions a year. The increase will not apply to tobacco supplied through Service canteens up to the present quantity. The rates of entertainments duty are doubled except those on seats selling for not more than 7d. On a wide range of "luxury" goods, the rate of Purchase Tax is to be doubled to 66½ per cent of the wholesale value. The yield of these increases will be:—

	(£ millions)	This Year	Full Year
Beer	42.0	48.0	
Spirits	14.0	15.0	
Wine	2.0	2.2	
Tobacco	90.0	90.0	
Entertainments	12.0	14.0	
Purchase tax	10.0	10.0	
Total	170.0	179.2	

These changes, together with the changes in income tax and the exemption of utility clothing from Purchase Tax, bring the total domestic revenue to £2,402 millions.

3.—The National Income

THE starting point for any discussion of the economics of war must necessarily be the national income. The proposition could almost be generalised to cover peacetime economics, too, but there is not then the same overriding concern with the limits of productivity as there is when the nation is deliberately straining its resources to the furthest attainable degree. The national income, the measure of the total production of the community, is the dividend that has to be split between the essential civil requirements of the population and the needs of war.

Unfortunately, the words "national income" may mean very different things in different countries. There is, to begin with, the controversy whether a deduction should be made from the apparent total of all individual incomes for indirect taxes. For example, Sir Kingsley Wood has this week increased customs and excise duties by £160 millions a year; this sum will be added to prices, and, if no adjustment were made, would increase the national income by an equivalent amount, without any real change in the output of the community having occurred. National income, including indirect taxes, is said to be "at market price"; excluding indirect taxes, it is said to be "at factor cost." Secondly, there is the question whether payments to depreciation funds should be included or not. The resources represented by these funds form part of the annual output of the community, but since they are required to maintain the existing stock of capital, they are not properly income. This distinction is marked by the terms "gross" and "net." Thirdly, difficulties arise out of the so-called "transfer payments"—that is, payments made, generally by the Government to individuals, without any current return of economic output. Unemployment pay, debt interest and pensions are examples; all of these could be increased or reduced without there being any difference in the real output of the community. These transfer payments are properly excluded from estimates of national income. But to their individual recipients, they are incomes like any others, and they are subject to income and other taxes. They must therefore be included in totalling up the corpus of incomes on which tax can be levied. Finally, there is the fact that the community, like an individual, can, for a time and within limits, consume more than its income by drawing on capital accumulations and by incurring debt. "Available resources" is a convenient phrase to include both income and drafts on capital; a distinction can be made between "available domestic resources" and "total available resources" according as overseas disinvestment is excluded or not.

The following table gives figures, almost all drawn from the White Paper, of these different magnitudes, and of the ways in which they can be combined.

	£ million		
	1938	1940	1941
1. Net national income at factor cost	4,595	5,585	6,338
2. Indirect taxes, rates, etc., less subsidies	630	850	1,103
3. Transfer incomes	277	263	264
4. Depreciation, allowances, etc.	(475)	(475)	(475)
5. Domestic investment or disinvestment	406	286	498
6. Overseas investment or disinvestment	55	759	788
Ia. Net national income at factor cost (1)	4,595	5,585	6,338
Ib. Net national income at market price (1+2)	5,225	6,435	7,441
IIa. Gross national income at factor cost (1+3)	5,070	6,060	6,813
IIb. Gross national income at market price (1+2+3)	5,700	6,910	7,916
III. Taxable income (1+3)	4,872	5,848	6,602
IVa. Available domestic resources at factor cost (1+5)	...	5,871	6,831
IVb. Available domestic resources at market price (1+2+5)	...	6,721	7,934
Va. Total available resources at factor cost (1+5+6)	...	6,630	7,629
Vb. Total available resources at market price (1+2+5+6)	...	7,480	8,732

* No closer estimate available.

These differences are not merely an exercise in academic precision; they are beginning to play their part in current public discussion and in international comparisons of different countries' war effort. Two magnitudes are frequently expressed as percentages of "the national income"—the amount of the Government's expenditure and the amount of money raised in taxation. If such statements are to have any real meaning, it is important to ensure that like is being compared with like. And if international comparisons are not to be misleading, the definitions must be the same in each case.

The comparison of expenditure with national income has been dignified, in particular, by President Roosevelt, who held out a figure of 50 per cent as a rough measure of a satisfactory degree of mobilisation. The simplest way of making the comparison is to take the crude total of expenditure and compare it with the most frequently quoted figure of the national income—that is, net national income at factor cost. Total Government expenditure in 1941, including local government expenditure, was about £4,810 millions, giving a comparison of 76 per cent. But except as the simple arithmetical relationship between two figures, this percentage has no meaning. There is no sense in which £4,810 millions "came out of" a national income of £6,338 millions. The expenditure figure is inflated by the effect of indirect taxes, by the inclusion of foreign expenditure and of expenditure financed by drafts

of capital, no one of which has a counterpart in the income figure. There is no reason why this particular proportion should not rise above 100 per cent; it should, therefore, be used only for the purpose of being laid alongside similarly unscientific comparisons in other countries. Table B in the White Paper, reproduced on page 531, gives one legitimate way of making the comparison, giving a figure of 52 per cent. A further selection of percentages, each of which possesses some justification, is given below (the figures refer to 1941):—

	£m.	As % of National Income on definition		
		16.	1V%	V%
A.—Total expenditure (central, local and extra-budgetary funds).....	5,107 798	58½	...	58½
Less overseas disinvestment.....	4,309	58	54	...
B.—Total expenditure requiring domestic finance.....	1,155	...	...	...
Less non-war expenditure.....	3,174	12½	40	...
C.—War expenditure requiring domestic finance.....	...	...	...	...

* Assuming, as is not strictly correct, that all local and extra-budgetary expenditure is non-war.

It will be seen that the range of possible figures is so great that these percentage comparisons had better be avoided unless the definitions both of income and expenditure can be made quite precise. All the figures will, in all probability, be higher in 1942.

The comparison of taxation with national income can be done with rather more certainty, as taxes can only properly be levied on net national income—that is, they are

4.—Sources

THE two questions that are most frequently asked about the Government's finances, both in informed and uninformed circles, are "Where does the money come from?" and "Is there any inflation?" The materials for the answer to the first question are to be found in the White Paper in Tables A (page 531) and III (page 532). In 1941, the expenditure requiring domestic financing was £3,822 millions, of which £1,832 millions was found by revenue. Of the remaining "domestic deficit" of £1,990 millions, £469 millions was financed by extra-budgetary funds, local authority surpluses, and compensation payments; £1,028 millions came from savings and undistributed profits, leaving a residue of £493 millions, representing domestic disinvestment. Since the "domestic deficit" in 1942-43 is, on the Chancellor's estimate, only £119 millions larger than in 1941, it is being left to be met in substantially the same way.

Table III sets out the answer in two different ways—the first showing the economic origin of the funds from which finance is available, the second showing the financial means by which they have reached the Exchequer. The results for 1941 can be summarised as follows, the figures in each case expressed as a percentage of the total expenditure of £4,663 millions:—

	%		%
Revenue.....	40.1	Revenue.....	40.1
Net personal savings.....	17.5	Government finance outside the Budget.....	5.3
Undistributed profits.....	4.6	"Small" savings.....	12.9
Surpluses on extra-budgetary funds, local authorities and compensation payments.....	10.1	Other long-term debt.....	21.9
Domestic disinvestment.....	10.6	Floating debt.....	19.8
Overseas disinvestment.....	17.1		
	100.0		100.0

At first glance, these figures appear to dispose of the question of inflation as neatly as they do that of the sources of finance. Everything adds up perfectly, and there is no entry labelled "inflation." But this may be deceptive; there never would be such an entry, in any case. Let us suppose that there were, in fact, an inflationary "gap" of, say, £500 millions a year—that is, expenditure of that amount against which there was no equivalent abstraction of resources from the public. How would such an inflation show itself? There would be several stages: (i) the inflation may be supposed to come into existence by the

a burden on net national income, though they are assessed on the rather larger figure of taxable incomes. The proportions for 1938, 1940, and 1941 are given in Table E. In 1942-3, if the national income exceeds that of 1941 by as much as 1941 exceeded 1940, the proportion will work out at about 46 per cent.

There is one further aspect of the national income on which the White Paper throws a great deal of light—namely, its distribution. The figures of rents, profits and interest, salaries and wages, are given in Table I (page 532). If 1941 is compared with 1938, the money sums, before taxation, have increased as follows:—

Rent of land and buildings.....	1.6%
Profits and interest.....	27.4%
Salaries (inc. pay and allowances of officers).....	12.5%
Wages (inc. pay and allowances, in cash and kind, of other ranks).....	69.0%

Table F is, if anything, still more interesting; it shows the total incomes, before and after tax, of certain income groups. The figures can be aggregated as follows:—

Range of Gross Income	of Total Gross Income	% of Total Net Income, after Tax		
		1938-39 rates	1940-41 rates	1941-42 rates
Under 500.....	75.0	80.6	82.9	84.2
500-2,000.....	13.9	12.9	12.1	11.4
Over 2,000.....	9.5	6.5	5.0	4.4

The proportionate share of "the rich," it will be noticed, is reduced by taxation to less than half of the gross figure. The rich (on this same very wide definition) now have only about 39 per cent of their gross incomes left after paying income-tax and surtax.

of Finance

creation of bank credit and its loan to the Government on the almost costless terms of deposit receipts or Treasury bills. The money would be paid out to wage-earners and industrial firms, and, no corresponding amounts having been abstracted, it would (ii) increase the national income and cause increases in (iii) consumption, (iv) taxation, (v) savings, and (vi) undistributed profits. Now all but one of these things were in fact happening in 1941. (i) The floating debt, almost all of which is held, directly or indirectly, by the banks, increased by £902 millions. (ii) The national income (net, at factor cost) in 1941, was £753 millions, or 13½ per cent, higher than in 1940, this ratio of increase being fairly steadily maintained from quarter to quarter. (iii) Personal expenditure on consumption was £126 millions higher. (iv) Tax revenue increased by £606 millions (in the financial year), only the smaller part of the increase being due to increased rates of tax. (v) Net personal savings increased from £555 millions to £815 millions. (vi) Only undistributed profits fell.

It is possible that all these phenomena can be explained by something other than inflation. But in some cases it would be very difficult to do so. The increase of 13½ per cent in the national income, for example, is far larger than can be explained on the basis of an increase in physical output; there must have been a swelling of money values. It is very difficult to resist the conclusion that there must have been some inflationary element in the finance of 1941, amounting perhaps to a few hundreds of millions of pounds. It is perfectly true, of course, that the cost of living—that is the cost of essentials for a working-class family—has not increased. But that is merely to say that the effect of the inflation has been diverted to the relatively unimportant sections of the economy. Some small element of inflation is probably unavoidable in conditions such as those of today, and so long as it is kept away from the centre of the national economy, it does little harm. But with a further large increase in the prospective expenditure, it becomes more important than ever both to prevent any widening of the "gap," and also to exercise the most complete control over the production, consumption and prices of all necessary goods.

White Paper Statistics

The following tables have been extracted from the White Papers issued with the Budget. The first pair, Revenue and Expenditure, come from the "Financial Statement (1942-43)" (4d. net), the remainder from "An Analysis of the Sources of War Finance and an Estimate of the National Income and Expenditure in 1938, 1940 and 1941" (Cmd. 6347, 4d. net). In some cases, definitions have been abbreviated and footnotes omitted. The textual comment is, in each case, by The Economist.

	REVENUE (£'000)		EXPENDITURE (£'000)	
	Budget Estimate 1941-42	Actual Receipts 1941-42	Budget Estimate 1941-42	Actual Receipts 1941-42

* Including Supplementaries.

A.—THE SOURCES OF WAR FINANCE			
	(£ million)		
	Calendar Year 1940	Calendar Year 1941	Budget Forecast 1942-43
Central government expenditure.....	3,333	4,620	5,286
Less Overseas disinvestment.....	759	798	775*
Expenditure requiring domestic finance.....	2,574	3,822	4,511
Less Central government revenue.....	1,253	1,832	2,402
	1,321	1,990	2,109
Less Extra budgetary funds and local authority surpluses.....	176	220	...
	1,145	1,770	...
Less Compensation received in respect of war damage claims.....	36	249	...
	1,109	1,521	...
Less Savings and undistributed profits.....	823	1,028	...
Residue (domestic disinvestment).....	286	493	...

* Including Canadian Government contribution.

The residue has been provided from (a) sales to public authorities of fixed capital assets, (b) sinking funds and depreciation funds, (c) net depletion of stocks and working capital carried by private finance, less (d) new investment privately financed, (e) replacements and renewals charged on depreciation funds and (f) replacements of war losses. Since sinking funds and depreciation funds are usually reckoned as being of the order of £475,000,000 annually, the other items must have approximately balanced out in 1941.

B.—PROPORTION OF RESOURCES ABSORBED BY GOVERNMENT EXPENDITURE

The following figures are presented as "one method of answering the question":—

	1941 (£ million)
(1) Total government expenditure (central and local) at market prices.....	5,107
Less:—	
(2) Government expenditure otherwise than on goods and services (items 24-28 of Table IV).....	925
(3) Government expenditure on goods and services at market prices.....	4,182
(4) Personal expenditure on consumption at market prices.....	4,550
Plus:—	
(5) Subsidies.....	139
Less:—	
(6) Indirect taxes on consumption.....	826
(7) Adjusted personal expenditure on consumption.....	3,863
(8) Sum of (3) + (7).....	8,045
(9) Proportion of (3) to (8).....	52%

C.—PERSONAL EXPENDITURE

	(£ million)		
	1938	1940	1941
Personal expenditure on consumption at market prices.....	4,041	4,424	4,550
Add Subsidies.....	15	70	139
	4,056	4,494	4,689
Debit Indirect taxes on consumption.....	472	623	826
Personal consumption thus adjusted.....	3,584	3,871	3,863

The reduction in the volume of consumption in 1941, compared with 1938, "probably lies within the limits of 15 and 20 per cent."

D.—PERSONAL SAVINGS

	(£ million)		
	1938	1940	1941
Gross personal savings, including provision for accrued taxation.....	233	640	909
Death duties, etc.....	90	85	94
Net personal savings after provision for death duties, etc.....	143	555	815
Accrued taxation.....	18	82	150
Net personal savings after provision for accrued taxation.....	125	473	665

E.—PROPORTION OF THE NATIONAL INCOME DEVOTED TO TAXATION

	(£ million)		
	1938	1940	1941
(1) National income (item 5 of Table I).....	4,595	5,585	6,338
(2) Direct taxes, War Damage Act contributions and premiums, etc.....	534	768	1,215
(3) Indirect taxes, rates, war risks insurance premiums, etc., less subsidies.....	630	850	1,103
(4) Excess of tax liabilities over payments.....	30	213	239
(5) Total tax liabilities, i.e., sum of (2) + (3) + (4).....	1,194	1,831	2,557
(6) Total tax liabilities as a percentage of national income.....	26%	33%	40%

F.—DISTRIBUTION OF PERSONAL INCOMES IN THE FINANCIAL YEAR 1940-41 BY RANGES OF GROSS INCOME SHOWING THE EFFECTS OF CHANGES IN INCOME TAX AND SURTAX, 1938-41

All the calculations have been done on the 1940-41 incomes. Thus the columns for 1938-39 and 1941-42 rates show what would have been left out of the 1940-41 incomes if the rates of tax prevailing in 1938-39 and 1941-42, respectively, had been

applied. The income of a husband and wife are reckoned as one income.

Range of Gross Income	Aggregate Gross Income 1940-41	Aggregate Net Income with Income Tax and Surtax at—			Proportion of Gross Income retained with Income Tax and Surtax at—		
		1938-39 rates	1940-41 rates	1941-42 rates	1938-39 rates	1940-41 rates	1941-42 rates
£	£m.	£m.	£m.	£m.	%	%	%
Under 250	3,344	3,329	3,301	3,242	99.6	98.7	96.9
250-500	1,038	1,000	946	883	96.3	91.1	85.1
500-1,000	477	428	391	358	89.7	82.0	75.1
1,000-2,000	320	266	230	203	83.1	71.9	63.4
2,000-10,000	367	259	206	174	70.6	56.1	47.4
10,000 and over	176	88	50	39	50.0	28.4	22.2
Total of above	5,722	5,370	5,124	4,899	93.8	89.5	85.6

TABLE I.—ESTIMATES OF NET NATIONAL INCOME AND EXPENDITURE IN 1938, 1940 AND 1941

Year ending—	£ million					
	Dec. 31st, 1938	Dec. 31st, 1940	March 31st, 1941	June 30th, 1941	Sept. 30th, 1941	Dec. 31st, 1941
1. Rent of land and buildings, profits and interest	373	383	381	379	379	379

NOTES OF THE WEEK

Loyal Government at Vichy

The new situation in France with Laval, the arch-laborer, as "Head of the Government with special powers," including, it appears, power to appoint all other ministers, and Darlan, the opponent of Britain, as Commander of the Land, Sea and Air Forces, suggests, on the face of it, the complete collapse of the fiction of Vichy independence. The only question now is not what Vichy will refuse, but what Berlin is demanding. Yet it is unlikely that France will be drawn back into the war on the side of the Axis. Marshal Pétain is still Head of the State; and there is nothing to suggest that the Marshal is any readier now than at any time during the last eighteen months to abandon the Armistice terms and accept military collaboration, the use of bases in Unoccupied France or the abandonment of the French Empire. His strength is the growing spirit of resistance among the French people. To whatever lengths Laval and Darlan may be prepared to go in their subservience to Berlin, there is a whole range of policies which it is doubtful whether they have the power to carry through—and one of these, surely, is to send the French into action against the Americans. The Nazis' aim in forcing Laval back into the Vichy Government is in the first place defensive. They have realised that the Vichy Government could not be relied upon to maintain the degree of collaboration reached hitherto. More and more of Pétain's closest advisers were coming to be known as anti-collaborationists. The British raids and the air attacks on French industry only encouraged their growing distaste for the Axis. In a word, Vichy no longer represented a government "loyal" to the Germans. Laval is an attempt to tilt the see-saw in the other direction. Vichy's "loyalty" to Berlin is far more vital this year than last. The second year of the Russian campaign is draining away men and arms from every part of German Europe—not least from France. At the same time, the offensive strength of the Western Democracies is rising week by week. The presence of Mr Harry Hopkins and General Marshall in London suggests that the strength will be used in unity and not necessarily on distant fronts. Once again, the nightmare of a war on two fronts is troubling the rest of the German General Staff. They can remember that in the last great revolutionary war to unite the Continent—Napoleon's—the war on two fronts began years after the "final" conquest of Europe. It began when Wellington came to Portugal. Where is Britain's Peninsula in this war? Could it be in France? This is the problem which the Germans hope Laval's "loyalty" will help to solve. They cannot, just before the spring offensive, increase the garrisons and policing forces in France. Nor can they rely upon the anti-collaborationists at Vichy. There are only about two men they can rely on—Laval, who will gladly drag the French in the interests of Berlin, and Darlan, who will fight the British if they attack French territory.

territory. The breach may come, in any case. If Berlin wants it, it will come from the side of Vichy.

Great Captain

The appointment of Lord Louis Mountbatten to be Chief of Combined Operations, which took effect last month, is at once a romance and a portent. In November, 1914, Prince Louis of Battenberg, Lord Louis Mountbatten's father, stood by Mr Churchill's side at the Admiralty as First Sea Lord. Mr Churchill has put on record that he was a great sailor; but he was despitely treated. Because of his German origin he was compelled to resign, although, as he once put it, he joined the British Navy before there was a German Empire. Now his son, who is also a great sailor, has been chosen to occupy a post which may prove to be the most important Service appointment of the war. Some weeks ago it was argued in *The Economist* that the greatest need, for the effective use of the country's fighting forces, was the introduction into their command, training and equipment of what Lord Swinton has since called "a three-Service mind"; that is to say, that there should be, at the top and in charge of every considerable fighting unit, not a tri-partite division between naval, air and military commanders, working in co-ordination, but a unified approach and direction. This contention has since been echoed by Sir Edward Grigg and the *Times* newspaper. The *Times* is content to state the problem in general terms and to ask for a single commander in place of the present system of co-ordination. *The Economist* went further. It asked for a new type of general officer, acquainted with naval, air and military matters, not only at the head, but in all positions of higher command. It asked not only for the Great General Staff in London, which the *Times* advocates, but also for similar staffs on a smaller scale for all considerable fighting units in any element—for unity in command, co-ordination in training and equipment, and co-operation in action.

Joint Action

The need for unity and co-operation in strategy has been underlined in the Indian Ocean and in Burma in recent days. It was debated in the Lords on Wednesday. Mr Churchill's explanation for the naval losses off Ceylon is that there are not enough aircraft and aircraft carriers to afford protection to all naval units at sea. There are certainly not enough aircraft of the right kind. But it is not enough to say that air protection for

To Break or Not to Break

The United States is, somewhat naturally, to "review" its policy towards Vichy. There is only one problem: Should relations be broken off? It has already been announced that no more foodstuffs or supplies will go to French North Africa while its future status is so uncertain. In spite of the Vichy Government's obvious swing towards closer collaboration with Berlin, it is difficult to see what difference it would make to remove Admiral Leahy from Vichy. Now more than ever Marshal Pétain needs whatever moral support he can get. The American representative at Vichy can still give his Government a shrewd idea of what is going on. In fact, it looks very much as though it would be to Berlin's, rather than to Washington's, advantage if Admiral Leahy were to go. The very sharp reply sent by Laval to the Washington Note, stating the Administration's reasons for recognising General de Gaulle's authority in French Equatorial Africa, suggests the label "made in Germany." Provided Vichy is treated as potentially an enemy power and every disposition taken to be ready for treachery, then there is really no harm done by maintaining trained observers in the heart of "enemy" territory.

ships in the Indian Ocean or for land forces in Burma is not available. In modern warfare, this is almost tantamount to saying that land and sea forces must go into action unarmed. The real problem is to ensure that "no naval or military unit should go into action without adequate air cover, air reconnaissance and air artillery, any more than it would fight without its other weapons or without ammunition"; and this can only be achieved by bringing about a sufficient integration of strategic command and production programmes. It is no answer to this contention to point, as Lord Sherwood did in the Lords, to the outstanding and indisputable achievements of the Bomber, Fighter and Coastal Commands of the RAF. The task is to raise achievements in every element to the same level. The air marshals are said to be afraid that this would mean making the air arm merely ancillary to the land or sea arms—which would, of course, be disastrous. In fact, in the present tempo of strategic developments, it might well mean precisely the reverse in effect; almost certainly, air warfare in all its aspects would be, and should be, the greatest beneficiary. The question is not which of three should be master, but that there should be one in command, not three—that strategy (and war production) should be single-minded instead of tripartite. On the side of production, a great stride forward has been made with the institution of Mr Lyttelton's organisation. On the side of strategic operations, the appointment of Lord Louis Mountbatten is a very welcome start. As Chief of Combined Operations, Lord Louis has been given high rank in all three services—Navy, Army and Air Force. He attends the Chiefs of Staff's Committee on specific occasions, and is the one general unified link in that tripartite body, which is responsible for directing the nation's defence and strategy. Lord Louis's appointment is surely a portent, not only of offensive action against the enemy on an increasing scale, but also of the real beginning of combined action by all three Services.

Axis Grand Strategy

Early in May the rains begin in Burma, and the Japanese hope to have reached the oilfields and Mandalay by then. They are already 90 miles or more beyond Prome, and may shortly be able to divert enough troops from the Irrawaddy front to turn the Chinese flank north of Toungoo. The pace is quickening everywhere in the great arc from Toungoo across the Bay of Bengal to Colombo, and it

begins to look as though the Japanese aim may possibly be to contain the Allied base of Australia, while the main drive sweeps on to Ceylon, to the coasts of Africa—to Suez. If there is any real co-ordination of German and Japanese strategy, then Suez as an objective makes sense, for it represents one prong of a vast encircling movement of which the other could be launched behind Rostov-on-Don. The only comparable movement would be a Japanese drive through Siberia to join with the Germans in the

central Russian steppes; the Russians are reported to have warned the Japanese sharply against any such undertaking. If this dual movement of encirclement were completed, Russia and China would be completely isolated from Britain and the United States. Its frustration depends to a very great extent upon co-ordination of Russia's land fighting with the sea power of the democracies. Their ships must take out Soviet supplies for the vital Caucasian front. The job must now be done in the teeth of strong Japanese naval concentrations. More and more the maelstrom of the war is moving to the Middle East.

Two Post-War Views

It is an event when two men so eminent in the spheres of labour and capital, respectively, as Mr Ernest Bevin and Mr Samuel Courtauld, give expression almost simultaneously to their views about the post-war shape of industry. It is particularly interesting that, on certain broad outlines, the labour leader and the captain of industry agree. Both regard greater state control as inevitable. Both regard closer co-operation between employers and workers as imperative. Mr Bevin, in his speech last week-end, was obviously mainly impressed by the need for disciplined demobilisation. To him the fatal error would be to allow the desire for quick profits or the disposition towards rapid and undue expansion to distort post-war development into a disastrous boom followed by the same sort of merciless slump as succeeded the last war. His solution is the maintenance of the controls which have apportioned resources in war economy in order to distribute those resources in the most beneficial way when the war is over. Mr Courtauld, too, is convinced, on broader grounds, of the necessity for Government control. Some of his reasons are very sound, and come refreshingly from the pen of an industrial leader. The Government, he says, cannot tolerate the *imperium in imperio* of monopoly and combination. The Government should have powers of supervision on questions of quality of product, wages and working conditions. The Government should not permit industry with sweated labour in blind alleys to exist in the name of free enterprise. The Government should take over transport, and perhaps coal mines, in the national interest. In part, of course, Mr Courtauld's thesis, expounded as a set of questions rather than a series of answers, is the rationalisation of his own industrial experience. It is presumably in the light of this that he deprecates so strongly the stifling of invention by blocking patents and regards financial institutions as, on occasion, "bandits levying a toll in a narrow defile through which all traders are bound to pass."

Industry After the War

In his tentative proposals for the future of industry, Mr Courtauld is faced by the dilemma which confronts all seekers after justice and efficiency in economic matters. On the one hand, he has no wish to damp down the private initiative which fosters economic progress. On the other hand, he wishes to make Government control, in the interests of the community, effective. He regards control by bureaucrats of the present style as tending towards complacency and stagnation. Civil servants, in his view, are incompetent industrial managers; and the processes of departmental and Treasury control are too devious and too complicated for industry to thrive under. In the end, Mr Courtauld's solution is somewhat nebulous. He would have Government directors upon the boards of companies, possessing no more power to interfere than shareholders possess already—which would merely give industrial sovereignty an official cachet. He is afraid of the influence of society catching upon wages policy, just as the section of society represented by Mr Bevin is afraid of the influence of vested interests upon the state's attitude towards profits. Both Mr Courtauld and Mr Bevin have plainly raised the key problem of post-war economic policy. Before the war, the tendency was to hand over the industries of this country to be run by the industries themselves in a sort of feudal baronage, with labour in each industrial fief not unwilling. During the war, a dual system has emerged in which industry runs and controls itself with a hierarchy of civil servants to exercise State supervision. After the war, the choice must be made. The desiderata are plain. On the one hand, there must be efficiency in industrial management, which cannot be achieved by civil service formulae. On the other hand, there must be communal control. In part,

the solution is to train and institute a new kind of civil servant capable in matters of industry and economics. In part, more broadly, the solution is to draw a sharp division between those necessary industries, such as food, transport and perhaps fuel, which must be managed directly under the eye of the community as represented in Parliament and the Government, and those industries which must be permitted to grow and develop within the usual pattern of private enterprise—but also within the rules and regulations of a decent, civilised and democratic society.

Aunt Sally

The vendetta against Mr Herbert Morrison has surely gone far enough. The attackers are worthy people who dislike wartime restrictions upon individual liberties; and it is no more than their duty to take every opportunity of preventing the abuse of wartime powers. But it is fantastic that every action of Mr Morrison in performance of his duties as Home Secretary should be assailed as a personal assault upon the ark and covenant of British freedom. Obviously enough, when Mr Morrison warns the *Daily Mirror*, he is acting on behalf of the Prime Minister and the War Cabinet and not indulging in personal oppression. Obviously, too, when Mr Morrison seeks the resignation of Colonel Blatherwick and sacks Sir Warren Fisher he is acting in his own lights as a wartime Home Secretary and not as Mr Morrison. Admittedly, his manner and his methods are not always happy. At first glance, it appeared that the dismissal of Colonel Blatherwick, the Deputy Commissioner for the North-Western Region, was perhaps unduly drastic. Now, however, it does seem that a man who was responsible for the gross waste of petrol involved in the travelling of a football team and himself, in official vehicles, from Bolton to Dumfries and back, without notice being given to anyone that he would be away from his post for fifteen hours, did something which the vast majority of public opinion in this country, in view of the restrictions which are being rightly and popularly laid upon civilian consumption, would protest against as strongly as Mr Morrison did. Sir Warren Fisher's action in protesting publicly, not against Colonel Blatherwick but against Mr Morrison, was quite unjustifiable, whatever irresponsibility Sir Warren may claim to have been implied in the terms of his appointment as Special Commissioner for the London Region. The demand of Mr Morrison's enemies in the House of Commons this week was for an inquiry into Mr Morrison's actions. Sir Warren Fisher has repeated the demand, and by implication questions the truth of Mr Morrison's account of the Blatherwick case. Mr Morrison refused the demand and the House of Commons endorsed his refusal—quite rightly. It may be true that Mr Morrison is not best fitted, temperamentally, either to exercise the necessarily distasteful powers of a wartime Home Secretary or to endure the storms of criticism which a wartime Home Secretary necessarily meets. But it seems as plain as a pike-staff that, in this particular matter, which is surely not worthy of the fuss and excitement which has been whipped up, he acted in the only possible way; and that, unless a majority in the Commons requires it, it is ludicrous to expect that every drastic action by a Minister should be vetted by some body of inquiry. The popular wish—and of the national need—is for more drastic action on the part of Ministers, not less. A Minister's responsibility is to Parliament and is part of the collective responsibility of the Cabinet. This personal feud against Mr Morrison is, in effect, a campaign of recrimination against the policy and methods of the Churchill administration itself.

Co-operation through Understanding

It is good news that *British War News*, a counterpart to *Soviet War News*, is now to appear in Russia; and the forthcoming arrival in Moscow of Mr John Lawrence, as First Secretary in charge of publicity matters, should help to increase the friendly contacts between the two Allies and to encourage the exchange of information between the two nations. There is, of course, an intense interest in this country in everything Russian. In many circles it is already some twenty years old; and various committees and bodies, such as the Society for the Promotion of Cultural Relations with the USSR, exist to cater for the interest. Now a short course for teachers on the Soviet Union has been inaugurated by M. Maisky in London. In his speech, the Soviet Ambassador referred to

the "wall of ignorance and suspicion" that had separated the people of Russia from the rest of the world, and went on to say that "to destroy that wall, to clear the air, to make the peoples outside the Soviet Union better understand his country was a matter of the highest importance." It is, of course, equally important, almost certainly more important, that the peoples of Russia should get to know something about the other nations of the world. Almost every honest observer of the Russians at home is astounded at the incredible ignorance that prevails about conditions and affairs in other countries. The *British War News* may be only a small step, but it is a step in the right direction. One may now hope that both countries will take seriously the task of increasing mutual understanding. To point out that the process is further advanced in Britain than in the Soviet Union is not to disagree with M. Maisky's main thesis—that without friendly co-operation between Russia, Britain and the United States "there is no hope for mankind to establish a just or durable peace."

End of Luxury Feeding

The Order now being drafted by the Ministry of Food, designed to regulate restaurant feeding, is much overdue. It is to be hoped that, now the Government has been persuaded of its necessity, the Order will be drastic and effective. Reports suggest that the number of courses will be limited to three; that a strict upper limit will be placed on the cost of meals; and that days without fish, game or poultry will be introduced. It is expected that meals after 11.0 p.m. will be prohibited, except for night workers and hotel residents, and that the holding of unnecessary public luncheons will be discouraged. It has been apparent since the outbreak of war, that the spectacle of luxury feeding was intolerable to a people on whom the need for total sacrifice was being officially impressed. Moreover, the possibility of building up food stocks through stricter regulation of restaurant, café and club meals should have outweighed the consideration that the net saving would be too small to make a perceptible difference to the current domestic ration. It is still not quite clear why, despite the admitted technical difficulties, the Minister of Food does not decide to go the whole way and introduce food rationing in restaurants. Coupons were surrendered in restaurants in the last war, and there has been more surprise than satisfaction that no such scheme has been brought in this time. Even under the new Order, there will be no upper limit, apart from actual physical capacity, on the amount of food which the crawler from eating place to eating place can absorb.

Concentration of Industry

The concentration of industry was begun by Mr Lyttelton, and carried on by Sir Andrew Duncan. Its further development is now being considered by Dr. Dalton, the new President of the Board of Trade. The seventh report of this session from the Select Committee on National Expenditure (which is outlined in a Note on page 548) is far from satisfied that the methods followed, or the results achieved, have so far been adequate. The object of concentration is to economise labour and plant—in particular labour—by making up the restricted wartime supply of materials in the most labour-saving factories. The view of the Committee is that, in the development of Mr Lyttelton's original scheme, post-war considerations have been permitted to bulk too largely. The Board of Trade has acted with reference to three factors: first, the raw material

The MERCANTILE BANK of INDIA LIMITED

Head Office: 15, Gracechurch St., London, E.C.3

Branches and Agencies throughout the East

Correspondents in all parts of the World

LETTERS OF CREDIT AND DRAFTS ISSUED

and labour available; secondly, the need to maintain a nucleus of firms in operation as a hard core on which to base post-war reconstruction; and, thirdly, the minimum needs of the home market. The Committee's view is that "it seems that undue weight has been given to the second factor, and too little to the third as the governing consideration." The Committee has seen concentration at close quarters. It has discussed the matter with the Ministry of Labour; and its advice is worthy of attention. For some months, it has been plain that the only way to extend the labour force in the war factories, and to increase the number of shifts worked there, is to comb out still more workers from the factories engaged on civilian work. The need for economy of labour in civilian factories is as great as in war establishments. If this economy has, in fact, been impeded, because the Board of Trade has paid too much attention to post-war needs, and too little to wartime efficiency, Dr. Dalton must put his foot down at once.

Priorities for Labour

The first principle of war economic organisation is priority, the principle by which scarce resources are allocated to work in the order of its urgency. The initial mistake made in this country was that priorities were made too rigid. When aircraft had the highest priority, for instance, it was difficult to get resources for other work, even though (in spite of the overriding need for aircraft), the rooth tank or the ten thousandth rifle might in any period be more important than, say, the thousandth airplane. The seventh report of this session from the Select Committee on National Expenditure shows this over-rigidity at work in the supply of labour. Priority was interpreted too literally. Employment exchanges took the view that, where labour was scarce, none should go to other work until the requirements of work on higher priority had been fully established. It was necessary in November, 1940, for the Ministry of Labour, to lay down the principle that no degree of priority for any product gave the firms making that product an exclusive right to available labour. The Committee's point is that, in spite of this set policy, the system of priorities is still too rigid and too centralised: that delays and bottlenecks in the supply of labour arise, and the balance of production is upset. Their solution—as great a degree of elasticity in local fact as is laid down in central theory—merits close study; and, in particular, the Committee's complaint that "the result is a pyramid of responsibility based, not upon local officers of the Production Department, but on the main contractors" will bear examination.

The Crown's Responsibility

In the House of Lords on Monday, Viscount Cecil moved a resolution asking the Crown to waive its immunity from civil action as the result of civil wrongs committed by its servants in charge of vehicles. The constitutional doctrine that "the King can do no wrong" was evolved to fix responsibility for policy upon the King's Ministers. It was never intended to relieve Government Departments of the same sort of responsibility for their employees' actions as fall upon private employers. Actually, of course, the Crown does in fact accept, of grace, the same responsibility as private employers in most cases. Otherwise it would be vastly unfair, because the only remedy of sufferers at the hands of official servants would be against the servants themselves, who, in the case of the drivers of Government vehicles, might very well not be in a position to meet damages. The point behind Monday's discussion in the House of Lords is that responsibility for the actions of Crown servants in charge of vehicles is only accepted if the vehicle is being used in the course of duty—which is right and proper, and analogous to the position of private employers. But, in the case of Government Departments, this matter is decided by the Departments themselves, which makes them judges in their own cause. Thus the problem is simply to close a loophole; and the Lord Chancellor announced that the Government had no objection to the introduction of a practice under which, if the claimant desired, the matter of responsibility should be referred to an independent person of adequate legal attainments, who would decide whether, if the driver of a Government vehicle had been privately employed, the private employer would have been liable for the civil wrong committed by him. It should be emphasised that the constitutional immunity of the Crown from civil action does not

actually, in most matters, bear hardly upon private individuals who may be wronged by its servants. The principle that, whatever the constitutional doctrine, the Crown should regard its responsibilities as precisely the same as those of private employers, is generally applied. The importance of Lord Simon's statement is that it adds an extra safeguard to the position of the private citizen.

The Role of Advertising

Mr Courtauld in his *Economic Journal* article is not friendly to advertising. He admits that advertising has a "legitimate" function, "to let people know where they can get what they want"; but he speaks of "high pressure salesmanship directed to selling things to people who do not really want them and are often unable to afford them." However justified they may be—and there must be few people who have never reflected on the "waste" involved in the gigantic apparatus of modern competitive commercial advertising, by which competition appears to push costs and prices up rather than down—these judgments are, of course, moralistic rather than economic, though the further point that distribution costs, which include advertising, have grown disproportionately compared with production costs has undoubtedly an economic significance. Mr Rothschild, in the same issue of the *Economic Journal*, looks at advertising in a different, and perhaps more fruitful, way. His concern is the economic lack-logic of the "advertising habits of the business world." He underlines one point which is overlooked by the moralists, that although expenditure on advertising may go, to a considerable extent, to people who save a large part of their income, advertising encourages employment—by causing an increased propensity both to invest and to consume—which is a welcome influence in "an economic system which constantly allows productive resources to lie idle." The lack-logic lies in the fact that business men cut down their advertising expenditure in a slump and enlarge it in a boom. Thus advertising habits tend to accentuate the movements of the trade cycle, by discouraging consumption, investment and employment when business is bad and stimulating them most when business is best. The effect is no doubt relatively very small. But it would plainly be preferable, economically, if advertising policy could be managed in precisely the opposite way—as it is managed by one or two individual firms—so as to mitigate fluctuations by stimulating demand when there is a tendency for it to fall. The great need, statistically, is, to find out exactly how influential advertising is, or could be, in encouraging employment. In wartime, of course, there is no need to encourage employment; the only proper stimulant is war needs. Resources are not idle, but scarce. As Mr Rothschild points out, not referring specifically to wartime, "If there is full employment the habit of advertising will lock up considerable resources in a socially useless struggle." In total war, there is full employment, and this dictum is very true.

A Plan for Education?

At the annual conference of the National Union of Teachers, Mr R. A. Butler described his aspirations, as President of the Board of Education, with some frankness. He announced his determination to introduce a national minimum of compulsory education, and to secure secondary education for all after the age of eleven. In addressing himself to the thorny problem of the place of religious education, on which matter he plans to take account of the Archbishop's Five Points, and in attempting to place financial aid at the disposal of non-provided schools without thereby robbing them of their special features, he is intrepidly tackling issues often regarded as insoluble. Of the more distant future, there will be little disagreement with his thesis that the school leaving age must be raised, and that it must be raised gradually; or with his plan—by now almost an old-fashioned ambition, so long has it been postponed—to differentiate post-elementary education in four categories: senior or modern, technical, secondary, and boarding schools, so that teaching is increasingly suited to leadership—from the entire community, rather than from a small and privileged class, as at present, cannot simply be achieved by the perfecting of the state system of education. The educational institutions outside the state system cannot be left outside and untouched. Mr Butler courageously committed himself, not only to the doctrine of *la carrière ouverte aux talents*, but also to that of *la carrière fermée au*

manque de talents. But discrimination, the claims of privilege, and the bottleneck of leadership must remain until the whole educational system of the country is integrated, and the resources of all existing public, private and independent schools used for the general good. The Association of Headmistresses at Malvern discussed this vital matter at some length, but voted against the "nationalisation" of non-state schools. No doubt it is more immediately important to build up the opportunities of the unprivileged than to eliminate the relative advantages of the moneyed. But the underlying issue—which is not to close the public schools, but to open them, not to block the present channels of leadership, but to make them nation-wide—is not one that can, or should, be postponed indefinitely.

South America and the Axis

The new Chilean President, Don Juan Antonio Rios, assumed office on April 2nd, and from his inaugural address it is clear that Chile is not yet ready to break off relations with the Axis. However, the reasons dictating this decision are probably rather different from those which decided the Government of Argentina to maintain its relations with the aggressor states. The Argentine Government preferred a position of isolation partly as a gesture against United States leadership, partly as a Government riposte to the strongly anti-Axis character of the Radical opposition. In Chile the determining factor is almost certainly strategic. The country has a coast-line of over 3,000 miles, a very small navy and no land forces to speak of. The progress of the war in the Pacific since the Rio Conference has done little to counteract the Chilean Government's original hesitations. If the Japanese can land as far west as the Andaman Islands in the teeth of the resistance of the British, Dutch and part of the American Navy, how easy, argue the Chileans, would it be for them to fall on the undefended coastline of South America, if they were once to spread their operations eastwards. Internal considerations play a part in Chile as well as in Argentina. Dr Rios, the new President, represents the extreme Right Wing of the Radical Party. He has an intense

dislike for the Communists, with whom his Party is in a very uneasy Popular Front alliance. The big propaganda line of all the Left Parties in South America is now, of course, all-out aid to the United Nations, and all-out co-operation with the United States in hemisphere defence. It is therefore just possible that Dr. Rios is maintaining relations with the Axis to off-set the influence of his own Left Wing. Meanwhile, in other republics, the drive against Axis activities and for ever closer relations with the United States continues. The week has seen the rounding up of a number of Axis agents in Brazil and the arrival of the President of Peru, Dr Prado, in Washington is rightly regarded as a singular tribute to the success of the Good Neighbour policy.

Discontent in Bulgaria

The resignation of the Filoff Cabinet in Bulgaria, and its reconstitution under the same Prime Minister, does not denote any change in foreign policy which was fixed at the time of King Boris's visit to Hitler. It is a safety valve for the country's deep dissatisfaction over economic conditions. In the last two years, the cost of living has risen fantastically; food—in a country normally with a food surplus—is growing scarcer. The reason is, of course, the German occupation. Not only have the usual wholesale requisitions been carried out, but the Bulgarian people are being compelled to contribute part of their earnings to a fund for "comforts" for the German troops. On top of the general discontent has come the Kastermann trial. Kastermann was director of the Belgian Electric Company, which supplied Sofia until the state took over the concern in 1941. It was then discovered that Kastermann had fantastically bribed a large number of Bulgarian officials and municipal councillors, including the director of the tram services. It appears that seven million leva were spent on bribes in a few years. It is against this background and internal economic discontent that the Cabinet changes must be read; it is significant that among the portfolios that have changed hands are commerce, agriculture, railways and public works.

AMERICAN SURVEY

Food for Lend-Lease

(From a Correspondent in Washington)

March 15, 1942

IT is about a year now since the United States first undertook to help feed the people of the British Isles. Shortly after the passage of the first Lend-Lease Act, the United States Department of Agriculture made its plans. The British required great quantities of highly nutritious foods—foods that had not normally been produced in the United States for export. The quantities required were so large that, at the beginning of the Lend-Lease discussions, both British and Americans could hope for delivery of only a part. The Lend-Lease food programme has depended upon increased production and increased handling of a long list of vital foods.

The first shipment of Lend-Lease foods left the United States on April 29, 1941. By February 1, 1942, we had made available to the British over 3 billion lbs. of fruits, vegetables, fats, oils, dairy products, eggs, meats, starches, cereals and vitamins, plus several hundred million lbs. of other agricultural products such as cotton, tobacco and naval stores.

Farm Organisation

During the first world-war, America's Allies wanted wheat. We produced the wheat that was needed. We ploughed 50 million acres of the Great Plains, and laid bare to the ravages of rain and wind land that was suitable only

for grass, and which, without the protective covering of a thick sod, soon began to blow away. Years later, the winds that swept the plains carried top soil from Texas to Chicago and New York, and even to the decks of ships on the Atlantic. In 1933, the New Deal took hold and built a new farm programme that was to rehabilitate farm land and farm people. That programme has tied down millions of acres of eroding soil, has nourished, terraced and watered tens of millions of acres of other land, and improved the standard of living of the farm population. Eight years later, when we were asked to produce more than we had ever produced before, six million farmers and 350 million acres of crop land were ready to do the job.

The farm programme of the New Deal sought, not only to aid the farmer by improving his economic status, but also to give him a direct share and greater responsibility in his Government. Farmers were given the opportunity to participate in the administration of the programme, and, through various procedures, in the formulation of policy. Accordingly, committees of farmers were organised on state, county and community levels. Now, in more than three thousand agricultural counties, some one hundred thousand committeemen represent six million American farmers. This administrative device, together with other less extensive field organisations such as the Extension Service and the Farm Security Administration, made it possible for every farmer of the land to be personally in-

formed of the expanded requirements for food, and to be asked to produce his allotted share of the total.

The United States, in recent years, has sought also to help resolve the paradox of "scarcity in the midst of plenty." Among other things, the Government has purchased surplus foods for distribution to people whose incomes did not afford a satisfactory diet. This programme called for an organisation equipped to make large purchases of many different foods, and to handle those foods from the producer to the consumer. The existence of this organisation permitted the taking of immediate steps to procure the food needed under the Lend-Lease programme. The Agricultural Marketing Administration of the Department of Agriculture began to purchase foods in anticipation of Lend-Lease requirements before any Lend-Lease funds had been allocated. The farmers felt the effects of these purchases in better prices for their produce early in the spring of 1941, when it was still possible for them to plan increasing acreage, hatching more chickens, breeding more sows, feeding more grain to dairy cows and hogs, and taking other steps for increasing their production of food. Without such an organisation, it would have been impossible to have acted so quickly.

During the next twelve months, America will produce more food than ever before. For 1942 the Secretary of Agriculture has asked for, and six million farmers have agreed to, an output exceeding their record production of 1941 by 9,500,000,000 lb. of milk, 472,000,000 dozen eggs, 59,000,000 chickens, 10,500,000 hogs, 2,145,000 acres of soya beans, 1,800,000 acres of peanuts for oil, the equivalent of 6,000,000 cases of canned tomatoes, 9,300,000 cases of canned peas, and by big margins in many other highly nutritive foods. For the most part, these increases will be produced without bringing additional land under the plough. But, if need be, we can add 50,000,000 acres of crop land now idle or fallow, and we can plough more than 100,000,000 acres of pasture land. And we won't need to plough the Great Plains as we did in the last war.

The Transport Problem

But the production of food is only part of the job. The food must be delivered to those who need it, both at home and abroad. No matter how liberally we anticipate available shipping space, there just isn't enough to carry all the supplies that must move across the oceans. As far as food is concerned, that means one thing in particular—we must take the water out of it. The dehydration of food is an old process. Food was dried during the last war. Cheese, pemmican, and dried fruits are old forms of dehydrated foods. A year ago, we shipped shell eggs and some frozen eggs. In July, 1941, we set out to increase our capacity to produce powdered eggs. At that time, working 22 hours a day, 300 days a year, we could produce at the rate of 42 million lb. To-day, we are producing at the rate of more than 225 million lb. and expect to increase that capacity by another 50 million at least. Thirty dozen eggs in the shell require two and one-quarter cubic feet of shipping space, whereas the same quantity of powdered eggs takes only little over one-half a cubic foot of space. Eleven lb. of whole milk makes one lb. of milk powder. Concentrated orange juice is one-sixth to one-tenth the volume of natural juice. One lb. of dried vegetables equals ten lb. of the fresh product. Water is also being removed from such fruits as raisins, peaches, pears, apples, apricots and prunes.

Handling the greatly increased production of food strains distribution facilities—containers, storage, refrigeration, rail and ship transportation. Dehydration eases these strains, but simultaneously taxes processing facilities. Increased food processing capacity has been encouraged, sponsored or financed by the Government. Compared with a year ago, for example, the rate of cheese production has increased by 300 million lb. per year; evaporated milk production is up 33 million cases; and dry skim milk has jumped from 375 to 500 million lb. The Government is building two plants in Florida to produce 500 thousand gallons of concentrated orange juice and 800 thousand lb. of pectin; other milk processing plants are under construction and plans are under way to produce an additional 15 million lb. of dried vegetables. Packaging Lend-Lease food is another difficult problem. There are critical shortages of tin for cans, rubber for plioform wrapping and daccawax coatings, steel for metal drums, nails, strapping and even wood and paper for boxes.

America can produce the food. Shortages of fertiliser, labour, and farm equipment will present problems of priorities, but the agricultural plant is capable of greater production than ever before.

American Notes

The Progress of Conversion

The first serious effect of the war on the American standard of living will be felt in durable consumers' goods. Mr Neison has forecast that all such production will cease within about two months, as the industries concerned are entirely converted to war production, although stocks will cushion the blow for some time. Industries where civilian production will be prohibited in the near future include automobiles, radios, phonographs, electrical equipment, and refrigerators, although the automobile industry is the only one where production has already ceased. Residential construction costing more than \$500 has been prohibited except under specific Government authorisation, and the limit for unauthorised commercial, industrial, and highway construction projects has been set at \$5,000. Conversion orders are expected shortly for the washing machine, agricultural machinery and office machine industries. Production of some articles has been limited, including typewriters, razors, musical instruments, bicycles; and stocks of bicycles, typewriters, tyres, and automobiles are already rationed. Wool available for civilian consumption has been cut drastically. Dress designs have been simplified for the duration. The production of golf clubs, golf balls, and metal household furniture has been prohibited. There are restrictions on the use of most metals and rubber. Gasoline deliveries to the East and West Coasts have been cut to 66 per cent of the average of the last three months. New dial telephone installations have been forbidden. That these orders only touch the fringes of the standard of living is realised, and criticism has been aimed at delays rather than their severity. It is pointed out that the production of refrigerators, allowed until April 30th, and electrical equipment, allowed until the end of May, is using up materials urgently needed for war production. The reply of the War Production Board has been that its policy is to accumulate stocks of consumers' goods, and then to cease production altogether, rather than keep a few firms working throughout the war; and that it is proceeding as rapidly as possible with conversion orders. It is also sometimes overlooked that industries not yet converted entirely are already at work on war contracts; the agricultural machinery industry, for instance, is turning out tanks.

The Shipping Bottleneck

The shipping shortage is receiving increasing attention. Testifying to the House Naval Affairs Committee, Admiral Land, Chairman of the War Shipping Administration, declared that it was, and would continue to be, the most serious bottleneck of the war effort. Shipbuilding goals have been raised again; Admiral Land stated that 10,000,000 deadweight tons could be built this year by a 13 per cent increase in production. There has been a steady raising of the sights. In 1941 the United States built about 1,000,000 tons of shipping, and planned to build 6,000,000 tons in 1942. After Pearl Harbour, the goal was raised to 8,000,000 by President Roosevelt. Efforts to break the bottleneck have taken three forms. Ships have been almost entirely removed from coastal traffic, and cargoes are being handled by the railways, motor transport, and inland waterways. Unessential imports from South America, such as coffee, bananas, and cocoa, are being reduced, and the ships transferred to other runs. Strenuous efforts are being made to economise shipping, speed up operation and give preference in facilities to the most urgent cargoes under the sweeping powers granted to the War Shipping Administration. Exercise of Service priorities is being supervised to assure that ships no longer go out half-loaded in answer to Army or Navy demands. Seamen's freedom of movement has been curtailed because it was found to interfere with efficient operation. The main hope for a solution, however, lies in the shipbuilding programme. Figures are not available, but it is known that as recently as March, building was behind schedule. In part this was due to a fault in design, in part to a bottleneck in certain items which has now been eliminated. Also, relations between labour and management have always been notoriously difficult in American shipping and shipbuilding. Admiral Land declared that a war labour policy was essential. A beginning has already been made on the Pacific coast, where a committee of employer and employee representatives has been established to consider methods of increasing production. The Americans are not a sea-faring people, and it has taken

time for the average citizen to appreciate the urgency of the need for shipping. Now, however, it is realised that the ability of the United States to fight the war, as well as to aid her allies, is determined primarily by ships.

Small Firms

Complaints that small firms have been unable to secure their share of war contracts have been growing, and have finally secured sympathetic attention, both from Congress and the War Production Board. Mr Nelson recently testified that lack of funds was the main reason why these firms were unable to obtain contracts. This difficulty has been met by an Executive Order authorising the Army, Navy, and Maritime Commission to guarantee loans to be made by the Federal Reserve Banks, the commercial banks, or the RFC to small enterprises to enable them to assume contracts. Up to now, the commercial banks have been unable to make such loans because of credit restrictions and the RFC has not considered small businessmen good risks. It is officially stated that these loans "will not be made under peacetime credit rules. They will be made by production men wherever additional financing is essential for additional production." Voluntary pooling of the facilities of small firms in order to obtain defence contracts is becoming increasingly popular, and has been favoured by the War Production Board. A Bill which has been passed by the Senate and is now before the House has developed this idea further; it provides for the creation of a "Smaller War Plants Corporation" under the War Production Board, which would secure contracts from procurement agencies and then break them down into orders which would be distributed to small enterprises. Mr Nelson has agreed that the contracts distribution department of the WPB has perhaps not been as aggressive as it might have been in employing small firms, and has promised a more vigorous policy, with emphasis on simplifying and standardising many of the articles demanded, so that they can be produced by small businesses, leaving more complicated jobs to the bigger concerns. The agitation to give small business its fair share of war work comes at present from businessmen threatened with idleness as their supplies are cut down, but as war production absorbs more and more of the country's industrial facilities, it will become increasingly urgent to use every means to mobilise the resources of all firms large or small.

The Closed Shop

A War Labor Board decision last week on the closed shop, ordering a small machine-tool company to insert a "maintenance of membership" clause in its union contract, may prove to be the solution the Administration has adopted on this vexed question. The dissent of all the employer members of the Board suggests, however, that industry is not likely to accept it without protest, and the whole question of labour policy, temporarily in abeyance, may move back into the spotlight. "Maintenance of membership" is one of the many compromises possible between the closed and the open shop; it provides that employees already members of the union must remain in good standing if they are to keep their jobs. It provides a very great degree of security to the union, both as regards its finances and its membership. In this case, it is also provided that new employees must join the union. Employer representatives have protested that it is only the closed shop under another name, and certainly at a time when employment is expanding so rapidly the distinction will probably prove slight in war industries. Other compromises are possible. It may be that no inflexible policy will be established. Considerable concessions to union security seems almost unavoidable, however, if the unions are to agree to the limitations on wage increases which are reported to be under consideration.

Sugar Squeeze

Some of the confusion over the necessity for rationing sugar has sprung from a free-for-all struggle which has been going on over the question of industrial alcohol, normally distilled from sugar. The participants—aside from the consumer, whose voices can hardly be heard—have been the industrial alcohol industry, the whiskey industry, Congressmen from the grain states, the War Production Board's Chemical Division, the Department of Agriculture, and the Office of Price Administration. The question at

issue was whether the entire facilities of the whiskey industry should be used to produce industrial alcohol from grain, of which there is a surplus, or whether 800,000 tons of sugar, one-twelfth of America's sugar consumption, should be sacrificed to the war effort. The difficulties, technical and legal, have finally been surmounted, but perhaps too late to save the sugar. The technical hitch was that alcohol produced by the whiskey industry would be only 140 proof, instead of the 190 proof needed for war purposes; until recently, it would have been illegal to increase it by using the industrial alcohol industry's facilities. That the law has now been repealed, and grain is to be used as the source of industrial alcohol lends a certain colour to the charges that the WPB's Chemical Division, staffed in part by men from the industrial alcohol industry, was reluctant to encourage competition which might be embarrassing after the war. They might have been even slower to move if Congressmen from the grain states had not been eager to seize an opportunity to increase the demand for grain, and if an investigation by Congress had not been threatened. The official denial from the OPA and the WPB that there had ever been any disagreement between them on the subject of sugar rationing does not entirely lull the suspicion that the industrial alcohol might have been produced without dipping so deeply into the sugar bowl.

Zinc Supplies

Estimates of a number of United States metal specialists place the country's zinc requirements in 1942 at about 900,000 short tons. Slightly over one-third of this total will be needed for brass-making, about one-third for galvanising, roughly one-tenth for die-casting, about one-eighth for rolled materials and the remainder for a variety of smaller uses. The greater part of the requirements for 1942 can be met from domestic sources. Production of recoverable zinc in 1941 amounted to 735,865 short tons, and in 1942 it is expected to exceed 800,000 tons, as a result of the increase in the domestic zinc price by 1 cent a lb. to 8.25 cents a lb., and the payment of a premium of 2.75 cents a lb. on any zinc produced in excess of 1941 figures. In addition, the Metal Reserve Company has acquired the whole exportable surplus of Latin America; Peru, Bolivia and Mexico together produce nearly 200,000 tons per year. The capacity of American zinc smelters has been increased to cope with increased supplies. In the latter part of 1941, potential output approached 900,000 tons and extensions in hand before the United States entered the war were scheduled to raise the country's smelter capacity to over 950,000 tons a year. The United States has also an extensive secondary zinc smelting industry, which in 1940 recovered the greater part of the 206,000 tons of secondary zinc produced in the country. With economy in non-essential uses, already well in hand, the only possibility of a shortage lies in the size of British requirements. Although the British Empire produces sufficient zinc ore, the loss of the Belgian smelting industry has made Great Britain dependent to an unknown extent on the United States for smelting.

Shorter Notes

Mr Rayburn, Speaker of the House of Representatives, has stated that the United States is now producing 3,300 war planes a month.

An agreement between Canada and the United States has been announced to make more effective use of agricultural resources. It provides for the increasing production of oil-bearing crops, such as soya beans, in the US, and of oats, barley and flax in Canada, and facilitates the seasonal movement of farm labour and machinery between the two countries.

The Chairman of the War Production Board has announced that munitions output and war construction expenditure during March exceeded 2,500 million dollars with an additional 500 millions for pay and subsistence.

The Office of Price Administration has given six Maryland communities, including the city of Baltimore, sixty days to reduce inflated rents to April, 1941, levels, before Federal Regulation is imposed.

THE WORLD OVERSEAS

The Churches of Europe—II

(By a Correspondent)

AFTER the fall of the Third Republic, the churches of France found themselves in a curious position. The fallen Republic bore in their eyes the stigma of its secularist policy. True, some rapprochement between the State and Catholicism had taken place, paradoxically enough, during the Popular Front period. But the laws of 1902 and 1905 were still in force; they barred the Church from exerting influence upon the State and education; they severely restricted the right of ecclesiastical bodies to acquire property and to accept donations or gifts. The spirit of Waldeck Rousseau stood between State and Church right up to June, 1940. Vichy seemed to bury the spectre of *laïcité* together with the Republic and its political parties and parliamentary institutions; it promised to undo all the wrongs inflicted upon the Church since 1789; and the personalities of Pétain and Weygand seemed calculated to raise high hopes among churchmen. On the other hand, it was hardly possible for the Church to flourish on the ruins of its own nation. Pétain pledged the restoration of the Church to its old glory in the life of the state; but, at the same time, he subjected the state to unheard-of humiliation at the hands of the conqueror. In addition, strange voices intruded themselves upon the chorus of Vichy. There was the voice of Déat, thundering against the "white terror" of clericalism. There were other "radical" supporters of Vichy, who added to the old secularist criticisms some of the new insults and slanders forged on the other side of the Rhine.

The policy of Vichy, therefore, wavered contradictorily—now seeking to please the Church, and now its opponents. The pro-Catholic Minister of Education, M. Chevalier, abolished the laws of 1902 and 1905. Religious bodies were recognised as institutions of public utility, and allowed to accept legacies and gifts without any restrictions; religious orders were permitted to acquire property and schools to give religious instruction. But M. Chevalier had to resign from his office under the pressure of a campaign waged by the Déat clique; and his successor withdrew a greater part of the pro-Catholic reforms.

The French Alignment

Under these conditions, the French Church was obviously unable to take a uniform political attitude. All the divergent shades and tendencies of French public opinion found their expression within the Church itself. There are, roughly, three main groups: the collaborationists, the Pétainists, and the Catholic Left. The open supporters of collaboration have an influence only among the highest ecclesiastical hierarchy; the most typical of them is Cardinal Baudrilart, the head of the Paris Catholic Institute, and a member of the Collaboration Group set up under the auspices of de Brinon.

Head Offices:
LIVERPOOL LONDON
North John St. Lombard St.

In 1870, as in 1940, there were in France partisans of a fight to a finish. It was those people who had brought upon us the horrors of the siege of Paris and of the Commune. These are the Cardinal's own stated motives for his attitude.

The majority of the upper and middle clergy is pro-Pétain, *sans phrase*. Loyalty to Vichy is their political axiom; in foreign politics, they nourish the illusion of the unity of the Latin, and consequently Catholic, bloc. But they frequently have to raise protests against quasi-totalitarian encroachments upon the spiritual influence of the Church. The struggle for youth has been a centre of contention. French Catholicism has exerted an enormous influence upon considerable sections of the younger generation; and the setting up of a State-controlled monopoly of youth movement has threatened to put an end to the existence of a wide network of Catholic youth organisations. In a special letter to the Pope, the Cardinals and Archbishops put forward their objections to the *Mouvement Unique de la Jeunesse*. Another source of friction has been the ban on Catholic trade unions. Racial discrimination has been yet another matter of controversy; and the hostile reaction of Catholic opinion probably accounts for the fact that Vichy's anti-Jewish laws have been directed against the confession rather than the race.

The main opposition to collaboration and to Vichy illusions has come from the broad mass of the lower clergy. The French curé is in daily touch with the sufferings and privations of the people. He witnesses the food requisitions in the countryside, and the misery of the war prisoners, abandoned families. More frequently than not he becomes the spokesman for his hardly-trying parishioners. A political cleavage has appeared between the upper and the lower clergy, a cleavage with a tradition which goes back to 1789. Besides the lower clergy, there is the Catholic Left, the circle of brilliant French intellectuals who have tried to reconcile Catholicism with the political tradition of the French Revolution; and there also are the cadres of the Catholic Trade Unions. It has been in these quarters that the policy of Vichy has been met with a strong and irreconcilable opposition. Nazi attempts to foster separatism in Brittany have been brought to nothing by the local clergy; and in Alsace-Lorraine the priest has once again, as after 1870, become the guardian of French national consciousness.

Nazism Over Europe

In the other occupied countries, the attitude of the churches may perhaps be described in the words of Cardinal Van Roey, the Primate of Belgium:

The Catholic Church adapts itself to all governments provided they safeguard the liberty of conscience. This is true. But as for adapting itself to governments that oppress the right of conscience, and persecute the Church—no, never. The Church is like the human organism. Man can get used to all kinds of changes of diet, but there are some that kill him.

The "diet" of National Socialism has been responsible for the dramatic revolt of the Norwegian clergy against Quisling's tutelage. The tension between the puppet Norwegian Government and the Church grew. Attempts to subordinate the Church to the State stopped at nothing. The Ministry of Education issued instructions on church services, and laid down regulations concerning the contents of service and prayer books, which caused a protest by the Bishop of Oslo. Then "ecclesiastical advisers" were nominated, sycophants of the *Nasjonal Samling*, who had to keep watch on the political loyalty of the clergy. The legitimate representatives of the Lutheran Church were barred from broadcasting. The refractory Association of

Clergymen was banned, and its funds were confiscated. The crisis was brought to a climax by the attempt to force the whole youth of Norway into the ranks of the *Hird*—the Quisling Youth. On February 24th all the seven bishops resigned their posts, and in a letter to the Minister of Education they wrote:

As it came to Luther so to us has come the moment when we must be loyal to our beliefs, and assert the justice of the Church against the injustice of the State.

This unique "ecclesiastical strike," started by the highest dignitaries of the Church, spread to the broad mass of the clergy on Easter Day, when the Norwegian people heard from the pulpits of the decision of their pastors to resign their administrative posts and emoluments. The attempt of the puppet Government to reduce the Church, too, to a puppet has failed.

The totalitarian "diet" is basically the same for every occupied country. In Czechoslovakia, there is the confiscation of the property of the orders and compulsory labour for monks; in Holland, there is the Nazification of the religious labour organisations. But nowhere has persecution been as relentless as in Poland. The struggle against the Polish clergy has been conceived as part of the general policy of extermination of the intellectual leadership of all classes of the Polish nation.

No sooner (said Forster, the Nazi leader of Danzig) had we come into possession of the lands of the former Polish Republic than the clergy became the spiritual leader of the illegal struggle against ourselves, the actual mouthpiece of Polish nationalism.

The whole internal life of the Church has been subjected to the strictest supervision by the Gestapo, which dictates even the hours and the time of duration of divine services. In the western parts of Poland, the use of the Polish language in services has been restricted, if not prohibited altogether. The resistance of the Church has thus assumed the character of an elementary struggle for the preservation of the national characteristics of the incorporated provinces. And here the ruthlessness of the Nazi policy has left almost no scope for any conciliatory manoeuvres. Hundreds of Polish churchmen of all ranks have gone to concentration camps.

The Russian Test

The outbreak of the Russo-German war was the critical moment in the relations between the churches and the German masters of Europe. German policy tried, of course, to tempt the churches into an active participation in the "crusade against godless Bolshevism." It seems that, apart from a few exceptions, the churches of Europe have withstood that temptation. This is illustrated by the somewhat impatient question put by the Belgian Quisling paper, *Volk en Staat*:

Where are the priests in our country that would start the crusade against Bolshevism?

To sum up, it may be said that the conquerors of Europe have proved unable to conquer Europe's churches. Attempts to find a *modus vivendi* have brought some results in France

and very few, if any, in the other occupied countries. The attitude of the churches has ranged from a carefully observed neutrality in countries like Czechoslovakia and perhaps Denmark, to uncompromising resistance, as in Norway and Poland. In spite of some attempts at a compromise, the churches have almost everywhere remained the only open bulwark of popular opposition, which can otherwise find a political outlet only in the narrow channels of clandestine movements.

Irish Transport Difficulties

[FROM OUR DUBLIN CORRESPONDENT]

March 23rd

THE war has dislocated the Irish transport system more seriously than any other activity. In the course of the last century, Irish transport had come to rely more and more on imports. Before the railway era, the whole transport system in the country constituted a demand for the products of Irish agriculture. With the growth of the railways, imports of coal and other articles became essential, but there still remained a considerable demand for Irish farm products in respect of road transport. In recent years, motoring, both private and commercial, has grown by leaps and bounds, with the result that the transport system of the country has come to rely to an ever-growing degree on imports of motor cars, motor parts, tyres, petrol and oil. One consequence of this revolution has been a reduction in the demand for horses and horse fodder. Another consequence has been the almost complete paralysis of road transport as a result of the war.

Partly as a result of the decline of motoring the railways have been experiencing a relatively prosperous period. In spite of the reduction of their services owing to coal shortage, their financial results have been quite satisfactory. The Great Northern Railway, which is partly situated in Northern Ireland but is not included in the British Railway War Scheme, has not suffered seriously from a shortage of coal and its profits have greatly increased. Last year, this railway carried nearly 4,000,000 more passengers and nearly 500,000 tons more goods than in 1939. Gross receipts amounted to £2,204,681, an increase of £797,157 on 1940. Although total expenditure was £304,612 higher at £1,601,787, net receipts were up by £492,545. Three years' arrears on the 4 per cent preference stock, and a dividend of 1 per cent in respect of 1941 on the ordinary stock, have been paid. The experience of this railway compares favourably with that of the British railways and of the Great Southern Railway, which is wholly situated in Eire.

The Great Southern Railway has suffered very seriously from coal shortage. The passenger train services were drastically curtailed in the second half of last year, and the restrictions on the movement of livestock owing to foot-and-mouth disease injured their goods traffic. In spite of these adverse factors, gross receipts were up from £4,568,604 to

£5,172,020, while expenditure rose from £4,235,654 to £4,643,563, with the result that net receipts stood at £528,457—an increase of £195,507. This satisfactory result rendered possible the payment of three years arrears on the Guaranteed Preference Stock. The Government has recently appointed Mr A. P. Reynolds, general manager of the Dublin Transport Company, as virtual dictator of this railway. Mr Reynolds' nominal position is that of chairman of a board of directors consisting of four directors elected by the shareholders. But, in fact, he possesses complete powers to manage the company in defiance, if necessary, of the wishes of his co-directors.

Road transport has been maintained until recently at a higher level than anybody would have forecast at the beginning of the war. In spite of the cut in petrol allowances, motorists heroically kept their cars on the road, and, although the mileage each year was drastically reduced, the actual number of motor vehicle licences was reduced far less. The extension of the war to the Pacific and the growing demand for petrol elsewhere have threatened to bring private motoring to a standstill for the time being.

The April allowance for private motorists has been reduced by 50 per cent, and in May private motorists will receive no petrol at all. Essential public services, doctors and commercial motorists will still receive a greatly reduced allowance. Imports of paraffin and fuel oil have also fallen off considerably, and fears are entertained of shortages of these fuels during the coming harvest on which so much depends.

The motoring habit has grown to such an extent in Ireland that the virtual disappearance of private motoring will cause acute inconvenience to large sections of the public. So far there has been no question of the cessation of the Dublin bus services, on which the city now depends for passenger transport, since the almost complete abolition of the electric trams. Why these trams, which derived their power from the Shannon Scheme, were put off the road during the period of petrol shortage continues a mystery to the average Dubliner. The reduction of motoring will in gravely affect employment in the assembling industries, in the petrol distributing trade and in the numerous garage and repair depots with which the country is studded. Finally, the revenue will also suffer.

Russia at War

Pan-Slav Conference.—In the first days of April, the second Pan-Slav Conference took place in Moscow. Among the participants there were not only the representatives of Slav nations under German occupation, but also some who spoke in the name of the two Slav countries—Bulgaria and Slovakia—that have lined up with the Axis. They urged their countrymen to oppose the policy of their rulers and to join the peoples of the Slavonic race in their life and death struggle.

The dominant note of the Conference was the "solidarity of all the Slav people against the onslaught of the Teutonic invader." Many speakers referred to the millennium-old tradition of a common Slav struggle against the Germanic tribes—rather than to the distinction between Nazi and German so strongly emphasised in Stalin's Order of the Day.

The tenor of the speeches was confident. Soviet speakers spoke of the impending Soviet offensive, and ridiculed German boasts. The Ukrainians appealed to their people in the occupied territories to prepare for the return of the Soviet armies to Kiev, Kharkov, Lvov, and so on. So did the White Russians.

But the conference did not confine itself to reiterating the slogan of Pan-Slav solidarity. The opening of a Slav front in the enemy's rear was propagated. Those Slavs who live far from the actual front, like the Czechs, were called upon to intensify sabotage and to impede in any possible way the German war effort. Those who live in the immediate rear of the enemy's lines were asked to go further than that and to take up arms. Such appeals, sometimes perhaps a little impatient and not quite free from polemics, were issued to the Ukrainians and Poles. An outstanding Communist-minded Pole said:

Poles! The hour has struck. The spring of 1942 will be the spring of liberation. The moment has come to prepare a new Grünwald (the battle of 1410 in which Poles and Lithuanians inflicted a heavy defeat on the Teutonic Knights). We cannot wait and hope for foreign help. We have to fight alone. This is not the time to listen to cowards who tell you to wait for the right moment. Take your weapons from the German arsenals, take your weapons from the German army and police. Not one train with war materials for the Eastern front should be allowed to pass through Polish lands. Workers, blow up factories; peasants, form armed detachments!

There is perhaps some analogy between these appeals and the demand to open up a second front in the West. But, whereas in the West that demand has at least some measure of a realistic background, conditions in the East do not seem for the time being to warrant the same hopes. True, reliable reports speak of intensified sabotage and growing resistance in the German's rear. But it is still a long step from this to the breaking into German arsenals and the disarming of German soldiers and policemen by people who have themselves been disarmed and terrorised.

The second Slav conference differed also from the first one, which met immediately after the outbreak of the war. This time some nationalities were represented only by distinctly pro-Communist spokesmen, whereas at the first conference their representatives had been drawn from a wider social and political field.

Cattle.—In the middle of March, the Council of People's Commissars issued a decree on cattle breeding intended to secure the supply of meat under war conditions. The decree was prefaced by a review of the livestock position. In 1941, the number of large-horned cattle decreased by 1.3 per cent, of cows by 8 per cent, of sheep and goats by 12.9 per cent and of pigs by 2.3 per cent. It is, however, not clear whether these figures should be related to the livestock of the entire Soviet Union or to the population reduced by war losses. In cattle-rearing, as in every other branch of economic life, the German-occupied western territories had a very high share. According to the 1938 census, about one third of the total of 16 million horses, one fourth of the 50 million horned cattle, one tenth of the 66 million sheep, and about one half of the 25 million pigs were bred in these occupied regions. Making all allowances for the proportion of cattle saved by evacuation—and the cattle evacuation from the Ukraine seems to have been carried out on a rather wide scale—1941 was bound to show a decline rather than an increase in numbers. The figures that speak specifically of the position in the Kirgisian steppes and in the Turkmenian Republic, the main cattle-breeding centres after the Ukraine, are easier to grasp. They put the increase in the various categories of cattle between 21-28 per cent; the Chelya-Binsk, Novosibirsk and Altai regions are blamed for the decrease in livestock shown in 1941.

Cattle breeding has always been a weak spot in the Kolkhoz (collective) system. When this war broke out, Soviet agriculture had not yet entirely recovered from the wholesale slaughter of cattle carried out by the peasants during collectivisation. Up to now, the collective farms have not been able to handle properly the breeding of young cattle. The official review of the position says, for instance, that in 1940 no less than 40 per cent of calves and 43 per cent of lambs were slaughtered or died as a result of neglect. In consequence of the war, a certain shortage of fodder must also have arisen; and there are some signs that cattle slaughtering has once again assumed somewhat abnormal proportions, especially in the case of evacuated cattle. To counteract this, it has—under the latest decree—been forbidden to slaughter or sell cattle under one year of age; and full-grown cattle can be slaughtered or sold only by permission of the Agricultural Departments. Positive steps have also been taken to ensure a better supply of fodder; Kazakhstan alone is said to have prepared winter pastures for 2 million cattle. Peasants engaged on cattle rearing have been granted exemption from military service, and special premiums have been fixed for good results in the preservation of young cattle.

Soviet agriculture has, for many years, developed towards specialisation. But specialisation is bound to produce a strain on transport; grain farms, for instance, have to buy meat or cattle from remote cattle farms and *vice versa*. The new decree aims at making every Kolkhoz self-sufficient. It has put upon the farmers the obligation to purchase 2,300,000 young cattle and the same number of sheep in the course of 1942. "Every Kolkhoz must rear its own cattle" has become the slogan.

THE BUSINESS WORLD

Finance and Banking

Banks and the Budget

The White Papers accompanying the budget statement were anticipated with special interest in the City in the expectation that they might reveal the result of the calculation of changes in personal bank balances recently undertaken by the banks for the Central Statistical Office. Unfortunately the classification of personal savings does not go into details. The figures of gross personal savings of £909,000,000 for 1941 comparing with £640,000,000 for 1940 and the comparable net figures of £665,000,000 and £473,000,000 are still "residuals" arrived at by deducting direct estimates of personal consumption and taxes met out of personal incomes from estimates of these incomes. These residuals have, however, been checked by such direct evidence of personal savings as is available and among this evidence, the results of the inquiry into changes in personal bank balances no doubt takes an important place. The budget has ceased to provide the money market with any hint as to the future course of money rates and borrowing policy. The position in this respect has become frozen into almost complete rigidity especially as regards short-term money rates and methods of floating debt borrowing.

Overseas Disinvestment

The analysis of the sources of war finance (reproduced on pages 531-2) estimates the amount of overseas disinvestment for the financial year 1942-43 at £775 millions. This compares with corresponding figures of £798 millions for the calendar year 1941 and £759 millions for 1940. The estimate for the ensuing year includes £225 millions in respect of the Canadian gift of supplies. This leaves £550 millions, representing the further liquidation of overseas securities and the accumulation of sterling balances by overseas countries. This is an item in the elaborate data prepared by the Central Statistical Office which at first blush invites scepticism. A reduction of a mere £23 millions in the proceeds of overseas disinvestment as compared with the year 1941 seems too small to allow for the fundamental changes which have occurred over the past year in the position of overseas assets and in the balance of payments of the United Kingdom *vis-à-vis* the Empire. Against the Canadian contribution included in the estimates for the current year must be set the liquidation of Canadian securities and the accumulation of Canadian sterling balances in the course of 1941. On balance, it will be found that the Canadian contribution to the disinvestment total will be little greater for the current year than it was in 1941. On the other hand, the US contribution will be far smaller, since Lend-Lease is left out of account. There is next to no gold left for sale—other than current production—and the liquidation or pledging of dollar assets in the coming year will yield but a small fraction of the total yielded by this source last year. As for the accumulation of sterling balances by overseas countries, it is difficult to see how the movement this year can hope to challenge comparison with that of 1941. The contribution of Malaya, which was running at the annual rate of at least £50 millions until last December, is now lost. The same is true of the items contributed by the Dutch East Indies and Burma. The biggest source of disinvestment within the sterling area was India, and given the approach of war to Bengal and the increased expenditure of the British authorities in that country, it is more than doubtful whether India's accumulation of sterling and repatriation of debt this year can be more than a fraction of what it was in 1941. South Africa with its gold exports remains the only large sterling area country from which the contribution to war finance under this head of disinvestment can be expected to remain unaffected. Some such doubts must have occurred to the framers of the estimate, for in a footnote to the table in question it is

pointed out that "if further enquiry should show that the amount of overseas disinvestment... has to be revised, then the residue (private net investment at home) will be revised by the same amount."

Extra-Budgetary Funds

The contribution to central Government expenditure brought by the surplus on extra-budgetary funds amounted to £166 millions in the calendar year 1941, compared with £140 millions in 1940 and £21 millions in 1938. These figures exclude the increased sterling investments of the Exchange Equalisation Account. The latter are the counterpart of sales of gold and foreign assets which are already included in the item of overseas disinvestment. One of the main items contributing to this increase is the surplus of the Unemployment Fund. This brought in £64 millions last year, against £24 millions in 1940, and compares with a deficit of £1 million in 1938. Unfortunately, the subdivision of the sources of extra-budgetary income does not proceed far enough to allow accurate deductions about the operations of the Exchange Equalisation Account. The changes consequent on these operations are shown in the tables merged with certain other extra-budgetary receipts, including war risk insurance and War Damage Act receipts. Some measure of the EEA operations can, however, be gained by the juxtaposition of the following figures:—

(£ million)	1938	1940	1941
Finance through Govt. agencies (including EEA)	253	543	247
Surplus on extra-budgetary funds	21	140	166
Reconstruction Finance Corpn. loan	...	...	87

The process of deduction will yield no exact measure of the operations of the EEA, but will nevertheless provide useful indications of their magnitude. The discrepancy between the figures of £253 millions and £21 millions in 1938 provides a fairly accurate measure of the gold lost by the EEA during that year—as indicated by the official half-yearly figures (March 31st and September 30th), which were still being published at the time. The much greater discrepancy for 1940 is probably explained in part by Government receipts under the War Damage Act, and for war risk insurance. But by 1941 it will be seen that the operations of the EEA had ceased to provide an appreciable source of extra-budgetary revenue, the discrepancy between the two figures being more than accounted for by the loan received in the course of the year from the RFC against the collateral of direct British investments in the USA.

Government Department Treasury Bills

The analysis of public borrowing at home in the White Paper provides a clue to changes in the holding of public departments. The increase in Treasury bills held outside Government departments and in ways and means advances from the Bank of England amounted to £279 millions over the year 1941. Of this, £15 millions was represented by ways and means advances, leaving the additional holding of Treasury bills at £264 millions. The actual expansion in Treasury bills outstanding over the year was £395 millions. It follows that £131 millions of additional Treasury bills were held by Public departments at the end of 1941 compared with the end of 1940. This figure approximates fairly closely to the increase in the fiduciary circulation during the year, namely £150 millions and the correspondence suggests that the increase in the non-market holding of Treasury bills was accounted for by the Issue department of the Bank of England.

Bombay Bullion

The breakdown of the Indian negotiations produced the immediate reaction of a sharp increase in bullion prices in the Bombay market. The price of silver which had fallen to Rs 78½ per 100 tolas in the previous week rebounded to Rs 80½ at the beginning of this week. The latter quotation gives a straight London parity of 29½d. per ounce. It is not the highest point reached in the recent silver boom. The quotation has since declined to around Rs 77. These market oscillations are in no way connected with official intervention in the market. Speculators have been snatching profits and, on what remains an extremely narrow market, their operations are inevitably having a considerable effect on prices. The silver price in London remains steady at 23½d., with occasional but small official sales of Indian silver to make the ceiling effective. The Bombay price of gold also jumped from Rs 49 2a to Rs 50½ following the deadlock in the New Delhi discussions. But in this market, too, there has been a sharp reaction, the price falling to Rs 48½d.

The Circulation

This week's Bank return does not provide the happiest commentary on that part of the Chancellor's speech in which he asserted that the enemy of inflation had established no bridgehead in this country. The note circulation shows a further increase of £3,184,000, a movement for which no particular seasonal explanation can be advanced. The total circulation thus rises to the new record of £767,110,000, leaving a mere £13,132,000 of unissued notes in reserve and reducing the reserve ratio to the low figure of 7.2 per cent. On this showing, a further adjustment of the fiduciary circulation can only be a matter of days. This movement added to a reduction of £10,130,000 in Government securities have reduced the cash basis, but bankers' balances, though they have fallen by £7,214,000, are still at the comfortable level of £127,882,000. The position in the money market this week has been easy, and most of the banks have begun to extend their bill purchases to July maturities.

THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

CAPITAL (PAID-UP) - £3,000,000
RESERVE FUND - £3,000,000

DIVIDEND No. 219

NOTICE IS HEREBY GIVEN that a DIVIDEND of 2 per cent., being at the rate of 8 per cent. per annum, upon the paid-up capital stock of the bank has been declared for the three months ending 31st May, 1942, and will be PAYABLE at the bank and its branches on and after 1st June, 1942, to shareholders of record 30th April, 1942.

By Order of the Board,
E. B. MCINERNEY,
London Manager.

6 Lothbury, London, E.C. 2.
April 16th, 1942.

THE CUNARD STEAM SHIP COMPANY, LIMITED

NOTICE IS HEREBY GIVEN that the Sixty-fifth Ordinary General Meeting of The Cunard Steam Ship Company Limited will be held at Cunard Building in the City of Liverpool, on Wednesday, the 29th April, 1942, at Eleven o'clock a.m.

1. To receive and consider the Statement of Accounts and Balance Sheet to the 31st December, 1941, with the Reports of the Directors and Auditors.
2. To elect Directors and Auditors in place of those retiring but who being eligible offer themselves for re-election.

NOTICE IS HEREBY ALSO GIVEN that the Transfer Books for Ordinary and Preference Stocks will be closed until the 29th instant.

By Order of the Board,
H. J. FLEWITT, Secretary.
Offices: Cunard Building, Liverpool.

Bank Accounts for US Forces

British banks have been advised by the Bank of England this week of the procedure to be followed in opening and operating accounts for members of the US armed forces serving in this country, and for civilians normally resident in the US employed in US bases in the United Kingdom. If such persons receive their pay and allowances in sterling, they may open US registered sterling accounts. If they are paid in dollars, they may open either registered or US dollar accounts. Those accounts may be credited without formality and there are to be no restrictions on debits to such accounts. Sterling cheques may be drawn on US dollar accounts (and converted at the official dollar cheque rate), provided the payees are resident in the sterling area. As regards other banking facilities, banks may encash or negotiate US dollar notes or

drafts for the persons in question. The official rates of exchange are to apply in all such transactions. Purchases of US dollar notes should be made at the net rate of 48. 10d. per dollar. US nationals concerned will not be required to sell their gold and foreign exchange to the British authorities, or to register their foreign securities.

National Bank of Egypt

Contrary to what was stated in last week's comment on the Egyptian circulation, there remained £E6,240,583 of gold in the issue department of the National Bank of Egypt on December 31, 1941. The metallic reserve was thus unchanged over the year, and the whole of the substantial increase in the note circulation found its backing in a corresponding expansion of the issue department's holding of sterling Treasury bills.

Investment

Investors and the Budget

If the investor, as such, cannot be expected to show any great enthusiasm for Sir Kingsley Wood's latest Budget, there is, at least, very little in it which constitutes a further direct attack upon his income. The two possibly adverse factors are the increase in sumptuary taxes and the absence of any further relief under EPT. So far as the taxes on beer, spirits and tobacco are concerned, the general assumption has been that even very sharp advances would fail materially to reduce the demand, and the fact that prices showed only the most nominal changes on the announcement suggests that this view is very widely held. The figures of the estimated yield under these heads also go some way to support the contention. The effect of doubling the purchase tax on luxuries will, possibly, prove more harmful to those concerns whose main business is to supply such of these commodities as are of a durable character, since the rise in price will reduce their attraction as an inflation hedge. It may, however, be the case that there will arise a new demand for some of these articles, from classes which have not previously owned them, which will more than offset the fall. In any case, a reduction in output is more likely to be brought about by lack of material supplies than by any net fall in demand. As to the EPT position, there will be some dissatisfaction, but perhaps little surprise, that no fresh concessions have been made. The one change is the assurance that the 20 per cent refund will accrue by statutory right, subject to its being used for capital purposes and not for the distribution of dividends or bonus shares. It is a little difficult to see how this restriction is to be applied. That is, however, a post-war problem, and the more immediate interest is how far the greater definition given in the matter of eventual payment will affect the position. It would seem that it is now at least permissible to enter, as a qualification of balance sheets, the fact that such a reserve exists. Whether it will be possible to disclose its amount, and, if so, how it can be brought into the actual accounts, are matters of considerable doubt.

£220,025. This excludes £13,887 received on account of registration fees for agents, imposed under the new regulations of June last, the whole of which has been used, in the terms of the agreement, to establish a special reserve. Expenses have been somewhat reduced, but economies are almost cancelled by war damage insurance premiums, while it has been necessary to find £22,873, against nothing, for the war damage contribution. The Managers have also decided to raise the provision for buildings replacement from £15,000 to £25,000, with the result that there is a deficit of £30,927, against a profit of £6,163. As already announced, there is no dividend, but the carry forward is reduced to £167,557 in preference to the alternatives of increasing the debenture debt or of making a call on the proprietors, whose liability on their shares is unlimited. Thus, although brokers, and probably jobbers, have enjoyed a rather better year, the company providing the physical amenities of the market continues to suffer more and more severely from wartime conditions.

Corrientes Repayment

The high standard of Argentina, among South American borrowers, is proverbial, but some of those who have lent to the provinces of the republic have been less fortunate. A case in point is that of the small Corrientes 6 per cent loan of 1910. Final default on interest payments occurred in 1921 and on principal in 1925. A case in the Argentine Supreme Court obtained the segregation of 75 per cent of certain revenues, on which the service of the loan was secured, but it was only after protracted negotiations that the bondholders received their first payment in 1938. Meanwhile, the quotation had sunk, at one time, as low as 10. Since then, payments have been received in respect of interest on coupons, and on bonds due for redemption but still outstanding, to a total of £90 6s. 8d. per cent gross in six payments. These payments were made only to bondholders who were joined in the Supreme Court action. Towards the close of last year, the province was able to secure loans from an American banking group, sufficient to liquidate outstanding debts, including this loan, and it is now proposed to repay the principal, of those bonds joined in the action, at par and to make a further interest payment. This will be £65 gross for those who have received only four of the six interim payments so far made, or £43 8s. 9d. gross for those who have received the whole six. That is to say, the total payments, since the definitive default of 1921, will aggregate £133 15s. 4d. per cent in respect of interest and of interest thereon under the agreement of September last, from which date interest will be paid at approximately 3.13 per cent on the whole sum due. The position of South America in the present conflict, as being the only large area not as yet directly involved, places the Republics in a very strong position. The Corrientes loan was, of course, a small affair and a substantial part of it was held internally. It is, nevertheless, all too rare an example of the successful prosecution of negotiations with a debtor who was at one time unwilling to meet his obligations. The offer is open for one month, that is to May 12th, and it seems only reasonable to accept it. Holders who have lodged their bonds with the Council of Foreign Bondholders, and who wish to accept, should send

Stock Exchange in Total War

The changes shown in the report of the Stock Exchange, London, for the year ended March 25th are, for the most part, small as compared with those of a year ago. But, in the financial field at least, they are important, since they convert the usual credit balance on the year into a debit. The explanation lies mainly in a further decline in total membership, from 3,715 to 3,604, and still more in active membership, which, including non-member clerks admitted to the floor, is down from 5,502 to 5,263. There was also a fall in settling-room clerks from 641 to 614, while the replacement of office clerks by women and men above registration age has gone on rapidly, although no statistics of this are available. Financially, the consequence of these developments has been that the Trustees and Managers have been due to receive less in subscriptions, and have had to make larger concessions from the reduced total on account of membership of the fighting forces. Despite the new special fees to preserve rights of membership and larger receipts from publications, due to higher charges, revenue is down from £264,815 to

their deposit receipts to the Council without delay, so as to secure the release of their bonds for lodging.

The League Loans Committee

In the twenty-two months since the publication of the last report of the League Loans Committee (London), the spread of the war has virtually eliminated all scope for intervention on behalf of bondholders. The current report, which covers the period July, 1940, to February, 1942, points out that the Committee is unable to represent bondholders in negotiation with countries to whom United Kingdom trading with the enemy legislation applies. This includes all but one—presumably Greece—of the debtor Governments. The most interesting feature of the report is the announcement that, in connection with the Hungarian League Loan of 1924, the principle of uniform treatment for each tranche has had to be abandoned. This departure from the principle of collective bargaining for bondholders has, of course, been made inevitable by the war. It is in a sense the latest breakdown of the collective principles of the League, and will no doubt be one of the first to be made once more effective. In the meanwhile, it was possible to arrange for the continuation of the service on Swiss and Swedish holdings under the 1937 settlement up to October 31, 1942, and to March 31, 1942, respectively. Payments on the American tranche on the coupons due February 1st and August 1, 1941, were made directly in Sweden, Switzerland and Hungary in cases where they were held in those countries. It is reported that service has also been met on the Italian tranche, but this matter has lain outside the sphere of the Committee's interest. The new defaults during the period covered by the report are, of course, those of Estonia, Hungary and Greece. It should be clear to future foreign lenders that, whatever loans are subscribed for reconstruction at the end of the present conflict and are internationally sponsored, are secured essentially on the terms of the future peace settlement. The League Loans Committee was a by-product of the function of the League as an organ of world peace in whose breakdown its own failure was implicit.

Company Notes

ICI Earnings

The preliminary statement of Imperial Chemical Industries for 1941 shows a further decline of £256,321 in profit, after all taxation, other than tax on dividends. These are maintained, as was expected, by a final payment of 5 per cent on the ordinary capital, making 8 per cent as in each of the three preceding years, but the cover for the dividend has declined from 10.2 to 9.9 per cent. This calculation treats the appropriation to War Contingency Reserve

BANK OF LONDON & SOUTH AMERICA LIMITED

as being an addition to free reserves, but the cost of the pension fund is considered as an expense. The appropriation to the former fell from £339,262 to £300,720 and even so the carry-forward is reduced by £16,867, whereas a year before it received an addition of £200,926. The following table shows profits and their allocation for the past three years:—

	Years to December 31, 1939	1940	1941
Profits after tax†	9,313,485	8,418,533	8,162,212
Central obsolescence and depreciation	2,000,000	2,000,000	2,000,000
Preference dividends	1,666,104	1,666,104	1,666,104
Workers' pensions	180,049	180,092	180,106
Ordinary stock:—			
Earned	5,467,332	4,572,337	4,316,002
Paid	4,032,140	4,032,149	4,032,149
Earned %	12.1	10.2	9.9
Paid %	8	8	8
War contingency reserve	1,375,000	339,262	300,720
Carry forward	881,428	882,354	865,487
NDC and EPT paid by group, approx.	2,500,000	5,600,000	6,400,000

† Other than tax on dividends.
‡ Includes £375,000 to General Reserve.

Further particulars as to the earnings of the group will be available in the full report. Meanwhile, it is clear, from the fact that the charge for NDC and EPT rose by some £800,000 to about £6,400,000, that the gross amount available was considerably above that of 1940. This suggests, not only that there was a very material expansion in turnover for the Services, but that this, coupled with any rise in prices which was secured, more than offset the fall in export business, on which the profit margin is presumably high, and also the narrowing of the normal peace-time home demand. No doubt, further development of overseas subsidiaries has contributed to this result. The fall in available profit is presumably due in part to the higher rate of tax, and possibly to heavier depreciation and provision for overseas losses, such as that of the Japanese and Malayan concerns. The price of the £1 ordinary shares rose fractionally to 33s. cum dividend, giving a return of £4 18s. 6d. per cent, less tax at 9s. 8d.

BSA Accounts

Full accounts of Birmingham Small Arms, for the year to July 31st last, show a decline in profits after contingencies, fees and EPT from £1,289,144 to £1,196,053. The chairman, Sir Bernard D. F. Docker, attributes the decline to the necessity of paying EPT at 100 per cent throughout the period. Charges for income tax and depreciation are both lower, at £425,000 against £475,000 and at £430,815 against £474,521, respectively. There is, however, a liability of £150,000 against nil for war damage contribution, which is responsible for a fall in equity earnings from £261,725 to £115,320, representing 8.2 against 16.1 per cent. Ordinary stockholders receive 7½ per cent as before. There is no transfer to reserve other than to reserve for repayment of debenture stock, against £87,483, and the carry forward is reduced from £301,065 to £278,249.

	Years to July 31, 1939	1940	1941
Profits*	921,769	1,289,144	1,196,053

The consolidated account shows an increase in the excess of floating assets over creditors, contingencies, taxation and other current liabilities, from £2,344,129 to

COMPANY NOTICE

JOHN BEDFORD & SONS, LIMITED

Founded 150 Years

HAPPY indeed is the firm that on the 150th anniversary of its birthday can look back on years of prosperity, on an unbroken record of family association, on permanent contributions to the advancement of its trade, and on notable service to the community by its personnel.

Such is a summary of the history of John Bedford and Sons Limited, Lion Works, Mowbray Street, Sheffield, which came into being in 1792 as steel tilers at the rural village of Oughtibridge, seven miles north-west of Sheffield, on the banks of the River Don (which river flows through the city of Sheffield), and passed through various phases to emerge in 1871 as makers of crucible cast steel, engineering files, edge tools, engineers' and blacksmiths' tools, saws, machine knives, shovels, spades and forks—all basic lines of manufacture destined to make the firm world-famous.

John Bedford, the founder, was a landowner and yeoman farmer of ancient and honourable lineage in a direct male descent dating back to 1250, and it was to set his third son, John, up in business in the steel trade that he rented a forge operated by power derived from water wheels, driven by the River Don. By family inheritance and marriage this son amassed wealth and was able to give his son, the third John Bedford, the benefit of what was a most exceptional privilege in those days—a Continental education.

EARLY TRADE BOOM.

It was this John Bedford who founded the firm as we know it to-day. Returning to Sheffield a brilliant linguist, a man of polish, of outstanding personality, and a keen man of business, he decided, upon becoming head of the firm, to get a share of a trade boom then being experienced in Sheffield and other industrial centres of England.

In addition to keeping on the works at Oughtibridge, he opened others in Sheffield, but upon the re-arrangements of certain partnerships he took his name, capital, and business, out of the company, and in 1864 joined a John Bramall, as Bramall and Bedford, at works in Mowbray Street—the origin of the present extensive premises.

Soon John Bedford was again doing extensive trade with the Continent. Upon the outbreak of the Franco-German war in 1870, he went to France to safeguard his interests, and it is believed that he was the last Englishman to leave Paris before the famous siege, and the first to re-enter it after.

It was the dissolution of this partnership in 1871 which brings into review the fourth generation of Bedfords.

PUBLIC SERVICE

The mantle of public service fell chiefly on Henry Hall Bedford, the second of John's three sons, who not only succeeded his father as head of the firm, but as chairman of the Royal Infirmary, a position he held until his death in 1930.

Mr. Henry H. Bedford served as Master Cutler, President of the Sheffield Chamber of Commerce, Justice of the Peace, Town Trustee, Governor of the University, and director of the National Provincial Bank Ltd.

Associated with him in the business at this time were his brothers, John George Hawksley

Bedford and William James Bedford. In due course the three sons of these three brothers came into the concern to prove worthy representatives of the fifth generation.

The three cousins served with distinction during the 1914-1918 war. Mr. Kenneth Savile Bedford (only son of Mr. J. G. H. Bedford) was killed in action, but Mr. John Bedford (son of Mr. H. H. Bedford) and Mr. Reginald A. Bedford (only son of Mr. W. J. Bedford) who was gravely wounded in France, were spared to return to carry on the family tradition.

Mr. John Bedford relinquished the position of managing director in 1935, but remained a director.

Mr. Reginald Asline Bedford is now chairman and managing director.

As this year is the bi-centenary of Benjamin Huntsman's revolutionary discovery that steel could be made from iron by liquid melting, it is of interest to note that Mr. Reginald A. Bedford is a direct descendant on the distaff side of Thomas Asline, who financed Huntsman in return for a half partnership (Huntsman and Asline) in the business which first produced crucible steels. Sheffield, with its varied steel industries, undoubtedly owes its growth and fame to Huntsman's discovery.

Thomas Asline Ward (the grandson of Thomas Asline) was in his day and generation an outstanding leader of both the public and social life of Sheffield.

TRADE FEATURES

So much for personalities in this survey of a century-and-a-half of industrial experiment and progress: the practical side presents equally notable features. From that day in 1871 when the grandfather of the present generation put up the plate "John Bedford & Sons," the firm has never looked back or stood still. It has made history with several of its products, the most notable being in the specialised production of hollow rolled bars (completely distinct from tubes) for all kinds of mining and industrial purposes.

The novel methods evolved have, since the world patent rights expired, become recognised as international standard practice.

The Company has a continued policy of growth and expansion, in accordance with its financial resources, with one view in mind of being self-contained, and in its group of factories, under central control, is now manufacturing a wide variety of highly specialised steel and steel tools of the finest quality.

The manufactures in its group of factories and departments are all serviced by the Company's rolling mills, tool making, engineering and electrical sections and metallurgical laboratories, in addition to which the Company has evolved and produced on its own premises a considerable number of varied specialised machines to produce and improve the manufacture of its various products.

Associated with Mr. Reginald A. Bedford and Mr. John Bedford on the Board of Directors, are: The Earl of Denbigh, Mr. Frank Stratford (also secretary to the Company), Mr. Arthur Waterhouse and Mr. David G. Reid.

This announcement is the copyright of John Bedford and Sons, Limited, Lion Works, Sheffield, 8.

£2,040,220. There is a jump in the latter item from £4,666,062 to £7,997,793, while debtors are some £2,500,000 higher at £5,633,973. The chairman points out that while there has undoubtedly been some expansion in debtors and creditors, the balance sheet figures are swollen by exceptional amounts outstanding which have now been cleared off. Stocks of the group as a whole are up from £3,344,584 to £4,063,285, while those of the company have risen from £1,434,056 to £2,215,614. The chairman reports progress in the important field of effective standardisation of the production of special steels. The export trade of pedal and motor cycles has, of course, been restricted since the introduction of Lease-Lend. The £1 ordinary stock, at 21s. 1½d., yields £7 2s. per cent.

Cement Preliminaries

The preliminary results of *Associated Portland Cement* and its controlled undertaking *British Portland Cement* reveal that the decline in profits, which dates from the outbreak of war, continues. Subject to audit, *Associated* states that, after repeating the depreciation allowance of £417,150 and increasing the debenture sinking fund allotment by some £3,000 to £96,158, net profits total £499,820 compared with the £539,648 earned in 1940. The ordinary dividend is, therefore, reduced from 10 to 9 per cent by a final of 6½ per cent. Assuming that the gross preference payment remains unchanged at £137,500, the equity payment is barely covered by earnings of £362,320 against £402,148 in the previous year. The gross payment of £360,000 on the equity, which compares with £400,000 last year, permits a slight addition of £2,320 to the carry-forward, raising it to £217,648. Assuming that in view of the continual reduction of the debenture debt, the interest payment is some £4,000 lower than last year's £147,298, and that fees are practically unchanged at £3,250, it would appear that the total profit is only some £40,000 lower than the total disclosed profits of £1,200,348 in 1940. This fall approximates to the reduction in the gross amount received from *British Portland*, and seems to suggest that *Associated* has contrived to avoid the fall in its own income which has been widespread in the industry. *British* results show a decline in net earnings from £452,641 to £403,134, calculated after a depreciation provision of £260,000 in both years, and debenture sinking fund requirements, which exceed by £555 the previous year's sum of £11,999. After meeting the preference dividend, earnings for the equity, at £302,334 against £351,841, again only cover by the narrowest margin the gross dividend payment, which is reduced from 17.5 to 15 per cent and requires £300,000 against £350,000. The carry forward is thus raised slightly from £222,400 to £224,734. While these results exceeded the market's hopes, the recent decline in building material shares is by no means unjustified in view of further possible restrictions and the fact that defence demands have long passed their zenith. At 45s., the £1 ordinary stock of *Associated Portland* yields £4 1s. 2d., and *British Portland* at 75s., £4 1s. 1d., which suggests that any post-war recovery prospects are fully discounted.

Paint and Varnish Results

Preliminary results of two leading paint and varnish manufacturers, *Pinchin, Johnson* and *Indestructible*

Paint, show a relative stability of net profits. Those of *Pinchin, Johnson*, in 1941, were reduced from £330,347 to £310,859, but the decline is matched by the writing down of stocks in enemy countries by some £19,000. Net profits of *Indestructible Paint* in the same period are reduced only from £38,045 to £37,400, but it appears probable that these results are before taxation, in which case the fall in surplus earnings may be more severe. In any case, the management has found it possible to maintain the total payment on ordinary capital at 20 per cent, a rate which in the previous year was covered by earnings of 22.9 per cent. Ordinary shareholders in *Pinchin, Johnson* receive 8½ per cent as before and the carry-forward is raised from £150,983 to £151,772. Consequently, the amount of equity earnings may be estimated at £78,404 against £115,250, after tax on dividends in both cases, representing 8.6 against 11.5 per cent. If this is the correct interpretation, only a narrow margin is left for the ordinary dividend. It is probable that the virtual cessation of the export trade and the rise in manufacturing costs, coupled with shortage of raw materials, is endangering dividend payments. The industry has, however, a solid source of demand in a rising total of Government orders, even if net profits show no increase during the remainder of the war. The *Pinchin, Johnson* 10s. ordinary shares, at 20s. 6d., ex dividend, yield £4 2s. 11d. per cent. The £1 ordinary shares of *Indestructible Paint*, at 81s. 3d., yield £5 per cent.

Selfridge Accounts

The full accounts for the year to January 31, 1942, of the reconstituted Selfridge group, whose preliminary statements were discussed in *The Economist* of April 11, unfortunately do not greatly illuminate the movement in earnings last year. The chairman, Mr. H. A. Holmes, suggests that the trading profit of the operating company, *Selfridges Limited*, which amounts to £296,758, is struck after a considerable undisclosed provision for deferred repairs and maintenance. Net war damage contributions, which amount to £33,290, are, however, charged against capital reserve, as are expenses of the scheme of arrangement and discount on the 4½ per cent Prior Lien Debenture Stock. After adding to capital reserve a further £8,000, being profits relating to the period prior to the incorporation of the company, this fund stands at £1,074,639 against £1,339,339. The net surplus of the (Holdings) company of £14,179, to be set against the deficit carried forward of £14,179, which is thus reduced to £2,840. There is, of course, a credit carry-forward of £24,970 in the accounts of the operating company. The balance-sheet of *Selfridges Limited* shows a surplus of floating assets over current liabilities of £690,650, against £687,021. In the accounts of *Holdings Limited*, losses in suspense total £1,686,473. The chairman provides a clue to the unexpectedly satisfactory nature of last year's profits in drawing attention to the resilience of consumption demand, based on higher individual earnings, and to the continuance last year of buying for stock. He rightly draws attention to the inevitable further reduction in retail turnover which the prosecution of the war entails. The £1 6 per cent cumulative preference stock—free of tax up to 6s. in the £—stands at 6s. 3d.

Industry and Trade

The Last Ounce

The seventh and eighth reports from the Select Committee on National Expenditure (Session 1941-42), summarised on page 498 of *The Economist* of April 11th, contain proposals which fall into three parts. First, the Committee suggests that there is room for further improvement in the distribution of able-bodied men and women between the fighting Forces and civilian occupations and, within the latter, between war workers and those ministering to the essential needs of the people. There are still numbers of people who are only partly occupied; some 188,000 are unemployed; and many more are employed on work which is either of no essential value or could, by improved organisation, be accomplished with less labour.

In order to secure the right kind of balance between the fighting Forces and civilian occupations, and between the various categories of civilian workers, the Select Committee advocates the appointment of an independent man-power committee responsible only to the War Cabinet. And as a means to securing the maximum contribution to the war effort of individual citizens, the Committee submits a number of recommendations designed to speed up the recruitment of women as full-time or part-time workers, to improve methods of training and up-grading, to reduce absenteeism, and to prune still further the number of workers in the consumption goods and service industries. Secondly, the Select Committee is of opinion that output is lost by faulty organisation. Not enough attention is paid to the advantages of specialisation in the distribution of

contracts or to the need for directing them to the most efficient factories; the distribution of sub-contracts is faulty in that it does not ensure the full and continuous working of the smaller factories; main contractors are not sufficiently well informed about the Government's programme or consulted about designs with the resulting lack of continuity of work; there is not enough supervision of non-essential firms; and not enough importance is given to the need for efficient management. The Select Committee therefore suggests that efforts to correct these faults must be speeded up. There is no short cut to efficiency, but much could be done by closer control at the centre and more devolution of responsibility at the periphery. Lastly, the Committee points out that the successful solution of the first two problems, the achievement of a proper balance in the use of the country's manpower and of greater efficiency in production depends to a large extent on planning. While admitting the need for flexibility, the Committee was left with the impression that "the whole production effort has, till now, carried with it too much of the stamp and character of improvisation." The two reports are among the best yet produced by the Select Committee; they deal with the problem as a whole and contain suggestions which deserve careful and unbiased examination by the new Ministry of Production.

Post-War Building

Like many other trade associations and interests, the National Federation of Building Trades Employers has decided to set up a commission to consider the problems of their industry after the war. In announcing the decision, Mr. Thomas Howarth, president of the Federation, said that among the post-war problems to be considered by the commission is the recruitment of labour, the prevention of overcrowding in the industry with the consequent danger of ups and downs in employment, and the relative advantages and disadvantages of competition or Government control in the industry. As Mr. Keynes recently pointed out in a broadcast on post-war planning, the national building programme after the war must be properly proportioned to the resources which are left after daily needs have been met,

and after enough exports have been produced to pay for essential imports. How large this surplus will be, and how much of it should be devoted to building, it is difficult to estimate at this stage. There is good reason to believe that it will be substantial and adequate for a large building programme. But it must be remembered that the demands upon this surplus will be manifold, and that the rate at which the standard of living can be raised after the war will depend largely on the efficiency with which the various requirements can be met. Thus, the smaller the resources required to carry out a given building programme, the larger will be the resources that can be devoted to other purposes. It is by an increase in its efficiency that the building industry can make the biggest contribution to post-war progress; it is to be hoped that the commission of the Master Builders' Federation will concentrate on this aspect of the problem rather than on the wider economic issues which will be decided on a broader plane. The various federations and associations in the building industry might with advantage co-ordinate their views on the technical aspects of post-war building, through the Building Industries National Council, for example; together they might do much in bringing about a substantial improvement in design, methods and efficiency.

Allied Rubber Supplies

The policy of ensuring adequate rubber supplies for essential purposes in Great Britain and in the United States is gradually being translated into action. Besides the strict curtailment of consumption for civilian purposes, which includes new and stringent tyre-rationing schemes in both countries, steps are being taken to expand the output of natural rubber in countries still accessible to the United Nations, as well as the production of reclaimed and synthetic rubber. As was pointed out at the annual meeting of the Ceylon Association last week, the rubber plantations in that country have postponed their replanting programmes and are concentrating on raising current production. The Ministry of Supply has offered substantial cash bonuses for any rubber produced in Ceylon in excess of 90 per cent of the standard quantities fixed under the international

UNION CORPORATION, LIMITED

(Incorporated in the Union of South Africa.)

ABRIDGED REPORT OF THE DIRECTORS.

In submitting to the Shareholders the Accounts of the Corporation for the year ended December 31st, 1941, the Directors state:—

The Accounts are drawn up in Union of South Africa currency, United Kingdom currency being taken at par.

The profit for the year is £221,380 14s. 9d., plus £122,150 13s. 6d. brought forward, making a total of £343,531 7s. 9d. A final dividend of 5s. 6d. United Kingdom currency per share was declared absorbing at par £423,500, making, with the interim dividend of 2s. 6d. per share, a total distribution of 8s. 6d. per share, or £616,000 for the year, leaving £127,531 7s. 9d. to be carried forward.

Holdings of Shares, Debentures and other securities have been taken into the Accounts at cost or under, but in no case above the market price of December 31st last, or, where no market price exists, above the Directors' valuation. At present market prices, these holdings show a very substantial surplus over the amount at which they stand in the Balance Sheet. The Directors, as on other occasions, have thought it expedient to provide for contingencies by reducing the book cost of certain holdings both below cost and below market price.

GOLD INTERESTS.

A summary of the operating results for the past year of the five gold mining companies operating in the Witwatersrand in which the Corporation is largely concerned is given below and is based on the market price for gold at 168s. 0d. per oz. fine:—

	East Geduld Mines	Geduld Proprietary Mines	The Grootvlei Proprietary Mines	Marievale Consolidated Mines	Van Dyk Consolidated Mines
Tons milled Dec. 31st, 1941	1,932,000	1,358,000	1,496,000	591,500	1,183,100
Yield per ton	48s. 5d.	48s. 1d.	45s. 1d.	44s. 8d.	43s. 6d.
Working Costs per ton	16s. 7d.	19s. 5d.	23s. 2d.	30s. 2d.	25s. 8d.
Working Profit per ton	31s. 10d.	29s. 7d.	21s. 11d.	14s. 6d.	16s. 10d.
Total Working Profit	£3,075,000	£1,440,000	£1,638,000	£229,000	£297,000
Dividends (Totals & per share)	£1,125,000 (12/6)	£986,078 (13/6)	£571,941 (4/0)	£225,000 (1/0)	£481,250 (1/9)
Ore Reserves:					
Tons	16,000,000	8,800,000	10,000,000	2,500,000	3,100,000
Value, dwt.	5.2	4.4	5.2	5.9	5.2
Stoping Width, ins.	59	53	45.5	38	39

The Working Profit figures include the amounts due to the Union Government for taxation and under government lease agreements, but exclude revenue from sources other than gold mining operations. Thus East Geduld Mines 1941 dividend income on its shareholding in The Grootvlei Proprietary Mines was £26,800 and Geduld Proprietary Mines 1941 dividend income on its shareholdings in East Geduld Mines and The Grootvlei Proprietary Mines amounted to £431,500.

ORANGE FREE STATE.—Western Holdings, Limited, with whom the Corporation is collaborating, has entered into the Prospecting and Mining Lease Agreement referred to in last year's Annual Report. Investigation by Western Holdings, Limited, of the area north of the original area has been completed without any discoveries being made.

OTHER INTERESTS.

BAY HALL TRUST. The dividend for 1941 was unchanged at 6½ per cent., leaving a credit on Profit and Loss Account of £75,945. At December 31st last, the investments, at their current market prices, amounted to £2,050,999 as compared with their book cost of £1,877,630.

BRITISH ENKA.—In spite of many handicaps, the Company was able to maintain the high quality of its production and to earn a modest but improved profit.

SAN FRANCISCO MINES OF MEXICO. For the year ended September 30th last, the Net Profit was £103,612, comparing with a loss for the previous year of £15,845. A dividend of 9d. per share has been paid.

SELECTION TRUST.—For the year ended March 31st, 1941, this Company paid a dividend of 9d. per Ordinary Stock unit.

SOUTH AFRICAN PULP AND PAPER INDUSTRIES.—Profit for the year, after providing for depreciation, was £91,023, which compares with £10,629 for the previous year and converts an adverse balance of £74,374 standing to the debit of Profit and Loss Account into a credit of £16,649.

ULTRAMAR COMPANY.—Oil concessions in Venezuela are being explored through two Venezuelan operating companies on joint account with Texas Corporation. A highly satisfactory oil-strike has been made recently in a well known as Mercedes No. 2 on one of the concessions in Guarico State.

RHODESIA AND WEST AFRICA.—The Mufilira Company and, in turn, Rhodesian Selection Trust, were unable to pay dividends owing to heavy taxation. The Roan Antelope dividend was reduced to 6d. per Ordinary Stock unit. Consolidated African Selection Trust repeated its Ordinary dividend of 6d. (free of tax) per Ordinary Stock unit.

COPIES OF THE FULL REPORT AND ACCOUNTS CAN BE OBTAINED ON APPLICATION AT THE LONDON OFFICE, PRINCES HOUSE, 95, GRESHAM STREET, E.C.2.

control scheme; exports in the first quarter of this year, at 35,496 tons, were nearly twice as high as during the corresponding period in 1941. An intensive production drive has been started in tropical Africa, where the Ministry of Supply is offering attractive f.o.b. prices as a stimulus. The American Government has concluded an agreement with Brazil by which the whole of that country's rubber surplus during the next five years will be at the disposal of the United States; to stimulate output, the United States has provided a development fund of \$5,000,000, and is paying a premium for any rubber produced in excess of 5,000 tons per year. Similar arrangements are now under discussion with other Latin American rubber producing countries. The rubber reclaiming industry in the United States has initiated an expansion programme, and a number of new reclaiming works are under construction in this country. The United States now envisages an output of 700,000 tons of synthetic rubber per year. The provision of the requisite facilities, which will be assisted by the freeing of the Standard Oil patents, is expected to take some 18 months, and will be carried out by 25 chemical, oil, and rubber concerns. Canada, too, has started the development of a synthetic rubber industry. A Government-owned company, the Polymer Corporation of Toronto, has been formed, and has formulated plans for the erection of four works of an aggregate capacity of 35,000 tons of synthetic rubber, equivalent to Canada's normal consumption. Like the plants in the United States, the Canadian works are to be in operation before the end of 1943. The plans of the British Government, if formulated, have not been made public, though Mr C. V. Pear, Joint Parliamentary Secretary to the Ministry of Supply, stated early in April, "we are also developing the synthetic process."

Motor Tyres

Owing to the threat to Ceylon (the only large source of natural rubber still available to the United Nations) the need for economising stocks, pending the expansion in the production of synthetic rubber, is more urgent than ever. The restriction on the supply of motor tyres which came into force on April 4th is therefore to be welcomed as a measure necessary for the conservation of rubber supplies. The new scheme provides that owners of private cars will be able to purchase new tyres only if they have been allowed a supplementary petrol ration, and that users of commercial

To Holders of Bonds of the

PROVINCE OF CORRIENTES 6 PER CENT. EXTERNAL GOLD LOAN OF 1910

As Agents for The First National Bank of Boston, Buenos Aires Branch, which is acting for account of the Government of the Province of Corrientes, we offer to purchase Bonds of the above Loan at the following prices:—

£100 for each Bond of £100 of original capital plus £65 (less Income Tax) for accrued interest; £20 for each Bond of £20 of original capital plus £13 (less Income Tax) for accrued interest.

Furthermore Interest calculated at the rate of 3.1347 per cent. per annum will be paid, less Income Tax, on the amounts of £165 and £33 from the 10th September 1941, to the date of liquidation.

The Bonds must have attached Coupons dated 1st August 1919, to 1st February 1925 inclusive, and be stamped with collection of the distributions effected in accordance with the Judgment of the Supreme Court of Justice of the Argentine Republic.

In order that this offer should be on a basis corresponding with that made in January 1942 to Holders residing in the Argentine Republic it is a condition of this offer that the gross amounts of distributions made in respect of any Bond subsequent to the Fourth distribution shall be deducted from the amount payable for such Bond.

Bondholders who desire to accept this offer must deliver their Bonds to Erlangers Limited listed on the special forms which are obtainable on application at their office. Payment will be effected as soon as possible after the necessary remittance has been received from The First National Bank of Boston.

A commission of one-eighth per cent. calculated on the purchase price will be allowed in respect of acceptances bearing the stamp of a recognised Banker, Broker or Agent.

This offer applies only to Bonds bearing the English Revenue stamp and any acceptance of such offer must comply with the Defence (Finance) Regulations.

This offer will expire on Tuesday, May 12th, 1942.

ERLANGERS LIMITED.

4 Moorgate, London, E.C. 2. 13th April, 1942.

vehicles must prove that they need them for essential purposes. Moreover, the opportunity has been taken to secure economies in the production of tyres by standardisation, and to simplify their distribution by a reduction in the number of depots. Some 1,200 depots have been selected by the Ministry of Supply from existing dealers; all other dealers must suspend their tyre business and surrender their stocks for cash. Users of commercial vehicles must register with an authorised dealer. The reorganisation of distribution should facilitate the control of sales and of prices; unauthorised dealings in tyres are to be subject to the same penalties as other black market transactions. The scheme provides the machinery for limiting sales to essential purposes, but its success will depend on the stringency of the test applied to applications for new motor tyres. Bicycle and motor bicycle tyres will continue to be available in limited quantities through normal trade channels. Meanwhile, experiments with steel tyres fitted to farm carts and trailers, carried out at the request of the Joint Standing Committee of the Agricultural Engineering Association, appear to have been successful; it is hoped that the data secured will assist in the design of a standard wheel capable of mass-production. For road vehicles, steel tyres are less suitable, especially as surfaces are not constructed to withstand the heavy wear involved by their use.

Vegetable Marketing

After a year's working the National Vegetable Marketing Company, Ltd., is to be wound up. It was formed to encourage the production of carrots and onions and to control their distribution. The Ministry of Food was represented on the company, which acted in fact as an extra department of the Ministry. Potatoes had been left in the hands of the Ministry since the Potato Control Scheme began in February, 1940. During the time the Ministry has Marketing Company has been in existence, the Ministry has widened the scope of its activities in the acquisition and marketing of potatoes. The administrative machinery which has been evolved for potatoes can be extended to include paratively small cost and with little inconvenience to include carrots and onions. Thus, the necessity for a separate organisation to deal with these vegetables no longer exists, and accordingly the National Vegetable Marketing Company is to be wound up as soon as its operations in connection with last season's crops have been completed. Growers' prices will be fixed for both carrots and onions; for carrots markets will be guaranteed, and for onions the Ministry is to arrange for an equitable distribution of the crop. It is to be hoped that the Ministry's enlarged vegetable control department will be able to solve the problem of pricing and equitable distribution of perishable vegetables.

Retail Wage Agreement

Another National Joint Industrial Council dealing with wages and conditions of labour in retail trade has reached agreement. The agreement, which was ratified on April 10th, concerns the retail bookselling, newsagency, stationery, tobacco and confectionery trades, and becomes operative on May 18th. No wage rate has yet been agreed for branch managers. Rates for other workers are the same as those which have already been fixed in other branches of retail trade. In London the minimum weekly wage for male workers aged 16 is 21s. 6d., rising to 65s. at 25; for female workers will receive 19s. 6d. at 16, rising to 43s. at 24. Provincial A (towns with a population of 10,000 or more) rates are 3s. a week less in all cases and Provincial B rates, 5s. a week less than in London. The rates for "male employees (excluding craftsmen, productive staff and transport workers) employed in or about the business of a shop for a substantial part of their time but not otherwise provided for" in the agreement, are to be paid 1s. less than the others. The rates are for a working week of 48 hours (exclusive of meal times) and subject to a daily allowance of not more than 30 minutes for clearing up and clearing the shop of customers. Other conditions, such as provisions for holidays, are similar to those laid down in other branches of the trade, which were described in *The Economist* of July 5th, October 4, 1941, and January 31, 1942. Both sides of the JIC are co-operating to regulate and control street trading; to eliminate all forms of selling, such as club trading and discount schemes, and other trading methods which they consider unfair and irregular; and to establish uniformity of hours during which particular commodities are sold.

COMPANY MEETINGS

HALIFAX BUILDING SOCIETY

STRONG LIQUID POSITION

SIR EDWARD WHITLEY'S REVIEW

The eighty-ninth annual general meeting of this society was held, in Halifax, on the 13th instant.

In moving the adoption of the report and statement of accounts for the year ended January 31, 1942, Brig.-Gen. Sir Edward N. Whitley, KCB, CMG, DSO, DL, the president of the society, said:—

The accounts show little important change but emphasise the tendency to a reduction of the funds due on mortgages and an increase in trustee investments.

We have received as interest from borrowers £280,000 less than last year owing to the reduced amount on mortgages and this is set off only to the extent of £100,000 by increased interest from investments and bank interest. We have had to pay £200,000 more in income-tax and NDC and have made provision for a sum of £200,000 for war damage contribution indemnities.

To enable the Society to meet these heavy charges we have, with great regret, had to give notice for the reduction of interest on deposits and shares. The board recognises the hardship which the reduction causes to many members, especially to those who have only fixed incomes, and they would gladly have avoided this if it had been possible, but it must be pointed out that after the reductions the gross yield to shareholders who are liable to income-tax at the full standard rate of 10s. in the £ is equivalent to 44 10s. per cent. subject to tax, and the great strength of the society is shown in the Balance-sheet, to which I now invite your attention.

STRONG POSITION

The reserve funds and undivided profit now exceed six million pounds, and the liquid funds, represented by British Government securities and loans to local authorities together with the cash in the banks and in hand amount to £29,839,323, or more than one-quarter of the whole of the investing share and deposit funds. Withdrawals during the year are the lowest for five years and we received from our borrowing members in repayment of their mortgages more than we have been able to employ in fresh advances which has enabled us to invest further amounts in Government securities, bringing the total to £5,323,169. In addition, we have channelled £3,776,305 into Government securities on behalf of members. We have made special provision for the sale at head office and daily branches of war savings certificates and bonds to members who wish to buy them.

WAR DAMAGE CONTRIBUTION

The Society, like all other owners of property, has to pay war damage contribution in respect of its office premises, but in addition we have under the Act to indemnify certain of our borrowers against part of the money which they have paid in respect of property in mortgage to us. The cost is certainly heavy, but we have to take the burdens as well as the benefits of the Act and you will I am sure agree that it is worth a great deal to know that in the event of damage to any of our securities or property by enemy action either the property will be repaired or there will be a value payment at the end of the war.

The amount owing on mortgages has been reduced during the year to ninety-four million pounds as compared with one hundred million pounds a year ago, and the average amount now owing on each mortgage is £390 as against £403. We have advanced close on one and a half million pounds during the year. We hope that in the present year we shall have suitable applications for a much larger sum, not only because it is a more profitable way of using our funds but also because that is the original purpose of the building society movement, and there is at present more activity in the buying and selling of property than there was a year ago. Our borrowing members have once again shown their keen desire to honour their obligations and they are for the most part keeping up their payments wonderfully well in spite of the difficulties caused by the war.

It is perhaps rash to forecast the value at that time of houses such as constitute many of our securities, but it does seem probable that they will all be worth more than when they were bought. At

present, fantastic prices are being asked and paid in some districts for houses with vacant possession, and it is clear that already there is a shortage of houses, and that shortage will grow each year even if we suffer no more large air raids, a thing on which it would not be wise to count. The problem of housing at the end of the war is one of the most important that face the Ministry of Reconstruction.

PROBLEM OF POST-WAR HOUSING

The problem will have to be looked at both from a short term view of the immediate need of houses and a long term view of the re-planning of many of our overgrown cities. The magnitude of the immediate need may be judged from the estimate which has been made that to complete the slum clearance schemes held up by the war, to overtake the deficiency in the normal number of new houses caused by the cessation of house building since 1939, and to replace the houses destroyed by enemy action will require a million new houses for each year that the war goes on, and I would remind you that in the twenty years from 1919 to 1939 not more than four million houses were built.

Of those four million houses one million were built by local authorities, about half a million by private people with State subsidies, and the rest, 2,500,000, were built by private enterprise without any public help. A large proportion of these last-mentioned houses were financed through the building societies and it is obvious that in solving the problem of housing after the war, the building society movement will have to play a large part. I am happy to say that the Council of the Building Societies Association under the chairmanship of Mr D. W. Smith is already preparing to fulfil this task. A committee of which Lord Sankey has consented to be chairman, has been set up to consider building society policy in relation to the post-war period both in its broader aspects and in relation to its practice and procedure. I have been honoured with an invitation to become one of the members of this committee and I look forward with great pleasure to taking part in this important work.

The recommended allocation of a bonus of 5s. per cent. to paid-up shareholders Class 1, and to monthly subscription investing shareholders was confirmed.

TELEGRAPH CONSTRUCTION AND MAINTENANCE COMPANY, LIMITED

WORKS FULLY OCCUPIED

The seventy-eighth ordinary general meeting of the Telegraph Construction and Maintenance Company, Limited, was held, on the 14th instant, in London, Mr Colin F. Campbell, the chairman, presiding.

The following is an extract from the statement of the chairman, circulated with the report and accounts:—

The balance of the trading account amounts to approximately £148,000, compared with £103,784 in the previous year, and, after putting aside approximately £93,000 to meet taxation, the balance remaining is £50,825. An interim dividend of 5 per cent. was paid in July last and the board now recommend a final dividend of 5 per cent., making a total for the year of 10 per cent., the same as for 1940, leaving £40,571 to be carried forward to the next year's account.

With a steady increase in capital expenditure and the 100 per cent. tax on excess profits many companies are naturally faced with difficulties regarding ways and means. It is not uncommon to see a balance-sheet with large paper profits accompanied by very heavy bank overdrafts. Your company has managed to avoid that situation so far, but, while we do all that is possible to maintain cash reserves, the excess profits tax precludes us from adding to the general and contingency reserves, which will be required to meet urgent demands for replacement of plant and machinery in the future.

The Selborne Estate in Malaya, which after many years of nursing was beginning to give good results, has now passed into enemy hands. The European staff, which consisted of the manager, Mr. Hartfield, the engineer and an assistant, left the estate some time ago after dismantling the main plant and removing the electric motors. They arrived in Singapore, but since the loss of that city we have had no further news except that their wives and families were successfully evacuated to Australia.

The report and accounts were unanimously adopted and a hearty vote of thanks was passed to the chairman, directors and staff.

THE SCOTTISH PROVIDENT INSTITUTION

SATISFACTORY RESULTS

At the one hundred and fourth annual general meeting held, on the 14th instant, in Edinburgh, Mr A. H. Bowhill, the chairman, said:—

The report and accounts are satisfactory and the funds at £25,292,140 show a reduction of only £34,160. The new business, 1,548 policies for £1,069,308, is smaller, the reduction being mainly due to war conditions.

The premium income, £1,236,597, is down by £97,000, due largely to the drop in single premiums and annuity business.

The interest revenue represents a return on the total funds, including the investment reserve fund, of £4 4s. per cent. gross or £3 3s. 4d. per cent. net as against £4 5s. 10d. and £3 4s. 9d. per cent. in 1940.

Claims by death, £981,118, are less by fully £40,000. Although including £93,737 due to war causes they are only 88.3 per cent. of the estimated amount.

All the other items of expenditure are down. The marked reduction in surrenders betokens a greater appreciation of the value of assurance under present conditions. Such appreciation might well, however, be shown to a greater degree in the selection of a policy at the outset. Too much emphasis is laid on the investment element of short-term endowment assurance and too little on the valuable protection afforded by a whole-life assurance. To provide the latter is still the chief purpose of the Scottish Provident Institution and a policy under the distinctive system the best means of securing it. Such a policy is, moreover, particularly adapted to present conditions.

The main feature of the assets side of the balance-sheet is the increase of nearly £500,000 in the Institution's holding of British Government securities in accordance with its policy of supporting the war loans to the utmost. Its holding of such securities approximates to 34 per cent. of the total assets.

The assets show a substantial margin over their amount in the balance-sheet after taking into account the investment reserve fund. The report and accounts were unanimously adopted.

TELEPHONE AND GENERAL TRUST, LIMITED

EFFECT OF EPT

The annual general meeting of the Telephone and General Trust, Limited, will be held, on the 20th instant, in London.

The following is an extract from the statement by Sir Alexander Roger, KCIE (chairman and managing director), circulated with the report and accounts:—

The profit amounts to £107,960, compared with £114,287, a decrease of £6,325. A final dividend of 5 per cent. is proposed to be paid on the ordinary stock, making 8 per cent. for the year, together with a dividend of 8 per cent. on the "A" ordinary shares, all subject to tax. All outgoings have been met out of the earnings for the year, together with a surplus of £1,302. But for the crippling effect of EPT on one of our associated companies, the results for 1941 would have been the best ever submitted.

Of the total investments of £2,527,326, £737,458 represents unquoted investments and loans mainly in telephone undertakings in

the British West Indies and foreign countries. There is a depreciation of 2.88 per cent. on the total, as against 10.6 per cent. in December, 1940. Of the investments, 78.99 per cent. is in Great Britain and the Empire, and 21.01 per cent. in foreign countries. Government stocks, debentures and loans amount to 15.57 per cent.; preference stocks to 15.20 per cent., and ordinary stocks to 69.23 per cent.

In spite of war difficulties the business of the Anglo-Portuguese Telephone Company is being well maintained. We are substantially interested in the Nacional Telephone Company of Venezuela through Telephone Properties, Limited. The Nacional Company continues to do well. Owing to the incidence of the EPT legislation the position has arisen whereby dividends payable to the ordinary shareholders of Telephone Properties have ceased for at least two years, and they and we are deprived of our just and modest reward for our part in the building up of the Nacional Company. The incidence of a flat EPT without sufficient regard to economic or political circumstances justifies re-examination by Parliament, which wants no more than we want—a square deal.

BIRMINGHAM SMALL ARMS COMPANY, LIMITED

SIR BERNARD DOCKER'S STATEMENT

The adjourned ordinary general meeting of the Birmingham Small Arms Company, Limited, will be held on the 21st instant in Birmingham.

The following is an extract from the statement by the chairman, Sir Bernard D. F. Docker, KBE, circulated with the report:—

The total available profit is £1,007,780. Out of this sum the large allocation of £425,000 has to be made for income-tax. The margin of profit left at our disposal is further reduced this year by the contribution under the War Damage Act of £150,000. Under all circumstances it has been impossible for us to add to the reserve fund with the exception of £32,567, being the sum required to cover the debenture stock redeemed. After payment of the preference and interim dividends and 7½ per cent. on the ordinary stock, there remains £278,249 to carry forward.

The profit on trading and income from investments at £777,26 compares with £825,972 last year. This reduction is largely due to the incidence of EPT. Before arriving at the profit there has been charged for depreciation £430,815 compared with £474,52 last year. In these times considerable provision under this head is very necessary.

I cannot tell you all that our enthusiastic and capable team are achieving. They are doing a grand job; they never spare themselves and are making a maximum contribution to win the war.

It is for obvious reasons impossible to go into the activities of our group. Exports are not now permitted to certain countries, but we have instituted methods by which close contact will be maintained with all our distributors and orders are already on the books for execution when facilities for export are re-established. The constant application of research and technical control to our products goes on and is every day justifying the concentration which we have paid to this aspect of special steel production. In spite of the very great efforts we have been making towards the vigorous prosecution of the war, we have kept well in mind the great importance of seeing to it that when the war is won the equally important task of winning the peace is achieved.

THE ALEXANDRIA WATER COMPANY, LIMITED

PAYMENT OF DIVIDEND.

NOTICE IS HEREBY GIVEN that a dividend of Ten Shillings and Six Pence per £5 Share will be paid without deduction of British Income Tax but less Egyptian Government Tax at 10½ per cent. making 9s. 4.77d. net on Coupon No. 107 on and after the 15th April, 1942, at the National Bank of Egypt in Alexandria at Rue Toussoun, or in London at 6 King William Street, E.C. 4.

Net Profits for the year ended 31st December, 1941, £159,600. (Last year £163,800.)

Dated, Alexandria, Egypt, the 9th April, 1942.

By Order of the Board,

T. D. KEY,

ROBERT WALTON,

Joint Managers.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

DESPITE the disappointing conclusion to the Indian discussions, the naval losses and further withdrawals in Burma, the only effect on the markets was a slight contraction of business, prices generally remaining steady. The Budget, which, until announced, acted as a further deterrent to activity, failed to arouse any particular interest. The gilt-edged market, however, was rather more active than other sections with gains of ½ to 1½ spread over both short and long dated issues as prices steadily improved. In contrast, the foreign bond market was particularly quiet. Apart from a few small gains among Brazilian stocks and some weakness in Chilean bonds on Monday, prices were generally unchanged, while the 6 per cent Corrientes loan was marked up sharply on the announcement of the Government's redemption offer. Quiet business in the home rail market failed to affect prices to any marked degree, although the slight improvement in turnover on Tuesday extended to the junior stocks and raised GW ordinary and Southern deferred ½ point. Steady investment support for some of the senior preference stocks generally left prices unchanged. The foreign rail market, however, was dull with Argentine stocks weaker on some light selling, although losses were restricted to ½ point. After the Budget the gilt-edged market was even firmer, War Loan 3½ per cent touching a new high for the year.

Narrow price fluctuations without trend reflected the general tendency in the

industrial market to await events, in particular the Budget, although this had little noticeable effect on quotations. Brewery shares were without interest prior to the Budget, and prices showed little change after the event. The motor and aircraft group, however, showed a slightly easier tendency, De Havilland losing ½ on Monday while Leyland Motors and Lucas both suffered small losses. Changes in the heavy industrial group were restricted to a few pence, but most movements were upward, while shipping shares enjoyed some slight improvement, Indo-China deferred gaining ½ at the reopening. Apart from a slight improvement in Courtaulds on renewed rumours of the Viscose settlement, textile shares were unaffected by the small volume of business. Tobacco issues were weak at the week-end on Budget fears, Carreras "A" falling ½, and Imps ½, but the early part of the current week witnessed a slight improvement, Imps rising ½ on Tuesday, although BAT declined a further ½. But later these losses were made good.

Conditions in the kaffir market were especially quiet in the absence of any display of interest from the Cape. Some light selling occasioned several declines at the reopening, West Wit Areas, among others, falling ½, but the tone generally was steady. Actual business in the rubber market was of small proportions, and price movements were both few and small. Tea issues were quiet, but the trend was downward, Kanan Devan and Pabbojan both losing 2s. 6d. on Tuesday, although some small improvements were recorded. Pending further developments in the various theatres of war, the oil market remained inactive. Leading issues suffered small losses before the week-end, when Ultramar lost 1s. 6d., while Burmah Oil dropped a further ½ at the reopening.

New York

THE course of events, both political and military, in India and Burma, together with uncertainties in France, occasioned some weakness on Wall Street during the past week. Trading was generally slow and the trend downward. Bethlehem Steel fell to the lowest level for the year at the week-end, while on Tuesday, average prices were at their lowest levels since March, 1938.

Finance

GOVERNMENT RETURNS

For the week ended April 11, 1942, total ordinary revenue was £35,017,000, against ordinary expenditure of £30,075,000, and issues to sinking funds of £203,155. Thus, including sinking fund allocations, the deficit accrued since April 1st is £103,826,000 against £112,531,000 for the corresponding period a year ago.
