The Battle and the Breeze

AT the time of writing the debate on Libya has not ended; and the critical battle for Egypt is reaching its climax. There was never any doubt that, while strong words would be spoken in the debate, the Government would win overwhelmingly in a division. There was a strong feeling in every part of the House that the debate should not have been on a vote of censure, that the inquest should have been upon the war, not upon personalities. The belligerent approach of the critics caused the Government speeches—both in the Commons and in the Lords, where a shadow debate has been proceeding—to take on the old, unhelpful form of apologia. Mr Lyttelton claimed, alternatively, that dive-bombers were of little use and that plenty would be forthcoming; that the Army's equipment in Libya was good enough and that, if it was not, the reason was that time could not be spared in the months after Dunkirk to put new types into production. He seemed to overlook that the Libyan army was generally supposed, by authoritative statements, to be as well equipped as the enemy and was being given priority in the latest tanks and anti-tank guns. Lord Beaverbrook, who took the Government under his wing in the Lords, would scarcely admit any deficiencies at all. He, in turn, seemed to overlook the fact that the battle in Libya had been soundly lost. But the state of opinion in Parliament mirrors the state of public opinion. Surprise, bewilderment and even alarm were wide-

spread; but the wish to hit out indiscriminately against Mr Churchill and his colleagues has always been confined to a petulant few. It is success in battle that is called for, not success in the division lobbies.

There is no lack of confidence in the eventual outcome of the war. A friendly Swede recently sought to explain why bad news about Britain depressed his countrymen more than it did the British. He concluded that the reason was that the thought of defeat never once entered British heads. The sober statement on war prospects put out by Mr Churchill and Mr Roosevelt at the end of their latest conversations did not disguise the many present disadvantages, but it left no room for doubt about the result, if the right means and methods can be contrived to transport and deploy the apparatus of victory and to use it rightly in battle. The position is better than it was in August or December last year because of the present flood of arms from belligerent America and because of Russia's successful fight. No working alliance was achieved in the last war at all equal to the combination of two great industrial powers which the President and the Prime Minister have brought about.

This is a crisis of self-confidence. There is a deep sense of disappointment at the repeated failures of British arms. The knowledge that British fighting men have never been more willing, more courageous, or, man for man, a better match for their enemy, only makes this disappoint-

ment more bitter. This mood of frustration, which affects both soldiers and civilians, can be dangerous. It makes men cynical. A plain sign has been given that there must be no more bungling, now that the makers of strategy have the material means of victory almost within their grasp, if they do not wish to see the spiritual means—the dogged undoubted endurance which saved Britain and the world two years ago—deprived of its edge.

Full confidence can only be restored by success in battle. Crisis debates have never failed to do good in this war; the first, in May, 1940, gave the country Mr Churchill as leader; the most recent, in February this year, led to the appointment of a Minister of Production. This time, if there is to be a similar tangible gain, it must be in the field of strategy. Logic may say that the Prime Minister and the Minister of Defence should be separate persons; but the facts probably speak otherwise. Mr Churchill must be taken as he is—or rather as he has grown to be after a lifetime of rich and varied experience not unconnected with arms. But the major strategic and tactical problem, which underlies every current anxiety—that is, the most effective use of air power—must be solved; and the responsibility rests upon Mr. Churchill, who will stand or fall in history by his success in solving it. What but air-power, properly used, gave the Japanese the freedom of the Eastern seas for three crucial months? What but air-power, properly used, has now set a limit to their expansion eastward? What but air-power, properly used, has pegged down the Mediterranean fleet, so that Rommel has been able to race from port to port along hundreds of miles of African coastline? Over the Libyan and Egyptian land-fighting the Allies have had air superiority; but they have not been able to employ air-power decisively. It is unfortunate that one motion put down in this week's debate, by two Service Members, calling for a genuine combined command of all arms, could not be taken. It is almost fantastic evidence of the "co-ordination" that has hitherto prevailed that the Secretary of State for War should be able to say, as Sir James Grigg did on Tuesday—after nearly three years of war—that discussions on the "general subject" of dive-bombers are going on between the War Office and the Air Ministry.

Three gaps have still to be filled. First, a combined command is needed at the top, with a single commander in place of the present federal arrangements by which three independent Service chiefs decide the day-to-day conduct of the war. This view of the Defence Forces as a single Service must be carried into output programmes, so that the air weapon is made available in the right kinds as well as the right quantities and so that its decisive contribution is never absent in any land or sea actions. Lower down in the hierarchy of arms, similar combined commands are needed at the head of every large operational unit, so that every battle is thought out and waged in all elements at once.

Secondly, the design of weapons of all kinds must be

placed on the same high level of authority as their use in operations and their manufacture. Both strategy and production are War Cabinet matters; design, until now, has not been. In a letter to the *Times* this week, Professor A. V. Hill put the point neatly:

For all operations, planning has been centralised in the Chiefs of Staff organisation; for supply, in the Minister of Production. The third member of the trinity, dealing with research, design and development, and quantitative planning of the use of technical resources, is altogether unrepresented at the highest level. Events in North Africa have proved amply that it is of little use for the factories of the United Nations to produce vast quantities of weapons unless the weapons produced are of the right kind. The most important aspect of the integration that is now taking place in British and American output programmes is the opportunity which it gives to concentrate on the best types of weapons.

But even to have the right kind of weapons in the right quantities is not enough. They must be moved to the right places, and they must be used in battle with the proper skill. The creation of combined commands, with a genuinely three-Service outlook, may produce battle leaders with the right methods as well as the right means. But a third gap will persist; the major task will still be to overcome the obstacles of time and space which impede the operations of the wide-flung Allies on their many fronts. It is imperative that supply, strategy and design should all three be linked still more closely to the factors of distance and transportation which make every weapon useless that cannot be moved into the front line. This fundamental disadvantage was placed foremost in the recent joint statement by Mr Churchill and Mr Roosevelt. There is no easy solution. Shipping losses, now perilously high, may be cut down. Shipping output may be raised to its peak. But geographical distances cannot be physically shortened. They can only be eased by carrying the pooling of all kinds of Allied resources to an extent far beyond that to which it has already been taken, so that national or political considerations are given little or no weight at all in the distribution of men and supplies between all the theatres of war. The single criterion should be to save time and distance.

The battle in Africa is still raging; but the breeze in Parliament has abated. If, as a result of these cries and counter-cries, the shortcomings in the British way of war are remedied, success may again be snatched out of the bitterness of defeat. The war is near the end of its third year and the beginning of its fourth. With audacity in decision, efficiency in planning and skill in combat, the war must be won. Without them, disasters will still lurk round every corner, and even the people of this island, who have endured for so long and so well, will grow sick at heart. This is the real challenge to Mr. Churchill. Rightly the Prime Minister has turned and rent the "profiteers from disaster." But only his policy can put matters right.

Middle Eastern Front

IN an article in *The Economist* of February 7th this year, an attempt was made to forecast the shape of Hitler's summer offensive. Arguing that the Germans can no longer expect to win outright and must therefore play hard for a stalemate, it was suggested that the heaviest blow might not fall in Russia—"Hitler cannot win Victory in Russia"—and that the summer campaigns might be spent in rounding off the defences of the citadel of Europe. To the south, in the Mediterranean, the doors were still open. Here, in North Africa, the job of insuring against reinvasion might be the first call on German arms in 1942. Moreover

complete control in North Africa, coupled with a thrust through Turkey, might give Germany control of the Middle East, solve the oil problem, and open a new front on Russia's vulnerable flank.

It begins to look as though this forecast of strategy may have some basis. Libya has fallen. Egypt is in very grave danger with the fighting surging forward to the banks of the Nile, and if the German broadcasts to the Middle East in the last weeks are any guide, Rommel's lightning advance is intended to carry him on across the Canal to strike at the oil-bearing lands beyond. The weight of the reinforcements which have been conveyed across the Mediterranean under cover of the Malta bombings suggests preparations for a long and fierce campaign. The garrison of Crete has not yet been brought into play. The booty taken at Tobruk makes the mounting of a big offensive easier and, now that Rommel has broken out of the dead land between Benghazi and Sidi Barrani, supply is no longer an insuperable obstacle. In the perpetual see-saw between Benghazi and Sollum, the

Germans have at last exploited the advantage that the howling desert comes to an end sooner in Egypt than in Tripoli.

The strategy of Middle Eastern conquest does not of course preclude bitter fighting in Russia, particularly on the fronts below Moscow. Even if the strategists' picture in the past—of the Caucasus as a stepping-stone to Middle Eastern oil—may have to be redrawn to make the Middle East the stepping-stone to the oil both of the Caucasus and of Perm, a strong thrust round the Black Sea, parallel with the advance through Egypt, is almost certain.

The defence of this wide area from the Nile and the Bosphorus to the frontiers of Afghanistan falls primarily on British, Russian and Free French arms. It may be that some American reinforcements have arrived—unconfirmed reports spoke recently of the landing of 20,000 at Basra. There may be some support from the local armies if the enemy actually reaches their territory—but the analogy of Egypt is so far not very encouraging. The trouble is that, if the fighting moves forward to the frontiers of Syria, Iraq or Persia, the Allied armies will be defeated armies, and there is little guarantee that any of the Middle Eastern states would throw in its lot with a possible loser. The national armies—in particular those of Turkey, Egypt and Iraq—have been equipped with British and American war material under Lend-Lease; but political considerations, not technical convenience, will decide the issue.

It is useless to pretend that the political omens are very favourable. True, there have been a number of improvements—there is not a Middle East state in which, on the whole, the political situation is not better than it was just over a year ago. The changes of Ministry in Persia, Iraq, Syria and Egypt have in each case brought in more popular and stable governments. M. Soheily in Iran is upholding the treaties and has political solidity in that he is the direct choice of the Majlis—the Persian Commons. General Nuri-es-Said in Iraq is an old friend of Britain. The reconstruction in Syria brought Husni Al-Barazi, a former member of the National bloc, to power, a change which has done something to reconcile the Syrian extremists. The government of Nahas Pasha in Egypt is pro-Ally and firmly based on a big majority in the Chamber and on wide popular support.

All governments have taken firm steps to deal with Axis agents, local fifth columnists, and even to check the inveterate rumour-mongering of the bazaars and clubs. In the sphere of economics, too, there is progress to report. All the states have experienced very serious food problems, which have been due in part to the dislocations of last year, in part to the collapse of foreign trade, but to an overwhelming extent to the hoarding and black marketing of local dealers. The scandal of high prices and hoarded stores was bad enough to bring down the Faroughi Ministry in Persia in March. The British authorities have given a good deal of direct and indirect

assistance to meet the crisis; in particular they have arranged for the import of grain throughout the Middle East. German propaganda has tried to minimise this assistance by blaming the armies of occupation for cornering supplies and forcing up prices. The rumours proved so successful in Iraq and Persia that official denials had to be issued. For the time, the food crisis has passed. Syria and Lebanon have produced double their needs. Turkey reports a good harvest; so does Iraq, and Palestine expects a bumper crop. Unfortunately, this economic improvement is not an unmitigated political advantage. The Germans cannot, or rather do not, feed their subject peoples. Greece is near enough to be a horrid object lesson. The Allies have pumped in food supplies and, if the local governments have taken the credit, they know that nothing has a more unbalancing effect on their political careers than recurrent and irremediable bread riots. But if the barns are filled, fear of Germany grows less. It is illogical, for the Germans loot as well as neglect their victims, but it affects the political situation nevertheless.

The fundamental weakness in the position of the United Nations in the Middle East is the success of Germany's arms. In every country, there is a fifth column, in every country active Axis agents. If things are going well for the Germans, they expand their incessant propaganda and embark on political action. When things go less well, the orchestra of lies and rumours subsides, and the underground men go back to their burrows. The seriousness of the fifth column is illustrated by its hold on every class and, astonishing though it may seem, on every race. One of the chief Axis agents in Palestine, Abraham Stern, who was shot early this year, was a Jew trained to Fascism in Italy. In Iraq, former Ministers have been shot or interned. In Persia, recently six leading citizens, including, significantly enough, the head of the largest Persian tourist agency, were banished. In Egypt, Ali Maher, an ex-Prime Minister, is under arrest. Military circles are disaffected; the peasants are caught by tales of hoarding and looting armies of occupation; the *effendi* class by the promise of advancement. All this would subside to nothing if the United Nations were winning, not in the "overall picture," but here and now in the Middle East. As it is, Axis agents based on the German Embassy and consulates in Turkey, come and go, leaving a trail of lies, rumours, discontent and sedition behind.

In the Middle East, the political situation is thus just as good or as bad as the military situation. What the British and Free French have been able to do in the way of managing national susceptibilities and minimising economic difficulties, they have done. Now they must win battles. It is probably still true that the Middle Eastern campaign has in the very long run a defensive purpose for the enemy—to make the reconquest of Germany's empire so long, so tedious and so expensive that the United Nations will abandon the attempt. if it were wildly successful, if a junction were effectively established with the Japanese, if a combined blow northwards round the Caspian and westwards from Siberia broke Russia's resistance, surrounded India, and gave over the great land mass of Eurasia to the totalitarian Powers, then once again, whatever the flow of arms from

Anglo-Saxon factories, and of ships from their yards, Hitler would be able to think in terms not of stalemate, but of total victory. It would be a miracle, considering their resources, if the United Nations were to be defeated outright. But miracles do sometimes happen. That is the longterm significance of the Middle Eastern front.

A Way Out

IN its third report, published last Tuesday, the committee appointed by the President of the Board of Trade in May last year to examine the problem of concentration in the non-food section of retail trade, has at last put forward a definite scheme which is summarised on page 24. One aspect of the problem, outlined in detail in the committee's second report, issued last January, and discussed in *The Economist* of February 14th, has become painfully familiar. Shopkeepers have been steadily forced out of business by exhaustion caused by lack of supplies or customers, or both, or by the loss of personnel called up for military service or for war work. But the formulation of a scheme designed to render this inescapable slimming process less painful was not the only task of the committee. The object of any such scheme must also be to hasten the process of releasing men and women for national service—and to safeguard the interests of consumers.

The committee was restricted in its choice of remedies, not only by its terms of reference, but also by Government policy. It was not appointed until the war had been in progress for twenty months. The food section of retail trade, which comprises more than half the total number of shops, was excluded from its purview. The committee was not asked to formulate proposals for a far-reaching reorganisation of the trade, but only to consider the "immediate needs of the conduct of the war and the position after the war." Finally, the committee was debarred from proposing a state-financed scheme of compensation, because of the Government's reluctance to accept the principle of compensation for losses of income or capital due to the war.

The scheme proposed is designed to facilitate the withdrawal of individual retailers from business during the war and their re-entry after the war. Contractual obligations and the fear of being unable to start again after the war are the main reasons why retailers continue in business, even if they cannot make ends meet; they do not move into other war work, where they are needed, until they go bankrupt. To overcome the first of these obstacles, the committee proposes the creation of a fund, financed by a levy on the turnover of those remaining in business, out of which payments will be made to retailers who may decide to go out of their business, either by "marriage" with another retailer or by temporary withdrawal from the trade. Payments to withdrawing shopkeepers will be calculated, not on the basis of their actual contractual obligations, but as a percentage of turnover during the twelve months preceding withdrawal. In the view of the committee, a sum representing five per cent of turnover would be adequate to meet charges, which consist chiefly of rent or, in the case of many owner-occupiers, of mortgage interest. Benefit is to be paid for the duration of the scheme if the rent liability persists; it is to cease automatically on the termination of the lease or at the earliest date when the lease can be broken.

In some cases, the "standard" rate of benefit will fall slightly below existing obligations, and in others it will exceed them. Where obligations exceed benefit, the committee suggests recourse to the machinery of the Liabilities (War-Time Adjustment) Act—which would require some revision—to secure a reduction in rent. Moreover, it rightly proposes that the rates payable in respect of premises from which fixtures and equipment are not removed on withdrawal from business should be reduced to a nominal level.

As a special inducement to the withdrawal of shop-

keepers without contractual obligations, or with obligations that can be terminated at short notice, the committee suggests the payment of a "special" benefit for a period of six months. "Special" benefit is to be calculated on the same basis as "standard" benefit, but it will only apply to the first £5,000 of turnover and cannot, therefore, exceed £125. Obviously, this provision is specifically designed to assist the small trader.

In order to meet the fear of being unable to start again after the war, the committee have tried to work out a way of ensuring that shopkeepers who withdraw or are called up will be able to set up shop again. Each trader who goes out of business will be entitled to ask for a certificate in two parts. The first part, which will be available to all traders, with one exception, will grant the holder prior rights of re-entry into the trade in which he had previously been engaged; the exception is the trader who claims "special" benefit in cash on withdrawal, but if traders in this class allow their claim to accumulate, at an agreed rate of interest, they will have the same rights as the traders who take "standard" benefit. The committee suggests that, while it would be impracticable to make benefit payments retrospective, the right of re-entry might also be granted to traders who go out of business before the introduction of the scheme. The second part of the certificate will grant the prior right to resume business in the same premises, the tenancy rights of which have been preserved under the scheme. The future is uncertain, and the right of re-entry must obviously be conditional.

The levy required to finance this "concentration insurance scheme" will be compulsory on all shops which remain in operation—except in the case of the "very small trader," who will be given the option of contracting out. The very small trader has been defined as the trader whose annual turnover is less than £1,000; he represents something like a third of the total number of non-food shops, but only five per cent of their turnover; and he usually holds a short-term lease, terminable at weekly, monthly or yearly intervals. It is proposed that the levy should be regarded as a business expense, not to be subject to tax. In view of the fact that a large proportion of the levy will become liable to income tax when the benefits are paid out in rent, this suggestion is not contrary to the Government's policy of refusing to finance concentration schemes out of public funds.

Within its limits, the scheme contains all the elements—not indeed of a solution of the problem—but certainly of a practical stopgap to mitigate the hardships of withdrawal. Possibly, too, it will hasten withdrawal, and so help the war effort as well as the shopkeeper. In addition to the traders who have already fallen by the wayside, there must be many thousands who, but for their contractual obligations, would also have given up their business and will inevitably have to do so sooner or later. To these the adoption of the scheme would undoubtedly bring relief; they will be enabled to conserve some at least of their resources, with a chance of starting again after the war. Since leases are not renewable under the scheme, those traders whose leases are still current at the end of the war will have an advantage, in the earmarking of post-war premises, over those whose leases have fallen in—though, in many places, landlords will not find it easy to find new tenants for vacant shops during the war. Landlords will obviously benefit from the scheme; they will continue to receive their rents, though only until the expiry of their leases. Admittedly, the scheme

contains no special provisions for underpinning the small trader. But this could hardly have been expected. It is part of the process of total war that the number of shopkeepers should be reduced. This is happening, scheme or no scheme. The committee's job was to make the process less painful. Nor does the scheme offer temporary pensions to shopkeepers who are compelled to go out of business; the majority of the personnel released will probably find other means of support, in essential work, during the war—though, obviously, in the case of elderly people, hardships due to the war, and in no way to the scheme, will scarcely be mitigated at all.

What of the consumer, the shopper? The committee has calculated that a levy of only one per cent on turnover would provide sufficient funds for the withdrawal of retailers representing some twenty per cent of total turnover. It should not be necessary for even this small percentage to be passed on to consumers in higher prices. The shops still in operation will take over part of the overheads of the closed premises, but not their wages bill; and their additional turnover should be adequate to compensate them for the increase in fixed charges.

The first criticism of the committee's plan is that it was not put forward and adopted a long time ago. The

scheme published this week could equally well have been prepared within two months of the committee's appointment. What its effect will be—as a stopgap measure—is uncertain. It is impossible to estimate how many people will be released for the war effort by traders taking advantage of the scheme. A time-limit for the payment of benefit of, say, six months from its adoption, might have made certain of a large response. But it must be repeated that the main defects of the plan are due to the restrictions imposed on the committee by its terms of reference, and by Government policy. There is no general compensation policy to form the context of a scheme for wartime retailing. As it stands, the scheme contributes very little to the reorganisation of retail trade. It is relief, not rationalisation; and it does little or nothing to provide against the tendency in shopkeeping towards monopoly. Nevertheless, half a loaf is better than none. If the Government is still adamant against a policy of compensation to spread the burden of war losses fairly and efficiently, such a scheme as this should be introduced without delay. It would be a pity, and a disservice to the small shopkeeper, if he were to become the subject of a long-drawn controversy at this stage, so that his body will be wrangled over, while he continues to bleed to death unsuccoured.

A New Social Service

THE social services can be divided broadly into two classes, those which provide benefits in cash and those which provide benefits in kind. During the war, a third category has come into prominence, those which furnish information and advice. Never has there been so much need for so much information by so many people as in this war. Evacuation, billeting, bombing, compensation, allowances—the problems which may burst suddenly upon any home are legion. In no other war have ordinary citizens required guidance of such novelty, such complexity and such urgency.

This aspect of total war was recognised at the outset by the National Council of Social Service. Citizens' Advice Bureaux were set up to assist people "to find their way through the welter of wartime legislation." In January, 1940, the citizen's advice notes, published by the NCSS, contained 958 items; by March this year the number was 1,477.

In general, three kinds of assistance are called for—information, advice, and legal opinion. Information and advice are the work of the Citizens' Advice Bureaux. The information provided may be of the most elementary kind. It may consist simply in bringing legislation or regulations to the notice of enquirers. The Citizens' Advice Bureaux have collected information about the amenities of their districts for the aid of war workers. The Bureaux have been increasingly used by Government Departments and local authorities to provide the public with essential information. Advice may, of course, be more complex. Hundreds and thousands of men and women have turned to the Bureaux for guidance on their difficulties, primarily in towns which have been subjected to heavy bombing. There are now about a thousand Bureaux established throughout the country, mostly in the larger towns and suburbs, but also in many smaller places. It has been roughly estimated that the Bureaux deal with two million questions in a year.

The invaluable work of the Bureaux, however, reaches its limitation when legal opinion is required to solve the inquirer's difficulties. Then, it is a matter for a lawyer. Fortunately, there was even before the war some machinery to provide the poorer people with legal advice—distinct from the free legal aid in the courts which is furnished by the Poor Persons' Committee. Free legal advice in the form of a poor man's lawyer was first started in London towards the end of the last century at Toynbee Hall, under the East London Tenants and General Legal Protection Committee. The Cambridge University Settlement in Camberwell followed suit at about the same time,

and it is highly to the credit of the settlement movement that it was the pioneer of this service. It was not until after the last war, however, that this service was expanded at all rapidly. By 1940, there existed 125 free legal advice centres in England and Wales, of which 55 were in London. The organisation and financing of these centres vary considerably, though the great majority are organised by local Law Societies. They may be organised directly by the legal profession itself. They may be under the control and management of a local council of social service, a community council, a borough welfare committee, or a personal service society. They may be run in connection with a Church or a mission or a religious or philanthropic body. This variety does not perhaps ensure the most economical service; but it does show how wide an interest the movement to provide free legal aid has attracted from many different quarters. In the London area, there is a measure of co-ordination, in so far as all the legal advice centres in the area are affiliated to the Bentham Committee. In 1931, the Bentham Committee laid down standards and methods which have now been adopted by practically all the London centres. The influence of the Committee has been considerable; and it may be expected that if the State ever takes over responsibility for this class of social service the Bentham Committee will provide a model for its expansion and supervision. It is a good omen that the Haldane Society, of which Sir Stafford Cripps is the president, has investigated the possibilities of extending the services of advice bureaux and poor man's lawyers during and after the war. In a publication called "The Law and Reconstruction," it recommends the establishment of a body managed by a committee of 11-13 persons, who would be appointed by the Bar Council, the Law Society, and by other public bodies closely connected with local authorities. It would give legal help to deserving persons with the financial assistance, where necessary, of the Treasury. The recommendations are intended to ensure that no person is denied, owing to lack of means, the opportunity of ascertaining his legal rights, as well as enforcing them.

No hard-and-fast line, of course, can be drawn between legal advice and legal aid. The system of free legal help at courts has been of great assistance to the legal advice centres; and the centres are naturally concerned to secure as great an expansion of legal aid as possible. In particular, they have been prominent in protesting against any restrictions on such aid, since this only facilitates the activities of "ambulance-chasing agencies" and speculative solicitors, whose object is to persuade poor people to

make agreements about the financing of their legal actions on a percentage basis. These agreements are illegal and void. But most poor people do not know this; and it almost appears as if legal advice on legal aid is yet another need.

The important point is that information and advice are not just matters for the complicated wartime period. They are radical parts of the social services themselves. The present social services have made almost no provision for this kind of assistance. Whenever official enquiries have been made into the operation of the great social insurance schemes, such as National Health Insurance or Workmen's Compensation, ignorance of the law on the part of insured workers has been much emphasised by witnesses. Where insured persons have behind them a trade union or other body acquainted with the intricacies of social insurance law, they are reasonably well protected. But the majority of workers do not enjoy this benefit. Moreover, in cases of dispute before the courts, workers may be confronted by lawyers who are experts in these matters, since they are accustomed to handle them in the interests of private offices, while the workers themselves have to rely upon advice of less expert counsel. This is only one of the defects of a sys-

tem of social insurance, the carrier of which is not an official body but private or semi-private concerns. In one branch of social insurance, that of working-class life insurance, or industrial assurance, this defect has already been recognised and remedied. There is an Industrial Assurance Commissioner with wide powers to give information and advice to insured people. This official, who is also the Chief Registrar of Friendly Societies, runs an advice bureau on a grand scale. He receives some 10,000 enquiries or complaints in a year; he receives and dispatches seventy to eighty thousand letters. There can be no doubt that his work—which is worthy of the tradition which the Office of the Chief Registrar has built up—has saved a great deal of unnecessary litigation and relieved many anxious and ignorant people of their worries. It should be regarded as a model for future progress. Whatever may be the special circumstances of wartime which have promoted this problem to a much higher place during the past three years than ever before, the experience of the Citizens' Advice Bureaux and of the legal advice centres proves beyond a doubt that, in the future, information and advice on the broadest scale should be regarded as one of the necessary conditions of social security. It is a new and much needed social service.

NOTES OF THE WEEK

Rommel's Drive

Since Tobruk, the German advance has driven towards Alexandria with only the slight pause necessary to pinch out Mersa Matruh. Rommel is keeping to the coast for his main line of advance. Speed is a chief factor in his African strategy, and here the going is good enough for a smart pace. The British have fallen back, flanked by the Quattara

Depression and the sea; and round El Alamein, where the front narrows to some 40 miles, the main battle is already joined. General Auchinleck has taken over command in person and, after the crippling losses in armour and fire power sustained in Libya, his decision to make a deep withdrawal is obviously sound. It brings the front nearer to the Allied supply base; if the comment may still be permitted, it lengthens Rommel's lines of communications. But supply is hardly Rommel's problem. Tobruk was a mighty haul. Good water is available at Sidi Barrani and Mersa Matruh. Convoys are still arriving in the Axis rear, and it does not look as though the RAF has yet got punch enough to disrupt the ever-lengthening line. Meanwhile, an armoured division may be feeling its way south, to Siwa and beyond. Here a string of bases could carry a swiftly moving tank column to the higher reaches of the Nile in a very few days. If Rommel has really divided his forces in this way, the tactic is well in keeping with his gambler's daring. It is still too early to judge of its success.

Price of Inaction

There are indications that the bill for the Government's failure to adopt a national wages policy will soon be presented. In order to ensure the flexibility in war production, which is necessary if the output of weapons is to be promptly adjusted to the changing needs of strategy, there must be

mobility of labour. The Ministry of Labour plans to move workers from jobs, the products of which are not so immediately needed or in which stocks have been accumulated, to work on ships, guns, aircraft and cotton goods which are urgently required in larger volume. But, inevitably, the transfer of labour from one job to another frequently involves, as it does in the case of transfers from munitions to coal or cotton, the movement of workers into a job where wages are lower. Workers are unlikely to accept transfer to less well-paid jobs without a sense of grievance which is hardly conducive to sustained effort. Mr Bevin has recognised the difficulty. In announcing the decision to move 5,000 women from war factories to cotton mills, he referred to the need for making wage adjustments. But cotton weavers and spinners, whose claims for higher wages—based on the discrepancy between their earnings and those in munition factories—were recently rejected on the ground that they had failed to establish a case, are unlikely to tolerate differential wage rates within their own industries. Unless some ingenious method of overcoming the difficulty can be found, they will renew their claim to generally higher wages. They could hardly be blamed for doing so. If transfers of labour, backwards and forwards within the war effort, are to be on a large scale, the inevitable tendency will be towards the levelling up of wages. If rates in the highly-paid munition industries remained stable, it might be possible to accept this tendency as the inevitable price for past inaction. But, as the heavy claim of the engineers shows, there is no reason to believe that demands for increases in the highly paid jobs are likely to cease. On the contrary, the pressure for increases has already been intensified; a numerous batch of new claims in various industries have already been tabled. Unless the policy of price stabilisation is to go by the board, the Government must surely be compelled to face the issue at last.

War Workers

Further steps to mobilise the nation for total war have been announced by the Ministry of Labour. First, Mr. Ince, speaking to the Industrial Welfare Society at Oxford, stated that the number of registrations for all purposes now amounted to nearly 23 millions. This means that something like a complete register of manpower has now been compiled—a pitifully long time after the proposals for a National Register were flouted and scorned. Secondly, the registration age for men has been raised to 50, and that for women to 45. Thus all middle-aged, self-evacuated women without family responsibilities will be called upon to play their part in the war effort. Thirdly, and most important, Mr Bevin announced in a speech at Liverpool that younger munition workers may be called up. This decision must be interpreted in the light of events in Libya—the losses in men killed

and taken prisoner—and in relation to the conversations between the Prime Minister and Mr Roosevelt. The increased call-up can hardly be intended for the purpose of swelling the ranks of the Army stationed in this island, and the engagement in large battles elsewhere would necessarily involve heavy calls upon manpower. There is a future implication, which may be dictated by the immediate shipping position, and which may be important in the long run—a shift of production from England to America because of the difficulty of expanding imports of materials. The policy is significant for the rôle played by women in production, both quantitatively and qualitatively. According to Mr Ince, 7½ million women have now been registered, and are being interviewed at the rate of 50,000 a week, and placed in industry and the Services at the rate of 20,000 a week; while the number of women employed in munitions and certain essential industries and services has increased by 1½ millions since June, 1939. The training of women as skilled workers has not progressed very rapidly—as was shown by the Select Committee in its seventh report. Employers are expected by the Ministry of Labour to provide four-fifths of the training in the factories, and they have often been both slow and reluctant to arrange this or have not had the necessary facilities. The Amalgamated Engineering Union has declared its readiness to co-operate in training women, and, very belatedly, is also condescending to consider the possibility of admitting women to union membership. Other factors which affect the entry of women into industry, and their productivity once they are employed, are the low rate of wages compared with those of the men; the provision of housing, transport, nurseries, shopping facilities, medical services; and the improvement of conditions in the factories generally. Insofar as the Government relies on women volunteers and hopes to increase the number of part-time workers, it is all-important that much closer attention should be paid to the training, wages and conditions of women workers.

Moves in India

There are new hopes of an accord among Indian politicians. For a while, it seemed that the efforts of Mr Rajagopalachari to secure an agreement between the Congress Party and the Moslem League were doomed to failure. They were rejected by the Working Committee of Congress; Mr. Rajagopalachari's followers in Congress were placed under a ban; and Mr Gandhi took advantage of the confusion to propose once more a policy of non-resistance and non-violence and to call upon the British to "get out." It seemed that Indian politics were back again in the depths of frustration. Pandit Nehru also asked the British to depart. Then came second thoughts. Pandit Nehru explained that he was only asking the British to abrogate their political power and not to take away their forces. Mr Gandhi himself lost confidence in his "foolproof" plan to save India by pacifism and anarchy. Almost plaintively, he explained in his newspaper that he had not meant what he said. He would not ask the Allies to take a step which would involve certain defeat; he could not guarantee that the abrupt withdrawal of the Allied forces would not result in the occupation of India by the Japanese and the certain fall of China; "I had not the remotest idea of any such catastrophe as the result of my action." Mr Rajagopalachari is still at work. He has been in consultation with Mr Jinnah, the Moslem League leader. Now, he is to meet Mr Gandhi. Hopes of agreement in India have invariably been dashed. But, this time, there is the basic fact that no Indian—not even Mr Gandhi, and certainly not Pandit Nehru—can contemplate a Japanese invasion of India without realising that it would be the end of any hopes of independence for either India or China. Dr Azad, president of the Congress Party, has made it plain that, "once Britain grants freedom to India," Congress would call the people to arms and support conscription. Mr Gandhi spins words too finely, and sets his plans in too mystical a sphere, for him to lead all-India in the right direction to deliverance; but it is just conceivable that he may cease to stand in the way of the practical work of others.

No Change for the Colonies?

It was the Conservatives' innings when the Colonial Estimates were debated last week—for the first time for three years, though there have, of course, been several debates on colonial affairs since then. During these three years, there has been something approaching a revolution in the attitude towards the colonies, both in and out of Parlia-

ment. The passing of the Colonial Development and Welfare Act established the principle that the colonies cannot be expected either to pay for their development, or to pay their way, and it was agreed that they would have to receive considerable assistance from Great Britain. At the same time, demands for self-government in the West Indies were growing, and measures of constitutional reform were introduced in Trinidad and Jamaica. Then came the loss of the East Indies and Malaya, which not only altered the economic position of the colonial empire, but also profoundly stirred public opinion about the whole basis of colonial policy. Many cherished ideas and ideals went with Singapore, but it was hoped that, out of the melting-pot into which they had been thrown, a new and better conception of imperialism would be born. These hopes were strengthened by a recent debate in the Lords, by a recent address of Lord Hailey, and by a leading article in the *Times* last week. They have been considerably shaken by the Commons' debate, which was for the most part a mutual congratulations party between Mr Macmillan and the Conservative members who dominated the debate. Mr Macmillan devoted the greater part of his speech to the new economic situation caused by the Pacific war and to the need for increased production in other colonies. But, as Mr Creech Jones said, "he was curiously obtuse in regard to the great human problems in the Empire." When he did touch on them, he was patronising rather than sympathetic. As for most of the other speeches, they seemed determined to establish the advantages of the old colonial system, the virtues and patriotism of the settlers and the disinterestedness of the traders, all of which, admittedly, have been too much decried lately, rather than to press for anything new—except for the setting up of a Colonial Development Board, which would appear to be a duplicate of the Colonial Office with the assistance of "business men" on economic questions. On the whole, it was the most disappointing debate on colonial affairs that has taken place for some time; its tone was far behind the trend of opinion in the House of Lords—and in the country as a whole.

Canada's War Effort

The chief feature of Canada's Budget for 1942-43 is its recognition that, great as Canada's war effort is in absolute terms, in relation to the national income it can still be even greater. In 1941, official estimates placed war expenditure at as much as 44 per cent of the national income; more recently, it has been recognised that the national income had been underestimated and war expenditure overestimated, and this spring the estimated proportion was revised to 36 and even 30 per cent. Evidence that the Canadian war effort was not yet placing a strain on the Dominion's economy was given in a letter from *The Economist's* Ottawa Correspondent (published in the issue of April 4, 1942, page 466), in which he gave instances of the boom in consumption goods, and stated that, in general, Canada was not so much tightening its belt as letting it out. The new Budget, presented last week, shows

More than a century's accumulated business experience and conservative progress form the background of the comprehensive service which the Westminster Bank is able to place at its customers' disposal.

The Bank's vast resources, its constant touch with current affairs and its extensive system of branch offices in England and Wales and agents elsewhere, combine to enable it to offer a wide range of facilities, details of which will gladly be given on request by the manager of any branch.

WESTMINSTER BANK
LIMITED

Head Office: 41 Lothbury, London, E.C.2

that the Government realises that the time has come to take a big tuck in it. Financially, Canada has arrived at the position Great Britain reached when Sir Kingsley Wood produced his Budget for 1941-42. Thus there is a very heavy increase in direct taxation, together with a reduction in the exemption limit for married persons and on account of children, while as an offset a certain amount of the tax collected will be treated as compulsory savings to be returned with 2 per cent interest after the war. EPT is raised from 75 to 100 per cent, of which 20 per cent will be returnable after the war. In addition, there are increases in the taxes on drinks, tobacco, telephone services, luxury articles and—an example which in this case Britain might follow—night club entertainment and transport. But all these increases will only raise the revenue by \$246 millions to \$1,918 millions, whereas expenditure for the year, including the gift to Britain of \$1,000 millions and compensation of \$85 millions to the provinces for their loss of income tax, will be at least \$3,570 millions and probably \$3,900 millions.

The Russian Defence Line

Sebastopol is now said to have fallen after four weeks' massed assault by superior German forces. The defenders' endurance has been breath-taking, and the respite they have gained for the Red Army elsewhere may prove decisive on the larger battle. Now the Germans are consolidating their gains in the Kupiansk sector and bringing up reserves for the next drive. Meanwhile, von Bock has attempted a break-through to the north in the Kursk area—apparently without much success; the Russians speak of terrific losses. Certainly one of the new factors in this second summer is the increasing cost exacted from the Germans in any attempted advance. The reason for this is almost certainly the existence of a very definite line of defence. All through last summer, the Russians were retreating too rapidly to build anything resembling a fortified front. The whole battle area remained fluid, once the Stalin line was breached. The work done last winter—on both sides—has introduced a more static position. The "hedgehog" may prove to be the answer to the mobility of the panzer. In every stage of military development, the defence tends to catch up the offensive; it is conceivable that the experience gained by both sides in the winter is once again bringing the seesaw down on the side of the defenders. The fighting in Russia is obviously still very far from trench warfare, but it has lost the breakneck mobility of 1940 and 1941. However, on neither side is there hedgehog defence in depth. The shell the Germans—and the Russians—have to pierce is harder, but the body behind is very vulnerable. A substantial break-through might lead to new territory-swallowing advances at the earlier speed. This death grapple will be determined by supplies. It is immediately relevant to the battle-front to know that, apart from the leased and lent weapons of war, supplies to the value of over £20 millions have reached Russia from Britain. The original £10 million credit is exhausted. The latest negotiations, foreseen in the original arrangements concluded last August, have led to a new credit of £25 millions. (The new arrangement is discussed on page 16.) It is to be hoped that, beyond the immediate needs of war, some thought is being given to the question of merging this interchange into a sound post-war exchange of goods and services.

Russia and Turkey

The Turkish Courts have passed a sentence of 20 years' imprisonment on the two Russians, Kornilov and Pavlov, who were accused of attempting to assassinate the German Ambassador, Von Papen. The trial—which opened on

April 1st—has been followed with growing irritation in Russia, and its dénouement was the occasion for a very violent outburst in the Soviet Press. Writing in *Pravda*, Zaslavsky spoke of "victimisation," or "buffoonery" and of the "judicial lawlessness" of Turkey, and demanded that "those responsible for this monstrous miscarriage of justice on two Soviet citizens should be called to stern account." The affair could not have occurred at a more unfortunate moment. Ever since Mr Eden's winter visit to Moscow, which was made the occasion of Axis-inspired rumours about British concessions to Russia over the Straits, the relations between the Soviet Union and Turkey have been strained. The Germans and Italians have naturally played upon Turkey's nervousness, and no occasion has been lost to increase distrust. For some time, for example, the repeated sinking of Turkish ships in the Black Sea was ascribed to Russian submarines. The trial offered a heaven-sent opportunity for intensifying this type of propaganda, and the Soviet Press, which had gone out of its way to report favourable Turkish comments, became angrier and angrier at the treatment and reporting of the affair. Coinciding with the reverses in Libya and Egypt and with the forced landing of American bombers in Turkey after a somewhat bizarre attempt to bomb Ploesti oil—as though every Allied bomber should not have made Tripoli its objective—it has done the cause of the United Nations little good. Nevertheless, there is a definite will to friendship on both sides. The Turks have given new evidence of this by appointing the Secretary-General of the Turkish Foreign Office, M. Achikalin, to succeed M. Aktay as Ambassador to Russia. M. Achikalin is the third ranking official at the Foreign Office.

High Revenue

The Revenue Returns for the first quarter of the financial year are printed in full on page 29. In the period from April 1st to June 30th, total ordinary revenue was £554,710,654, compared with £319,157,988 in the quarter ended June 30, 1941. The increase is over 73 per cent—a remarkable jump. One item, however, is new; the Canadian Government Contribution, under the recent agreement, amounts to £98,073,850. There was no such item in the revenue for the June quarter of last year, so that the actual increase in ordinary domestic revenue is £137,478,816, an increase of 43 per cent. The increase, at this stage of the war, is remarkable enough. The estimated increase in revenue from domestic sources for the whole of 1942-43 is less than 16 per cent. Direct taxation, comparing the first quarter of 1942-43 with the first quarter of 1941-42, has also risen by 43 per cent; income tax, as a result of the increased standard rate and the extension of income tax to lower incomes, is up by as much as 62 per cent. A remarkable feature is that revenue from indirect taxation has risen even more than revenue from direct taxation; in the first quarter of this financial year, receipts from customs and excise were 48 per cent higher than in the first quarter of last year. In part, this shows the higher levy that is now being taken from consumption; but, in part, also, it suggests that actual consumption, in physical terms, has not been reduced sufficiently. The object of extra indirect taxation in the total stage of war economy is to reduce consumption rather than to raise revenue.

Lower Expenditure

The figure for supply expenditure in the first quarter of 1942-43 shows a marked increase compared with the first quarter of 1941-42; but it is considerably lower than the figure for the fourth quarter of 1941-42 and only slightly higher than the figure for the third quarter of last year. Between April 1st and June 30th, £1,198,277,500 was spent on the supply services. This compares with £985 millions in the June quarter of last year, £1,071 millions in the September quarter, £1,168 millions in the December quarter and £1,338 millions in the April quarter. In part, of course, there is an inevitable tendency for war expenditure to fall as the costs of factory building and other capital works fall off. The first quarter is always the quarter of lowest spending. In addition, increasing aid is being obtained outside the budget, under Lend-Lease. Nevertheless, it is surprising that expenditure should have fallen back to the level of the second half of 1941. Even so, the difference between revenue and expenditure remains large. Total ordinary expenditure in the quarter up to June 30th this year (including interest

and management of debt, payments to Northern Ireland Exchequer and other consolidated fund services) was £1,295,390,988 compared with total ordinary revenue of £554,710,654. The need to raise genuine savings to the highest possible level and to mop up excess purchasing power by every means is very plain.

Fresh Start

The reconstituted regional boards began work on Wednesday, when Mr Lyttelton's eleven representatives—mostly well-known business men—took the chair, not as directors, as was suggested with sound sense by the Citrine Committee, but as equals among their colleagues—a situation which, in some measure, reflects the practical and political limits which have been set to the powers of Mr Lyttelton himself. The other members of the boards consist of representatives of the Admiralty and the Ministries of Supply and Aircraft Production; the regional controllers of the Ministry of Labour; the regional representative of the Board of Trade; and three representatives of the employers and three of the workers in the region. The executive committees include, besides the regional controllers of the Minister of Production as chairmen, the representatives of the three Supply Departments and the Ministry of Labour, as well as two vice-chairmen, one representing labour and the other employers. The inclusion of the latter suggests that the Government has not adhered to its original view that, at any rate to begin with, the executive committees should consist only of officials. Since Mr Lyttelton's representatives on the regional boards, though their chairmen, will have no powers to override their colleagues, their authority will depend in a large measure on individual drive and initiative. The Citrine report made very plain the serious shortcomings of the regional boards, which have now been in existence for some two and a half years. It is to be hoped that the local business men who have been chosen by Mr Lyttelton to be his representatives will provide the skill and impetus required to make them into efficient instruments for correlating and speeding up local production. If their powers prove to be insufficient for their tasks, these powers must be increased.

Fuel Economy

The campaign to secure an adequate reduction in the consumption of fuel without the introduction of rationing was initiated by Major Lloyd George, Minister of Fuel and Power, in a broadcast appeal last Sunday. In his view, there should be no difficulty in securing the requisite economies voluntarily; it only requires goodwill. But Major Lloyd George made it quite clear that his Ministry was making all the necessary arrangements to introduce compulsory rationing if the public's response falls below expectations. As a means of buttressing his appeal for voluntary reductions in consumption, the Minister of Fuel and Power has issued an Order—the Waste of Fuel Order, 1942—by which waste and the uneconomic use of fuel are prohibited. It is difficult to see, however, by what test the response of the public will be judged during the next summer months, when there will be very little demand for fuel for heating and when the consumption of electricity and gas for lighting will in any case be at a minimum. Moreover, although there is no limitation on the consumption of gas and electricity, deliveries of coal and coke are already subject to restriction. There will be a tendency, among those who have the storage capacity and the means of payment, to lay in solid fuel to the limit permitted. Deliveries of coal during the next few months will be no indication at all of actual coal consumption. The tendency to buy solid fuel to the limit permitted will be even stronger in winter than now, so that the reduction in domestic consumption will continue to be largely a function of the extent to which maximum deliveries are curtailed. That is to say, the only effective way of securing a sufficient cut in consumption is by some form of rationing.

Dr Salazar in Doubt

Dr Salazar, in his recent broadcast to the Portuguese people, expressed his anxiety about the present and the future position of his country. On the score of Portugal's plight to-day, his anxiety was obviously justified and understandable. Neutrality is an incredibly precarious thing

in the vast vacuum of lawlessness through which the Great Powers are hurtling this way and that in their death grapple. Any neutral may be knocked flat at any moment, and even if a real measure of independence is maintained, it is in a world of shrinking rations and tighter belts. Dr Salazar complains of the Allied blockade. He should complain rather of the U-boat campaign which has reduced the United Nations' shipping supply below the margin of safety. Great Britain has gone out of its way to help Portugal—in the purchase of sardines and wine, for example; but shipping remains the one great intractable problem of the war effort. Portugal, as a maritime Power, cannot expect to be totally unaffected by it. Dr Salazar's more distant worries are perhaps understandable; they are quite certainly unjustified, and in the context of the third year of the war they gave a very false impression indeed of the general situation. The Portuguese Prime Minister referred to the Anglo-Soviet Treaty and talked of the widespread anxiety that the post-war world would be a prey to the evil of Bolshevism, which, he contended, was at the root of the troubles of the last twenty years. At a time when most of Europe is under the heel of the most ruthless, godless and soulless tyranny mankind has ever known, and when only the resistance of the "Bolsheviks" on one side of Europe and of the Anglo-Saxon Powers on the other, stands between Portugal and the extension of this tyranny to all mankind, the terrors of Bolshevism might with rather more realism be allowed to fade a little. As for the future, a Pact with Russia will make little or no difference to the kind of social disintegration Dr Salazar fears. Russia will be an enormously powerful state in its own right. It is far more likely to try and permeate with "sedition" a Europe ranged against it in a hostile coalition than a Europe ready and anxious to co-operate in building up a more prosperous and peaceful great society. The Atlantic Charter gives Dr Salazar the guarantees he seeks. His speech would have been more balanced if he had mentioned the safeguards as well as the dangers of the post-war world.

Suñer's Travels

Señor Suñer has returned to Spain after a tour through the Latin countries, during the course of which he visited Paris as well as Rome. There are no very clear indications of the purpose of his journey. He may be acting as a sort of broker between the competing territorial claims of France and Italy—Italy has certainly piped down after the recent and grandiloquent military demonstrations in Savoy. Another possibility is that, as Foreign Minister, he wished to sound the other Mediterranean Powers about the course to be adopted in the event of a sweeping German victory in the Mediterranean. It still remains true that the presence there of Britain has given the Latin sisters a certain purchase in dealing with their heavy Teuton brother. If a division of the Mediterranean spoils is to come into question, it is in the interests of the three neighbours to present a united front rather than to be played off against each other, leaving Germany to take the swag. Yet it is doubtful, however victorious Rommel may be, whether either France or Spain will come into the war. The United States link with Vichy and the Anglo-Saxon foodships for Spain have a decided value, and in Spain there is a strong body of opinion equally opposed to involvement in war and to the Falange. It includes sections of the army, the Requetés and the Monarchists, and is decidedly influential. However, if Suñer were able to pull off a "restoration of Spain's colonial glories" in Morocco without a shot being fired, he and the Falange would have scored a major victory on the home front.

THE COMMERCIAL BANK OF SCOTLAND LIMITED

Incorporated by Royal Charter and Act of Parliament

PAID-UP CAPITAL . . . £2,250,000
RESERVE FUND . . . £3,150,000

ESTABLISHED 1810

INDEX TO VOLUME CXLII

Shortage of paper makes it impossible in wartime to follow the normal practice of distributing to every reader a copy of the Index to *The Economist*. Copies of the Index to Volume CXLII (January to June, 1942) will be available on July 17 and will be sent, free and post free, to all those who have applied since July, 1941, and to any others who make application now.

THE ECONOMIST - Brettenham House - London, W.C.2

War Workers' Children

Labour peers and Labour women united last week in pressing the Government to speed up the provision of wartime nurseries. The House of Commons returned to the charge in Tuesday's debate. The figure quoted by Lord Snell of 1,332 war nurseries at the end of May (540 opened, 576 approved or shortly to be opened and 216 planned), with accommodation for just over 52,000 children, represents a marked advance over the January figures (276 in operation, 374 approved and 257 planned). There has also been an extension in the provision of nursery classes and residential nurseries, and an increasing number of firms have established nursery centres; while for the older children, play centres both before and after school hours have been opened, and the Board of Education have just announced that schools are to remain open during the holidays. All this will help, but there is still much to be done. Even the target figure mentioned by Lord Nathan—5,000 nurseries to accommodate 250,000 children—would cover only a small proportion of the 2½ million under-fives in England and Wales. Until women are satisfied that their children will be adequately cared for, they will not be prepared to enter industry. A recent survey conducted by Rowntrees showed that the problem of what to do with their children was the chief deterrent to married women seeking work. There are, of course, considerable obstacles. There are prejudices to be broken down, and there are the practical difficulties of premises, equipment and staff. The announcement that training courses for nursery school teachers are being established is very satisfactory, but a higher scale of remuneration should be offered in order to attract recruits. The Select Committee recommended a reduction in the present basis of staffing, but the Minister of Health in a recent speech affirmed his determination not to do anything that might lower the standard. Indeed, the proportion of 1 adult to every 4 or 5 children cannot be considered excessive, since it includes all domestic staff, and even on the present basis, assuming that the provision of accommodation for 40 children frees 30 mothers and that the staff required is 10, the net gain to industry is 20 women. It is to be hoped that the Government will continue their policy of establishing nursery schools as opposed to the alternative, which seems to have gained some favour (vide Circular 2535 of December, 1941) that of "registered daily guardians." This system, though it may be suitable in some suburban areas, is uneconomical in woman-power and is much less satisfactory for the health and well-being of the children than properly-run nursery schools.

Seamen's Welfare

There is a great fund of public sympathy for the men of the merchant navies who face danger and death in their daily work; translated into practical terms, this sympathy demands that these men should not have to risk their lives in bringing over non-essential imports and that their conditions both on board and on shore should be improved. Increased safety measures and better arrangements for welfare at ports were the principal subjects discussed by representatives of shipowners and seamen of the Allied Nations in London this week at the twelfth session of the Joint Maritime Commission of the International Labour Organisation. The men's representatives held that there was still far too great an element of charity in the matter of seamen's welfare, which they regard, very properly, as a right. In Britain, at any rate before the war, arrangements for accommodation and welfare in the ports were largely left to voluntary organisations such as the British Sailors' Society and the Missions to Seamen—for instance, the British Sailors' Society during 1938 provided nearly one quarter of a million beds in its institutions, besides 20,000 free beds for destitute seamen. The Government did not take any direct action until the end of 1938, when, acting on a recommendation adopted by the International Labour Organisation, it conducted a survey of existing facilities in the main ports and established the Seamen's Welfare Board, though this body did not actually meet until October, 1940—over a year after the outbreak of war. Its functions are to advise the Minister of Labour "on all questions concerning the welfare of British, allied and foreign seamen in British ports and of the crews of British ships in overseas ports." Port welfare committees have been set up in all the main ports and full-time welfare officers have been appointed. At the same time, the co-operation of voluntary societies has been secured through the establishment of a Central Consultative Committee, composed of twenty-four organisations. However admirable their "pioneer" work,

the voluntary organisations suffered through insufficient co-ordination and were often hampered by lack of funds. The provision of seamen's welfare seems to be a clear case of a sphere of activity which should not be left to voluntary effort; as Admiral of the Fleet Lord Chatfield said in a recent speech, it is to be hoped that the state will continue after the war to exercise the responsibilities for seamen which it has had thrust upon it during the war.

The Nation's Health

There is certainly cause for satisfaction in the Minister of Health's statement that the nation is now in some ways healthier than it was before the war. The figures quoted in Tuesday's debate (which, incidentally, attracted an attendance of only 40 members) of the lower infant mortality rate were reassuring; major epidemics of infectious diseases have been avoided; and an increasing number of children are being immunised against diphtheria. It is indeed remarkable that the public health should have suffered so little from war conditions, with the dislocation of normal life, nutritional problems, the depletion of medical staff and a shortage of nurses—which is giving rise to particular concern. On the other hand, there is cause for alarm in the increase in tuberculosis, cerebro-spinal fever and pneumonia. The increase in tuberculosis can be directly attributed to war conditions—shelter life, overcrowding, housing shortage, black-out and bad ventilation. But quite apart from war conditions, there is the legacy of past neglect—the lack of provision for early diagnosis under the panel system; the meagreness of the financial benefit involving too early a return to industrial life; the inadequacy of maternity benefit and the lack of pre-natal treatment; the fact that TB sufferers are often unable to gain admission to an approved society and consequently forgo the prospect of additional benefits; and the shortage of sanatoria, convalescent homes and rehabilitation measures. To combat TB, the Ministry are ordering miniature radiography sets which should be available for local authorities towards the end of the year and more attention is to be paid to after-care. The maintenance of the standard of public health is largely due to the improved provision for children, both of pre-school and of school age. Credit must in part be given to the Board of Education and the Ministry of Food for the development of school meals, and the supply of milk and fruit juices. The picture of health in industry is far less satisfactory. The accident rate has greatly increased and long hours of work and strain have begun to tell, particularly on young workers and women. Preventive treatment, as the BMA's Medical Planning Commission has emphasised, is the essence of the problem. The conditions, hours and status of the nursing profession need to be improved. The situation demands greater co-ordination and unification of the country's hospital and nursing services. These are measures which should not wait until after the war to be put into effect.

Misquotation

Reference to the verbatim text of Lord Beaverbrook's speech at Birmingham on June 21st suggests that, when he spoke of "persons in high places" who were opposed to a Second Front, he appears to have meant Hitler and Mussolini, whom he mentioned a sentence or two later. This qualification did not appear in any published version of the speech, not even in the *Daily Express* which printed "the text." One newspaper which printed the first part of this passage verbatim left out the later sentences. A number of listeners to the speech apparently gained the same erroneous impression of Lord Beaverbrook's meaning as was conveyed in a Note in last week's *Economist*—namely, that he meant persons in high places in this country. The reason is, probably, that it was an odd way of stating the truism that the Fuehrer and Duce do not wish to be attacked. Under paper rationing, no speech is printed in anything like full terms in the national newspapers; and it was specifically stated in *The Economist's* Note that the comment was on the speech "as reported in the press." It is Lord Beaverbrook's right that the correction of this misquotation should receive the widest publicity. It should be pointed out, of course, that the argument of *The Economist's* Note did not stand or fall by this citation. The argument was: Lord Beaverbrook states that there should be a Second Front "forthwith" and that, from his knowledge, the physical means of carrying it out exist; the implication can only be that, if it does not happen, persons in high places in Britain are holding it back.

AMERICAN SURVEY

Portrait of Britain

(By a Correspondent lately returned from the United States)

IN a famous passage in the *Education of Henry Adams*, the narrator describes the astonishment with which he saw, in 1858, the English "Black Country." On his way to London, the young American felt "the sense of unknown horror in the weird gloom which then existed nowhere else." Now the black country exists in Adams' own country—and in the chief enemy of that country—on a more impressive scale than it does in the pioneer home of modern industrialism. But it is time that the people of the United States were reminded of the fact that Britain is still one of the great industrial powers of the world and that, if this had not been so, Britain could not have stood out against the powers of darkness when American material and spiritual preparations were still so inadequate.

Statistically, in terms of war output, Mr Lyttelton has lately done the job well. But there remains a permanent American misconception of British life and resources to be attacked. In the days when Henry Adams first came to London, Americans arrived at Liverpool and, even if they took time off to visit Chester, they could not escape the impressive novelty of the Black Country. Now they enter, in peace time, by Southampton. They need see nothing of the kind of country where the vast majority of the English people live. Nor is Britain any longer the sole workshop of the world. Her old exclusive predominance is gone; and it is an easy step from that undisputed fact to the illusion that "industrial Britain's dead and gone, it's with the coal trade in the grave." Such, at any rate, is a very wide-spread American illusion, and it is one of the most hurtful illusions among the many that make Anglo-American relations, at this moment, so delicate.

It is not, perhaps, too much to say that the American man in the street thinks of the British effort in the past year as a series of campaigns fought by Australians armed with American equipment. Even the RAF is thought of as largely Dominion in personnel and overwhelmingly American in machines. That until very recently Britain has been its own armoured and its own provider of soldiers, sailors and airmen is not known. The relative contribution in men is something that can be dealt with by the release of more figures and more stories of individual achievement. But the industrial picture cannot be made understandable without a great deal of spadework. For there is a rival picture, painted with some skill and more zeal, and this has to be scraped away before the drabber, but more impressive, realities of British life and power, can be seen.

What is the picture painted for Americans by British films, novels, belles-lettres, lectures? Amazingly, it is of a predominantly rural country with a large rentier population living on the profits of empire. It is there that the characters in the *Wodehousian* drama disport themselves when not in the West End. There lives Mrs Miniver. There die the baronets and others who are found slain in libraries and country house bedrooms. There, in their gardens and on their lawns, the English upper-middle classes play at rural life like Marie Antoinette haymaking at the Petit Trianon. The only important shadow cast on this idyllic picture is that thrown by grim and "powerful" novels and plays of the depressed areas. "Murder in the Country House" and "Love on the Dole"—that is all that many Americans know of the eastern bastion of their own security.

A great deal is done to reinforce this impression. In the outer office of the British Information Services in New York lies a copy of the admirable Office of Works survey of Oxford, in which practically no building later than 1700 is mentioned. There are copies of the shiny paper weeklies with illustrations of contemporary England, such typical scenes from the island fortress as the market place of Chipping Camden and a meet of the Pytchley. Can it be wondered if the fact that, despite the distressed areas, Britain made great advances in wealth and modern industrial resources in the years before the war is unknown in America, or that, in consequence, the character of Britain's war-time achievement is not understood at all? To many Americans, the fact that the British people "can take it" is no longer impressive; to these, with the decline in the intensity of the air war, it merely means that the British people can take the things they send to Britain. There is a danger that Britain may come to be regarded by the American people as simply a convenient battlefield or base from which Germany can be attacked, much as Britain regarded Spain in Napoleon's time.

The pretty-pretty rural picture of England not only makes the American public underrate what Britain has done and can do in the industrial field; it also makes them under-estimate the nature of Britain's agricultural and food achievement. Many Americans seriously think of the problem as being a matter of ploughing up a few ducal parks, deer forests and golf courses, and then feeding amply. That all of England is the size of New York State, with four times the population, is not realised. That the British food problem has been intelligently and competently handled is not understood. The "black market" is becoming, in American eyes, something as big and normal as the booze racket was under prohibition. And as long as this country is talked about in these suburban-rural terms this is bound to be so. For it must be remembered that Americans are, in the mass, far more familiar with real farming than most British people are. It is at least two generations since the majority of the British people knew anything of farming at first hand. But in America, the farmer's son from Iowa or Norway is a very familiar figure in all ranks of society. The Americans are not to be taken in by æsthetic country-lovers with their amateur attitude to a great economic problem. That British farming, when good, is the best in the world, and that Britain can give lessons to California in the running of "factories in the field" is not known at all. All the neo-agrarianism of British men of letters and politicians merely makes Americans wonder if there is any future for Britain at all. They talk seriously of Britain evacuating most of its population to Canada after the war. They are convinced that British power is largely a result of a past and now irrelevant prestige.

At home, the British people know how seriously to take the neo-feudalism of the successful magnate who wants to put as many miles as possible between the factory and the renovated castle. They know how seriously to take the peasant enthusiasms of popular journalists, enthusiasms made possible by the profits of the great capitalist press. They know that the greater part of England is far more like western Pennsylvania than it is like western Connecticut, and that Dunster is no more typical of England than is Santa Barbara of the United

States. It is well that it is so. Power and national survival to-day are a function of industrial power. The Americans know this. The Germans know this. The Russians know this. And the British know this, too. The nations whose industrial power is inadequate, the French, the Poles, and the Italians know it no less. It is true that high industrialisation made Britain run the risk of being starved. But a high degree of concentration on agriculture at the expense of industry would simply have substituted the certainty of being conquered.

The rural picture painted by Britain's literary spokesmen, and fostered by the snobbery of Britain's official classes is not only false. If true, it would simply reinforce the popular American belief that the British sun is very definitely setting. Snobbery may be harmless and respectable. But it is certain that, say, Mr William Shakespeare, prototype of Cotswolds and South Downs literary country lovers, had no illusions about where the money came from that enabled him to retire to gentility at Stratford. It was a nation of shopkeepers, not a nation of amateur farmers, that saved the sum of things in 1940. As a nation of farmers Britain will not cut much ice, and the Americans know it. As a nation of shopkeepers and ingenious mechanics, Britain can and will. Let those who speak for Britain recover some of the pride of Cobden or George Stephenson.

American Notes

Unified Command

The reverses in Libya and Egypt have provided a healthy corrective to the illusion that the production records in American factories would win the war. The question whether the right arms were being produced has brought a somewhat belated assurance from the head of the War Production Board that no time would be lost in bringing together the strategists and the production men. Even more discussion is being devoted to the problem of securing a unified command, both of the American Forces and of the United Nations as a whole. There was disappointment that this did not emerge as one of the results of the Roosevelt-Churchill talks. *The New York Times* argues that both Britain and the United States suffer from the failure to create a unified military command:

In both cases an overburdened Chief Executive who must be responsible for literally hundreds of decisions in the fields of foreign policy, fiscal policy, labour policy, war production, social legislation, public morale and other questions of importance, is trying also to serve as his own Chief of Staff. In both cases such unity of command, as exists between the different branches of the Armed Services exists in the person of this one hard-working and distracted man. . . . A Joint Chief of a Joint General Staff, representing no one service, but detached from all services and intent only on the strategic planning and direction of the military phase of our war effort, has long been needed and is needed more each day.

The same paper has urged that the appointment of a single United Nations commander in each theatre of operations is essential. Unfortunately, the melancholy succession of events in Singapore, Burma, and Libya makes it unlikely that the American public would feel much enthusiasm for placing American troops under British leadership. One popular military commentator, George Fielding Elliot, has suggested that President Roosevelt should assume supreme command of the United Nations; but there has been considerable acid comment on civilian interference and political influence in matters of high strategy, and there is more support for the selection of a "new Foch," to be given full powers and responsibility before it is too late. The Army reorganisation of several months ago gave much greater representation to the air force in the War Plans Division of the General Staff, and a policy of unified command for task forces is already in effect. The ranking officer of the Service most likely to bear the brunt of the fighting is placed in control of all naval and military and air units. In many cases, including the defence of the Panama Canal, an air officer has been put in charge. Thus the selection of Major-General Dwight D. Eisenhower, a tank expert, to command the European theatre for United States Forces, is taken to mean that armoured forces will dominate any second front in Europe. Inter-Service training, whereby air officers are attached to the fleet and naval officers to the

army air corps, is now recognised service policy, although how widespread it is in practice is not clear. The fact that the Air Force is divided between the Army and Navy makes this, organisationally, a simpler matter than in Great Britain. The main concern of the critics is the Supreme Command and the method by which fundamental strategic decisions are agreed upon; but if it is true that the only unity of command which exists at the highest level is provided by President Roosevelt, it is doubtful whether the solution can be divorced from the problem of further generalisation of training between all arms all along the line.

The Prospects for Rationing

Both Mr Nelson and Mr Henderson, the Price Administrator, have gone out of their way in recent weeks to warn the American public that the sacrifices have only just begun. Mr Henderson, in a report to Congress, forecast wider rationing of essentials, and mentioned 15 rationing programmes which have been drawn up. These have been in existence for some time; presumably they affect imported commodities like coffee or those which make too great demands upon transportation or labour. The extension of rationing will not take place without Congressional opposition, however, particularly if it is scheduled to go into effect before the elections. There are reports of an increase in the sugar ration; and the prospective increase of the petrol ration along the Atlantic Coast to four gallons weekly, for pleasure-driving only, reflects fears of the wrath to come in November. There are other reasons for Congress's displeasure with Mr Henderson, which displayed itself in the cutting of his appropriation for his office by very nearly half. The appointment of price control and rationing officials appeared to some Senators and Representatives as an opportunity for a glorious patronage spree. Mr Henderson has steadily resisted the suggestion that these appointments should be influenced by political considerations and is demanding a free hand in selecting his men. Mr Henderson's weapon is the suggestion that Congressmen are playing politics with the war effort; Congress has replied by refusing to act on subsidies needed to bolster up the OPA's price ceilings. The work of the Office of Price Administration is constantly growing in importance. Besides controlling rationing and price ceilings, it is now reported to be working out orders governing the prices of munitions sold to the War and Navy Departments, originally excepted from the price control order, with the aim of limiting profits and wage increases. The disadvantages of the American system of divided powers has never been more evident than they are this summer, with the nervousness of some Congressmen and the greed of others blocking and delaying the essential work of restricting civilian consumption—both in this instance and in the creeping pace at which an admittedly inadequate tax bill is taking shape. Nor can the Administration, or even the President, be totally unaffected by political pressures. The magnitude of the American war effort appears all the more remarkable in view of the restraints and pressures to which it is subject.

Wages and Union Security

The "maintenance of membership" device for safeguarding union security—a compromise on the closed shop issue, which provides that union members must remain in good standing for the duration of the contract—had achieved such substantial success that cabled reports of the granting of the "closed shop" in the steel industry are unexpected. The managements of Federal Shipbuilding and International Harvester accepted maintenance of membership clauses with so much reluctance that it seems unlikely that the War Labour Board would have imposed even more drastic terms on the steel industry, which has been a notorious recalcitrant in its dealings with labour, and which often sets a precedent for other industries. Management has obstinately denied that there was any substantial difference between maintenance of membership and the closed shop; this may be responsible for the report. The grant of the dollar a day increase demanded by the newly formed Steel Workers' Union, possibly considered necessary to consolidate its position with the men, breaks away entirely from the compromises of other recent wage rulings which have reflected at least in part the President's request for stabilisation of remuneration. It will encourage the growing volume of demands for higher rates of pay, already stimulated by stories of fat profits on war contracts, and rationalised by

the argument that "equalisation" of wage rates is necessary to remove a dangerous incentive to labour turnover. Adjustment of wage rates is still being handled by several Government agencies, including the War Labour Board, the Department of Labour, and the Labour Division of the War Production Board; and in recent months they have devised a number of formulae to limit the scope of wage increases. However, many wage increases now being granted lie outside the jurisdiction of the agencies. The competition for skilled labour, particularly in the aircraft industry, makes employers only too willing to grant rises. These voluntary and uncontrolled increases have caused some alarm, and it has been suggested that Government sanction should be required for general rises in wage rates to workers earning more than \$25 a week, or that, alternatively, the Services should refuse to allow wage increases to be reflected in prices for war materials. Unquestionably, there are many anomalies in the wage structure, and it will not always be easy to rectify really sub-standard wages, which often exist in industries which could not grant increases without raising their prices and threatening their price ceiling. It is thought that increases may only be allowed where they will not be reflected in prices. The pressure on the President to elaborate a wage policy and make it plain where equalisation leaves off and stabilisation should begin, will be increased by the steel decision. A more firm and central direction of wage policy is certainly urgent, both for the success of the anti-inflation programme and the best use of the supply of man-power.

The Limitation on New Construction

The belief that the War Production Board would severely cut new construction this year, in order to push the immediate output of arms, appears to have been exaggerated. In April, all construction activities above a certain scale were placed under priority control, and it was thought that exemptions would be only sparingly granted. It is now reported that of the 300 applications reaching the War Production Board every day, about 90 per cent

are being passed. As early as the middle of April the Department of Commerce estimate that total construction in 1942 would amount to nearly \$12,000 millions, and it seems likely that this figure will be exceeded. In 1941 construction totalled just under \$11,000 millions, and in 1940 it stood at about \$7,000 millions. Military and naval work will absorb more than double the amount of labour and material than it did in 1941, and industrial and commercial construction, almost entirely for war purposes, will increase from \$2,262 millions to \$2,850 millions. Some of this is for new raw material industries, and conversion of existing plant is still proceeding; but it looks as if the cream has been skimmed off the possibilities of conversion, and as if the desire for specialised and up-to-date plant has outweighed the need for economising on materials and labour. Progress is being made, however, in substituting wood and cement for structural steel in new construction.

* * *

Shorter Notes

Representative Vinson, chairman of the House Naval Affairs Committee, announced last month that Congressional investigation into war production costs and profits has saved the Federal Government \$507 millions. Direct savings through re-negotiation of Army and Navy contracts totalled \$337 millions. Of this nearly \$300 millions resulted from the revision of contracts with five companies.

*

The House Ways and Means Committee has voted a post-war credit of 14 per cent from corporation excess profits taxes. Shortly after payment of the excess profits tax at the rate of 94 per cent provided in the tax bill, the corporation would be issued with non-negotiable and non-interest-bearing bonds equal to 14 per cent of its excess profits. These would be made assignable after the end of the war. The Treasury has reduced the scale of its proposed deductions at source for income tax from 10 per cent to 5 per cent of income.

THE WORLD OVERSEAS

Trouble in Trinidad

(By a Correspondent)

OF all the British West Indies, Trinidad, with its oil resources and US bases, is strategically the most important; industrially, it is the most advanced, with over 260 factories at work on secondary industries; and, financially, it is the most prosperous, having sent over \$11 millions in gifts and loans to Britain. The total trade of the island in 1940 reached the record figure of \$102,931,949, an increase of 19.4 per cent over the 1939 figures. Exports showed an increase of \$9 millions at over \$46 millions. This increase was almost wholly due to the demand for oil. Imports in 1940 were \$45 millions, the increase of \$10 millions on 1939 being mainly due to the need for metal goods and construction materials. The main sources of imports were the United Kingdom, the United States and Canada, which supplied respectively 31.8 per cent, 27.9 per cent and 21.3 per cent.

Conditions were even better in 1941. The revenue for that year exceeded the estimate by almost \$2½ millions, half of which was lent to the United Kingdom, interest free, for the duration of the war. There is also an expected surplus of \$1,804,925 for 1942, when revenue is estimated to reach over \$19 millions, an increase of over \$4 millions on the 1941 estimates. Five years ago the revenue was under \$12 millions.

Trinidad, then, would appear to be one of the wealthiest colonies of the British Empire. Unfortunately, this outward prosperity is most unsoundly based. In July, 1941, Mr Newman, Acting Canadian Trade Commissioner, said: "Unemployment has disappeared and labour conditions are the best the country has known for years." But the present

good fortune is entirely dependent on the two factors already mentioned, the wartime demand for oil and the construction of the US bases, neither of which is permanent. When the output of the oilfields begins to decline, and when the bases are finished, Trinidad's economic welfare will be determined almost solely by what has always been its primary industry—agriculture. Ever since the oilfields of Trinidad have been exploited on a large scale, agricultural exports have totalled very much less in value than petroleum and asphalt exports. Even so, the Olivier Commission of 1930, the Forster Commission of 1937, the Moyne Commission of 1938, and Major Orde-Browne's Labour Report of 1939 all stressed the fact that agriculture was still Trinidad's essential industry, and only if this premise were accepted could any plans be made or reforms suggested which would ensure the future welfare of the colony. It is when the agriculture of Trinidad is considered that it is realised that the outward prosperity is completely misleading, and that behind the façade of Budget surpluses, increased trade and large gifts to the United Kingdom there are factors at work which, if ignored, are likely to produce poverty and discontent, leading, as in the past, to riots and disturbances.

Bankrupt Cocoa Industry

The agricultural exports for 1940 totalled \$8,680,000 out of the total export figure of \$46 millions. Sugar (\$4½ millions) and cocoa (\$2½ millions) were the chief items. Citrus, a growing industry, came third with over half a million. The cocoa industry is more or less bankrupt. The 1942 crop

will be in the region of 11 million lb, the lowest on record and a fifth of what it was ten years ago. Since 1935 the industry has been paid a subsidy, and the cocoa vote for 1942 was \$449,752, with an additional \$100,000 to be spent on controlling witchbroom. A rehabilitation scheme was started recently, but it has had to be dropped until the witchbroom disease is properly under control. An agricultural credit bank was started a few years ago, with funds of over one million dollars to assist agriculture, the small peasant proprietors in particular. Soon after the bank was opened, however, the big landed proprietors took up almost all the money available, and now, owing to the depressed state of the cocoa industry, they cannot pay their debts to the Government. It is likely that these indebted estates will be taken over by the Government and put up for sale. But, until a more satisfactory way of controlling witchbroom is found, the present cocoa industry of Trinidad seems doomed, and the sooner that is realised the better it is likely to be for the island's agricultural future. Even if a scheme of rehabilitation could be carried out, there would need to be a complete change in colonial policy, insofar as the price would have to be stabilised before the industry could produce and market cocoa in a way that would enable the conditions of the workers to be improved to any extent. In the meantime, the British Government has requisitioned 1,650 tons of the 1942 crop at a price (60s. per cwt shipped to the UK) which producers say gives them no profit and is so much under New York market prices that they will lose £35,000 by the transaction. It is certainly curious that on the one hand a subsidy should be paid to the industry and on the other the producers should lose a certain profit in order to keep down consumers' prices in the United Kingdom.

Now that the other colonial sources of sugar have been cut off the United Kingdom requires more West Indian sugar, and Trinidad has been urged to produce 180,000 tons of sugar a year. Output in 1941 was 131,609 tons, against 92,191 tons in 1940 and 128,455 tons in 1939. The decline in 1940 was said to be due to the climatic and pest conditions and particularly to the Government's Cane-farming Control Ordinance, which encouraged farmers to produce less than their contracts rather than risk a surplus for which the sale would be uncertain. This year's sugar crop should be in the region of 130,000 tons. But this depends on the labour available for reaping, for there is an acute shortage of labour, owing to the attraction of work on the US bases, and leading agriculturalists have been appealing to the Government either to relax the present immigration laws or to introduce a form of labour conscription. The latter, in view of the trade union opposition, the Government has been unwilling to do, but the immigration laws have been amended so that American firms have been able to introduce 2,000 labourers from Barbados for work on the bases. But the whole question of labour, and how to keep workers on the agricultural estates, is bound up with the economic policy of the Colonial Office. The sugar industry of Trinidad is at present making a comprehensive valuation of its assets, with a view to presenting a solid case for better markets in the United Kingdom after the war. There seems to be no reason why, if this move is successful, sugar should not continue to be the most important of Trinidad's agricultural exports. An increase of only ½d. a pound would add over two million dollars to the revenue of the sugar industry of the colony, and if proper safeguards were taken could be used to make a considerable improvement in labour conditions. The sugar industry claims that it has increased its wage-rates for labourers by 32 per cent since 1938, but in the same period the cost of living has increased by 38 per cent. Prevailing conditions are therefore very similar to those at the time of the '1937 disturbances, and agitation has ceased mainly because the US bases provide work for nearly 20,000 labourers at rates very much more than Trinidadians have been paid before. A day's work of ten hours at the bases is worth \$1.17. The sugar estates pay 95 cents a day, including a war bonus, and cocoa workers make 60 cents in time and 80 cents in piece-work.

Deplorable Housing

In spite of some improvements, housing conditions in the estates are still generally deplorable. Although the Commission on the 1937 riots urged that all the existing barrack accommodation on the agricultural estates should be "swept away," only a few dozen new buildings have been erected. A much bigger effort has been made in the towns, and a Planning and Housing Commission set up in 1940 has built 750 homes for slum-clearance purposes. But such a number has only a small effect, and it is doubtful whether what are

after all only "token gifts" to the Empire's war effort should be made when these sums of money would make a big difference to the housing conditions of the colony. In view of the island's outward prosperity, it is surprising how inadequate are all the social services—medical, health, education—and the blame for this must very largely be attributed to the chaotic state of the agricultural industry.

A complete re-orientation of agricultural policy has been called for time and again. The reports of the Moyne Commission of 1938 and of Major Orde-Browne in 1939 urged that there should be a great increase in land settlement and that the peasants should concentrate on growing foodstuffs for home consumption and not for export. At present Trinidad only produces one-fifth of its essential foodstuffs. Submarines in the Caribbean have now caused the food situation to become very serious. A Food Production Committee has reported that 100,000 acres would be needed under cultivation before the colony would be self-sufficient. It suggested that the Government should sponsor a scheme to cultivate 10,000, but admitted that that would not go very far if the island's supply was cut even by 20 per cent. A Government "Grow More Food" campaign has ended in failure. Stampedes have occurred at some of the markets. Profiteering is very prevalent, and the Price Control Board has not enough power to deal with it effectively. A Food Controller has been appointed, but any form of rationing is said to be impractical, although the neighbouring island of Barbados has introduced it to a limited extent.

Trinidadians are hoping that the recognition that more foodstuffs must be grown has not come too late. They are suggesting that the scheme to pay \$10 an acre for cocoa land cleared to plant food crops should be extended to include a further payment of \$10 an acre when the crops are actually planted. They are arguing that the Government should take over the large cocoa estates which are in debt to the Agricultural Bank and parcel out the land in small plots for food crops. The present situation thus demands measures which should also go far towards putting Trinidad's long-term agricultural policy on a sound basis.

French Railway Traffic

[BY A FRENCH CORRESPONDENT]

June 20th

A fog descended over economic activity in France when war broke out, and publication of the majority of statistics ceased. This fog thickened further after the Armistice. At infrequent intervals a few figures were released for the satisfaction of public curiosity. But the figures related almost entirely to public finance, that is, to the monetary aspect of economic life. The figures were substantially influenced by the movement of prices, and as these were not made known, the real movements remained concealed.

The recent publication of the railway results in 1940 and 1941 partially lifts the veil. The following table shows the daily movements of loaded trucks in the three years ended 1941, not including military transport since September, 1939. The figures for June and July, 1940, have not been included in the annual averages. Moreover, the figures for the eastern region no longer include the traffic on the railways of Alsace-Lorraine.

DAILY MOVEMENTS OF LOADED TRUCKS.			
Regions	1939	1940	1941
Est.....	4,553	2,579	3,239
Nord.....	8,823	6,176	6,108
Ouest.....	6,417	5,576	4,829
Sud-Est.....	8,383	8,640	8,778
Sud-Ouest.....	6,050	5,831	5,946
Total.....	34,226	28,802	28,900

For the whole of the French railway system, the 1941 traffic amounted to 79 per cent of that in 1939. Between 1940 and 1941, there was no substantial change. By regions, the 1941 traffic as a percentage of that in 1938 amounts to: Est, 64; Nord, 69; Ouest, 77; Sud-Est, 94; Sud-Ouest, 84. These figures suggest a number of observations:—

The 1940 figures have very little significance, since not only have the results for June and July been omitted, but two totally different periods are covered—January to May and August to December.

The setback in economic activity which the traffic figures indicate is an understatement. The virtual cessation of road transport must be taken into account and the fact that lack of fuel oil has considerably reduced water transport by river and canal. For the same reason and for others which may easily be guessed, coastal shipping has almost entirely disappeared.

The reduction in transport has apparently been much less marked in the unoccupied zone than in the occupied zone, but, as has been pointed out, the figures do not take into account military transport. It is probable, if not certain, that traffic in the occupied zone has, in fact, been much heavier, but that a very considerable proportion has been military.

Non-military transport includes an important section carried for the benefit of Germany. Transport of raw materials from Germany to France and of finished and semi-finished products and of foodstuffs from France to Germany is, at least in part, included in the civil statistics.

If military transport is taken into account, the total activity of the French railways cannot be far below the pre-war total and may surpass it. Since the rolling stock and permanent way have not been renewed, there is a constant wastage of installations and equipment. Consequently, equipment in the unoccupied zone, which has been reduced by more than one-third by German looting, can only with difficulty sustain the strain imposed by the burden of the actual traffic.

Portugal's Economic Problem

[FROM OUR LISBON CORRESPONDENT]

May 25th

THE Portuguese Government has, on the whole, coped successfully with the menace of inflation, but the recent substantial increases in banking deposits and the lack of profitable outlets—at present—for such surplus funds may cause complications. A marked increase in buying real estate, chiefly rentable urban and suburban properties, cannot absorb very much money, while new building, and even repair work, is so handicapped by the cost of necessary imported material that little is now done in this

direction. Rural properties, from the innumerable tiny peasant holdings down to the larger farm and forest areas of the south and east, are patriarchally held; certainly they do not change hands in the open market to any extent worth mentioning. Meanwhile money is superabundant in the hands of a comparatively limited proportion of the population, and prices, all government measures notwithstanding, are slowly but surely rising. There has been next to no corresponding increase in the wages of day labourers, who form the bulk of Portugal's working population, and their standard of living has consequently declined. Never luxurious, the menu of the married working man with a family, paid for by unskilled agricultural labour, is 25 per cent inferior to what it was before 1939. Necessities have become luxuries—for example, dried cod, salt bacon, olive oil—while the replacement of clothing is an almost insoluble problem. If Portugal is to avoid a serious economic relapse, some way must be found whereby the consumption of the mass of the population is increased. An improved standard of living for Portugal means a full and medically adequate diet for the workers and, in the cities, reasonably hygienic housing. The Government is well aware of the need; the question is whether these essentials to economic health can be ensured soon enough to forestall the dangers which lie ahead, and, if things in general follow their present trend, may be much nearer than many people suppose.

Rise in Bank Deposits

Figures published recently on Portuguese banking show a strong contrast between the banking deposits of January 31, 1942, and those of the same date last year. They were then 6,308,938 contos (1 conto = £10); in January, 1942, they stood at 11,064,967 contos, an increase in which all the principal Portuguese banks share. The Bank of Portugal heads the list, its figures rising from 1,059,111 contos to 3,013,442 contos. It may be granted that international agreements arising out of the war explain in part this particular increase, but the tendency is general. Thus the Banco Espírito Santo e Comercial, whose relations with Axis business are public and notorious, doubles its figures; from 558,538 contos they have sprung to 1,022,381.

Russia at War

Skilled and Unskilled Labour

ONE of the main problems preoccupying industrial managers in Russia recently has been the disproportion between skilled and unskilled labour in many factories. The training of skilled workers has apparently not kept pace with the influx of new unskilled labour into industry; and the dilution of labour reaches sometimes a point where the intake of more unskilled workers is useless, because the staff of technicians and engineers is too small to handle the newcomers properly. This difficulty was, for instance, reflected in a laconic telegram received by the People's Commissariat for Mortar Arms from a factory manager:—

Sixty workers taken on, chiefly housewives. Am refraining from taking on further workers in view of the absence of skilled cadres.

This factory manager hoped to get some skilled workers from outside. But the Commissariat could only warn him against any such hopes and urge him to start the training of the new workers by such means as he could find within his factory. The correspondence between the Commissariat and the factory manager, published in the press, is, no doubt, typical. It is said that trade schools, railway training schools and factory schools trained no less than 700,000 skilled workers during the first ten months of the war. But this was not enough to fill the gaps caused by mobilisation; and, as the network of trade schools has been unable to cope with all the vast training schemes, most of the training has to be done in the factories.

Cadres must be trained in your own factory, in your own workshop, by your own engineers, charge hands and old workers.

runs an instruction to directors of factories.

It is only natural that the results of such hasty factory training are not always satisfactory. Many of the "dilutees" do not fulfil their production quotas; instances have been mentioned in which about one-third of the factory crew produces less than the norm. Besides this, the factory trainees have been taught to carry out only one or two definite operations; thus they cannot be easily shifted from one job to another when industrial overhauls, which are frequent, make such adjustments necessary.

The situation has led the Central Council of Trade Unions to take action. In an appeal on May 27th, addressed to local branches and trade union groups, the Central Council laid down a ten-point "programme of action," which is, in itself, an interesting illustration of the rôle played by the Soviet trade unions in the present production drive:—

1. Assistance to workers in raising their productivity.
2. Keeping in touch with the technical experts and bringing production plans to their knowledge.
3. Struggle against stoppages of machinery.
4. Watching day by day the results

German Europe

Manpower Problems

By the incorporation of Polish, Belgian and Yugoslav territory, Germany's population increased from 79.4 millions in May, 1939, to 90.7 millions in 1941. If Luxemburg and Alsace-Lorraine are added to the territory now under German civil administration, the total population numbers roughly 92 millions. The number of foreign civilian workers employed in Germany has been officially given at various dates as follows:

(thousands)			
January, 1941.....	1,150	September, 1941....	2,139
April, 1941.....	1,539	February, 1942.....	2,138

Manpower has become the most acute problem in Germany. The total number of workers employed in German agriculture, industry, transport, commerce and finance has been given as follows:

(thousands)			
July, 1939.....	24,460	May, 1941.....	23,083
January, 1941.....	22,670	February, 1942.....	24,084

of the "socialist emulation" and aiding those who lag behind with their work. 5. Care for the proper use of devices and proposals for rationalisation of labour. 6. Organisation of "patronage" of skilled workers over the unskilled ones (so that "unskilled workers should be put for a period of two or three months under the supervision of skilled workers, who will teach them a trade"). 7. Proper distribution of new workers who have come from the trade schools. 8. Publishing of records obtained by Stakhanovites. 9. Control over dining-rooms and canteens in factories ("putting them in such an order as to preclude any loss of labour time"), and 10. Passing on of productive experience from factory to factory and from workshop to workshop.

It can easily be seen that all the points are concerned with "spurring on" the workers, and particularly the unskilled ones, to greater effort. Only the ninth point has a bearing on the workers' standard of living.

It is interesting to note that the trade union delegate has the right to intervene directly in the process of production ("through the foreman"—as the programme puts it). The party cell in an industrial establishment is entitled to act in the same way. There may, therefore, be some overlapping between industrial management, party cell and trade union—though all these elements work towards obtaining the same end—an increase in production.

Financial Agreement.—On June 27th, an agreement on financing British war supplies to the Soviet Government was signed in Moscow by the British Ambassador, Sir A. Kerr, and M. Mikoyan, the Russian Commissar for Foreign Trade. The agreement provides for delivery of war materials without payment; it is retrospective and will be considered as being in force since June 22, 1941. Part of the Inter-Allied Lend-Lease arrangements it applies to deliveries of war materials and armaments only. Other deliveries of raw materials and equipment have hitherto been based on the agreement of August 16, 1941, under which Britain granted the USSR a credit of £10 millions. This limit, it has been stated in Moscow, has now been nearly reached, and the British Government has recently opened to the Russian Government a new credit account of £25 millions.

Sugar Beet.—The shortage of sugar is expected to be somewhat eased by this year's good beet harvest. The main sugar beet areas are now in the central Asiatic republics, Kirghisia and Uzbekistan. The areas sown there are said to be 250-300 per cent larger than they were last year; but it should be remembered that sugar cultivation in those republics used to be on a negligible scale, so that a high percentage increase in area does not necessarily mean a correspondingly high output in absolute figures. Most of the Asiatic plantations are artificially irrigated. The expected yield per acre is 16 tons; and some Kirghisian plantations gather as much as 20 tons. The refineries, which have been evacuated from the Ukraine, are being set up in the vicinity of the plantations.

These figures include foreign civilian workers. The increase of a million from May, 1941 to February, 1942, is of particular interest. Official figures suggest that, during this period, only 600,000 foreign workers were brought in, so that, in spite of very heavy recruiting for the forces, it is made to appear, first, that the men called up were replaced, and, secondly, that an additional 400,000 German workers were found. Actually, there is little doubt that these statistics are deliberately misleading. The increase between May last year and February this year can only be explained by the fact that the population of the incorporated territories has been added to the figures since the beginning of last year; it can be roughly estimated that an additional labour force of some 4 millions is available in the incorporated territories, with their total population of about 12 millions. During the same period, a considerable number of extra married women have been employed, mainly on part-time work, though the figures obviously count each of them as a full worker.

The fact is that the frenzied campaign for recruiting more foreign workers, the appointment of a labour dictator,

and the introduction of compulsory labour on the land bely the optimistic impression given by the official statistics. The total labour force, reckoned in man-hours, may perhaps have been maintained at the level of May, 1941, but only by drawing workers from the incorporated territories into the industries of Greater Germany. The composition of the foreign workers in Germany has changed. The number of French workers, for example, increased from 48,500 in September, 1941, to 160,000 in May, 1942; similar increases were reported in the numbers of Belgian, Dutch and Italian workers. The total number of foreign workers, however, remained unchanged, which means that Hungarian, Slovakian and Roumanian workers were mobilised for military service.

At present, the main source of additional labour seems to be prisoners of war, who are not included in the official statistics. The number of employed prisoners of war, mainly on the land, rose from one million in January, 1941, to 1.5 million in September, 1941, and may now have reached at least 2.5 million. If Germany's effort during 1914-18 is taken as a guide, it can be estimated that the utmost number of men that Germany can mobilise for military service from her present increased population is about 17 million, that is, 80 per cent of the entire male population between the ages from 18 to 47 years. If this figure has been reached, it means that some 15 million men had been mobilised since July, 1939, which seems a stupendous total. The most conservative estimates of losses in manpower since the beginning of the war, and of the men required for the occupation of a great number of countries, and the necessity of training at least two classes of men at a time, make it clear that the total number of men mobilised up to the present period cannot be far from 16 millions. This would mean, after deducting at least four million losses in dead, wounded and prisoners, a total strength of roughly 12 millions. The ceiling has been reached. The great number of additional workers brought in have made this total mobilisation possible. Now every soldier killed or permanently disabled is an irreplaceable loss—after the classes who have been trained during the winter and spring have been used up.

This explains why Germany's allies have been called upon to provide more soldiers. The grand total of the population of the allied and satellite countries, that is, Italy, Slovakia, Hungary, Roumania, Croatia, Finland, is about 94 millions, or about the same as the population of Greater Germany. This seems an enormous reserve. But these predominantly agricultural countries would be crippled if they were mobilised to the hilt; their armies must, moreover, be equipped by German production. The European countries under German occupation are inhabited by roughly 101 million people. All of them have either lost great numbers of prisoners, or sent considerable numbers of workers to Germany; their capacity to supply more workers for Germany is, to say the least, strained. Every calculation must be speculative and tentative, but the fact seems inescapable that Germany's striking power depends increasingly on millions of people of non-German nationality.

Department Stores.—The biggest German department store, *R. Karstadt A. G. Berlin*, points out in its annual report for 1941 that the value of the total turnover increased slightly compared with 1940. The value of stocks remained unchanged. The annual reports of other department stores show the same tendency. The volume of turnover fell greatly. Actually the stores are selling mainly rationed commodities. The explanation is that the prices of the main articles, such as textiles and clothing, sold by the stores have increased considerably. By value, the main groups of articles shared in the turnover as follows:—

	1938	1940	1941
	%	%	%
Foodstuffs.....	9.1	7.3	6.6
Textiles and clothing.....	60.4	58.0	60.0
Furniture.....	17.5	17.2	15.9
Miscellaneous.....	13.0	17.5	17.5

The fall in the turnover of foodstuffs, where prices have been more closely controlled, is obvious. It shows at the same time that non-rationed foodstuffs, such as poultry, and fruit, in which the stores specialised before the war, have disappeared. Prices of textiles and clothing are on an average 50 per cent above the level of August, 1939, and this is explained by a genuine increase in the costs of production. The share of miscellaneous articles has considerably risen during the war, which reflects higher prices for unrationed commodities. The most interesting point is that the number of customers is now greater than before the war, which indicates concentration in the retail trade. Sales are now

more evenly spread over the whole year. Male employees of military age have disappeared completely and all reports speak of labour difficulties.

★

Co-operative Aid.—The continued wave of concentration has put new and heavy demands on the system of co-operative aid for closed down industries which was introduced in 1939. By imposing a levy on the entire industry a fund of Rm 32 millions had been accumulated during 1939-40. At the beginning of 1942, roughly 3,000 applications for financial aid for maintaining factories and shops had been received, and roughly two thirds of the funds had been paid out to applicants, half of whom belonged to the stone-quarrying and earthenware industries. The situation has now changed and the list of new applicants is headed by the textile industry. Greater funds are needed to meet requirements and the banks will also contribute to the funds. It appears that, for the first time, the larger and more modern factories, which have had to close down under the new scheme of concentration, have applied for financial aid.

★

Textile Fibres.—Concentration in the artificial textile fibre industry under German domination continues. The three leading Dutch manufacturers—*AKU, the Hollandsche Kunstzidje* and the *Kunstzidjespinnerij Nyma*—have combined in an "efficiency co-operative." The German concern *Vereingte Glanzstoffgrupp* has close connection with *AKU*, which in its turn has subsidiaries in France, Spain, and Italy. The manufacture of cellwool with straw as the raw material will shortly begin in Holland. Collaboration between the German and French industries has become even closer. The concern *France Rayonne* is building new capacity on the basis of beechwood, after the example of German concerns, which own 33 per cent of the capital of *France Rayonne*. The German *Phrix* group owns 26 per cent of the capital of the Spanish company *Fefesa*, which will begin production this autumn, also using straw. The *Norsk-Cellulfabrik* in Norway and *Fabela* in Belgium are also using German patents.

INTRODUCING—

Cigarlets

THE CIGAR'S LITTLE BROTHER

And not quite so little! CIGARLETS are Cigars in miniature, in a cigarette paper wrapping and are a good satisfying smoke. Made from choice imported Cigar Tobaccos, CIGARLETS rival their big Brothers in taste, fragrance and aroma.

THE BUSINESS WORLD

Companies' Liquid Resources

ONE of the commonest complaints about the effects of EPT is that the tax will tend to exhaust the liquid resources of those paying it, and so to complicate still further the process of post-war adjustment. If this contention is correct, its effect should by now be apparent in the relation between floating assets and current liabilities in company balance sheets. With the object of providing an answer to this question, and of throwing light on a number of cognate problems, an analysis has been made of a batch of accounts, 416 in number, presented during the first quarter of the current year. In view of the growing practice of lumping all current liabilities other than bank debts under one heading, only two items can be presented on that side of the account. Liabilities all too frequently include reserves for contingencies, and the whole value of the movement in *net* floating assets depends on the extent to which these contingencies mature. It is, however, reasonable to assume that their inclusion under current liabilities is some sort of guarantee that the contingency in mind is not the post-war replacement of plant.

Current liabilities exclude inter-company debts, and include final dividends and other payments, shown as due in the report, whether they are so included in the accounts or not. Similarly, debtors exclude inter-company loans and include payments in advance. The other items are self-explanatory, except that it must be borne in mind that most companies do not state their holding of gilt-edged securities separately, so that the figure of Government securities applies only to a moderate and by no means random sample of the whole. Other investments exclude, so far as may be, not only holdings in subsidiary and associated companies, stated as such, but definite trade investments of a permanent character. The types of company covered are those contained in *The Economist* profits index, but no accounts of oil, rubber or tea companies with financial years ending in the fourth quarter were received.

The accounts presented in the first quarter of this year were made up to dates ranging from March, 1941, to February, 1942. It is doubtful whether the aggregate figures are of any value; but they are given as material for those who care to use them. Further, it was necessary to split the accounts into three groups: First, those without subsidiaries or whose subsidiaries were of such modest importance, relative to the parent, as not to call for a consolidated balance sheet; secondly, those which presented a con-

solidated account; and thirdly, those for which a consolidated statement was desirable, but which did not provide one. The numbers of companies in these three groups were 301, 30 and 85 respectively, but the aggregate floating assets of the third group exceeded those of the first two combined. This is further evidence of the highly unsatisfactory nature of British company accounts to-day, for the absence of consolidated balance sheets makes it impossible to draw any really valid conclusions from the figures of the third group.

In the circumstances it has seemed most helpful to concentrate, in this first tentative survey, on the figures of 212 companies of Groups I and II, whose accounts were made up to some date in the final quarter of the year, usually to December 31st. Figures for three years are given in the second part of the table at the foot of this page. It will be seen that, with the exception of bank loans and other investments, every item shows a rise in each year, but that the increase was much more marked in 1940 than last year, except for debtors, where the expansion was only slightly less in the later period. While there is reason to suppose that the percentage increase in the figures, even of those industries working for the Services, underestimates the average expansion of output, there would appear to be no justification for assuming that the factors involved vitiate the comparison between the yearly fluctuations. A further dissection of the figures shows, however, that the slackening in the rate of increase, particularly in the items debtors and stock-in-trade which best reflect activity, is due entirely to measures taken to restrict private consumption. A group of companies producing food, drink and tobacco, and distributing these and other goods, shows a modest decline in total floating assets during 1941 after an increase, which was above the average, in 1940. Meanwhile, the total increase in the case of other manufacturing companies was little changed, while that in debtors and stock increased in the later period. The value of these figures as an indication of the physical volume of stocks is reduced by lack of information about the basis of valuation, but the general conclusion, that there was substantial progress last year, but, according to this small collection, little in 1940, in the switching of a larger share of total effort to the production of war material, appears to be valid. The relevant figures for two groups of companies, the one catering solely for the individual and the other

producing mainly capital goods are given in the following table:—

	Accounts to last Quarter of Year Figures in £1,000,000's					
	Consumption Goods			Capital Goods		
	1939	1940	1941	1939	1940	1941
Bank loans	0.8	0.5	0.5	1.2	1.0	1.6
Other current liabilities	13.8	20.6	18.9	25.9	34.2	44.5
Total	14.4	21.1	19.4	27.1	35.2	46.1
Cash	12.1	13.5	12.6	7.8	8.2	9.4
Debtors	6.6	6.7	5.9	19.0	22.3	26.9
Stock-in-Trade	14.8	16.8	16.9	22.3	25.3	29.1
Government Stocks	3.0	7.5	8.3	5.9	7.6	6.6
Other non-trade investments	3.1	5.1	3.8	2.3	3.1	3.0
Total	39.6	47.6	47.5	57.3	66.5	75.0
Net floating assets	25.2	26.5	28.1	30.2	31.3	28.9

If the general picture of British industry, as presented by the 212 companies, is taken as a whole, it will be seen that the rise in *net* liquid assets was virtually arrested last year. Actually, the small increase is less than the amount received by four shipping companies in respect of ships lost during the twelvemonth. Further, it will be seen from the table above that there was an improvement for the capital products group in the earlier year and a falling off in the later one. This may well owe something to the basis for the calculation of stocks, and possibly even more to the composition of the current liabilities item; but it suggests, in the context of rising prices and turnover, that liquid resources are less adequate. It must, however, be remembered that there is a 20 per cent refund of EPT, of which the accounts take no cognisance, while it is not improbable that, where the tax has not been fixed, the allowance for it under contingencies is on the generous side.

Another matter of some interest is the degree of liquidity of the actual floating assets. It will be seen from the percentage figures, given in the second part of the first table, that the proportion held in investments has declined despite a sharp percentage increase in holdings of Government paper of one sort and another, including Tax Reserve Certificates. The really large increases are in debtors and stock-in-trade, and, as already suggested, the published figures understate the case in this respect. In actual figures, there is a decline in other investments in the two-year period, and since this figure, in all probability, conceals a considerable rise in holdings of gilt-edged stocks, the real

fail has probably been substantial in amount. With fuller figures, it may be possible to make a guess about the extent of the expansion in the total holding of the Funds, but it is a pity that all companies are not required to provide a reasonable classification of their investments.

In normal times a decline in the ratio between floating assets and current liabilities, and the fact that well over half the total absolute increase in the former was in debtors and stock-in-trade, would cause misgiving, which would be in part offset by the growth in gilt-edged holdings. In existing circumstances the reverse may prove to be the right attitude, at least as concerns the distribution of the assets. It is improbable that the consumption trades are making bad debts, and such stocks as they have should prove a source of profit; but if the decline in the ratio is real, and if it continues, a serious position may result. The increase in net liquid assets during the two years is only some 4.76 per cent. It represents 17.7 per cent on the 1939 value of stock-in-trade, and to restore the companies to their position at that time the physical volume of that item has to be maintained and capital losses made good. The rise in wholesale prices on the two years, according to the Board of Trade index, was 28.9 per cent.

There is some indication that the figures may not be representative in the fact that the rise in net liquid assets is distinctly higher, both for the 416 companies reporting in the first quarter and for the 53 concerns in the third group, the relevant figures for which are given in the final section of the table on page 18.

The figures serve to stress the relatively small part played by bank finance in industry today, but they should furnish some guidance about the total of bank advances which are made to industry and the extent to which industry is responsible for their fluctuation. Unfortunately, so few companies differentiate between cash in hand and cash at bank that it has not been worth while to prepare separate figures. It will, therefore, be difficult to estimate the extent to which bank deposits are received from industry and trade without some guidance about the change in companies' holdings of currency, itself a matter of speculation.

Finally, since the figures are an investigation of the liquid position, no attempt has been made to bring in either repayments of capital or new expenditure on fixed assets. If this could be done, some measure of new investment or dis-investment would be provided. But here again inquiry is balked by the inadequacy of information in British accounts, for while repayments of capital are easily traced, there is seldom any means of discovering the absolute amount devoted to new capital expenditure.

Finance and Banking

Credit Expansion

In the general opinion, the turnover of money on the final day of June was as large as any in the history of the market, and the special assistance needed to prevent credit stringency was also substantial. By allowing end of June maturities both of Treasury bills and Treasury deposits to run off, the banks and the market forced the Treasury to expand credit by £36.3 millions of ways and means borrowing from the Bank of England; but the banks nevertheless called in the 'bulk' of the 'bad money' against which the market had been financing its heavy Treasury bill allotments in the later part of the month. Fortunately, the market was well provided with short-dated maturities acceptable to the special buyer, whose purchases were estimated at more than £20,000,000. That special buying should have been necessary on so large a scale is partly explained by the Bank return, which shows that some £11,000,000 of the additional credit was absorbed by a contraction in the reserve, as the counterpart of note withdrawals, and by an increase in public and "other" deposits. Bankers' deposits consequently show a rise of only £38 millions to £171.6 millions, notwithstanding an addition of £49 millions to the Banking Department's securities holdings. These movements naturally do not show the full extent of the credit expansion over the turn of the month, when bankers' deposits probably reached £190 millions. The note circulation reaches a fresh record level of £801.6 millions, with a further expansion of £5.6 millions, against only £4.4 millions in the corresponding week last year. No doubt the rise is partly

explicable by end of the month requirements, but it may be noted that the resumption of the upward trend in the previous week was associated with a sharp relapse in small savings.

* * *

Book-keeping of Canadian Aid

The importance of Canada's assistance to this country is attested by its influence on the national accounts. Thus the remarkable buoyancy of revenue in the first quarter of the financial year is partly due to the inclusion under this heading of £98.1 millions in respect of Canadian Government contribution, representing some £435 millions of the \$1,000 millions gift. Even if this factor is excluded, however, revenue from domestic sources shows a rise of over £137 millions. It will be recalled that in addition to the \$1,000 million gift, Canada agreed to convert \$700 millions of accumulated sterling into a loan free of interest until after the war, when an appropriate rate of interest and terms of repayment are to be negotiated. This operation has now been carried out and is reflected in the June debt return in the conversion of £157.3 millions of Treasury bills into "other debt." Another operation which must have its main counterpart in the redemption of Treasury bills into "other debt." Another operation which must cent Funding Loan, 1959-69, for the National Debt Commissioners. It would, therefore, seem that the apparent decline of £141.8 millions in Treasury bills outstanding

return on others is very moderate. More interesting than the actual terms, which have been set out below, is the method of covering any balance of new stock offered not taken in conversion of the old. In return for a commission, which has so far worked out at about $\frac{1}{4}$ per cent, underwriters of the issue guarantee to take any stock not applied for in conversion, and to retain it. Only insurance companies, investment trusts and similar undertakings will be accepted as underwriters and the object of the arrangement is said to be the familiar one of preventing competition with the Government's own issues. This may be the intention, but it is difficult to see that it does any more than substitute for the potential demand of the underwriters on the market the actual demands of those holders who do not accept conversion. The Treasury has already intimated to insurance companies that a purchase of any but its own issues would be considered against the national interest—and has probably given a similar hint to other institutions—so that the arrangement seems more calculated to grant relief to these institutions than to assure the utmost demand for Government stocks, since there is substituted for a demand which is controlled, one over which the authorities have little or no means of influence.

The Conversion Offers

In addition to the brewery offers, Plymouth now announces the terms for the conversion of a part of its maturing 3 per cent stock, while Crosse and Blackwell are repaying the whole of their 6 $\frac{1}{2}$ per cent debenture, not a part, which was all they were prepared to do when they sought Treasury sanction some time back. Details of the various offers are given in the table below. The issue prices are net of any cash payment which is to be made to those accepting conversion of the old stock. The redemption dates for the new stock are the latest possible and most of them are to be repaid over a period of years.

Name	Amount Repayable	Rate %	Repaid at	Amount Offered	Rate %	Date Final	Issue Price
Bass	1,982,511	5 $\frac{1}{2}$	101	1,500,000	3 $\frac{1}{2}$	1976	101
Courage	324,715	5 $\frac{1}{2}$	105	324,715	4	1979	102
Portsmouth & Brighton	230,000	4 $\frac{1}{2}$	101	438,340	4	1973	99
Crosse & Blackwell	208,340	6	101				
	1,179,564	6 $\frac{1}{2}$	100				
Plymouth Corpn.	981,242	3	100	600,000	3 $\frac{1}{2}$	1982	100

It will be seen that in addition to the Crosse and Blackwell repayment, Bass and the Plymouth Corporation are both paying off considerable sums. The terms of Plymouth appear a trifle meagre, but the 3 per cent stock of Aberdeen, with a maximum life three years greater, stands at some 98 $\frac{1}{2}$ after deducting accrued interest in the price. With the exception of the last named the new issues should be attractive to raise the very modest return obtainable in trustee securities.

Nominee Holdings

In reply to a question in the House last week, the President of the Board of Trade stated that the Defence Regulations give the necessary power to compel disclosure of the real ownership of shares held by nominees, and that it is within the discretion of the Minister, to whom the facts are disclosed, to publish the information. On the larger subject of a general prohibition of nominee holdings, he stated that Parliamentary time is not now available for the alterations of the Companies Act involved. This reply seems to betray a complete lack of appreciation of the importance which a large and growing section of the public attributes to proper publicity in these matters. It is symptomatic that in only one case has the public been given any information as to beneficial ownership in the cases where it has been specifically sought, and that there is no other case on record where disclosure to the relevant Minister has been demanded. The more general aspect of this matter was dealt with in *The Economist* of April 11th. Since then several questions

have been asked in Parliament, all with negative results. Nominee holdings are, however, only one of many points of company law and practice which urgently need overhaul. It is no exaggeration to say that it would constitute a considerable stimulus to the war effort to bring both law and practice more in line with modern thought. The trouble is, of course, that consent cannot be secured without lengthy discussion. If this is impossible in time of war, it is a matter which should have a high priority among post-war measures of reconstruction, and it would do good if the need for reform were officially stressed, and a preliminary investigation were set on foot now. It is too commonly assumed that purely physical needs are the only ones which are worth consideration at this stage, whereas much that is best calculated to affect morale and the war effort lies in the sphere of removing, both misapprehensions, and solid grounds of complaint.

Company Notes

"Shell" Earnings Recovery

The maintenance of the tax-free ordinary dividend on "Shell" Transport and Trading at 5 per cent, by a second interim of half that amount, announced at the beginning of last month, had left the price of the shares virtually unchanged. The full accounts, now to hand, show a fall in income from £2,382,822 to £2,367,778, and after meeting fees and maintaining the dividends, it is possible to raise the carry forward from £519,794 to £586,540. The accounts are as uninformative as ever, and the only movements of any importance in the balance-sheet are falls of about £315,000 each in the value of properties and interests, and in cash, more than offset by rises of £775,000 in investments and £144,000 in debtors. The net increase has been financed by the significant expansion of £218,000 in unclaimed dividends to £369,000. If the accounts are not helpful, the same cannot be said of Lord Bearsted's statement. As the market price of the ordinary shares gives the net assets a value not much short of twice their balance-sheet figure, the market may not attach much importance to his assurance that, after all losses to date, properties are still worth the figure they stand at. Of more immediate interest are his reminders that, while the group will get much new and up-to-date installation and equipment after the war, these will take time to build, and that, while results for the current year to date are better than those of a year ago, the outlook for the whole year is uncertain. There is also a largely post-war interest in the news that a new field of commercial importance has been discovered in Colombia. He was also able to give the news that no negotiations had been undertaken about the Mexican Eagle property, a statement which caused severe disappointment among some of the optimists of the oil share market. From several angles the effect of the statement is to stress the extreme importance of the American interests of the group, and the fact that the expansion in refining capacity is taking place in that country. Lord Bearsted is, however, probably satisfied that the increased demand for products will not be of an ephemeral nature, for, in commenting on the anxieties of shipping and civil aviation concerns as to post-war competition, he expresses the view that there will be plenty of room for both, and, presumably, plenty of demand for petroleum products. Since the date of the dividend, events in the North African theatre have caused a net fall in the price of "Shell" ordinary of some 4s. to 4s. 7 $\frac{1}{2}$ d., at which the yield is £4 7s. 9d. per cent, less tax.

Elder Dempster Assets

A further layer of blackout has been interposed between the shareholders of *Elder Dempster Lines Holdings*, and the facts of the operating company's working. The latter ceased to differentiate between different sources of revenue in 1937; in 1940 it gave earnings net of all costs, other than directors' fees, and for 1941 it gives profit after taxation and deferred repairs. This figure of £385,916 appears to compare with one of £537,495 for 1940. If so, the fall is almost entirely made good by the fact that depreciation is cut from £318,475 to £179,293, leaving the percentage earned on ordinary capital unchanged at 16.4. The dividend is repeated at 10 per cent, and this enables the Holdings company to repeat its distribution of 9 per cent, announced rather over a fortnight ago. The operating company again adds £75,000 to reserve and slightly increases its carry forward, but the Holdings company has

to make a small draft on the amount brought in to meet the dividend. If the profit and loss account of the operating company is uninformative, the balance-sheet is eloquent. The principal items of both are set out below, together with comparisons for the two preceding years:—

	Years ended December 31st, 1939	1940	1941
Fleet valuation	2,513,000	1,853,075	985,890
Depreciation of fleet	300,000	300,000	155,597
Fleet Replacement Account	—	990,525	2,123,194
Government Tonnage Account	—	302,600	765,500
General Investments	772,000	2,042,456	3,685,236
Net liquid assets†	681,000	2,465,000	4,312,319
Earned for Ordinary	206,717	217,520	205,122
Paid on ordinary	143,125	132,500	125,000
Paid %	9	10	10
Earned %	13.0	16.4	16.4
Holding Company	8	9	9
Paid %	—	—	—

† Excluding inter-company items.

As will be seen, there is a reduction in the fleet valuation in 1941, before deducting depreciation, of some £867,000, while the company's fleet replacement account is up by £1,133,000, suggesting that £2,000,000 has been received on account of ships lost. This follows on a corresponding figure of £1,350,000 during 1940. There is also a further credit of £462,900 in the GTRA, which can only be drawn upon as tonnage is actually replaced. The bulk of the funds received have gone to swell gilt-edged holdings by some £1,676,000. A rise of £929,000 in the omnibus item sundry creditors, voyage accounts, taxation and reserves for repairs, may be set against rises of £824,000 in cash and £340,000 in debtors. Stocks are also a trifle higher, and a loan of some £40,000 to a subsidiary is substituted for borrowing of some £36,000 from one a year before. It is impossible to extract any detailed information as to results from these figures, but it would seem that earnings from the ownership and management of ships must still be very substantial, since the annual net income from investments at the increased figure shown in the balance-sheet, could scarcely exceed £75,000. The shares of the Holdings company stand at 27s., giving a yield of £6 13s. 4d. per cent.

Distillers' Preliminary

According to the preliminary statement, the profit after fees disclosed by Distillers for the year ended May 15th last is reduced from £2,110,936 to £1,962,168. In 1940-41 there was added back to profit a sum of £78,137, not included above, representing the difference in tax on the final dividends of 1939-40 due to the raising of the rate to 8s. 6d. No similar windfall accrues to the company in 1941-42. Since the disclosed profit is computed after depreciation on buildings, plant and investments, as well as tax and contingency provisions, it is not possible to assess with any accuracy the actual results of the year's trading. Nevertheless, it appears that the company has well withstood the strain of restrictions on domestic sales of spirits, increased prices of raw materials and possibly reduced exports. At current rates of tax, the preference dividend, which last year absorbed £70,950, should require some £66,000, while the allocation to the fire insurance fund is reduced from £225,000 to only £100,000. Hence, it can be assumed that the ordinary dividend, which is maintained at 16 $\frac{1}{2}$ per cent by a final of 10 per cent, including a bonus of 1 $\frac{1}{2}$ per cent, is covered by earnings but little lower than the £1,814,986 of last year. The allocation to reserve is reduced £100,000 to £500,000, but the difference is placed to a newly created war contingency fund. The higher current rate of tax should reduce the net payment on the equity from £1,286,256 to approximately £1,216,096, and possibly on account of this the draft on the carry forward, swollen last year by the addition of £78,137 tax rebate to £544,139, is hardly £20,000. On the news of the maintenance of the dividend the £1 ordinary stock rallied to 74s. 3d., at which the yield is some £4 8s. 9d.

Ironfounders' Recovery

The full accounts of Allied Ironfounders for the year to March 31st last leave no possible doubt that, after two disappointing years, the group has found its niche in the war effort. The revenue, consisting almost entirely of dividends less tax from subsidiaries, is up from £114,853 to a high record of £322,259, while the actual earnings of operat-

ing companies, after all costs, depreciation and ARP, are £423,726 against £220,849. It is stated that the statutory provision for income tax, after taking account of credits from previous years, is £90,469, against £104,688, while the corresponding figures for NDC are £20,131 and £10,927 respectively. Further provision, by way of income-tax reserve, is made in the accounts of the parent company of £110,000, compared with £25,000 a year ago. This and preference dividend are almost the only charges against revenue, and the amount earned on the ordinary capital jumps from 6.0 to 19.8 per cent, while the distribution is raised from 6 to 12 $\frac{1}{2}$ per cent for the first time since 1935. Revenue and its appropriation for the past three years is set out below:—

	Years to March 31st, 1940	1941	1942
Total Revenue	113,677	114,853	322,259
Directors	2,811	2,827	7,909
Tax Reserve	—	25,000	110,000
Preference div.	41,773	36,019	35,962
Ordinary shares:—			
Earned	69,093	51,007	168,389
Paid	53,372	50,639	106,374
Earned %	6.5	6.0	19.8
Paid %	5	6	12 $\frac{1}{2}$

Reserves 178,197 | 179,617 | 160,000 || Carry forward† | 178,197 | 179,617 | 183,706 |
| † Of which half to General and half to Contingencies Reserve. | | | |
| ‡ After crediting tax refunds of £1,558, £1,052 and £2,014. | | | |

The report gives no clue to the cause of the improvement, but the statutory balance-sheet shows substantial expansion in net loans to subsidiaries, while the consolidated statement suggests a considerable expansion in business, which can scarcely have occurred in normal domestic equipment, unless the construction of new dwellings for displaced workers is on a scale far greater than was supposed. Fixed assets of the group show a slight decline, while floating assets are up by £346,122 to £1,694,790. Against this there is an increase of only £125,855 in creditors, including the final dividend of the parent. In consequence the excess of the book value of holdings in subsidiaries—in the accounts of the parent—over the tangible assets of the companies in question is reduced from £323,201 to £161,351. The principal rises in floating assets are some £101,000 in stock in trade and £134,000 in debtors. The £1 ordinary shares of Allied Ironfounders stand at 28s. 9d. ex dividend, giving a yield of £8 13s. 11d. per cent.

Plaster Board Surprise

It has always seemed that the principal products of British Plaster Board should be adaptable to the exigencies of wartime construction and repair, and there was some surprise, if not at the decline in 1939-40, at least in the failure of profits to recover in the following year. Now, apparently, the expected has happened, for the directors have declared a final dividend of 15 per cent, making 25 for the year ended March 31st last, against 15 per cent for the previous year. Taking account of the 100 per cent share bonus, given in 1940, this is as good as the best touched in the 35 months ended March, 1939, and compares with a 15 per cent distribution, on the basis of the present capital, for the first year of the company's existence as a public body, namely, 1932-33. A preliminary statement of results shows that consolidated earnings of the group, available for dividends, have increased to £390,969, from £214,383, while the corresponding figure for the company is £357,827, compared with £211,203. After writing back tax these appear to be new high levels, giving a percentage earned on the ordinary capital of around 44, compared with 24.6 per cent for 1940-41, and a previous high, equivalent to 35.8 per cent on the present capital, for 1936-37. The market gave the news a good reception, marking the 5s. shares up to 23s., at which the yield is £5 10s. 6d. per cent.

Industry and Trade

The New Landlord

Almost unnoticed, the ownership of Great Britain's vast coal estate, estimated at 190,000 million tons, passed from private interests to the state last Wednesday. The decision to nationalise Great Britain's coal resources was taken almost exactly four years ago—the Coal Act was passed on July 29, 1938. The legal ownership of the coal is vested in the Coal Commission set up by the Act. The Commission, which was appointed by the Board of Trade, consists of a chairman (Sir Ernest Gowers) and four other members, all independent of the coal-mining industry. Two of the members must have had practical experience in coal-mining, one of them in the capacity of wage-earner. The function of the Commission as landlord is to promote "the interests, efficiency and better organisation of the coal-mining industry," but it is not to engage in the operations of mining other than searching and boring for coal. Under the Act, the Board of Trade was given power to give "general directions" to the Commission, in matters affecting the national interest. The nationalisation of the coal estate will not have any immediate effect on output, but it will facilitate the reorganisation of the mining industry, which remains a private enterprise. The price of acquisition, to be financed by a loan, was fixed at £66,450,000, on the basis of fifteen years' purchase of the income from royalties. The process of valuing individual claims has not yet been completed, but the Coal Commission is empowered by the Coal Act, 1938, to make payments on account, pending the completion of the valuations.

Soft Drinks Concentration

Nearly 150,000,000 gallons of soft drinks are produced annually in Great Britain, in hundreds of factories, using labour, machinery, transport, home produced and imported raw materials. The soft drinks industry is now under the axe of the Ministry of Food Concentration Committee. It is expected that over 200 factories will be released in the first stage of concentration and further concentration may occur later. The objects of the scheme are the same as those set in other industrial concentration schemes. According to Ministry of Food plans, concentration will not affect the actual quantity of soft drinks available to the public. Not only is production to be concentrated, but also the drinks themselves. They can then be diluted by the consumer. The quantity of ready-to-drink drinks is to be reduced. This change in production will mean first of all a large economy in transport. It would be easy to reduce the output of soft drinks of 150,000,000 gallons by a third, and this would mean a saving of nearly 750,000 tons of transport (calculating about 30 lbs. to a gallon, including the bottles and crates). A sector scheme for transport and production will also be introduced, special consideration being given to those districts where the population, and especially the working population, has greatly increased since the war. Problems of compensation and finance are complicated, but it is expected that the industry itself will find a way of solving them. It is noteworthy that the Ministry intends to abolish entirely the names of the manufacturers on the labels, and, as well as controlling minimum standards, to impose a national label. This is the first time that the Ministry has decided to introduce a national label for a branded food product. In the case of jam, sweets, chocolates, pastes, and so on, standards were introduced, but manufacturers were allowed to produce the goods under their own name. The scheme is not yet worked out in detail, and some changes may be introduced to meet the wishes of the trade. A wartime association for the industry with a compulsory membership was formed under the direct control of the Ministry of Food some weeks ago and all the plans are swiftly being put into operation.

Milk Distribution

Rationalisation of milk deliveries, on the basis of the White Paper on Milk, published on May 26th, has already begun in some areas, and the Ministry of Food has issued notes of guidance for local committees of the war-time associations of retail dairymen. The Ministry recommends that schemes should be so planned as to maintain deliveries every day during the summer months, to ensure the most

efficient use of processing and bottling facilities, premises and equipment. The loss to the consumer of his choice of supplier must not involve any loss of quality, and provision is recommended whereby the consumer gets the kind of milk to which he is accustomed. Detailed guidance is given on the constitution of local associations and committees. Each association must include all retailers in the area who deliver milk, and the committee must have a representative on it of every type of retailer in the area. Voting of members for the purpose of electing the committee and of general policy is to be proportionate to the quantity of milk sold, but the committee of management is to have one vote per person. Schemes must be submitted to the Ministry of Food for approval, and minorities are allowed to submit reports. The consumer will accept rationalisation of milk deliveries with as good a grace as he accepts all other restrictions on choice, if rationalisation is efficiently managed.

Quality of Milk

The restriction on consumers' choice which is involved by schemes of distribution planned to save transport are made less irksome by the standardisation of the articles involved. There is indeed a duty in this respect to see that no consumer suffers by being compelled to purchase inferior goods. Manufacturing specifications are laid down by the Ministry of Food for most of the foods covered by the sector scheme which is to begin on August 24th. As part of the new milk policy, milk is to be tested and classified under three headings: market, salvage and rejected. Thus, milk of poor keeping quality will not go to consumers, either directly or mixed with other grades. The market category will be added to the existing "T.T." and "accredited" classifications, all of which will supply the liquid market. Milk suitable for manufacturing processes will be paid for at "salvage" prices, and "rejected" milk will receive no price. The testing of milk for keeping quality is under the administration of the Ministry of Agriculture and has already begun. Facilities will be made available for technical advice to farmers and distributors on how to raise the quality of their milk to "market" standard. It is contemplated that, on the basis of the tests, milk may be paid for at different rates.

The Coal Bill

The increase in miners' wages, payable from June 1st, has been estimated to add £23½ million to the annual wages bill of the coal mining industry. The Government has decided that the bill should be met by the consumer. On Tuesday, it was announced that the Ministry of Fuel and Power had authorised an advance of 3s. a ton in the pit-head price of coal from July 3rd. The price of coal to the consumer has been raised correspondingly. The increase is not only in respect of the addition to the wages bill, but also covers higher costs already incurred in certain mining districts. Little news has been heard, since the Government's approval of the coal plan, of the steps taken to secure an expansion in output. It is to be hoped that output can be speeded up in time to enable the Ministry of Fuel and Power to accumulate a substantial reserve during the next three months.

Retail Trade Concentration

The recommendations of the retail trade committee's third report, Concentration in the Retail Non-Food Trades (commented upon in a leading article on page 4), fall roughly into two parts. One part deals with the position and commitments of the retailer who continues in business, and the other with the position and benefits accruing to the retailer who decides to withdraw. Since the retailer who continues in business will derive advantage from the withdrawal of other retailers, withdrawal is to be financed by the continuing firms.

1. A levy, based on turnover, is suggested, to begin at the rate of one per cent. The Committee considers that this rate should not be exceeded without further investigation, and that the levy should be considered as a business charge.

2. The levy would be paid into a fund to be known as the *Retail Concentration Insurance Fund*, to be used to assist traders to withdraw from retail trade for the duration of the scheme. It is assumed that the chief reason why traders operating at a loss remain in business is because contractual obligations (mainly rent) continue.

3. Assistance for withdrawal would be by means of *standard benefit* or *special benefit*. *Standard benefit*, it is recommended, should be at the rate of 5 per cent of the twelve months' turnover immediately prior to withdrawal. This benefit would be paid for the duration of the scheme, but would cease at the first opportunity provided by the lease. *Special benefit* is to meet the needs of retailers whose contractual obligations are small or of short duration; it would be paid at the same rate as the *standard benefit*, but only for a period of six months and with a maximum of £125.

4. The Committee suggests that provision should be made for the re-entry of traders into retailing after the war. A certificate granting rights of re-entry to the trade would be granted in all cases. Where benefit would be paid for the duration of the scheme, an additional certificate of right to re-occupy actual premises would be granted.

5. The levy would be *compulsory* on all traders with a turnover exceeding £1,000 per annum. Traders whose turnover is less would have the *option* either of paying the levy from the start of the scheme, and insuring for withdrawal benefit, or of contracting out of the scheme.

6. A section of the Report deals with the financial structure of the scheme—the basis of the levy, turnover records, machinery of collection and for benefits, and uses for empty shops. It is recommended that the scheme should be administered by a small *central authority*, consisting of persons of wide trade experience and independent persons of standing.

Backyard Hens

The shortage of balancer meal is likely to prove a sad blow to many of the million households with hens in the back garden. On October 1st, the end of the current rationing period for domestic poultry, a ration for one hen will be given only on the surrender from July 27th of a shell egg registration. Until October 1st, no cutting-down of poultry flocks will be necessary, since the ration at the rate of 4 lbs. of balancer meal for every bird up to 12 will continue. But the domestic poultry-keeper will be deprived of a share in the meagre egg supplies available for general distribution. Skilful hen-keepers, with large gardens or allotments, will probably be able to feed the same number of hens as before. Those who will suffer will be the town-dwellers, with small families and little space for producing extra food. They will have to face the problem whether the labour of keeping two or three hens is worth the eggs they produce. A good average hen may produce as many as 180 eggs a year, against a yearly ration of round about forty to the registered consumer. But three hens are nearly as much trouble as a dozen. The pooling of backyard hens may prove a solution in many cases. Priority egg consumers, who are entitled to four eggs for each one issued to the ordinary consumer, are to receive no priority in balancer meal for any hens they may have. It is perhaps rather anomalous that priority should prevail in one form of egg distribution, but not in another. An amendment is to be made to the Eggs (Control) Order, requiring owners of flocks of 25 birds (instead of the present 50 birds) or more, to sell their eggs to packing stations. Supplies of hens are likely to reach the table in larger numbers than in recent months.

Cereal Prices

Prices of the main cereal crops of this year's harvest were announced last February and discussions have presumably been proceeding since then on the prices to be paid on sales by growers, ex farm, in the months after the harvest. They were announced by the Ministries of Agri-

	Millable Wheat per cwt.	Minimum	Maximum	Oats per cwt.	
				Feeding	Milling

July	17 2				

culture and Food on June 18th. Prices for millable wheat and oats are given in the accompanying table. Potentially millable wheat will be paid for at the same rate as millable wheat, less a charge for reconditioning, of not more than 2s. per cwt. The maximum price of non-millable wheat will be 14s. per cwt. throughout the season. Prices for rye of 15s. 6d., malting barley 35s., and feeding barley 14s. 6d. per cwt. will remain unchanged throughout the season. The maximum price of dredge corn is fixed at 13s. 6d. per cwt., but it may be produced only by re-sowing dredge corn of the farmer's own growing where wheat does not exceed 25 per cent of the mixture. The maximum price of feeding beans has been raised to 22s. per cwt. to encourage this crop; a maximum price of 35s. per cwt. has been fixed for feeding peas.

Pooled Tea Supplies

Negotiations for centralising tea purchases, which have been going on between the Governments of the United Nations for some weeks, have reached their final phase, and only some minor details remain to be settled. The value of centralised tea buying was stressed recently by the new boomlet on the Calcutta tea market, by which prices have been forced up by another 20 to 25 per cent; prices now quoted on the free market are more than 100 per cent above the average price of the last pre-war season. In spite of this highly speculative price development, the British Ministry of Food has been able to buy tea since the autumn of 1939 at the average quotation of the 1936 to 1938 seasons, plus minor additions covering increases in production costs since the outbreak of war. Under the new central buying scheme, the Ministry of Food will extend its buying contracts in the producing countries to cover the whole available surplus of production above domestic requirements. The tea thus acquired at a reasonable price will be shared amongst the consuming areas

MANCHESTER - 94, Portland Street

on the basis of their normal consumption. Besides excluding speculation the central buying and pooling scheme will facilitate tea shipments from the producing areas. The appointment of the British Ministry of Food as "managing agent" for the whole scheme is logical. Apart from the fact that this Department, by monopolising this country's tea imports, has contracted for more than half the world's tea surplus since the outbreak of war, tea available to the United Nations since the loss in the Far East, comes from three British areas—India, Ceylon and East Africa. It is expected that these areas will be able to supply about 750,000,000 lb. of tea this year, roughly

four-fifths of world tea shipments in the last pre-war season. This quantity could meet all normal requirements of the United Nations, although considerations of equal distribution would probably require a certain reduction of the quantities available to the United Kingdom, which on the basis of the current Ministry of Food contracts exceed 500,000,000 lb. this year. It is not unlikely, therefore, that the pooling of available tea supplies between the United Nations will sooner or later result in a reduction in the British tea ration, although only a month ago the Ministry of Food stated that such a cut need not be expected just yet.

INSURANCE NOTES

LONDON AND LANCASHIRE; NORTHERN; ROYAL

THE 1941 accounts of the *London and Lancashire* show higher premiums in the three major spheres of operation—fire, accident and marine; in the first two departments a factor improving the home revenues has been the conclusion of an arrangement with the Royal London whereby all the fire and accident liabilities of that company are now reinsured by the London and Lancashire. The fire department produced an excellent profit, notwithstanding another poor experience in the United States. The accident profit was less handsome, increased hazards in workmen's compensation and motor car insurance being responsible; here again the influence of the American account was no doubt important. In marine—written through the Marine and Standard Marine companies—the profit is arrived at after making a special provision for unexpired risks of £350,000 over and above the 40 per cent. reserve usually established by the London and Lancashire in this account. The chairman (Sir Frederick Pascoe Rutter) uttered a warning concerning the apparent prosperity of the marine department, and indicated that "it was not to be depended upon with any confidence in the immediate future, or after the war is over, when millions of chickens of all kinds will be coming home to roost." Life business is transacted through the medium of the Law Union and Rock, and new business at £1,384,000 is slightly less than in 1940, and about half the pre-war level, premium income remaining steady; pleasing features are a slight rise in the net interest rate, from £3 5s. 4d. per cent. to £3 7s. 5d. per cent., and the low figure for surrenders.

The underwriting profits of £612,000 are supplemented in profit and loss account by net interest earnings on the non-life funds of £340,000—a reduction of £49,000—making the aggregate credit transfers £952,000. Of this figure British taxation on profits takes £386,000. The chairman mentioned incidentally that the total cost of British and overseas taxation on premiums, profits and interest was no less than £958,000, and staff pensions and widows funds £60,000; after providing for the dividend (unchanged), absorbing £385,000, the balance of £3,509,000 carried forward is higher by £121,000. The balance-sheet position remains strong.

The *Northern* accounts include the figures of its associated companies, notably the London and Scottish, Provident Accident and White Cross, Indemnity Marine and World Marine and General. Premiums are substantially higher in all three principal departments. The fire department shows a profit of 3.3 per cent. against a small loss the previous year; the chairman (Mr A. S. R. Bruce) indicated at the meeting that the profit would have been better had it not been for the disappointing results of the business in the United States, where conditions continued to be difficult throughout the year. The very profitable accident account, which does not include an American portfolio, maintained its reputation. No profit is being released from the marine account, the directors preferring to keep a substantial surplus in the fund, which now stands at 139.3 per cent. of premium income, by comparison with 114.5 per cent. at the end of 1940. In the life department the net new business of £805,000 represents an increase of £100,000 on the previous year; the net rate of interest earned at £3 5s. 11d.

per cent. is less by 1s. 2d. per cent., but the continued downward tendency is the inevitable sequel to the investment of all surplus moneys in War Loans.

Aggregate transfers to profit and loss account, including net interest of £170,000 (a reduction of £26,000), come to £428,000. Income-tax on profits and N.D.C. absorb £133,000 and there is a transfer to contingency reserve of £50,000; after providing for pensions and certain miscellaneous charges, interest on debenture stock and the dividend (unchanged), the balance carried forward is £1,224,000, a reduction of £12,000 on the corresponding figure a year ago. In the balance-sheet the free reserves include a general reserve of £2,000,000 as well as the balance of profit and loss account.

In the case of the *Royal Exchange*, the revenue accounts do not include the figures of the important affiliated companies and, therefore, inadequately convey the magnitude of its operations. Aggregate premium income of all departments, as revealed by the accounts, is £4,827,000, but the total for the Royal Exchange and all its subsidiaries is £10,403,000. In keeping with the figures of other offices, premium income is higher in the fire, accident and marine departments. The improved result in the fire department is largely due to the level of business, but results from general overseas trading, other than in the United States, have also been satisfactory. Accident business also produced a good experience, although the level of profits is below that for the two previous years. From the marine department a small transfer has been made to profit and loss; the surplus is materially higher than a year ago, now amounting to 165 per cent. of the premium income. In the life department the net sums assured under new policies at £2,715,000 are higher by £500,000 than the figure for 1940; the chairman (Lord Bicester), in his statement circulated with the accounts, referred to the increase as "evidence of a remarkably healthy spirit prevailing in the public mind, and as showing a steadiness of outlook towards the future of this country." The Royal Exchange was one of the offices to take the lead in including war cover on new policies for civilian lives at normal rates of premium, and the chairman expressed satisfaction that this extended service had so far not imposed a heavy liability upon the company.

The profit and loss account, in addition to the underwriting profits of £233,000 receives net interest earnings on the non-life funds of £137,000 and a transfer of £9,000 from the trustee and executor department, making total credits of £379,000. Of this provision for taxation absorbs £110,000 and other expenses £96,000, and £20,000 is written off office property; the dividend at 30 per cent. (unchanged), less tax, takes £149,000, and the balance of £1,052,000 carried forward is slightly higher than that brought in. In the balance-sheet holdings of British Government securities have increased during the year by over £1,000,000, from £3,302,000 to £4,354,000.

The principal subsidiaries are the Motor Union, Car and General and State. The two former are primarily accident companies and both show higher incomes in the main account, coupled with good profits. In the case of the State, fire insurance is the largest department; premium income is higher and the result an improvement on the previous year although, excluding interest income, it represents a small loss. These three subsidiaries all maintain their dividends at previous rates.

COMPANY MEETINGS

CABLE AND WIRELESS (HOLDING) LIMITED

LORD PENDER'S STATEMENT

The 13th ordinary general meeting of Cable and Wireless (Holding), Limited, was held, on the 30th ultimo, in London, the Right Hon. Lord Pender, Governor and managing director, presiding.

The following are extracts from the statement of the Governor circulated with the report and accounts:—

I propose to confine my remarks to the investment situation generally. In my review of the companies' reserve fund investments a year ago, I made reference to the firm prices ruling for high-class stocks and to the rise in British funds which had then taken place. As a result largely of the Government's financial policy, and with little setback on the receipt of unfavourable war news, this rise has been continued during the past year and has affected favourably most sections of the list of marketable securities.

VALUE OF INVESTMENTS

The book value of our investments at December 31st last was £16,208,058 and the market value was £14,413,180, showing a depreciation of £1,794,878 or 11 per cent., as against a depreciation of 19 per cent. at December 31, 1940. The total investments have been increased by a very substantial amount, as a result of further subscriptions to the various new Government issues. About 93 per cent. of the total market value of the investments is represented by securities within the British Empire. Income from the investments received in 1941 amounted to £539,453, compared with £540,234 received in 1940.

In the face of so many uncertainties it is, of course, impossible to express any

opinion on the future of security values, but it would seem that the future value of all investments must largely depend on the wisdom of those who will be called upon to fashion our post-war economy and that any attention that can, without detriment to the war effort, be devoted now to the study of the problems involved is likely to stand us in good stead later on. Every effort is being made to agree the liability of the companies for Excess Profits Tax. This has not yet been settled but satisfactory progress is being made in the negotiations. It is estimated that the profits retained by subsidiary companies will be sufficient to meet any liability that may arise.

OPERATING COMPANIES

Having regard to the character of the work upon which the company and the group as a whole is concerned, it will be appreciated that I am again unable to give you the detailed survey of operations which it was always my custom to lay before you, but I can say this, both of the principal companies, Cable and Wireless, Limited, and Marconi's Wireless Telegraph Company, are continuing to do most important work under the able chairmanship of Sir Edward Wilshaw, K.C.M.G., and Admiral H. W. Grant, C.B., respectively.

You will also need no assurance, I am convinced, of the vital role the associated companies continue to play in the prosecution of the war, and I here pay tribute to their loyal and zealous staffs, constant in their maintenance of the best traditions of the telegraphic services both at home and overseas. It is my invariable custom never, either in good days or bad, even to attempt to forecast what the company's fortunes may be ahead. Of one thing, however, I am certain: what we shall reap in the days to come depends entirely on the direction and intensity of our efforts to-day. We have one immediate and common task before us, to give of our utmost in the cause of freedom—to win the war.

The report was adopted.

LONDON ELECTRIC WIRE COMPANY AND SMITHS, LIMITED

SATISFACTORY RESULTS

The thirty-third annual general meeting of this company was held, on the 26th ultimo, in London.

Mr W. J. Terry (chairman and managing director), in the course of his speech, said: The profit and loss account balance of £89,581, after fully providing for taxation and contingencies, shows a reduction of £8,435, which may be regarded as satisfactory in the circumstances.

During the year supplies of some of our raw materials have been restricted and substitutes have been found to meet these altered conditions. The prices of the principal commodities in which we are interested have remained fairly constant, and the Non-Ferrous Metals Control has rendered a great service to this industry by maintaining the price of electrolytic copper at the fixed level of £62 per ton throughout the year.

There has been much Press comment (without effect) upon the Excess Profits Tax at 100 per cent., which takes everything above the earnings of the standard period, whether the standard period was favourable or unfavourable, except for the somewhat nebulous 20 per cent. post-war refund.

Statistics presented by *The Economist* in their issue of June 6th show that net profits ranging over 2,000 companies have been reduced by more than half since 1938. The position facing many companies to-day is that their liquid resources will be seriously strained which will eventually lead to borrowings in order to meet current commitments. In addition there is the grievance that revenue wear and tear allowances are insufficient to meet the existing heavy depreciation of plant and machinery.

The report was unanimously adopted.

RECORDS and STATISTICS

STOCK EXCHANGES London

Note: All dealings are for cash

As on previous occasions, the adverse news from the battle fronts has been reflected in a decline in the volume of business, which measured by the bargains marked in the official lists reveals a slight fall in the early part of the current week compared with the last week. The lower turnover has, however, been accompanied by marked steadiness in the gilt-edged market, the main effects of the news being seen in a gradual downward drift in equity shares, attributable largely to a lack of support rather than selling. Both turnover and prices have been well maintained in the gilt-edged market, where at the end of last week investment support held prices steady, 3 per cent War Loan and Funding both improving $\frac{1}{8}$, although Local Loans lost $\frac{1}{8}$. The reopening witnessed some quiet trading, bargains marked totalling 555 against the previous Monday's total of 536, but, as on the following day, prices generally remained unchanged. Interest in the foreign bond market was slight, and activity showed little variation, daily bargains averaging just over 80 throughout the week. Some selling of Brazilian issues reduced prices slightly, while declines of $\frac{1}{8}$ were general among Chilean stocks before the week-end. A rather firmer tendency became apparent at the reopening among these stocks, but Egyptian loans resumed their downward course on the latest developments, the 4 per cent Unified losing 6 $\frac{1}{2}$ points in the first three days of this week. Turnover in the home rail market

was quite well maintained compared with last week, when the daily average of bargains marked was some 220, although actual business was light. Losses were general but small at the end of last week, declines of $\frac{1}{8}$ being registered by GW ordinary and LMS 4 per cent first and 1923 preference issues. Further small losses were registered at the reopening, although GW ordinary improved $\frac{1}{8}$, but the next day LMS and Berwick 4 per cent preference issues were weak. Small but widespread and persistent declines were registered for Argentine issues in the foreign rail market, while elsewhere Canadian Pacific ordinary steadily weakened. In this, as in other sections, midweek brought a recovery which in some cases eliminated two days' falls.

*

The adverse war news occasioned some marking down in the industrial market of leading stocks, but little selling; while lower prices failed to attract any marked support, daily markings averaging some 750. Price movements were in consequence narrow, although several dividend announcements aroused some interest. Thus among brewery shares Distillers rallied slightly on the preliminary statement, but among other issues changes were narrow. A rise of $\frac{1}{8}$ for BAT on Friday was followed by declines of $\frac{1}{8}$ for Imps and Tobacco Securities at the reopening, but the next day Imps regained $\frac{1}{8}$. Brown Bros. was a weak feature in the motor and aircraft group, losing 1s. 3d. at the reopening, but Leyland was supported throughout, while Thos. Tilling, Dennis Bros. and Rolls Royce suffered small losses. Prices in the heavy indus-

trial group fluctuated narrowly with declining turnover. Small losses were registered by Stewarts and Lloyds deferred and Dorman Long, but Tube Investments and Richard Thomas preference were firm. Turnover in the shipping group remained at a low level, while Elder Dempster Holdings eased on the report. Textile shares followed the downward trend, Patons and Baldwins and Tootal Broadhurst each losing $\frac{1}{8}$ at the reopening, but losses, though widespread, were usually small. In the miscellaneous market, Barry and Staines lost $\frac{1}{8}$ on the reduced dividend and Murex $\frac{1}{8}$ on Monday, while Brazilian Traction, Boots and Ranks, among others, all weakened.

*

After a late rally before the week end, interest in the Kaffir market subsided, Friday's total of 120 bargains comparing with 76 on Tuesday. In the absence of support, prices moved to lower levels, and on Tuesday Sallies, Sub Nigel and West Wit. Areas all lost $\frac{1}{8}$. Turnover in the rubber market improved in the early part of this week without affecting prices to any extent, but in the tea market British India lost $\frac{1}{8}$ on Friday when Jorehaut and Jokai were both sold. Later, interest further declined. A recovery in the oil market leaders of $\frac{1}{8}$ on Friday was not held at the reopening, when Anglo-Iranian lost the same amount and Burmah and Shell declined $\frac{1}{8}$. Mexican Eagles fell sharply on the Shell chairman's statement, losing 10 $\frac{1}{2}$ d., while the next day Anglo-Egyptian fell $\frac{1}{8}$, most issues remaining steady.

(Continued on page 30)

Finance

GOVERNMENT RETURNS

For the 10 days ended June 30, 1942, total ordinary revenue was £67,780,000, against ordinary expenditure of £141,737,000 and issues to sinking funds of £300,000. Thus, including sinking fund allocations of £1,883,155, the deficit accrued since April 1st is £742,563,000, against £756,629,000 for the corresponding period a year ago.

New York

TECHNICAL considerations rather than the war news have been the determining factors on Wall Street during the past week. Despite the general lack of incentive, occasional support, on the view that the market was largely oversold, induced some slight improvement. Movements were, however, narrow and generally irregular.

COMMODITY AND INDUSTRY NEWS

Utility Furniture.—The President of the Board of Trade, in answer to a Parliamentary question on June 30th, stated that he would shortly make an announcement regarding the production of utility furniture at controlled prices. He said that his proposals would put on the market a supply of good furniture of sound construction.

Increased Cotton Yarn Output.—The output of cotton yarn for the week ending June 20th reached a record high level. The figure achieved was 86.2 per cent of the "target," as against a previous record for the week ending June 13th of 85.1 per cent. The inflow of labour into the industry is now beginning to be felt, and a number of women have returned to the mills from their homes in answer to the recruiting campaign. Minimum demands for war purposes are rising.

Fertiliser Prices.—It has been decided to continue the stabilisation of fertiliser prices for the season 1942-43, and the Minister of Supply has accordingly made the Control of Fertilisers (No. 23) Order, 1942, and a general direction thereunder, both with effect from July 1st, whereby the existing maximum prices for sulphate of ammonia, superphosphates, ground phosphate and compound fertilisers are maintained. The control of sulphate of ammonia prices has also been extended to Northern Ireland. Provision has again been made for substantial early delivery rebates, and by the Control of Fertilisers (No. 21) Order, 1942, Direction No. 1, early delivery rebates are granted on triple superphosphates.

Pencil Prices Controlled.—The Board of Trade, after consultation with the Central Price Regulation Committee, have made a direction (S.R. & O., No. 1256) and the Pencils (Maximum Prices) Order

(S.R. & O., 1239) controlling the prices of pencils. Control is exercised over all pencils permitted to be made under the Order and direction (S.R. & O., 984 and 985) which came into force on June 1st. Different maximum prices are fixed at the different stages of sale according to the

quantities sold. Maximum retail prices per pencil will be 1d. for ordinary graphite pencils, 2d. for coloured pencils, 3d. for drawing pencils and copying ink pencils, and 5d. for china marking pencils, with lower prices for larger quantities. These prices became operative on June 27th, but non-utility pencils made before June 1st may be sold at the old prices.

Every description of Banking Service undertaken, including Foreign Exchange, Trustee and Executorship business.

The Other Churchill

AMONG the great unspoken speeches of English history are those which Winston Churchill might have made in 1940, 1941 and 1942, if he had not had the destiny of his country to decide himself. The voice which spoke for England after Munich would not have kept silent after Norway, Crete, Singapore and Tobruk. But there is only one Churchill, and his role has been to govern and to lead, not to thunder. Upon him has been laid for two historic years the heaviest burden any English statesman has ever borne. The world was saved by Britain in 1940 and by Russia in 1941; Britain itself was saved at the beginning of its fight two years ago by Mr Churchill.

On the benches opposite there is a sad gap. Not one of the speeches in opposition during last week's debate on the conduct of the war caught even a trace of the deep humanity and the matured sagacity which Winston Churchill brought to the affairs of state when he walked alone. In far too many of the speeches, the critics echoed not the murmurings of the people, but their yelpings. In the absence of a Churchill, they were little men called upon to perform a great duty. In Winston Churchill's place there stood Sir John Wardlaw-Milne.

But the duty that these men tried to do had to be done. Winston Churchill would not have left it unperformed. When the claim of Parliament to be the grand inquest of the nation is denied, victory will go by default, whatever the course of the battle. At the end of the long debate, Mr Churchill spoke of Parliament's "unbridled freedom"; he damned his fellow Commons for the effects of their criticisms upon opinion and morale, at home and abroad alike. His impatience can be understood: it was the impatience of a great statesman who is savaged by small politicians. But it was not a fair or a final judgment. "I am in favour of this freedom, which no other country would use or dare to use, in times of mortal peril"; there spoke the true Churchill who has been made and unmade, raised and cast down and raised again by Parliament. Mr Churchill is faced today by the dilemma of Cromwell, who became Protector and dictator despite his avowed wish to use the free words of Parliament for his support and guidance. Mr Churchill, too, has a Rump to deal with. But he must not; and will not, make Cromwell's choice. Without Parliament—even this Commons, but still more the Commons of English tradition—there is no guarantee for English freedom, however clear-cut

the victory may be or however subtle and comprehensive the plans for reconstruction.

Last week's debate in Parliament, which ended with 475 votes for the Government, 25 votes for the motion of censure and perhaps 30 abstentions, has produced no tangible result—beyond the voicing, however inadequately, of the nation's fear and the demonstration, by an overwhelming majority, of Parliament's and the people's trust in Mr Churchill. For the matter to end there would be a disaster. No better thing could happen now than for the Prime Minister to ask himself what Winston Churchill would have said, and what he would have asked for, had he been speaking in the place of Sir John Wardlaw-Milne last week. Without a doubt, he would have told the Government what to do and, in the true accents of English oratory, he would have warned them of what would happen if they did not do it. Out of the buzzing talk in the streets, at firesides, in public houses, in factory canteens, in clubs and camps, he would have caught the cry of the common man—"Get on with it." He would have vested this appeal, not only with the majesty of language, but with the shrewdness and wisdom of a statesmanship unrivalled in the experience of affairs and arms. He would have called for a combined command of all the nation's forces to bring them to bear together against the enemy at every point of battle; he would have regarded the *ad hoc* arrangement in North Africa by which the army commander sets bombing targets in battle as the merest common sense; and he would have demanded a much greater integration of the three Services at every stage of training and operations, and in every detail of their equipment. He would have asked for the utmost sharing by all the United Nations of their joint resources, so that no consideration but that of victory should stand arbiter of their employment. He would have asked for a larger vision and a greater imagination in the scale and the design of warlike supplies. Above all, he would have asked for three things: first, that every man in a key post, large or small, should be vested with power to decide and to act forthwith upon his decision; secondly, that every man with these powers should be held responsible, in person and on the spot, for his decisions and actions; and, thirdly, that there should be among the nation's high Ministers men with the duty, not of acting or of administering, but of following up every decision to see that action is taken, in time and with success.

In the days before Napoleon, when revolutionary France was facing a combination of kings and princes,

the guillotine was held ready for generals who failed in battle. It was an apt spur. Today, it is not chiefly over the generals in the field that the Damoclean sword should be held. It is because weapons and their blueprints, warlike supplies and their schedules, are time and again held up in a limbo of procedure that the massive industrial effort of this country has time and again struck too lightly in the battlefield, that the wrong instruments of war have been made in too great quantities, and that the decisions to make the right ones have been too long delayed. It is because those in authority have allowed their plans and their deeds to be too small, too slow, too tentative and too timorous that Britain, fully mobilised and fully embattled, is still too weak to strike with its proper strength.

Winston Churchill would have spared no harsh words or sombre menaces as he faced this scene. As he scanned the history of aircraft production, tank output and the manufacture of guns, he would not have allowed the impressiveness of the immense advance which has been made in the quantities produced to turn away his wrath. At the least, he should have demanded that good should be made better; at the most, he would have pleaded that heads should roll in the dust if this were not done.

This nation, forty-seven million people in a tiny kingdom, has done more than well in this war. It stood alone against the mightiest war machine the world has ever seen. But these are now topics for the historian of tomorrow, not for the statesman of today. The task, now is not to rest upon the record of past achievements, but to make sure that these achievements are not undone and lost by procrastination, delay, compromise, short sight or narrow mindedness. Two qualities especially Winston Churchill would have called for last week, had he not been Prime Minister—frankness and fearlessness: frankness in stating and discussing all the difficulties, social, political, economic and diplomatic, that still stand in the way, and fearlessness in dealing with them. He would have reminded the House of an earlier Prime Minister, Mr David Lloyd George, who stamped his mark upon the winning of the last world war by the promptness and the large scale of his decisions at crucial moments. Little men now sit in Winston Churchill's place on the back benches—and beside Mr Churchill on the front benches. But this is a big war; and it calls for even bigger decisions than those made by Mr Lloyd George twenty-five years ago. Winston Churchill would have seen that these were made—or else he would have known the reason why.

L'Expérience Laval

THE Germans know that, short of a complete debacle for them in Russia, the decisive battles of this war will be fought in the west. The whole of conquered France has to be prepared to meet the onslaught of the invader. This is not simply a question of the "Western Wall," coastal defences, artillery, troop concentrations and so forth. Very much depends upon the temper of the French people and the attitude of the government at Vichy. In the spring, after St. Nazaire, it was becoming daily more obvious that, as a rallying point for French opinion, and even as a reliable instrument in itself, Vichy had failed.

The workers were as hostile as ever. The attempt to incorporate them in the National Revolution by means of the *Charte de Travail* had proved a fiasco. The tradition of free representation within independent unions was too strong for the workers to accept the new state unions, with their "leaders" chosen and imposed from above. Moreover, they were seeing day by day the effect of not having their own independent organisation. The cost of living was up by 300 to 400 per cent, but the wage stop of 1939 was still in operation. The workers found themselves without the means to secure either wage increases

or the stabilisation of prices. Under-employment in some industries—the 22 hour week in the textile factories, for example—and unemployment in others weakened their bargaining position still further.

Perhaps it was not surprising that the working class proved intractable. The Vichy regime is, after all, fundamentally anti-popular and anti-industrial. Its failure on the peasant front was far more serious. Here, if ideology could have made a difference, loyalty should have been assured, for everything was done to woo the peasants, to play them off against the industrial centres, to represent them as the pure and uncorrupted root of the nation's existence. The effort has been a flat failure. The peasants have noted Vichy's acts, not Vichy's words; and the acts have chiefly consisted in efforts to get food supplies away from the farms. The output of grain in France has undoubtedly declined. German plunder and the shortage of agricultural labour, machinery and fertilisers are responsible. Some estimates put the wheat deficit alone at over five million quintals. In these circumstances, the peasants' reaction is to keep hold of everything they produce, especially as the money offered them can buy nothing in the present drastic

shortage of all kinds of industrial goods. The peasants have preferred to hoard their food. Government requisitioning has been fiercely resented, and deliveries of grain to the state were anything up to 50 per cent below schedule this spring.

The two largest classes of the population are thus radically disaffected. Matters are little better among the middle classes, to whom the *mystique* of a para-Fascist experiment might perhaps have appealed. But the French make bad Fascists. The roots of liberty run too deep, and the spirit of mockery runs too near the surface. It has been impossible to create the essential instrument of Fascism, the *parti unique*, with its discipline, fanaticism and driving force. The *Légion Française*, which was planned to fulfil this function, has failed completely. It had no homogeneity, and the tasks it has been set are contradictory. It has had to try to combine the rôle of propagandist with that of assistant policeman. Its unpopularity was thus assured. It has even earned the undying hostility of the administration it was supposed to help. The civil servants have strongly resented its efforts to set up a parallel political machine. With the people at large, it simply represents an inefficient but repellent secret police.

Even at the heart of political power, friction remained. The Vichy Governments have been no more stable than those of the Third Republic. The Cabinet was remodelled every other month. The shiftings and shufflings represented the uneasy see-saw of influence and opinion under the stress of foreign events. Pétain preferred to lean heavily on the old guard conservatives of the Maurras—*Action Française* type. Complete "reactionaries" in so far as home policy was concerned, they were anxious to avoid too close an entanglement with Hitler's unquestionably revolutionary New Order. Their game was *attentisme*—the French version of "wait and see"—fulfilment of the Armistice and strict neutrality. These men were constantly under fire from the collaborationists à outrance, the Doriot and Déats who accused Vichy of muddling away France's only asset, the chance of collaboration with the "new" Germany in the "new" Europe.

This was the incoherent and crumbling system on which the Germans had to rely to keep order in a vital area which at any time might become a battle zone. They could not occupy all France; for that their manpower was already spread too thin. They needed a reliable *Gauleiter* who, in spite of his willingness to co-operate with the invader, stood some chance of welding France into a disciplined unified whole. The only possible man was Laval.

Laval has now been at work for three months. It is impossible not to feel a moment's admiration for the completely unscrupulous way in which he has gone about his task. He knows his Frenchmen. He has been careful to speak an idiom they understand, to play on their weak-

nesses, to manage their fears and suspicions, to be all things to all men in order to render more absolute his own supremacy. To the Fascists he spoke of total collaboration, to the conservatives of France's rights and autonomy, to the unregenerate republicans of France's liberal spirit and of his desire to preserve some continuity with the pre-1940 regime. To the workers he promised an all-round increase in wages; he attacked the *Charte de Travail* and promised that in future the men should elect their own trade union representatives. The peasants were given a scapegoat in the shape of the Minister of Agriculture, M. Caziot, Vichy's professional peasant lover. In his place, Laval installed M. Leroy Ladurie, a big landowner from Normandy, with the job of inaugurating a species of French NEP. A maximum figure was fixed for grain deliveries to the state; the surplus would be the peasants'. At the same time the new Minister for Agriculture announced stringent measures for punishing the wastage and mismanagement of food reserves by the civil service. Indeed, throughout this spurious agricultural "new deal," the civil servants were made to stand the blame for all the peasants' earlier vexations. Yet the civil servants got their plum, too. The *Légion Française* was ostentatiously degraded and stripped of all its political and administrative functions.

Yet the *expérience* Laval is a vast deception. There is hardly a promise Laval has made that he has not known to be illusory. The only result of the promised labour policy has been new pressure on the workers to go to Germany. About 170,000 have been despatched already, including 90,000 skilled workers from the metallurgical industries round Paris. M. Bichelonne, the Minister of Production, is also talking of the "redistribution of labour," in other words, the shifting of workers from industry to agriculture. Thus Germany's policy of de-industrialising and balkanising France goes steadily forward. As for the peasants, there can be and will be no real relief for them. France's food situation is grave; requisitioning will continue.

The demotion of the *Légion Française* is being balanced by a centralisation and strengthening of the police force. The Gendarmerie and the *Garde Civil* have been transferred from the Ministry of War to Laval's own Ministry of the Interior. The new France may not be a party state. It is to be a police state with full powers concentrated in the hands of Laval. Under these conditions, it is hardly surprising that few of the fundamental political feuds have been healed. Déat, it is true, now takes the line that Laval is the only man who can combine collaboration with Germany with some measure of autonomy.

If the Laval experiment is interrupted or if it fails, no other Government of an autonomous type will be possible. Let us have no illusions about that.

EQUITY & LAW
LIFE ASSURANCE SOCIETY

Established 1844

THE SERVICE OF LIFE ASSURANCE

● Life Assurance provides the means whereby your regular savings, year by year or month by month, may be converted into the form best suited to your needs. Provision may thus be made for your retirement, for the education of your children or for your dependants after your death.

● The service of Life Assurance cannot now be offered to you by personal approach owing to the absence of so many of the Society's staff on war duties. This service is, however, still available on request and will gladly be placed at your disposal.

Head Office: 163/4, STRAND, LONDON, W.C.2. Telephone: TEMple Bar 0381
(temporarily transferred from 20, Lincoln's Inn Fields)

City Office: 36, Coleman Street, E.C.2. Telephone: KELvin 5111/2

But Doriot is as sceptical as ever about the real "will to collaboration" at Vichy. He is attempting to push his counter movement, the *Parti Populaire Français* out into unoccupied France. His papers have not noticeably abated their attacks on "clerical reaction" at Vichy. And the Germans discreetly encourage his filibustering. He can yet be used as a means of pressure on Laval just as Laval was used to put the screws on Marshal Pétain.

It does not seem on balance that the French situation is any more stable now than before Laval's return. None

of the basic problems has been solved, none of the feuds brought to an end, no spirit of solidarity created. Among the people, the spirit of total resistance grows—General de Gaulle's agreement with all the organised underground movements is a symbol of this. For full revolt to develop, the United Nations must strike harder and with greater success; but there is little doubt that, when the day of re-invasion dawns, the Pétain-Laval experiment will be blown sky-high and almost as many men will be fighting against the Germans behind their defences as are landing from the sea.

Youth in Industry

THE registration of the 16-18 year-old boys and girls, and subsequent interviews, have revealed some grim facts about the long hours now being worked by young people in industry. It is a pity that the 14-16 year-olds were not included, and that an opportunity has thus been missed to obtain a full record of what the young people of the country are doing in wartime. The picture is incomplete; but, from the information that has been collected by education authorities (much has been published in the *Times Educational Supplement*, and quoted in Parliament), it is possible to make a rough sketch.

There was no lack of willingness on the part of young people to be interviewed—in most areas the proportion attending was 90 per cent of those invited. The great majority were unattached to any youth organisation, but showed themselves ready to join one or to undertake some form of pre-service training; the pre-service units were the most popular—the ATC membership figure of 209,333 speaks for itself—and numerous instances were quoted of boys falsifying their ages in order to join the Home Guard. The really serious point which emerged, however, was that, in far too many cases, the Education Committee were unable to make any recommendation, simply because the young workers had no leisure time or were too exhausted at the end of the day to engage in any outside activity.

This is not merely a question of isolated cases of exploitation. The same story is told by interviewers in all parts of the country; the same facts are reported from such widely different areas as London, Lincolnshire, the woollen towns of the West Riding, and the mining districts of South Wales.

Hours of work were recorded as appallingly long—50 to 60 or even 70 hours a week. The maximum hours of work applying to juveniles in industry in wartime seems beyond their physical capacity. . . . With girls the cases of excessive hours were as bad as with the boys, if not worse. 7.30 in the morning to 7 at night are normal weekday hours in the foundries and engineering firms. Many girls appeared tired,

writes the Lincoln Youth Committee.

The Huddersfield authority found that many of the 17 year-old boys were suffering from "physical and mental exhaustion." Mr James Griffiths, Chairman of the Welsh Advisory Committee, stated in the House of Commons that, in one town in West Wales, out of 198 boys and girls interviewed, 81 were working impossibly long hours, and in one factory the hours on five days a week were 7.30 a.m. to 7.15 p.m., with six hours on Saturday. Mr Lindsay spoke of boys in aircraft factories working a 60-70 hour week, and quoted the opinion of an interviewer that

a high proportion are being worn out at an important stage in their development by the prevailing industrial conditions.

Evidence has also been given of long hours worked in clubs, hotels and cinemas. In addition to the actual hours of work, many young people had fire-watching duties and long distances to travel.

The Minister of Labour has promised to investigate cases brought to his notice. But, though there may be some individual employers who exceed the statutory

maxima, there is no question of any general evasion of the law. The law permits these things to happen. Under the Factories Act of 1937, maxima are laid down of 48 hours a week for young persons over 16 and 44 hours for those under 16; but provision is made for overtime, and permission to depart from peacetime requirements may be obtained from the District Inspector of Factories. During the first five months of the war, orders extending the hours of young persons were made in respect of 2,459 factories, of which 1,267 were engineering firms. Special emergency orders have been issued for cotton spinning and doubling mills, flour mills and engineering—as well as the notorious pottery order, which has since been revoked. The excuse, of course, is the wartime shortage of adult labour and the fact that in many industries, particularly in cotton spinning, shipbuilding and certain classes of engineering, juveniles are working side by side with adults; for them to cease work earlier would dislocate production. But it has been conclusively established that overlong hours defeat their own object and reduce efficiency. The Chief Inspector of Factories wrote in his 1940 report that

the experience of the year has shown that some valuable lessons of the last war had been widely forgotten or were not yet sufficiently appreciated. I have particularly in mind the lesson that excessive hours mean less production.

Young people are especially prone to accidents, and the increased accident rate among juveniles during 1940, compared with pre-war years, was attributed in the report to longer hours and greater exposure to risk—young people being now employed to a larger extent on "accident producing" machines—and to deterioration in training and supervision.

It is sometimes said that youths are compensated for their long hours by receiving high wages. But, even if wages are high in individual cases, where much overtime and especially Sunday time is being worked—or where a special shortage of labour pushes up the local rate—the common allegation of excessive wages is not borne out by a study of the earnings of young persons as a whole, though there has been a large increase. The June Ministry of Labour Gazette shows that the wages of youths and boys for the principal industries averaged 42s. 6d. a week in January, 1942, compared with 26s. 1d. in October, 1938—an increase of 63 per cent; those of girls increased less, by 45 per cent from 18s. 6d. a week to 26s. 10d. The highest rates, as one would expect, are found in the engineering and building groups (61s. 10d. in aircraft and vehicle manufacture, and 55s. 6d. in public works contracting) and the highest relative increases in marine engineering (102.3 per cent), and in cotton (90.2 per cent). Boys engaged on labouring work in the building industry are covered by agreements which lay down rates in proportion to adult earnings—at 15 years, 40 per cent; at 16, 50 per cent; at 17, 75 per cent; and at 18, 100 per cent. Coal mining is not included in the Ministry's returns, but the low wages earned by pit-boys compared with wages in munition works or Government training centres in the same area have been the cause of recent strikes in South Wales and Yorkshire, and have acted as a deterrent to the entry of youth into the industry generally. (The Greene Committee on coal miners' wages

recommended additions per shift, on a graduated scale, to the wages of young workers between the ages of 14 and 21).

High wages may be earned because the work performed has been a man's work, and it would be difficult to refuse the young worker's claim that he is entitled to the wage or the job. Whether it is desirable that a youth should do a man's job and work a man's hours is a different and arguable matter. Clearly, from the point of immediate health, well-being and efficiency, it is undesirable. It is

equally foolish from the long-term point of view. It is difficult to reconcile the present position with the policy set out by the Board of Education in their admirable circular, "The Challenge of Youth," which advocated the provision of facilities for recreation and useful activity outside working hours, and demanded that attention should be paid to

the building of character . . . developing the whole personality of individual boys and girls to enable them to take their places as full members of a free community.

NOTES OF THE WEEK

Front Line in Egypt

The El Alamein position still holds, and after several fierce attempts to break through the British positions Rommel appears to be building strong defences along his own right flank. The rapid advance from the Libyan frontier has left him inevitably with these long exposed positions. Here, if the British can bring up sufficient reinforcements, a rippling blow could be struck. Rommel's best equipment is still better than anything the British can put into the field, but against a long and scattered line the weight of

numbers can still tell. The good work already done by aiding columns is perhaps a hopeful portent of the next phase of the battle. The British forces are near their own base and their own workshops, and their marked superiority in the air should make it possible to hamper the bringing up of Axis reserves over the long, exposed routes from Tripoli and Benghazi. Meanwhile, in the rear, Egypt is surprisingly calm. Cairo is blacked-out, but there seems to be no very general fear of heavy raids. Cars go about with very bright blue head-lamps and many windows still show lights. The people are giving little sign of panic. The bazaars are crammed with merchandise and with purchasers. The Cairo Fire Brigade has been able to take time off to stage an elaborate funeral. The general atmosphere is one which was already noted by Mr Lyttelton and by Nahas asha earlier this year, when they both complained that the Egyptians did not realise how serious the position was. To-day, this is perhaps a mercy, though the calm of apathy reeks all too easily into panic. The British community continues to show the usual odd contrast between irresponsibility and the grimmest heroism. The restaurants are full of diners, eating their five and six-course meals at the St. James's or Continental Roof Garden, and yet beside them men with bandaged heads or wounded limbs, panting to get back to the front line. As one American correspondent wrote: "Tanks can crush British bodies, but nothing seems able to crush their spirits." Unfortunately, the dining and training is all too often the preparation for battle, and modern warfare demands cool brains as well as stout hearts.

Fighting on the Don

The week has seen a serious development in the fighting in Russia. On the Kursk front, the Germans have

managed to break through the Russian defences and to cross the river Don. They claim the capture of Voronezh. This thrust, if Voronezh has been reached, cuts the Moscow-Rostov railway, and will greatly increase the problem of supplying the northern Russian armies with oil. It is not, of course, a decisive advance from the military standpoint. The attack itself was not part of a general offensive, and the picture on the Russian front is still, on the whole, one of attrition. But attrition does not mean siege warfare or a static front. It entails an active offensive wearing down of the Soviets' economic resistance. In this context, the cutting of a major railway and the capture of an important road junction like Voronezh can have economic consequences of a far more general and grievous character than the actual military losses in terms of territory, men and materials. The Russian war economy is, inevitably, working on a narrow margin. Anything—faulty transport, delays, detours, or the maldistribution of supplies—that increases the economic strain, reduces that margin. A war of attrition is a war of reserves, and Russia's are not, as is so commonly supposed, inexhaustible.

New Policy

The tasks of war economy are two-fold: first, to marshal and mobilise every available resource; and, secondly, to apply labour, plant and materials to the points of production where they are most needed at any particular time, with the utmost flexibility. It is this second task which is now most pressing. The overall picture of the economic war has altered radically in the past six months. The United States is now at war and its great industries are more and more on a war footing. In quantity, British war output has now come near its peak. Between the United States and this country lies the Atlantic and, for many months, shipping losses have been running at an extremely grave level. Finally, the time is close when Allied strategy in every important theatre must be to attack, not to defend. All these considerations, taken together, make an overhaul of economic policy essential and urgent. There are signs that an adjustment is taking place. The policy of moving war workers from one war job to another more immediately pressing has been laid down by Mr Bevin. Steps to cut down non-essential manufactures still more drastically have been decided upon. The programme of concentration, standardisation and the production of utility articles for personal and household use has entered an advanced stage. A pointer to the new phase of policy was given by two recent announcements—Mr Bevin's statement that it would soon be necessary to call up young munition workers, and the announcement last week that war building, instead of tapering off as the war factory programme is completed, will be kept up by a new programme of further construction. Britain in the next two years is to be a base as much as an arsenal; the United States will increasingly become the main arsenal of all the United Nations. The important need is for the Government to pursue the new policy with the utmost vigour. There is still labour to be saved, for the Forces, for industry or for public works, in the swollen administrative structure of wartime. In many departments of Government service, and indeed in many branches of civilian work, the process of combing out has been tentative and not very effective. So, too, has been the approach to the British public for fresh sacrifices in consumption. The kid-glove methods which are over-tender to the staffs of Government offices, and which have made the alleged

attempt to cut down luxury feeding in hotels and restaurants a ludicrous farce, will not win the war. Just as the only way to cut down luxury feeding is to ration it, so the only way to comb out the few reserves of labour that are left is to act promptly and decisively without interminable negotiations and delays.

The Drive for Austerity

Two months ago, it was announced that quotas under the Limitation of Supplies (Miscellaneous) Orders, which would normally have expired at the end of May, would be retained in June and July pending discussions between the Board of Trade and a wide range of consumer goods industries. Last week-end, Mr Dalton revealed the result of these discussions. The most important step, which will be widely applauded, is the complete prohibition of the manufacture of certain goods, including certain toys and games; some leather goods such as trunks and bags; some types of glassware and fancy goods; metalware, cash registers, hand-operated lawn mowers; certain domestic furniture; and certain types of jewellery and cutlery. For most of these goods, the previous quota was as high as 25 per cent in value. In addition to these absolute prohibitions, the manufacture of other goods will, after August 1st, only be permitted if a licence has been granted by the Board of Trade. These goods include floor coverings; hollow-ware and kitchen hardware, metal furniture, domestic electrical appliances, mechanical lighters, athletic sports and outdoor games, musical instruments, fountain pens, and umbrellas. There will thus be a very strict control of the production of unessential and semi-essential goods; and instead of granting general quotas for wide classes, and then allowing the manufacturer a free hand in the production of different items, in future the quota will vary with each individual item—some quotas, such as for cooking utensils and pottery, which have become too scarce, will be increased, and certain goods, such as glass tumblers and jugs, plastic cups and mugs, and combs, will be unrestricted in supply. But the extension of the licence system will enable control to be exercised over the way things are produced, as well as their amount. There will consequently be considerable simplification and standardisation, and utility designs will be introduced as far as possible. Two objectives are thus secured by the new control: first and foremost, it will release 30,000 workers for direct war industry or the Forces; and, secondly, it will enable the public's urgent needs to be met by cheaper and more economically produced articles. It has taken three years for civilian manufacture to be placed on a war basis, but its full mobilisation is at last within sight of achievement.

Rye for Victory

The Ministers responsible for Britain's foodstuffs have wisely ceased to mince matters. Rather ironically, the Minister of Food has called upon the public to look at the present shipping losses, which are, of course, not published, except through American leaks; Lord Woolton would do well to insist among his colleagues upon the need for the public to be given the figures to look at. Mr Hudson has said frankly that the people of this country will be lucky, having regard to the shipping position, if they get through the next two years with only rye as well as wheat in their bread. It is most encouraging to have this evidence that the Government is looking at the bread position realistically. For a long time, it has seemed plain that, if the shipping position did not ease miraculously, the authorities would be faced with two alternatives, in order to make the most of the shipping space occupied by imported grain. They could either introduce bread rationing, soon enough for the ration to be sufficiently large for every consumer, or they could prepare to mix wheat with other substances in the loaf. The point about bread in this context is the astonishing extent to which it is wasted. Rationing would prevent this without depriving consumers of the necessary bulk basis for their diet. If rationing is still taboo, then other means must be adopted to restrict grain imports. It seems that the decision has been made to increase the production of rye, explicitly as a substitute for wheat in the making of flour. The step is wise; but it is still very

doubtful whether either rye should be grown or wheat imported, simply to be wasted as bread is wasted in so many households and restaurants.

Moves in India

At the beginning of the war, the Executive Council of the Viceroy of India was made up of ten persons, three of them Indians. Last July, five extra posts were created, all to be held by Indians, making Indian representation eight places out of twelve. Now, a year later, the Council has been expanded to fifteen, of whom eleven are Indians, one a non-official European and only three, including the Commander-in-Chief, official representatives. Most significant of all, perhaps, is the appointment of an Indian, from the Punjab, as Defence Minister. It was over the functions of an Indian Defence Minister that so much controversy took place during Sir Stafford Cripps' recent mission; and, not unexpectedly, the main Indian political parties, which still refuse to participate in the present system of Indian Government, regard the power of the new Defence member as merely nominal. Nevertheless, a plain sign has been given that the British Government and the Viceroy are prepared to go as far as possible in the direction of associating representative Indian opinion with the conduct of the war. It is not the fault of the Viceroy or of the British Government that Congress and the Moslem League are not represented. They would be included if they wished it; and the expansion of the Executive Council gives an added importance to the moves which are being made, chiefly by Mr Rajagopalachari, who has now resigned from the Congress party, to bring about an agreement between the Congress Party and the Moslem League. At the moment, it does not seem that Mr Rajagopalachari is doing so well as he seemed to be a short time ago. To the incalculable attitude of Mr Gandhi has been added, it is reported, a completely intransigent reply from Mr Jinnah of the Moslem League who, it is said, will make no compromise. More and more, it is evident that the present leaders of the Indian political parties are entirely incapable of making any contribution whatsoever to the settlement of Indian politics and to the salvation of India itself. They are lost in a maze of frustrations and old inhibitions. It is right that the Viceroy and the British Government should take every step possible, towards a fuller association of Indians in the War. But it is plainly impossible, until the Indians themselves show some semblance of being able to agree, for the offers which were made by Sir Stafford Cripps to be renewed or for negotiations to be reopened.

Retailers and the Report

The first reactions to the report of the Retail Trade Committee have not been favourable. The national body of newsagents', tobacconists' and confectioners' organisations, representing some 150,000 shopkeepers, have announced their opposition to the plan, on the ground that the levy on turnover is too heavy and will do more to drive shopkeepers out of business than war conditions have done. They claim that the fact that some retailers have stood up to three years of trading under war conditions proclaims their fitness to remain in being for the remainder of the war. But this argument misses the whole point. It is perfectly plain that, if the war economy is to be efficient, more shopkeepers must go out of business. The real criticism of the Committee's plan is not that it will drive small men out—it will not—but that, in view of the fact that war conditions will continue to drive small men out, while leaving the big shops in, no attempt is made in the plan to rationalise the process of slimming on a compensation basis, so that the combines will gain no permanent advantage. Clearly in reception areas, retailers, limited only from the supply and not from the demand end, have been doing well, whereas those in depopulated or coastal areas have been struggling, if they have not actually been forced out of business. But this state of affairs is no proof of "fitness," only of the haphazard effects of war which the plan was intended to remedy. The difference is shown in the returns quoted by the Committee—of seven large towns investigated, the number of shops in five non-reception towns showed a decrease of from 10-14 per cent, while those in reception areas showed hardly any change. Mr Palmer, the Co-opera-

tive representative on the committee, stated, in a brief minority report, that he could not support a proposal which

would impose a levy of several million pounds per annum on the consumer and which would in the main pass as rent and interest into the hands of landlords and mortgagees.

As shown in last week's *Economist*, the levy need not be passed on to the consumer, as the wages bill of the closed premises would not enter into account and the non-closed shops would probably secure sufficient additional turnover to compensate them for increased fixed charges. True, many landlords have been obliged to accept less than their full rents, whereas, if the scheme is given effect, in most cases they will receive full payment until the leases expire. In so far as small shopkeepers have only been kept in business because of their contractual obligations to landlords, the scheme will facilitate withdrawal, but traders may have many other financial obligations and it is insufficient to relieve them mainly by cancelling their rent obligations. Nor will the limitation of the special benefit to £125 provide much incentive to withdrawal. A scheme for general compensation would have been far more satisfactory and would produce better results, but the Committee was debarked from tackling the main issue of compensation.

Higher Coal Prices

On July 3rd, the pithead price of coal was raised by 3s. per ton to compensate collieries for the increase in wages, estimated to add 2s. 6d. per ton to the cost of production, and for certain other advances in costs. The Chancellor of the Exchequer has decided against a direct subsidy to the coal-mining industry; the increase is to be passed on to the domestic consumer. He stated last week that this would raise the cost of living index by about one point. Sir Kingsley Wood was at pains to point out in the House of Commons, on July 2nd, that this did not involve a departure from the Government's price stabilisation policy, and that the Government would effect such reductions in the retail price of other commodities which enter into the cost of living as "may be necessary to compensate for the increase in domestic coal prices." It is difficult to understand the logic of this argument, unless it means that the cost to the Exchequer of effecting compensating reductions in the prices of other commodities is likely to be less than the addition to the consumer's coal bill. Apart from its direct effect on the domestic consumer, the increases in coal prices will add—in some cases appreciably—to the costs of industry. In the case of iron and steel, for example, the additional burden is said to be of the order of £5 millions. In answer to a question in the House of Commons, on July 7th, Sir Kingsley Wood pointed out that the effect on steel costs of the increase in prices must be discussed with the industry in order that "we may decide on the necessary measures." Obviously the Treasury is not likely to allow industry to pass on the increase in costs to its consumers—now mainly the Government—without applying some kind of needs test, though, in the case of firms liable to EPT, it can hardly escape footing part of the bill at least through a reduction in the yield of this tax. On the whole, a policy of discrimination is probably justified in the case of industries working wholly and mainly for the Government; so far as domestic consumption is concerned, a direct subsidy should have been the solution.

The Pricing of Coal

Important changes appear to be contemplated in the method of fixing coal prices. Hitherto, individual collieries have discriminated between different categories of consumers. For example, a representative steam colliery had a minimum scale of 18s. per ton f.o.b. for large coal supplied for export as cargo and bunkers. But for home consumption the minimum price for the same coal was 19s. 6d. per ton at pit to public utility undertakings; 20s. 8d. per ton to householders; 17s. 10½d. per ton to the railways; and 18s. 6d. per ton to industrial consumers and for all other purposes. Lower prices were charged for long-period contracts than for current sales, and among collieries supplying the home market, the practice of selling on a delivered basis instead of on a pithead basis has been increasing. But while individual collieries were thus able to differentiate between different classes of consumer, competition among them has made for a measure of uniformity within these

categories at the points of consumption. In view of the need for increased flexibility in distribution, involving the reallocation of the output of individual collieries between different categories of consumers and places of consumption, it has been suggested that individual pits should in future charge a uniform pithead price to all consumers for a given quality of coal. The change in practice, which is said to have official sanction, has recently been accepted "with scarcely a dissentient voice" by the colliery owners in Yorkshire, Notts, Derby and Leicestershire, and is apparently to take place in all the more important of the "inland" coalfields. While there is a good deal to be said for the institution of uniform prices at individual pits, the proposed method of computing these prices is open to criticism. It is reported that the weighted average price is to be determined for each pit, or group of pits, by reference to the experience in a three-monthly period during 1941, at the discretion of the colliery concerned, though steps will presumably be taken to ensure that the average profit per ton will be no higher than before. The introduction of uniform prices for individual pits will lead to the curious state of affairs whereby the price of coal at the point of consumption will vary with its origin. In order to overcome the anomaly of differential prices for the same class of coal used for identical purposes in any one locality, the country should be divided into consuming areas, and the coal supplied to each area at various prices should be pooled and sold at uniform prices for each grade, based on average costs. Uniform prices for given grades of coal at each point of consumption are an essential counterpart to uniform pithead prices.

China's Due

On July 6th, Allied statesmen and soldiers vied with each other in paying tribute to the Chinese people and their leader, General Chiang Kai-shek. The debt which the free nations owe to China for sustaining the fight against Japanese aggression unaided for four and a half years, and for containing on Chinese soil upwards of thirty enemy divisions at the present time, can only be assessed in the light of history. The most telling tribute was paid by the Japanese General Shunroku Hata, who commands his country's expeditionary force in China, and who has an unrivalled opportunity of appreciating the true significance of the Chinese will to victory. He said

although the Chungking régime has now been completely isolated from both Great Britain and the United States, it still stands in the way of the construction of the Eastern Asia Coprosperity Sphere.

This acknowledgment is more impressive than the sincerest eulogy. It also teaches a lesson. It was not until the Chinese had endured a war on their own soil for four and a half years that their strategic position was desperately threatened by the Allied losses in the south-west Pacific and by the fall of Burma. It was not until the conflict, which started as a China incident, had become a world war, and China had found allies in the community of the United Nations, that the worst and most crippling blows fell. These are circumstances which would have broken the spirit of any but the most determined people. How many of the newer recruits to the war against aggression could sustain such tragic news at the moment of their greatest expectations with equal fortitude? The corollary is obvious. China must be given first-class priority both in the allocation of material and the planning of strategy. The Generalissimo has broadcast his belief that this is being done; but unmistakable proof must be made apparent to the Chinese nation.

Air Transport

The Army is handicapped now by an earlier lack of appreciation of the role of air transport in war. Before the war this method of transport played an important part in the provisioning of outlying districts in various parts of the Empire. As has been demonstrated by the Germans in Russia and North Africa, an adequate supply of air freighters can be of crucial importance in the provisioning of forward and encircled positions. This country was not in a position to produce all types of aircraft in adequate numbers, and, in any case, the deficiency is now being remedied by an expansion of output in the United States. But the Army is not the only sufferer from the shortage of transport aircraft. British Overseas Airways Corporation, responsible for civil transport, has to rely largely on obsolete machines, and has been unable to replace them with new aircraft of British design; failing the construction of new aircraft in this country, it should be possible for the Corporation to secure some American machines for its urgent needs. Finally, aircraft manufacturers are perturbed by the Government's policy to rely on American factories for the supply of transport machines, on the ground that it will be difficult for them to meet foreign competition after the war. These anxieties merit sympathy; but post-war considerations must not be allowed to stand in the way of the most advantageous distribution of production between America and Great Britain. Just as it is in the interests of the United Nations as a whole that America should concentrate on the production of bombers, which can be flown across the Atlantic, it is probably also in their interest to leave the manufacture of transport machines to America.

Debating Propaganda

The long debate which followed the Estimates for the Ministry of Information ranged over a very wide field. On the home front, while some members found the British people "allergic to propaganda," others contended that this state of mind referred to bad propaganda only, and that a central need was a definition in practical terms of the faith for which the country fought. Mr Garro Jones found an echo in the House—and far beyond the House—in his plea that

something more should be done to crystallise into a practical policy the actual purposes for which we are fighting the war

and in his concern over the Prime Minister's determination to consider such an attempt a "waste of time." Mr Vernon Bartlett's plea that the BBC, by broadcasting the "sentimental sloppy muck" of the Forces programme was missing an opportunity of educating the people to be worthy of democracy, was obviously linked with this plea for a greater clarity in the definition of war aims and here the question of propaganda on the home front merged with the wider question of propaganda abroad, the problem to which the House devoted most of the debate. There was general agreement that, while Mr Bracken was the best Minister of Information so far, things were far from well. Nearly every Member stressed the need for absolute truth in British reporting, and on both sides of the House there was anxiety about the lack of information about Britain in Russia and about America in Britain. Few suggestions were made about a positive basis for British propaganda. It should be individual, it should express in dynamic terms the faith of Britain—yes; but what is the faith of Britain? Mr Pickthorn and Mr Garro Jones agreed in urging that

the conflict is primarily a conflict . . . between those who believe in good faith and the rule of law and those who do not.

This definition, admirable as a beginning, was carried no further. Otherwise the debate concentrated on machinery—the curious dual control of the BBC between the Governors and the Ministry of Information, the treble or quadruple control over the propaganda Services to enemy countries, the continuing lack of control over the Service censors. Mr Bracken admitted that they were queer, but that they worked and, in any case, the House had approved them. "Tu Pas voutu, Georges Dandin."

New Zealand's New Administration

A curious compromise has been reached in New Zealand over the attempt to give the Opposition a greater participation in the conduct of the war. Two years ago, a

joint War Cabinet was formed, which included two members of the Opposition, but though this Cabinet was responsible for questions of war policy, the administration of that policy remained the sole responsibility of the Labour Government. This was obviously not a satisfactory arrangement, and for a long time there have been attempts to secure a closer association between the two parties. But certain sections in each would not accept the complete loss of their party's identity. After many months of patient negotiations, however, political unity has been carried a step farther. The War Cabinet will be expanded into a War Administration, consisting of seven members of the Labour party and six from the National party. The chairman is Mr Fraser, the Prime Minister, and the deputy-chairman is Mr Holland, of the Opposition. The names of the portfolios are interesting as evidence of the attempt that has been made to divorce war from domestic administration. Thus the Labour members are Ministers of Supply and Munitions, Defence, Transport, the Maori War Effort, Industrial Manpower, and Health. The Opposition has the portfolios of War Expenditure, Supply and Munitions in association with the Labour member, Armed Forces and War Co-ordination, National Service, Civil Defence, and Primary Production for War Purposes. The War Cabinet will continue in being as the executive; it will at present consist of three members of each party, but it will be joined by Mr Nash, Minister of Finance, when he returns from America, and he will also presumably be a member of the War Administration. Members of the Labour Government not included in the new Administration will continue to hold their positions in the domestic Cabinet. It is difficult not to feel that there will be a certain amount of overlapping between the Labour and National members of the War Administration—between the Minister of Industrial Manpower and the Minister of National Service, the Minister of Defence and the Minister of Armed Forces and War Co-ordination, the Minister of Finance, when he returns, and the Minister of War Expenditure. Moreover, it is quite impossible to separate war measures from domestic affairs. War economy is indivisible, and the allocation of resources to military and civilian purposes is a single process. But the fact that the politicians have had to compromise on unity should not cast any reflection on national unity or on New Zealand's determination to wage war both against Japan and Germany to the utmost. The activities of the New Zealand troops in Egypt are evidence enough of that.

* * *

Activity in the Aleutians

Now that Russia is fully engaged on the Western Front, the temptation to Japan to open a second front is so obvious that the surprising thing about the Far Eastern scene is not the evidence of Japan's warlike intentions, but the lack of it. True, there are reports and rumours, for example, of a million men massing in Manchukuo, and something can be made of Russia's accusation that a Japanese submarine sank the Russian ship *Angarstoi* early in May. Moreover, in one area which might seriously affect Russia's Far Eastern position, the Japanese are busily at work consolidating their hold. The Aleutian Islands lie directly on the shortest route between Russia and the United States. If there is to be any trouble in Siberia, then the Japanese have much to gain by establishing fighter bases along the road which must be used by United States bombers and transports. They appear to be digging in at Attu and Kiska. The Aleutian fog covers their activities, but Kiska could easily be developed both as an air base and as a submarine base—there is a good harbour and flat land for airfields. The United States is taking steps to meet the Japanese encroachment, and four Japanese destroyers were destroyed last week off the occupied islands.

* * *

Population Trends

The decline in the birthrate has become a topic of general concern and a controversy has been raging through the columns of *The Times*. There are two separate questions. In the first place, the accuracy of the conclusions of the White Paper on Population Trends (analysed in *The Economist* on May 30th) is disputed; Mr Harrod accuses the Registrars-General of understatement and overoptimism and considers that an increase in the net reproduction rate from 75 per cent to unity would have to take place within the next 15 years if a great decline in population is to be avoided. Secondly, what measures can and should

be taken to achieve this increase in the net reproduction rate? *The Economist* has referred to family allowances as a desirable measure of social reform *per se*—quite apart from any consideration of their value as a means of increasing the birth rate, which was the argument advanced by some speakers in the House of Commons debate. The rate of allowance would certainly have to be substantially higher than 5s. per child in order to make any difference in births. There is indeed some dispute about the extent to which population can be increased by such measures. The Weimar Republic in Germany operated a scheme of family allowances, but did not succeed in arresting the decline in the birth rate; the same is true of France, where a limited scheme of family allowances was introduced after the last war. Mr. L. J. Cadbury, in an article in the *Eugenics Review*, gives a warning that some social security legislation is as likely to discourage as to encourage parenthood. It is probably true that a mere raising of lower incomes would not increase the population very appreciably, since the greatest decline has occurred in middle and lower middle class groups in Britain who limit their families primarily for economic and social reasons. A public school and university education is the key to a successful career and so energies are concentrated on equipping one child; other forms of expenditure—doctors' bills, income tax, clothes, holidays, entertainment—are weighed against the cost of adding to the family. On the other hand, a general improvement in the standard of living, better housing, improved social services, greater equality of educational opportunity, plus a scheme of family allowances, would be bound to have generally beneficial effects. Greater confidence in the future would promote earlier marriages; at present, the largest number of children are born to mothers in the 25-29 age group and, as has been pointed out, half the increase in births necessary to maintain the existing population could be secured if women who would normally marry between 24 and 30 married 3 years younger. The Russians claim that the increase in their population (by 23.4 millions between 1926 and 1938, according to the Soviet census of January, 1939) is due, not so much to any deliberate stimulation of the birth rate by the authorities, as to the provision of large-scale social services, especially for maternity and child welfare, and to the abolition of unemployment.

* * *

Industrial Disarmament

Ever since the events which followed the last war, seekers after peace have been sceptical about the merits of military disarmament as a means of preventing war. It is argued, rightly, that a nation's power to make war depends, not upon its stock of soldiers and weapons, but upon the capacity of its heavy industries. Proposals have recently been made to sterilise the warlike capacity of German industry by such devices as the prohibition of the manufacture of machine tools, the key instruments of war production. On Tuesday, the Archbishop of Canterbury carried this line of thought a stage further. The German problem, he said, has two aspects: first, the so-called Prussian tradition or Germany's record of aggression; and, secondly, the industrial capacity of the Ruhr, which must be the basis of all German war-making. The Archbishop favours the placing of the Ruhr under the control of some international syndicate, public or private. In the short run, it is incontestably true that the first task in disarmament must be to make Germany unable to go to war. In the long run, however, what is sauce for the Ruhr must be sauce for every other centre of industrial power in every continent. All these ingenious economic and industrial devices for making war impossible are half-truths. The fundamental fact is that to end war, nations and groups must be rendered unwilling to go to war on behalf of their sovereign claims. There is no easy economic way out. The problem is to find a political *modus vivendi* between all the nations; and the Archbishop is probably on firmer ground when he speaks of the need to secure basic security for every individual and for every nation than when he looks to tricks of industrial disarmament to do the job.

* * *

The Public Schools Committee

Neither the terms of reference nor the membership of the latest committee of inquiry into an aspect of the country's educational system are very encouraging. The

committee, under the chairmanship of Lord Fleming, includes a few headmasters of public and secondary schools, two headmistresses, two members of local education authorities, and two trade unionists, besides a scattering of professional and business men, Mr G. D. H. Cole and the Bishop of London. Conspicuously absent is any name particularly associated with progressive ideas about education. This may have been inevitable from the terms of reference, which are not to inquire into post-primary education as a whole, with particular reference to the public schools—post-primary education has indeed been much investigated before—but merely to consider means whereby the association between the public schools and the general educational system of the country can be developed and extended, girls' public schools being included. This seems to assume that the existing connection is on the right lines, and that all that needs to be done is to extend it by giving more scholarships to elementary schoolchildren or by introducing the free place system in return perhaps for Government grants. In other words, it is apparently assumed that the present peculiar position of the public schools is to be maintained, whereas what is really wanted, as was emphasised in an article in *The Economist* of June 20th, is the development of a post-primary system of education diverse enough to fit the talents and desires of all children, in which the public schools will have shed their social exclusiveness and become the true socialist institutions which their traditions and community life could make them. It may be that the new committee will go beyond the terms of its reference and bear these wider interests in mind. But it is difficult to see how any really constructive proposals can come out of a committee which has the public schools as its *raison d'être*, not the reform of the country's education as a whole.

* * *

Shorter Notes

After a heavy defeat in the Maldon by-election, where Mr T. Driberg, Independent, secured a 5,993 majority over the National Government candidate, the Government scraped home at Windsor. Its majority, however, was only 2,740, which is all the more remarkable since Windsor is a traditionally Conservative constituency, and the Conservative candidate was returned unopposed in the two previous elections.

*

The divergence between the policy of Argentina and that of all the other American nations is growing steadily under the influence of President Castillo's anti-United States, anti-democratic and increasingly pro-Axis policy. This week has seen a further ominous step in Argentina's decision to recognise and comply with the German blockade. No Argentine merchantmen are allowed to enter an area bounded by Denmark, the east coast of Canada and the east coast of the United States.

The Kaiser Saga

(From Our Washington Correspondent)

June 15th

LUMBERJACKS' tales, as tall as the timber they worked in, have for half a century built up the image of the mythological hero of the Northwest, Paul Bunyan. According to legend, Paul began operations in the woods of Michigan, Wisconsin, Minnesota; after these were cleared, he went west, through Idaho and Montana to Washington, Oregon, Northern California. He did things in a big way. During his early operations in the North Central states, his camps were so big that, in order to make enough flapjacks for the men's breakfast, he had to use a griddle so large that it took a battalion to surround it, and hire little boys with hams tied to their feet to skate around on it to grease it.

That same Northwest territory has been worked over a second time in our generation. The stories about Henry J. Kaiser now making the news are on the scale of the Bunyan saga—only Kaiser is real. His story reads like a nineteenth century theme translated into twentieth century technology and twentieth century objectives. It is the Rockefeller story, the Carnegie story, the James J. Hill story all over again. Only, on its technological side, the pouring of cement is substituted for the piping of oil, the manufacture of magnesium is substituted for the manufacture of steel, boatbuilding is substituted for railroad building. And on the side of objectives, Government decision about what is to be built is substituted for private decision.

Builder to the Nation

The story is probably most pertinent as a story of private enterprise in public business. The list of things which the Kaiser family has done—highways, dams, bridges, and now a bridge of ships—is from first to last a list of Government orders. But the filling of those orders by the Kaisers has been a classic of individual capitalism.

Kaiser went into the cement business. He took some new ideas with him. The application of those ideas brought the price down 30 cents a barrel. On his first major venture, pouring cement, his company was too little to get into the bidding—the job was Boulder Dam. So he linked six companies together, and got the \$48,890,995.50 contract. He finished it two years ahead of schedule. Next came Bonneville. Then Grand Coulee, the biggest construction job man has ever undertaken. (The cement—20 million tons of it—exposes an area more than three times the state of Pennsylvania). At Coulee there were problems: one was a 200,000 yard hillside on the move; the men on the job figured that frozen ground keeps its shape, so they froze the threatening area until the work was finished. It was on this project that Kaiser developed an overhead four-track trestle, from which, 1,180 ft. above bedrock, 13 cranes weighing 368,000 lb., worked simultaneously handling steel and pouring cement. When Kaiser priced railroad rates hauling sand and gravel to Shasta, most recent of the dams, he thought them too steep, so he built a ten-mile conveyor which hauls 1,100 tons an hour. The dams stored water; the Golden Gate Bridge spanned it. The formidable tides in the San Francisco harbour made the going tough; placed under difficulties, the 51 piers for the bridge had to be set deep, and stay there. He put them down; the lowest goes 242 feet.

Through these years, Kaiser's Gargantuan doings made little news. At the very time when the biggest projects ever undertaken were taking shape, the fashionable assumption was that America's construction period was over. But, within the last few weeks, newspapers and periodicals have fallen over each other to get the Kaiser story. The story they are now telling has many chapters. Kaiser is supplying the cement for new works at Pearl Harbour. Kaiser is excavating the third set of locks on the Panama Canal.

Kaiser is experimenting with the magnesium process of an interned Austrian; now working on ores from Luning, Nevada, he thinks the sea water and dolomite limestone at Moss Landing, California, may prove a better raw material. But most of all, Kaiser is building ships.

The Shipping Miracle

Kaiser had once considered building a fleet of ships as a good way to move cement around; and shipyards were included in his investment. But that was as close to a keel as he had come until he got a contract for 60 British freighters at the very end of 1940. At first he had a working arrangement with the Todd Shipbuilding Company, an old firm with the knowhow—but this spring that painter was cut. To-day he has eight shipyards of his own, strung along the Pacific coast, with 73 ways to them; his boast is that he can build 10,000,000 deadweight tons of shipping on these ways next year. (The President mentioned that figure as the merchant shipping goal for the entire country in his speech of January, 1942.)

His boast has body to it. In World War I, the Hog Island shipyards averaged just under a year—355 days—to a ship; their best time was 213.4 days. The average of the fastest yard constructing ships like the 10,400-ton *Liberties*, which form the bulk of the present programme, was 102 days. This time, the Maritime Commission started with 140 days as a reasonable period for a completion, and set 105 days as a goal. The first ship that Kaiser built took 197 days, the tenth took 146; the twenty-fifth, sixth and seventh finished for the celebration on May 22nd, came off in 71-65-60, and on June 1st the record was cut to 46 days.

There are several constant features to Kaiser's technique. If the time spent by each ship on the ways is cut down, if much of the construction takes place somewhere else, and the ways are used only to put it together, the need for more ways disappears. Kaiser ships, therefore, begin to take shape in long sheds some distance from the water. Preassembled double bottoms, fore and after parts, side sections, decks, funnels, converge on the ways to be lowered into place by huge cranes. Once these are in, the ship is slid out of the ways and tied up alongside the shore for further fitting, while the next keel gets its essential structure. The trick is to cut time by good timing.

On all his jobs, Kaiser works around the clock. That experience has given him skill in the use of the second and third shifts, from which the crucial margin of extra production must come. The theory of multiple shifts is that a plant's second shift can at best employ not more than 60-80 per cent of the number of employees on its first, and 40-60 per cent on its third. Most plants fall far below this level. Oregon Shipbuilding is running at a ratio of 100-63-40.

In days when sinkings outnumber completions, when the job of transportation just ahead makes the job of World War I look like operating a rowboat in a park, when the sights on the merchant shipbuilding programme need vigorously to be raised, this new Paul Bunyan saga is good news out of the West.

American Notes

Debate on the War

The debate on the war continues without a lull, but the better news from Egypt and the overwhelming defeat of the motion of censure in the British Parliament have made it less bitter. The United States would regard the replacement of Mr. Churchill as a catastrophe, and relief was all the greater because of the impression, which made some

headway, that this was a possibility. There has been, too, a determined campaign in many quarters to confine criticism of Britain to that which is constructive and friendly, and to emphasise the share of the responsibility which the United States must bear, through the quality of American tanks and the unreadiness of Pearl Harbour. But while the victory in the House was applauded, there was a feeling that it left many questions unanswered. A certain amount of doubt persists whether Mr. Churchill should not give up day-to-day supervision of the war; the facts about the equipment of the Eighth Army have underlined the need for better leadership. The *Baltimore Sun*, after praising the vote in the Commons, commented that Mr. Churchill's future, and perhaps that of the United Nations, depended on his ability to get better brains into the British Army. While other commentators were less blunt, there is a very strong feeling that there is something wrong with the direction of the war, and the pressure for a United Nations High Command is growing. There is speculation this week about whether a preliminary step, the creation of an American United Command, is about to be taken. It was reported that President Roosevelt was considering the appointment of a supreme commander for the US Forces, and it was thought that the post might go to Admiral Leahy, who, it is announced, will not return to Vichy. Nor has the pressure for a second front in Europe diminished, although out-and-out advocacy of British action in Europe is now confined in the main to the less responsible sections of the press and the public. It is these papers which are also conducting a campaign to bring MacArthur back from Australia, either to lead the second front, or to assume command of the United Nations—and which are most outspoken about the need of American generals for American troops.

Campaign in New York

The selection of their candidate for Governor of New York is one of the most critical decisions to be made this year by the Republicans. The governorship is regarded as one of the stepping-stones to the Presidency, and the Republicans are thinking ahead to 1944. More important still,

it will be another test of strength between the Republican Old Guard and the progressive Willkie wing. The most likely candidate of the conservative Republicans is Thomas Dewey, the Attorney General of New York City, who was soundly defeated in the 1940 elections for Governor. Even from their point of view, Dewey is far from an ideal candidate. He is regarded as a political opportunist, inexperienced, disliked by labour, and only a reluctant convert to the idea of international collaboration; and it is doubtful whether he could swing New York State, where labour holds the balance of power, and belief in intervention has always been strong. It is even reported that the Democrats have been quietly trying to encourage Dewey's candidacy. The only solid hope of the Republicans in New York would be to nominate a man who could attract Democratic and Labour votes; and the only answer appears to be Willkie, who in the 1940 elections for President won nearly as many votes in New York as President Roosevelt. Mr. Willkie's disclaimer of any aspirations to office is not taken too seriously, and it is thought that he could not refuse to run if any strong movement to draft him was organised. Only this week it is reported that the former Governor of New Hampshire, Mr. Murphy, has left the Republican party, with harsh words about its "synthetic and stumbling leadership in these desperate times," and its record of "petty partisanship, mediocre talents, personal and political aggrandisement at the sacrifice of principle." If the Old Guard triumphs in New York, the drift of able men out of the party will probably be accelerated.

Control of War Production

The announcement by Mr Donald Nelson of a "re-alignment" of the organisation of the War Production Board comes after the conclusion of two investigations into the Board, that of the Truman Committee and that of Dr Luther Gulick, both undertaken at the request of Mr Nelson. Mr Nelson has appointed two vice-chairmen, both engineers, one to act as his deputy and the other to be responsible for "the determination of the programme"; and a new director of operations will put "programmes

and policies into operation. Tendency to return the direction of war production to the Services has been noted for some time. Increasing numbers of civilian advisers have been appointed to the Services by Mr Nelson to supervise these functions, creating a very close interweaving of WPB and Service personnel which should help to assure that integration of strategy with production which Mr Nelson has promised. One recent conspicuous example was the appointment of four civilian advisers to Army Ordnance. The War Production Board will be free to concentrate on broad policies, and to give more constant attention to the urgent questions of the distribution of raw materials in short supply, machine tools, and new construction. It will continue, however, to be finally responsible for war production, and Mr Nelson has denied that any division of authority is contemplated. The Truman report and the Gulick recommendations were the product of the charges against the WPB made by Robert Guthrie when he resigned from the board (referred to in *The Economist* of March 21, 1942, p. 393). To a large extent the Truman Committee has accepted the Guthrie criticisms: that the WPB was too slow in converting industry to war production; that those responsible for conversion resisted it, while paradoxically those responsible for civilian supplies, such as Mr Henderson, were the most enthusiastic advocates of curtailment. The Committee commended Mr Nelson personally, but concluded that in general the WPB had been content with mere curtailment of civilian supplies, and had failed to press the conversion of facilities; that this was the fault of dollar-a-year industry representatives who were "unable to divorce themselves from their subconscious gravitation to their own industries"; and that control over conversion and the distribution of contracts should be granted to the recently created Smaller War Plants Corporation. Mr Nelson is known to be firmly convinced of the need for experienced industrialists in the direction of war production, and it is reported in the American magazine, *Time*, that he felt the report so unfair that he asked for a postponement of publication, which was not granted. Dr. Gulick's commission to recommend reforms in the WPB organisation suggested, however, that there was some substance in the Guthrie complaints. Dr. Gulick recommended a clarification of authority within the Board, the lack of which constituted one of Mr Guthrie's main grievances. The new appointments at the top of the WPB are clearly intended to meet this point, and they are also evidence of Mr Nelson's willingness to follow up constructive criticism. There is no evidence, as yet, though, that the changes in the control of war production involve a recognition of the principle that controllers should not supervise their own industries.

The Silver Lining

There is an Alice-in-Wonderland quality about the silver situation. Supplies are so short now in relation to demand that they are being unofficially rationed in New York, yet the Treasury, under existing legislation, must continue to buy domestic silver, and only foreign supplies reach the market. Silver is price-fixed at 35½ cents an ounce, but the Treasury is paying 71.11 cents an ounce. This increasing demand for silver for war purposes has led the War Production Board to request the Treasury to release 40,000 tons of silver for the construction of bus-bars, used to conduct electricity in the processing of aluminium. In January, Secretary Morgenthau made a plea for the elimination of silver legislation from the statute books, particularly those provisions which required the Government to purchase domestically mined silver at such an outrageous price; but hopes that the Government would defeat the powerful silver lobby by a frontal attack have proved premature. The legislation remains untouched, and, in addition, the silver bloc has been conducting a vigorous campaign against the restrictions on mining equipment imposed by the War Production Board. The policy of the Board was to give preference in equipment to mines producing the largest quantities of strategic metals such as copper, zinc, and lead; and, in March, it issued an order refusing priority ratings for mines whose gold or silver output was 30 per cent or more of their output. Pressure by the lobby compelled the WPB to grant a blanket priority to gold and silver miners; but apparently the WPB has yet to assign the serial number which would make purchases of equipment possible in practice. The continued employment of labour and equipment in silver mining, when the Treasury holds an enormous stock of silver which could be used for war purposes, as a substitute for tin and copper,

is illogical and indefensible; but Mr Morgenthau has advised the WPB that legislation is necessary before the monetary silver may be released. If the Board persists, it may be the silver lobby's last battle; but it must be remembered that this is an election year, and western Congressmen will do their best, or worst, for their constituents.

Mineral Production

In order to meet the demands of the Defence Departments for a general guide to mineral supplies, the Bureau of Mines this year has compiled its annual estimates of production with greater speed than usual. The results are impressive. At \$6,600 millions, the value of America's minerals output exceeded that of the preceding year by 18 per cent. It was roughly twice as high as in 1934, and has in the past only once been surpassed, namely, in 1920, when prices reached the peak of the post-war boom and far exceeded the average price level of 1941. The 18 per cent increase on the year is partly the result of higher prices, although some important mineral prices—and in particular those for the two light metals, aluminium and magnesium—have been reduced. At the same time, the volume of production has been materially raised and such important products as aluminium, magnesium, zinc, iron-ore, crude oil, petrol, including aviation spirit, and coke were produced last year in larger quantities than ever before. Among the various groups of minerals, that of mineral fuels, comprising oil, coal and coke, continued to account for more than half the country's total mineral output. At \$3,630 millions, the estimated value of this group showed an advance of 18 per cent on the year and was the highest since 1920. The output of crude oil, at 1,404,000,000 barrels, and of coke, at 64,678,800 short tons, established records. Production of bituminous coal, at 502,860,000 short tons, was 11 per cent up on the year but remained below the 1929 record, while production of Pennsylvania anthracite, following its steady decline since the last war, reversed its trend in 1941 by rising 6 per cent on the year to 54,351,000 short tons. The value of production of metallic minerals in 1941, at \$1,970 millions, was 17 per cent higher than in 1940 and has previously been exceeded only in 1917 and 1918, when prices were far higher than last year. In this group new records of iron ore shipments (92,684,000 tons or 23 per cent more than in 1940), light metal supplies (with increases on 1940 ranging between 50 and 107 per cent) and zinc supplies (an increase of 12 per cent) were outstanding. The great majority of other metals also showed advances both in quantity and value; only the output of gold and silver fell slightly. The value of the output of the group of non-metallic minerals, excluding fuels, advanced by 21 per cent to exactly \$1,000 millions, and was the highest for a decade. Building materials such as cement, stone, sand and gravel, as well as lime, gypsum, clay products, salt and sulphur, recorded marked advances. At the same time, a number of minerals normally almost entirely secured from foreign sources, like asbestos, graphite, kyanite and mica, were produced in sizeable quantities from domestic sources.

Shorter Notes

The Navy has made an appeal to fishermen and yachtsmen for 1,000 small boats to be used to report movements of submarines and to rescue survivors of the Battle of the Atlantic. Over a thousand of such craft are already in service with the Navy. According to Admiral Vickery, of the Maritime Commissions, sinkings are still greater than launchings of new merchant ships.

Congress has passed a Bill authorising the Federal Reserve System's Board of Governors to relax the reserve requirements of member banks. Reserves in New York had fallen so low that the success of future Treasury issues was felt to be endangered.

Congress has reached a compromise on the appropriation for the Department of Agriculture. Legislation has been passed providing funds for activities on which the House and Senate are agreed; for the activities on which the two Houses are not agreed the Department can spend money during July and August at the rate of the 1942 appropriation. Congress has been holding up the appropriation in order to force the enactment of a provision forbidding the sale of stocks of grain at below parity prices.

THE WORLD OVERSEAS

The Quebec Minority

(From Our Ottawa Correspondent)

June 16th

THE continuing problem of unity in a federal system calls constantly for vigilance and for ability in composing economic and social differences among outlying sectors. To have that problem accentuated by a sharp, deeply-rooted racial difference is Canada's distinction. No understanding of the historic conscription debate that has taken place in the Canadian Parliament this summer is possible without keeping both these aspects in mind. The solution must be reconciliation, for French Canada will never, in the foreseeable future, be assimilated.

There is no precise parallel to be found for the problem of Quebec in a study of other economic strains that have beset the Canadian Confederation—for example, in the traditional objections taken in the Atlantic maritime provinces to policies dominated by "Upper Canada." Nor is there guidance in the historic campaign for economic equity by the western provinces, which finds kinship in many of its basic causes with the secession sentiment of West Australia a few years ago, or in the rising populism of the western states of America in an earlier era.

Nor can one uncover here the precise pattern of federal disruption that developed in the American Union in a generation of growing irritation between the South and the rising industrial economy of the North that presaged the War of the States. There has been extremist talk in Canada, these recent weeks, that the conflict between Quebec and Ontario, if pressed too far, must lead in time to civil war. But this would certainly not happen under the shadow of world war. The position of the French-speaking minority, representing nearly 30 per cent of the population, creates the paramount problem of Canadian statesmanship, and the events of this summer are another reminder of that fact. Its origins lie far back in the British occupation of Canada in 1763. It is not merely a matter of economic conflict. It is the greater problem of maintaining harmony where a cohesive and enduring minority possesses racial and religious distinctions.

The Two Views

A classic statement of Quebec's opposition to conscription, and the related issues, came from P. J. Arthur Cardin, a former Minister of Transport and Public Works. He was a descendant of the founders of Canada, he said, of those who first discovered and established Canada as a civilised, Christian country. He was proud of his race. He had to reason in his mind why he had to support the British flag, and spend his energies on the defence of British rule. Canadians of British stock, on the other hand, acted from the impulse of the heart when England was concerned. Their hearts became inflamed at the mention of the British Empire.

Actually, the majority of English-speaking Canadians in 1942 possess few of the characteristics attributed to them by Quebecers of the Cardin school. The main points cleaving up the Quebec nationalist position are pride of race and claim to indigenous Canadianism, opposition to British imperialism of which conscription has become the established symbol, and a conviction that French-speaking Canadians occupy a position of economic inferiority within the Confederation. "There is no great wealth," said Mr Cardin, "to be conscripted from the hands of French Canadians, because they have no great share in the economic development of Canada. We have lived alone in our corner, in our little part of Canada. We have always been told that we would not be forced to go and fight outside the limits of Canada."

That, then, is the basis of the conflict between Quebec, dominated by the Catholic Church, with its society based upon its own educational standards, and the English-speak-

ing provinces. It has become more marked under war conditions. This is a war of science and mechanisation. The educational background of the Quebecer is an initial disability to his complete absorption into the modern army of the kind Canada has created. There are disabilities of longer standing, imposed by the English-speaking traditions of Canadian army administration. Only within the past year has a serious attempt been made to organise French-speaking units larger than a battalion, and only a few months ago was the army manual issued in French for the first time.

The economic inferiority of the French Canadian, an obsession not only in Quebec, but in certain other parts of Canada, has less foundation. The Rowell-Sirois Commission examined the position of all the provinces, and failed to find evidence to support the theory of Quebec inferiority. It discovered, in fact, that Quebec consists of a number of regional economies of unique diversity, from the metropolis of Montreal and its rich tributary area to several sub-marginal areas on the lower St. Lawrence, and on the northern frontiers. Even to-day, there are settlements of central Europeans on land that French Canadians gave up as too barren. The economic position of destitute areas of the prairies is worse than many of the poor, rocky farms of Quebec.

The Imperialist Minority

What passes for British imperialism in popular politics in Canada arouses aversion not only among Quebecers. In a Dominion that has led in developing the concept of Commonwealth, Mr Cardin would find difficulty in locating a majority of English-speaking persons whose hearts inflame at the mention of England or the British Empire. The English-speaking provinces, moreover, are more mixed in racial origins and outlook than the Quebec minority. There is an imperialist minority. It is usually identified with Ontario and Toronto, because it usually finds expression in a section of the Toronto press. But it is a dwindling minority of colonialism. It is true that this minority, like the Quebec minority, but for different reasons, views the issue of conscription with special sentimentality.

Within the confines of this conflict, Canadians find a set of extreme and irreconcilable views that feed upon animosity. The voice of the majority of Canadians is probably closer than either extreme to the view expressed by

Brooke Claxton, M.P. for a Montreal division. He said: "Both groups of extremists are basically colonial-minded; both of them charge each other with disloyalty; the clashing knives of their bitterness sharpen each other; both are wrong; both threaten national unity, and interfere with the war effort; both undermine Canada's faith in herself, and prevent her from taking the full responsibilities of nation-hood."

Social Policy in Poland

[BY A CORRESPONDENT]

THE chief aim of Germany's social policy in occupied Poland is, according to the Nazi press, to differentiate between Germans, Poles and Jews, and to separate these main sections of the population from one another. For instance, the best available living quarters in Polish towns are usually reserved for the Germans, and various municipal councils have issued special orders forbidding non-German people to enter their towns, in view of the lack of accommodation; the worst slum quarters, on the other hand, are reserved for the Jews. The food rations of Polish people are only about half of the German rations, and the Poles are not allowed to buy any clothes except necessary working clothes; the Jewish clothes ration is still lower.

Polish workers in the Reich receive only 85 per cent of the ordinary wages and they do not receive many of the benefits of the German social services; they must in practice pay higher taxes, since no dependants' allowances are granted. In the Polish General Government, a new regulation for agricultural wage rates is now in preparation "which will make it possible for the German agricultural worker to attain a standard of living distinctly different from that of the Polish labourer." The necessity of higher wages for the German workers in Poland is sometimes justified by the argument that they have, at the same time, to act as "political soldiers in enemy territory."

It was originally planned to employ a large proportion of the Polish population on German territory, and over a million persons were actually transferred from Poland to German farms and factories during the first year or so after the German invasion. However, these transfers were apparently on a smaller scale during the last few months, and the total number of Polish workers in the Reich was roughly 1,100,000 in April this year, according to the German wireless. Dr. Meinhold, of the Institute for "German Labour in the East," has recently pointed out that, in theory, several million Poles might be made available for work in Germany, but this "would be dangerous from the racial point of view." There is indeed much evidence that a large proportion of the German population have refused to treat Polish workers with enmity, and no complete segregation can be attained if large numbers of Poles are sent to Germany.

Much to their own dislike, the Nazis had, therefore, to employ increasing numbers of Poles in Poland itself. The number of Poles at present engaged on industrial work in the General Government seems to be only slightly smaller than it was in the whole of the Polish Republic before the invasion. A certain number of the Polish workers have been employed in semi-military labour companies for some time past. In April, 1941, the "Building Service," a Polish variety of the German Labour Service, was made compulsory for all youths of 21 and 22 years of age; they have so far been chiefly occupied in road building, irrigation work and so on. A similar labour service has now been made compulsory for the whole male population except Jews and gypsies, and it is very likely that increasing numbers of Poles will actually be called up and used for every kind of work in the near future. The spirit of the labour regimentation in the General Government can easily be grasped from the educational efforts of the Labour Front camps in Poland, where Poles are trained in eight-week courses to become semi-skilled bricklayers and carpenters. The instruction in these 29 camps is purely

military in character; building processes have been divided, for the purpose, into a number of simple operations; each of them, for instance, the throwing of bricks or the swinging of trowels, is done by the trainees on military orders. The orders are partly given in German, and the instructions are often interrupted by tool parades, clothing parades and so on.

The manpower of the numerous Polish Jews is, of course, also used by the Nazis, the more so since many of them are skilled artisans. They mostly work within their ghettos on behalf of German firms; the *Koelnische Zeitung* recently wrote about these workers, in defiance of the whole "racial" theory: "Their work is satisfactory. . . . The Jew proves himself to be a skilled manual labourer." In Lublin, a number of Jews were even asked to work in German factories and offices, and they were given special living quarters, separated both from the ordinary ghetto and from the houses of the Aryan population. Furthermore, last December, when the deportation of German Jews to Poland was at its height, a number of Polish Jews were forcibly sent to labour camps in Germany. Seldom has the folly of "racialism" revealed itself more clearly than in Nazi-controlled Poland.

Chilean Copper Developments

[BY A CORRESPONDENT]

June 20th

ACCORDING to the United States Bureau of Mines, Chile's copper production in 1941 was the highest ever recorded. At 453,594 metric tons, the year's output was 115,893 tons up on the year and exceeded the previous peak, in 1937, by almost exactly 40,000 tons. Actually, the new record figure does not reflect the full importance of last year's advance. In January, 1941, Chile's copper industry produced only 29,603 tons of the metal, an annual rate of 355,236 tons, while, in December last, output had advanced to 43,364 tons, or 520,368 tons yearly. Early this year the rise continued.

The rapidly rising trend of Chile's copper production deserves attention for more than one reason. Last year, roughly 90 per cent of Chile's copper supplies were absorbed by the United States, and since February, 1942, the whole of the country's copper surplus is at the disposal of the United States Government under an agreement concluded between the Government-owned United States Metals Reserve Company and the Chilean authorities. The country's rising copper production is not only of value to the Allied armament industries during the war; it will also influence world markets after the war. Moreover, since the decline of Chile's nitrate industry, copper has become the backbone of Chile's national economy. Last year, copper accounted for three-fifths of Chile's total exports by value, and the proportion is increasing. Finally, the prosperity of Chile's copper industry is of importance to the holders of Chilean bonds. Under the country's current external debt scheme, the Chilean Government's tax receipts from the copper industry are transferred to the Chilean Autonomous Amortisation Institute and earmarked for the service of the foreign debt. Last year, these copper payments amounted to 70 per cent of all funds available for the foreign debt service. After the record production in 1941, the proportion should be still higher this year.

Chile's copper industry is not young. Even before the discovery of the American continent, the Incas mined copper in Chile. When the foundation of a world copper market was laid about a century ago, Chile, which then sent the bulk of its ore to Swansea for treatment, was the world's largest copper producer. It retained this position until 1882, when the United States took the lead. At the outbreak of the last war, Chile produced 43,000 tons of copper per annum and occupied fourth place among the copper producers. During 1914-18, however, the huge British and United States demand had a big effect on the Chilean copper position. In 1915, the Chuquibambilla mine in Antofagasta entered production in order to meet the high international demand, and since that time Chile has been second among the world's copper producing areas. By the end of the last war, its output had exceeded 100,000 metric tons per annum. By 1926, it had passed the 200,000 tons mark. Three years later production exceeded for the first time 300,000 tons, and in 1937 it passed 400,000 tons. This year it will almost certainly jump to over 500,000 tons.

Technical Advantages

Altogether, the copper content of all known Chilean copper deposits amounts to no fewer than 35,500,000 metric tons, or about one-third of the known reserves of the entire world. Apart from the size of the ore reserve, Chile's copper ore is easily mined and refined. Chuquibambilla copper, for instance, is mined by open-cast method, and the ore contains hardly any admixtures which require special refining methods. In fact, the great bulk of Chile's copper ore is refined within the country, and most of the Chilean copper smelters produce substantial quantities of precious metals, especially gold and silver as by-products. These advantages outweigh the chief drawbacks of Chile's copper mines, which is their geographical situation high up in the Andes; this required expensive railway construction in the early development stages of the industry.

Chile's copper production is dominated by United States capital. The Chuquibambilla deposit is exploited by the Chilean Exploration Company, which like the Andes Copper Mining Company, exploiting the Potrerillos deposit, is a subsidiary of the United States Anaconda group. The El Teniente deposit is worked by the Braden Copper Company, a subsidiary of the American Smelting and Refining Company. In 1941, these three groups produced between them no less than 97 per cent of Chile's total copper.

The favourable working conditions of the Chilean copper industry, together with the supplies of United States capital on the one hand and the unlimited United States demand on the other, will almost certainly assure a rapidly rising output from Chilean copper mines for the remainder of the war.

Shorter Notice

"A German Protectorate." By Shiela Grant Duff. Macmillan. 12s. 6d.

IN any study of the "New Order," Czechoslovakia must occupy a prominent place. It has had a longer experience of Nazi rule than any other non-German state. This book is an important contribution to such a study, and Miss Grant Duff is especially well qualified to write it. Any account of Czechoslovakia written in England to-day must be incomplete. But as far as the material available (chiefly the German and Czech Press and broadcasts) permits, Miss Grant Duff has given a full and careful picture of what Nazi rule means for a non-German people. The constitution of the Protectorate is theoretically a diarchy, the hierarchy under the Reich Protector being parallel to the so-called autonomous government of Dr. Hacha. But it is in the nature of all diarchies to be shams. The Germans rule the Protectorate, and the Czech Cabinet, civil service and police are merely agents of the German will. From Miss Grant Duff's analysis two things emerge. The first is the deplorable damage done to the Czechoslovak state and the Czech people. The Germans have overthrown most of the achievements, political, economic, social and cultural, of Masaryk and his collaborators. Secondly, this book makes it clear that the work of rebuilding of the Czechoslovak state will not be easy. Hundreds of thousands of Czechs have been driven into exile or deported as serfs; for three years, no Czechs have been trained as doctors, lawyers, schoolmasters or university teachers; thinking and discussion have been repressed, and the press has been perverted and enslaved. The history of the Protectorate has yet to be written; Miss Grant Duff's book is a valuable first volume of that history.

Canteens for war workers

EFFICIENT OPERATION REQUIRES EXPERT PLANNING

By the creation of the National Society of Caterers to Industry, an extensive pool of technical knowledge has been made available to those managements of vital war industries who may have found that the provision of canteen facilities has produced problems which cannot be resolved with the resources normally available to them.

The Society's members, as will be seen, are firms of high standing, each with a long specialist experience in planning, equipping and operating works canteens—an experience which grows daily with the rapidly increasing calls upon their services.

- AGARS (1936) LIMITED, Manchester.
- THE BAR & CANTEN SUPPLY CO. LTD., Glasgow and Manchester.
- BARKERS (CONTRACTORS) LIMITED, London and Provinces.
- BENNETTS (SOUTHAMPTON) LIMITED, Southampton.
- BUTLINS LIMITED, London and Provinces.
- THE BINDON MOORE COMPANY, London.
- CANTEN CATERERS LIMITED, London, Sunderland and Glasgow.
- CARDER CANTEENS, Bristol, Coventry, Launceston, Scotland, etc.
- CATERING CONTRACTORS LIMITED, London and Provinces.
- D. ELLIS & COMPANY LIMITED, London and Provinces.
- FACTORY CANTEENS LIMITED, Croydon.
- JOHN GARDNER (LONDON) LIMITED, London and Provinces.
- K. & A. HALL (CATERERS) LIMITED, London and Provinces.
- INDUSTRIAL CANTEN SERVICES, Leeds.
- INDUSTRIAL CATERING LIMITED, London.
- NORTHERN CATERERS LIMITED, Huddersfield and Northern Counties.
- STAFF CATERERS LIMITED, London and Manchester.
- STEWART & WIGHT LIMITED, London.
- ULSTER MENU COMPANY LIMITED, Belfast and Northern Ireland.

Consultation with members of the Society provides that expert guidance at all stages without which the efficient operation of the canteen must be impaired.

German Europe

Vagrant Money

At the end of March, 1942, Germany's total debt stood at Rm 142,030 millions. The average monthly increase has been Rm 4,500 millions, suggesting that, at the end of May, the total exceeded Rm 150,000 millions, which was the total reached at the end of the last war. When the post-war inflation had run its course, this tremendous State debt had been wiped out; numerous small investors and owners of real estate simultaneously lost their investments or property; small savings disappeared; during the inflationary period itself, real wages were appallingly low. It is not surprising that the German people dread nothing more than another inflation. The slightest sign of an upward rush in prices jogs their unhappiest memories.

Actually, conditions in 1942 are quite different. The comprehensive system of control makes inflation of the kind experienced between 1918 and 1923 impossible as long as the control measures remain effective. The wage stop has prevented any spectacular increase in wages. Severe rationing has not led to a dangerous excess of purchasing power among the great bulk of the working class. The wages tax is 150 per cent of the pre-war rate. Working class savings have probably remained at the pre-war level. The system of iron savings introduced last autumn, which was in effect a reduction in taxes, shows that there was no appreciable margin of wages left for savings. There has been a large increase in small savings, but this comes mainly from small shopkeepers and small businessmen, who have either sold out their stocks or been concentrated.

The monetary scene in Germany is ruled by the rise in purchasing power derived from the wartime liquidity of agriculture and industry. This is the explanation of the heavy demand for shares. Shares were the only "free" commodity in Germany apart from real estate. The public looks upon them as *Sachwerte* (real value) and were naturally eager to invest the wartime surplus derived from greater earnings and idle reserves. The majority of shares in Germany are held by big concerns and companies; demand, therefore, exceeded supply; and, after many threats, shares acquired after September, 1939, had to be registered. At the beginning of June, 1942, a general call up of these shares was made possible by a special decree. Holders of registered shares may not sell them without having offered them to the Reichsbank. If shares exceeding Rm 100,000 in market value are called up, they will be exchanged for Treasury bonds, which will be blocked for the duration. The Reichsbank will use the called-up shares to increase the supply on the bourse, if necessary.

Actually, dealings on German bourses have come almost to a standstill since the introduction of registration. Vagrant purchasing power is, therefore, seeking investment in house property and other *Sachwerte*, such as paintings, jewellery, *objets d'art* and stamp collections. The demand for *Sachwerte* is not necessarily due to distrust in the Reichsmark. The tremendous demand for war production, since the attack on Russia, has put an end to the possibility of normal repairs and replacements in industry and agriculture. There has been another concentration of industry. Idle money capital was bound to increase at a faster rate than before. The suggestion of abolishing depreciation accounts has been rejected; the proposal to close the bourses has not been accepted. Another remedy to curb the vagrant money is now being discussed. The Government, it is suggested, should no longer advance payments to private industry, but should leave the financing of public orders to the banks which are desperately trying to find an outlet for their enormous deposits.

Nobody in Germany believes that the country, if reduced to its former size after defeat, would be able to bear the present debt without crippling the entire economy. The present policy in its monetary aspect is possible only because of complete control and because of the hope that the actual capital losses will be made good after the war by consolidating Germany's conquests—a hope which is reflected by the proposal in the press that the shares of companies in the conquered countries of Eastern Europe should be placed on the market.

Continental Oil.—*Continental Oel AG, Berlin*, founded in the spring of last year, has published its first annual report, covering the period from March 27, 1941, to December 31, 1941. This concern, in which the German Government holds an important interest, was founded for the centralisation of the European oil industry under German domination. The report contains no details. By acquiring capital interests in oil companies and refineries, a foothold was gained in foreign countries; and former German property—that is to say, property that was in German hands before the last war—has been regained. This probably refers to the leading Roumanian companies *Concordia-SA* and *Steaua Romana SA*. For operating the Roumanian interests, a subsidiary, the *Deutsch-Rumänische Mineraloel GmbH*, has been founded.

The conquest of Russian territories extended the concern's activities. The Ostland Oil Distribution Company was specially founded to develop the shale oil industry of Esthonia and to distribute oil and oil products in the occupied territories. *Continental Oel*, which is mainly a controlling and holding organisation, showed during its first business year a loss amounting to Rm 1.43 millions.

Fuel Economy.—German industry, asked to economise in the consumption of fuel, has found it necessary to offer a bonus to stokers. The bonus system has had good results; and the labour trustees have been persuaded to permit this increase in wages. For the first 20 tons of coal saved, the stoker gets Rm 0.45 per ton; for every further 20 tons saved, the bonus is increased and reaches a maximum of Rm 2.5 per ton.

Building.—Minister Speer, who is also special commissar for the building industry, has reorganised the priority system for building. The new regulations are mainly concerned with stopping work on all buildings not needed for fortifications. Material and labour released will be used on the most urgent works. At the same time, building contractors who continue non-essential works will be heavily penalised. Building contractors, Government officials and even foremen have been warned once again to check all work under construction in order to release as much material and labour as possible.

Concentration in Sweets.—A special decree regulates the production and distribution of sweets. The volume of production has been drastically reduced. A considerable number of wholesalers and retailers will be closed down. No deliveries may be made to restaurants and canteens, grocers, tobacconists or wine shops.

Clothing.—Last year, clothing retailers experienced a shortage of material, and the Clothing Board ordered a compulsory reduction of the stocks held by the textile industry and by wholesalers. This action is said to have been very successful in securing the restocking of retailers, and will be repeated this year. By the end of this year, textile factories must have reduced their stocks by 18½ per cent. In addition, 6 per cent of the output during the third quarter of 1942 must be kept ready for special delivery. This is explained by the necessity of reorganising the system of distribution after a great number of textile factories have been closed down under the new concentration.

The variety of material for clothing has been considerably reduced and special regulations will be issued to the clothing industry for the most suitable methods of using the new material in the manufacture of clothing. The fourth clothing card is due in January, 1943. It is stated that the card is in preparation. Meanwhile, points 1 to 20 of the third clothing card have been declared valid from November 1, 1942. Validity of the second clothing card has been extended until August 31, 1943. The third clothing card is thus still mainly a reserve card, whose different coupons will become valid according to the supply situation, which is obviously strained.

Luxemburg.—The Government has taken over the entire assets of the Luxembourg railways. Shares of the *Wilhelm Luxemburg* railway and the *Prinz Heinrich* company will be paid Rm. 82 for nominal Rm. 50. Preference shares will be paid Rm. 21.4 for nominal Rm. 10. German price regulations and price-law will come into force on June 1, 1942.

German-Dutch Collaboration.—The Central Order Department in the Hague announced recently that the total value of the orders placed by German firms in Holland amounts to roughly Rm. 2,500 millions.

Russia at War

Electricity and Coal

ONE of the major difficulties with which the evacuated Soviet industries have been confronted is the supply of electrical power. The third Five-Year Plan provided for a very great increase in the production of electricity; the "target figure" for 1942 was 75 milliard kw. hours (against 39.6 milliards in 1938). A large proportion of the new power plants were to be constructed in the eastern regions on Siberian rivers; 91 fuel power stations were planned in Western Siberia and Kazakhstan. Their geographical distribution was planned in a decentralised manner in accordance with the general tendency of construction in the last pre-war years. The achievements in switching over to electrical power supply in industry were, in fact, very substantial. Lenin's famous equation, "Socialism = Soviets plus electrification," deeply impressed the young generation of Soviet technicians and industrial managers; they took a justified pride in the development of electrification and measured the progress of the new economy by the numbers of kw. hours produced every year.

But these plans could not provide for the abnormal contingency of such a massive evacuation of industries as took place in the second half of last year. And it was precisely in the Urals, one of the main reception areas for war-evacuated plants, where electrification lagged behind. Since the end of 1941, a feverish effort has been made in all the reception areas—in the Volga region, in the Urals, in Siberia and in Central Asia—to build new power stations and to use the old ones more intensively. The difficulties have been enormous—lack of building materials, shortages of labour and of fuel. Figures for May and June have shown an increase in output by the old power stations; but reports on the construction of new electrical plants complain of the unsatisfactory tempo of work. The Urals—now the main centre for iron, steel and metallurgical industries—still remain the weak spot; and *Pravda* recently drew attention to the unsatisfactory state of repair work in the Urals power stations.

Insufficient supplies of fuel have also been a difficulty. Many of the electrical power plants have to work on peat. The output of peat has come under the responsibility of the People's Commissariat for Power Stations, and the press has recently addressed some sharp remonstrances to the Commissariat for its failure to supply the power stations with adequate quantities of peat. The power stations that work on coal also complain of irregularity in supply, and *Pravda* has repeatedly appealed to railwaymen not to hold up coal transports destined for electrical plants.

The coal position has also shown some instability. With the resumption of the fighting in the Donetz area, the coal output there must have been practically lost. The total output of the eastern regions was planned to reach about 85 million tons in 1942. The results of 1941 varied from region to region. The Kusnetsk Basin fulfilled the plan, though with some difficulties; the Ural mines did not. The reports about the first half-year of 1942 give a somewhat confused picture. The "over all" results are more or less optimistic. It is said that production in June exceeded the figures for May very substantially. But more detailed reports are less reassuring. The Karaganda Basin did not fulfil its plans during May and June. The loss will be seriously felt by the iron and steel industries in the Urals because Karaganda coal is of a high quality, and any falling off of Karaganda supplies makes the iron and steel works more dependent on the Urals brown coal. The Kusbass mines,

Household Utensils.—A system of private rationing has been introduced by retailers in many German towns to prevent the "hoarding" of household utensils. German retailers have been complaining for some time that any new stocks of kitchen and household utensils are sold out at once. Retailers in many towns are, therefore, marking clothing cards for each purchase. In some towns, special cards have been issued, which carry coupons for 14 groups of articles. In other towns, blank cards are in use, issued by the municipal administration on which the retailer marks each purchase. It seems that these experiments are officially encouraged, and they may be followed by a general system of rationing.

on the other hand, have fulfilled their plans quantitatively; but the quality of output has left much to be desired. The main difficulty there has been in the output of coking coal. For several months, a rather heated correspondence has been going on in the press between managers of the Kusnetsk mines and directors of the Magnitogorsk steel and armament works. The latter have complained about the poor quality of the coking coal which prevented them from working according to plan. The managers of the Kusnetsk mines have replied that coal is being unduly wasted in the steel works. The press seems to put the blame at the doors of the coal producers rather than at those of the steel directors.

Murmansk Harbour.—The following figures illustrate the intensity of the work performed at Murmansk harbour during the first half of 1942. They also indicate the growing flow of Allied supplies to Russia. The average load handled per dockworker in January, 1942, was under 3 tons per working day. In February, it rose to more than 4 tons, in March to 5.1 tons, in April to 5.2 tons. In May, there was a sudden leap to 9.3 tons, and in June this figure was even exceeded. There were dozens of air-raids over Murmansk during June; but these have not seriously affected the unloading of supplies or their transport to the interior of Russia.

Aviograd.—Aviograd, or the Town of Aircraft, is the name of a new industrial town built on a bare steppe. The town has specialised in aircraft production. It has sprung up during the months of industrial evacuation. It has blocks of three and four-floor houses, cinemas, clubs and libraries. The aircraft plants work at full stretch, and rows of planes leave the assembly shop at frequent intervals. Many similar factory towns have sprung up like mushrooms in the remote northern tundra during the first half of 1942.

Invalids' Labour.—A decree of May 16, 1942, has put upon industrial managers the obligation to provide work and housing accommodation for wounded ex-servicemen. At the same time, special training courses have been organised for invalids unable to work in their former trades. They are now being trained for light jobs and office work. The general shortage of labour and the relatively big numbers of disabled ex-servicemen make it imperative to speed up rehabilitation and training to the utmost. Training courses have been organised directly in military hospitals so as to enable invalids to take up jobs immediately after convalescence.

INDEX TO VOLUME CXLII

Shortage of paper makes it impossible in wartime to follow the normal practice of distributing to every reader a copy of the Index to *The Economist*. Copies of the Index to Volume CXLII (January to June, 1942) will be available on July 17 and will be sent, free and post free, to all those who have applied since July, 1941, and to any others who make application now.

THE ECONOMIST - Brettenham House, London, W.C.2

THE BUSINESS WORLD

A Wheat Plan

AFTER protracted negotiations, interrupted by the outbreak of war, but resumed in Washington in July last year, officials of Argentina, Australia, Canada, and the United States (the great exporting countries), and of Great Britain (the leading importer), concluded an agreement last April which came into operation on June 27th with the approval of the Governments concerned. The agreement falls into two parts. First, it provides for the creation of a relief pool of wheat and flour for distribution among "war-stricken and other necessitous areas so soon as, in the view of the five countries, circumstances permit." To begin with, the Governments of Canada and the United Kingdom are to contribute to the pool 25,000,000 bushels of 60 lb. each and the United States 50,000,000 bushels; but the United Kingdom may contribute transport capacity in lieu of part or the whole of its share. If more is required, the five signatory countries are to contribute the additional quantities needed in agreed proportions. Secondly, and this has been the main object of the discussions, the agreement provides for a plan designed to smooth the disastrous fluctuations in wheat prices which have been the curse of exporting countries, and to expand the market for cheap wheat in importing countries. This plan, or draft convention, is to be submitted to a conference of the nations "having a substantial interest in international trade in wheat which are willing to participate." Pending the conclusions of this conference, which can hardly be convened before the end of the war, the five countries will bring into effect among themselves certain provisions of the scheme at a date to be announced within six months after the cessation of hostilities.

The importance of the plan is threefold. First, it represents an attempt, sponsored by the Governments of the four principal exporting countries and of the chief importing country, to solve, for one important commodity, the problem of inordinate price fluctuations which has long harassed the producers of many primary products and made for world economic instability. Secondly, it may be used as a model in the preparation of schemes for other primary products—and may thus vitally influence Great Britain's prosperity, which must continue to depend on the import of cheap foodstuffs and on the conversion of cheap imported raw materials into manufactured goods. Thirdly, the scheme provides a test of the goodwill of five important countries in translating into practice the principles of the Atlantic Charter and of the Lend-Lease master agreements. The draft convention, therefore, deserves careful scrutiny.

The Principles

The principles of the scheme are not new. They comprise

national and international measures for the regulation of wheat production in both exporting and importing countries, for the orderly distribution of wheat and flour in domestic and international trade at such prices as are fair to consumers and provide a reasonable remuneration to producers and for the maintenance of world supplies which shall be at all times ample for the needs of consumers without being so excessive as to create a world burden of unwanted surpluses.

Countries which have hitherto employed land uneconomically for the high-cost production of wheat by erecting barriers against the import of cheap foreign grain are exhorted to change over to the production of other more suitable foods rich in vitamins, proteins and minerals. The Governments of Argentina, Australia, Canada and the United States, in turn, are to adopt appropriate measures to ensure that the production of wheat in their territories does not exceed the quantity needed for domestic consumption and the basic export quotas and maximum reserve stocks for which the agreement provides—a principle which, according to the way in which it is quantitatively interpreted, plainly involves the danger of restriction and restraint of trade as much as it does the possibility of smoothing out fluctuations. If production in any one of the four exporting countries exceeds the "prescribed" quantity in any crop year, the Government of that country must take steps to ensure the disappearance of the excess before the end of the next crop year, subject to special provisions for excess production due to a yield above the average of the preceding twenty years.

While provision is made for special contingencies, the four exporting countries are to ensure that stocks of old wheat at the end of the crop year are neither inadequate nor excessive. The lower and upper limits have been fixed as follows: 35,000,000 and 130,000,000 bushels for Argentina, 25,000,000 and 80,000,000 bushels for Australia, 80,000,000 and 275,000,000 bushels for Canada, and 150,000,000 bushels and 400,000,000 bushels for the United States. Surplus stocks may be held in case of an abnormally high yield.

Exports are to be regulated by reference to periodical estimates of the total volume of international trade in wheat and flour, and each of the four exporting countries is to be given a quota. There are to be three kinds of quota: basic, secondary, and supplementary. The total volume of trade done by Argentina, Australia, Canada and the United States is to be shared in the proportions of 25, 19, 40 and 16 per cent respectively; but the actual size of these countries' basic quotas will be adjusted to allow for the exports of countries not adhering to the agreement and for the allocation of basic quotas to other exporting countries which decide to participate in the scheme. If the combined exports of the four signatory exporting countries exceed 500,000,000 bushels in any quota year, they are to be given secondary export quotas in proportion to permitted surplus stocks or, in the absence of surplus stocks, in proportion to their basic quotas. Any country which is unable to export its quota during a quota year is to re-allocate its unshipped quota as supplementary quotas to the other exporting countries, in proportion to surplus stocks or, in their absence, in proportion to their basic quotas. It may be necessary for the scheme, but it is ominous for the future of world commerce, and the interests of consumers that, in order to prevent non-participating countries from impairing the scheme by "abnormal" exports, the contracting governments are to "co-operate in taking . . . such practical measures as may be necessary to attain this end." The big stick, that is, will be used against price cutters and interlopers. Obviously no

such plan could be tolerable unless it was freely accepted by all exporters.

Export prices are to be controlled by the fixing, in August of each year, of a basic minimum and a basic maximum price, c.i.f. United Kingdom ports. Provision is made for a periodical adjustment of these prices to allow for carrying charges. The prices are to

(a) return reasonably remunerative prices to producers in exporting countries; (b) be fair to consumers in importing countries; (c) be in reasonable relationship to prices of other commodities; and (d) make appropriate allowance for exchange rates and transportation costs.

The Governments of the four exporting countries are to ensure that wheat for export is at all times on sale at prices not in excess of the maximum prices.

The scheme is to be administered by an International Wheat Council consisting of one or more delegates of each contracting Government. The Council is to meet in January and August and at such other times as it may determine, but it may take decisions, after correspondence, without a meeting. An Executive Committee, to be set up by the Council, is to keep "under review the working of the agreement" and to report to the Council. Its chairman, to be appointed by the Council, need not be a delegate of a contracting Government.

Provisions are made for the accession of additional importing and exporting countries to the agreement, which is to remain in force for four years after the last day of the month of July following the date upon which it comes into force. If it is shown to the satisfaction of the Council that any one of the four leading export countries has either exceeded its basic, secondary or supplementary export quotas or has sold wheat for export below the minimum price, the contracting Government of any exporting country may withdraw from the agreement within 90 days on 30 days' written notice to the Council. In the event of the withdrawal of Argentina, Australia, Canada or the United States, the agreement will lapse, unless the Council decides to maintain it by three-fourths of its total votes.

The Dangers

The draft convention, as published in a White Paper (Cmd. 6371) issued last week, provides a basis for discussion rather than a final and acceptable scheme. The talks in Washington were no doubt handicapped by the small number of governments represented, comprising the four chief exporting countries, and only one importing country. The convention raises as many problems as it attempts to solve; even as a bare statement of principles, it is open to serious criticism.

The object of the scheme is unexceptionable. Some control over the supply and price of wheat is as essential to the removal of the disastrous instability of prices in ex-

porting countries as the removal of incentives to high-cost wheat production and the utilisation of such land for more suitable produce is to the rise in the standard of living in countries which have hitherto encouraged this uneconomic practice. Since there was only one high-cost producer represented at the discussions and that one, Great Britain, the convention does no more than exhort in this matter of land use. But wheat exporters were well represented; and one of the outstanding defects of the convention is the absence of a clear definition of the basis upon which minimum and maximum export prices are to be fixed. Under the convention the prices fixed are to "return reasonably remunerative prices to producers in exporting countries." If this meant "remunerative" to all producers, whatever their costs, it would be a disastrous principle, and an attempt to hold world consumers to ransom. It would be interesting to know whether the delegates at Washington explored the possibility of creating a fund, financed by wheat producers, for the compensation of high-cost producers in exporting countries or whether they have, in fact, decided that prices must at all times be "reasonably remunerative" to marginal producers. The marginal producers cannot expect a guaranteed income at the expense of consumers and regardless of efficiency; low cost producers cannot expect to live in clover, by international agreement and guarantee, upon the difference between the price at which they could sell wheat remuneratively and the much higher price at which the highest-cost producers must sell to make both ends meet. The proper principle is plain enough. No control scheme must make the average price of wheat over a stretch of years, taking in a period of boom and a period of slump, any higher than it would have been in the absence of control. The purpose of control—the only legitimate purpose, that is—is to steady the price of wheat, not to raise it. It would be interesting, too, to know whether there is any provision for increasing the total export allocation before prices actually reach their maximum level, or whether producers will be given a guaranteed and protected right to hang on and sell the biggest possible amounts at the highest price, safe from competition. Dangers of this kind call for the utmost vigilance. Is there any provision, for instance, for revising the proportions in which the basic export quotas have been allocated to the countries concerned, in order to make possible an expansion in the exports of countries with the lowest costs—or are consumers to be cut off entirely from the benefits of lower-cost production?

These and many other aspects of the problem remain to be discussed. If the need for wheat control is accepted, the principle of regulation is likely to be extended to other primary products. But such a radical departure from pre-war practices can only be justified if the consumer is not likely to be sacrificed to the interests of producers. No argument from expediency can alter the fact that quantitative restrictions can be the worst form of restraint of trade.

Finance and Banking

Credit Abundance Again

Reabsorption of the additional credit created over the end of June is reflected in the principal movements in the Bank return. Bankers' deposits have come down with a run by more than £25 millions to £146.5 millions as the chief counterpart of a contraction of £21.8 millions in the Banking Department's securities holdings and of 5.8 millions in the reserve. Even so, the credit base at the date of the return was still considerably larger than normal. It is hardly surprising, therefore, that credit has been abundant and the clearing banks eager buyers of bills, notwithstanding that TDR payments for the week exceed maturities by at least £20 millions, and that some of the maturing Treasury bills must have been taken off the market by last week's special buying. The discount market has consequently experienced no difficulty in financing its substantial Treasury bill quota of 40 per cent. In the light of the current reports as to the manner the "Holidays at Home" campaign is being conducted in the provinces, the further sharp increase in the note circulation is hardly unexpected. The week's net withdrawals of £5,834,000 compare with £4,665,000 in the corresponding week of 1941, while the note circulation at its latest record level of £807.4 millions, shows a rise on the year of £159 millions.

Argentina Controls Axis Funds

It is well known that Axis funds were transferred on a large scale from the United States to Latin America in anticipation of the US blocking order last year, and they no doubt accounted for a fair proportion of the influx of 325 million pesos of capital into Argentina in 1941. Much satisfaction will therefore be felt at the Argentine decision,

FOR ALL INSURANCE NEEDS

Head Offices:
LIVERPOOL LONDON
North John St. Lombard St.

in spite of Argentina's continued neutrality, to place restrictions on the use of foreign assets. The Axis countries are not specifically mentioned, but there can be no doubt that they will be principally affected by the decree, which must itself have arisen out of the inter-American conference in Washington on systems of financial and economic control. It has the effect of bringing Argentine regulations into line with those of the United States, and of blocking all operations in American dollars wherever there is any suspicion of Axis interest. All imported Argentine and foreign securities must be declared to the Central Bank, whose authorisation is henceforth needed before they can be sold or re-exported. Imported US dollar notes must be deposited with the Central Bank until the necessary permit has been obtained, and dollars may not be exported except through organisations authorised by the Government to control the currency exchanges with the United States.

Decline in US Gold Stock

Though the United States suspended publication of gold movements at the beginning of December, the stability of the monetary gold stock is evidence that the gold inflow remains a mere trickle, or may even have been reversed. At the end of June, the gold stock amounted to \$22,735 millions, an increase of no more than \$115 millions on the year and an actual decline of \$65 millions from the peak reached last October. In eight months, US production alone might have been expected, even in the absence of imports, to add some \$150 millions to the gold stock. There has, however, been a continued increase in gold held under earmark for foreign account, which in the five months to March rose by as much as \$374 millions to \$2,429 millions. If earmarkings have continued at the same rate, this would suggest that gold imports continue at a level of some \$50 millions a month. If any substantial amounts have been released from earmark in the past three months, on the other hand, this would indicate an actual export of gold. During the past year, there has in any event been a slight increase in gold holdings outside the United States. Until April, 1941, imports into the United States were still running well in excess of current production. In the succeeding seven months, however, imports totalled only \$296.1 millions, against world production for the period of \$758.6

Investment

Railway Stocks in Favour

The immediate response of the market to the partial relaxation of tension on the Egyptian front has been a sudden recovery in prices and volume of business. Brokers still talk of a small turnover, but, as judged by the record of bargains marked, there is a distinct improvement. According to this criterion, business on Monday was over 15 per cent greater than a fortnight before and more than 29½ per cent up on the week, while the corresponding figures for Tuesday were 20½ and 26 per cent, respectively. The expansion on the fortnight was common to almost all sections—there are partial exceptions in the case of mines and shipping shares—but the really marked rise in prices and in activity was in home railway stocks. Both equities and prior charges were affected, perhaps for rather different reasons. The interim dividend declarations are announced for the last week of the month, and, in part, the rise marks the usual pre-dividend gamble, which seems to be even less justified on this occasion than usual, since the most that can be hoped for is the payment, at due date, of certain junior preference dividends postponed for various reasons in recent years. This can, however, scarcely explain rises of considerable amount in debentures and senior preference stocks, and here the explanation appears to lie merely in a recovery from recent weakness. One of the features of the setback on the Libyan disappointment was the sudden reversal of the tendency for industrial debentures and preferences to catch up on first line fixed interest stocks, a movement which finds some reflection in the index figures discussed below. This was read at the time to indicate that the earlier improvement, itself a result of plentiful money resulting in part from vesting orders, had been rather too rapid. Money is now again particularly abundant, and it is interesting that it should once more rush into these stocks, for, so far as can be gathered, other industrial debentures

millions. In 1940 and the first four months of 1941, by contrast, imports exceeded world production (outside the USSR) by no less than \$3,680 millions. The chief apparent source of imports was Canada, with a total for 1940 and the first eleven months of 1941 of \$3,014 millions, no doubt representing for the most part Great Britain's gold losses. Imports from South Africa for this period totalled \$477.4 millions, compared with that country's production of \$953.5 millions.

Dutch Capital for Exploiting Russia

The recent establishment of a finance company in Amsterdam, to provide Dutch capital for the exploitation of German-occupied Russia, was presented by the German Press as an indication of the willingness of Dutch people to co-operate in the creation of a European economic system under German control. There is, however, evidence to show that the participation of Dutch capital in the scheme is far from voluntary. On June 16th three Amsterdam firms, normally engaged in trade with the Dutch Colonies, were placed under the control of the *Kommissarischer Verwalter*. At the same time, it was announced that these firms had "decided" to employ their liquid resources, which in present circumstances cannot be used for trading with the colonies, for financing enterprise in Russia. Similar arrangements are likely to be made with regard to other Dutch colonial companies, and the total resources thus to be raised are estimated by the German Press at some 200 million guilders. This effort to obtain the participation of Dutch capital in the exploitation of Russia is partly due to the German desire to entangle the European economy as much as possible, to lend colour to the arguments of Nazi and pro-Nazi sophistry that it will be impossible after the war to "unscramble the omelette." Another object is to reduce the frozen Reichsmark balance of the Netherlands Bank with the Reichsbank. In spite of the large sums in occupation costs levied on Holland, that balance tends to increase rapidly, owing to the grossly one-sided character of German-Dutch trade, and to the large German purchases of Dutch securities. Since it has proved impossible to induce Dutch investors to acquire German securities, Germany has now resorted to this new method of offsetting German purchases by enforcing an export of Dutch capital to German-controlled Russia.

have not been equally in demand. It is possible that the movement owes something to talk of forming a public board for the whole transport industry, although past experience is not such as to provide any guarantee that this would give better security, even to prior charge stocks. Such a development might work in the opposite direction for the equities—note Transport "C" stock—while it is hard to see anything but an adverse factor for all railway stocks in the renewed demand of the operatives for increased wages.

June Price Changes

The appearance of the figures of *The Actuaries' Investment Index* as at June 30th makes it possible to fill out the bare picture of a fall in the latter half of the month, which had wiped out an antecedent rise, presented by the chart of *The Financial News'* figures in last week's issue. According to *The Actuaries' Index*, 159 British industrial equities were unchanged in price, but there had been some sharp rises, particularly in aircraft, building materials and gas stocks, and heavy falls in coal and oil shares. The rise in building material shares was assisted by better dividend payments, and this was also a factor in producing modest improvements in heavy industrial and stores shares. In consequence, with the average price unchanged, the yield rose, until it rather more than made good the loss during May, despite a rise of a point in the price index on the two months. It is interesting to observe that a year ago, when the immediate effect of Hitler's Russian venture was still uncertain, a rise in the price index of 2½ points in two months coincided with a fall of 0.42 points in the yield, owing to falling dividend rates. Meanwhile, as was indicated at the time seemed possible, last month's movements in fixed interest quotations were quite appreciable.

This is particularly true of industrial preference shares. The value of both these and industrial debentures is almost back to the level of three months before, while, on a yield basis, the former are back to December. As stated above,

the improvement in most sections, which has accompanied the holding of Rommel, has brought the beginnings of a recovery in these fixed interest sections *vis-à-vis* the Funds.

South American Debt Negotiations

A permanent settlement of the Colombian sterling debt negotiations is now within sight. The terms, which are recommended for acceptance by the Council of Foreign Bondholders, are sufficiently attractive in present circumstances to command the support of the disillusioned foreign investor. Provision is to be made for the total discharge of arrears of interest since 1934 on the six loans in question by the issue of Three per Cent Thirty-Year Sterling Registered Funding Stock. Investors would receive, in this form, 50 per cent of arrears due up to December 31, 1939, and 60 per cent from that date to March 31, 1942. Future payments on the six loans, the largest of which is the 6 per cent External Loan, 1913, would be resumed at 50 per cent of the contractual value from April, 1942. In addition, the Republic proposes that payment should continue in full on the 4 per Cent Sterling Funding Certificates, while the Agricultural Mortgage Bank, whose 6½ per cent guaranteed Mortgage Bonds are an indirect Government responsibility, has been recommended to seek a similar settlement to that made with holders of its dollar bonds. In view of the interruption of world trade, which can in no way be lessened before the conclusion of the war, the terms of the Colombian offer appear fully as good as can be expected, and yet should be capable of discharge. Hope is also stirred by the news that the First Debenture Holders Advisory Committee of the Sorocabana Railway Company and the similar body representing Southern San Paulo Railway debentures are proposing to negotiate with the Brazilian Government for the return of or compensation for the securities and cash, held by the Bank of London and South America in Brazil on behalf of the debentureholders, and sequestrated by decree in July, 1940. Alternatively, a cash payment in redemption of the debentures might be accepted. There should to-day be no lack of good will on the part of the Brazilian Government to modify this arbitrary proceeding, and it is to be expected that the committees, if they obtain the plenary powers which they seek, will reach a satisfactory solution. Only in the latter case is there any question of referring back an offer considered unsuitable. Sorocabana holders are expected to give their committee *carte blanche*.

ABPC-Union Cinemas Offer

The latest accounts of Union Cinemas, dealt with in *The Economist* of June 27th, showed a very marked improvement in earnings, which appeared to offer distinct possibilities for the preference shareholders. In the event, however, it is the holders of the 5s. ordinary and "A" ordinary shares who are to be the first to receive something, since Associated British Picture Corporation has offered to take over both classes of capital at 2s. 6d. a share. This offer is open for twelve days only, and is conditional upon acceptance by holders of nine-tenths of the shares in the hands of the public. Actually, ABPC already

holds 70 per cent of these two classes of capital, and the offer is made because it must be some time before a reconstruction can be effected to deal with the arrears of preference dividend, and, *a fortiori*, before the ordinary shareholders can look for any return on their investment. As was explained a fortnight ago, it is quite impossible to deduce from the accounts of Union Cinemas any idea of the real value of the ordinary capital. The offer made is rather above the recent market price, which was higher than anything recorded since the year following the company's registration in December, 1936. No investor ought to be asked blindly to make the choice put before the holders of these shares, but unless there is an organised movement to obtain more information—for which the time is very short—holders will probably be well advised to accept. The amount offered seems as much as they are likely to obtain in a reconstruction, on the basis of the results to date, and the position of a small minority of dissentients is likely to be difficult, both because their holdings will not enjoy a ready market, and because their interests may well conflict, at some later date, with those of ABPC. In fact, once the ordinary capital is in one hand, the desirable solution is a rapid settlement with the preference holders and the complete absorption of the company.

Company Notes

Union Castle Results

The announcement made in the middle of last month, that the ordinary dividend of the Union Castle Mail Steamship Company was to be repeated at 5 per cent, gave a better impression of the year's results than is perhaps warranted on the showing of the full accounts. Profits, after depreciation, which is again at the increased rate allowed by the Inland Revenue, are up from £713,785 to £815,834, after charging £73,157, for repairs, to antecedent voyages instead of to those following the repair. The former figure was after £50,000 for income tax reserve, and the bulk of the tax payable was offset by accumulated arrears of wear and tear allowances for income tax and a deficiency of EPT in 1939. For last year, little was available from these sources, and, against a recovery of tax of £7,307, there is a provision for taxation on current profits of no less than £650,000. This, together with interest charges and £150,000 reserved for deferred repairs and renewals, has to be set against appropriations a year ago of £350,000 for fleet replacement, £52,981 for writing down investments, and £50,000 for staff benevolent account. Returning to revenue receipts, income on investments is up by £5,000 to £122,832, while past provisions and the final adjustment of the Government account are responsible for a further £120,418. Even with the assistance of this item, some of which can scarcely be subject to tax, the dividends necessitate a small draft on the carry forward. In the absence of any figure for depreciation, the balance sheet value of the ships lost or disposed of cannot be stated, but the net valuation of the fleet has dropped by £1,177,320 on the year to £7,834,384, including a payment on account for a new fully refrigerated ship. Meanwhile, the surplus of realised over book values of £277,858 has been added to fleet replacement, while the GTR Account receives £89,600. Among liabilities, creditors are up by some £720,550, largely as a result of the tax provision, but secured advances of £1,455,130 have been paid off. While net liabilities are sharply reduced, floating assets are up by some £800,000, the principal rise being in debtors, while there is a new item, tax reserve certificates, of £200,000, and cash is swollen by £133,934. Thus net liquid assets of some £400,000 are substituted for a deficit of over £1,000,000 a year before. It is extremely difficult without further details of the tax provisions than are given in the report and chairman's statement to form any opinion as to the immediate prospects for the concern. The £1 shares stand at 17s. 10½d., giving a yield of some £5 11s. 11d., which suggests that some further setback is expected. It is indeed difficult to see how a further fall in gross earnings can be avoided, but there appears to be a considerable EPT cushion.

Distillers' Accounts

The full accounts of Distillers for the year to May 15th last show a reduction in disclosed profits, after depreciation and all taxation, of only £147,780 to £1,974,610, against a reduction of £318,863 in the previous year. As was esti-

mated in a note on the preliminary statement in *The Economist* of July 4th, the reduction in equity earnings is very slight, the fall being only from £1,814,986 to £1,796,168. Thus, the ordinary payment maintained at 16½ per cent is actually covered by a higher rate of earnings, which amount to 24.0 against 22.9 per cent. By again transferring £600,000 to reserves, including £100,000 for war contingencies, the carry forward is left at £524,210 against £544,139. The balance sheet shows a rise in net loans from subsidiary and associated concerns from £8,748,478 to £9,120,973. Holdings of British Government securities are up from £11,018,076 to £13,423,764, of which some £1,900,000 is taken from cash holdings, reducing this total to £2,975,738. There is a slight rise in stocks from £928,002 to £1,009,580, a jump of some £225,000 in debtors, and almost complete stability of creditors, including taxation. Thus, the position remains very strong. The directors point out that the shares of Distillers, Delaware, have been lodged with the British Treasury. The results as a whole are surprisingly good, in view of the fact of severe control of distillery output. Grain distilleries have been completely closed down throughout the year. This is, of course, an influence which will make itself more seriously felt in future. For the present, the concern is no doubt placing on sale whisky distilled seven or more years ago. If the management intends to equalise potential sales over, say, the next decade, it is probable that there must, before long, be some further reduction in the current volume. Whether rising retail prices and lower total production costs will cancel out the effect on net earnings is doubtful. In present conditions, it is highly unlikely that the increase in the price of whisky to 23s. per bottle will in itself restrict total sales. The chairman, Lord Forteviot, points out that the yeast factories have been working to capacity throughout the year. The demand for industrial spirit must also have been keen, but the results of United Molasses suggest a downward trend in receipts from interests in that group. The £1 ordinary stock, at 76s. 3d. ex dividend, yield £4 5s. 3d. per cent.

Heavy Industrial Results

The accounts of *Swan, Hunter and Wigham Richardson* for last year show that, after falling from £463,459 to £179,294, the profits of the company have recovered to £313,160. The improvement is, however, due to the settlement of the standard profit for EPT, and not to higher actual earnings, all the figures being after tax. It is, of course, quite impossible in these circumstances to place any reliance on the latest figure as a measure of probable future earnings. Other sources of revenue have declined on the year, dividends being £83,709 against £90,452, while there is nothing from profit on sale of investments against £24,131 in 1940. Further, the revenue of that year was increased by a draft of £20,052 on investment reserve, which contributed only £1,050 last year. Depreciation takes £33,715, against £36,702, and ARP £49,862 compared with £36,978. Staff pensions again receive £25,000, and the ordinary dividend is maintained at 10 per cent. After this, it is possible to place £70,000, against nothing, to reserve at the cost of a draft of less than £1,000 on the carry forward. The balance-sheet shows a number of increases in floating assets and in advances to subsidiaries, but these are more than offset by a fall of some £440,000 in bills receivable. This, read in conjunction with a shrinkage in all classes of current and near liabilities, suggests that turnover has not been fully maintained, but the chairman states that the whole group has "worked to full capacity during the year." The preliminary statement of a company at the other end of the range covered by the definition heavy industry, *Guest, Keen and Nettlefolds*, shows a very modest expansion in earnings after all costs and taxation from £1,165,507 to about £1,203,054. Debenture service is slightly lower at £95,054, but depreciation receives £250,000 against £200,000. After providing £46,000 against £40,000 for war damage, and reducing the provision for contingencies, including deferred repairs, from £60,000 to £50,000, there remains some £762,000, against £768,369. The exact appropriation of this is not disclosed, but reserve again receives £100,000, and the ordinary dividend is raised to 10 per cent, less tax, by a final of 6, compared with 3 per cent, tax free, for the year to March 31, 1941. The amount earned for ordinary dividend appears to be virtually unchanged on the year at approximately 13.5 per cent. The £1 stock units of *Guest, Keen* stand at 23s., ex dividend, giving a yield of £8 14s. per cent, while those of *Swan, Hunter* are quoted at 33s., returning £6 3s. 6d. per cent.

Boots Pure Drug New Record

With total profits, after taxation, except most of the tax on dividends, of £1,025,093 against £1,001,370, the full accounts of Boots show that, for the third year in succession, earnings have touched a new record level. As in the previous year, war damage premiums, requiring £40,417 against £45,000, are charged directly against contingencies reserve. There is, however, a higher liability of £95,745, against £70,959, for war risks insurance and an increase in depreciation provision from £112,697 to £125,589. Equity earnings are £100,000 lower than was estimated in the note on the preliminary statement in *The Economist* of June 20th on account of the transfer of this amount against nil to tax reserve. Thus, the ordinary dividend, maintained at 24 per cent, is covered by earnings of £426,034 against £532,360, representing a rate of 33.2 against 42.5 per cent. Freehold property reserve receives £35,188 against £128,273, bringing the total of the fund to £360,000, while there is a transfer of £38,000, against nil, to war contingencies and damage. Since £147,000 has been appropriated to write off war damage in addition to the provision against war damage premiums, the total is reduced from £908,350 to £758,933 in the latest balance sheet. The surplus of current liquid assets shown in this account is sharply reduced from £431,123 to £144,127, and in addition there is a rise in the company's overdraft from £502,298 to £550,617. This movement is partly accounted for by the increase in net loans to subsidiaries from £883,400 to £1,030,657. Against a considerable increase in creditors and contingencies from £1,971,806 to £2,563,149 there is a modest rise in stocks from £1,931,906 to £2,108,917. In his statement Lord Trent points out that the current results have been achieved despite curtailment of sales of toilet preparations to 25 per cent of the pre-war level, under the limitation of supplies order, and by the closing of a high proportion of retail shops. There has also been a serious labour shortage, which has affected the ability to make up prescriptions. Experimental and research work, particularly in the field of agriculture, is being pushed ahead. The 5s. ordinary shares at 34s. ex dividend yield £3 10s. 7d. per cent.

Reckitt and Colman Stability

The trading profits of the Reckitt and Colman group for the year ended December 31st last reveal only a slight decline from £1,891,288 to £1,862,903, but an increase of £70,000 in the tax requirement reduces the net profit by nearly £100,000 to £721,967. The net dividend, which is maintained without difficulty at 20 per cent requires only £610,000 against £721,250, owing to the higher rate of tax, and after allocating £16,000 less than last year's figure of £153,000 to the prosperity sharing scheme fund the carry-forward is only some £14,000 lower at £95,197. The effect of the reduced net payment is better seen in the accounts of the two holding companies, Reckitt and Son and J. J. Colman, who, despite lower receipts, are again able to pay 22½ and 16 per cent, respectively. Although the latter is unable to put anything to general reserve against nearly £70,000 last year, both companies have raised their carry-forwards slightly. Of especial interest is the chairman's statement that, despite the loss of all Continental markets, the group's total overseas sales exceeded those in any previous year, thanks to the policy of building up stocks abroad. Nevertheless, with restriction of supplies and the acute shipping position, he does not look for such good results in future. The balance sheet of the operating company reflects the activity of the group with considerable rises in liquid assets. Cash at £317,695 and government securities at £472,725 are some £86,000 and £67,000 higher respectively, while both sundry debtors and loans to subsidiaries show considerable expansion. Excluding inter-company items, however, the excess of liquid assets over liabilities is reduced by some £140,000 to £1,575,642, owing to a sharp rise of £286,000 in the omnibus item sundry creditors, due mainly to the increased tax provision. The higher valuation of goodwill by £30,000 at £1,380,000 is occasioned by the taking over of the assets of two subsidiaries, which is reflected in a fall of almost £134,000 to £2,007,866 in share holdings. Holdings in American subsidiaries have been pledged to H.M. Treasury, but the group retains control and revenue. The satisfactory conduct of the group's affairs, and the potential post-war earning capacity, together with a sound financial position, are reflected in the relatively low yields on the ordinary stock of Reckitt and Sons and

J. and J. Colman. The former stock at 93s. 9d. and the latter at 71s. 3d., both ex dividend, yield £4 16s. and £4 9s. 10d. respectively.

Oil Company Profits

The accounts of both *Royal Dutch* and *VOC* for 1941 show results which are fully up to expectations. In the case of *Royal Dutch*, income from dividends and investments stands at Fl. 23,409,385, against Fl. 23,625,294, including Fl. 364,312 profit on sale of securities, an item which is not repeated in the later year. As in 1940, the balance after meeting charges against profits, is transferred direct to reserve against loss on investments. Last year this sum amounted, however, to only Fl. 22,739,527, against Fl. 25,243,272, in view of the fact that the 1940 allocation included the balance brought forward from 1939, and was not reduced by an exchange loss of Fl. 532,039. The balance sheet total of the fund now amounts to Fl. 47,982,798. The main feature of this account is a shift in assets by the reduction of "claims on undertakings in which interested" from Fl. 17,622,045 to Fl. 12,584,972, which has made possible the purchase of £1,000,000 of 2½ per cent National War Bonds, raising the total of securities from Fl. 800,000 to Fl. 8,400,000, and an increase in the total of cash holdings from Fl. 2,064,875 to Fl. 22,208,860. There is a moderate rise in the suspense account, which now stands at Fl. 762,755. *Venezuelan Oil Concessions* appear to have had a successful year, with an increase in net profits from £1,103,666 to £1,222,116. This has been achieved despite a slight reduction in gross income from £6,623,054 to £6,510,976 through strict control of drilling and other expenses, and a fall in tax liability from £696,000 to £632,000. Depreciation has been well maintained at £787,269 against £783,769. The ordinary payment, maintained at the customary 16.875 per cent, is covered by

earnings of 17.1 per cent, whereas in the previous year it was underearned by some 1.5 per cent. The consequent draft on the carry forward has not yet been made good, but there is an increase from £132,302 to £139,826. The balance sheet shows a rise in investments from £1,127,235 to £2,081,536, financed by a reduction in cash from £476,345 to £174,975. Creditors are approximately stable and debtors sharply reduced from £385,069 to £85,738. There is a moderate rise in material in stock from £1,563,623 to £1,717,510. The chairman, Sir Andrew Agnew, points out that capital expenditure has been reduced again from £357,000 to £312,000, spent on routine requirements. The *Royal Dutch* Fl. 100 shares stand at £19 10s.; the *VOC* 13s. 4d. units, at 35s. 7½d., yield £6 6s. 3d. per cent.

Leyland Results

The publication of the full accounts of *Leyland Motors* for the years to September 30, 1940, and 1941, at last provides shareholders with a picture of developments since the outbreak of war. Earlier publication was delayed by the slow progress of EPT negotiations, which, it is understood, have now terminated in an acceptable compromise. It is to be regretted that the management has felt it necessary to strike disclosed profits after all taxation and contingencies, thus effectively obscuring the true trend of earnings. Total profits are shown to have declined from £377,619 to £286,339 in 1939-40, and to have risen slightly in the latest year to £299,497. Against these figures have been charged substantially higher depreciation provisions of £135,820 and £132,591 respectively, while in each of the two later years the concern is liable for war damage insurance costing £13,979 and £15,196. As was to be expected, equity earnings are sharply reduced from £191,151 in 1938-39 to

THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

JOHN FORBES, Manager.

£53,030, after which there is an improvement to £71,436. In 1939-40 the 10 per cent interim on ordinary capital is covered by earnings of only 10.3, and it is consequently impossible to make any further payment on that year. The increase in the earnings percentage to 15.2 in the following year permits a rise in the total ordinary distribution to 15 per cent. In the absence of any transfer to reserve, against £100,000 in the last pre-war, there is a steady increase in the carry forward from £107,807 to £110,210, two years later. The results may occasion some disappointment that the pre-war dividend rate of 20 per cent has not been restored on the conclusion of the EPT negotiations. Whether it is the tax liability or the contingencies transfer which prevents such a distribution, the management are undoubtedly wise to conserve resources. In his statement

the chairman, Mr C. Basil Nixon, points out that 1939-40 was a difficult transitional year for the company. For the remainder of the war, there appears to be every prospect that earnings can be stabilised at around the present level. The balance-sheet shows a consistent increase in the surplus of liquid assets from £1,778,190 in 1938-39 to £1,888,312 in 1940-41. There has been the inevitable expansion in debtors and creditors common to a period of increasing turnover. Stock in trade rose over the two years from £1,707,066 to £2,542,811, cash holdings are slightly higher at £351,427 against £330,912, and £2,000 has been invested in trade and Government securities, bringing the total to £22,666. General reserve remains unchanged at £1,100,000. The £1 ordinary shares, at 65s., offer £4 13s. per cent.

Industry and Trade

£5 a Week

The Ministry of Labour Gazette for June contains the results of the Ministry of Labour's investigation into workers' earnings in sixteen industrial groups in the last pay-week of January, 1942. The inquiry was similar to those carried out in October, 1938, July, 1940, and July, 1941. While the omission of the tabulation of hours of work is unfortunate, the Ministry is to be commended for shortening the interval between these periodical analyses. The wages ascertained are total earnings, inclusive of bonuses, before any deductions in respect of income tax or of the workers' contributions to statutory insurance schemes. Some 56,200 undertakings, employing a total of 6,000,000 workers, furnished returns to the Ministry. The rise in the average earnings of men, boys, women and girls since October, 1938, is shown below:

AVERAGE WEEKLY EARNINGS

	Men (21 years and over)	Boys (Under 21 years)	Women (18 years and over)	Girls (Under 18 years)
	s. d.	s. d.	s. d.	s. d.
1938—October.....	69 0	26 1	32 6	18 6
1940—July.....	89 0	35 1	38 11	22 4
1941—July.....	99 5	41 11	43 11	25 0
1942—January.....	102 0	42 6	47 6	26 10

Between October, 1938, and January, 1942, the average weekly earnings of men rose by nearly 50 per cent, from less than £3 10s. to over £5. During the same period the Ministry of Labour's index of the cost of living advanced by less than 30 per cent; moreover, the stabilisation of the index since the beginning of 1941 has not prevented a continuing upward trend in earnings. Higher wage rates are only partly responsible for the advance in earnings; according to the Ministry of Labour the average level of wage rates for a full ordinary week's work, exclusive of overtime, was about 22 per cent higher last January than in October, 1938. The difference between the rise in weekly wage rates and total earnings is due to the increase in working hours, the extension of night shifts and the growth of the system of payment by results. The difference between the average earnings of men and women remains substantial. True, between July, 1941, and last January the rise in women's wages has been more marked than the increase in men's, but this phenomenon may be due largely to the movement of women into the more highly paid occupations.

Engineers' Wages

Pending the publication of the Amalgamated Engineering Union's demands for higher wages, the nature of the claim remains obscure. The substance of the main claim by the rank and file of the union, which is said to be looked upon with disfavour by its executive, appears to be a demand for an increase of 11s. a week, to be added to the basic wage and not to the war wage. Since bonus payments are calculated by reference to the basic wage only, the proposed increase in the basic wage would lead to a slight improvement in bonus earnings. In addition, there has been pressure for the restitution of the arrangements for overtime pay in operation before 1931. Apart from the improvement in bonus earnings which would accrue if 11s. per week were added to the basic wage, the combined effect of those demands would be to add an average of about

15s. to the total weekly earnings of workers doing ten hours overtime, a practice which is by no means universal. The demand in respect of time workers which is understood to have the support of the executive is distinct from the claim put forward by the rank and file of the union. It is for a so-called "lieu" payment, equal to one-third of the basic wage, and is designed to improve the position of time workers who, unlike piece workers, have no opportunity to benefit from intensive work and represent about one-third of the engineers. The statement that the engineers' claim would add 35s. a week to the wages of engineers, made during the recent AEU conference at Blackpool, appears to have been calculated by adding the claim put forward unofficially to that said to be favoured by the union's executive. Thus, a time worker on a basic wage of, say, 49s. per week, would receive an additional 11s. per week, bringing the basic wage up to 60s. A "lieu" payment equal to one-third of the new basic wage would secure him an additional 20s. per week, and the extra payment for 10 hours' overtime would add almost a further sum of nearly 48s., making a total of 35s. But the demand for a "lieu" payment only applies to time workers; the advance claimed in the earnings of piece workers amounts to about half that sum. Even if the claim for an additional 35s. per week applies only to time workers, the order of magnitude of the new demands of the engineers are substantial. The AEU has not yet formulated its claim, and comment must await its publication. But any further advance in the wages of engineers is likely to speed up the demands from industries in lower wage categories, and would render the maintenance of the Government's price stabilisation policy increasingly difficult.

Wage Differentials and Mobility

If war production is to attain the degree of flexibility required for the continuous adjustment of output to changing needs, labour must be mobile. The wages problem facing the Ministry of Labour in the transfer of labour is illustrated by the following table, which shows the average earnings of workers in sixteen industrial groups:—

AVERAGE WEEKLY EARNINGS IN SIXTEEN INDUSTRIAL GROUPS
(Last Pay-week in January, 1942)

Industrial Group	Men (21 years and over)	Women (18 years and over)
Earnings	Earnings	Earnings
	s. d.	s. d.
Iron, stone, etc., mining	81 3	45 4
Treatment of non-metallic mineral products	92 7	39 4
Bricks, pottery, glass	88 10	40 6
Chemicals, paint, oil, etc.	100 2	44 6
Metal, engineering, shipbuilding	119 2	58 9
Textiles	84 6	47 6
Leather, furs, etc.	90 9	41 6
Clothing	85 0	32 3
Food, drink, tobacco	88 5	35 2
Woodworking	86 2	30 1
Paper, printing, stationery, etc.	101 3	20 2
Building, contracting, etc.	84 2	27 5
Miscellaneous manufactures	104 4	51 0
Transport, storage (excl. railways)	92 10	32 6
Public utility services	79 9	26 4
Govt. industrial establishments	115 8	53 7
All industries	102 0	47 8

On the whole, women's earnings show much more uniformity than men's. While transfers may often involve the translation of workers into a higher wage category, movements into lower wage categories are frequently unavoidable. This may well accelerate the upward trend of wages in industries where they are comparatively low without arresting it in the metal and engineering industries, where they are highest—and where the percentage increase has been biggest.

Retail Trade

The retail trade report for May and the Bank of England's index numbers of retail sales were published in the *Board of Trade Journal* for July 4th. The average value of daily sales (1937=100) fell from 113 in April to 109 in May, whereas a rise usually occurs in this period on account of pre-Whitsun purchases, last year practically no movement was recorded between these months. The fall was mainly due to a large drop in the value of sales of apparel (from 121 to 101) which may be due to the fact that May was the last month of the rationing period. The index for household goods dropped by 5 points to 79, and there was a

PERCENTAGE CHANGE IN VALUE OF RETAIL SALES
SINCE THE CORRESPONDING MONTH A YEAR AGO

	Food and Perishables	Other Merchandise
	%	%
1941 May.....	-4.3	-2.4
June.....	-3.1	+6.8
July.....	-6.7	-15.9
August.....	-1.9	-10.8
September.....	-0.8	-8.2
October.....	+0.2	-23.5
November.....	-0.4	-2.3
December.....	-1.9	-7.4
1942 January.....	-1.1	+12.0
February.....	+1.8	+11.3
March.....	+4.3	+5.3
April.....	+0.9	+0.8
May.....	+5.0	-2.5

rise of 2 to 119 in sales of food and perishables. Compared with a year ago, household piece goods and the furnishing departments show rises of 18.0 and 20.8 per cent, respectively, in the value of sales, although it is in these departments that stocks show the greatest decline in value (-34.3 and -18.8 per cent). During February to May, compared with the same period in 1941, the average daily value of sales rose by 3 per cent, the non-food total rose by 1.8 and the food and perishables total by 3 per cent. The highest rise was in household piece goods, 36.1 per cent, the furnishing departments next with 31.3; the largest reduction was -15.3, recorded in dress piece-goods.

Agricultural Machinery

The intensive wartime development of agriculture demands more mechanisation of farming, and the Agricultural Machinery Development Board, set up at the beginning of this year, has been working on the problems involved. It has arranged for the testing of machinery and implements, considered questions of uniformity and standardisation, and the provision of educational and advisory facilities. The Board has found that it needs a highly qualified staff of agriculturalists and engineers with adequate workshop facilities. To meet this need, the National Institute of Agricultural Engineering is being established, at Askham Bryan, near York. The Institute of Research in Agricultural Engineering has been handed over by the University of Oxford to the Ministry of Agriculture to form the nucleus of the new Institute. During the war, it will be housed in temporary accommodation, but it is intended to build permanent buildings for it after the war. The work of the Institute will be purely practical and will be concerned with carrying out tests on new and improved implements, and experimental work designed to improve the utilisation of existing machinery. It will be ready to receive ideas from farmers, inventors, and others, which can be put into machines to be manufactured. The Institute will act as a clearing house for information about agricultural machinery and its use, and will arrange demonstrations. For re-

search work, the Institute will rely on the Agricultural Research Council and the Department of Scientific and Industrial Research.

Re-registration for Rationed Foods

Re-registration for rationed foods this month has caused a small burst of competition between retail shops in an effort to keep old and attract new customers. The great danger of tying consumers to specific shops is that service often tends to deteriorate, and anything which puts the retailer back on his mettle is welcomed by the customer. It was for this reason as much as any that the public (and, incidentally, the grocer, too) welcomed the system of points rationing for food. The yearly re-registration has once more been the signal for better service by retailers, but, unfortunately, a number of "dodges" have been thought out to trap the unwary. Butchers, for example, are in some cases keeping open later, although it is unlikely that they will continue to do so throughout the year. Some grocers have been hoarding unrationed foods which are in short supply, and are now selling them to all comers. Yet other firms are selling below maximum prices. No exception need be taken to devices to attract new custom, especially the practice of selling at the lowest possible price, provided they become part of the practice of the firm concerned. The Ministry of Food has said that any customer will be allowed to change his registration if his retailer reverts to the maximum prices. The policy of selling below maximum prices was begun by stores with large numbers of customers, which they claimed enabled them to sell at lower prices. Some stores have, indeed, managed to increase their profit owing to lower wartime costs (smaller staffs, less advertising, and so on), and are prepared to pass this on to their customers, and so reduce EPT liability. On the other hand, if some firms can sell below maximum prices, there may be a case for the revision of margins in the chain of distribution.

Co-operative Trading

Sales of the Co-operative Wholesale Society for the thirteen weeks ended April 11th totalled £35,542,241, of which grocery and provisions accounted for £26,173,042. This was an increase of nearly 8 per cent on the corresponding quarter of 1941. Supplies from the society's productive works were £11,326,473, an advance of 4½ per cent. The directors do not expect any major change in the prices of foodstuffs and believe that the utility programme of the Board of Trade based upon rationing according to the individual needs of the consumer will be more effective than the general provisions of the Prices of Goods Act. They welcome it as a price control measure rather than a policy of standardisation. Deposits and withdrawals in the CWS bank reached a record of £253,495,666 for the quarter. There are now 870 co-operative societies banking with the wholesale, and of the 45,251 current accounts in operation, 10,031 are with trade unions, as compared with 9,647 a year ago. The drapery and men's wear departments have shown substantial increases; but sales of boots and shoes, and furnishing and hardware have dropped 12 per cent. The export and contracts department's turnover decreased by 6 per cent to £797,091 and the agricultural department's turnover was reduced by 14 per cent to £787,326. Sales to the Ministry of Food were £678,864, as compared with £1,122,556 in the corresponding quarter of last year. Manchester, London and Newcastle are the chief centres of distribution and the industrial activity in the Tyneside area is reflected in the substantial trade advance in the Newcastle branch, this being 21 per cent in groceries, 34 per cent in men's wear, 12 per cent in drapery and 3 per cent in coal, while the decreases in furnishings and footwear were less than in Manchester or London. The effect of the war on hotel expenses is suggested in the directors asking the shareholding societies to allow them out-of-pocket expenses of 10s. per day and 25s. when staying overnight when travelling on business for the society. The present allowance (7s. 6d. and 20s. respectively) has operated since 1929.

West African Commodities

The West African Cocoa Control Board has been enlarged into the West African Produce Control Board. Like the cocoa board, the new board will sit under the chairmanship of the Under Secretary of State for the Colonies; its members will be the members of the old cocoa

board, together with two oilseed specialists and a former Deputy-Director of Agriculture for Nigeria. The meetings of the board will be attended by representatives of the Free French Colonial Commissariat, who act as observers for the Free French West African colonies, which—as has been the case with cocoa since 1940—will be included in the sphere of operations of the new board. While the cocoa scheme, which was introduced early in the war, will be continued without change, the new board will “control the marketing and export of the whole of the production of certain other agricultural crops.” Among these, oilseeds and vegetable oil will be by far the most important; the Colonial Office states that for these products “arrangements will be made as soon as possible.” Rubber, ginger, and, possibly, also cotton, are amongst the other commodities which come within the scope of the new scheme. The new board, like

the cocoa board in the past, will utilise the services of the existing trade organisations as its agents. This may be necessary, but it is unfortunate, for it will strengthen their existing monopoly in West African trade, which, together with the absence of any direct representatives of growers, may increase the latter's mistrust of the buying firms. Minerals are excluded from the scope of the new board. Nevertheless, since West Africa is one of the world's richest sources of oilseeds and vegetable oil, supplies of which are greatly needed by the United Nations, the board's work will be very important. This extended Government buying scheme in West Africa is primarily founded on considerations of supply, while the West African cocoa scheme has been mainly a relief measure for the West African native farmers who have lost a large part of their former markets.

INSURANCE NOTES

LONDON; PHENIX; SUN

THE *London* records in 1941 an increase of nearly £500,000 in the premium income from its three major departments, the strong upward movement being in accordance with the general trend. Contrary to the experience of other offices, however, the fire results suffered a deterioration, due almost entirely to the operations at the New York Branch; this is balanced by a profit considerably better than the average of the offices in the accident department, which does not transact business in the United States. The marine fund, after releasing £50,000, as in 1940, is very strong at 142.6 per cent of premiums; the governor (Mr R. Olaf Hambro) explained in his statement to the shareholders that the fund has been built up in accordance with a policy of making it sufficiently strong in itself to carry any disabilities which may assert themselves in future underwriting years. In the life department, new business at £1,144,000 is lower by £291,000 and the net rate of interest earned has fallen by 3s. per cent to £3 3s. 9d. per cent; mortality experience has been in every way satisfactory, despite seventy-five deaths directly due to the war, involving claims of £49,000.

Credit transfers to profit and loss account aggregate £493,000, the underwriting profits of £284,000 being supplemented by interest earnings on the general funds of £209,000, virtually no change from the previous year. On the outgo side, sundry expenses, pensions, etc., take £100,000 and provision for UK taxation (overseas taxation being debited in the underwriting accounts) no less than £250,000. Dividends at the same rates as before cost £181,000 and the balance of £895,000 carried forward is lower by £39,000. The balance-sheet reveals a very strong position, there being a general reserve of £3 millions in addition to the balance of profit and loss account. Stock Exchange securities show a substantial surplus over book values.

Premium income of the *Phoenix* in 1941 expanded considerably and now exceeds £10 millions, assets in the same year having passed the £40 millions mark. Notwithstanding another small underwriting loss in the United States and a high rate of fire wastage at home, the fire result represents an improvement of nearly £100,000 on that for the previous year; the chairman (Mr R. Y. Sketch), in his statement circulated with the accounts, mentioned the accumulation of values subject to one fire or conflagration as a factor leading to more violent fluctuations in this department than would be generally expected. The accident experience remains excellent, but the chairman indicated that the present level of premiums cannot be maintained in view of the laying-up of cars, both at home and overseas. In the marine department, the fund, after transferring £75,000 to profit and loss account, is higher by £492,000, an amount considered adequate to cover the exceptional demands resulting from the extension of the war to the Pacific and Far East and its intensification on the eastern seaboard of the Americas. Life new business at £1,669,000 is lower by 18 per cent, and premium income has fallen sharply; the department

is being administered on conservative lines with the object of maintaining the fullest possible measure of security for all policyholders.

In the profit and loss account, net interest on the general funds at £281,000 is lower by £42,000, due to heavier taxation, and aggregate credits amount to £765,000. Of this figure the reserve for pensions and ARP and other charges together absorb £182,000 and the reserve for British taxes £200,000; net interest on debenture stock takes £29,000, and after reserving £302,000 for the dividend at the same rate as before, the balance of £1,288,000 carried forward is higher by £52,000. The balance-sheet shows an increase in British Government securities from just over £6 millions to more than £7,500,000, of which no less than £3 millions has been subscribed since the outbreak of war; the investment and contingency reserve of £1,849,000 is unimpaired and there is a general reserve of £2,500,000 in addition to the balance of profit and loss account. Up to the end of 1941, the company had issued 150,000 policies under the Government War Risk Insurance Schemes. Fifty-one per cent of the total pre-war home male staff have been released to the Forces; 11 per cent of the female staff have also been released.

The accounts of the *Sun* disclose substantial gains in premiums in all three departments, coupled with excellent underwriting results. The fire department benefited from a marked improvement in the loss record at home by comparison with the abnormally poor year of 1940; good profit margins were obtained in the Dominion and Colonial fields, but, as with other companies, results were unfavourable in America. In the accident department, the United States was likewise the only unprofitable sphere of operations. The marine fund again releases £100,000, but remains strong at 150 per cent of premiums. Life business is written by the sister company, the *Sun Life*, the accounts of which were reviewed in *The Economist* on June 13th.

Profit and loss account receives combined credit transfers of £640,000, including net interest of £175,000—a reduction of £10,000, due entirely to increased taxation. Outgo items include £190,000 for British taxation, a contribution of £100,000 to the pension fund, transfers of £150,000 and £22,500 to investment, exchange and contingency reserve and general reserve, respectively, and miscellaneous charges totalling £21,000. The dividend of 2s. 9d. per share (unchanged) costs £170,500, leaving a balance carried forward of £1,111,000, a reduction of £14,000. In the balance-sheet, the general reserve is restored by the transfer of £22,500 to the 1939 figure of £1,000,000; of the sum of £150,000 transferred to investment, etc., reserve, £119,000 has been utilised to write off all securities and balances in countries becoming enemy or enemy-occupied during the year, leaving a balance in the reserve of £271,000. The fire and accident funds contain additional reserves of £1,600,000 and £600,000 respectively, and market values of securities are stated to be substantially in excess of book values.

COMPANY MEETINGS

BLEACHERS' ASSOCIATION, LIMITED

COTTON INDUSTRY IN POST-WAR YEARS

“NEED FOR COLLECTIVE EFFORT WISELY DIRECTED”
—SIR ALAN SYKES, BT.

The forty-third ordinary general meeting of Bleachers' Association, Limited, was held at the registered office, Blackfriars House, Manchester, on the 3rd instant.

Sir Alan Sykes, Bt. (the chairman), presided. In proposing the motion for the adoption of the report and accounts, Sir Alan said: As the report of the directors and the accounts have been circulated I will, with your permission, take them as read. (Agreed.)

The balance-sheet which I have to place before you this year shows no very important changes.

The value of the fixed assets, including net capital expenditure during the year and after deducting the balance of the depreciation and obsolescence fund, amounts to £6,809,307, which is £135,000 less than the corresponding figure appearing in last year's balance-sheet.

The depreciation and obsolescence fund itself has been increased this year by the usual provision of £140,000, and the charges against the fund amount to £205,667.

The value of shares in subsidiary companies—£1,325,314—shows no change, but advances to subsidiary companies at £897,123 are £160,000 less than last year. This item represents the working capital of our subsidiary companies and the following two items—stocks on hand and sundry debtors—which together are also lower than a year ago, are of the same nature. This reduction in working capital reflects the lower volume of trade which has characterised the past year.

War damage insurance premiums paid now amount to £101,025. This amount has to be provided out of our cash resources, although it is statutorily defined as capital outlay—which merely means that we also have to pay income-tax on it—and ultimately it will disappear from the balance-sheet, together with the corresponding reserve for the amounts provided which appears on the liabilities side. We think it better to carry forward both items until all transactions relating to war damage are finally settled.

Cash with bankers at £274,908 and investments at £929,326 are both substantially higher than the corresponding amounts last year—the latter largely by reason of the inclusion of a purchase of £100,000 of tax reserve certificates. This amount, as well as a large part of our cash resources, is held against payments which will become due for taxation.

On the other side of the balance-sheet there is no change in the amount of issued capital or debenture stock, but the total of credit balances is slightly larger than it was last year. This is due to the inclusion of the necessary provision for taxation, but the amount is not fully reflected in the increased total as the sums due to trade creditors are lower on account of present trading conditions.

The war damage insurance reserve I have already referred to, and there is no change in the remaining items except for a small reduction in the superannuation fund which arises from the payments made during the year.

PROFITS AND PROVISION FOR TAXATION

The balance brought forward in the profit and loss account from last year was £144,369 and out of this we paid the half-year's preference dividend, which you authorised at our last meeting, leaving £75,963. The balance of profit available from this year's trading is £109,304 which, as you will see from the profit and loss account, is arrived at after providing £140,000 for depreciation and the pay-

ment of directors' fees and debenture interest.

We thus have £185,268 available this year, and you will have seen from our report that we recommend the payment of a further six months' arrears of preference dividend, and after providing £36,000 for war damage insurance premiums, that the balance of £80,862 should be carried forward to the next account.

The total available trading profit this year amounted to £353,164, which is nearly £15,000 more than the corresponding figure last year, but in any comparison of the figures we must take account of the difference in the amount which it has been necessary to provide for taxation in the two periods. This year we have had to set aside considerably less than in 1940-41 and the proportion of the trading profit which is available is therefore relatively greater.

CONDITIONS LESS FAVOURABLE

Actual trading conditions during the past year have been much less favourable, and have fully reflected the national policy of concentrating all productive resources on the war effort.

After fulfilling the requirements of Government contracts and meeting the essential needs of the civilian population, there is little to spare for the export trade upon which the cotton industry so largely depended. These conditions, which are inseparable from the successful prosecution of total war, have naturally resulted in throwing idle a substantial part of our plant. This has been effected by an organised policy of concentration throughout the industry, and I am glad to say that in the bleaching trade we were able to effect the necessary contraction almost entirely by voluntary arrangements which provide not only for the adequate compensation of those whose works have been closed, but also for the protection of the goodwill of their businesses during the period of enforced closure.

Whilst on this subject, I should like to pay tribute to those who have had the somewhat thankless task of putting into operation the Government's policy so far as it affects the cotton industry, not only in the matter of concentration, but in the general regulation and control of the trade. The responsibility has been shared by the Cotton Control and the Cotton Board, and I believe that they have carried out a most difficult task with efficiency and impartiality.

There may have been some mistakes—it would be strange in such novel circumstances if there were not—but it must be remembered that the policy is determined by the Government, that it is dictated by national needs and that the circumstances upon which it is based have themselves been continuously changing. The Cotton Control and the Cotton Board are the instruments by which that policy is effected—they are not necessarily, if at all, responsible for that policy, much less for the circumstances which dictate it.

NEED FOR COLLECTIVE EFFORT

There is one other aspect of this question that I think we should keep in mind. The re-establishment and the maintenance of the cotton industry in post-war years will not be achieved without collective effort wisely directed. Our war-time experiences should provide us not only with the knowledge but with the foundations of an organisation which, with suitable modifications, should facilitate the easy transition from a war-time to a more normal basis. But no organisation will succeed if it has not the whole-hearted collaboration of the industry behind it.

For the time being the main volume of our output, and therefore the measure of our profits, will depend upon the requirements and restrictions of Government Departments, upon the production of Utility cloths, and upon the very limited quantity of cloth that will be available for export. You will realise, therefore, that our future operations are to a large extent beyond our own control, but the concentration of the industry has resulted in putting out of commission a substantial part of our assets which not only imposes a limitation on our capacity to earn profits, but accentuates the problems which will confront us in post-war years.

Although for the moment our main concern must be production for essential needs, your directors have constantly in mind the re-establishment of our business after the war. Nothing is being neglected that will enable us to take our full share in the resumption of normal trading relations, and to that end your property and plant are being maintained in the highest state of efficiency permitted by existing restrictions.

I am sure that you will wish me to express on your behalf our thanks to the managing directors and to the other members of our board, as well as the managers of our branches and all our employees, who have rendered unstinting service in carrying on under conditions of great difficulty and anxiety.

The resolution approving the report and accounts was moved by the chairman, seconded by Sir William Clare Lees, Bt., and carried.

The retiring directors were re-elected, and Messrs Jones, Crewdson and Youatt and Messrs P. and J. Kewan were re-appointed joint auditors.

The meeting terminated with a vote of thanks to Sir Alan Sykes, Bt., for presiding, proposed by Mr E. R. Clark, J.P., and carried unanimously.

“SHELL” TRANSPORT AND TRADING COMPANY, LIMITED

VISCOUNT BEARSTED'S SPEECH

The annual general meeting of this company was held, on the 7th instant, in London, the Rt. Hon. Viscount Bearsted, M.C. (the chairman), presiding.

The following is an extract from the chairman's statement circulated with the report and accounts:—

The Group's participation in the war effort throughout the world, including the many theatres of military activity, has constantly expanded, and in a war in which petroleum plays such a vital part you will realise how great a responsibility the Group carries. It is now that your company feels the benefit of the conservative policy which successive boards have pursued for so many years, and in the opinion of your board, taking into account the reserves which have been made throughout the years, the valuation of your properties is fully warranted.

EARNING CAPACITY OF GROUP

In compliance with the instructions of the Governmental Authorities concerned in the different countries, many producing, refining and transportation facilities were destroyed or demolished, including important tank farms and loading installations at many of the ports. In due course, no doubt, compensation will be forthcoming for this demolition, but apart from this you will appreciate that the earning capacities of the Group have been gravely affected and will continue to be affected by the loss of these assets until the time when it proves possible to complete the rebuilding of the Group's oil structure. It will probably be some time after the end of hostilities before the profit-earning capacity of the Group can be fully restored.

I am not in a position to reveal any details of the operation of the Group's fleets. The masters, officers and crews of these great fleets of tankers have justly earned the admiration of the Authorities and the country as a whole for the gallant

operation of their ships under circumstances often involving extreme danger.

In the United States of America, Shell Union Oil Corporation has played its full part in accelerating the erection of plants to manufacture the essentials of war, and has made a valuable contribution towards petroleum transportation, perhaps the industry's most serious current problem.

However, despite the satisfactory financial results in 1941 and the improvement recorded so far in the current year, the outlook as regards profits must be regarded as uncertain. Of one thing I am certain, namely, that in the far more important matter of continuing to provide the materials necessary for victory the oil industry in the U.S.A. will not fail to overcome the difficulties which must necessarily arise from time to time.

The report was unanimously adopted.

WM. CORY & SON, LIMITED

Sir Arthur Cory-Wright, Bart., chairman of the company, presided in London, on the 9th instant, at the forty-sixth annual general meeting of Wm. Cory and Son, Limited.

The accounts, he said, showed a net profit of £666,219, a decrease of some £37,000 as compared with the previous year. After payment of the final dividend of 15 per cent., making 20 per cent. for the year, a balance of £1,078,378 remained to be carried forward.

The extension of the area of hostilities, and the intensification of the National war effort, had necessitated continuous vigilance on the part of the board to meet the changing and increasingly difficult conditions.

The company was taking advantage of the possibilities of replacing some of the vessels which had been lost since the outbreak of war. They could face the future with confidence and with full regard for the National interest.

The report was adopted.

CALLENDER'S CABLE AND CONSTRUCTION COMPANY, LIMITED

DIVIDEND MAINTAINED FOR 23RD YEAR

The forty-sixth annual general meeting of Callender's Cable and Construction Company, Limited, was held, on the 3rd instant, in London, Sir Fortescue Flannery, Bt. H.M.L., M.Inst.C.E. (chairman of the company), presiding.

The chairman drew attention to the fact that while the turnover had been well maintained there had been a reduction in the amount of the gross profits for 1941 compared with 1940, which was due to the heavy additional sums that had been provided for taxation. The total expenses were less than in 1940, in spite of the increases in repairs and maintenance of plant and buildings, pension fund and superannuation allowances. Regarding investments of the pension fund, it was gratifying to know that on December 31, 1941, these stood at £345,721.

The chairman paid tribute to the long and valued services of Mr Charles Pipkin (director and joint manager) who in November last had completed 50 years' association with the company.

The chairman concluded by reminding the stockholders that the foundation upon which the company was established by the late Sir Tom Callender, and carried on by the present managers, placed the company in a position of substantial solidarity and they might look forward to continued success with as much confidence as was possible in the present dangerous epoch.

The chairman then formally moved the adoption of the report and accounts declaring a dividend of 15 per cent. per annum for the 23rd year; the resolution was carried unanimously.

The retiring directors (Sir Malcolm Fraser, Bt., G.B.E., and Major-General the Rt. Hon. Sir Frederick Sykes, P.C., 3.C.S.I., M.P.) were re-elected.

ARISTON GOLD MINES (1929) LIMITED

BURDEN OF TAXATION

The twelfth ordinary general meeting of this company was held, on the 3rd instant, in London, Mr Francis Allen, chairman of the company, presiding.

The following is an extract from the statement by the chairman, which was issued with the report and accounts:—

In the "profit and loss account" the increase in the cost of materials and labour is reflected in the cost of mining at £352,767, being nearly £100,000 higher than the same costs for the previous year. To some extent this increase is accounted for by our having crushed 45,000 tons of ore more this year than last, but the larger part of the increase is due to the general rise in wages and the cost of all materials used on the mine. For the current year, a still further increase in costs is to be expected.

TAXATION

We are faced once more with the necessity to provide a very large figure for taxation, the amount being £270,000. In conjunction with other West African mining interests we have approached the Treasury from time to time for some recognition of the hardship imposed upon us by excess profits tax in the exceptional case of our own company and others similarly placed, who, in addition to operating a wasting asset, are not reaping any excess profits in consequence of the war, but solely as a result of expenditure and efforts made in pre-war years, during which time revenue and profits were necessarily limited owing to the properties and plant being in various stages of development. In the years on which the standard profits are based, the production output was not a true criterion of the mines' normal output, which was reached when the programme undertaken had been completed.

The committee set up to deal with this matter is still in negotiation with the authorities on questions of principle affecting the allowance for wastage of assets, which is provided for by statute.

In the meantime, considerable payments on account of taxation have been and will continue to be made pending settlement of outstanding questions.

As regards the item of "Development," it will be noticed that the expenditure for the year totals £83,173. Our underground development is in an extremely strong position, and the board have instructed the general manager to limit current development to the minimum.

MINE PRODUCTION

Production from the mine was maintained uninterruptedly throughout the year, all the 285,200 tons treated being hoisted through the central shaft.

The gold produced realised £776,750, compared with £728,263 for the previous year. The steadily rising cost of materials previously referred to has more than offset any advantage gained by the increase in tonnage treated, the cost per ton being 24s. 6d., against 20s. 11d. per ton for the year 1940.

The development footage during the year amounted to 14,941 ft., being an increase of 893 ft. over the previous year. The work generally can be considered as most satisfactory, which is exemplified by the ore reserves position, the tonnage at September 30th last being 2,227,888 tons, of a value of 7.17 dwt. over a width of 233 in. This is an increase over 1940 of 508,385 tons, and with the 285,200 tons crushed during the year makes an increase of nearly 800,000 tons as a result of the year's work. The value of the ore reserves at September 30th last was 0.55 penny-weight lower than the ore reserves valuation at September 30, 1940. The reason for this is that over 360,000 tons of the new ore reserves are in the lower grade No. 2 orebody.

The report was adopted.

MOSS' EMPIRES, LIMITED

INCREASED TRADING PROFIT

The forty-third ordinary general meeting of Moss' Empires, Limited, was held, on the 7th instant, in London.

Mr R. H. Gillespie (the chairman), presided. Commenting on the balance-sheet and profit and loss account for the year ended December 31, 1941, he pointed out that debenture stock had been further reduced through redemption by £7,450. Further reductions on leasehold properties and depreciation on furnishings had been provided on the usual lines. Creditors showed a considerable increase, almost entirely due to provision for increased taxation. Cash at bankers and investments in War Savings Bonds had increased by some £100,000.

Profit from theatre trading had increased by some £40,000, to £237,740, but provision for taxation absorbed about £105,000, an increase of £35,000. After all provisions, the profit and loss balance is £104,699, being an increase of £9,000 over 1940. Ordinary dividends paid were 10 per cent., less tax, and the carry-forward is £49,679, against £33,278 brought in. £126,000 was paid in entertainments tax for the year, making over £4,000,000 since inception of the tax.

The chairman said it was difficult to forecast prospects for the current year. Increase in entertainments tax, demands for manpower for the Services and munition work make heavy inroads on company's resources. But the management were endeavouring to overcome all difficulties. Up to date results this year were satisfactory.

With the warm approval of the Minister of Labour and National Service the management had assisted materially in setting up a theatres war service council. Through this organisation necessary arrangements were made with managers and artists to provide additional entertainments for the Services in camps and canteens and workers in munition factories, even remote from ordinary entertainment facilities.

The report was unanimously adopted.

LONDON ASIATIC RUBBER AND PRODUCE COMPANY, LIMITED

The annual general meeting of this company was held in London, on the 6th instant, Mr H. J. Welch (the chairman) presiding.

In his address the chairman said: In December and January last, all our estates fell into the possession of our enemies, and I regret to have to record that most of our European staff in Malaya became prisoners of war. Fortunately, the wives of all married members of our European staff and other dependents escaped internment. Our thoughts are full of sympathy for them in the sufferings which the hardships of war have inflicted upon them.

Notwithstanding our having to write off the total loss of the local liquid assets, the profits justified the board in recommending the repetition of a final dividend of 6 per cent., making 10 per cent. for the year. It is obvious, however, that no further dividend can be expected until possession of our properties is regained.

To conserve our financial resources, the board has created a taxation and contingencies reserve, to which the £50,000 which stood at the credit of dividend equalisation reserve has been transferred, and it is recommending that £100,000 should be similarly transferred out of the year's profits.

The estates were among the cheapest producers. The net cost per planted acre at which the plantations and equipment stand in the books is less than £20 and our surplus liquid assets are very considerable. If the estates, etc., are recovered without having sustained very serious damage, the prospects of this company should again compare very favourably with those of any other rubber producer in the East.

The accounts and the directors' report were adopted.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

THE improvement occasioned by the better news from Egypt at the end of last week was continued in the early part of the current week despite the serious reports from the Russian front. Turnover, as revealed by the number of bargains marked, showed some improvement, averaging over 3,000 bargains daily. The gut-edged market was particularly active although the present shortage of stock restricted business. Gains of 1½ were general, while several of the irredeemable stocks advanced ½ before the week-end. In the current week a further widespread improvement was registered, in which 3½ per cent War Loan advanced ½, and 2½ per cent National Defence Bonds ½ on Tuesday. The feature of the foreign bond market, where turnover was well maintained, was the firmness of South American issues, Brazilian, Chilean and Mexican stocks all moving to higher levels. Egyptian bonds rallied on the war news, the 4 per cent Unified issue being raised 5 points in the first two days of the current week. The home rail market attracted good support in anticipation of the interim statements, bargains marked averaging some 270 daily against 210 last week. Home railways were a prominent feature, with rises throughout the list, but later equities reacted, while the leading debentures continued firm. There were also minor improvements in South American rail stocks, in which San Paulo and the Peruvian Corporation debenture were prominent.

Interest in the industrial market was well spread throughout the various sections and small improvements were general. There was rather more activity than of late, over 1,700 bargains being marked on Monday, although the average on other days was about 800. Among brewery shares Distillers advanced strongly after publication of the results, while Watney deferred and Bass both improved. Tobacco issues were quiet and steady, and apart from gains of ½ and ¾ for BAT and Imps respectively at the reopening, prices were little changed. Motor and aircraft issues displayed no great activity but became rather firmer on Tuesday on some quiet support. The dividend announcement of Guest Keen raised the shares 2s. 6d. and occasioned a steadier

tone throughout the heavy industrial market. Among other advances Allied Iron was outstanding with a rise of 1s. 9d. in the first two days of this week. Paton & Baldwins were strong on the dividend. Among textiles British Celanese ordinary, J. P. Coats and Lancashire Cotton all advanced. In the stores group, Marks & Spencer "A" ordinary, after earlier improvements, rose 1s. 4½d. at the reopening, when John Barker gained ½s, while Woolworths held an early gain of 9d. Brazilian Traction was strong on the annual report, rising ½ on the week, while Sudan Plantations recovered sharply after their recent fall.

*

The kaffir market enjoyed a better tone, Cape support occasioning several improvements. West Wit Areas were prominent with a rise of ½s on Friday, while East Geduld and Crown Mines both rose ½. Among diamond issues, De Beers preferred and deferred issues both advanced ½ in the week. Turnover in the rubber market was very light and prices were hardly affected. After quiet conditions before the week-end a firmer tendency developed in the tea market and small advances were general early this week. The decision of the Mexican Supreme Court occasioned a jump of 1s. 6d. in Mexican Eagles on Friday, while the better news from Egypt was well received in the oil market, but there was a partial reaction later.

New York

APART from a slight improvement in leading war stocks, conditions before the holiday on Wall Street were quiet. At the reopening some support for rail and steel issues was registered, but Tuesday and

without special authority. Wines and spirits once sold by auction may not be sold again by auction, and they may be sold only at a reasonable price.

Lac Control.—The Minister of Supply has issued the Control of Lac (No. 1) Order, under which the use of any lac for the purpose of making sound records is made subject to licence from July 14th. Licences will be required even if the lac to be used is in stock. Lac is defined as the resinous secretion of the lac insect,

whether in the form of sticklac, seedlac, buttonlac, shellac, recovered lac, or any other form.

Export Control.—The Board of Trade has issued the Export of Goods (Control) (No. 28) Order (SR and O No. 1251), the chief effect of which is to consolidate previous export control Orders. The Order comes into force on July 15th and sets out the position in regard to export licensing control at that date. Changes have been

COMMODITY AND INDUSTRY NEWS

Wines and Spirits Auctions.—Since July 1st, no wines or spirits have been permitted to be sold by auction except under licence granted by the Minister of Food. Sales by auction may be made only to persons holding an excise licence authorising them to sell wines and spirits by wholesale or retail. The names of the owners of lots must be indicated in the catalogue. A buyer at an auction sale will not be permitted to sell to any person holding an excise licence similar to that held by him,

ASHANTI GOLDFIELDS CORPORATION, LIMITED

NOTICE IS HEREBY GIVEN that an Interim Dividend (No. 92) of 45 per cent., less Income Tax at 10s. in the £, has this day been DECLARED on the issued Capital of the Corporation in respect of the year ending 30th September, 1942, and will be payable on and after the 27th August, 1942, to all Shareholders on the Registers on the 7th July, 1942.

The TRANSFER BOOKS will be CLOSED from the 8th to 15th July, 1942, both dates inclusive, for the preparation of Dividend Lists.

As stated in the notice published 3rd June last, this dividend will take the place of the two Interim Dividends which have been paid during recent years.

By Order of the Board,

H. E. ASHBY, Manager and Secretary.

Temporary Registered Address:
St. Hilda's, Bushey, Herts. 7th July, 1942.

BIBIANI (1927) LIMITED

made in the list of the "all goods" destinations and in the provision under which certain goods may be exported through British Indian ports for transit overland to destinations in China.

Frustrated Cotton Exports.—The entry of Japan into the war caused apprehension in Lancashire about cotton goods awaiting shipment to Java and about the supplies in course of shipment. The Netherlands Government has agreed that the goods in stock in this country and diverted cargoes may be resold, but one of the conditions is that any loss or profit entailed will, to the extent of 50 per cent, be borne by the Royal Netherlands Government. The agreement has given considerable satisfaction to Manchester merchants.

which are now under way in the United States, average productivity in the British war industries, including ship-building is almost certainly still higher. But this is a war of survival; and it would have been a dereliction of the Government's and the people's duty if, towards the close of the third year of war, these things had not been done. The point is that, in many instances, they were done too tardily. This is not the first time British guns and tanks have been given the palm in Minister's speeches. Six months ago there was no Minister of Production, no Joint Production Staff and no effective regional organisation. The Weapon Development Committee and the Scientific Adviser of the War Office are only a few weeks old.

In all fairness, the difficulties which have had to be faced must be appreciated; the contradiction in war production between mass manufacture and flexibility in the introduction of new types must be realised. But difficulties, though they may be explanations, are no excuse in wartime; if they are not overcome, the war is lost.

The American Challenge

THE speech made by the Under-Secretary of Agriculture, Mr Appleby, at Charlottesville, on July 10th, was the latest in a remarkable cycle of speeches given by leading American statesmen. The Vice-President, Mr Wallace, Mr Milo Perkins, Director of the Board of Economic Warfare, and Mr Sumner Welles, the Under-Secretary of State, spoke in May. In June, Mr Winant took up the tale at Durham. In July, he was followed by Mr Claud Wickard, the Secretary of Agriculture, Dean Acheson, the Assistant Secretary of State, and Mr Appleby. All these men work at the centre of public affairs. Their views may be taken to represent official American thought on the problems of post-war reconstruction. There are, of course, great stretches of the canvas which have still to be filled in, but the broad outlines of the picture are there—an impressive picture, drawn in the grand manner, with vision, with confidence, and with hope.

The basic assumption is concerned with the nature of war and peace. War is seen as part of a continuous process whose roots lie deep in poverty, insecurity, starvation and unemployment. A world from which these evils have not been banished is a world in which Hitlers and wars will perpetually recur. In Mr Wallace's words,

We failed in our job after World War No. 1. We did not know how to go about it to build an enduring world-wide peace. . . . We did not strive wholeheartedly to create a world where there could be freedom from want for all the peoples.

The war will not really be won until the deep causes of war have been rooted up. "Anti-Fascism is not a short-term military job," said Mr Winant,

it was bred in poverty and unemployment. To crush fascism at its roots, we must crush depression democracy. We must solemnly resolve that in our future order we will not tolerate the economic evils which breed poverty and war. This is not something that we shelve "for the duration"; it is part of the war. . . .

Here is a new thesis, a far deeper view of social and international responsibility than was ever enunciated at the close of the last war. It goes down to the foundations of society to discover the causes of such surface manifestations of social disease as totalitarian war. Above all, it seeks to put an end to isolationism, not only on the grounds of comradeship and world solidarity, but also in plain self interest. Economic selfishness breeds war, and war is national disaster.

How is war to be banished? The solution is studied in very broad terms. Its political framework is the will to peace and the continued co-operation of America and Britain. By reason of their power and experience, the English-speaking peoples will play a predominant part, but in no spirit of aggressive domination. The recognition of the "sovereign equality" of nations is maintained

Ministers cannot, like company chairmen, simply report progress and promise better things next year. Next year comes after this year's campaigns; and in war, there is only one test of work—success or failure in battle. Well done is not enough. However well they fight, Bock or Timoshenko, Rommel or Auchinleck will have no excuse if they are beaten; they will simply be beaten. The real test of British and American war policy will not come on the floor of Parliament or Congress or in the columns of any press. Russia is once more in peril. The Middle East is still in danger. At sea there is a lack of ships and heavy sinkings persist. The work of Allied statesmen will be tested, not by the worthiness of their brief, the goodness of their intentions or even the merit of their deeds, but by their ability to grapple successfully with the enemy, to free the seas, and to succour Russia before the enemy wins a new lease of life. The Government needs and deserves every aid. Not least in that aid is criticism to speed the Government on its way.

against the doctrine of the *Herrenvolk*. As Henry Wallace put it:

No nation will have the God-given right to exploit other nations. Older nations will have the privilege to help younger nations get started on the path to industrialisation, but there must be neither military nor economic imperialism.

In unconscious—or conscious—reaction against Wilsonism, the political structure of this co-operative world order is left vague. Mr. Sumner Welles clearly envisages a political association no closer than that of Pan-America which,

based as it is on sovereign equality, on liberty, on peace and on joint resistance to aggression, constitutes the only example in the world today of a regional federation of free and independent peoples.

None of the speeches goes into very precise details about the "system of general security" envisaged in the Atlantic Charter; but Mr Welles does give a general outline of the stages of security—a long armistice, the disarmament of the aggressors, a United Nations police force, and finally the United Nations as

the nucleus of a world organisation of the future to determine the final terms of a just, an honest, and a durable peace to be entered into after the passing of the period of social and economic chaos.

The reason for this rather vague and generalised approach to political and military security springs from the new conception of the deep causes of war. If Hitler is only the puppet of misery and unemployment, it is the economic ills of the people that the new system must primarily put right. All the speeches dwell at much greater length, and in much greater detail, on the side of post-war economic collaboration. And in this sphere, too, there is evidence of an entirely new and dynamic conception of post-war world relations. Underlying it is a great faith in the prodigies of production and science which the "era of the machine and the test-tube" has made possible. The scientific and economic resources which produced the weapons of war can produce in as great a measure the instruments of peace. As Mr Winant said:

What we want is not complicated. We have enough technical knowledge and organising ability to respond to this awakening of social conscience. . . . When war is done, the drive for tanks must become a drive for houses. The drive for food to prevent the enemy from starving us must become a drive for food to satisfy the needs of all people in all countries. The drive for physical fitness in the forces must become a drive for bringing death and sickness rates in the whole population down to the lowest possible level. The drive for manpower in war must become a drive for employment to make freedom from want a living reality. The drive for an all-out war effort by the United Nations must become a drive for an all-out

peace effort, based on the same co-operation and willingness to sacrifice.

This is the expansive, purposive concept of economics which underlies the new American outlook, the philosophy of the "new frontier . . . a frontier of limitless expanse," in Mr. Sumner Welles' words, "the frontier of human welfare."

The key is expanding markets, a "mass consumption great enough to use mass production," a future planned "in terms of increase and not curtailment." On this, agreement is absolute. There remains the vital problem of how these new standards of human consumption and welfare are to be built up, maintained and expanded. The instrument will be industrial capitalism, operating, broadly speaking, under conditions of private enterprise. This does not preclude a measure of Government control. Mr Sumner Welles believes that

given sound national policies directed toward the benefit of the majority, and not of the minority, and real security and equality of opportunity for all, reliance on the ingenuity, initiative and enterprise of our citizens rather than on any form of bureaucratic management will in the future best assure the liberties and promote the material welfare of our people.

Mr Milo Perkins talks of

a bold and daring use of long-term credits by every enlightened government of the world. Governments must enter fields where private finance cannot enter without assuming risks that are too great to take with other people's money.

In the sphere of agriculture Mr Wickard does not believe that

the United Nations will conclude a peace which permits unregulated competition for world trade, wildly fluctuating prices and periodic collapses. Rather we may look forward to an equitable sharing of markets, price stabilisation and regulation of supplies.

But within some very broad framework of this sort, private enterprise and free trade—the progressive scaling down of trade barriers, and the end of all discriminatory measures—are to be the chief instruments of economic advance.

Let there be no mistake about it. The policy put forward by the American Administration is revolutionary. It is a genuinely new conception of world order. It is an inspiring attempt to restate democracy in terms of the twentieth century situation, and to extend its meaning in the economic and social sphere. The fundamental point about it is that it calls for a co-operative venture, broadly based on the idea of the United Nations. The driving force behind it is to be the resources of the two most powerful industrial nations in it—the United States and Britain. On their partnership, the whole experiment must to a large extent depend. "If we cannot work with Great Britain," says Mr Appleby, "with what other equal political entity can we deal?" It is, therefore, quite staggering to realise that not one official word has gone back from this country, to take up, to welcome, to amplify,

or to clarify the challenge of these American speeches.

The dangers of this extraordinary silence are obvious. On the purely political plane, it means the passing of all initiative from this country to the United States. The partner becomes the poor relation. The great rôle of mediator, and bridge with Europe, is lost.

The position is even more dangerous in the sphere of economic organisation. The speeches came from the most progressive elements in America. But beside these elements there are thousands of men and hundreds of vested interests who do not in the least accept the thesis of co-operation. The United States is in the position of Britain in the nineteenth century. It can underbid and outsell any other producer in the competitive markets of the world. The business interests are aware of their advantage. Behind Wallace's "Century of the Common Man" stands Henry Luce's "American Century." Behind "the freeing of international trade" lurks "Break the British Monopoly." The great debate on world co-operation is not yet decided in America; and it is as short-sighted as it is tragic for this country to strengthen the forces of economic imperialism in the United States by ignoring the lead given by the Administration. The only schemes for post-war reconstruction that have seen the light in this country during the period covered by the speech cycle are the reports of the Chambers of Commerce, the National Union of Manufacturers and the Federation of British Industries. Let clauses 19 to 24 of the FBI Report be compared with the American statements. The contrast is appalling. Instead of co-operation for and in an expanding world market the report envisages

a system of barter or at any rate a system of bilateral trade . . . import and export controls, possibly by quota, preferential treatment of the imports of those countries which are prepared to assure us of the means of paying for them, and exchange control.

Dr Schacht is thrown back at Mr Welles and Mr Perkins. The American Administration is answered by those very interests which are most calculated to rouse the imperialist spirit in the ranks of America's own business men. And, if the post-war world is to bring with it fierce economic rivalry between British and American industry, there can be absolutely no question which nation will be the loser.

This is not to deny that large problems and great difficulties exist. It is to plead with every argument of sanity and economic interest that the problems and the difficulties should be dealt with at the level of governmental thought and action, at the level which the American Administration has chosen to make the first advance, and not in the boardrooms and directors' offices of interested bodies on both sides of the Atlantic. The United States has given the lead. Each day's postponement of a concrete and creative reply from the British Government frustrates the hope of a just and lasting peace.

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

Report on Eire

[The first of two articles by a Special Correspondent who has just come back from Eire; the second article will deal with the economic position in Eire.]

AFTER close on three years of war, Eire remains a convinced and uncompromising neutral. Support for Mr De Valera's foreign policy is virtually unanimous. The Irish are determined, if it is physically possible, to stand aside from the war. And any suggestion that there is a moral obligation to come in gives rise to both surprise and resentment. Yet, to the average Englishman, Irish neutrality still appears incomprehensible, irritating and, often, innately "disloyal."

The reasons which are keeping Eire out of the war are more complex than the motives which have prompted other neutrals. To a belligerent people, these reasons must appear short-sighted and not completely logical. But they are a fact of existing Anglo-Irish relations which must be reckoned with. There is, of course, a fervent and general desire to remain at peace—a state of mind which will be painfully familiar to anyone who has lived in Europe, or for that matter in the United States of America, during the past decade. But this straightforward anxiety to keep out of war is shot through and reinforced, in Eire's case, by the age-old "Irish question." By remaining neutral when the British Empire is engaged in the most desperate war in its history, Eire is anxious to demonstrate that national independence is real. And a substantial majority of the Irish people do feel themselves a nation. The preservation and emphasis of their distinct nationality is a matter of general concern. The Irish see themselves as one of the ancient nations of Europe with as much right to elect to remain neutral as Portugal, Turkey or Sweden. They refuse to regard themselves as bound by their past connection with the United Kingdom. In consequence, the common assumption in Britain that Eire has a duty to enter the war on the Allied side serves effectively to stiffen the determination to remain neutral. This attitude is not based on animosity towards the British people. Indeed, it is agreeably evident that the Irish do not look on the individual Englishman, despite the blood and thunder of the past, as the Czech looks on the German. But Irish history for the past seven hundred years is regarded as the history of a conquered people who have struggled unceasingly, and in the end successfully, for independence. With this background, the Irishman is apt to be sceptical about the correctness of the British claim to be the champion of liberty and small nations. The Irish have seen the seamy side of imperialism; to prefer an Allied victory as the better of two evils is not enough to inspire a desire to take the Allied side.

Moreover, there remains the virtually insoluble problem of partition. The Irish believe the inclusion of the Six Counties in the United Kingdom to be a crime against nationality. How much the average inhabitant of Southern Ireland, whether small farmer or industrial worker, really concerns himself with the partition question is doubtful. It is possible, too, that the younger generation, which took no active part at the time of the troubles, is less interested in the partition question than the revolutionary generation, still in power, which failed to prevent the secession of the Six Counties in 1922. But there is genuine and widespread sympathy for the Roman Catholic minority in the north. Unfortunately, the matter has now become doubly difficult. To the intricate rights and wrongs of one of the most complex minority problems in the world have been added considerations of strategy. The loss of the southern ports and bases and the neutrality of Eire have served to emphasise the strategic indispensability to the Allies of Londonderry and the north, while, from the Irish standpoint, the failure to end partition has proved one of the most powerful obstacles to entering the war. Eire holds aloof from this war partly because the last war—for one reason and another—resulted in partition.

The Irish are, of course, too intelligent to ignore the consideration that it is the hated fact of partition which is largely responsible for continued territorial immunity in the south. Eire is, after all, still neutral simply because it has not been invaded. Ironically, the presence of British, and to-day more significantly American, forces in the Six Counties is playing a vital part in safeguarding Irish neutrality. There is, of course, no doubt that, had Germany and not Great Britain been the next door neighbour, immunity would not have been enjoyed. But it cannot be too clearly realised that, whoever the invader, Irish resistance would be very vigorous; and the trouble which an invader could be given by the tough, commando trained and expanded Irish army, as well as by the guerrilla operations and sabotage of practically the whole population, should not be underestimated. Nevertheless, the Irish possess no panzer divisions and, in the absence of the Allied bridgehead in the north, the country would have proved a standing temptation to German arms. It is recognised in Eire that the Allies' pressing need for Atlantic ports, and for air bases with which to expand the air offensive against the continent, might well be a temptation to Allied arms—a temptation which might grow, as need grows, now that the United States is in the war. In consequence, there is a constant attempt to prove that the strategic value of the Irish ports is negligible.

Yet, the most characteristic thing about Eire to-day is the overpowering majority of opinion which hopes for an Allied victory. This is true, in spite of the fact that, under the German "New Order," partition might be ended in favour of the south and that dislike of Communism for philosophic, religious and temperamental reasons is common ground in Eire. There is, of course, a minority which wishes for a German victory, as there is also a section of opinion which would prefer a compromise peace. It is scarcely possible to distinguish groups or categories which typify these various points of view. There would appear to be little distinction, even of emphasis, between the unswerving neutrality, or the grounds on which it is based, of the Government party, Fianna Fail, of Fine Gael, the opposition party led by Mr Cosgrave, or of the small Labour party. A very high proportion of the nation is solidly behind neutrality and, within this body of opinion, hopes and fears for the outcome of the war are dictated by personal, not party, group or class, factors. The Irish are intensely individualist, and their actual or probable reactions to any situation defy any but the broadest classification. Outside the main body of neutrality supporters, there remain the two small groups of "interventionists": the heirs of the protestant unionist tradition, who would probably be glad to see Eire among the Allied nations; and the modern IRA, posing as the heirs of the republican tradition, who are to-day pro-German. These two groups, which, on matters of foreign policy constitute the real opposition, appear to be completely untypical. The majority do want the Allies to win; and this aspiration takes practical form. Although the Government maintains a rigid neutrality, the absence of a foreign enlistment act permits men and women of working age to serve, in large numbers, in the British forces or to work in British war factories.

The typical Irish apologia amounts to a plea that the neutrality of Eire, then, cannot be judged by the standards of Dominions such as Canada or New Zealand, or by the standards of the liberated nations of the continent such as Poland and Czechoslovakia, or even by the standard of the first of the lost colonies, the United States, with whom time has placed many indiscretions for Britain and America. Without minimising the assistance which a belligerent could afford, it is not unreasonable to say that the position is in many ways better than it was in the last war. Then, Ireland was a constant source of anxiety, seething with open and sub-

terranean revolt. To-day, the average Irishman is well disposed towards Great Britain. Many Irishmen are risking their lives in British service, undeterred by conflict at home. Pro-German sympathies have been reduced to a minimum.

A most unhappy aspect of Irish neutrality is undoubtedly the fact that, however the war ends, the Irish people will have alienated much good feeling in England and America. The sentiments of nations at war are not

compatible with understanding and sympathy for the neutral who thinks he knows better—particularly when that neutral must seem less foreign than the Portuguese or the Turk. Eire will continue to make its own judgment, and has every right to do so. Yet, it must be asked—however grim the record of Cromwell and the Black and Tans—whether the Irish will be proved right by history in their decision to stand aside from a conflict which is to determine the future of the world for a thousand years.

NOTES OF THE WEEK

Withdrawals on the Don

It is useless to minimise the gravity of the position in Russia. The German break-through across the Don in the Voronezh area has been extended and the town is in imminent danger. To the south, von Bock has followed up the capture of Rossosh and Boguchar by a new drive into the angle formed by the river Don in its sharp turn southwards. The direction of this new offensive is Stalingrad, a town which Red Star calls "the solar plexus of our country." Its capture would irrevocably cut off Marshal Timoshenko's army in the Caucasus from the Russian armies in the north; it would give the Germans control of the Lower Volga and thus of one of the main supply routes of Russian oil; it would also mean the loss of the last effective north-south railway line of communication. Thus, the economic consequences of a successful drive to the Volga would be disastrous indeed, for Russia's armies must depend very largely on the oil in the Caucasus. It is probably true to say that the Germans are more anxious to cut the Russians off from this source of supply than to secure it for themselves. The dislocation of transport which would follow from the loss of the Stalingrad sector would be equally damaging. Yet it should not be forgotten that the Germans, too, are straining depleted resources. They have superiority in armament, but they have still failed to surround and annihilate the Red Army. Russia's withdrawals are designed above all to keep the fighting machine intact, and there is nothing to suggest that the blows in the south or the new attacks in the Kalinin area have led so far to any serious disintegration in the Soviet ranks. The trouble is, of course, that after last year's retreats, the area within which strategic withdrawal can still be carried on without endangering the army's supply position is growing weekly less.

Second Front

In these critical days it is natural that the Russians should strain their eyes across Europe for some sign of the "promised" Second Front. The British communiqué issued at the time of Molotov's visit to this country did not contain a specific guarantee; but the Russians believe it did. Now the Russian press is beginning to urge the need of speed. Zaslavsky wrote in *Pravda*:—

Time is the ally of the brave. But it turns against the faint-hearted, the waverers, the unresourceful. The anti-Nazi coalition has every opportunity to frustrate Hitler's plans and destroy him now. . . . But opportunity is not reality. A lost opportunity means lost time and lost forces. To miss a chance of striking at the enemy is to give him a chance to entrench, to give him a breathing space to enable him to bide his time.

Colonel Gavrilov, writing in *Soviet War News*, speaks confidently of all that Hitler is trying to achieve "before the Second Front opens in Europe." It is no good baulking the problem of the Second Front. Only those who know all the military details can judge the strategic aspects of the problem. A successful Second Front at this stage would be the best means of winning the war; a disastrous failure in reinvasion might lose it. But, apart from the strategic and military question, there is a political problem which exists, whether or not a Second Front is practicable. It is the problem of the good will of the Russian people. For twenty long years they have believed in encirclement; they have believed in the fundamental hostility of capitalist governments to the achievements of Russia's social revolution. The first great break in this fear psychosis was the offer of a British alliance when Hitler attacked. Possibly an even greater breach was made in the walls of suspicion when, under Mr Eden's personal initiative, the Anglo-Russian

Treaty was signed in June. The Russian people felt at last that the outside world was no longer so alien and hostile. Thus among the most precious of the creations of this war is the small capital of good will which has been built up between Russia and the West. If there is to be a peaceful and co-operative era after this war, that capital must be preserved at all costs, for fear is the most potent breeder of international rivalry and war. Will it be possible to maintain it if right through the long agony of this summer no military action is taken in the west? Will the Russians not argue that the capitalist Powers waited for the collapse of Russia's resistance before beginning in earnest the task of defeating Hitler? This doubt about the intentions of Britain and America fits far more easily into the psychology of Revolutionary Russia than the other, more hopeful but more recent, view of great nations working together for the building of a prosperous world.

Egyptian Defence Line

The initiative in Egypt has passed to the British. First, they attacked and gained control of Tel el Eisa. The position was consolidated and a firm salient driven into Rommel's line in the northern sector. Then a "limited offensive" was successfully launched against the centre of the German line. The enemy's counter-attacks have failed. It looks as though the British are recovering sufficiently from the disaster of June 13th to exploit their strong defensive position at El Alamein. Until the break through on the Don, the course of the Russian campaign suggested an increased strength in the defensive, and now that the British are defending a relatively short line, within easy distance of the supply base, they may be able to resist much harder knocks than Rommel has so far been able to deliver. Nevertheless, the fact that they are holding now does not gloss over the fact that on all counts the fighting in the Libyan and Egyptian campaigns shows at every turn the shortcomings of the three-Service point of view. The RAF has been in action day and night in increasing strength to aid the ground troops, but even this air superiority could not be effectively exploited, for lack of earlier integration between land and air in design, equipment and training. Apart from the single short, sharp bombardment of Messa Matruh, Rommel's whole long seaward flank has not once

been harried by the Navy; there has been no use of airborne troops in any capacity. These are not the methods that can bring about a victory. If the United Nations are to turn to the offensive, then it must be an offensive conceived in a far more imaginative and far more scientific light than has hitherto been the case.

Mayotte—and Madagascar

The peaceful occupation of Mayotte, the largest island in the Comoro group at the northern end of the Mozambique Channel, on July 2nd by a mixed force of British and African troops again draws attention to the situation in Madagascar. The operation against Mayotte was probably inspired by the recent sinkings of Allied and neutral vessels in the Mozambique Channel. Mayotte has a useful harbour which could not be allowed to fall into hostile hands. The action was well timed and successful, but it cannot fail to underline the general surprise that, in the two months and more which have elapsed since the capture of Diego Suarez, little offensive activity, short of exploratory patrolling, has been undertaken by Allied forces. The truth is, of course, that Diego Suarez is not only the sole naval base, it is virtually the only harbour in the island. Tamatave, Fort Dauphin, Morondava, and the rest possess anchorages of far less general utility to either the Allies or the enemy. And the Mayotte affair provides an earnest that the suspended animation which hangs over Madagascar is not just due to an official oversight. There are competing claims for limited resources and, in the process of allocation, Madagascar, with its naval base in Allied hands, does not head the list. That the campaign must be completed at the earliest opportunity is obvious. Marshal Pétain himself pointed the moral in a statement at Tulle last week that the Allied occupation would not prove durable so long as the Vichy forces were able to maintain a foothold in the island.

Threats from Wardha

The Working Committee of the Indian Congress Party has not gone all the way with Mr Gandhi in his latest *gaffe*. The plan of the Mahatma was to call upon the British to abdicate at once and to threaten immediate civil disobedience if this was not done. The Working Committee has softened Mr Gandhi's pacific fury. The British Government is asked in the Wardha resolution to hand over power to Indian hands; but it is emphasised that there is no wish to hinder the prosecution of the war and that the Congress Party is most unwilling to use "its non-violent strength." Moreover, it is now made plain that—not unnaturally, in view of the closeness of the Japanese forces—there is no wish to see the complete departure of the British from India. The argument is that, if British rule is withdrawn, Indians will come together to form a representative Government which will rally the Indian people in the defence of their country and proceed later to the making of an independent constitution. Plainly, this is the Working Committee's revised version of the Cripps plan. Equally plainly, it is built on sand. The suggestion that Indians should come together was made by Britain, and it has signally failed. The Wardha resolution will not become effective until Congress has met in Bombay in August. Meanwhile, Mr Gandhi has made his own gloss: "There is no room left for negotiation . . . this is open rebellion . . . by a mass movement on the widest possible scale . . . as short and swift as possible." Mr Jinnah, the President of the Moslem League, has not been helpful in the recent search for Indian agreement, but it is hard to deny the correctness of his view that "Gandhi is rattling the sword" and that "Gandhi, by independence, means Congress rule." There is still time for common sense to prevail. More and more, it is clear that the Cripps plan was the best and most workable scheme. Nothing that can be done to bring together Indians of good-will should be neglected.

Shops in Wartime

The National Union of Retail Tobacconists has a simple solution for the problems of war-time retailing. Instead of reducing the number of small shops, they suggest, an increase in shopkeepers' margins of sale, entirely overlooking

the fact that, whatever the case in peace-time, there are too many shops and shopkeepers in war-time, when the need is to free every possible hand from civilian work. It has even been suggested that the Government should be asked to fix increased margins in order to keep tobacco retailers in business—an extraordinary inversion of common sense. The tobacconists' attitude arises in part from their experience of the domination of manufacturers; the manufacturers are not prepared to increase margins, so they hope the Government may be persuaded to do so instead. The drapers, it seems, according to the *Drapers' Record*, are too sensible—or too safely established—to see the war-time situation in this extraordinary light as a choice between fewer shops or higher margins. They consider, referring to the retail trade committee's plan to assist withdrawing shopkeepers, that

this scheme which disposes of practically all worry over rent or mortgage interest, should be considered carefully by every trader who might be tempted to fritter away his resources in a hopeless attempt to carry on.

Other well-established shopkeepers, like ironmongers, are in agreement. A more general attitude, however, judged by the trade journals, is the view which welcomes the scheme for concentration, not because it will help the war effort or shop-keeping while the war is on, but because it may be the thin end of the wedge for the control of post-war shopping by trade associations. Here at last, in the prior rights of re-entry which are proposed for withdrawing shopkeepers, seems the chance to make retailing a closed shop—the goal and aspiration of every trade association, with its plans to license retailers, to fix prices and margins and to coerce price cutters. The fact is that retailing does not, and cannot, speak with a single voice. The scheme for concentration is regarded quite differently by different trades, according to the size, number and stability of their units and according to their varying relations with manufacturers. The voice which is least often heard is that of the substantial and well-established shopkeepers who belong to, and are represented by, no trade association and whose independence is threatened far more by the associations than it is by the war or the plan for concentration.

France Combattante

Another Fourteenth of July has come and gone. In Vichy it brings to an end another year of collaboration and surrender, during the course of which the prestige and autonomy of the Pétain regime have been steadily whittled away. Among the Free French, a year closes that has had its ups and downs—the St. Pierre incident, the departure of Muselier—but has on the whole led to a clarification of the Movement's position and a great strengthening of its international status. The National Committee has been established, and there is a possibility that the representation on it will be further extended and strengthened. The United States has recognised the Free French authorities in Africa and the Pacific; and within the last week Admiral Harold Stark, Chief of the United States European Naval Forces, and Brigadier-General Charles Bolte, Chief of Staff of the American Army's European Headquarters, have been appointed to consult with Free French Headquarters in London on all aspects of the war. The State Department makes it clear that the step is of military not political significance, for

the destiny and political organisation of France must in the last analysis be determined by the free expression of the French people under conditions giving them freedom to express their desires, unswayed by any form of coercion.

This is, of course, the view of the French National Committee, and as an appropriate symbol of its purpose, the name Free France is now to become Fighting France, *France Combattante*, a change which underlines the fundamental motive of total resistance to Germany and links in a closer way all those who carry on the struggle, whether free or unfree, outside or inside France.

Coal Control

On July 13th the Minister of Fuel and Power assumed control by Order over the operation of coal mines, as a first step in the Government's plan to increase coal output. Major Lloyd George has divided Great Britain into eight coal-producing and four non-producing regions and appointed

a controller for each region at a salary of £2,000 to be paid by the Exchequer. These controllers, which include Mr. E. Raymond Evershed, chairman of the Central Price Regulation Committee, will exercise the powers of the Minister; they will

assume control of colliery undertakings and give directions to the managements regarding the carrying on of the undertakings.

In order to enable the controllers to act swiftly and decisively, individual collieries have been asked to nominate a single person for the purpose of receiving and carrying out directions. It is understood that the new organisation, which will include a national and regional coal board, representing the interests concerned, but acting in an advisory capacity to the Controller-General and the regional controllers, is being completed as rapidly as possible. It is to be hoped that the process of setting up machinery will not be delayed, for, after all, the main reason for the new organisation is the urgent and vital need to increase production at once. There is no reason why plans designed to speed up output should await the completion of the organisation. The call is for more coal now. A substantial reserve by the end of September is imperative. On the side of consumption, common sense has been frustrated by the anti-rationers, who have put the war effort in jeopardy to satisfy a slogan; on the side of production, there can surely be no more delay.

Fuel Economy

The campaign designed to secure an adequate voluntary reduction in the consumption of coal and other fuel by householders is in mid-stream, and official spokesmen still express the hope that rationing will be unnecessary. The Government's attitude towards the public takes the form of "it all depends on you"—which, according to all experience in this war, should rightly be regarded by now as a solecism. It is more encouraging that the Ministry of Fuel and Power is now taking the preliminary steps necessary to introduce rationing if necessary. Forms are being distributed by the Ministry to households in order to enable it to secure the necessary data about numbers of rooms, size of households and of stocks, and the registers of residential, and of industrial premises consuming less than 100 tons of fuel, in terms of coal, per annum, have been transferred from merchants to the local fuel overseers. Economy in the industrial consumption of fuel is encouraged by exhortation and advice; but this can hardly provide an alternative to the introduction of a system of allocation of coal similar to those employed in the distribution of other scarce raw materials. The Ministry is now appointing "enforcement" departments to ensure that its Waste of Fuel Order is carried out. A former member of the Metropolitan Police, ex-Superintendent Roderick Stewart, has been appointed head of its enforcement staff in the London area. To begin with, these enforcement staffs are apparently to concentrate their attention on public places, rather than on factories and private houses, and they will thus not "interfere" with the campaign to secure voluntary economies in private households. But, while a system of rationing remains the best means of combining a reduction in consumption with fair distribution, the effectiveness of the present campaign to secure voluntary economies would have been enhanced if a definite time limit to the trial period had been set.

Conflict in Canada

By 158 votes to 54, the Canadian House of Commons has given a second reading to the Bill removing the geographical limits on conscription. Thus, each step taken by Mr Mackenzie King's Government on the conscription issue merely emphasises what was obvious as soon as the war began—that conscription for service overseas would be almost unanimously opposed by the French Canadians, who accounted for 47 of the 54 against. Both this minority and the minority who pushed the conscription issue to the forefront are, as our Ottawa Correspondent pointed out in an article published in *The Economist* last week (page 45), extremists who "are basically colonial-minded." How remote the issue is from most Canadians is shown by the enlistment figures which have kept well ahead of requirements. In winding up the debate on the second reading, Mr Mackenzie King said that the totality of Canada's war effort would not have been increased by

the use of compulsion for raising men for overseas service, and that as soon as the Government reached a decision to use it, Parliament would be informed and would be given the opportunity of recording its confidence or lack of it in the Government. Possibly, the only advantages yielded by Mr Mackenzie King's conscription policy are, first, that the plebiscite and the debates over the Bill showed that there is no issue in Canada over the war itself if it were necessary to prove that—and, secondly, that the Bill is a useful accompaniment to the new Budget: it will emphasise to Canadians as a whole that still greater efforts and sacrifices must be made. But these advantages are probably outweighed by the uncovering of the cleavage that exists and by the weakening of the Government's position in Parliament and the country as a whole.

Waiting on Vichy

If there is any military advantage to be gained by tempering the wind to the shorn Pétain, then the State Department is perfectly justified in its long suffering. But serious doubts must be raised every time the Mediterranean battlefield becomes more active. There is conclusive evidence that transport trucks and other vehicles have been reaching Rommel through Tunisia. Any distinction between weapons and transport is, of course, fatuous in mechanised war. The trans-shipment of vehicles is direct military aid. It is not as though the United States were securing any concessions in return for their conciliatory attitude. When the stringency of the Allied shipping problem and the pressure of danger on Egypt are considered together, the American offer to send the interned French fleet under its protection from Alexandria through the Suez Canal to some neutral or American port appears incredibly generous. The Note which made the offer also pledged the return of the ships to France. Vichy's reply was a tart rejection. This was followed apparently by a further American offer to give the ships a safe conduct to Martinique. Vichy replied that it would prefer to move the ships to a less distant French harbour. It was only at this point that the United States decided that the British would be justified in sinking the ships if an attempt was made to hand them over to German control. The attitude of the State Department in this instance has obviously done no particular harm. But the incident is striking evidence of a state of mind that might have very dangerous consequences if ever the military needs of the United Nations were to come into sudden and violent conflict with the authority claimed by Vichy.

Summer Rations

The shipping position makes it imperative that all possible measures for the restriction of imports and for food control should be applied. It is quite wrong to suppose that the "hardships and sacrifices" referred to on Tuesday by Mr Lyttelton have come anywhere near the limits of endurance; the merest glance at Russia—or Germany—would restore the perspective of those people who think that they have. The Ministry of Food has announced, on the one hand, that the points available to consumers under group rationing are to be reduced, and, on the other, that the cheese ration is to be doubled. The reason given for the first decision is the need to stock up for the winter, and for the second, the fact that the policy of importing cheese and dried eggs, giving the best value in the smallest shipping space, has already improved the stock position of these commodities. It is possibly also due to the fact that

THE BRITISH LINEN BANK
Incorporated by Royal Charter, 1746

LONDON OFFICES:
City Office: 38 Threadneedle Street, E.C.2
West End Branch: 198 Piccadilly, W.1

people have not fully used their cheese ration. Cheese gives the next best protein value to meat, and it will probably be necessary to accustom the public to eat less meat and more cheese in the next months. The Ministry are "popularising" cheese among housewives; they may have been premature in reducing the points of some canned meat. Although the cheese ration for special classes is also to be increased, it is a pity that more discrimination in favour of heavy manual, mining and agricultural workers could not have been exercised; cheese is the staple diet of such workers. At the same time, it is to be hoped that the Ministry, which is ready to apply elasticity to the rationing system, will consider bringing more foods, at present in short supply, into the points system—which is the only way to ensure the equitable distribution of supplies.

Eating Out

It is perhaps too early to judge the effect of the "Meals in Establishment" Order. Superficially, the position appears little changed and it is difficult to find evidence of "austerity" in the meals served in restaurants, hotels and clubs. The larger establishments have to a certain extent compensated for the restriction on food charges by their house charges, by cutting down the portions or by adding to drink bills. The chairman of Grosvenor House said at the company's annual general meeting last week that the Order was bound to affect business adversely in the long run. He complained about unfounded attacks in the press on so-called "luxury" hotels, which, he pointed out, received no preferential treatment and had exactly the same sources of supply as British restaurants and industrial canteens. (The severe sentences recently passed on certain London black market offenders should act as a warning against attempts to seek unofficial sources of supply.) It would indeed be peculiar if hotels and restaurants were to receive preferential treatment over British restaurants and canteens in rationed goods. But their buying power does give them access to poultry and other unrationed goods in precedence to housewives, an unjustifiable anomaly which could, and should, be removed by control over their purchases. The majority of their customers do not need any extra rations; in fact habitual eaters-out can draw their ordinary rations over and above the food they consume away from home. The case for giving up coupons for rationed foods consumed in restaurants is a very strong one and no valid arguments against such a scheme have yet been advanced.

Ships for Allies

Arrangements have now been made by which Allied Governments, like British shipowners, will be able to purchase, in proportion to their losses, merchant vessels constructed on behalf of the Government. Details of the scheme were published in a White Paper (Cmd. 6373) last week. The chief difference between the agreement with British shipowners and that with Allied Governments is that in the first case the scheme provides for deferred delivery and, in the other, for immediate transfer, provided the vessels are manned by a complete crew of the nationality concerned. Like the British vessels requisitioned by the Government, the vessels purchased by Allied Governments are to remain on charter to the Ministry of War Transport for a period defined as not more than six months after the cessation of hostilities; and it has been agreed that the vessels are to be available for the purpose of re-victualling Europe after the war—both essential safeguards. In order to fulfil these conditions, the Allied Governments have agreed not to dispose of the vessels during the currency of the charter parties with the Ministry of War Transport. While the agreement between the British and Allied Governments is itself unobjectionable, it raises the question of shipping collaboration in the post-war period, and, particularly of the conditions attaching to the transfer of American-built vessels to the British Government under Lend-Lease. True, the position is not analogous. The agreement between the British and Allied Governments provides for the partial replacement of lost tonnage chartered to the Ministry of War Transport and may be said to fulfil a moral obligation, an issue that does not really affect deliveries of American vessels to Great Britain. Moreover, provided crews are available, American-built ships would presumably be transferred to Allied Governments on the same conditions as those by which they are delivered to this country. While nothing

must be allowed to prejudice the shipping position during the war, it might nevertheless be possible to clarify the position. What is needed is not for the United States to impose conditions upon Britain, or Britain upon Allied Governments, but for all the United Nations to make a common binding agreement to secure co-operation in the use of transport when the war ends.

Africans in the Colonial Service

It is excellent news that two Africans, Mr K. A. Busia and Mr A. L. Adu, have been appointed assistant district commissioners in the Gold Coast administrative service. Other Africans have held office, and high office, in Government service in the Gold Coast before now, but they have been in the specialist and technical branches. It is the administrative service which brings its members most closely into touch with the everyday lives of the people; the district commissioner's functions are all-embracing and responsible—his tasks may range from the preservation of law and order to settling marriage disputes and assessing taxes. There could be no better way, therefore, of fitting a colony for self-government than by giving those of its people who are fit to do so the chance to govern. They will be able to obtain an intimate knowledge of their country and their people which will help them to assume responsibility for policy as well as administering it. For it must not be forgotten that the people of such a progressive colony as the Gold Coast will not be diverted from their claims to self-government by the grant of self-administration, even though the latter may be considerably extended. The appointment of Mr Busia and Mr Adu is a good beginning, but it is only a beginning and it is a small one.

Science and War

The Association of Scientific Workers has accumulated evidence about the frustration of research. There are a large number of scientific bodies advising the Government, such as the Department for Scientific and Industrial Research, the Medical Research Council, and the Agricultural Research Council; and the Supply and Service Departments have their own scientific experts. But the work is largely unco-ordinated, too divorced from practical administration, and too remote from the places where decisions are made. Much of the work on research and design is carried out in the field by industrial scientists; but, too often, firms are jealous of their trade secrets, and refuse to pool information, whether they are working direct on Government orders, or are sub-contracted to another firm. Another criticism is that many industrial scientists are engaged on work which is not directly connected with the war effort—an example recently quoted is that of research into a new kind of tooth-paste—but which is designed to secure the competitive superiority of a particular product in the post-war market. There is evidence of lack of co-operation between research and production departments. The representation of research and technical staffs on joint production committees would be one way of achieving better co-ordination. Mr Lyttelton is investigating the whole question of how scientific organisation could be improved. In the United States the Office of Scientific Research and Development, including the country's leading scientists, acts as a Scientific General Staff.

Holidays at Home

The holiday season has come round again and with it the usual muddle about railway travel. The Government has issued its usual exhortations to the public to stay at home; local authorities have been arranging local amusements; the Railway Executive Committee advertises that "needless travel adds to the major problem of the United Nations"—and the railway companies are running special, extra and relief trains to take people to the seaside. This stupid inconsistency is quite unnecessary and very irritating to people who are holidaying at home and, according to the opponents of fuel rationing, to people who are economising in fuel. Most workers would naturally prefer to go away, because, however successful the attempts to brighten up their home towns, what they want—and often unquestionably need—is a change of faces, a change of scene and a change of air. Nor is a holiday at home anything but working overtime for the housewife. People who go away are not necessarily unpatriotic if they return refreshed enough to re-

sume their work with added vigour. Moreover, the industrial districts of the north-west are conveniently near seaside towns for travelling to them to make comparatively small demands on transport and fuel. Sir Arthur Salter admitted last week that there had been some "let-up" on the previous restrictions on extra holiday trains; but he said that they were only allowed if they did not interfere with freight traffic and did not exceed the number run last year. But he also exposed the whole inconsistency of the Government's case when he said that it was a matter of balance between the relatively small amount of coal involved and the considerable advantage to the enjoyment and health of those concerned. If enjoyment and health are to be taken into consideration for some, they must be taken into consideration for all, and the appeals not to travel should be suspended for the holiday months. If the Government thinks that this cannot be done without endangering essential traffic and consuming an undue quantity of coal, then enjoyment and health must be ignored and the ban on extra trains rigorously maintained.

Shorter Notes

The death of the Prime Minister of Turkey, Dr Refik Saydam, came at a critical juncture. But the news that he has been succeeded by M Shukri Sarajoglu, the Foreign Minister who negotiated the Anglo-Turkish Treaty of 1939, is a welcome guarantee of continuity in Turkish policy. The portfolio of foreign affairs will not, as was at first reported, be retained by M Sarajoglu, but will be held by M. Menemenjoglu.

According to a parliamentary answer, the estimated annual cost to the Exchequer of the various social services is at present as follows:—

	£ millions
Old age, contributory and supplementary pensions	104.6
Unemployment insurance and assistance	31.5
National health insurance	9.1
Education	68.0
Housing subsidies	18.5
	231.7

The table excludes expenditure by local authorities and contributions from the insured as well as the cost of war-

time social services, such as allowances for the dependants of men in the forces, war pensions, food subsidies and evacuation.

The cost of food subsidies was given by Lord Woolton in the House of Lords this week. From January 1st to March 31st this year the cost, including freight and marine war risk insurance, was at the rate of £127 millions per annum, after allowing for £10 millions profits realised on certain commodities. The individual rate of subsidy for the foodstuffs subsidised was as follows:—

	£ millions	National milk scheme, etc.	
Flour, bread, oatmeal and animal feeding stuffs	40	18	
Meat	23	11	
Potatoes	20	3	
Sugar	13		
Milk	2		
		ham, carrots and other items	7

The following table gives the number of civilian casualties in air raids since September, 1940:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept.-Dec., 1940	21,669	30,556	52,225
1941:—			
January-June	18,698	20,451	39,149
July	501	447	948
August	169	136	305
September	217	269	486
October	262	361	623
November	89	155	244
December	34	55	89
1942:—			
January	112	61	173
February	22	21	43
March	21	13	34
April	938	998	1,936
May	399	425	824
June	300	337	637
Totals to date	43,431	54,285	97,716

Of those killed in last month's raids, 126 were men, 137 were women and 37 were children under 16.

AMERICAN SURVEY

The Supply of Materials

(From an Industrial Correspondent)

Cleveland, June 27th

MUNITIONS manufacturers are now drawing so heavily upon North America's industrial materials as to force fundamental changes upon both the organisation of supplies and the plans for future expansion. The conversion of plant to war uses has not only been faster than was expected last autumn; it has also led to greater drafts upon raw and partially finished materials than had been counted upon in the enlargement of the material-producing plants themselves. It has, therefore, become necessary to devote to the enlargement of the "choke points" farther back in the industrial process some of the constructional and mechanical resources which it was intended to use for expanding the finishing industries.

Thus the pressure is increased upon the building of blast furnaces and other smelters, and upon the collection of scrap, with some expansion also in the manufacture of ships' plates and the building of marine engines. A considerable amount of plant investment which had been blue-printed is being put on the shelf until the material supply is more definitely assured—though some very large factories to build very large bombers and their equipment are still being erected. It is now conceded, that is, that differences in the rate of speed at which raw material and fabricating

plants could be brought into operation were not fully taken into account last year. The gigantic task of industrial conversion is so far along that the War Production Board, the chief civilian agency of production, is beginning its gradual retirement from supervising the process. The WPB will concentrate from here forward on the growing problems of material supply.

There remain the same difficulties which Britain experiences in the co-ordination of regional agencies of production. They are the greater here, perhaps, because the flow of industrial products is enormously complex, overlapping and cross-crossed. Washington must remain the clearing house in production, whether it is supervised by the Services or by civilian authorities, because no branch organisation in this country can possibly parallel the structure of industry. On the physical side, the difficulties of interior transportation must increase; on the administrative side, there is the rising quantity of "paper work" the industries themselves must do.

Some business houses affect to be in despair about their ability to find and train the office workers needed to carry out their end of the new Production Requirements Plan and its adjunct, the "end-use" or allocation classification system. This system partially takes the place of the priorities method which has been used for the last 18

months or more. Growing difficulties in fitting the flow of materials to the needs of industry brought about a continuing elaboration of the priorities procedure—with the introduction late last year of direct allocations in certain departments. In one crisis last year, the priorities office became so gorged with mail that a staff of clerks was brought in from Chicago mail-order houses to sort it. In the last few weeks, the value of high priorities has been steadily depreciating, like the value of paper currency in a condition of unlimited issue. Where a customer of steel had formerly been able to get it with a priority of A-6 or A-5, recently even the A-1-j to A-1-e priorities had become of little value. Some steel mills were almost entirely occupied on orders bearing the numerous A-1-a priorities. The WPB concluded it was writing cheques for much more money than it had in the bank; the supply of materials had become too tight.

The priorities system having proved to lack precision, it is giving way in the metal industries to the new PRP, known colloquially as "Purp." This will provide a much tighter administration of metals, and, from Washington's point of view, will simplify the task of directing the flow of metals to the most essential industries; trade branches other than those in metals remain for the present under the priorities system. The new system goes far beyond anything Americans have experienced, just as the scarcities are more extreme than anything known here for generations. Reaching as it does from the suppliers to the sub-sub-contractors, it is described by staff members of the WPB as being far more precise than either the British or the German systems. In those countries, too, where the distribution of materials is made to the primary contractors and the redistribution left to them, the "red tape" is asserted to be greater. The new plan is expected to give the WPB the ability to find out quickly and at any time just what supplies are available at any level of the much-stratified industrial structure.

With certain exceptions, companies must submit to the WPB their applications for the materials they will need for the ensuing quarters. These must carry symbols designated by the WPB. For purposes of distinguishing the companies which must use these symbols, industry has been divided both horizontally and vertically. In one group are the transportation, construction and many service industries; in another are all companies using less than \$5,000 worth of metals in a quarter. The symbols are made up in twenty-three groups, with decimals to the first place. They resemble a library book-classification system and can be endlessly extended. Thus both salt and shellac carry the symbol 8.20, and both scales and screens 20.20; but it would be possible to discriminate between them by filling out the second decimal places. In tabulating the applications which come to it, the WPB will be able to link the separate uses of materials into long chains which will show the entire circulation of materials in the existing American economy.

To provide against errors in calculation a "kitty" or cushion of materials is to be set aside—a "bank" of critical materials to be imported by the Economic Warfare Board against new emergencies—an extension of the "stock-pile" plan to still more commodities.

It remains to be seen whether the new system will dry up the "black markets" which have developed in metals. Some makers of goods for civilian use, and even impatient purveyors to the Government, are said to have been able to buy left-over materials from concerns which cannot continue in business because they have run out of certain other essentials.

American Notes

Washington Spokesman

Mr May, chairman of the House Military Affairs Committee, appears to have constituted himself an unofficial spokesman on military matters. Last week, he prophesied that the war would probably end in 1942 and certainly in 1943, basing his statement on private knowledge of American preparations. Later he declared that Germany and Italy would be unable to stand up to the crushing blows which would be dealt by the United States "at a reasonably early date." The reason for Mr May's optimism appears to have been political. There is strong opposition to the drafting of the 18 and 19 year olds, despite the fact that this may be necessary to win the war; and as Mr May innocently pointed out, if the war is over in 1942, there is no reason to press for their induction. Mr May's position at the head of

the House Military Affairs Committee is due to seniority rather than to any military perspicacity; and he has been thoroughly hauled over the coals by the press for his statements. The fact remains, however, that, by virtue of his position, he has access to information denied to the public, and a certain amount of weight unavoidably attaches to what he says. His optimism must be particularly vexatious to the Administration which has made so many efforts to prevent unfounded waves of confidence from sweeping the country. Unfortunately, any suggestion of interference would arouse the greatest resentment. The secrecy which surrounded Molotov's recent visit to Washington was bitterly attacked by some sections of the press as political censorship; it was argued that, had his presence been known, it would have stimulated the demand for a Second Front, and that this was not desired by the Administration; the question of Molotov's personal security hardly received the attention it deserved. It is no consolation that the course of the war appears likely to discredit Mr May's forecasts; he might with advantage note the career of the Cairo spokesman.

Battle for Information

The first trial of strength between the Services and the new Office of War Information has resulted in a substantial curtailment of the powers originally granted to Mr Davis by the President. In the Executive Order, it was specifically stated that all departments of the Government would be required to observe Mr Davis's directives and to furnish him with whatever information he deemed necessary. A clash with the Services was inevitable sooner or later. The test case which Mr Davis selected was the trial by military commission of the eight saboteurs who were landed on Long Island and the Florida coast by German submarine. Mr Davis's argument was that there was strong public interest in the case, and that defence against sabotage was, in part at least, dependent on giving the public adequate information about the danger. His first request was that hand-picked newspapermen should be admitted to the trial, their stories to be subject to military censorship. This was refused. He then asked that a representative of the Office of War Information be admitted. This was also turned down, and when the question was carried to the President, he is reported to have upheld the Service point of view. The most that the Army would grant was that certain newspapermen should be admitted to the courtroom before the trial began; that they should be allowed to see—nay! even to handle—such innocuous pieces of evidence as a pair of rubbed shoes; and that they should be allowed to see—but not to question—the prisoners. At the end of fifteen minutes, they were unceremoniously bundled out. There are obvious security reasons why, in this particular case, extreme precautions are necessary, and Mr Davis's choice of ground for his battle seems ill-advised. But what has angered the press and radio has been Mr Davis's rough handling by the Service Departments. Another test case would probably have shown a similar result, however, for Mr Davis has been unable to enforce his powers over Service communiqués. After the original refusal of the Services to submit to Mr Davis's editorial discretion, a compromise has been reached by which he is privileged to see communiqués before they are issued and to offer suggestions. In case of serious disagreement, the matter is to be referred to the President. Once more it has proved impossible for Mr Roosevelt to make any substantial delegation of his powers. Mr Davis may still be able to prevent some of the extraordinary contradictions and over-optimism which have characterised Service releases in the past, but the first fine careless rapture has been sharply snubbed.

Caribbean Convoys

Colonel Knox, Secretary of the Navy, has announced that coastal convoys have been extended to the Caribbean Sea and that they would be extended to the Gulf of Mexico. In recent weeks the bulk of sinkings have taken place in southern waters, and it was only a matter of time and escorts before the convoy system should be applied there as well as along the Atlantic coast. The unofficial count of United Nations sinkings in the Western Atlantic since January 14th is now 337. Secretary Knox, who has been making a tour of inspection along the Atlantic coast, revealed

that the Navy has been using fishing boats to aid in the campaign against the U-boats; and that it is not waiting for the construction of appropriate escort ships, but is using whatever craft is available. British vessels have been co-operating with the US Navy for some time, and last week the Navy made an appeal for private yachts to report U-boat movements. Certain facts have now been made public in the United States concerning the construction of a captured submarine. It was able to submerge to nearly 600 feet, twice the usual operational limit of depth charges; it was powered with a single diesel engine that burned oil in surface cruising and a mixture of hydrogen and oxygen when submerged; an improved motor used in some U-boats makes possible greater speed in crash-diving. The new German submarines are more manoeuvrable; they have much greater cruising ranges, and carry a heavier torpedo load. Smaller torpedo tubes make possible the standardisation of torpedo manufacture for aircraft, motor torpedo boats and submarines. The formidable improvements in submarine construction explain to some extent the striking successes they have enjoyed in recent months and make more urgent than ever the perfection of measures to defeat the U-boat campaign.

Fighting Farmers

When President Roosevelt signed the Bill by which the Department of Agriculture is permitted to continue spending at the rate of last year's appropriation for the months of July and August in default of its regular appropriation, he urged Congress to act quickly on the deadlocked appropriation bill, so that war needs should not be compromised by discord on the issue of farm prices. Behind this plea lies three months of manoeuvring by the farm bloc to relieve agriculture of the sacrifices called for in the President's anti-inflation programme. So far from accepting the President's request that ceilings for farm prices be set at parity, instead of 110 per cent of parity, as provided in last January's price control law, the vocal farm interests have been campaigning for a revision of the parity formula which would increase agricultural prices even further. One farm spokesman brazenly accused the Government of "continually harassing the people with false alarms, unnecessary threats of inflation, and alarms about shortages." The main issue, however, between the Administration and farm interests has been the Government's right to sell its stocks of grain at less than parity prices for feed purposes. Mr Wickard has testified to the urgency of cheap feed for livestock, in order to assure the expansion of dairy production planned for this year. He pointed out in May that the country was getting only half the hoped-for 7 per cent increase; and that unless weather and pasturage were favourable, the increase might average less than half what was needed. At present the Commodity Credit Corporation holds title to 417 million bushels of grain, including 197 millions of 1941 wheat which were not redeemed under the Government's loan scheme, and 109 million bushels of the 1939 and 1940 crops. The farm bloc has been stimulated to even greater efforts by the decline in prices of agricultural staples which followed the freezing of the cost of living.

The Senate has proved less obdurate than the House in the matter of sales of Government grain. Its version, which carried Mr Wickard's blessing, allowed the sale of 125 millions of wheat feed at 85 per cent of parity, as well as unlimited sales for the manufacture of industrial alcohol and rubber. The House, however, has refused to countenance sales below parity except in the case of deteriorated grain, and inserted a provision forbidding the Commodity Credit Corporation to use its administrative funds to finance the sale of grain below parity. In June, Senator Bankhead, alarmed by the farm price slump, introduced a Bill providing for loans to growers of cotton, wheat and corn at 100 per cent of parity instead of 85 per cent. This should prevent prices from falling below parity at any time. The bargain which seems impending is that the Administration will accept this measure as the price of its right to sell its stocks at 85 per cent of parity—in effect a concealed subsidy to certain farm interests. The price ceiling for tinned fruits has already had to be increased by 15 per cent because of the rise in raw fruit prices, thus increasing the nation's food bill by nearly \$34 millions a year. Unless there is a radical change, which seems unlikely, the Administration must admit to a further defeat at the hands of the farm lobby.

Women in War Industry

The manpower needs of 1942 and 1943 are directing increased attention to the possibilities and problems of employing women in war industries. In May of this year, out of an estimated total of 8,500,000 war workers, 1,000,000 are women. It is thought that this total will reach 4,000,000 by the end of 1943, and that nearly that many will have to be absorbed into civilian jobs. However, premature glamorisation of opportunities for women in war industry has led to disappointment for many in the United States as it did in Britain. The US Employment Service has announced that it has a million and a half women on its books, and that there is little likelihood of immediate employment for them. Of 675,000 war jobs expected to be filled between May and July, it was thought there would only be openings for 79,000 women. Local registrations of women have already taken place in Connecticut and Oregon, however, and may be expected in other centres where acute labour shortages exist. A recent survey by the US Employment Service found that women could perform 80 per cent of the jobs in war industry, although at present they hold only 8.5 per cent of them. A California survey has suggested that women were easier to supervise; that they caused less damage to tools and fewer accidents; and that their employment decreased turnover and increased production. An elaborate survey of the problems and policies of American firms has been published by the Industrial Relations Section of Princeton University of New Jersey under the title "Women in War Industries." Among the points which it makes are the desirability of a 40-hour week for women, and perhaps a six-hour day to keep absenteeism at a low level; and the need for giving women a choice of shift, even when it cuts across seniority privileges. There is support for a three or even four-shift system to keep hours short. The pressure of labour shortages has moved many companies to consider the upgrading of women to jobs where they were unknown before; but there is still insufficient advance planning in the training of women, and much unevenness of training even within the same plant. Few firms pay the "rate for the job" irrespective of the sex of the worker, but it is expected that, as the labour shortage grows, the differential will vanish. Some restrictions which impede the hiring of women are state labour standards; in California women may work between 11 p.m. and 6 a.m., only at the penal rate of time and a half; in other states, length of women's hours is governed by Statute. In general, however, these restrictions are relaxed upon proof from the company that they interfere with war production. One endearing revelation is that many companies insist on hiring only young women because the men accept them more readily if they are "young and pretty." Complete austerity is not yet the rule in war production.

Shorter Notes

The Federal Bureau of Investigation has announced that it has arrested 8,844 enemy aliens, seized 3,000 guns, 200,000 rounds of ammunition, 1,652 sticks of dynamite, 1,645 short-wave radios and 956 swords, bayonets, and dirks. Nevertheless there is some uneasiness about the possibility that other spies besides the eight captured may have been landed from submarines and some surprise that such a substantial round-up of spies and aliens should only be taking place after the United States has been at war for eight months.

Mr Willkie has once more denied that he has any intention of becoming a candidate for the New York State governorship. The Republican nomination will presumably therefore go to Mr Dewey.

Mr Elmer Davis has announced appointments to his Office of War Information. They include Mr M. S. Eisenhower as Director, Mr Gardner Cowles Jr as Assistant Director for Domestic Information, Mr Robert Sherwood as Assistant Director for Overseas Information, and Mr Archibald MacLeish, the poet, as Assistant Director for Policy Development. Mr MacLeish formerly headed the Office of Facts and Figures.

THE WORLD OVERSEAS

New Order in Ostland

(By a Correspondent)

July 6th.

IT is nearly a year since Hitler occupied the Baltic States, the eastern parts of Poland, Soviet White Russia and the Ukraine. No other region in Europe is such a complex of political and economic problems as these territories. At the time of the Nazi occupation, they consisted of two main groups. The first was the Baltic States and the Polish territories which were, a short time before the occupation, incorporated into the Soviet Union and were then adapting themselves to the Soviet system. Behind these territories were stretches of Soviet White Russia, the Ukraine and other provinces of Russia proper, which were all an integral part of the Soviet Union since its creation.

Rosenberg, the head of the newly-created Ministry for the Ostland, seems to have realised that the difficulties in the general structure and in the political aims of the people make it impossible to apply a unified system of administration. The Nazis, however, took advantage of nationalist tendencies to try to bribe the people by some vague promise of independence in exchange for full collaboration.

The first move in the direction of conciliation was made towards the Poles. After the withdrawal of the Soviet forces from the former Polish territories, three Eastern Galician districts, with Lwow as their capital, were incorporated into the General Government of Poland. When the Poles did not show any enthusiasm for the new arrangement and remained as passive as before, a policy of still greater oppression was applied. A greater success was achieved with the extreme Ukrainian nationalists, who expressed their willingness to co-operate in exchange for small favours, in spite of the fact that Hitler had not kept his promises either about the Ukrainian independent State or about cultural and national autonomy. It was sufficient for the Ukrainians to obtain a status which put them on a higher scale than the Poles; for this they collaborated with the Nazis in local administration and policing, and also accepted the Nazi ideology as the basis for education and any cultural activities which they were allowed to carry on in their own language.

The White Russians of the former Polish territories remained aloof from the Nazis, and their status was, therefore, no better than that of the Poles. Hitler's plans for creating a White Russian state with Minsk as its capital were a failure, owing to the resistance of the White Russian population and the absence of quislings.

The Administration of Ostland

All the other eastern territories occupied by the Germans were organised as the Ostland under the direct administration of Alfred Rosenberg. The boundaries of Ostland are in a state of flux, and changes are still being made. Official German sources estimate that these territories have a population of about 18 millions, with a total area of about 500,000 square kilometres; they include Estonia, Latvia, Lithuania, Soviet White Russia and small parts of the Ukraine (most of the Soviet Ukrainian territories with Kiev are organised as a special Reichskommissariat under Erich Koch). The Reichskommissariat for the Ostland is divided into four General Commissariats: for Lithuania, Latvia, Estonia and White Russia. Each of these is administered by a General-kommissar, responsible directly to the Reichskommissar. Each General Commissariat has its own administrative departments and its own staff of German officials. There is a further sub-division of each General Commissariat into District and City Commissariats. In addition to these administrative units, there are some districts which are exclusively under military administration; into this category fall the territories around Smolensk which are included

in the "Generalbezirk" of White Russia. The military authorities, however, also influence the administration of the whole of Ostland, especially in matters relating to transport and economic organisation and supplies. Authority in all these matters remains with the Economic and Armament Oberkommando of the Wehrmacht.

At the end of March, 1942, Rosenberg decided to grant some autonomy to the three Baltic States, and a national administration was formed in Estonia, Latvia and Lithuania. Estonia obtained a "Landesrat," which consists of five Directorates with Dr. Mäe as President; Latvia obtained "Self-government," which consists of six General Directorates with General Dankers at the head; Lithuania obtained a "General Council," which has seven Councillor-Generals, with General Kubilius at the head. Neither White Russia nor the Soviet Ukraine has obtained any autonomy.

Recent reports show that the policy of the German authorities at present is to push the native administrations into the foreground as much as possible, so that they shall seem to share responsibility for the numerous hardships and restrictions imposed on their countrymen. For this purpose, local self-government was organised in the towns, and communes in the rural districts were re-established. One of the objects of these organisations is to collect

INTRODUCING-

Cigar-lets

THE CIGAR'S LITTLE BROTHER

And not quite so little! CIGARLETS are Cigars in miniature, in a cigarette paper wrapping and are a good satisfying smoke. Made from choice imported Cigar Tobaccos, CIGARLETS rival their big Brothers in taste, fragrance and aroma.

20 for 2/-

FROM ALL GOOD TOBACCONISTS AND N.A.A.F.I. CANTEENS

taxes, especially taxes in kind—for instance, grain from the farmers, the collection of which, according to German announcements, has hitherto been very unsatisfactory. Police and internal security remain in German hands; some local policemen are, however, enlisted for service under the Germans.

One means of gaining the confidence of the people of the Baltic States is the incorporation of new territories within the boundaries of the different national General Commissariats. Parts of Polish White Russia, for instance, were recently incorporated into Lithuania; the Russian district of Vilekije Luki was incorporated into Latvia, and the district of Pskov into Estonia. Each such incorporation is followed by celebrations and national holidays.

Economic Infiltration

The infiltration of German capital and of German commercial and industrial companies proceeds with the usual thoroughness. Many new companies have been formed in order to exploit anything worth while. The largest company formed recently is the "Ostland Gesellschaft," with a capital of Rm.250,000, which aims at acquiring the management of all industrial undertakings in Ostland. A special company, the "Ostland Oel Vertriebs Gesellschaft," now has the monopoly of dealing in oil and its by-products. A similar German monopoly was formed for the production and distribution of films. German banks have opened branches, and the whole export trade of these countries is controlled by German companies.

Full Production in Canada

[FROM OUR OTTAWA CORRESPONDENT]

July 1st

SINCE Canada entered the war, its industrial production has expanded greatly both for war and civilian purposes. Though lacking experience in armaments, Canadian industry has equipped substantial Canadian armed forces, filled orders of increasing volume for Britain, the United States, and other United Nations, and maintained a high standard of consumption by the Canadian population. The 1942-43 Budget marks the end of that situation. In his review of the financial tasks of the Treasury, Mr. Isley said: "The conclusion is inescapable that industry will not be able to supply goods for civilian consumption and private investment on the scale of last year." Announcing a programme of taxation which notably increased the income-tax, established the principle of compulsory savings, and raised the excess profits tax to 100 per cent (with a rebate of 20 per cent in the British style), the Minister of Finance said, "Will this mean a reduction in our standard of living? Certainly . . . I am not asking that anyone's standard of living should be reduced below the level of personal efficiency and decency. I am asking that it should be no higher than that level."

Canada has moved well into the zone of full employment. The scope of private investment and civilian production is steadily narrowing. The new Budget reflected this fact, in contrast with previous War Budgets, which regarded financial policy as one of the agencies by which Confederation was brought into full use of its resources and manpower. The stage in which deliberate expansion of credit and currency could be undertaken has long been passed. The evidence of the full employment of physical resources is now unmistakable, in the opinion of the Budget architects. No one any longer denies the scarcity of labour in Canada. There is still scope for the expansion of war production, but chiefly at the expense of other activities.

The dollar value of national production increased by 25 per cent in 1941-42, reaching a level 80 per cent above the pre-war value. The national income level, from a figure of \$4,200 millions in 1938, has risen approximately as follows:

	\$ millions
1939-40:	4,800
1940-41:	5,400
1941-42:	6,400
1942-43:	7,900 (estimated)

A sum greater than the full increase in national income—so the Budget speech affirmed—has gone into expenditure on war. Increased expenditure for private consumption has drawn, as well as upon current production, upon inventory stocks which are now substantially reduced; upon reserves that would have otherwise have gone into repairs

Money into battle

First one front, and then another, leaps into activity and a spotlight is thrown on tanks, ships and aeroplanes in turn . . . On one vital front the battle rages ceaselessly—
The Financial Front

It is now three months since the last Warship Week was held in England and Wales.

I desire to thank most warmly all those who contributed to the success of these Weeks by investing in Savings Bonds, National War Bonds and other Government securities.

But I would urge that investment should not be confined to special Weeks. The need is continuous, and urgent.

1942 is witnessing an immense quickening in the pace of the war and in the rising tide of battle. This must be matched by an intensified effort on the financial front.

I appeal, therefore, to all Directors and Financial Executives, whether in large or small concerns, as well as to private investors, to give consideration again now, and constantly, to the need for systematic investment.

Money invested in war loans on tap is the outward and visible sign, for friends and foes alike, of our determination to keep our financial front sound and unbreakable. It is a direct contribution to victory and to post-war stability.

Survey resources now! Invest now!

Shindler
PRESIDENT,
National Savings Committee.

and replacements, the maintenance of which was hampered by shortages of materials; and upon imports from the United States which, to the extent of \$200,000,000 in 1941-42, were not paid for out of current production. Funds mobilised in recent bond-selling drives have hitherto come in part from idle bank balances, and to some extent indirectly from private bank loans, as well as from current income. The recognition that proceeds from bond sales must in future come largely from current income is implicit in the new war loan policy, which provides for an uninterrupted campaign of bond sales in an attempt to secure continuous diversion of income.

Obviously, sources outside current output will be thinner in the future. Under the Hyde Park agreement, for instance, Canada accepts the principle of paying for deliveries of goods by exporting to the United States. The 1942 Budget was based on the major assumption that war requirements will be drawn from current income. The Budget estimates provided that 52 per cent of expenditures would be met out of revenue:—

1942-43 Budget	
	\$ millions
Total expenditure	3,900
Estimated revenue	2,050
Budgetary deficit	1,850
Refundable taxes	95
Borrowing	1,755

The rate of personal savings to be sought will be sufficient to provide two-thirds of the total that must be borrowed. The rate must be, it is estimated, not less than \$22,500,000 a week in a population of 11,500,000 persons. The rate of personal investment in war funds recently has been around \$12 millions a week.

The Canadian Budget has been increased by \$1,000 millions by the inclusion in it of the sum granted free to the United Kingdom Government. In 1941-42, the United Kingdom's deficiency of Canadian dollars amounted to \$1,100 millions, of which \$700 millions were financed by an interest-free loan. The over-all Budget total of \$3,900 millions represents expenditures in the neighbourhood of 50 per cent of the national income.

Extension of Controls

Since Canadian economic policy, as reflected in the Budget, envisages greater war production at the expense of civilian goods, rather than the absolute expansion upon which previous war budgets were predicated, the new economic controls which have been erected rapidly and extensively may be seen in proper proportion in the national setting. Since prices started to rise sharply in the autumn of 1941, controls have been applied to the entire field of prices, of wages, of supply and manpower. Supply controls have hitherto been restricted to essential war materials and certain commodities affected by the dislocations of the war. Control of manpower, at present still in an experimental stage—and largely negative in that movement of labour to unessential occupations has been restricted—must shortly enter the stage of positive direction. The conscription debate, in this respect, served to educate the public to the need for selective service on the broadest basis.

The new Budget is seen, therefore, primarily as an instrument to aid the closer direction of national programmes—mobilising men and materials. It is equally an instrument to control inflation, complementing, by a direct reduction of purchasing power, the other controls of price, rationing of supplies and direction of manpower. "The offensive," said Mr Ilsley, "must be maintained on all four fronts."

War Economy in Palestine

[FROM A JERUSALEM CORRESPONDENT]

May 1st

AFTER two years of war, Palestine's economy still remained comparatively free. A licensing system was applied to imports and exports, and a number of foodstuffs, chemicals and other essential commodities were declared controlled articles—licences had to be obtained for trading in them, weekly returns of stocks were to be made, and permits granted for purchase. Maximum prices were fixed for wheat, flour, rice, sugar, fats, petrol, pharmaceutical products and so on. A similar system was introduced for building materials and essential engineering goods. Later, fuel, leather, paper, tyres and textiles came under special

control, and Government agencies took over the importation of wheat, flour, sugar, fertilisers, and certain other commodities. However, several stocks escaped registration; most prices were unrestricted; and the regulations left many loopholes, while they were neither very strictly nor uniformly enforced. Industry and agriculture remained comparatively untouched by Government intervention, and attempts made to combat profiteering met with little success.

Nevertheless, this state of affairs was more or less satisfactory up to the conquest of Syria, which had been depleted of stocks during the year of the Vichy regime. Under the influence of this adjacent market, prices began to rise steeply in Palestine too, a tendency which continued with the events in the Far East. The wholesale price index rose from 147 in July, 1941, to 189 in October, 1941, and to 202 in January, 1942, while retail food prices soared during the same period by 51 per cent in the Arab markets and by 38 per cent in the Jewish markets. The Jewish Agency's cost of living index in February, 1942, was 80.3 per cent above the pre-war level.

Government intervention became indispensable, not only in view of the distress caused by the rising prices, but even more owing to the need to save shipping space and to divert it to direct war purposes. According to figures disclosed in December last, Palestine's shipping quota in 1941 was 413,000 tons, less than half of its peace-time requirements. Of this, about one-quarter was needed for the importation of wheat and one-quarter for rice, sugar, oilseeds and other foodstuffs. The situation has since been aggravated. On the other hand, military orders placed with local industry are to be doubled in 1942, and are expected to reach £P 8 million, which amounts to almost the total value of Palestine's industrial output in 1939.

The First Rationing

After a number of tentative measures, the Government decided to secure the local food supply by acquiring the whole of the country's cereal crops. The registration of crops was ordered, and the harvesting, sale, or removal of cereals without permission became a legal offence. The purchase prices, however, have not yet been fixed, and it is understood that standard prices for staple crops for the whole of the Near East are aimed at. The centralised import of cattle and sheep, and Government control of the local cattle trade, are contemplated as preliminary steps to the rationing of meat. In the meantime, two meatless days a week have been introduced. Sugar rationing (1 kg per head monthly) is already in force, and rationing schemes for other foods are in preparation. Despite the difficulties presented by the existence of two peoples with differing standards of life and habits of consumption, no serious complaints have so far been heard, and in some localities the rationing of various foods has been voluntarily introduced.

The control of engineering goods and industrial raw materials has also been extended, and its application is now more rigidly enforced. The fixing of prices on a "cost-plus" basis, formerly applied only to articles imported by the Government and to building materials, has now been extended to engineering supplies and other commodities. A general prohibition of profiteering was promulgated, and municipalities were authorised to fix maximum prices for bread, milk and vegetables. Furthermore, a Price Controller is to be appointed. In the meantime, there has been a big reduction in import and wholesale trade owing to the decline in imports and the activities of the Government's commercial agencies. In 1941, the Government's share in Palestine's civil imports was estimated at about 18 per cent, but it is expected to be much higher this year.

Most industries have also been brought under the scope of Government control by the prohibition of the use of a great variety of engineering and chemical goods without a special permit from the competent authorities. Under the auspices of the War Supply Board, local industry has already placed upon the market standard bread and standard shoes, and the production of standard cloth is envisaged.

A Labour Disputes Ordinance was enacted empowering the District Commissioners to prohibit any interruption of work in industrial enterprises. Should the dispute not be settled, the case may be referred to an arbitration court nominated by the High Commissioner, and representing employers and workers with an impartial chairman. Although the law was opposed by the General Federation of Jewish Labour, the way in which it is being applied has caused general satisfaction. It was strengthened by a general agreement fixing the cost of living allowances.

German Europe

Coal, Power and Steel

SINCE the beginning of the war, Germany has not been able to report any appreciable increase in German coal output; and the volume of coal produced in the Western European countries under German control is also smaller than it was before the war. Monotonously, the reports of German coal-mining companies for 1939, 1940 and 1941 repeat the phrase, "we were able to maintain output on the level of the previous year." The companies mining lignite do, however, report a steady increase in production. In the third year of the last war, Germany's coal output had fallen to 88 per cent of the 1913 output, but lignite production had increased to 110 per cent of 1913. There is no doubt that in this war Germany's demand for coal is increasing at a greater rate than in the last war. Synthetic products require great quantities of coal for their manufacture, and an enormous volume of electric power. German coal and coke are necessary for industries in Italy and the occupied countries of Western Europe. But, so far, there is no sign that Germany's war industry has experienced any serious shortage of coal. Ruthless rationing of household consumption has been practised since October, 1939. The shortage of miners has been partly made up by longer working hours, greater mechanisation, and the concentration of output on the most productive pits. But the shortage of skilled labour remains the chief obstacle to any appreciable expansion in coal output.

At the moment, fuel economies in industry and improvements in the production and use of by-products are the main elements in German policy. The sinking of new shafts takes three to five years. Mechanisation and concentration have probably reached their limit. It is doubtful whether production can in future be maintained as it has been so far.

The annual reports of the leading electric power companies give a different picture. Each year, these companies report substantial increases in output—often more than 15 per cent. There are hardly any indications that generating capacity has been expanded. Greater output has been achieved almost exclusively by extending the grid system, and by linking the power stations of the Reich with those in the occupied territories. The *Rheinisch-Westfälische Elektrizitäts Werke*, for example, cover 250 power stations by the grid system. Steam plants and water power stations have been linked up, and some systems employ wind turbines. Every available power station has been brought back into operation in preference to building new power plants. In 1940, the situation seemed so favourable that the price of electric power was reduced; but, at the end of 1941, the price commissar was forced to prohibit any further cuts. Economy in household consumption has been strictly enforced, and the use of electric current for heating rooms prohibited.

The reports for 1941 are less optimistic than those for 1940. Mostly, the non-committal phrase, "we were able to supply all demands" is used. Figures show that the increase in output over the year was usually well below 10 per cent. The peak output of electricity seems to have been reached. The construction of new plants takes several years, and planning bodies in Germany seem to have neglected coal and electricity. Industrial federations have frequently complained that the Government's demands, arising out of the armament programmes, failed to take into account that adequate expansion in these basic industries requires unusually long periods.

Germany's iron and steel industry, which is closely linked to the coal mining industry by integration, has also reached its record output. The theoretical capacity of German Europe's and Italy's steel industry is roughly 50 million tons. The supply of iron ore and manganese ore is adequate. Swedish, Lorraine and Russian high grade ore can be used; but Goering's steel plan, conceived in 1936, enforces the use of low-grade German iron ore in a considerable part of the blast-furnace capacity. Transport difficulties are another cause of the sparing use of foreign mined iron ore.

In 1939 and 1940, the reports of the iron and steel concerns emphasised that output was still rising. But the reports for 1941 point out that production was maintained only on the level of the previous year. In the third year of the last war, Germany's pig-iron output had fallen to 70 per cent of 1913. During the first two years of this war, new

capacity was still coming into operation. But steel consumption is far greater than in 1914-18. Enormous quantities of steel have been used in building fortifications along the Atlantic coast, and there is no doubt that the steel supply situation has been strained since the beginning of this year. Stocks held by the manufacturing industry have been called up for redistribution, and strict economies have been enforced. Coke output seems to constitute the most important difficulty for maintaining the record output of pig iron. Technically, the basic industries of German Europe have reached their peak output. The recent reforms in organisation were, therefore, imperative for maintaining output.

Joint-Stock Companies.—During 1941, the total number of joint-stock companies rose from 5,397 to 5,418. Total nominal capital increased during the same period from Rm 21,490 millions to Rm 24,900 millions. There is a noticeable increase in the average capital of new companies founded in 1941. The average nominal capital of 40 new companies founded in 1941 amounted to Rm 26 millions against an average of Rm 14.6 millions for 30 companies founded in 1940. The actual rise in nominal capital, accounted for by new companies and actual capital increases, amounted to only Rm 1,800 millions. Under the dividend-stop, companies got facilities for capital adjustments for the purpose of reducing share quotations and nominal dividends, and these adjustments increased total capital by another Rm 1,230 millions, making an increase of Rm 3,410 millions in all. Adjustments of nominal capital are still going on. At the end of May, 883 companies had adjusted their total capital from Rm 4,946 millions to Rm 7,853 millions; and the dividends declared by these companies are now, of course, well below the 6 per cent limit. The number of companies which were wound up during 1941 amounted to 226 against 185 in 1940; the concentration of capital is clearly shown.

War Industries.—The tightening of Germany's Essential Works Order has created some confusion among employers. The Labour Dictator has been forced to define what war industries are. Besides the factories declared war factories by the labour exchanges, all the basic industries—railway, shipping and postal services—are war industries. In these industries, employers must inform workers about the Essential Works Order, and workers no longer needed must at once be notified to the labour exchanges.

Cellwool Cheques.—The system of fixed quotas—that is the allocation of raw materials to manufacturers by Reich Boards—is slowly being replaced by a cheque system. A "cellwool cheque" has been introduced. Manufacturers are supplied with cheques denoting their individual quota of cellwool supplies, and can, in theory, cash this cheque at any cellwool factory. With certain limitations, manufacturers have thus been given a free choice of materials, and the Chemical Fibre Co-operative, which introduced this system of cheques, is of the opinion that it is the first step back to free competition.

Clothing Repairs.—For a long time, small-scale tailors have been overloaded with orders for repairing clothing. A system of priorities could not increase the insufficient facilities for mending. The large-scale clothing industry had, therefore, to organise special repair shops. The first shop has been established in Munich, and other big towns will follow suit. The clothing industry and clothes retailers will collaborate. Retailers will collect orders for repairing by machinery and will dispatch the goods to the new shops. German papers leave no doubt that there will be no lack of orders.

CHOICE OF SHERRY!

A selection of eight to choose from, including Findlater's FINO, DRY FLY, DRY CLUB and MARCH BROWN, at 1/6 a glass. Also, if required, other Fine Wines and Good English Food.

SHIRREFFS' WINE PARLOUR,

15, Great Castle Street . . . Oxford Circus . . . W.I.

It is regretted that owing to enemy action, Shirreffs, Ludgate Hill, is out of service.

Russia at War

Second War Harvest

THE peasants have now started the second war harvest. Last year's harvesting was a race against time. The lightning advance of the German armies cast a shadow upon the fields of the Ukraine and of Western Russia; and towards the end of autumn more than 40 million hectares of cultivated land—about 30 per cent of the country's sown area—was occupied by the invader. But a substantial part of last year's harvesting was done before the occupation, and a considerable part of the crops was carried eastwards in time. This year, the problem is again to bring in the harvest as speedily as possible and to deny it to the Germans in the areas threatened by their advance.

True, the advance has this time been less rapid, and so far it has been confined mainly to the southern Don sector. This should leave more time for completing the work in the fields. On the other hand, the distances have now become shorter. The fertile land on the Don has come under fire before the grain could have ripened. The crops will probably be lost like those of Eastern Poland and Bessarabia last year. The Ukraine was then the "second line" of Soviet agriculture; now the "second line" has shifted to the Volga region and to the Northern Caucasus, the next grain centres of the USSR, which used to produce great surpluses of rye and wheat.

It is on the surplus of the Volga region that the food supplies to the industrial centres in the Urals and in Central Asia largely depend; and the agriculture of the Northern Caucasus has been the main food-base for the Transcaucasus. The Kursk and Orel regions, with more than five million hectares of grain-growing land, used to supply Moscow and the adjacent industrial province with bread. Now this region will have to rely almost entirely on stocks.

A decree of the Council of the People's Commissars on July 12th, fixed time limits for harvesting and for grain deliveries to the State in various republics and regions. The usual intervals between harvesting the crops and delivering it to the state have been abolished. From now on, supplies from the collective and State farms are to arrive at the collection points from the first day of harvesting. The amount of deliveries has been increased; and a special Grain Fund for the Red Army has been established to which the 1942 harvest must contribute two and a quarter million tons. Press comments on the measures recently taken have lifted the veil from last year's efforts in the interior of Russia. It is said that

in a number of regions, territories and republics last year the harvesting was drawn out too long and this caused serious losses in crops, violation of the established times for grain delivery and deterioration of the quality of grain delivered to the collection points.

The collective farms have now been warned not to repeat last year's errors.

Emphasis was laid during the sowing on the expansion of the sown acreage in the Volga regions and in Siberia. The acreage of the extra cultivated land has not been disclosed. Some figures suggest that it is between five and seven million acres. This is a remarkable achievement. But, at the same time, it is only a fraction of the lost area. Any estimate of the prospects of Russian grain output should take these facts into account. The population that has to be fed by Soviet agriculture has not diminished to the same extent as has the sown area. Soviet sources have mentioned "tens of millions" of evacuees shifted to the eastern territories. A part of these consists of Ukrainian and Russian peasants who have been put to farming work in Asiatic reception areas. But a high proportion of the evacuees are industrial workers who have to be fed from a diminished agricultural output. And the problem of providing the evacuees with foodstuffs from local resources has been one of the major preoccupations of the authorities.

Apart from this, there is the difficult problem of mechanisation in wartime conditions. A partial description of the position was given in *The Economist* on June 13, 1942. It was pointed out that a large part of this year's agricultural work would have to be done, not by the mechanised technique of collective farming, but by the more primitive technique which was once typical of the old small-sized Russian farming. The partial switch over from tractor to horse and from mechanical plough and harvesting machinery to primi-

tive agricultural implements has since been corroborated by several official statements. *Pravda* wrote on July 2nd that this year a large area will have to be harvested by hand. Therefore, it is important to get scythes and sickles ready right now.

But scythes and sickles are the private tools of the *Koikhoznik* who uses them to cultivate his small private plot; they do not belong to the *Kolkhoz*. *Pravda* therefore asks the peasants

not to refuse the collective farms the use of these for bringing in the collective harvest.

The peculiar war circumstances thus make work in collective fields partly dependent on the private tools of farmers—a development which may have important economic and social implications.

Appeals urging the peasants not to rely on tractors, but to use draught animals (horses and oxen) wherever possible, are being repeated almost daily. It is difficult to say to what an extent the tractor can be replaced in this way. But the magnitude of the problem is illustrated by the fact that, in 1939, about 70 per cent of the traction power employed in Soviet agriculture was mechanical and only 30 per cent was provided by animals. The war has also caused a drain, not only on the technical equipment and staff of the collective farms, but also on their horses.

The main difficulty seems to be the unsatisfactory state of repair of agricultural machinery, which is due to the call up of technical staff. Some days ago *Pravda* wrote:

Throughout the country, there are not a few districts which have launched work on repairs to combines in a fine spirit. The work is being done best of all in the Krasnodar and Ordjonikidze territory. The programme for combine repairs was completed ahead of schedule in Turkmenia. Many districts, however, are still tarrying and lagging behind. On June 25th, in the Kuibyshev region, only 6 per cent of the capital repairs on harvesting machinery had been carried out and only 11 per cent of the current repairs; in the Frunze region, only 3 per cent of the capital repairs and 10 per cent of current repairs. There has been an intolerable delay in repairing combines in the Saratov, Chelyabinsk and Chkalov regions.

The regions which "lag behind" are among the decisive grain-producing provinces on the Volga.

The Soviet Government is making a mighty effort to overcome all these difficulties. No doubt much of this effort is being rewarded with success. But a substantial deficit in this year's harvest seems to be unavoidable. To what extent the immediate food position will be affected depends on the size of the war stock of grain accumulated in pre-war years. Some expert estimates put that stock as high as 7 milliard pood, or 112 million tons—an amount equal to the annual grain output of the USSR. It is probable, however, that this estimate errs on the optimistic side. Recent reports from Russia suggest some deterioration of the food position in industrial towns.

Textiles.—Textiles, cotton and silk have shown an enormous increase in production. M. Akimov, the commissar for the textile industries, stated that, in June, the cotton industry turned out 20 per cent more than in May; the woollen industry had shown an increase of 60 per cent; and the silk industry had increased its output by 65 per cent. The high percentage of increase has been possible because there has been no shortage of raw material in these branches. The cultivation of cotton and silk has been concentrated mainly in the Asiatic republic of Tadjikistan and Uzbekistan; and thus no losses have been caused by the war. This year's silk harvest has been excellent; and deliveries to the State have been made ahead of schedule. The prospects for Tadjikistan's cotton crops are also said to be exceptionally favourable.

Vitamin Production.—The production of vitamin concentrates is perhaps the youngest branch of Soviet industry. It has actually been developed during the war; and the Government has done much to further its rapid growth. It is now reported from Frunze that a Vitamin C factory has been constructed there, the output of which is expected to be twice as big as the whole Soviet output of Vitamin C concentrates before the war. The concentrate is produced from green walnuts, which are available in inexhaustible quantities in Kirghizia's rich forests.

THE BUSINESS WORLD

An Engineers' War

AT bottom, the war is a war of engineers. It will be won by the side that can place in the field the most effective compound of quantity and quality in weapons. The importance of quality was illustrated in the Battle of Britain, when the numerically superior *Luftwaffe* was defeated by the technical superiority of the RAF. The reverses suffered last month by the Army of the Nile can be traced in part to the superior fire-power of Rommel's equipment. True, quantity and quality are only too often available as alternatives; a little more of the one means a little less of the other. As Mr Lyttelton pointed out in the House of Commons last Tuesday, the difficulty caused by the "pull" between mass production and flexibility

is the constant production problem with which we are faced, because mass production and flexibility are opposite terms. One is the antithesis of the other. The strategist would like to feel that in any theatre of war he is going to have the right weapon available at once, and the tactician requires that tactical lessons should be translated into steel in a few minutes. But the production engineer requires something different. He requires to have types very steady if possible, and one of the reasons why this is particularly so in this country is that we are using diluted labour to an extent that has never been attempted before. If you dilute skilled labour it means more elaborate tooling of the factory, and again, elaborate tooling is the enemy of flexibility.

At the present stage of British mobilisation there is still scope for more and better weapons. The rate of improvement depends very largely on the opportunity and ability of the scientist, the engineer and the manager to put the skill at their disposal to better use and on the degree of fusion between "military plans and thought and production plans and thought." There is still room in Britain for that "extraordinary ingenuity and restlessness of mind" which Mr Lyttelton found among American engineers.

Britain's resources are now mobilised in the sense that the reserve of labour among those in non-essential or over-staffed occupations is now almost exhausted. Civilian production has already been cut virtually to the bone. Nevertheless, as Mr Lyttelton pointed out last Tuesday, there is still scope for further expansion in production by the more efficient utilisation of existing resources. This view has found detailed support in a memorandum on how to increase production without increasing facilities, recently presented to the Minister of Production by the Institution of Production Engineers. The engineers responsible for this memorandum suggest a fourfold approach to the problem: a more intensive use of machinery; the simplification of the design of weapons; a reduction in the number of types in production and increased specialisation; an improvement in manufacturing methods by making fuller use of the knowledge of production engineers. The first of these four proposals is largely a matter of organisation; the last three fall within the province of the engineer.

In the view of the IPE, the scarcity of labour is now at least as marked as the scarcity of machine tools. On a superficial view, this state of affairs suggests that the limit of "machine activity" has been reached. After examination, however, the IPE reached the conclusion that the labour shortage is not so much a general shortage as a scarcity for shift working. Few factories are short of labour for day shifts, but there is apparently some unwillingness, encouraged by the present administration of the Essential Work Order, to do night work. The majority of engineering machine shops are working a nominal two-shift system of, say, fifty-five hours per shift week; but many shops are still working only a day shift, and there are some new factories that are unable to work even full day shifts. Three shift or staggered shift systems appear to be the exception. A better distribution of available labour among day and night shifts seems called for. In the view of the IPE, this could be brought about by allocating a larger proportion of

whole-time workers to night shifts and by filling the resulting vacancies on day shifts by part-time workers, who are still available in considerable numbers. The adoption of this solution would undoubtedly lead to a fuller use of machinery and an increase in output.

Apart from the loss of machine hours due to the maldistribution of labour between shifts, output is also lost by the scanty use of the system of grouping small firms, many of which are comparatively inefficient. Some two-thirds of the total labour engaged in engineering is employed in 4 per cent of the total number of firms, but two-thirds of all the firms employ less than fifty persons. Owing to the Government's policy of paying more attention to the limitation of profits than to the limitation of costs, the multitude of small firms have no incentive to grouping. In order to increase the over-all efficiency of small firms, the IPE suggests an extension of the powers of district clearing centres, or, better still, the formation of district production groups responsible for the allocation of work according to productive capacity. This is one of the problems which can be tackled best by the reorganised regional boards.

The extent to which costs of production can be reduced and resources economised by simplification of designs is

illustrated in the IPE memorandum by some impressive examples:—

COST OF MECHANISMS BEFORE AND AFTER SIMPLIFICATION OF DESIGN

(1) BREN GUN PART

Original cost per 100:	£	s.	d.	Cost per 100 after re-design as a simplified pressing:	£	s.	d.
Material	4	7	6	Material	1	10	0
Man/machine hours	234	7	6	Man/machine hours	10	0	0
	238	15	0		11	10	0

This case represents a saving of 797,000 machine hours, equivalent to £204,975 for an order for 90,000.

(2) AIRCRAFT PART

Original cost per 100:	£	s.	d.	Cost per 100 after re-design all as one unit:	£	s.	d.
Material	1	0	2	Material	14	2	
Man/machine hours	4	4	10	Man/machine hours	2	16	0
	5	5	0		3	10	2

This case represents a saving of 5,407 machine hours, equivalent to £1,346 for an order for 95,000. Total saving of material and machine hours over a quantity of 95,000 is £1,631.

(3) PERCUSSION FUSE PART

Original cost per 100:	£	s.	d.	Cost per 100 after re-design and die-casting:	£	s.	d.
Material	2	6		Material	1	7	
Man/machine hours	12	6		Man/machine hours	3	10	
	15	0			5	5	

This case represents a saving of 77,480 machine hours, equivalent to £17,334, for an order of 4,000,000. Total saving of material and machine hours over a quantity of 4,000,000 is £19,180.

(4) TWO-POUNDER GUN MOUNTING PART

Original cost per 100:	£	s.	d.	Cost per 100 after re-design:	£	s.	d.
Material	250	0	0	Material	68	6	8
Man/machine hours	850	0	0	Man/machine hours	180	16	8
	1,100	0	0		249	3	4

Apart from saving in machine hours and cost, this re-design has also eliminated the use of high-grade alloy steel.

(5) SIX-POUNDER BREACH MECHANISM PART

Original cost per 100:	£	s.	d.	Cost per 100 after re-design:	£	s.	d.
Material	1	2	6	Material	12	6	
Man/machine hours	15	12	6	Man/machine hours	3	2	6
	16	15	0		3	15	0

Practically the whole of the machine hours saved were milling machine hours.

(6) STANDARD AIRFRAME PART

Old Method— Made from bar per 1,000:	£	s.	d.	Old Method— Made from sheet per 1,000:	£	s.	d.
Material	4	1	9	Material	2	17	11
Labour	52	9	10	Labour	15	11	0
	56	11	7		18	8	11

This case represents a saving of 13,100 machine hours, equivalent to £3,812 10s. over an order for 100,000.

Similarly striking instances were quoted by Mr Lyttelton last Tuesday—in his view, the United States is ahead of Britain in simplification of design and in the substitution of materials for those in scarce supply:—

An important machine-gun component used to take 2½ man-hours to manufacture, and by ingenious redesign this has been reduced to six minutes, with great economy in material. The money value saved amounts to £220,000 for 100,000 machine-guns. The Bofors platform, which was a foreign design, took 1,050 man-hours to manufacture, but, redesigned, it now takes 230. The two-pounder barrel originally took

193 man-hours, and the far larger six-pounder now, as a result of redesign and so forth, requires only 72 man-hours. The Sten gun, which is by far the cheapest and most rapidly produced weapon of conventional design, is another instance of the ingenuity which has been displayed. Components of aero engines taking 8½ hours now take three hours. In a standard air frame, material has been reduced by 25 per cent and time by 75 per cent.

Not every mechanism offers similar scope for a reduction in the consumption of materials and in machine hours. Nevertheless, a review of existing designs and specifications would probably reveal some waste of resources, either because they embody unnecessary elaborations and refinements or because they could be adapted to simpler methods of production. True, changes in design frequently have the disadvantage of affecting interchangeability, a consideration that cannot be overlooked. But this disadvantage is often outweighed by the economies that can be secured by simplification. In the view of the IPE, the Supply Ministries should continuously explore the possibilities of modifying mechanisms in large-scale production, and firms manufacturing similar products might form product groups for the interchange of technical information and ideas.

The memorandum also draws attention to the economies that can be secured by standardisation and by a higher degree of specialisation. A good deal has already been achieved by the standardisation of consumption goods, such as building materials and hollowware, a policy which is to be extended under the utility schemes. The IPE holds that the standardisation of war equipment offers a fruitful field for saving machine hours; extreme examples are the persistence of the three Supply Departments in adhering to separate designs for products serving identical purposes. The reduction in the number of types also facilitates interchangeability and provides an insurance against the destruction of production facilities in air raids. In addition to the introduction of a greater measure of standardisation, the memorandum suggests that resources would be saved by a reduction in the variety of products produced by individual firms. True, specialisation has been deliberately avoided as an insurance against the consequences of air raids. It is suggested, however, that the safety-first policy of spreading contracts among a multitude of firms has been carried too far, and that the premium represented by loss of efficiency is too high.

Finally, the IPE emphasises the scope for improvement in methods of production. Large contractors employ highly skilled production engineers, but there are many small concerns which lack the advantages of expert advice. While this deficiency could be remedied by the formation of products groups, the IPE suggests the utilisation of the experience of its members who, for this purpose, would be prepared to offer voluntary assistance to small firms in their district. In view of the shortage of experienced production engineers, methods designed to "spread" their skill might yield valuable results.

The ideas of the IPE are not new; the greater part of its suggestions have long been part and parcel of the policy of the Supply Departments, and are being translated into practice by the Minister of Production. The real shortcomings are to be found in the pace of their application. It is a question of timing and tempo. The need is for what one speaker in the Commons on Tuesday called "absolute speed."

tions of the general licence releasing Swiss dollars from the operation of the freezing order restrict the purposes for which they may be used. In these circumstances, Switzerland has little incentive either to increase its holdings of gold overseas, or to undertake the expense of shifting gold home across the Atlantic. Finally, the creation of purchasing power within Switzerland, which would form the counterpart to any purchases of exchange, would tend to aggravate inflationary tendencies. Although the balance of financial transactions would appear to be favourable, therefore, Swiss gold and exchange holdings together have actually declined slightly over the past year to 3,585 million Swiss francs on June 30th. Ever since the US freezing order, however, there has been a steady conversion into gold of foreign currency holdings. From a record level of 1,308 million Swiss francs, these had declined to 679 million Swiss francs by the end of 1941, while at the end of June this item stood no higher than 143 million Swiss francs.

Further Contraction in Credit

The whole of this week's £35 millions TDR issue has represented fresh money; nor will there be any maturities for five weeks to come. With the credit base still inflated by the end of June operations and the current deficit running at a high level, however, floating debt borrowing on this scale was not expected to disturb the prevailing ease of credit. Indeed, expectations of a keen demand for bills were reflected in a jump in Treasury bill applications at last Friday's tender to £157.7 millions, the highest figure for six months. In the event, the outlet for bills has been decidedly restricted, possibly as a result of the sudden rush of National War Bond subscriptions in anticipation of an early withdrawal of the issue. The previous demand for October maturities dried up completely. Even so, the market has had no difficulty in financing its 33 per cent Treasury bill quota, since the banks have been well supplied with funds. The drop of £25.7 millions in bankers deposits shown by the Bank return still leaves these at the comfortable level of over £120 millions. Apart from the further decline of £21.6 millions in Government Securities, the credit base has been reduced also by a drop of £5.2 millions in the reserve, reflecting further heavy withdrawals which raise the Note circulation to a fresh record level of £812.6 millions.

Coupon Banking Speeded Up

Coupon banking has now had time to get into its stride, and the scheme is operating with great smoothness. Indeed, it would hardly be an exaggeration to say that the system is working perfectly, for the one difficulty of any importance that has arisen since its introduction has been the reluctance of multiple stores to allow their branch shops to operate coupon accounts. That the scheme is not making unreasonable demands on bank staffs is evident from this week's announcement that the banks are now prepared, where possible, to confirm vouchers on the day of presentation. Originally it was stated definitely that confirmed vouchers would not be available until the following day. In practice, most bank officials have found that it is less trouble to confirm vouchers actually on presentation than to require the customer to call again. The concession, however, is naturally subject to the exigencies of current work, and vouchers presented at a peak period for normal banking work would naturally be held over until the following day. No solution in principle appears to have been found for the multiple shop difficulty. Experience under ordinary banking law, which the courts interpret increasingly to the disadvantage of the banks, has made the latter chary of introducing customs which are sooner or later construed as obligations, and they therefore refuse to accept

any instructions restricting drawing powers on coupon accounts. On the other hand, it would be difficult to work out a satisfactory basis for fidelity bonds covering dealings in coupons.

Frozen Reichsmark Balances

Information about the amount of frozen Reichsmark clearing balances and of other frozen Central Bank balances with the Reichsbank is rather scant, as for obvious reasons the German authorities are not anxious to draw attention to the situation. Nevertheless, from time to time the returns or reports of Continental Central Banks contain some figures indicating the rising trend of such balances. The figure of foreign exchange reserves in the weekly returns of the Netherlands Bank and other German-controlled Central Banks may safely be regarded as a reliable indication of accumulating Reichsmark claims, since it is unlikely that Germany would allow any of the conquered countries to run up a big export surplus in relation to any country other than the Reich. The annual report of the Danish National Bank shows that foreign balances have more than doubled during 1941, their increase being Kr. 460 millions. This increase is almost entirely accounted for by the changes in the clearing accounts. During the past year the National Bank had to pay out to Danish exporters Kr. 858 millions on account of goods exported under clearing agreements—mostly to Germany—while the amount paid into clearing accounts by Danish importers was only Kr. 418 millions. The balance of Kr. 440 millions is represented by frozen clearing balances, for the most part by a frozen Reichsmark clearing balance. The newly established Serbian National Bank has already managed to accumulate a frozen clearing balance of Rm. 70 millions, although against this there is a German counterclaim arising from the liquidation of the liabilities of the Yugoslav National Bank. The rapid increase in the note issue of the Serbian National Bank—during the past twelve months it has risen by nearly 50 per cent—was partly due to the financing of this frozen clearing balance. In Hungary, the financing of the export surplus to Germany is arranged in a different way. The Hungarian National Bank advances pengös to German banks, by means of which the latter settle those claims of Hungarian exporters not covered by the amounts the National Bank collects from Hungarian importers of German goods. On August 31, 1941, this item in the return of the National Bank stood at 71.7 million pengös. By the end of 1941 it had risen to 139.6 million pengös, and on June 29, 1942, it was as high as 376.8 million pengös. The arrangement also covers Italy, but it is known that up to the end of last year that country had not made any use of it. The chances are that this year, too, it was only Germany that accumulated frozen debts to Hungary in that form.

Investment

Funds Assume the Lead

The increase in stock market turnover, and, to a large extent, the rise in prices, continued steadily until the middle of Tuesday morning, but with the weight of the rise shifting gradually away from equities and towards gilt-edged securities. The facts that, so far, Rommel has suffered no definite reverse, that the Russian armies have been forced to yield ground, that Japan continues to achieve some success against China, and, above all, that the grave loss at sea continues, all threaten a prolongation of the war. Such a development would favour fixed interest stocks against equities, long, or at least medium long, dated stocks against those of short life, and all equities, and stock in total or partial default, which promise to benefit under war conditions as against those whose chief attraction is for recovery in a better post-war world. Speaking very broadly, movements in prices have conformed to this set-up, but with a tendency for business to fall away in the last day or two, and for the rise in prices to disappear as turnover declines. So far, however, actual falls have been few and of no great moment. A further factor which may have an influence on the Funds is the renewed talk of a new offer of the shorter dated "tap" issue. As is usual in these circumstances, the money

market is talking its book by putting forward the suggestion of a really short bond, possibly 1944-46, at 2 per cent. The impression of the problem from the outside is that the Treasury has already quite sufficient really short dated stock to deal with immediately after, or possibly during, the war, and that, if any change is made, it will be in the direction of further lengthening the life of a 2½ per cent bond, or possibly of creating one bearing 2½ per cent—there is little objection to small fractions in the rate so far as money market stocks are concerned. There is no need to take any action much before August 1st, the next interest date, and, if military developments continue no more favourable than of late, the atmosphere may be such as to enable the authorities still further to reduce the rate they pay on medium dated stock, with some consequent strengthening of the whole fixed interest position.

Bank and Discount Dividends

As was generally expected, the interim dividends of the leading English banks and discount companies show no change from those of a year ago. To this, there is one exception in that, as announced at the annual meeting, the board of the National Discount Company has decided to

Finance and Banking

Strength of Swiss Exchange

Wide fluctuations have recently taken place in the New York rate for "non-commercial" Swiss francs, as distinct from the pegged rate of 23.30 for francs to be used for commercial and other specified purposes mutually agreed between the Swiss and American authorities. At one time in May, the non-commercial rate touched a peak of 36.20, or a premium of more than 55 per cent over the pegged rate. By the end of the month, there had been a relapse to 29.00, but even this represents a premium of 24 per cent, indicating the extreme scarcity of offerings (presumably from Swiss nationals in the United States). Supplies at the pegged rate, on the other hand, are severely restricted by the policy of the Swiss authorities, who in principle are unwilling to buy dollars. This attitude is understandable on a variety of grounds. Physical imports into Switzerland are naturally limited under the blockade, while the condi-

make the two instalments of its total distribution more nearly equal. There is, therefore, every reason to suppose that the rise of two points in the interim will be counteracted by a fall of equal amount in the final. The lack of any change in the payments does not necessarily mean that there has been no alteration in the gross income of either group. Indeed, it is highly probable that the banks at least have secured an increase. The June figures are not yet available for all banks, but there was an average rise in deposits in the first five months of the year, against the

corresponding period of 1941, of some 12½ per cent, or £340,000,000. There was little, if any, alteration in the rates paid on deposits or received on earning assets. Treasury Deposit Receipt holdings have expanded at the expense, in part, of call money and bills, which yield, on the whole, a slightly lower rate, while investments are up by some £216,000,000, and advances are down by about one-third of that amount. The margin between the earnings on the latter and that on the former is probably substantial, but on balance there can scarcely fail to be a larger profit on the

increased amount. The position of the discount houses is less favourable, for they had to curtail their bond holdings, and may not have been able to replace them in full. Despite closing of branches, the banks have had increased expenses for staff, owing largely to the practice of paying bank officers who are in the Forces. In any case, there is reason to suppose that 1941 profits were not far short of the EPT standard, so that there is no prospect whatever of further increases in dividends. The fact that, despite this limitation, all prices have risen substantially reflects the general trend of both fixed interest and equity stocks. It will be seen from the accompanying table that the general yield on the partly paid shares is around 4½ per cent for the banks and 1 point higher for the discount companies.

The Half-Year's Capital Issues

The tables printed below, which analyse total capital issues in the first half-year of 1942, show a slackening in the Government absorption of the resources of the new issue market, which has been growing since the outbreak of war. Although the totals of both Government and non-Government issues in the latest half-year, at £829,218,400 and £6,877,000, are greater than those in the first half-year of 1941, at £765,970,500 and £3,309,000 respectively, there has been in the latest quarter a relative decline in Government in favour of non-government demands. Thus the total of Government borrowings, made up of Savings Certificates, 3 per cent Defence Bonds, 2½ per cent National War Bonds, and 3 per cent Savings Bonds, declined from £493,119,997 in the first quarter to £336,098,385 in the second quarter. The total of non-government issues rose in the same period from £2,134,300 to £4,742,700. The increase in the latter totals does not, of course, represent exclusively the subscription of new money, but in many cases the offer to the public of capital already authorised. The decline in the total of Government borrowing, a decline which has occurred in each of the separate issues, but most strikingly in the reduction of subscriptions to 2½ per cent National War Bonds from £175,256,085 in the first quarter to £94,217,769 in the second quarter, is due to Canadian assistance. Of the non-government issues, all of which were offered by permission to deal, the largest was made by Powell Duffryn Steam Coal to a nominal amount of £1,832,873, which accounts for the jump in the total of the iron, coal and steel group. Lancashire Cotton Corporation issued £240,045 ordinary stock, South Essex Waterworks £100,000 3½ per cent debenture stock and Allied Bakeries £185,046 5½ per cent cumulative preference capital. It is probable that the time is approaching when certain sections of industry may begin to suffer from a moderate capital hunger, but at this stage in the war, the question is, of course, one of the availability of real factors of production rather than the monetary capital.

The Brewery Conversions

The first result of the recent brewery conversions to be announced is that of Portsmouth and Brighton. This was the case where £438,340 of 4½ and 6 per cent stock was to be converted in 1940 into 4 per cent stock. Apparently, holders of approximately 80 per cent of the two issues combined accepted the offer, leaving only some £87,000 of stock to be taken up by the guarantors, who were probably well satisfied to get such an allotment. This is likely to be followed by a similar statement about the conversion of the Courage stock, this being another case where no net repayment was provided for. Contemporaneously, the terms of another important conversion, that of £1,378,000 of Watney Combe Reid 5½ per cent stock, are announced. This is to be repaid in March next at 10s, and holders are offered an equal amount of 3½ per cent stock, 1956-68, at 96½. That is to say, they receive 4½ per cent in cash, which they get in September, instead of waiting a further six months. A semi-speculative attraction is given to the new stock by the fact that a sinking fund of about 2½ per cent per annum, to redeem the stock by drawings at par, is to start in two

years' time. The underwriting or guarantee fee is £10,500 for the whole issue. The running yield on the new stock is approximately 3½ per cent, with the chance of a substantial, and the certainty of a material, profit on repayment.

Company Notes

Wiggins, Teape Results

Consolidated gross profit on trading of the Wiggins Teape group of paper manufacturing companies declined in 1941 from £1,499,912 to £1,295,553. With a rise in ARP and dependant's allowances from £102,143 to £159,261, the balance on consolidated profit and loss account is reduced from £802,518 to £569,604, and the profits of the parent amount to only £427,272 against £594,088. The latter has, however, benefited by a sharp reduction in the sum which has to be found for taxation from £278,819 to £62,584. This is in part due to the possibility of drawing on taxation reserve and in part to the absence of any claim for EPT, since the pre-war standard was not earned in 1941. The directors point out that no credit has been taken for refund of EPT. Consequently, equity earnings, at £168,177 against £118,079, are actually higher than in the previous year, and the ordinary payment, maintained at 7 per cent, is covered by a rate of 12.9 against 7.0 per cent. There is a transfer of £50,000 against nil to contingencies and an increase in the carry forward from £52,153 to £52,386. The setback is due to shortage of materials, which could not be completely overcome by the use of alternatives, and the general reduction in the weight of papers. The group is increasingly engaged in the production of special papers, photographic and others, which continue to enjoy a priority, but on which the profit margin is probably small. The consolidated balance sheet shows a reduction in stocks from £1,618,699 to £1,321,271. There is, none the less, an increase in surplus liquid assets, excluding £59,218 current accounts of subsidiaries with the Madras branch, from £2,401,196 to £2,442,122. Meanwhile, bank loan is reduced from £15,343 to £13,600; and cash holdings from £733,274 to £381,249, in order to finance an increase

in holdings of Government securities from £27,771 to £305,310. The improvement in equity earnings last year is, of course, governed by the special circumstances of the company's tax position. It would be surprising if, when refunds of income tax have been exhausted, equally good results were obtained in the current period, but the concern should be in a position to maintain the ordinary dividend if the management sees fit to do so. The £1 ordinary shares, at 30s. ex dividend, yield £4 13s. 4d. per cent.

Hudson's Bay Recovery

In view of the marked expansion in activity which already existed in Canada a year ago, the very modest recovery, shown by the Hudson's Bay Company at that time, caused some comment. Fortunately, the preliminary results for the period ended January 31st last, make a substantially better showing. After finding taxes of £710,969, against £486,123, there is available for dividends and reserves £91,651, compared with £60,054. In consequence, the amount available for ordinary shares is increased in a much greater proportion, and the dividend from ordinary profits is raised from 1 to 3 per cent, subject to tax at an unstated rate. At the same time, the payment from the Land Account, not subject to tax, is 2 against 1½ per cent. In conformity with a hint, dropped by the chairman at the last annual meeting, the board proposes to effect a further repayment of £600,000 of 5 per cent preference capital. This will, presumably, be effected by a return of 30s. per share, reducing the amount to £2. There was a similar repayment six years ago. The effect of the repayment on the ordinary capital should be a modest increase in distributions, but the return of capital makes the preference shares less attractive, and they have recently declined in value. On the news, the ordinary shares of £1 advanced 4s. to 28s., while the £3 10s. preference reacted further to 7½s. 3d.

Brazilian Traction Earnings

The accounts of Brazilian Traction, Light and Power for last year are remarkable in that they show a recovery in net earnings for the ordinary capital to the best figure for over a decade. As was disclosed some time back, dividends are resumed, but with a payment of 40 cents, which

is far below the best recorded. Full particulars, so far as these are published, are set out above for the past three years. It will be seen that gross earnings from operations have increased sharply, with only a modest rise in operating expenses. The former must owe a great deal to war

demands, which have facilitated Brazil's task of cutting away from coffee and cotton, and concentrating on the export of raw materials and manufactured goods. The value of the former has risen from 41.5 per cent of total exports to 48.3 per cent in two years, while for manufactures the increase is from 0.8 to 5.5 per cent. The balance sheet shows a rise of \$8,000,000 odd in fixed assets and an expansion of \$12,250,000 in liquid resources, of which the bulk occurred in cash, including Brazilian currency. Against this, current liabilities are up by some \$3,250,000 and reserves and surplus show an expansion of \$17,500,000. The report contains a definite hint that operating expenses will rise, and it is very probable that they will to some extent catch up on rising revenue. The crux of the matter is, however, the rate of exchange. There was a very modest improvement in this from 4.83 to 4.85 US dollars in the special free market rate, which governs general remittances, other than in payment for imports. Only strictly limited amounts have been available for the financial service, and, so long as there is any prospect of an improvement in the rate, it may well pay the ordinary shareholder to wait. In existing conditions the board appear to believe that some improvement is not improbable, and therein lies the best hope of any material amelioration in the position. There can be little doubt that Brazil is achieving as much success as any of the South American republics in improving its economic position, and that the development of the war, and the good neighbour policy of the USA, are helping it. There is also reason to suppose that Brazilian Traction must benefit, in larger sales, from any increase in the country's prosperity. It will, however, depend on domestic policy how far such a development is reflected in an improved rate for the milreis, and how far foreign capital is allowed to benefit from any such improvement.

W. T. Henley's Telegraph

The results of W. T. Henley's Telegraph, the last of the big electric cable companies to report for the past financial period, show an expected stability of income after taxation, except tax on dividends, and special war expenditure. Trading profits for 1941 are actually rather higher at £410,645, against £400,484, and, although depreciation absorbs some £4,000 more than in the previous year at £74,016, while staff funds receive £5,000 against nil, equity earnings are up from £308,066 to £312,379, representing a rate of 28.1, against 27.3 per cent. The rise in rate is due mainly to the fact that the 1941 figure is subject to directors' bonus, while the others are net of £3,500 on that account. The ordinary payment is maintained at the usual 20 per cent, including a 5 per cent cash bonus; contingencies receive £50,000, as before, and there is a moderate rise in the carry forward from £378,897 adjusted to £381,276, subject to directors' bonus.

† Subject to payment of bonus to directors.

The balance-sheet, which shows great strength, suggests that business expanded last year. Thus, increases in creditors from £2,206,099 to £2,480,335, and in debtors from £1,282,266 to £1,352,796 are accompanied by a jump in cash holdings from £132,419 to £302,078, and a rise in the total of stocks and work in progress from £1,071,110 to £1,216,575. The liquid position is, thus, very strong. It may be presumed that this apparent expansion has been achieved despite lower output of the peacetime subsidiary products of the group, such as tennis and golf balls, and despite a contraction in the rubber manufacturing side of the business, which will be much more evident in 1942. The 5s. ordinary stock, at 22s. 6d. ex dividend, yields £4 8s. 11d. per cent.

Powell Duffryn Higher Payment

Profits of Powell Duffryn Associated, the operating company of the Powell Duffryn group, show an increase, after all expenses including taxation and depreciation, from £576,439 to £667,171 in the year to March 31st last. There is a rise in the sum distributed as dividends to the two holding companies, Welsh Associated Collieries and Powell Duffryn Steam Coal, from £234,130, excluding the £40,000 distributed in the previous year from contingencies reserve, to £319,000. The apparent decline in total income of Welsh Associated, 99 per cent of whose ordinary capital is now held by Powell Duffryn Steam, from £179,720 to £122,109, is due to the absence of the special compensatory payment distributed by the latter in 1940-41. Welsh Associated is, consequently, obliged to reduce the ordinary payment from 4, of which 3 was a special dividend, to 1½ per cent, against 1½ per cent in 1939-40. Powell Duffryn Steam Coal, the only company in the group in which the public is directly interested, has suffered a reduction in income from £227,336 to £219,534, the higher dividend from Powell Duffryn Associated not compensating for the smaller dividend from Welsh Associated and the absence of the previous year's special payment. Consequently, the earnings percentage is reduced from 7.3 to 6.9 per cent. Ordinary stockholders, however, receive 7 against 5½ per cent. In the previous year, the surplus was required for the payment of special compensation to Welsh Associated. An income-tax refund of £1,795 makes it possible to raise the carry forward, despite the fact that the dividend is under-earned, from £5,770 to £6,038. The chairman, Mr Edmund Lawrence Hann, states that there has been no difficulty in marketing the whole output of the operating company, but that there has been a steady rise in mining costs, and that the labour shortage presents an acute problem. He puts forward a plea for the construction of vessels which utilise the latest coal-burning technical developments as a means of ensuring continuity of post-war output. The Powell Duffryn Associated balance sheet shows a small rise in stocks from £690,968 to £702,387. Net loans from subsidiaries of £23,880 have replaced net loans to subsidiaries of £600,175, while reserves have increased by £150,000 and fixed assets fallen by £108,089. Higher creditors and tax liability, coupled with lower debtors and cash holdings, are responsible for a jump in tax reserve

certificates and trade investments from £619,744 to £2,364,795, while surplus liquid assets are some £900,000 higher at £2,162,192. The £1 ordinary stock of Powell Duffryn Steam Coal, at 15s. 3d. ex dividend, yields £9 3s. 7d. per cent.

British Plaster Board

The full accounts of British Plaster Board for the year to March 31st last—the preliminary statement was discussed in *The Economist* of July 4, 1942—show consolidated profits, after all taxation including EPT, of £396,936. This compares with profits before tax in the previous year of £563,304, when total tax liability amounted to £342,555. It cannot be too strongly regretted that the management has seen fit to withhold comparable figures for the latest year. The scope of the improvement can, of course, be judged from the rise in the earnings percentage of the company, which, at 44.1 against 24.6 per cent, provides ample cover for the ordinary dividend, raised from 15 to 25 per cent. The carry forward is £152,747 higher at £265,072. The chairman, Lord Belper, points out that the recovery in earnings is due partly to the revival in the demand exercised by the section of the building trade, that concerned with rehousing and construction of public buildings, which British Plaster Board supplies, and partly to the decline in imports. A statement by the chairman that "we have not been liable for any measure of EPT" appears to apply only to the holding company. The consolidated balance sheet shows a reduction in debtors of some £100,000 to £485,268, coupled with an increase in all other forms of liquid assets. Investments are some £90,000 higher at £911,157 against £824,911, stock some £50,000 higher at £265,617, while cash holdings have risen from £162,252 to £540,149. On the liabilities side, the total of taxation and creditors has risen from £609,455 to £754,046. The company's statement shows the elimination to £693 standing to the credit of general reserve through the transfer of this amount to investment reserve. There is every probability that the demand for the products of the group will be maintained at a high level during the remainder of the war and into the peace. The 5s. ordinary shares, at 23s. ex dividend, offer the sound yield of £5 8s. 8d. per cent.

DEFENCE (FINANCE) REGULATIONS

By F. C. HOWARD, Esq., M.A.
Solicitor of the Supreme Court

"Should be of service to financial and business men if only because the Courts have, so far, not been called upon to give an authoritative interpretation of many of the regulations."—*The Times*.

BUTTERWORTHS, Bell Yard, Temple Bar, LONDON, W.C.2

Industry and Trade

Still Over 100,000

As the peak of war production is approaching in this country, drastic steps are being considered, and taken, to increase the supply of labour. Young men are being removed from munition factories and women are being interviewed under the Registration for Work Order at the rate of 50,000 a week. It seems therefore anomalous at first sight that there should still be as many as 106,170 persons fit for, able and willing to work on the unemployment register after nearly three years of war. The fact is, however, that the unemployment statistics are no longer any real guide to the remaining labour reserve. Although no analysis has been published recently showing the average duration of unemployment, a large proportion of the unemployment register now probably consists of persons, temporarily rendered idle by weather conditions or the completion of contracts, and of workers who are being transferred from one job to another. In order to reduce the duration of unemployment, the Ministry of Labour now interviews all persons who have been on the register for at least two weeks: women in the appropriate age

REGISTERED UNEMPLOYMENT IN GREAT BRITAIN.

	Wholly Unemployed.	Temporarily Stopped.	Persons Normally in Casual Employment.
May 11, 1942.			
Men	55,060	2,579	2,945
Boys	10,711	20	6
Women	32,902	3,084	281
Girls	10,290	106	—
Total	108,963	5,789	3,232
June 15, 1942.			
Men	54,097	1,846	2,994
Boys	8,669	15	8
Women	28,758	1,715	255
Girls	7,716	94	3
Total	99,240	3,670	3,260

groups can then be directed into war work; men can be persuaded to take up work or join the forces, or directed if their age groups have registered for work. Some of the unemployed may later be fitted into the "unsuitable for work" categories, and some may be immobile in districts where work is not available. In the absence of recent statistics about the average duration of unemployment, however, it is impossible to know how far the measures taken by the Ministry of Labour have been successful. In view of the shortage of labour, avoidable unemployment, whether between jobs or in the factory, must be cut down to the lowest possible level.

Synthetic Rubber

The question whether Great Britain should, or should not, rely entirely on American supplies for its needs of synthetic rubber has assumed the proportion of a political controversy. It has its origin largely in the doubts—expressed in the United States by Mr Leon Henderson, for example—about America's ability to supply single handed its own and the British Empire's needs. Last Tuesday the Government's policy was reaffirmed categorically by Mr Lyttelton.

We do not consider at present (Mr Lyttelton said) that we should make synthetic rubber in this country, because there is no saving in shipping unless the synthetic rubber is derived ultimately from coal. The present method is to extract oil from coal first and then to use that oil for the manufacture of

synthetic rubber. Our policy is to concentrate the production of synthetic rubber in the United States.

For the time being at any rate the controversy has been settled for good or for evil.

Administration of Coal Levies

Since the publication of the Government's White Paper on coal on June 3rd last, several important measures have been taken by the Board of Trade and the new Ministry of Fuel and Power to extend effective Government control over the finances of the industry. It will be recalled that while the proposals of the Government devolved upon the regional controllers, acting for the Minister, full and undivided responsibility for the policy and general conduct of mining operations, it was expressly stated in the White Paper that it was not intended to introduce any fundamental alteration in the financial structure of the industry. Apparently, this disclaimer concerned only the procedure governing the district monthly or quarterly ascertainment of proceeds and their distribution between wages, other costs of production and profits, for the Government has now taken over the control not only of the levies imposed for the service of the Coal Mines (War Levy) Scheme of December, 1940, and of the Guaranteed Wage provision of the Essential Work Order applied to the industry from June 1st, 1941, but also of the whole of the revenue from the recent increase of 3s. per ton in the pithead price of coal. The transfer of the administrative control of the levies from the Central Council of Coal Owners (created under the output, supply and price regulation provisions of the 1930 Coal Mines Act) to the Board of Trade took place under the Coal (Charges) Order of June 3rd last, and of the proceeds of the recent 3s. per ton increase in the price of coal under the Coal (Charges) (Amendment) Order, dated July 3rd, raising the charge payable to the Board of Trade by 3s. to 3s. 7d. per ton on disposals. On the basis of current sales, this increased charge represents an annual revenue of between £30 and £35 millions. It is understood that, of the 3s. per ton increase in the price of coal, 6d. was earmarked for the benefit of districts where there were little, if any, credit balances; and it has been officially announced during the past week that out of the pool, the Ministry of Fuel and Power has authorised allowances of 1s. 1d. per ton in Durham, and in the South Wales coalfield of 4d. per ton on steam and bituminous coals, with an extra 1s. 6d. per ton for washed and graded coals, and an average of 4s. 7d. per ton on anthracite coals.

Building Labour

At the beginning of this year, it was officially stated that building activity had reached, or passed, its peak. On the basis of current estimates, it was then held that the volume of construction would remain heavy until next autumn, but would then begin to decline rapidly with the completion of the major part of the Government's building programme. Since the industry's labour force numbered 820,000 male operatives in the summer of 1941, any substantial curtailment of building operations would release large numbers of workers for transfer to the Armed Forces or to other civilian occupations. It has since been announced, however, that the calling up of large numbers of building operatives had been postponed as a result of a new demand for labour. To fulfil this demand the Ministry of Labour has set up a building and civil engineering department; workers who were due to be called up are to be directed to industrial work. The new demand for building operatives illustrates the importance of mobility in effecting rapid transfers of workers from one job to another.

Industrial Diamonds

During the current week the Diamond Trading Company has held its midsummer "sights" in London. Although full details of the transactions concluded are not yet available it appears that the new sights have, in the main, con-

firmed the recent market trend. During the first half of this year, the international trade in diamonds has undergone a substantial change. The total value of sales through the syndicate remained virtually unchanged on the year (during 1941, world sales of rough diamonds reached £7 million—the highest level since 1937, when the turnover amounted to over £9 million). Sales of gem stones were appreciably lower, but were counterbalanced by increased sales of industrial diamonds. As prices for industrial diamonds, by arrangement between the producers and the Government, have remained unchanged since the outbreak of war, while prices for gem stones have shown marked advances, the maintenance of sales values in the past six months reflects a considerable advance in the volume of sales. The reason is the huge and still rising demand for industrial diamonds for war purposes.

Diamonds are the hardest known substance, and for this reason they find employment in industry, in particular for use as abrasive material and to prevent abrasion. For decades past, industrial diamonds have been indispensable in glass-cutting and rock-drilling, but to-day these standard uses absorb only a small fraction of industrial diamonds. The development of harder metal alloys (especially steel alloys), the progress towards greater accuracy in engineering and the greater working speed in industry, have greatly enlarged the demand for industrial diamonds. Progress in the use of industrial diamonds has been particularly marked in the past fifteen years and has received a new impetus through the war. Many of the hard armament alloys could scarcely be worked accurately by any other substance, and efficiency and speed of work would be much reduced without supplies of diamond crystals or diamond dust embedded in special preparations, such as powdered metal, plastics, and so on, used to-day for almost all fabricating processes, including cutting, drilling, grinding, trueing, shaping, sawing, and polishing. Apart from abrasives, there are important uses—diamond dies, diamond atomisers in oil burning furnaces—in which diamonds are the best possible material to prevent unnecessary abrasion by other materials. Unlike gem diamonds, industrial diamonds are definitely consumed and in normal times over half the diamonds used in industry were destroyed after twelve months' continuous employment. To-day the "life" of industrial diamonds should, on the average, be shorter owing to the intensity of work and the hardness of the alloys used for armament purposes. On the whole, any diamond is suitable for industrial purposes, but as a rule—the Brazilian "carbonado" and the rare "ballas" disregarded—only stones of little use in the jewellery trade find their way into the industrial market. A large part of the diamonds used for industrial purposes consist of diamond dust. Normally about two-thirds of the annual world production of diamonds are industrial stones, but the value of these hardly exceeds one-fifth of the total annual diamond output.

Unessential Production

The Board of Trade proposals for limiting the production of consumption goods were briefly outlined on page 38 of *The Economist* on July 11. In a memorandum, "Control of Manufacture and Supply and Limitation of Supplies (Miscellaneous) Quotas after August 1, 1942," the Board of Trade gives the full details. The memorandum is divided into three parts. In Part A—Control of Manufacture and Supply—the manufacture of the following classes of goods will be permitted only under licence:—

Floor coverings, holloware and kitchen hardware, metal furniture, domestic electrical appliances, mechanical lighters, athletic sports and outdoor games, musical instruments, fountain pens and umbrellas.

Definitions of controlled goods are given in every case. Control, in so far as it has been exercised in respect of these goods, was by varying means; in most cases under the Limitation of Supplies (Miscellaneous) Order, in others by individual Orders, in some through control of raw materials. Goods the manufacture of which will be prohibited are dealt with in Part B. Licences to manufacture goods in this class may be granted only in exceptional cases. The manufacture of certain descriptions of the following classes of goods are prohibited:—

Jewellery, goldsmiths' and silversmiths' wares, cutlery, including spoons and forks, toys and games, leather goods

and other receptacles, glass-ware, fancy goods, metal-ware, cash registers and hand-operated lawn-mowers, and domestic furniture made of any material other than metal.

For domestic furniture, the memorandum sets out the classes of goods which may be manufactured, with specifications of the amount of material which may be incorporated in them. The third section, Part C, deals with quotas under the Limitation of Supplies (Miscellaneous) Order, after July 31. In order to dispose of stocks in the hands of manufacturers and wholesalers, the following classes of goods covered in Parts A and B will be free from supply quotas under a Limitation of Supply Order:—

Floor coverings, glassware, metal furniture, holloware, wicker furniture, musical instruments and records, fancy goods and machinery.

Other goods will be subject to a supply quota during the six months beginning August 1st, based on a standard period of the year ended May 31, 1940. The figures in brackets show the permitted quota, expressed as a percentage of the supply, by values, during the standard period:—

Lighting fittings (10), cutlery (20), trunks, bags, etc. (10), photographic goods (20), toys and indoor games only (15), and jewellery (10 and 25).

Utility Furniture

The utility clothing scheme is in the main succeeding in its objects of providing the public with clothes of good value, using the minimum of labour, materials and factory space in their production. In view of its success, attention is being turned towards other durable and semi-durable goods which are essential even in time of war. The necessity for a utility scheme for furniture production is emphasised by the way in which prices have risen, while quality, owing to lack of materials and the loss of skilled labour, has deteriorated. Point was given last week to the present condition of the furniture market by Sir Douglas McGraith, chairman of the Price Regulation Committee (North Midland Region), when he announced that a review in his area had disclosed that prices are as much as three times as high as before the war; he confirmed the inferior quality of much of the furniture now on sale. A few days earlier, the President of the Board of Trade announced the appointment of an advisory committee

to produce specifications for furniture of good, sound construction in simple but agreeable designs for sale at reasonable prices, and ensuring the maximum economy of raw materials and labour.

The composition of the committee provides some assurance that designs will in fact be simple and agreeable. Utility furniture may even set new standards of taste in home design. It is expected that some utility furniture will begin to come on to the market in the late autumn. The tendency appears to be that all goods which are essential, and the production of which is permitted, will eventually be made to utility specifications.

COMPANY MEETINGS

NATIONAL BANK OF NEW ZEALAND, LIMITED

RECORD DEPOSIT FIGURES

The statement by Lord Balfour of Burleigh (the chairman), circulated with the report and accounts, after referring to the recent appointment of Mr John Macmillan to the board, continues:—

In New Zealand, as elsewhere, the vast expenditure on the war has resulted in a great increase in deposits with the banks, and it is not surprising that deposits are higher in our latest balance-sheet than they have been in the history of the bank.

One of the main features of banking in New Zealand is the finance of primary production, and large seasonal fluctuations in the trading banks' figures are therefore inevitable, especially when normal movements are affected by special factors, such as shipping difficulties.

REDUCTION IN RATES

Our profit-earning capacity has also been seriously affected by the arrangement which, as Mr Nash announced in his budget speech in July, 1941, was made with the trading banks for the reduction of overdraft rates to a minimum of 4 per cent. and a maximum of 5 per cent. This reduction was accompanied by small reductions in our rates for fixed deposits, but the net effect of this arrangement was a considerable reduction in the bank's profits. Add to all this the fact that our exchange business has been still further curtailed, and it becomes clear that our profits for the past year would have been much lower than in fact they are if we had not during the past year received the relief, for which we have waited so long, through the passing last

October of an Act amending the Land and Income Tax Act. The rates at which we pay taxes have recently been increased, and we now have to pay income, social security and national security taxes in New Zealand of just over 14s. in the £ on our profits. We are not complaining of these high taxes, because we understand the necessity for them, and we are thankful that the Government has now abolished the arbitrary system under which the banks were previously taxed, but the increase in rates of taxation naturally means that the saving effected for us by this reform is not as great as we had at one time hoped it would be. The net profit shown by the year's accounts is £92,585, an increase of £10,849 on last year's figure.

ALLOCATION OF PROFITS

One of the results of our being taxed on the same basis as other companies is that, in order to obtain the full income-tax allowance for depreciation on premises and furniture, we have to write off during our accounting year depreciation on these items at certain specified rates. The allocation to premises this year is £2,000 higher, £12,000 being the net amount, after the crediting of rents received, which has been written off from the profit and loss account. The allocation to pension and gratuity funds is also increased by £1,000 to £15,000, which amount will cover the annual contributions required of the bank as a result of the establishment of the women's pension fund, which is mentioned in the directors' report. The interim dividend of 1½ per cent., less United Kingdom income-tax paid in January, absorbed 20,719, and of the remaining amount available the directors propose that £10,000 be transferred to contingency accounts, and that £34,531 be paid as a final dividend of 2½ per cent., less United Kingdom income-tax. This will leave £116,184 to be carried forward, which is £335 more than last year.

The statement concludes with a tribute to the New Zealand forces, and also to the staffs of the bank both in New Zealand and in this country.

UNION CORPORATION, LIMITED

MR P. M. ANDERSON'S REVIEW

Summary of the proceedings at the ordinary general meeting of shareholders of Union Corporation, Limited, held in Johannesburg on May 28, 1942. Mr P. M. Anderson presided.

The Chairman said that the net profit for 1941, after providing for all outgoings, including taxes, etc., amounted to £621,381. He stated that they were fortunate, in these difficult times, in again paying a total dividend of 8s. per share, absorbing £616,000, leaving £127,531 to be carried forward.

The book value of their claim and debenture holdings showed little change, but sundry participations, etc., had risen to £91,983, due to the purchase of certain gold mining rights, chrome and iron ore interests.

At the close of the year their cash assets, including debtors, exceeded their liabilities by £200,000.

The salient features of the Witwatersrand gold mining industry, and, in particular, the operating results of the gold mining companies on the Witwatersrand under the administration of the corporation, were then reviewed.

In the Orange Free State, Western Holdings, Limited, had obtained a lease over certain farms north of Sand River. The corporation would undertake the administration and technical management of operations in this area and preliminary work would start when conditions permit. Bay Hall Trust had again paid 6½ per cent. and increased the balance carried forward by £4,616, to £75,945. The market value of the trust's assets had improved by over 12 per cent. and had at the end of the year an aggregate value of £2,050,999.

San Francisco Mines of Mexico was able to resume dividend payments with 9d. per share for the year. The outlook gave considerable encouragement.

Shipment of chrome ore was continuing.

THE BOARD

By the death of Mr Joseph Temperley in May of last year and of Sir Reginald Mant in March this year, the corporation lost two highly esteemed colleagues of its directors. Mr Temperley joined the board in June, 1915, and served as its chairman until April, 1924; Sir Reginald Mant was appointed in November, 1934. The corporation had also lost the valuable collaboration of the Right Hon. Brendan Bracken, who resigned his seat on being appointed Minister of Information.

Continuing, Mr P. M. Anderson said: Sir Henry Strakosch has intimated to the board that he feels the need of reducing his activities, and that he therefore desires to relinquish the managing directorship of the corporation on June 30th next—an office which he has held for the past forty years. The board has acceded to this request with great regret, but I am glad to announce that Sir Henry will continue to act as chairman of the board, and will, in addition to the ordinary duties of chairman, continue to collaborate with the management by undertaking the general supervision of the corporation's affairs. His advice and guidance will thus remain currently available. Mr C. T. Pott and I are to be appointed managing directors, I serving in Johannesburg and Mr Pott in London. Your board is confident that this new arrangement will prove in every way satisfactory.

TRIBUTE TO SIR HENRY STRAKOSCH

During the eventful forty years through which Sir Henry Strakosch has been responsible for the management of our affairs, expansion in our business has been remarkable. I give you by way of illustration a few figures concerning our Rand interests only. In 1902 the mines of our group on the Rand milled 171,000 tons of

ore, yielding 76,000 oz. of gold for a working profit of £125,000. Last year our group milled 7,195,000 tons, yielding 1,825,000 oz. for a working profit of £7,692,000, and over those forty years the corporation has distributed to its shareholders nearly £9,500,000 in dividends. In spite of Sir Henry Strakosch's unsparing devotion to our affairs, he has managed to find time to render important public service to the Empire. So far as South Africa is concerned, I need only mention his recommendations to the Union Government that brought about the South African Currency and Banking Act in 1920 and the subsequent establishment of the Reserve Bank provided for in that Act.

The Chairman thanked the depleted staffs in London and Johannesburg for efficient service rendered throughout the year; the report and accounts were adopted and the auditors reappointed.

N.B.—A copy of the full report of the above proceedings is available for inspection at the London office.

THE GROOTVLEI PROPRIETARY MINES, LIMITED

INCREASED WORKING PROFIT

The thirty-fifth ordinary general meeting of the Grootvlei Proprietary Mines, Limited, was held on May 12, 1942, at Johannesburg.

Mr P. M. Anderson, the chairman of the company, presided, and in the course of his remarks said: Owing to inevitable delays in obtaining delivery of equipment from overseas, it was not until the current year that the extended reduction plant reached its capacity of about 150,000 tons per month. Despite this, the ore milled during the year showed a substantial increase of 261,500 tons, to 1,496,000 tons. The working revenue was £3,376,007, of which £1,738,551 was expended in working costs, leaving a working profit of £1,637,456, or £360,217 more than in the preceding year. After taking into account sundry revenue and income from investments and deducting sundry charges, and providing £922,720 for taxation, which represents 56 per cent. of the working profit, there remained a net profit of £710,126, or £39,143 more than in 1940. The addition of the unappropriated balance at the commencement of the year made available for disposal an amount of £885,974, from which were paid two dividends, totalling 4s. per share.

Capital expenditure during the year, including the net cost of acquiring the assets of the Palmietkuil Company, was £905,114. This amount was provided as to £167,146 by capital funds in hand, as to £538,236 by the issue of shares and the balance of £199,732 has been appropriated out of the year's profits. This, together with an increase in cash assets, resulted in a deterioration of about £97,000 in the cash position, which will need to be restored out of future profits.

Development work during the year totalled 69,982 ft., of which 48,395 ft. were on reef and sampled, 27,075 ft., or 56 per cent., being classed as payable with an average value of 12.1 dwt. over 28 in.

The ore reserves at the year-end were estimated as 10,000,000 tons of an average value of 5.2 dwt. over an estimated stopping width of 46½ in. Compared with the previous year the value is unchanged, the width 2½ in. less, and the tonnage shows an increase of 2,500,000 tons, which is partly due to the inclusion of the Palmietkuil reserves, these having been taken in at a lower tonnage and higher value than estimated by that company before its assets were acquired by us. Your company has now attained a substantial ore reserves position, and this has permitted a reduction in the rate of development by over 60 per cent. as from the beginning of the current year in order to conserve the use of materials, particularly steel, during the war.

The report and accounts were adopted.

July 18, 1942

GEDULD PROPRIETARY MINES, LIMITED

MR P. M. ANDERSON'S REVIEW

The forty-first ordinary general meeting of Geduld Proprietary Mines, Limited, was held on May 12, 1942, at Johannesburg.

Mr P. M. Anderson, the chairman of the company, presided, and in the course of his remarks said: The ore milled reached the total of 1,398,000 tons, and the yield per ton milled, at 4.75 dwt., was nearly two-tenths of a pennyweight higher than in 1940. Working revenue amounted to £2,797,326, and working costs, which rose to 19s. 5d. per ton milled, absorbed £1,356,803, leaving a working profit of £1,440,523, or £31,763 more than in the previous year. Due to lower dividend distributions by the East Geduld Mines and the Grootvlei Proprietary Mines, our income from investments and sundry revenue decreased by some £50,000, to £461,317. The gross profit was £1,901,840, and after deducting sundry charges and taxation—the latter increasing by £87,945, to £846,407—there remained a net profit of £1,042,390, or £109,684 less than in the previous year. With the addition of the unappropriated balance at the beginning of the year the amount available for disposal was £1,350,686, from which was paid two dividends totalling 13s. 6d. per share—a decrease of 1s. 6d. over the previous year.

Development work in main reef areas totalled 17,479 feet, and of 11,425 feet on reef, 35 per cent. were payable with an average value of 8.6 dwt. over 37 in. These results must be considered as satisfactory, for work on this reef now consists mainly of splitting large low-grade blocks. On the Black Reef horizon, which is being prospected from the Nos. 5 and 7 shafts, a total of 7,771 feet were driven. Of 2,670 feet on reef, 24 per cent. were payable with an average value of 7.4 dwt. over 34 in. These disclosures are encouraging, but considerably more work will be necessary before any opinion can be formed as to the economic possibilities of this reef in your mine.

The ore reserves at the year-end were 8,800,000 tons of an average assay value of 4.4 dwt. over 53 in. In comparison with the previous year there is a decrease of 200,000 tons, the value is one-tenth of a pennyweight lower, and the width unchanged.

In response to the Government's request to the industry to further conserve the use of materials, particularly steel, your company has from the beginning of this year curtailed its development work on Main Reef, and at the present time work on this reef has virtually ceased. Work on the Black Reef has also been curtailed for the same reason and now consists of putting in main connections to the various shafts from which exploration of this reef can be carried out expeditiously when conditions permit.

Our shareholdings in East Geduld Mines, Limited, and the Grootvlei Proprietary Mines, Limited, remain unchanged. Both companies continue to show satisfactory progress.

The report and accounts were adopted.

HENDERSON'S TRANSVAAL ESTATES, LIMITED

The thirtieth ordinary general meeting of Henderson's Transvaal Estates, Limited, was held on London on the 15th instant.

The following is a summary of the statement of the chairman, Mr W. L. Castleden, which had been circulated with the report and accounts, for the financial year which closed on March 31, 1942:—

Investments in Government securities have increased by £62,600, while our cash is reduced by £44,200. We have accordingly fully recovered the drop in liquid assets reported to you last year. We have to tell you again this year that the market value of our quoted securities is below book value, but this depreciation is covered several times over by the reserve we have set aside to meet such a contingency. On

the other hand, we are pleased to be able to inform you that the value of our unquoted securities shows little alteration, and still remains well above the figure at which they appear in the company's books. You will observe that our total reserves now amount to £230,000, i.e., nearly 50 per cent. of our issued capital.

The result of the year's working is that we are able to recommend the payment of a dividend of 10 per cent. and to carry forward £46,950, a result which shareholders will agree is satisfactory.

The report was unanimously adopted.

VAN DYK CONSOLIDATED MINES, LIMITED

INCREASED ORE MILLED

The eighth ordinary general meeting of Van Dyk Consolidated Mines, Limited, was held on May 13, 1942, at Johannesburg.

Mr P. M. Anderson, the chairman of the company, presided, and in the course of his remarks said: Operating results during the year were satisfactory, the ore milled showing an increase of 54,900 tons, to 1,183,100 tons, while the yield per ton milled was 5.17 dwt. The working revenue was £2,574,196, and working costs amounted to £1,577,276, leaving a working profit of £996,920. Taxation increased by £57,113, to £425,494, equivalent to 55 per cent. of the working profit, and, after allowing for other items detailed in the accounts, the net profit was £551,165, or practically the same as in 1940. Together with the unappropriated balance at the commencement of the year, there was available for disposal an amount of £804,451. From that amount two dividends, totalling 1s. 9d. per share, were paid.

During the year a total of 107,606 feet were driven, and of 68,830 feet sampled, 31 per cent. were payable with an average value of 9.6 dwt. over 23 inches. The value showed a falling-off in comparison with the previous year and disclosures in certain areas have not come up to expectations.

The ore reserves as recalculated at the year-end amounted to 3,100,000 tons of an average assay value of 5.2 dwt. over 39 inches, the tonnage and width remaining unchanged and the value being two-tenths of a pennyweight lower.

In response to the Government's request to the industry to further conserve the use of materials, particularly steel, your company has from the beginning of this year curtailed its development work by about 15 per cent.

The report and accounts were adopted.

EAST GEDULD MINES, LIMITED

LARGER TONNAGE MILLED

The fifteenth ordinary general meeting of East Geduld Mines, Limited, was held on May 12, 1942, at Johannesburg.

Mr P. M. Anderson, chairman of the company, presided, and in the course of his remarks said: During the year 1,932,000 tons were milled, or an increase of 22,000 tons over the previous year; while the yield per ton milled was maintained at 5.75 dwt. The working revenue was £4,676,644, of which working costs absorbed £1,602,605, leaving a working profit of £3,074,039, or £40,649 more than in 1940. Taxation increased by £141,216, to £1,906,273, which is equivalent to 62 per cent. of the working profit, and after adding income from investments and sundry revenue, less sundry charges, the net profit was £1,187,970, or £104,290 less than in 1940. The addition of the unappropriated balance at the commencement of the year made available for distribution £1,520,565, from which two dividends, totalling 12s. 6d. per share, or 1s. 6d. less than in 1940, were declared.

Development work during the year, which was mainly confined to the No. 2

Shaft area, totalled 28,927 feet, and of 23,860 feet sampled, 61 per cent. were payable, with an average value of 10.4 dwt. over 29 in.

The ore reserves as recalculated at the year-end amounted to 16,000,000 tons, of an average assay value of 5.2 dwt. over an estimated stopping width of 59 inches. In comparison with the previous year the tonnage shows an increase of 800,000 tons, the value being unchanged and the width 2 inches greater.

In response to the Government's request to the industry to further conserve the use of materials, particularly steel, your company has from the beginning of this year curtailed its development work by about 90 per cent. This substantial reduction has been made possible by the strong ore reserves position which the mine has attained.

Our shareholding in the Grootvlei Proprietary Mines, Limited, which continued to expand its operations, remains unchanged.

The report and accounts were adopted.

MARIEVALE CONSOLIDATED MINES, LIMITED

INCREASED PROFITS

The seventh ordinary general meeting of shareholders of Marievale Consolidated Mines, Limited, was held on May 13, 1942, at Johannesburg.

Mr P. M. Anderson, the chairman of the company, presided, and in the course of his remarks said: The ore milled increased by 60,000 tons, to 591,500 tons, and the yield per ton milled was 5.30 dwt. The working revenue was £1,320,401, of which working costs absorbed £892,338, leaving a working profit of £428,063, or £72,810 more than in 1940. Taxation, which was less than the normal amount payable owing to the effect of a prior assessed loss, absorbed £125,890 and, after allowing for the other items detailed in the accounts, the net profit was £295,173, being an increase of £30,105 over the previous year. With the amount brought forward at the commencement of the year there was available for disposal £418,616, from which two dividends totalling 1s. per share were paid.

The dewatering of the No. 2 Incline Shaft area was completed during the year, enabling development below the 7th level to be resumed. The total footage driven in the mine amounted to 47,967 ft., and of 34,920 ft. sampled, 18,360 ft., or 53 per cent., were payable with an average value of 14.2 dwt. over 21 in. These results show an improvement over those of the previous year, and it is gratifying that disclosures in the lower levels of the mine continue to be encouraging.

The ore reserves as recalculated at the year-end amounted to 2,500,000 tons, of an average assay value of 5.9 dwt. over an estimated stopping width of 38 in., being increases of 500,000 tons and two-tenths of a pennyweight in value with the width one inch lower.

In response to the Government's request to the industry to further conserve the use of materials, particularly steel, your company has from the beginning of this year curtailed its development work by about 25 per cent.

The report and accounts were adopted.

VENEZUELAN OIL CONCESSIONS, LIMITED

INCREASED PROFIT

The twenty-sixth ordinary annual general meeting of this company was held, on the 10th instant, in London.

The following is the statement by the chairman, Sir Andrew Agnew, C.B.E., circulated with the report and accounts:—You will note that the profit for the year 1941 is £1,222,116, which is £118,450 more than last year.

Turning to the balance-sheet, you will see that capital expenditure, which, in 1940,

July 18, 1942

(Continued from page 92)

Spinners and Manufacturers' Association and the trades unions concerned.

Domestic Poultry.—The Ministry of Agriculture has issued a leaflet which is to be distributed free by local food offices, entitled "Rations for Domestic Poultry Keepers: The New Scheme and How It Works." It contains a full summary of the details of the scheme, and in three sections answers questions which poultry keepers are asking or are likely to ask.

Meat Products.—The Minister of Food has made an Order controlling the manufacture and sale of manufactured meat products other than those in airtight containers which are already subject to the provisions of the Canned Meat and Canned Soup (Control and Maximum Prices) Order, 1941. The new Order, which incorporates the existing provisions of the Sausages (Maximum Prices) Order, 1941, in regard to sausages and sausage meat, limits from July 27th the varieties of meat products which may be manufactured and sold, and prescribes a range of meat content for certain of these products.

Toilet Preparations.—The Limitation of Supplies (Toilet Preparations) (No. 3) Order is to be renewed on August 1st for a period of five months, subject to two amendments. The first makes face powder

and talcum powder free from control for the time being, since the materials from which they are made are not in short supply. Manufacturers will not, however, have protection either for their labour or premises. The second amendment makes the quota 20 per cent, and excludes face powder and talcum powder from the standard period supply figures. For firms participating in concentration schemes the quota will be 50 per cent. From August 17th manufacturers will be required to put their names and addresses on all controlled cosmetics and toilet preparations manufactured by them.

"THE ECONOMIST" SENSITIVE PRICE INDEX (1935=100)

A Grim Hour

THE Germans have broken the great curving line of the River Don. They are moving south into the coveted Caucasus and, although no crossing eastward has yet been forced, their armies are perilously near to Stalingrad and the Volga. More rich regions of coal and iron and wheat have been overrun. The main land links and supply lines of the Russian forces in the south have been cut or are closely threatened. To disguise the imminent danger would be blind and stupid.

It would be no less foolish to cry defeat. The Germans have been in Rostov-on-Don before, and they were beaten out. This time, the scene is very different from the awful spectacle of last summer, when the Germans tried with a single set of blows from the Baltic to the Black Sea to destroy all Russia's armies and to put an end to the Soviet regime. They failed before Moscow and Leningrad; they were held in the south; they were driven back in the winter, and could only cling to the key railheads and junctions and strong points, from which they might hope this summer to re-start their advance. No longer can their aim be to destroy the Soviet at a stroke. Russia has proved too strong to be slain, and Germany is now too weak to gamble on a coup de grâce this summer. The aim now is not to destroy but to cripple—to maim Russia,

so that the Red Army will no longer menace all that the Germans have won in Europe, and so that the German armies may be freed to face the vast onslaught which is in the making in the west.

It is still the strategy of one by one. Hitler turned on Russia last year in order to remove his main land enemy before the industrial power of Britain and the United States could be mustered and deployed against him. This is still his hope, to emasculate Russian might before the heaviest blow of all against the Nazi Empire can be struck. He has not been unsuccessful so far. The Russians were weakened, too, in last year's fighting. They suffered grievously in men and material and in the loss of land, industries, mines and foodstuffs. Their western network of railways was seized and held. To-day, when the German armies are moving forward to more and more distant places in the south, the Russians have not yet been able to mount a counter-stroke on the long line from Leningrad to Briansk. Plainly this is Hitler's greatest danger. All along the northern and central fronts, the Germans no longer have the strength to strike with the fury of last year; for months, Leningrad has scarcely been bombarded, and Moscow has not been bombed. The left flank of the advancing Germans is exposed and

lengthening; and the Russians have taken a heavy toll at Voronezh and in their fighting retreat from the Donetz to the Caucasus and towards the Volga. It may still be that the Russians will strike back in time. The armies of the south, who have avoided every trap, are still intact. It is already reported that resistance is stiffening, both on the Caucasian approaches and at the elbow of the Don. The counter blow may still come further north, at Voronezh or beyond, if the Germans over-reach their strength in the south. The Russians have many reserves.

But these are hopes and speculations. To-day, the Nazi star is in the ascendant. The new advances have weakened still more the striking and staying power of the Russians. In little more than a year (as the tables on page 145 show) the Russians have lost 6.4 per cent of their territory; 60 per cent of their iron; 50-55 per cent of their coal; 33.5 per cent of their wheat; and all the industrial equipment which it has not been possible to move back to the Volga and the Urals. The Russian war economy has been driven back to the Volga. The lateral railway from Rostov to Stalingrad has been cut. The Rostov pipe-line has been beheaded. The railway from Novorossisk to Stalingrad, which takes on Baku oil near Krasnodar, may be cut at any moment. If the oil of the Caucasus is kept intact, it must go by Astrakhan and the Volga to all the fronts, factories and farms in Russia's spaces. If the Germans can win and hold a line from Rostov to Astrakhan, they will lie across or menace every southern route for supplies to Russia. If they can snatch the northern oilfields of the Caucasus, they will win much more than a tenth of Russia's output, more oil than any source in German Europe now yields except Roumania. The great oilfields further south round Baku are still hundreds of miles away, and for Hitler to capture them would be a remarkable feat, after fighting on the grand scale through the mountains; but for him to rob the Russians of this oil, three-quarters of all the oil of Russia, by sealing up its outlets, would by itself be a great victory.

There the issue stands. The bid to chip away Soviet strength and sever Russia's arteries proceeds. Allied aid to the Russians in their struggle is menaced, not only by the thrust to the Caucasus and the Volga, but also by the bombing of Murmansk and the loss that is being inflicted upon Arctic convoys. There is no weakening in the fighting spirit of Russia; and the final battles have still to be fought. But Soviet resistance cannot subsist entirely upon the morale which is the wonder of the world. It is at bottom a battle of supplies. More and more, Russians are being forced to live upon their stocks of food and fuel—and, in some accounts, these stocks are immense. But whatever successes may still be won by the Red Army in its great defence, in the south, in the centre, or in the north, the stranglehold which the Germans are seeking to achieve must be beaten off and broken.

The challenge to Britain and the United States is to lend their aid before the worst can happen. Hitler's aim is to strike Russia down before the strength of America can redress the balance. America's aim must be to beat him in the race. This is well enough known by the statesmen who have the strategy of the democracies in charge. If it is impossible to intervene in force in the battle of Europe at this climactic, it is an index, not of unwillingness or unmanly caution, but of the unseeing years when the democracies stood weak and waiting while the enemy grew strong. For two years, Britain had to fight alone and unprepared; the United States has been at war for no more than eight months.

No elaborate argument is needed to see that if the Allies could attack with sufficient force in the west to draw off and defeat a large part of the Axis armies and air forces which are now ravaging Russia, it would be the master stroke. There is nobody who does not agree that, as soon as the right moment comes, the blow must be struck with all speed and every atom of strength; and for anyone to claim that the decisive thrust is being withheld because of ideological or other differences between the Soviets and their Allies is mischievous nonsense.

Right and Left alike, in both Britain and the United States, are equally eager to aid Russia to the fullest possible extent in the shortest possible time; no Englishman or American, of any creed, is prepared to risk the loss of the war, through the downfall of single-handed Russia, merely for the sake of an old political argument.

The question is not one of politics, but of possibilities. The bounds set to military enterprise by shipping are now seen. The need to win air mastery over the invaded coast is common talk. But the limits of British manpower, which for the best part of three years has been called upon to equip and man fronts all over the world, are ignored. Too often it is stated by advocates of an immediate Second Front that, say, four to five million British troops are standing idle. It needs no inside information to show how misleading such figures are. Perhaps so many men have been called up and trained. But the Air Force, the Navy and civil defence may well account for half the total; more than a million men have gone to the Middle East, to aid the Russians on the Caucasus line as well as to hold Egypt, to India and to key points and garrisons all over the world.

The troops at home include every variety of soldier, combatant, technical, supply, transport and ancillary; willy-nilly, too, the land and air forces were built up after Dunkirk primarily for defence; a large part of the home forces are engaged on anti-aircraft duties. Only part are the skilled and specialist shock troops needed to break into Europe. The possibility has to be admitted that there may not be a sufficient number of British troops in this country to draw off any appreciable proportion of the enemy's forces from the Russian front.

Calculations of this kind are necessarily very rough and ready; the margin of error is large. But it is certain that the picture of a great British army straining at the leash in the west. It is perfectly true that, if Russia is beaten down before Germany can be attacked in the west, victory will at the best be long-delayed and at the worst scarcely possible—with the old danger renewed of a German invasion of Britain. But it would not help if the troops in whose hands the defence of Britain still rests were first to be cast away. An unsuccessful attack on Europe would make the invasion of Britain still more probable; and the British base is vital as the springboard for air as well as land attacks on the enemy and for the deployment of American men and arms. Its loss or crippling would be the crowning disaster for all the United Nations, including Russia.

Western Europe must be invaded as soon as possible. But it does not seem likely, from the limited size of British manpower, and its immense industrial and strategic commitments, that the attack can start until a sufficient force of trained and equipped American troops is available to turn the scales decisively in numbers and in weight of metal. Ever since the fall of France it has been plain that American manpower, as well as American supplies, would be needed to tip the balance. America must be there. This may indeed be soon—very soon. No layman—and no German—can tell. But, until this Allied force is ready to strike, the course of action is clear. Material aid to the fighting Russians must be maintained at a peak. The air assault against German Europe must be made increasingly shrewd and increasingly severe. Finally, no effort must be spared to find, at an ever increasing rate, the shipping that is needed to nourish the great army of reconquest in Britain. It is not as a direct deterrent to the invasion of Europe that the shortage of shipping counts most. Shipping is the bottleneck through which the men, the weapons, the equipment and the supplies of the invasion force must pass; every needless shortcoming in the protection of ships at sea and every needless use of a single ton of shipping delays the hour when Russia can be succoured and Europe freed.

No mortal blow has been struck. Russia still stands and fights. The race is with the clock and the calendar. Will Russia's allies be able to go forward in time to grasp the destiny that Russian blood and valour still offer them?

Painless Prosperity?

THE shortest distance between two points is a straight line. One of Mr Cordell Hull's many qualities is that he knows this. Politically, he said last week, speaking of the world as it must be after the war, "some international agency must be created which can, by force if necessary, keep the peace among the nations"; economically, peace must be insured by free trade, by stable exchanges and by overseas investment. In more general terms, Mr Eden, who touched off the belated contribution of British speeches to the drafting of the post-war world, agrees: "each nation must live and work freely."

Too few people, public or private, recognise the obvious so readily as Mr Hull. Mr Eden himself speaks, in the current idiom, about "organising" full production, without making it clear that the really important task is not to impede it. Sir Stafford Cripps, too, talks about "regulating" the production and distribution of raw materials, without making it plain that the only reasonable aim is to maximise output, so that, under whatever conditions of regulation are devised, the price of raw materials will be no higher and the quantity for sale no less than would have been the case, over a period, in conditions of genuinely free enterprise. Organisation and regulation there must be, to banish the fluctuations, the wasted effort, the dislocation and the unfair and inefficient distribution which cursed the pre-war world. But both Mr Eden and Sir Stafford Cripps seemed to speak as if there were already enough of everything in the world for everybody—and it was just a matter of arrangement to make a brave new world for all. Mr Eden did mention "self-denial and sacrifice." But there was little talk of the toil and sweat and abstinence that will be needed in every country before it can earn, by its output and its productivity, its fair share of better things. Actually, the problem of production is nowhere near being solved. After the war, the governments of the world, in each country and in cooperation, will have to undertake responsibility for seeing that the conditions of economic progress and social security exist, and that investment, at home and abroad, does not fall below the level needed for full employment. But the post-war world will still depend for its prosperity on the skill of its workers, the enterprise of its traders, and the courage of its investors—not simply, as speaker after speaker seems to suggest, on this or that ingenious contrivance for better distribution; and the freer world trade and investment can be made, the fairer and fuller the distribution of the world's goods can be.

Sir William Jowitt, too, who is responsible for reconstruction in the British Government, is somewhat timorous of plain words. Rightly, he says that there is a

danger that nations in financial difficulties after the war will go back to trade restrictions, and that "generous help" must be forthcoming from other countries to avoid this error. The fact that generous help, after the first period of pure relief to distressed peoples, is a euphemism for overseas investment, involving abstinence first on the part of the investing countries and then on the part of their debtors, is too stark to be stated. Indeed, there are some people who will not admit this at all. Lend-Lease, for instance, is apparently regarded by some as the prototype of a perennial Christmas tree. One tiny group of business men is working out a theory of what is called "outright grant." Allegedly, this is an application of the principles of Lend-Lease to peace-time economic relations. It is based on the view that international debts cannot be paid without the dislocation of national economies. On the face of it, it seeks to make a principle of the fact that nations, like individuals, wish to have their cake and eat it. It presupposes a process of free gifts from countries like the United States to finance the development of other countries. Like so many of the schemes for post-war economy which are being devised, it is too ingenious to be ingenuous. When this country was the only creditor nation in the world, no schemes of this kind came from British sources. There was no magnification of the difficulty of paying debts. It was taken for granted that, if creditor countries were willing to open their markets, as Britain was, world debts could be discharged. There was no suggestion, as there is now, that capital receiving countries do not obtain an increase in their productivity and output, as a result of loans, to enable them, not only to pay their debts in goods, but also to pay for their other goods they need from other countries. As it stands, the doctrine of "outright grant" is a denial of the history of a hundred years. The whole process by which Britain was industrialised first and the American world was then transformed by British investment and British capital exports is made an impossible legend even though it happened.

There is much more danger in the present Heath Robinson approach to economics than there was in the much-maligned Robinson Crusoe approach of the so-called classical economist. Another plan, this time from America, is for "trade equalisation accounts," so that dollars will be made available to backward countries, to be matched by equivalent sums in their own currencies, which will lapse after two years if the United States is not ready to convert them into imports of goods or services. The intention of the scheme is admirable—to equalise international accounts at the highest level of trade and to lay upon the creditor the obligation of taking payments in

goods, instead of laying upon the debtor the obligation of restricting imports to secure a favourable balance of payments. But the method is baroque and rococo. If there is the freest possible exchange of goods, services and capital between the nations, it will work; if there is not, it will not. It would be more straightforward and more helpful to regard the object of policy as being simply the smoothest possible transfer of goods, services and capital without multiplying these complicated means to secure the end by a by-wind. American plans for progress which do not admit the need to reduce tariffs are as open to suspicion as British plans for prosperity without payment of debts.

The time has surely come for a plea for simplicity and directness in projects for post-war economy. It would perhaps be unfair to assume, say, that the theory of "outright grant" is born of the fact that post-war Britain may owe more than is owed to it; or to suggest that British industrialists are in favour of a vast economic defence system in depth after the war because they are afraid of American competition. Nevertheless, these are inevitable inferences from all these elaborate devices. In the twentieth century, as in the nineteenth, world economic progress and the standard of living of every nation depends in actual fact upon the fullest possible production, the fullest possible trade and the fullest possible investment. It is by investment that output and commerce are sustained; they are not enemies but allies. The vast industrial capacity of the United States today was founded by British investment; and it was from that capacity that British investors in American development were paid. The same will be true tomorrow of other countries as it was yesterday of the United States. There may indeed be a case for saying that war debts, which may not increase the peace-time productivity of the debtor country at all, create no proceeds from which they can be discharged. But there is none, in the light of history and of common-sense, for saying that normal international investment, upon which the post-war future of a large part of the world must depend, comes in the same category. The proper object of post-war economic policy, as Sir William Jowitt said last week, is to raise standards throughout the world; and only by the restoration of long-term international lending can this be done. It is the view of the baroque economists that this is impossible. Creditors, it is argued, cannot be expected to adjust their prices and costs and tariffs to receive payments; debtors, it is affirmed,

cannot be expected to adjust their economies to make possible the payment of their debts. If this is true, no ingenious devices can save the future; the result is anarchy or autarky—or both. It was not impossible in the past for free trade Britain to receive payments from its debtors. Nor is there any reason why debtor countries should not be ready to engage in precisely the same degree of abstinence to meet their foreign obligations as would be required to make possible the same amount of investment from domestic sources.

The truth is that too many people are searching for the soft option, for a world in which lenders will lend and borrowers will not repay, in which sellers can sell and need not buy in return. Mr Eden's call last week to "self-denial and sacrifice" was no mere phrase. If Englishmen are preparing for a world in which the United States is Santa Claus, then England is lost. What is needed, on both sides of the Atlantic, is more talk about enterprise and efficiency and expansion, and less about guarantees, much more emphasis upon adaptability to changing technical and market conditions and much less emphasis upon protection and safeguards. The standard of living of any country is measured by the productivity of its people; and the conditions laid down by Mr Cordell Hull—free trade, stable exchanges and overseas investment—are essential to raising standards everywhere. It is the necessary duty of every country, in whatever kind of post-war world may emerge, to pursue the policies which are most likely to bring about, at one and the same time, domestic and international equilibrium. The pernicious doctrine is abroad that, while political sovereignty must be abated to secure the rule of law, economic sovereignty can be raised to the nth power to protect national standards of living. This doctrine is not only full of peril for the world; it is also quite impossible of achievement. Mr Eden has said that "Americans can be sure that we shall be ready to meet and work with them all the time and all the way." If this means anything, it must mean collaboration between the nations, not to "regulate" trade and output, but to expand them, not to protect this or that national claim, but to multiply the world's stock of goods and services to the utmost. Prosperity, like peace, must be founded upon Mr Hull's "free trade and investment," and on a process of give and take, which will involve great changes in the set ways of every nation.

Wartime Incomes

THE income tax is the most efficient, flexible and forthright of the instruments yet devised for transferring the income of individuals to the state. It can be inserted at any point in the ascending layers of personal incomes, merely grazing the bottom layer, but cutting ever more deeply as it approaches the top layers; it is scrupulously fair in that it does not discriminate between persons with like incomes and similar family responsibilities; it has long been the most important single source of taxation in Great Britain. Although its contribution to total national expenditure has declined from 37 per cent in the last pre-war year to 18 per cent in 1941-42, it still produces more than two-fifths of the total revenue from taxation which rose from £896 millions to £1,962 millions during this period. This has inevitably involved a reduction in the exemption limit and a drastic increase in rates of income and surtax. The implications of these measures, and the changes in the size of individual income

categories since the outbreak of war, are revealed in Table I which was given by Captain Crookshank, Financial Secretary to the Treasury, in the House of Commons on Thursday last week.

The number of individual incomes reviewed for taxation showed an impressive increase between 1938-39 and 1941-42, from 9,800,000 to 15,000,000; this means that one in every three members of the population, including women and children, was in receipt of an income above the exemption limit in the past financial year. The increase in the number of persons actually liable to pay tax was even more marked, rising from 3,800,000 to 10,500,000; two out of every nine persons had to pay income tax last year. The reasons for this increase are twofold. First, the net of the tax has been widely cast by the reduction in the exemption limit; secondly, the number of incomes in the lower categories has shown a remarkable increase as a result of the growth of the national income. As interesting as the overall increase in the number of persons assessed for, and liable to pay, income tax, is the change in the size of the various income groups. The biggest increase has taken place in the lowest income categories. The number of individual incomes between £125 and £250 a year rose from 7,250,000 to 9,200,000; those between £250 and £500 rose from 1,750,000 to 3,500,000; the size of the £500-£1,000

group increased from 500,000 to 685,000, and that of the £1,000-£2,000 group from 195,000 to 210,000. But here the increase suddenly stops. Indeed, as the table shows, the number of incomes in excess of £2,000 a year in 1941-42 was precisely the same as in 1938-39. Even the numbers of the individual income groups above £2,000, taken to the nearest 100, is shown unchanged.

This analysis of the changes in numbers of taxpayers and in the size of individual income groups between 1938-39 and 1941-42 throws further light on the redistribution of the increased national income during this period. Almost all the increase has gone into the lower income layers; a little has percolated to the £1,000-£2,000 income group; but none of it appears to have reached the higher levels. These facts strikingly confirm the impression given by *The Economist's* analysis of industrial profits and by the Ministry of Labour's inquiries into the earnings of workers.

The redistribution of the national income, the reduction in the income tax exemption limit, and the increase in the rates of income tax and surtax, have profoundly affected the incidence of personal taxation. The combined effect of these three factors is summarised in Tables II and III, which are based on the figures issued by the Financial Secretary to the Treasury. The contribution made to the total amount of income tax payable by the four income groups in 1938-39, and in 1941-42, is shown in Table I. The total amount payable rose from £310 millions to £835 millions, and there was an increase in the actual contribution made by each of the four groups. But the change in the proportionate contribution made by those groups varied in inverse ratio from the lowest to the highest levels. The under £500 group contributed nearly a third of the total last year, or more than four times its share in 1938-39. The share of the £500-£1,000 groups was only slightly higher than three years before, and the proportion of the total contributed by the

higher income groups, on whom previously much the heaviest burden of direct taxation had fallen, showed a decline which is very marked in the over £2,000 category. The explanation is to be found, of course, in the redistribution of the gross national income in favour of the lower income groups, and in the fact that many individuals in these groups have been called upon, for the first time, to share the burden.

Equally interesting is the change in the proportion of the gross income in each of the four income categories which is sliced off by income tax and surtax. This is shown in Table III. The increase in the contribution of each group again varied in inverse ratio with the level of income. The proportion subtracted from the under £500 group by direct taxation has been increased eightfold; the percentages taken from the £500 to £1,000, and from the £1,000-£2,000 groups, have been more than doubled; but the increase has been less marked in the over £2,000 group, which was already heavily taxed before the war. The lower and middle income groups have been called upon to make a much heavier contribution.

Significantly, as is shown in Table I, the total amount of non-personal incomes assessed for income tax—mainly company reserves—actually declined between 1938-39 and 1941-42, from £340 millions to £300 millions; after allowing for taxation, the net amount was reduced drastically from £250 millions to £155 millions. The combined effect of EPT and the higher level of income tax has thus markedly diminished the capacity of industry to accumulate reserves.

The outstanding features of these statistics are their revelation of the extent of the redistribution of personal incomes in favour of the lower income groups, and of the use of the instrument of the income tax as a means of speeding this tendency, and of spreading the cost of the war as widely and as fairly as possible.

NOTES OF THE WEEK

Between Two Battles

After a four days' battle inside the burning walls of Rostov the city has been surrendered, and the battle of the Don has actually come to a close. Superiority in both tanks and aircraft has brought von Bock his latest success. Marshal Timoshenko's armies have all the time had to rely mainly on their artillery, which has done wonders in slowing down the German advance. The next stage—after the battle of the Don—is the battle of the Caucasus and the lower Volga. The interlude between these two great battles is filled by manoeuvring for bridgehead positions across the Don. It is difficult to say whether it was Marshal Timoshenko's hope to establish a solid defence line on the southern bank of the Don. In any case, the tactical value of rivers and similar natural obstacles has been greatly reduced by the technique of this war. The struggle for the river crossings has reduced the tempo of the German drive south and east; but it can hardly stem it altogether. German casualties have, no doubt, been very heavy in the duel between the German pontoon units and the Russian defenders on the southern bank. Throughout the week the Germans have been engaged in the typical search for the "weak spot." This they seem to have found at Bataisk, a few miles south of Rostov, on the Rostov-Krasnodar-Novorossisk railway. A push along that line might bring them dangerously near to the Maikop oil district. But a narrow break-through at the Rostov end of the Don is not enough. A crossing "along a broad front" is needed to secure the flank. The German High Command, in fact, claims to have effected this in the Tsimlyanskaya sector, and to have reached the region of the Don's two tributaries, the Sal and the Manych. Russian and neutral reports, however, do not corroborate the claim. In the easternmost part of the Don elbow at Kalach, situated opposite Stalingrad, near the Volga-Don canal, no crossing has yet been secured by the Germans; and, because of the difficult terrain, it would still take some time before Stalingrad itself could be attacked. The new feature of the week's fighting has been the bombardment of various points on the Volga. Not only Stalingrad in the south, but even Saratov, some 200 miles to the north, is said to have been subjected to air attacks. The fighting in the Voronezh area has been inconclusive. The hopeful feature of the position is that even the Germans make no extravagant claims, which were customary last year, about big numbers of Russian prisoners. This points to the fact that Marshal Timoshenko's forces are retreating in good order; and important reserves are probably being kept in readiness for action.

The Great Debate

It is a long step forward that, one after another, British Ministers have taken up the challenge set by the recent constructive utterances from across the Atlantic.

We must either build an orderly, law-abiding international society in which each nation can live and work freely . . . or we shall all be destroyed in a welter of barbaric strife.

Thus Mr Eden.

At the end of the war, the United Nations must undertake international regulation of the production and distribution of essential raw materials, both in the interests of the immediate rehabilitation of devastated countries, as well as with a view to attaining a steadily rising standard of living throughout the world.

Thus Sir Stafford Cripps.

We want collaboration between ourselves and the United States to go on after the war, but it must not be exclusive collaboration . . . We must raise the standard of living throughout the world, beginning with nutrition.

Thus Sir William Jowitt. The ground is now ready for the next and most important step, which is to translate precept into practice—and, in particular, to face the solid political problems which, on both sides of the Atlantic, make these aspirations still somewhat remote from reality. Mr Cordell Hull, the latest of the American spokesmen, is not afraid to grasp nettles:—

We are forced to fight because we ignored the simple but fundamental fact that the price of peace and the preservation of right and freedom among the nations is the acceptance of international responsibilities.

American isolation is thus denounced. But there are other simple and fundamental facts. There is the American tariff; there is, on this side of the Atlantic, the paraphernalia of tariffs, quotas and Imperial preferences. There are too many people, in both Britain and the United States, who believe that, after the war, it will be possible to go in two directions at once—to maintain all the marks of economic nationalism and to secure at the same time all the benefits of international co-operation. Until the practical means to achieve the vital ends stated by American and British statesmen have been considered, and until it is realised that successful international co-operation, in any sphere, is impossible without a radical readjustment of national policies, the so-called realists will be right when they say that such speeches are only words. Actually, these speeches are much more than words. They are, or can be, the voice of a great awakening—but only if it is realised, in every practical and political detail, that the goal can only be reached by the frankest exchange of problems and the freest possible exchange of goods, services, capital and people between all the nations of the world, without regard to the "national monopolies" which Sir Stafford Cripps denounced last week-end.

Equal Terms

The fact that increasingly large bodies of Allied troops will be stationed in this country in coming months has two economic aspects—one physical, the other financial. As was pointed out in *The Economist* last week (on page 102), American standards of accommodation and victualling, which are appreciably higher than British standards, must mean a considerable demand for extra shipping, materials and supplies. The financial effect is more controllable. American troops, apart from differences in living standards and diet, are paid more than British troops; basic pay for a private, not counting allowances, is something above £100 a year. Multiplied by the number of American troops who will be in this country in a comparatively short time, this will represent a large addition to total purchasing power here—as it would be, indeed, even if American and British pay were the same. But the total amount of unrationed goods and services available for purchasing by all soldiers and civilians in this country will grow smaller rather than larger. The net effect is likely to be a scramble for goods and services with American troops and British civilians the highest bidders and British troops the hindmost. In theory, at least, it would seem that some degree of equalisation in purchasing power is called for. It is true that there has, so far, been a signal failure in this country to work out and apply a rational wages policy; but it should not be beyond the wit of the British and American authorities to work out a three-point programme. First, the long-delayed policy to restrain wartime increases in civilian purchasing power might be devised. Secondly, the purchasing power of British troops might be brought nearer to the level of British civilians and members of the American forces, with perhaps some stop on the proportion that could be spent currently. Thirdly, the amount of American pay which can be spent in this country might be brought nearer to the British level, with the balance left available to spend in the United States.

Behind Closed Doors

There was no debate in the House of Lords this week on air strategy. At the last minute, the Government decided that the debate would need to be in secret session, and it has been postponed. This is not the first last-minute decision of this kind. It was only at the eleventh hour that the Government decided that the recent shipping debate in the House of Commons could not be held in public. Apart from the odd vacillation which causes the Government to say, first, that discussion can be open, and then that the same discussion can only be held *in camera*, it is probably time that the whole question of secret debates was reconsidered. There is one solid argument in favour of secret sessions, namely, the necessity for keeping information from the enemy. But even this argument is not perhaps so strong as it seems. It is very hard to see what

can be said to hundreds of M.P.s or scores of peers that could not equally well be said to the millions outside, or, conversely, to see how the Government can possibly reveal to Commons or Lords facts which must not leak out. Neither M.P.s nor peers are, every man jack, models of discretion. Actually, the real argument for secrecy on recent occasions has probably been rather different. The Government's contention is that it cannot defend itself against criticism without either being indiscreet itself or letting its cause go by default. This cannot simply be a matter of secret information, which ought not to be put into the hands of Parliament in any case. It is probably rather a question of inter-allied susceptibilities. The British Government cannot publish facts in which the American Government has a prime concern. The remedy is surely not secret sessions, but more public frankness between the Allies. As it is, Britain and the United States are well out of step in the information they put out about the war. If they were in closer unison in this matter, debates in Parliament might well be less fettered.

The Atlantic Link

The integration of British and American war production proceeds. The growing numbers of American troops in this country makes the completest possible pooling of industrial facilities, as well as of weapons and equipment, more urgent than ever. In June, a Combined Production and Resources Board was set up in Washington. This week, a parallel board has been set up in London, made up of Mr Lyttelton (with Sir Walter Layton as his deputy) and Mr Harriman, representing Mr Donald Nelson. Its task will be to consider the best joint use in the combined Anglo-American production programme of British productive resources; and the supply of British munitions to the American forces in this country will come within its scope. Two other Combined Boards, set up at the beginning of the war, have their being in London as well as in Washington—the Munitions Assignment Board and the Shipping Adjustment Board. Plainly the final power of decision in all matters affecting the disposal of British or American resources must still remain with the respective Governments; but the work done by these Combined Boards, with the Combined Chiefs of Staff Committee in Washington, in translating their decisions into terms of specific allocations of industrial facilities, shipping and finished munitions is indispensable to the making of common programmes and a common effort.

French Resistance

The Fighting French in London have received an impressive reinforcement in the former Socialist Deputy for Lyons, M. André Philip, who was professor of economics at Lyons University. M. Philip, with two years' experience of a France split between the Germans and Vichy, brings encouraging news of the growth, not only of active antagonism to the Germans, but also of the rising conviction that Nazi domination must be fought at any price. Gone are the days of *il faut en finir*. The Fighting French outside France can now move in step with popular resistance at home. On the subject of how to support, encourage and canalise this resistance, M. Philip's experience gives food for thought. There is a danger that French hostility to the invaders and to the collaborationists will spend itself in hopeless, wasteful gestures. Effective direction of the French underground movement requires that resistance shall be brought to a climax when, and only when, an Allied invasion of French soil can bring military aid. Careless discussion of Second Front strategy, by raising hopes and straining nerves, is a disservice to French resistance; a miscalculated and unsuccessful military adventure on the Continent might be disastrous. Nor should it be forgotten that the force which inspires French resistance is the determination that the French themselves shall, with Allied help, throw the invader back. When the day does come, it will be the belief that France is undoing its own defeat by its own efforts that will rouse French zeal to the highest pitch.

Coincidence?

"The question whether the Petroleum Board should make use of independent consultants or of facilities outside those belonging to the companies associated with the Petroleum Board is, in the view of the Secretary of Mines,

a matter which the Board must decide." On the face of it, the practice of industrial feudalism in wartime has seldom been so frankly admitted as in this quotation which is stated, in a memorandum prepared by a well-known technologist, to come from a letter from the Petroleum Department of the Board of Trade to an independent firm of petroleum consultants. A later chapter in the story is that this particular firm has been obliged to go into voluntary liquidation for lack of business. It was established in the twenties to do research and advisory work for the smaller and independent oil companies, and until war broke out performed the same functions on behalf of these companies as are performed for the large petroleum combines—Shell, Standard Oil and Anglo-Iranian—by their own laboratories. The firm was responsible, not only for the larger part of the technical work done on behalf of the independent concerns, but also for the construction of most of the independent non-combine refineries in the consuming centres of Europe. When the war broke out, the Petroleum Board, which is, in make-up, an association of the major combines and includes only one member to "speak" for the independent companies, was set up under the direction of the Petroleum Department to bring the resources of all importers and distributors of petroleum products under centralised control. It was assumed, rather rashly, perhaps, by the firm of consultants, which has now gone to the wall, that it would be permitted to carry on some part at least of its technical work for the smaller independent companies. From the start, however, the Petroleum Board could not see its way to using the firm's services, and the firm's former clients, most of them taken over by the pool on the outbreak of war, were not permitted to use them. The position now is this. Before the war, there were four large petroleum laboratories in this country, equipped and staffed for chemical and engineering research, three belonging to the large oil groups and one working for the independent companies both in this country and in Europe. Now there are only three such laboratories; the independent laboratory has gone. Undoubtedly, there is another side to the story. It may very well be that wartime exigencies have required a concentration of technological activities. Nevertheless, it is a strange coincidence, and one which must arouse some misgivings, that the laboratory which has been put out of business is the one which enabled independent oil concerns to do business on the same technical footing as their larger competitors. Whatever the rightness or wrongness of the decisions which have led to this result—and no layman can judge fairly on the technical issues involved—it certainly seems that the decisions have been taken in conditions which have afforded no guarantee of impartial treatment. Without a full statement from the Government, it would not be reasonable to impute error, and still less malice, to the Petroleum Board. But it is apparently a fact (as the stated view of the Petroleum Department, quoted above, shows) that the major companies associated with the Petroleum Board have been made, with Government support, judges in their own cause—and in this instance, it so

More than a century's accumulated business experience and conservative progress form the background of the comprehensive service which the Westminster Bank is able to place at its customers' disposal.

The Bank's vast resources, its constant touch with current affairs and its extensive system of branch offices in England and Wales and agents elsewhere, combine to enable it to offer a wide range of facilities, details of which will gladly be given on request by the manager of any branch.

LIMITED

Head Office: 41 Lothbury, London, E.C.2

happens to their own ultimate benefit. At the least, there should be some public explanation from the Petroleum Department as well as from the Petroleum Board.

York or Plaza Toro?

The Retail Trade Committee's plan for the concentration of the non-food section of the retail trade, discussed in *The Economist* on July 4th, was debated in the House of Commons last week. Mr Dalton opened the debate with a review of the problems facing the trade, and of the difficulties in the way of any attempt to reconcile the demand of the war effort for labour with the need for maintaining sufficient retail outlets, and for avoiding hardship. Hostility to the plan is expressed by the co-operative movement (though not by the representatives of the National Union of Distributive and Allied Workers), and by the National Chamber of Trade, in whose view the real problem was not how to facilitate withdrawal, but how to keep the small trader in business—a fantastic misconception of the wartime issue. Neither the Retail Distributors' Association nor the Multiple Shops' Federation considers that the scheme offers a satisfactory solution. Their view is that the benefits would go to landlords and mortgagees, and not to traders—a view which has some slight validity. The Association of British Chambers of Commerce, though divided, is, on the whole, opposed to the plan; the National Pharmaceutical Union, the Company Chemists' Association, and the associations of newsagents, tobacconists and confectioners are all bitterly opposed, arguing that they should not be regarded as part of the retail trade, and should be allowed to contract out. The Drapers' Chamber of Commerce is one of the few organisations which has given its qualified support to the plan. In the face of such a body of hostile opinion, Mr Dalton has decided to think again, which probably means that the plan has been killed. Once again, the Government is apparently making ready to retreat. As with coal, so with retail trade—and Dr. Dalton has played a leading role in both withdrawals. Whether the Duke of Plaza Toro, who found it less exciting to lead his army "from behind," is a better parallel for the President of the Board of Trade than the good old Duke of York, who marched his men "down again," is an open question. The matter cannot be allowed to rest. It would be pusillanimous to a degree if the Government were to defer to the army of trade associations, regardless of the need of the war effort for men, and for the rationalisation of distribution—and regardless of the unknown shopkeepers, who will simply continue to be pushed out of business by war conditions without even the small aid promised by the plan. The plan has many faults. A much better one could be produced, which would concentrate and compensate on fair and efficient lines. Perhaps Dr. Dalton has this in mind. Probably, and shockingly, he has not.

Nearly Two-Thirds

Britain has now entered the period which Mr Lyttelton has described as the most dangerous since the Battle of Britain, and it is now fully realised that the peril lies in the heavy losses among ships carrying food and supplies to this country. Yet the debate on the estimates of the Ministries of Agriculture and Food seemed completely lacking in any sense of urgency. This attitude is presumably due to the apparent absence of any food shortage. It is a long time since any rations were reduced, except for minor variations in the points scheme. On the contrary, the cheese ration has been doubled; milk is plentiful; syrup and treacle have been taken off the preserves ration and put on the points scheme; there are strong rumours that the preserves ration itself will shortly be doubled; an extra pound of sugar is being given this month for jam-making; there is a glut of cherries; new potatoes are plentiful and cheap; fish is more easily obtainable than for some time; dried eggs have been put on the market. It is hardly surprising, therefore, if the public, and consequently Members of Parliament, are apt to think that there is no danger to its supplies of food. There have been danger signals; domestic poultry keepers have had to surrender shell egg registrations in order to obtain rations of meal for their hens; the public is being exhorted to eat home-grown potatoes instead of bread. The present abundance, in fact, reflects the time of year and favourable weather rather than that food supplies are assured. Credit is certainly due to the Ministry of Food, not only for the success of its rationing schemes,

but also for its wider handling of the food situation. But neither this nor the considerable achievements of British agriculture will be enough unless the U-boat menace is countered. Mr Hudson spoke of an increase in the wheat acreage in England and Wales of 600,000 next year, a 10 per cent increase in the potato acreage, and a further expansion in vegetables, and he stated that milk production in the first six months of this year was 10 million gallons more than on the pre-war average, and 13 million gallons more than in 1941. He also said that nearly two-thirds of the country's food supplies is now produced at home. Nevertheless, these favourable statistics should not blind the public to the fact that it is the remaining third which is the most important, for upon its maintenance or loss the country will live or die.

An Opposition Vote

Even the Government is not content with its own proposals to assist necessitous pensioners. To the Labour request on Wednesday (when the new Draft Supplementary Regulations for old-age pensioners were debated) for a specific assurance that further measures would be introduced next session, Mr Bevin replied in general terms that "reasonable provision" would be made; the matter would come up again, he said, when the Beveridge report on the social services was available. The leader of the Labour Party, Mr Greenwood, was satisfied by this assurance. But a majority of the Labour members present were by no means satisfied. Sixty-three votes were cast against the Government, the biggest opposition vote in the life of Mr Churchill's administration. Actually, the votes should rather be described as having been cast against the Labour members of the Government. It is widely held by Labour men that Mr Attlee, Mr Bevin, Mr Morrison and Dr Dalton do not stand up firmly enough, in the Cabinet, for the social causes they should especially speak for; and, in the case of old-age pensions, the conviction that pensioners should be given a higher income, as of right and not by way of alms after tests, is shared by people of all political opinions.

The Efficiency of Labour

In some quarters it was thought that in presenting the Ministry of Labour estimates last week, Mr. Bevin should have given a review of manpower policy rather than the more restricted topic of the work of the Factory Department, which was transferred to his Ministry from the Home Office in June, 1940. But it is easy to see why Mr Bevin chose this subject. Manpower policy is not now a matter at issue. There is little that can now be done to find new sources of labour; it only remains to hasten the comb-out of non-essential trades, and to make the most efficient use of labour in all occupations—civil and military, skilled and unskilled, professional and business alike. It is with this latter object in view that the work of the Factory Department becomes important, because some of the chief factors that detract from the efficiency of labour are sickness, accidents and bad working conditions generally. Mr Bevin rightly claimed credit on behalf of the Department for the big advance that has been made since the war in all that is loosely summed up in the word welfare. The new Factory and Welfare Board acts as an advisory body in this connection, and itself obtains advice from the Industrial Research Board, the TUC, employers and others experienced in this sort of work. But Mr Bevin dealt too superficially with the question of accident prevention. From the point of view of first-aid and medical supervision, progress has certainly been made, though even now the number of wholtime works doctors is only 150, and part-time 550. It is, however, the prevention of accidents which should be more effectively tackled, because, as Mr. Bevin himself said, they are "one of the greatest hindrances and delays to good production." Hitherto, the Ministry of Labour has relied mainly upon propaganda; even its own inspectors have found themselves to a certain extent helpless, because "you cannot by the best devices in the world draft regulations to cover everything." The fundamental treatment of accident prevention would, it is true, involve embodying it in workmen's compensation, and placing it on an insurance basis, and it will without a doubt be argued by the Ministry of Labour, with monstrous iteration, that the Beveridge Report must be awaited first, and that in any case a comprehensive scheme of reform cannot be attempted in wartime—when the need for it is most urgent.

Overseas Conscription

From time to time since the beginning of the war, the Government has been asked whether it could call up for military service British subjects living overseas, especially those in the United States, and the answer has always been that there were no powers for doing so. By the National Service (Foreign Countries) Bill, which passed through all its stages in the House of Commons this week, those powers will be granted. On the face of it, this seems an entirely logical step—British subjects should have the same obligations wherever they reside—but it raises interesting questions. There is, first of all, as Mr Aneurin Bevan pointed out in the second reading of the Bill, the distasteful possibility that it abolishes the idea of sanctuary. If the British Government can stretch out its arm to its citizens abroad, then other foreign governments may claim the same power over their citizens in this country after the war is over. There is, further, the difficult question, also brought up in the debate, whether the application of conscription by a belligerent in a neutral country will constitute a breach of neutrality. The Attorney-General thought that it would not, but it might, for instance, easily raise an important issue with the Argentine Government if it were decided to apply the Act to Argentina. To begin with, it will only apply to Egypt, which is only technically neutral, and where a large British army already exists; and it will be applied to other foreign countries—but not the Empire—by future Orders-in-Council if necessary. It is not, however, proposed to interfere with the present arrangements with the United States, under which British subjects of military age join the United States army if they do not enter a military or other service approved by the British Government. The procedure in Egypt is also interesting. Since the aim of the Bill is to apply all the National Service Acts *in toto*, those affected will have rights as well as obligations—in particular, the rights of deferment and of conscientious objection. The machinery for calling up will be under the control of the British Ambassador—not, it is interesting to note, the Minister of State. To advise him there will be a central board, consisting of a lawyer, a military representative, and two civilians, one of whom will be a woman. There will also be three local boards which will consider problems of deferment and so on, but there will be a right of appeal to the central board. Independent tribunals will also be established for conscientious objectors. The most difficult question, of course, will be how to enforce the measure, since no British courts for the purpose exist. It is, therefore, proposed that persons who fail to respond to the enlistment notice will be arrested as deserters, which will involve the co-operation of the local police.

Scandinavia

Discussion of the future of Scandinavian foreign policy has lately taken a somewhat polemical turn. The chief difficulty which confronts all supporters of regional federation is already becoming evident—the territorial definition of suitable groups. Probably the difference of emphasis shown in the recent press controversy between Norwegian and Swedish spokesmen will prove to be more apparent than real. The enthusiasm in certain Swedish circles for a close form of Scandinavian co-operation after the war has evoked a statement of the Norwegian attitude in *Norsk Tidend*, the only Norwegian paper published in London. This statement, which suffers from condensation in the form in which it was published in the British press, drew attention to the dangers of Scandinavian federation and to the interest which Norway, as an Atlantic power, now has in closer ties with Britain and America. Many Norwegians feel the necessity of military guarantees for the security of Norway's long Atlantic coast-line and do not believe that any Scandinavian bloc, however well organised, would be able to resist successfully the assault of a great Power. It is too early to forecast the attitude of Sweden after the war. But there is no reason to suppose that Sweden will wish to be "neutral" in the peace. The fact that the success of Swedish neutrality is largely accidental and that, in any future war, neutrality could not possibly be relied on to succeed, cannot have escaped notice in Sweden. Almost certainly Scandinavia by itself cannot ensure its own territorial integrity—the military problem which Denmark provides is nearly insoluble—and support from the great Powers is probably essential. The greatest living Canadian editor once wrote that "the British Empire cannot exist, except within the framework of a world-wide system of collective

security." This is even more true of Scandinavia. There is no contradiction between Norwegian participation in a trans-marine Atlantic bloc and Norwegian co-operation with a Scandinavian unit pledged to play a positive part in maintaining world peace. Norway borders on two regions, the Atlantic fringe and the Scandinavian region, and must serve as an essential link.

A Case of Breach

Mr Kendall, the "Production for Victory" Independent M.P. for Grantham, who was described in the press at the time of the by-election as "the man to focus attention on inadequate war production" and who boasted in his election speeches of his own "high sense of responsibility," has run into troubled Parliamentary waters. The statement which he issued this week, implying that the Public Accounts Committee Report on the British Manufacturing and Research Company, of which he is managing director, was "an inspired criticism," was, not unnaturally, regarded as a breach of privilege, and he was obliged to apologise to the House on Tuesday. The statement itself did not provide a satisfactory answer to the Committee's criticisms, and (as described by the Committee) the record of the firm, though admitted to be a highly efficient concern, in first haggling over the price, and then exacting too high payment from the Ministry of Aircraft Production and in refusing access to its books, is not, perhaps, calculated to inspire complete confidence. The answer of the chairman, Lord Ashfield, in defence is that all this took place before he became associated with the company in June, 1940. The Ministry of Aircraft Production does not come too well out of the matter. Not until March 24, 1942, did it issue directions under the Industry (Records and Information) Order to obtain and inspect the books of the company, though, in the opinion of the Public Accounts Committee, the need for such action should have become apparent by the end of 1940. The Committee's report and in particular the attitude of MAP are likely to be the subject of a Parliamentary debate before the summer recess.

Business Men

The vexed question of civil servants as business men and business men as civil servants is discussed in the Select Committee's twelfth report, which deals with the appointment of Mr Beaver and Mr Bennett to the Ministry of Works and Planning. The Committee in general sees no objection to the appointment of business men to control the businesses they represent, and would deprecate the introduction of any ruling that they should entirely sever their business connections while holding official positions:

A policy so stringent would deprive the Government in wartime of the services of men in a position to render invaluable help to the state.

This is surely a reflection on the patriotism of business men. If other people can be conscripted into the forces or industry, is it too much to expect that business men should not temporarily forgo their emoluments from their enterprises to serve the state as its paid employees in the capacity for which they are most qualified, with the knowledge that after the war they would be able to return to their previous positions? In the particular cases under consideration, both

RESERVE FUND . . . £3,150,000

ESTABLISHED 1810

the individuals and the firms are clearly exonerated from the charges made against them. Mr Beaver and Mr Bennett both emerge with their personal reputations unscathed. The work undertaken by their respective firms consists of supervising the construction of certain ordnance factories and hostels, and of designing hostels. The cost of supervision by Sir Alexander Gibb and Partners worked out at £1,100,000, plus a further sum of £931,000, which is considered "a lower figure than is ordinarily paid to consultant firms engaged on works of considerable magnitude." The Comptroller-General in his 1940 report on the Civil Appropriation Accounts, on the other hand, thought that the figure of £1,100,000 (equal to 3.6 per cent on the cost of the work supervised), which was paid to "a firm of consulting engineers" employed by the Ministry, was on the high side. Whatever may be the rights and wrongs of this particular case, the fact that the necessity for public inquiry should have emerged at all seems to indicate the undesirability of appointing business men to control their own businesses.

Government Advertising

In a written parliamentary answer, the Chancellor of the Exchequer has given the following estimates, which are only approximate, of Press advertising expenditure by Government departments from the outbreak of war to the end of June, 1942:

Admiralty	63,000	National Debt Services	25,000
Air Ministry	414,100	Post Office	19,000
War Office	133,400	Supply	55,900
Agriculture	186,000	Trade	62,000
Food	855,000	War Transport	151,000
Fuel and Power	84,000	Works and Planning	42,000
Health	35,000	Agriculture (Scotland)	6,000
Home Office and		Health (Scotland)	2,000
Home Security	89,000	National Savings C'ttee	1,251,100
Information	93,000	Scottish Savings C'ttee	70,500
Labour	168,000		
		Total	3,805,000

It will be noticed from this table that the National Savings Committee comes first, followed by the Ministry of Food and then, unexpectedly, the Air Ministry, after which there is a big drop in expenditure. The large amount spent by the Air Ministry is surprising at first sight. Possibly, it is due to the fact that the recruitment of air crews is voluntary; advertising, therefore, may be considered necessary in order to maintain a constant flow of recruits. If this explanation is correct it may be argued that the exploits of the RAF are an adequate and better form of advertising. In any case, the table provokes the suggestion that, whatever the merits of the voluntary principle, it incurs a great deal of expenditure in advertising. It may be doubted, for instance, whether the National Savings Committee would spend nearly so much if saving were made compulsory, or the Ministry of War Transport if unnecessary travel were prohibited instead of the subject of appeal, or the Ministry of Fuel and Power if fuel rationing were imposed. It is quite true that the Ministry of Food is the second biggest advertiser, and it might consequently be argued that rationing itself breeds expensive advertising. But a considerable part of this advertising is by way of public service—in the form of recipes and so on. On the whole, it is almost certainly a greater economy to impose a uniform system of thrift and then to advertise changes rather than to spend the same or more money on obtaining small savings.

Raw Materials

Last week-end the post-war production and distribution of minerals was discussed at a gathering of experts and scientists, arranged by the Division of the Social and International Relations of Science of the British Association, with special reference to clause four of the Atlantic Charter; this clause proposes "access for all states, on equal terms, to the raw materials of the world necessary for their economic prosperity." The scientists naturally concentrated on the technical aspect of the problem rather than on its political complications. The conference recommended the formation of an international resources organisation as a fact-finding and advisory body for governments and, as a first step, it suggested that a scientific survey of the world's mineral resources should be undertaken. One speaker, discussing the financial aspect of mineral production, again drew attention to a present political trend which points to the fact that colonial peoples may eventually be compelled by their awak-

ening national consciousness to assume control of their own resources. The conference disclosed many interesting technological facts about mineral supplies and their consumption. Professor Fawcett, for example, drew attention to the tendency whereby consumers are relying increasingly on supplies of materials recovered from scrap. In his view, the world's supply of metal would be regarded as a revolving stock, to be used over and over again, and to be replenished only by new metal to the extent that replacements are needed and to provide for new uses. Owing to the wartime scarcity of raw materials, technological progress in the utilisation of metals has been speeded up quite appreciably during the war. A statement of considerable topical interest was made by Sir Thomas Holland, who gave it as his considered view that Germany's decision to drive eastwards was influenced much more by her shortage of manganese, an essential material needed in the production of steel, than by a scarcity of oil which could be made to an increasing extent from the abundant brown coal supplies in Germany.

South-West Pacific

After a period of comparative lull, the war in the south-west Pacific is beginning to flare up. Last week-end the Japanese landed a force, originally estimated at between 1,500 and 2,500, but now believed to be considerably stronger, at Gona, on the north-east coast of Papua, and have advanced some 55 miles along a reasonably good road towards Port Moresby. From their present position at Kokoda to Moresby, the terrain becomes increasingly difficult, and there is only a narrow pass through high mountains to the sea. The Japanese have also extended the range of their bombing activity, and have raided Townsville, on the north-east coast of Australia, which is appreciably nearer the main centres of population than the outposts, Darwin and Broome. Last May, when the Japanese attempted to advance on Port Moresby, they were turned back by the US navy, and suffered heavy losses in the Coral Sea battle. The attack was not renewed; and, since then, enemy activity has been limited to bombing, and has provided a further example of the impossibility of achieving major successes by the air arm alone. The Allied air forces are replying vigorously by bombing Japanese positions, and the enemy land forces have received their first check at Kokoda. It would be premature to forecast whether this land offensive is the prelude to an attempted invasion of Australia, whether it has been undertaken more with the object of reconnaissance and consolidation of position, or whether it is intended as a diversion to distract attention from the main objective, say, an attack on Siberia. Japanese forces are deployed on so many fronts—China, Burma, the Aleutian islands, and along the Soviet border—that it seems scarcely credible, especially in view of the limits of Japanese merchant shipping and the growing strength of the American navy, that any major offensive in the Pacific theatre of war is imminent.

Testament of Treachery

Lord Haw-Haw, William Joyce, has written his own *Mein Kampf*. He calls it, wishfully, "Twilight Over England," and it is being published by the *Frankfurter Zeitung* in parts. Oddly, he boasts of being truly British, and he traces his paternal ancestry, which was Irish, back to the twelfth century, a feat which Hitler himself only performed after he came to power. Joyce was born in New York in 1906. He was educated at a Jesuit college in Ireland and at London University. At the age of 17 he became a British Fascist. Then, after some teaching experience, he set out to convert the Conservative party to "genuine nationalism"—an attempt which he now calls "foolish and rash." In 1933, the year in which Hitler came to power in Germany, Joyce joined Mosley's British Union of Fascists. Modestly, he claims to have become the Union's leading propagandist. He even converted the Union to anti-semitism—or so he says. By now Joyce was modelling all he did on Hitler, and he was still restless. In 1937, with John Beckett, a similar condottiere of the street corners, he formed his own party, the National Socialist League. Now, breaking up other people's meetings, and taking part in demonstrations, Joyce, the "warrior," was in his element. His face, he says, bears the scars of his battles; but, on the outbreak of war, he took himself off to the promised land because his conscience did not allow him to fight for his country. There in the Third Reich, perhaps not so promising now, he must stay. The chief comfort taken by English readers from this sordid story is that men like this do not become Führers in England.

AMERICAN SURVEY

The Arsenal in Action

THE figures of American war production released last week by the War Production Board throw the first real light on the degree to which the programme laid down by President Roosevelt in January is being achieved. The President fixed a figure of 60,000 aircraft for 1942, that is, a monthly rate of 5,000 planes; in May, less than five months later, nearly 4,000 aeroplanes were produced. The tank figure was to be 45,000 for 1942, about 3,750 a month; in May 1,500 tanks were turned out. Artillery and anti-tank guns are now being produced at the rate of 2,000 a month, machine guns at over 50,000 a month, and sub-machine guns at a rate of 55,000 a month. The President's figure for anti-aircraft guns for 1942 was 20,000; in this case there are no progress figures, and Mr Nelson frankly admitted a serious lag in production, although he declared the situation was improving. The shipbuilding figures are presented in such a way as to make a comparison with the goal difficult; the President in January mentioned a figure of 8 million dead weight tons, which was later raised to 9 million; but the WPB only reports that 228 ships were delivered in the first six months of 1942 against 103 in the whole of 1941. Whether there is a special caution in publishing shipbuilding tonnage, or whether the facts, unlike those on other aspects of the production effort, would give aid and comfort to the enemy, is not certain. But it has been reported for several months that the overall shipbuilding picture was unsatisfactory. Total war production in June, however, was nearly three times that of last November, and for the first half of 1942 was 50 per cent greater than that of the whole previous year.

These figures give body to Mr Lyttelton's statement that American war production surpassed the British several months before it was expected to, although the absence of similar British statistics makes impossible any detailed comparison of the production efforts in the two countries. They are probably calculated—and with reason—to offset some of the pessimism arising from Allied defeats on the battlefield. The past six months have seen a magnificent industrial achievement in the United States, which in many respects, particularly in aircraft production, has surpassed expectations. With new bomber plants coming into operation, there should be no difficulty in meeting and overtaking the goal of 60,000 aircraft which seemed so breathtaking at the beginning of the year. The "extraordinary ingenuity and restlessness of mind" of American engineers to which Mr Lyttelton paid tribute is already reflected in the monthly totals of production, and there cannot be too much praise for the efficiency and devotion of management of labour and of the administration in seeking out new methods of increasing the output of arms.

Bottlenecks Ahead

All aspects of the production programme are not equally favourable. Nor, indeed, was it ever likely that they would be. Mr Nelson's warning, which accompanied the report, shows that he has fully learned the dangers of over-emphasising good news:

The biggest part of the job is ahead. I want to emphasise again and again that the picture is in no sense one that provides a basis for undue optimism. . . . Production is going well in some categories, although others are lacking somewhat. Serious raw material shortages are looming up. Many bottlenecks are being broken, but some new ones are forming. The Government is working hard on these problems. The country must not get the impression that the battle of production is won and that we can stand at ease. . . .

Shortages of raw materials have been receiving steadily increasing publicity and attention. On June 3rd, Mr Batt relinquishing his job of Director of Materials, stated:

As the vast production machine which has been created over the last two years swings into action, the difficulty of providing materials to feed it will become more and more apparent. . . . I can see times ahead when a shipway may stand idle for lack of steel and an ammunition line may slow down for lack of copper and brass. . . . The past months

have been relatively easy. The military has taken from the civilian to meet its needs. This pool is nearly dry. From here on it will be a continuous problem to provide materials to meet the needs of our fighting forces. Industry must get ready to "patch and pray" to keep existing equipment at work.

These material shortages are caused, in the main, not by absolute scarcity, but by the increasing pace of a variety of war demands. It is true that many sources of raw materials have been lost in the Far East and that ship sinkings contribute to the inadequacy and irregularity of certain supplies. But the relative self-sufficiency of the United States makes this a far less weighty factor than in Britain. The main reason for the present difficulties is the lack, during the past year, of that synchronisation and timing of production, so difficult to achieve, but so absolutely necessary if there is to be a smooth and continuous flow of production and balance in the output of arms. It was not, for example, expected last year that fabricating plants would be eating up raw materials at anything like the rate which has already been attained, and plans for the expansion of raw material production are consequently short of what would be desirable to-day.

Steel production, for instance, at 99 per cent of capacity, is still insufficient to provide for all war needs. The cancellation of shipbuilding contracts at the Andrew Higgins yards last week was based on the need to use steel for the immediate construction of ships rather than for facilities which would only go into production next year. "Must assignments" in the second quarter of the year were reported in "Business Week" to be 98½ per cent of maximum output, divided 66½ per cent to the Army, Navy, Maritime Commission, and Lend-Lease, 14 per cent for farm machinery, railway equipment, exports, and mining machinery, and 18 per cent for expansion of essential war industries, such as aluminium, rubber, steel, high octane petrol. For the 1½ per cent of the remainder, demand—with a priority rating of A-10 or higher—was more than ten times supply. The construction of additional steel capacity has had to be somewhat curtailed because of the lack of materials. Steel operations themselves dropped in June owing to the shortage of scrap and the necessity of shutting down furnaces for repairs.

The Production Requirements Plan was first introduced for 13 critical metals where the position was most serious. The greatest difficulty is in the alloys used for hardening steel. Despite strict controls over nickel, chromium, vanadium, tungsten, and manganese, the immense demand and inadequate imports make this a continuous and menacing bottleneck. Copper is another example of serious shortage.

Rubber, of course, is a case apart. Unless there is a miracle of production in synthetic rubber even with the strictest economy in military use, and with no rubber for civilians, there is expected to be a deficit in 1943 and 1944. The supply of lumber is becoming tighter as the demand for steel substitutes rises. Production is below last summer's peak, owing to labour and equipment difficulties; a "Czar" has been appointed for the West Coast industry, and the allocation of important types of timber is probably not far off. The same is true of hides and wool.

There has been an improvement in the machine tool position; this was probably one of the bottlenecks that Mr Nelson had in mind as being broken. Production in May reached \$107 millions in value, nearly half the total production for 1929 and the backlog of orders is being reduced.

The need of housing for war workers, with its heavy demands on steel, lumber, and other materials, as well as labour, is growing more urgent daily. Transport, of fuel and petrol, of finished arms and of crops, promises to be one of the major difficulties of 1943. The shortage of trained manpower, already marked in centres of war industry, will become increasingly acute.

This catalogue of problems should not be taken to mean that any one of them is beyond solution or indeed that substantial progress is not already being made toward re-

solving them. They are the same set of problems—different only in detail—that has confronted the war economies of both Allied and Axis powers. In some ways, the difficulties are greater in the United States. In part, this is due to the geographical distribution of American industry; in part, to the greater speed with which it has been necessary to wrench industry out of its peacetime setting. Again, there are grounds for suggesting that American industry, with a tradition of independence and less experience in co-operating with Government and labour, finds the changeover to a strictly regulated economy more harassing than industry abroad.

The Agenda

There are these special difficulties in the United States, but there are also unique advantages. Mr Batt was probably guilty of exaggeration when he suggested that the limit had been reached in what the military could take from the civilian. The United States is now reaching the point where military demands are beginning to hurt and where they will not be satisfied without some protest. But that is not to say that there is not still an enormous pool of civilian resources which can be harnessed to the war effort without endangering a standard of life reasonable for wartime.

All available information suggests that the necessary controls are now shaping up. The Production Requirements Plan, together with the "allocation classification" system, which are now being extended to other materials beside metals, are expected to rationalise the materials situation and make it impossible for some manufacturers to obtain more scarce materials than they need. They are also being counted on to put an end to priority violations, particularly in aluminium. A Maintenance Requirements Plan, applying similar principles to the supply of materials for maintenance, is being studied. A plan for inventory control has been announced; it aroused such a storm of protest from business that it is being reconsidered, but some form of inventory control, designed to keep inventories at a minimum, and prevent hoarding of materials and stocks, will soon be in effect. Salvage of all kinds is receiving increasing attention and the comparative failure of voluntary drives is paving the way for compulsory powers. The restriction of civilian consumption of scarce materials, insofar as it lies within the province of the WPB, is being pressed. The use of iron or steel in another 150 articles for civilian use has just been forbidden, and not only is their manufacture prohibited, but also their delivery or acceptance.

New Phase

The first stage of American war production is over. A period of comparative plenty for the purposes of war production is giving way to an economy of scarcity. Increasingly decisions must be taken, not to produce guns and butter, or even to produce guns or butter, but rather to distribute resources between urgent categories of military production. Mr Batt said that industry must get ready to "patch and pray." But more than this will be expected both of industry and the Government, and of the civilian population as well. The aim must be, under conditions of increasing difficulty, to achieve a balanced relationship between output of different kinds of armaments; to tie production securely to strategic decisions; and to guarantee an orderly flow of the right materials and labour to the factories where they are most needed. The difficulty involved will be appreciated in Britain which, for three years, has been grappling with much the same range of problems. It is a time for prayer, perhaps, but also a supreme test of planning and of the organisation and techniques which have been built up in this first six months of American belligerency. But the responsibility is not that of the War Production Board or the Services of Supply alone. It extends to an even greater degree to the Administration, to Congress and to the American people themselves, who must make the decisions on manpower, rationing, taxation and many other political issues which affect war production at every point.

American Notes

Full Circle

The speech of Mr Hull, the Secretary of State, is unlikely to be the last of the historic cycle of American speeches on post-war policy, but with it the representation of varying viewpoints within the Administration is very

nearly complete. Mr Hull's emphasis on caution—at one point he warned that

new policies should always be guided by cautious and sound judgment lest we make new mistakes in place of old ones and create new conflicts

—and his repeated stressing of the necessity of nations relying on their own efforts toward economic betterment, within a framework of international law and co-operation, have been interpreted as a modification of the speeches delivered by Mr Wallace and Mr Perkins. Mr Hull's main points on post-war reconstruction referred to the removal of impediments to action rather than to daring social experiments; he argued that with

peace reasonably assured, with economic shackles removed, with political stability established, a vast fund of resources will be released in each nation to meet the needs to progress . . . to invigorate the constructive forces of initiative and enterprise.

This is a far cry from the bold policies advanced by Mr Wallace and Mr Perkins; for that very reason it will find more support in conservative circles, which were alarmed at the enthusiastic reception of Mr Wallace's demand for a "people's revolution." It is only natural that "Judge" Hull should be primarily interested in the legal machinery of the post-war world, in an international court of justice, in an international police force. It should not be taken for granted that Mr Hull's speech means an abandonment by Mr Roosevelt of the forward positions established in earlier speeches. It is more likely that President Roosevelt is sounding out public opinion by stimulating the expression of a variety of views by his official family, and that the President's own course will only be determined after an appraisal of the reactions of the public. Particular interest has been aroused in the United States by what is believed to be an implied warning to the leaders of the Congress party, and perhaps to Vichy, in Mr Hull's statement that those who refuse to fight show themselves unworthy of liberty, and make more difficult the task of those who are already fighting.

BEW at Work

The recent announcement of agreements with Bolivia and Mexico for the purchase of rubber and alcohol are examples of the work which the Board of Economic Warfare is doing to increase the production of scarce materials in the Western hemisphere. The terms of the Bolivian agreement provide that the Rubber Reserve Company will during the next five years purchase all rubber produced in Bolivia other than that required for essential domestic needs and 250 tons to be available annually for export to neighbouring countries. The Rubber Reserve Company is to spend \$2,125,000 in the development of rubber resources in Bolivia. Similar agreements are already in effect with Brazil, Peru, Nicaragua, Costa Rica and Colombia, and negotiations are at present proceeding with other countries. The Mexican agreement provides that the Commodity Credit Corporation will purchase the entire exportable surplus of Mexican alcohol production up to the end of February, 1943, at a price of 40 cents a gallon. It is an interesting feature of these agreements that they are announced jointly by the State Department, the Board of Economic Warfare, and the RFC commodity corporation concerned. The hostility which was incurred by the Board of Economic Warfare at the time when its powers were being so strikingly increased appears to be dying down. The amicable relations which now exist appear to be due in large part to the steady avoidance by the Board of any publicity which would reflect on the other departments and agencies with which it must co-operate. On the other hand, it does not appear to have had to modify its activities. One of the most reassuring aspects of the Board's programme is its realisation of the difficulties which will be created after the war by the increased self-sufficiency of the Western Hemisphere. Mr Wallace, who is chairman of the Board, has already publicly expressed his fears concerning the pressure groups which will spring from the expansion of the synthetic rubber industry in the United States, and the similar problems which will have to be faced in the Central and South American countries will not have escaped his attention.

The Primaries Continue

The primaries are now in full swing, and although in the majority of cases the issues are local, as is usual in an off-year election, much of the recent activity on Capitol Hill has been carried on with a direct eye to its effect back home. The creation of a new rubber agency to supervise

the production of synthetic rubber from grain is a case in point, and the disinclination of oil-producing states to share in petrol rationing for the conservation of rubber prompted a hundred Congressmen to announce that they were firmly opposed to nation-wide petrol rationing, unless it could be proved that there was a general petrol shortage. A large number of Congressmen are now devoting the unofficial recess to the urgent task of fence-mending; and the President himself has intervened in New York to give his endorsement to Senator Mead's candidacy for the Democratic nomination for Governor. The Labour party, which holds the balance of power in New York, had repudiated Bennett, Mr Farley's candidate, and the risk of his defeat led Mr Roosevelt to endorse a more liberal candidate who might secure the labour vote. The danger is that, if there is no reconciliation between Mr Farley and the President, Mr Dewey, the Republican candidate, may profit by the split. There appears to be agreement, however, that in general the Democratic party will increase its representation in Congress, although there are no signs that the country is disposed to condemn any man for pre-Pearl Harbour isolationism. The argument appears to be that a Congressman is not expected to be more foresighted than his fellow citizens. The details and personalities of most of the elections are too complicated to be of much concern outside the particular locality. But it is of some interest that Representative Ham Fish, implicated in the Vereck case, is conceded a good chance of being returned again. Martin Dies has secured, unopposed, the Democratic nomination of the Second Congressional District in Texas, which means that he will be elected. Gerald L. K. Smith, the Coughlinite, is busily stumping Michigan for the Republican nomination for Senator; his expenses are said to be interesting the Senate Committee to Investigate Campaign Expenditures. The primaries never fail to provide their quota of surprises and local colour. In Connecticut, Clare Boothe Luce, the playwright and wife of the publisher of *Time*, *Fortune* and *Life*, is in the running for a Republican nomination. In Georgia, reviving Prohibition sentiment has prompted the candidacy of "Wee Willy" Upshaw on a platform of "God, the Ten Commandments, a Sober Nation, and the American Flag."

The Rubber Tangle

President Roosevelt's announcement that he would probably veto the Bill establishing a new agency to handle the production of synthetic rubber from grain, and that he was planning some action of his own on domestic rubber production, is evidence that the argument over synthetic rubber has not been finally settled. Even the hope that there would be rubber for civilians seems to have been revived by the reports that the rubber industry believes it will be possible to supply all mechanically usable cars with tyres for the next two years. The industry stresses that this will only be practicable if driving is reduced by 40 per cent, speeds reduced to 40 m.p.h., and tyres checked every week. Even with this cautious proviso, the announcement seems unfortunate, in view of the public confusion over the rubber situation. More prudent estimates suggest that, even with the strictest economy on the part of the Services, with no rubber for unessential use, and if 1943 sees the strict fulfilment of the programme for producing 250,000 tons of synthetic rubber, there will be an absolute shortage of over 100,000 tons. The deficit is expected to last well into 1944, even with production of synthetic rubber reaching 650,000 tons in that year. Confusion over the synthetic rubber programme has been heightened by a long-drawn-out argument about the merits of basing it on petroleum or on wheat. —actually, of course, it will employ both processes. The farm bloc has been a determined proponent of the rubber-from-alcohol-from-wheat method, while the Administration and the War Production Board have favoured production from petroleum. Mr Henderson, the Price Administrator, has caused some surprise by favouring the Congress view that rubber should be produced from alcohol. The pros and cons of wheat *versus* petroleum cover the questions of time, of materials for plant, and of cost. For wheat it is argued that the USA has a vast surplus of wheat; that the process is chemically more direct, and therefore shorter. For petroleum, it is claimed that the plants needed would not require the copper needed for alcohol-butadiene equipment, or so much compressor horsepower; and that is cheaper. According to a special article in the magazine *Time*, in 1944, when 800,000 tons of synthetic rubber is scheduled to be produced, 100,000 will be specialty rubbers; 60,000 Standard Oil's butyl; 40,000 Du Pont's neoprene; the rest will be Buna-S, with 220,000 tons produced from alcohol, the other 480,000 tons from petro-

leum. The greatest danger is that pressure from the farm bloc, the Big Four rubber companies, the small companies, the refiners and the public, may keep the whole programme open to revision. *Time* reports that the US has already used up one-third of its stockpile of 700,000 tons of natural rubber. The problems of expanding the industry from a capacity of about 30,000 tons a year to 800,000 tons are enormous. If there are further delays in starting the job, even the 250,000 tons scheduled for 1943 may not materialise.

Shorter Notes

The State Department has announced that agreements have been reached with the Central American countries concerned for the construction of a gravel highway between the southern frontier of Mexico and Panama. The surveying of the road is in progress and construction will begin immediately. Besides its strategic importance, the road will ease the difficulties of the Central American countries which have depended largely on shipping for their transport needs, and which have been the victims of the U-boat campaign in the Caribbean and the Gulf of Mexico.

Sugar rationing has worked so well in the United States, and supplies have been coming in so much more regularly than was anticipated, that the ration may have to be raised in order to dispose of surpluses. Stocks have piled up to such an extent that refiners are now forced to turn away raw cargoes.

It now appears that the report that the War Labour Board proposes to grant wages increases up to 15 per cent to workers who have not had increases up to that amount in the period January, 1941, to May, 1942, were correct. If the unions have received part of the increase the Board will grant the balance, and it reserves the additional right to adjust inequalities in the lower income levels. As existing price ceilings are based on last year's wage rates, either price ceilings will have to give way, or Congress will have to grant the OPA power to grant substantial subsidies to industry if the Board is upheld by the President.

INTRODUCING -

Cigar-lets

THE CIGAR'S LITTLE BROTHER

And not quite so little! CIGARLETS are Cigars in miniature, in a cigarette paper wrapping and are a good satisfying smoke. Made from choice imported Cigar Tobaccos, CIGARLETS rival their big Brothers in taste, fragrance and aroma.

THE WORLD OVERSEAS

Reign of Terror

(By a Correspondent)

ALL reports from occupied Europe speak of a new climax of intensity and ruthlessness in the German terror. What emerges from those reports is no longer the picture of a "normal" regime of conquest and occupation, but the horror of the *Nacht der langen Messer*, which has now fallen upon a whole continent. The "blood and revenge" (*Blutrache*) of the old SA songs have become for the subjugated nations an everyday reality. Whatever scepticism may be aroused by "atrocity stories," facts suffice to show that Europe has been turned by its present masters into a shameful jungle, into a hunting-ground for the *Urwaldmensch* armed by the technique of the twentieth century.

Poland still holds first place among the victims. All the normal political and moral standards of a civilised age must be set aside in order to gain a proper understanding of what has been happening in Poland. The question there is no longer merely one of oppression and slavery, but one of political and cultural, and in some parts of the country, even physical, extermination. In the western parts of Poland, the so-called Warthegau and Silesia, it has been the avowed purpose of German policy to clear these territories of their Polish population. Gauleiter Greiser has repeatedly stated that not one Polish word will be spoken in the Warthegau in a few years' time. All Polish schools—even the elementary ones—have been closed. Masses of people have been driven from their towns and villages into the region of the General Government—or into labour camps in Germany. Executions are reported daily by the German press of Western Poland. In Central and Eastern Poland, it is primarily the intellectual class that is being exterminated; the aim is to deprive the nation of its political and moral leadership—actual or potential. The whole body of University professors and lecturers is being physically destroyed. Some weeks ago, the professors of Lvov University were murdered or deported to concentration camps just as were their colleagues of Cracow University some time earlier. The ranks of clergymen and village teachers have been decimated in the same way. And this summer a great purge was made of former reserve officers of the Army. The scope of the Terror among the common people can be measured by the fact that Poles are being sent to twenty-three big concentration camps in Poland and Germany.

But, even against this background, the massacre of Polish Jews stands out as a unique crime. The slaughter started towards the end of 1941, and this summer it is still going on. Whole Jewish communities have been wiped out by machine-gunning. The pogrom started in Eastern Poland—formerly Soviet occupied—and from there it spread westwards. The most conservative estimates put the number of the victims at over 100,000, while inside reports from the ghettos speak of a much higher total. The massacre has surpassed anything recorded in the long history of anti-Jewish pogroms, even the famous slaughter of 1648, during the Khmelnicki rising, in the Ukraine.

Preventive War

Poland is the nearest "normal" rear behind the Eastern front, the base for supplies and communications. German reverses in the East have raised high hopes among the Poles; the underground movement has grown in strength; and the unbroken spirit of the Polish people has remained a constant menace to the nearest rear of the fighting forces. To crush the spirit of resistance, precisely at a time when the military situation might favour that resistance, became imperative from the invader's point of view. The Germans, in fact, have been waging a preventive war against the pending danger of Polish guerrillas. The underground movement has shown an astounding degree of vitality. All

attempts to destroy the network of clandestine organisations have failed. The Germans, therefore, decided to strike at those classes of society—the intelligentsia first of all—from which the cadres of the underground movement come. The fury of the Terror can also be explained by the panicky nervousness of the hundreds of thousands of *Volksdeutsche* who have been settled in Poland in the homes and on the land of expelled Poles. Their lot and even their life depends entirely on the military position: it is the *Volksdeutsche's* fear for their future that has fed the wave of terror.

Heydrich Assassinations

In Czechoslovakia, the court-martials still try "crimes connected with the assault on Heydrich." Nearly 1,300 executions have been carried out, besides the wiping out of Lidice and Lezaky. Here, too, the object has been to cut off the underground movement from the broad mass of the people. The newly-established National Tribunals try, not only the "traitors," but also their families and employers. Thus, the Gestapo tries to frighten the Czechs into assisting its spies in hunting members of clandestine organisations. Seven University professors, a number of teachers and Army officers have been shot recently. Officials of the Protectorate's Ministry of Agriculture had to pay with their lives for the failure of the Nazis to get hold of the peasants' crops and cattle.

Opposition to the Germans now comes even from those political quarters which some time ago were inclined to "collaborate." General Alois Elias, Prime Minister of the first Czech puppet Government, was executed on June 19th. The leader of the Agrarian party and the Czech Prime Minister of the post-Munich period, Rudolf Beran, was sentenced to ten years' penal servitude. The SS group leader, Reischauer, has been appointed deputy to the Czech Minister of the Interior; the peculiar thing is that the terrorism in Czechoslovakia is carried out under the auspices of Hacha and Moravec. These Czech quislings embarked upon the path of "collaboration" with the now familiar excuse that they were thus going to save whatever might be saved for the future of Czechoslovakia; now they assist the invader in destroying the nation, morally and politically.

In Western Europe, the position is different. The Nazis there still keep the kid glove on the mailed fist. Even so, more people have been arrested in Belgium during 18 months of occupation than were arrested during the whole of 1914-18. The death penalty has been introduced for circulating illegal papers. In occupied France, the practice of shooting hostages has not been enough; and now families of saboteurs have been made responsible for their relatives' doings. If those "guilty" of sabotage are not found within ten days, their families' male members over 18 years are to be shot, and female members sent to forced labour camps, according to an official German announcement.

It is perhaps not very useful to indulge in further descriptions of the Nazis' misdeeds. Their cruelty is matched only by their inhuman monotony. Two political conclusions seem to be important. The physical and moral exhaustion of the oppressed nations grows with every year of the war; all reports from Underground Europe, particularly those from the Slav countries, give alarming evidence of this exhaustion. Secondly, it would be a fallacy to suppose that this prodigious reign of Terror fails to obtain some of its objectives; it does lead to depression and despondency. But this despondency borders on hope and eagerness for action as closely as it has never perhaps done before; and which will prevail depends on the next developments in the battlefield.

New Zealand's War Finances

[FROM OUR CHRISTCHURCH CORRESPONDENT]

May 20th

OWING to the increase in expenditure resulting from the Pacific war, the Government has presented estimates for war expenditure this year much earlier than usual. Though neither the accounts for last year nor the detailed estimates for the present year were complete, the Prime Minister, acting as Minister of Finance, was able to state that expenditure in the Consolidated Fund, the Social Security Fund and the National Development Account, were below the revenue last year, and can be financed this year without any changes in taxation. Comparing the estimates for 1942-43 with the results for 1941-42, Consolidated Fund expenditure decreased by about £NZ1.5 millions, expenditure on social security increased by about £NZ2.3 millions, and capital expenditure on public works and housing is reduced from £NZ12 millions to £NZ4.5 millions. War expenses cost about £NZ53 millions last year. About £NZ20 millions was raised by special war taxes, £NZ31.7 millions from loans, including £NZ8.2 millions from Britain, and £NZ4.4 millions was carried forward from the previous year, making the total receipts £NZ56.1 millions. For the present year, war expenses are expected to total £NZ133 millions, though it is admitted that close estimation is impossible in the circumstances. To meet this expenditure, it is proposed to raise £NZ46 millions under the agreement with the British Government, £NZ10 millions under the lend-lease agreement, making £NZ56 millions from abroad, and to borrow £NZ35.6 millions in New Zealand. Present war taxes will yield £NZ20 millions, transfers from the Consolidated Fund £NZ3 millions, and other items £NZ4 millions. It is proposed to increase the taxes on incomes, beer, wine and spirits, tobacco and cigarettes, and the sales tax, to raise an extra £NZ14.4 millions, making the tax contribution to war expenses £NZ34.4 millions.

With these additional taxes, total taxation is expected to yield £NZ77.8 millions, or about £NZ47.15 per head of the population. National and social security taxes will be 2s. 6d. in the £ on all incomes, without exemption except for war and social security pensions and benefits. Including these, taxes on individual incomes will start at 5s., after income-tax exemptions, and reach 18s. in the £ above £NZ2,500 in the case of unearned incomes, and above £NZ3,700 in the case of earned incomes, while company taxes, starting at 5s., will reach 14s. 0d. in the £ on incomes above £NZ7,950. The figures given do not permit an accurate balance of the accounts, but the following is an approximate summary of the results for last year, and the estimates for this year:—

RESULTS 1941-42 and ESTIMATES 1942-43

	(£ N.Z. millions)	Approx. Results 1941-42	Estimates 1942-43
Expenditure:—			
Consolidated Fund.....		39.7	38.2
Social Security Fund.....		13.7	16.0
Development A/c (Loans only)....		12.0	4.5
War Expenses A/c.....		53.0	133.0
		118.4	191.7
Less Transfers.....		5.1	5.1
Total Expenditure.....		113.3	186.6
Receipts:—			
Taxation:—			
For Consolidated Fund.....		35.5	32.5
.. Social Security Fund.....		10.9	10.9
.. War Expenses A/c.....		20.0	34.4
		66.4	77.8

French Workers in Germany

[BY A FRENCH CORRESPONDENT]

July 27th

VICHY's efforts to send French industrial workers to Germany have not abated. The propaganda is even more intense in the unoccupied zone than in the occupied. New promises are made every day: no compulsion will be applied to workers who do not want to renew their contract; they will be assured of finding a job when they come back to France; a lump sum of money (1,000 francs) will be paid to them for their equipment, etc.

Recently, the radio from Vichy has revealed the goal which Laval had set himself. Three hundred thousand French workers must go to Germany so that the same number of peasants are released. This figure does not include the 150,000 French workers who were already in Germany when Laval started his campaign. Up to now, the results have been very disappointing for Vichy and the Germans. From June 22nd to July 3rd, 11,658 people left France to work in Germany, among them 2,715 women. In the following week (July 4th to July 11th), the total figure was 4,190. On an average, the enlistment of French workers for German industry reaches about 5,000 a week. If the rate is not increased, Vichy would need more than a year to attain its goal, assuming that all the workers renew their six months' contract when it expires.

A law of July 11th has placed French manpower in Germany under the authority of Laval, who has delegated his powers to Benoit-Méchin. New measures are being taken to increase the emigration of labour. Instructions have been sent to employers to form squads of workers for Germany, including foremen and technicians. Big undertakings must organise squads by themselves. Small and medium ones will have to co-operate for the same purpose. It appears that the total number of workers to go to Germany has been divided between the different industries (especially the metal industries, but the building industry also), and a quota has been assigned to each Committee of Industrial Organisation (employers' committees put by Vichy at the head of the different industries). It is still too early to say if this procedure will give better results than have been achieved hitherto. But it can be deduced from the French radio and press that employers are very reluctant. "Too often employers refuse to give up their best workers," says the Vichy radio.

No prisoner has yet been released by the Germans. The exchange ratio between industrial workers and prisoners has never been officially stated. But a recent announcement in a Paris paper discloses that, as might have been expected, the bargain has been highly favourable to the Germans. According to this paper, only qualified workers from the metallurgical industry will count for the release of prisoners, and then only after a considerable number have arrived in Germany.

DOG IN THE MANGER

BY

N. H. BACON

As one reads this book, the pieces of the economic jig-saw are seen to fall into place; the fundamental cause of trade depression and unemployment becomes clear.

Gladwin & Bacon

German Europe

Social Policy

IMPROVISATIONS and makeshift arrangements have been the features of Germany's social policy since the spring of last year. Labour conscription; land service for boys and girls; the so-called duty year for girls (that is, compulsory domestic service); the tremendous increase of married women employed in industry; and the employment of 2.5 million foreign workers, all created problems which can no longer be solved by the activities of the Labour Front. The great number of men and women of poor physique employed in industry has increased the sickness rate considerably. Factories actually paid premiums for punctuality and regular attendance until the Trustees of Labour made a drive for better factory discipline by introducing penalties for absenteeism. Independent artisans and retail shops, which were unable to provide facilities for welfare, sport and recreation comparable to those supplied in large-scale factories, were encouraged to form "social co-operatives" bringing together groups of small-scale businesses for the purpose of providing sports grounds, entertainments, extra sickness benefits and medical aid.

The biggest problem has been provision for working mothers, especially those expecting children. After Hitler came to power, the existing safeguards for mothers employed in industry were either abolished or fell into disuse, because of the dismissal of most married women. Now, about half the total number of married women are employed in agriculture and industry and special measures have become necessary again. A new "safety for mothers law" came into force on July 1st. According to this law, expectant mothers must not be employed on work which involves the constant lifting of weights exceeding five kilogrammes. Overtime work, night shifts and work on Sundays are prohibited. The most important point is that women must be given sick leave six weeks before and six weeks after confinement. Nursing mothers are paid "nursing allowances." The terms of the new law show, first, that expectant mothers have up to now been employed on heavy work as well as on night and day shifts; and, secondly, that it is now necessary to restore safeguards and benefits which were in force before Hitler came into power.

Old-age pensions and sickness and other benefits were increased during 1941-42; but, on the average, they are still below the pre-Hitler level. No cuts in benefits and pensions are made if old-age pensioners above 70 years of age go back to work. But all other old-age pensioners and disabled persons in receipt of benefits are paid reduced rates if they return to work. The very elaborate safeguards of pre-Hitler Germany for young people employed in industry have largely fallen into disuse; but the prohibition against young people under 16 years of age being employed on night shifts has been strictly enforced. On the other hand, boys and girls have been taken from school in great numbers before the school-leaving age to fill vacancies in industry. The vocational guidance departments of the labour exchanges reported that, in the spring of this year, there were 757,000 vacancies for boys, but only 631,700 could be filled. The land service, the Hitler schools and numerous other institutions claim a considerable part of the boys and girls leaving school.

Formally, foreign workers, except Poles, enjoy the same social benefits as Germans, but their actual treatment is very different. Most foreign workers are housed in special camps under the control of the Labour Front. Medical services are organised on military lines. The labour turnover is very great among foreign workers and the benefits they derive from paying insurance contributions are thus extremely small.

There is a definite trend towards combining all the different social services in one organisation. The shortage of administrative personnel is acute. A general reform, however, is not possible at the moment. The first step towards concentration was made in combination with the deduction of the wages tax at the source; three different insurance contributions, sickness, old age and unemployment, were lumped together. Contributions are no longer computed according to a wages schedule; a lump-sum contribution, amounting to 5.6 per cent of weekly wages in the Old Reich and 10 per cent in Austria and the Sudetenland, is deducted. The sale of insurance stamps has been abolished. Benefits, however, still vary according to the

former schedules. Generally speaking, Nazi policy has been successful in increasing the number of contributors. Most independent artisans are now paying contributions and accident insurance has been extended to office workers and domestic servants, whose accident rate is extremely low compared with workers in industry. Social insurance contributions, in fact, have thus become an important means of financing state expenditure.

Harvest Preparations.—The compulsory delivery of cereals, which was introduced for wheat and rye in 1937, has been extended to all cereals. Barley is particularly mentioned in the decree as being needed in the new season to supplement bread grain. Last year, the Minister for Agriculture has stated, deliveries of bread grain had exceeded the quota by 800,000 tons. This year, delivery quotas of all kinds of foodstuffs will be greater than ever before. Premiums will be paid for additional deliveries of milk, butter, eggs and poultry. It is officially announced that 2.5 million hectares under cereals, which were damaged during the winter, have been resown. The discussion of this announcement in the press makes it clear that a considerable part of this damaged acreage has been used to extend the area under potatoes, which is reported to have been increased by 13 per cent compared with 1941.

Difficulties in the supply and transport of potatoes last winter led to attempts to prevent a repetition. Special potato commissars were appointed in the agricultural districts. Their main task is the organisation of deliveries, transport and frost-proof storage. Additional storage facilities are under construction, and there is even talk of a scheme for manufacturing frost-proof transport vans. A further increase in the consumption of potatoes is expected.

The acreage under vegetables will be extended in 1942 to 306,000 hectares, against 241,000 hectares in 1941, when the acreage had already been increased by 25 per cent compared with 1940. There is, however, a shortage of vegetables.

Overloading.—At the beginning of the war, permission was given to overload railway goods trucks by one ton. Overloading of two tons is now permitted on German trucks. French and Belgian trucks, which were excluded from this rule, may now be overloaded by one ton. The authorities are not satisfied with the turn round of goods trains. A propaganda campaign for making the best use of available rolling stock is being conducted vigorously. Wherever possible, the transport of civilian commodities is cut down by creating supply districts beyond which industries are prohibited to deliver their goods; the transport of beer over long distances has been forbidden.

Building Societies.—At the end of 1941, Germany's public building societies reported that total deposits amounted to Rm. 95 millions, against Rm. 72 millions and Rm. 68 millions at the end of 1940 and 1939, respectively. During 1941, 27 private building societies concluded 30,000 new building agreements against 16,000 in 1940. This tremendous increase in building agreements, at a time when all private building activity is stopped, is described as alarming by the press. The total of building agreements concluded by the private societies at the end of 1941 was 120,000; during the last years before the war, the annual number of small houses constructed was roughly the same figure. The press doubts whether the contracts can be carried out as soon as the war is over.

Industrial Repairs.—The Minister for Economic Affairs, by special decree, has given priority to repairs in essential war industries. The object is to ensure that urgent repairs which have been postponed for a long time are carried out. It is pointed out that production must not be hampered by neglected repairs. At the same time, factories are discouraged from diverting valuable material and labour for repairs which are normally done by specialised contractors.

Bones.—The Commissar for the use of waste and scrap material has established a special department for bones and horn with the object of utilising them more thoroughly for the war-economy.

Russia at War

The New Losses

THE new German advance to Rostov and beyond is, in many ways, a completion of last year's conquest of the Ukraine. Economically, the newly-lost territories were linked by strong ties with the area to the west which was occupied last autumn. The industries of the Rostov area were a part of the productive entity of the Southern Ukraine, with its iron ore base in Krivoirog, its coal in the Donetz basin, its iron and steel works at Mariupol and its large scale engineering plants at Voronezh, Voroshilovgrad and Rostov. Similarly, the farming area on the Don and around Rostov supplemented the great Ukrainian agricultural economy.

The following tables compare Russia's economic losses towards the end of last year, when the German offensive was brought to a standstill, and the new Soviet losses which have resulted from the withdrawal in the Don area and from the fall of Rostov. The figures are only approximate; their accuracy is by no means certain. The Russian administrative divisions to which statistical data relate do not always coincide with the actual battle zones. Most of the figures available were provided by the census taken in 1939; and, since then, many changes, apart from those caused by the war, must have taken place. The most important changes are those which are due to the course of hostilities, such as industrial and agricultural evacuation. But, in spite of all these shortcomings, the tables do reflect the relative proportions—if not the exact extent—of Russia's new losses; they also indirectly provide a clue to the scope of any probable industrial evacuation from the recent battle zones.

TABLE OF LOSSES

	Nov., 1941	End of July, 1942	Total
Territory (sq. km.)	1,200,000	150,000	1,350,000
Population (millions)	45	5.7	50.52
Sowing area (million hectares)	40	7	47
Cereal crops (million tons)	25	8	33
Wheat (million tons)	7	3.5	10.5
Railway lines (km.)	25,000	6,000	31,000

According to the 1939 census, the total figures for the USSR were: 21 million square kilometres of territory; 170.5 millions of population; 137 million hectares of sown area; 90 million tons of cereal crops, of which 31 million tons were wheat. The losses (new and old) expressed as percentages of the USSR total are given in the following table:

LOSSES IN PERCENTAGES (Round Figures)

	1941	July, 1942	Total
Territories	5.7	0.7	6.4
Population	26-27	3-4	29-31
Sowing area	31	5.5	36.5
Cereal crops	27	9	36
Wheat	22.5	11	33.5
Railway lines	30	7	37

The loss in territory is the least significant. The loss of population is, of course, very much smaller than suggested by the tables; according to the Soviet press about one-third of the population of the lost territories has been evacuated. The loss in cultivated land and in crops is very high; and only a small fraction can be made good by an expansion of agriculture in the east. Similarly, the loss in railway lines is not replaceable.

The next table gives an estimate of the comparative losses of industrial capacity (in percentages of the total Soviet output).

INDUSTRIAL LOSSES

	Nov., 1941	July, 1942	Total
Coal	5-10	45	50-55
Iron ore	60	—	60
Pig iron	—	—	60
Machine building	15	15	30
Steel	47	13	60
Rolled Iron	47	10	57

The figure for coal is lower than that suggested by the 1938-39 statistics, because it takes into account the development of the Kuzbass and Karaganda mines, which has probably reduced the share of the Donetz in total Soviet output from 60 to 50 per cent.

The Azov and Black Sea region is most important as a centre for the production of pig iron. It is, however, difficult to say what proportion of the total output of the region was produced in the Mariupol-Taganrog area, which was lost last year, and what proportion in the present battle zones. The same applies to machine building. When the South Ukrainian industrial district is taken as a whole, it will be seen that, last year, it was mainly the raw material base which fell to the Germans, while this year's conquests affect primarily the manufacturing centres of the local iron and steel industries—a fact which has an important bearing on the likely scope of evacuation, because, apart from the coal district, a much higher proportion of the industrial capacity of the newly-lost territories could be saved by evacuation than was the case last year.

The Northern Caucasus has now become the most directly threatened area. The economic importance of the Northern Caucasus and Transcaucasia is illustrated by the following figures. Caucasian territory is 1.6 per cent of the Soviet total; the population is 9 per cent of the whole; 7.5 per cent of the arable area lies in the Caucasus; and 14 per cent of Russia's cattle are bred there. In oil production, the Caucasus' share is about 85 per cent; of this 75 per cent comes from the Baku oilfields. In the actual danger zone of the Northern Caucasus, there are the old wells of Maikop and Grozny, which between them account for 3.4 million tons of oil, more than 10 per cent of the Russian output. Armavir and Tuapse are the great refining centres in the Northern Caucasus; the Armavir refineries are situated some 160-170 miles south of Rostov. Should the Germans be able to seize the Armavir-Maikop-Tuapse oil wells and refineries, then they would have won a great prize. But the Russian "scorched earth" policy will, no doubt, deny them the use of the Northern Caucasian oil; and, between Maikop and Grozny in the north and Baku in the south, the Caucasus mountains form a tremendous obstacle to any advancing army.

Shorter Notices

"The Democratic Advance." By Edward Mousley. Dakers. 198 pages.

Lord Ironside has said of this book that "the chapter on strategy is the best thing I have read in this backboneless world"—not perhaps an unqualified tribute coming from the man who was CIGS when British strategy was at its nadir. Nevertheless, the book is well worth reading. The author restates his view, elaborated earlier in *Man or Leviathan?* that "superior force is no less essential to maintain the victory than to win the victory"; that "the only alternative to war . . . is the rule of systematised power enforced, where necessary, by power"; that "in order to win at all we must strike down and supplant the rival order."

Mr Mousley is not humble. He seems convinced that he was the first to discover these truths. He appears to think that he is alone and not given his due—a man with a grievance as well as a message. *The Democratic Advance* is too repetitive. Its constructive chapters are much fuller of wordy phrases with no clear meaning than the author, who believes he has a plan, would credit. But if Mr Mousley still has no very clear plan, he is not alone in that; and he certainly has something to say worth listening to. This book, which is really a footnote to his earlier opus, would have made an inspiring and suggestive pamphlet.

"The Stock Exchange Official Year Book, 1942." Thomas Skinner and Co. (Publishers), Ltd. 3,165 pages. 24 net.

The regular production of that truly indispensable publication, *The Stock Exchange Official Year Book*, despite all wartime difficulties, is a matter for genuine congratulation. The work is, of course, increasingly complicated by censorship regulations as well as by the shortage of labour and materials. Yet, none of these hindrances is apparent from inspection of the latest volume, which is as comprehensive as ever, and includes a list of emergency addresses of companies and registrars in the supplement. It has again been necessary to omit general information and certain special chapters to comply with the requirements of the Paper Control, but these sections can be found in the 1940 edition.

THE BUSINESS WORLD

Insurance: A Wartime Industry

LIKE other industries, insurance has been mobilised for war. On the one hand, it has had to adapt its normal activities to war conditions, which have upset many former risk schedules; and, on the other hand, its facilities and resources have been enlisted in the war effort. Its world-wide organisation has been recruited to aid the Allied war effort and, where possible, to hamper the enemy's; its assets, both at home and overseas, have been mobilised to assist in financing the war; and a large proportion of its personnel has been released to join the Armed Forces.

It is natural, because it is these which most impress the imagination, to consider first the towering totals of insurance companies' assets. These assets derive partly from the need to accumulate funds as reserves for known liabilities, chiefly under policies of life assurance. In addition, there has been the desire, in the interests of security, to build up a sheet-anchor of free reserves to provide against unforeseen contingencies. It is largely because British insurers have always followed the practice of distributing less than they earn that the industry has been able to acquire its predominant international position and its immense financial strength. Even in times of peace, a large share of these assets was invested in Government securities. Now virtually all available cash is being placed in the Government till—not only new moneys, but also the proceeds of repayments and requisitions—and since the beginning of the war the total thus invested has been in excess of £200 millions. Since the net interest earned on Government securities is less than 2 per cent, and the

rate assumed for most life assurance contracts issued in the past has been 3 per cent or more, an appreciable sacrifice of profit-earning power has been involved.

This does not represent the sum total of the insurance companies' contribution from their assets. By virtue of their world-wide business, their assets at the outbreak of war included a considerable proportion of overseas investments, which were required to finance the purchase of war supplies from abroad. To the extent that these investments were not held as security for contracts in individual countries, they were mobilised very soon after the outbreak of hostilities. The "tied" investments could not be so readily realised, because they could only be sold as part and parcel of overseas businesses. The solution in regard to the major area involved—the United States—came with the announcement last July of the Reconstruction Finance Corporation's loan to the British Treasury. This loan was for a total of \$425 millions, and British offices' interests in subsidiary American insurance companies formed a substantial part of the security. Current interest and trading earnings in the United States are placed at the disposal of the Treasury for the service of interest and amortisation. All current earnings of British insurers throughout the world—companies and Lloyd's—are at the disposal of the Government. Actually, the profit-earning capacity of British insurance has been well maintained, although the occupation by the enemy of successive spheres of operations has naturally tended to reduce the volume and spread of business.

How has the industry's administrative organisation contributed to the war? Here, again, a distinction has to be drawn between the position in this country and the position overseas. At home considerable additional work has been taken on by companies and underwriters in acting as agents for the Board of Trade in the operation of Part II of the War Risks Insurance Act, 1939, providing for the insurance of commodities, and of the "Business" and "Private Chattels" schemes under Part II of the War Damage Act, 1941. This work, which involves the issue of policies at the rate of some five millions a year, has been undertaken on a non-profit basis. Although companies and underwriters are not responsible for the actual payment of claims under these schemes, they have accepted the work of handling all losses under the "commodities" and "business" schemes and have instituted a country-wide organisation for the purpose. In addition to their administrative organisation, their technical service has been placed at the disposal of the Government, and technical committees have been established throughout the country to assist Government departments in the vital work of fire prevention.

But the main business of insurance in fire, life, accident and marine has gone forward, without noticeable loss of efficiency, in the face of many wartime changes. As the nation's factories have been converted to war purposes, so fire insurance has followed *pari passu*; the insurance of motor vehicles has kept in step with the transfer of private and commercial vehicles from non-essential to essential work; marine insurance has completely changed its character, for, apart from the actual insurance of war risks, even the straightforward insurance of marine perils has taken on a considerable measure of war hazard. Not all the business now underwritten is such as would have been accepted in

time of peace. In fire insurance, for example, in their desire to afford full cover, offices have taken larger net lines than in normal times, when the assistance of the European re-insurance market was available, and this has involved some loss of underwriting stability. In marine insurance on hulls, much business is being written which would rather be avoided, for it is only too clear that, because of the limitation of repairs to work essential to keep ships seaworthy, there will be a long legacy of repairs to be made good in the post-war period, when the level of costs cannot be foreseen.

Abroad, the main pre-occupation has been with measures to ensure that British insurance protection should be withheld from the enemy and those working for him. An instance of this policy—which has involved the severance of many old connections—is the so-called ship warrant scheme. In these matters, insurers have worked in close co-operation with the Ministry of Economic Warfare and the Trading with the Enemy Department of the Board of Trade. Activity of this kind is, of course, useless if protection can be secured elsewhere; and although British offices and underwriters wield great power in international insurance, the British market is not the only one. It was with the realisation of this that two general managers accompanied a Treasury official to Washington last September—before America's entry into the war—on a mission of co-operation, which was very successful.

The insurance industry can claim to have adapted itself to the requirements of a wartime industry. The question of man-power is at the moment under examination by the Kennet Committee; it is known, however, that insurance offices have parted with more than half their pre-war male staffs and that an appreciable proportion of their permanent female staffs has also been called up.

Open Market Policy—II

By-Passing the Market

THE direct business in bills between the Bank of England and the clearing banks—described in an article last week in *The Economist*—assumed substantial proportions in the first eighteen months of the war. The bulk

of the floating debt borrowing during this period was made in the form of Treasury bills, and a considerable part of the clearing banks' increased holding of these bills came to them, not via the discount market, but direct from the

On Active SERVICE

The Canada Life Assurance Company reviews with pleasure a position achieved by its sound and progressive policy which, after 95 years of active service, is enabling it to maintain a traditional service to policy holders and to assist the war effort to the fullest extent.

The following figures are extracted from the 1941 Report, a copy of which will be sent on request.

Total Business in force	£154,147,800
Assets increased to	£58,483,004
New Policies issued for	£9,014,184
Payments to Policy holders	£4,997,459
Surplus Funds and Special Reserves	£2,870,233

Incorporated in Canada as a Limited
Liability Company.

there being a cash payment of 2 per cent, in respect of premium, to all holders of the Yorkshire Electric Power 5 per cent debenture. The recently offered Bass debentures stand at a point premium, and a similar fate is expected for the Watney, Combe issue.

Further Railway Interims

Like holders of Transport "C" and London and North-Eastern second preference stock, those of the Great Western ordinary are to receive increased interim payments. The interim is raised from 1½ to 2 per cent, which is exactly half the total distribution for 1941, but, exceptionally, the holders of LMS ordinary are again to wait until the end of the year for a payment. In the case of LNER, the warning has been issued that the higher interim must not be read as indicating a larger total payment. Thus, three of the five participants in the railway pool have evened out their half-yearly payments. In the

	Prices Jan. July		Dividends				
	High	Low	Close July 29	July, 1941	Jan. 1942	July, 1942	Yield %
Gt. Western Ord.	47½	39	45	1½	2½	2	8.889
LMS Ord.	20½	16½	20	...	2	...	10.000
LNER 2nd Pref.	23½	18½	22½	...	2½	1	10.556
Southern Pref.	66½	61½	65½	2½	2½	2½	7.663
" Deft.	17½	14½	16½	...	1½	...	10.448
Transport "C"	41½	38	44½	1	2½	1½	6.424

fourth case, that of the Southern, it appears that the re-casting of the capital structure makes it impossible to adopt a similar policy with regard to its deferred stock, even if it wished to do so. The preferred and deferred are, in fact, separate parts of the one stock, the ordinary, and it seems that nothing can be paid on the junior section until the claims of the senior for the year have been fully satisfied. The decision of LMS may be influenced by the fact that revenue, outside the rent charge, is relatively important to this company. The table gives the range of quotations for the six stocks in question over the first half of this year, the latest closing price, the yield on last year's dividend, and payments at the last three half-years. It will be seen that the yields are such as to discount an appreciably less favourable experience under peacetime conditions, except, possibly, in the case of LPTB.

Insurance Share Index

The position of *The Economist* index of insurance shares at June 30, 1942, with comparative figures at half-yearly intervals since the middle of 1940, is shown in the

Company	June 30, 1940	Dec. 31, 1940	June 30, 1941	Dec. 31, 1941	June 30, 1942

appended table. Calculations are based on the investment of £1,000 in each of 24 representative securities in 1913. Notwithstanding the reverses in Libya, the index discloses a further improvement in values, which have risen by 3 per cent in the six months, and are now almost restored to the level of December, 1939. Of the shares listed, 14 show increases, 7 decreases, and 3 no change. The most important movements are in *Prudential*, from 22½ to 26, and *Scottish Union and National*, which at 100s. are higher by 11s. 3d.

Company Notes

Hudson's Bay Accounts

The full accounts of Hudson's Bay Company for the year to January 31st last show that the improvement in total earnings was fully as satisfactory as was suggested by the preliminary statement discussed in *The Economist* of July 18, 1942. The trading account has an increase in gross profits from £703,520 to £949,488, and the land account from £79,500 to £121,542. With depreciation on the former account £10,000 lower at £140,000, the ordinary dividend, raised from 1 to 3 per cent, is fully earned, even in face of the jump in tax liability from £486,123 to £710,959 and the carry forward is slightly higher at £94,566. In the Land Account, where the transfer to capital reserve is up from £13,156 to £35,424, equity earnings are still nearly £20,000 higher at £53,544 and, after the increase in ordinary payment from 1½ to 2 per cent, tax free, the carry-forward is raised by nearly £4,000 to £17,358. The directors indicate that the improvement realised on Land Account was due mainly to the delay in marketing the good wheat crop of 1940. They point out that the area sown in 1941 and 1942 was some 25 per cent lower. The average price of land sold per acre was reduced from £1 6s. 7d. to £1 0s. 6d., partly on account of the sale of 24,000 acres of particularly low-grade land. Profits of the large retail stores again reached a new record level, while the Wholesale and Fur departments increased their earnings, the latter largely by the sale of Canadian, African and Asian furs in New York. The indications are, however, that, with the possible exception of the last named, limitation of supplies will progressively reduce turnover. The balance sheet shows a rise in net liquid assets from £2,999,070 to £3,141,181, most notably in stocks, from £1,314,231 to £2,143,789. Debtors are some £300,000 lower at £911,151, and creditors over £440,000 higher at £1,774,126. Economic activity will continue to increase in Canada as war production expands. There will, of course, be a contraction in the normal civilian trade side of the concern's business, and it remains to be seen what opportunities can be found to adapt activities to the necessities of war economics. As was expected, the repayment of £600,000 of preference capital will reduce the nominal value of the preference shares by 30s. to £2.

London County Freehold and Leasehold

With a further decline from £377,255 to £360,616 in total income of London County Freehold and Leasehold Properties for the year to March 31, 1942, this concern realised the lowest earnings since 1931-32, when the capital was much smaller. Since the charge for leasehold amortisation was again higher at £38,262, against £36,779, while maintenance reserve received £50,000, against £10,000, and interest required little less than in the previous year, at £221,424 against £222,832, there is a drop in equity earnings from £67,687 to £11,100, representing less than 1 per cent on the ordinary capital. Of the surplus, £10,000, against nil, is transferred to general reserve, and the remainder goes to raise the carry forward from £238,910 to £240,010. The last ordinary dividend was 8 per cent in 1939-40. Sir William J. M. Burton, the chairman, attributes the decline in profits to further loss of rent, higher cost of services and the necessity of raising the provision for doubtful debts. There is no provision for war-damage contribution, which is in arrears for the two years ending July 31 last, since payments on account of damage sustained, including substantial sums received since the close of the financial year, still leave an excess owing over contributions due, which amounts to £140,000 gross annually, equivalent to 5½ per cent on the ordinary stock. The

directors point out that the surplus of debenture, mortgage and bank loan and of current liabilities over liquid assets has been reduced from £5,749,367 to £5,601,275 over the past two years. An excess of liquid assets over current liabilities in 1940-41 of £33,030 has, however, been replaced by an excess of current liabilities of £53,335 in the latest financial period. Total reserves, though higher than two years ago, have declined in the last year from £1,797,017 to £1,765,536, mainly through reduction in war-damage reserve from £150,000 to £27,500. Bank loan, at £470,000, is £50,000 lower than in the previous year, while debtors, including sums estimated as recoverable on account of war damage, have risen from £112,950 to £184,197. Valuation of properties, which is scarcely changed at around £10,300,000, has not been adjusted for war damage. The continuance of war conditions and the burden of war damage contributions appear to put an ordinary dividend out of the question for the immediate future, but it is possible that, unless bombing restarts this autumn, rent receipts may improve so that preference payments will remain secure. The 10s. ordinary shares at present stand at par.

Cairn Line Setback

The Cairn Line accounts for 1941 show a fall in disclosed profits, after taxation, from £69,121 to £45,927. Repairs and maintenance charged against profits absorb only £6,490 against £10,156, so that equity earnings amount to £38,676, a decline of some £20,000. The ordinary dividend, maintained at 4 per cent, is covered by a rate of 12.9 against 19.4 per cent; total reserves receive £30,000 against £40,000 and the carry-forward is reduced from £9,716 to £6,392. Before the appropriation, general reserve and classification account were down by £11,531, against a fall of £1,262 in 1940. The setback in earnings is due partly to the fact that, in 1940, the company enjoyed the benefit of certain free voyages before the Liner Requisition Scheme came into operation; partly to the possession of smaller total tonnage; and partly to higher cost factors. The chairman, Major T. Russell, puts in a plea for a revision of the requisition terms, in view of the serious drain caused by the high cost of ship repairs. The balance sheet shows a strengthening of the financial position as a result of the reserve appropriations. Valuation of fleet is unchanged at £49,774, against which the company now holds a fleet replacement account of £50,000 and general reserve of £20,035. A reduction in debtors of some £177,000 to £22,365 is accompanied by a jump in cash holdings from £273,105 to £434,593 and the investment of £26,000 in marketable holdings. There is a rise in net liquid assets from £611,508 to £626,652. The results are consequently in line with average shipping earnings and the shareholders continue to enjoy a substantial cushion in the cover for ordinary dividends. The 10s. ordinary shares, at 7s. ex dividend, offer a yield of £5 14s. 3d. per cent.

UDT Contraction

As the war progresses, less and less of the national effort is devoted to satisfying individual wants, while the Treasury sees that necessary capital is, in large measure, provided for those working for the Services. In these circumstances, it is inevitable that there should be less demand for the facilities provided by the United Dominions Trust. Shareholders may, therefore, be satisfied that the showing of the company, and its six wholly owned subsidiaries, during the year to June 30th last, is a smaller loss than that incurred a year before. The figure is £45,114, against £59,658, and there has to be deducted from it a tax refund of £23,751. The result is that the cumulative preference dividend is met at the cost of reducing the carry forward from £43,035 to £7,297. The consolidated balance-sheet of the group shows a rise in cash and investments of £482,655, against a fall in notes in hand, loans and advances of £620,557, a clear indication that a good deal of old business is being successfully liquidated, and that the company is in a strong position to finance new ventures once conditions are ripe. Mr J. Gibson Jarvie, chairman, states that difficulties of collection persist, but that there are indications that losses will be much smaller than was originally thought probable. The year's loss has been sustained, in the main, by the parent company, as five of the subsidiaries have made profits. All six, however, show contractions in business, and it is not at all easy to see how any improvement is to be obtained until after the war, unless the company

ventures into new and untried fields, a policy which it is unwilling to adopt in existing circumstances. The price of the £1, 4½ per cent, cumulative preference stock units is 17s. 6d., yielding £5 2s. 10d. per cent.

Machine Tool Payment

The full accounts of Scottish Machine Tool Corporation for the year to March 31st last show a rise in profit, before tax and depreciation, from £98,481 to a record of £109,149. Depreciation takes a trifle more than last year at £20,616 and War Damage £3,545, compared with £2,000. Unfortunately, the rise in tax provision from £57,900 to £70,000 is greater than that in profit and the net amount available is down on the year. This is distinctly disappointing, but, for those who require income, there is a consolation in the fact that the distribution is to be 8 per cent plus a cash bonus of 2 per cent. This compares with 6 per cent for 1940-41. Earnings amount to 6.6 per cent, but Sir Harry Greer, the chairman, explains that the additional two per cent distributed is to make up for the ultra-conservative policy adopted a year before, and that the intention is to restore the usual rate of 8 per cent. In point of fact, published earnings over the two years amount to 14.6 per cent, so that there has been an over-distribution. The carry forward has been reduced, on that period, from £19,071 to £16,574, nothing placed to reserve, and nothing written off patterns and drawings. The balance-sheet shows a small reduction in fixed assets and a rise of £15,361 to £189,060 in net liquid assets. In his statement to shareholders, Sir Harry points out that, while selling prices are strictly controlled, the cost of those components which the company is obliged to purchase increases. Although the company is paying EPT, this means that the post-war refund is *pro tanto* reduced. The extent to which profit margins are cut by the numerous special controls seems to vary considerably, and this practice introduces an element of arbitrariness into the refund which is most undesirable. The price of the 4s. ordinary shares is some 3s. 6d., which gives a yield of some £9 2s. 10d. per cent on a distribution of 8 per cent. Unless tax provision can be reduced, it is difficult to see how this payment is to be made in respect of the current year.

Johnnies' Results

The ordinary shares of Johannesburg Consolidated Investment remained unchanged on the announcement of the maintenance of the ordinary dividend at 10 per cent. Ability to repeat the previous payment in the year to June 30, 1942, had been generally discounted, although it was perhaps not generally realised that there would be an increase in the rate of cover. The preliminary statement shows a rise in equity earnings from £530,689 to £534,000, representing a rate, unadjusted for taxation, of 13.5 against 13.4 per cent. For the first time since 1937-38, the management have decided to make a transfer to reserve, which receives £150,000, bringing the total fund to £3,200,000. There is a consequent draft on the carry forward of some £11,000, reducing it to £220,000. The 10 per cent dividend is subject to non-residents' tax of some 1.95 per cent on the net amount after deducting normal United Kingdom income-tax. In the absence of more detailed information, the improvement finds its most plausible explanation in a further expansion in finance business. It will be recalled that most of the gold mines in the group declared lower dividends on the year, owing in part to higher costs and in part to the rise in Union taxation. At the current price of 35s. ex dividend, the £1 ordinary shares yield £5 14s. 3d. per cent, subject to tax adjustment.

NORANDA MINES LIMITED

DIVIDEND NOTICE

Notice is hereby given that an interim dividend of One Dollar (\$1.00) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable September 15, 1942, to shareholders of record at the close of business, August 20, 1942.

By Order of the Board,

Toronto, J. R. BRADFIELD, Secretary.
 July 21, 1942.

Industry and Trade

No More New Cars

Since July, 1940, when the purchase of new private cars was prohibited except by licence, output has been on a small scale. During the first half of this year, for example, 1,202 licences were issued to "persons or firms engaged in work of national importance to acquire" 1,620 cars. In view of the large numbers of second-hand cars still available, the production of even a small number can no longer be justified. Moreover, the abolition of the basic petrol ration and the introduction of a stringent needs test should provide a reserve of cars on which it might be possible to draw for essential purposes. Production is now at last to be stopped. In a reply to a question in the House of Commons on Thursday last week, Mr Noel Baker, Parliamentary Secretary to the Ministry of War Transport, said that arrangements had now been made to "terminate the manufacture of motor cars in the near future."

The Wages Front

The delay in negotiations over wages claims, due to the tendency of employers to reject the original demands and to their subsequent reference to arbitration tribunals, has been an important factor in slowing down the pace of advances. Not unexpectedly, the National Union of Railwaymen's demand for an all-round increase of 10s. a week which, it is estimated, would cost £14,500,000 a year, has been rejected by the railway companies; instead they have made an undisclosed offer which is now being considered by the executive of the NUR. The last increase in wages secured by railway operatives was in March when the Railway Staff National Tribunal awarded an additional 4s. 6d. per week, bringing the total advance since the outbreak of war up to 15s. 6d. per week. They now receive 65s. 6d. a week in the London area, 63s. 6d. in industrial, and 62s. 6d. in rural areas. Meanwhile, women in engineering are pressing their claims for a reduction in the admittedly wide gap between their own and men's wages. On Saturday last week, the Transport and General Workers' Union and the National Union of General and Municipal Workers submitted to the Engineering Employers' Federation a claim for a new minimum scale of wages for women. At present women doing women's work receive a minimum wage of 43s. a week, and, although provision has been made for the payment of a man's rate to women doing a man's job "without additional assistance or supervision," it appears that very few women in engineering have in fact been able to secure "the rate for the job." By a recent agreement relating to women employed in royal ordnance factories, those who carry out a skilled man's job with additional assistance or supervision receive between 75 and 85 per cent of the men's rate, according to their ability. The general claim now put forward is for a minimum of 55s. a week, which is equivalent to about 85 per cent of the appropriate men's rate.

Laundry Services

The demand for the services of laundries has tended to increase rather than diminish as a result of the war. In reception areas, facilities have been strained by larger numbers, and wherever they are, service requirements must be met. Laundries have lost part of their labour force, but the Essential Work Order is now applied where necessary. Laundry work can provide an outlet for the use of part-time labour. Delivery services have been cut down: work is collected and delivered at the same time, and often there is only one delivery in a fortnight. Many laundries cannot take on new customers. Some economies can be made in the use of laundries by the community, but certain facilities must continue. The President of the Board of Trade has appointed a Director of Laundry Services "to ensure that maximum output is obtained and is apportioned with the minimum disturbance of facilities." Mr P. A. Warter is to be Director, in addition to being Controller-General of Factory and Storage Premises. Under the Laundry (Control) Order (S.R. & O. 1433) the Director can allocate laundry capacity between service and civilian use in particular areas. The administration will be largely delegated to regional controllers, since laundries are essentially local services.

Care and Maintenance

Lancashire cotton weaving mill owners who have had their sheds closed under the concentration of production scheme, have decided to make an application for increased payments for "care and maintenance," following the success which has recently been achieved by the owners of stopped mills in the spinning section. A special committee of representatives of the firms affected is about to be appointed, which will be assisted by officials of the Cotton Manufacturers' Association in ascertaining facts. Concentration in weaving started in the autumn of last year. Compared with the spinning section, rather more success was achieved by voluntary agreements amongst manufacturers. It was estimated that there were about 500,000 looms in the country, chiefly in Lancashire and adjacent counties. No official figures have been published, but it is understood that about one-third of the machinery in the weaving branch of the industry ceased to work; about 330,000 looms have been given nucleus status. After some delay in arranging the financial terms, it was agreed that the running firms should contribute to a fund on the basis of £4 a year for looms of 40-inch reed space; up to now the "care and maintenance" payment has been £6 a year. It is understood that there now is a surplus in the "care and maintenance" fund, and it is probable that nucleus firms will not object to paying a small addition to the present levy. Since the scheme came into operation, certain costs have increased.

Clothing and Textile Prices Control

On July 24th, a new set of Orders and directions was announced by the Parliamentary Secretary of the Board of Trade after consultation with the Central Price Regulation Committee, fixing prices for cloth, clothing, household textiles, bedding and utility footwear. The Orders are a further instalment in carrying out the Government's price stabilisation policy. The Price Regulation Committee is engaged in considering other goods, and it is likely that more price regulating Orders will be issued. Utility cloth and clothing prices have been revised in view of the lifting of the purchase tax from these articles, and new lines have been added to the schedules. Prices have been fixed for utility household textiles, which include towels, tea towels, cotton sheets, blankets and quilts, and for mattresses and footwear, all of which are newly added to the list of utility articles now appearing, or about to appear, in the shops. Orders have now been made bringing prices of non-utility cloth and clothing under strict control. Manufacturers may not charge more than they did for comparable goods on June 30th last, and maximum margins of profit for wholesalers and retailers are laid down. For retailers these margins vary from 30 to 37½ per cent. In addition to cloth and clothing, control is established over non-utility hats and haberdashery, household textiles and bedding, and the orders apply to stocks as well as to goods in the course of manufacture.

Utility Clothing and the Purchase Tax

On page 118 of last week's issue of *The Economist* it was inadvertently stated that, from October 1st, retailers would have to sell all clothing free of purchase tax, even though the tax had been paid. In actual fact, retailers are allowed, under certain conditions, until January 31st to dispose of utility clothing on which purchase tax has been paid, at present prices. The incorrectness of the date mentioned last week does not, of course, invalidate the conclusions drawn. From October 1st, retailers will only be permitted to include purchase tax in the price if they comply with certain conditions, which include stating that they have paid purchase tax, and the taking of other steps in order that the fact may be easily proved. Until September 30th, it is left to the retailer's honesty not to charge the higher price if purchase tax has not been paid. There may be few purchasers of utility clothing during the next two months, and the consumer may buy warily from the beginning of October to the end of January; the wisest will probably postpone purchases of utility clothing until after January 31st.

Sisal Production De-Restricted

At the annual meeting of Sisal Estates, Ltd., an East African sisal plantation firm, Colonel C. E. Ponsonby said that at the end of 1941 the British Government withdrew its restrictions on sisal production and called on East African producers for a maximum output. Shortage of labour is causing anxiety to African sisal plantations, but it is expected that steps will be taken to transfer workers from less essential branches of East African agriculture. Arrangements have been made between the United States and Mexico by which the latter is to increase its production of *henequén* fibre without delay. The chief reasons for the sudden change in the position of sisal supplies are the loss of the Philippines and the Dutch East Indies and the entry of the United States into the war. Before the war, world production of hard hemp fibres amounted to about 600,000 tons per year, of which the Continent of Europe absorbed over one quarter. The European countries now controlled by Germany absorbed in particular about 70,000 tons of East African sisal out of the total Kenya and Tanganyika production of about 130,000 tons. At the outbreak of war the East African plantations were faced with ruin. The Ministry of Supply agreed to acquire the East African output, on condition that production did not exceed 100,000 tons per year. Even this quantity exceeded United Kingdom requirements and led to certain accumulations of stocks. The United States showed little interest in East African sisal until last December. Before then the position was such that the British Government took steps last year to ascertain the reactions of the Dutch East Indies and Mexico to a world restriction scheme, by which excessive accumulations of sisal and a possible breakdown of prices after the war could be avoided. The loss of the Philippines, which produced between 150,000 and 200,000 tons of hard hemp fibres (chiefly Manila hemp) a year, and the Dutch East Indies, which used to put 90,000 tons of sisal on the world market, have completely reversed the supply position. Recently the United States has been an active buyer of sisal in East Africa without being able to cover its whole requirements from current supplies. Although the great bulk of the world's sisal used to provide binders in agriculture (chiefly for cereals) the product is to-day playing an important part in a number of war industries, especially in shipping, where it is needed for such things as ropes and tow mats. Despite

rising East African and Mexican production, strict economy will be needed to meet current Allied requirements.

Coal Output Bonus

It now seems probable that an output bonus scheme will be brought into operation in the coal-mining industry at an early date. The Greene Board of Investigation recommended this expedient in its report on the wages issue on June 18th last, and suggested that it should take the form of wage additions in accordance with a sliding scale for increases in output beyond a prescribed standard figure (adjusted from time to time to meet changes in manpower and other factors beyond the control of the workmen) for each pit. These additions were to be calculated in terms of so many pence in the £ of the earnings of each worker over four-weekly periods, and the standard output proposed by the Board was 95 per cent of the target figure allocated to each pit by the Coal Production Council in November, 1941, based on the four best weeks' production during April/July that year. The provisional scale of payments would have secured for each wage earner a weekly addition of 1s. 2d. in the £ when the target was reached, 2s. when it was exceeded by 5 per cent, and 3s. by 10 per cent or more. On the current approximate average earnings of £5 10s. per week, this scale would have meant weekly additions ranging from 6s. 6d. for producing the target figure to 16s. 6d. for improving upon it to the extent of between 400,000 and 450,000 tons per week. To what extent these proposals will be embodied in the final scheme is not yet known, but the most promising development during the past few days has been an agreement between the representatives of the employers and miners on joint proposals relating to the preparation and introduction of an output bonus scheme. These proposals were debated in conference with the Board of Investigation last Monday, when Lord Greene intimated that he would be reporting to the Government, and when a general desire was expressed that the scheme should be introduced with the least possible delay. It is understood that the owners, like the Board of Investigation, favoured a scheme based on the output per pit, but apparently it is a district basis that was ultimately adopted, under the joint proposals of the representatives of the owners and workmen.

INSURANCE NOTES

ROYAL; LIVERPOOL AND LONDON AND GLOBE; YORKSHIRE

THE Royal has had a very satisfactory year, premium income in 1941 being higher by about one million pounds and profits substantially better than in the previous year. The chairman (Mr A. Kentish Barnes), in his statement on the accounts, attributed the expansion in fire income to rising values and the growth of industrial activity. Losses were lower at home, but heavier in the United States, several fires of exceptional severity having occurred; Canada produced a moderate profit and results in Australia and New Zealand were again highly satisfactory. In the accident department the US subsidiary—the Royal Indemnity Company—again produced satisfactory results, coupled with a considerable increase in premiums, and the Dominions and general foreign field make a substantial contribution to the aggregate results. The marine account discloses a good profit on 1940 operations, but the chairman stressed the many uncertain elements in the position. New life business at a net figure of £3,195,000 was slightly higher; war deaths cost £74,000 out of total death claims of £902,000.

Net interest earnings on general funds amounted to £867,000, a rather sharp fall on the 1940 figure of £967,000. With underwriting profits of £1,238,000 and a transfer of £132,000 from the marine suspense account, being an amount now released in respect of earlier years' accounts, the aggregate credits to profit and loss come to £2,237,000. Of this sum £240,000 was transferred to staff superannuation funds and £425,000 set aside as provision for British taxation. Loss on investments realised absorbed £75,000, £350,000 was written off investments—a purely precautionary measure—and £50,000 was written off freehold house property. The dividend, which is unchanged at 6s. 6d. per share, less tax, takes £923,000, so that the balance carried forward at £2,307,000 is higher by £174,000. The balance-sheet position is strong, with additional reserves in the fire and accident funds of £7,000,000, a marine fund at 118 per cent of premiums, and a general reserve of £1,500,000 in addition to the balance of profit and loss account. The chairman stated that book values of investments in the aggregate are substantially exceeded by market values and that full provision has been made for investments in territories in enemy occupation; new investment in this country has been confined to Government war loans and the company has also been able to support the call for subscriptions in the United States, Canada, Australia, New Zealand and South Africa.

The *Liverpool and London and Globe*, which is associated with and under the same management as the *Royal*, also enjoyed a substantial addition to premium income and an improved profit. Its results were governed by similar considerations to those affecting its associate, but the remarks of the chairman (Mr A. Kentish Barnes) throw further light on some aspects of the business. Concerning home fire insurance, the chairman indicated that while advancing values and expansion of industrial activity brought increases in sums assured, the latter have not generally kept pace with rising values, and he particularly urged householders, shopkeepers and property-owners to re-examine their policies in the light of present-day replacement costs. In the accident department, the restrictions on the supply of petrol, tyres and accessories, which did not appreciably affect the volume of motor insurance written in 1941, are likely to have considerable bearing in 1942. The particularly large increase in marine premiums—26 per cent—is largely attributable to business in the United States. New business in the life department at £1,331,000 was lower by about £60,000; the chairman mentioned that rather than attempt spectacular figures the company preferred, as a general policy, to concentrate on protecting the interests of the present life assured. Death claims at £391,000 include £35,000 on account of war deaths.

Combined underwriting profits of £779,000 are supplemented in the profit and loss account by net interest on the general funds of £324,000—a reduction of £50,000, due entirely to the effect of British taxation—so that aggregate credits come to £1,103,000. Trustees of pensions funds received £100,000 and provision for British taxation took £200,000; there was a loss of £55,000 on investments realised and sums of £250,000 and £50,000 were written off investments and house property respectively. Interest on debenture stocks accounted for £17,000 and after making provision for the dividend, which is unchanged at 27s. per share, less tax, and cost £363,000, the balance of £1,527,000 carried forward was higher by £68,000. Additional reserves in the fire and accident funds amount to £3,025,000, and apart from the balance of profit and loss account there is a general contingencies fund of £2,000,000, which remains entirely free. The company has written off, or offset by reserves, all investments in enemy and enemy-occupied countries and made full provision for all liabilities in these areas.

The accounts of the *Yorkshire* show a large addition to fire premiums, a substantial part of the increase being derived from

(Continued on page 156)

COMPANY MEETINGS

METAL BOX COMPANY
LIMITED

RECORD EXPANSION

MR. ROBERT BARLOW'S
REVIEW

The twenty-first annual ordinary general meeting of the Metal Box Company, Limited, was held, on the 29th ultimo, at the Connaught Rooms, Great Queen Street, London, W.C.1.

Mr. Robert Barlow (chairman of the company) presided.

The Secretary (Mr. John Cartner) read the notice convening the meeting and the report of the auditors.

The Chairman's review, which had been circulated with the report and accounts, and was taken as read, was as follows:—

I would refer first to changes in the board since the last general meeting. Mr. F. N. Hepworth, who had been chairman of the company since its formation in 1921, expressed a desire to relinquish that position, and at the request of my colleagues I agreed to combine the duties of that office with my position of managing director. I should like to pay tribute to the great services Mr. Hepworth has rendered to the tin box industry in general and our company in particular over a long period of years. Mr. A. McKinsty, M.Sc., M.I.Mech.E., M.I.E.E., has been elected to the board, and his wide business experience is proving of great value to us.

At the request of the Minister of Production I have accepted the chairmanship of the Industrial Panel which he has set up, and I am devoting some part of my time to that work.

The year under review has been one of effort and accomplishment in offices and factories at home and overseas, and I wish to record my appreciation and that of my colleagues of the continued loyal service rendered by all our workers and staffs.

SUBSTITUTION OF LACQUER COATING

The war has created many problems for us, and its extension to the tin-producing centres of the Far East has had far-reaching effects upon the supplies of our principal raw material, tinplate. Tinplate, being a steel sheet coated with tin, fulfils two main functions in the container industry; first the provision of an attractive appearance and a convenient medium for decoration, etc., and second the protection of the product from deterioration. For the protection of certain foods and other commodities the use of tin is essential and supplies for these continue to be available. In the majority of other cases, however, lacquer coating has been substituted for tin coating and we are satisfied that the protection it affords will be adequate for these purposes. Our research and development departments have had and continue to have, in consequence of these changes, a very busy time, and we have been happy to make available to those concerned the results obtained in this connection.

A high degree of standardisation of size, shape and type of containers has been developed during the year, resulting in considerable savings for the national effort in materials, labour and transport.

WELFARE OF EMPLOYEES

Working conditions and welfare of employees have continued to occupy our attention, and during the year we have extended and improved canteen facilities at our factories. Works committees consisting of representatives of management and employees have also been set up or extended at each factory. Through the medium of these committees we hope to augment the regular means of consultation and so secure the fullest co-operation for all measures

undertaken in the mutual interest of the company and its employees.

THE ACCOUNTS EFFECT OF WARTIME
TAXATION

The accounts now presented record further expansion but again reflect the effect of war-time taxation on trading, for while the balance of profit available for shareholders of £210,369 is approximately £10,000 greater than the previous year, it is, with the exception of that year, the lowest for several years, notwithstanding the increase which has taken place in turnover.

Following our practice of previous years we have written off expenditure incurred during the year on air-raid precautions and in respect of war damage premiums and contributions.

ASSETS EXCEED LIABILITIES BY OVER
£2,300,000

The consolidated statement reveals a strong position with reserves of £1,807,826 against ordinary capital of £1,488,743, and an excess of current assets over current liabilities of over £2,300,000. With the growth of the business stocks and debtors stand at higher figures, and this, with increased taxation liabilities, accounts for the rise in creditors.

The usual interim dividend of 5 per cent. was paid on the Ordinary stock on January 1, 1942, and your directors recommend for the fifth year in succession a final Ordinary dividend of 10 per cent. and a bonus of 2½ per cent. This leaves a balance of £45,482, which has been added to the amount carried forward. In addition, undistributed profits of the year of subsidiary companies, applicable to the shareholdings of your company, amount to £18,907.

Finally, we wish to express our greetings and good wishes to those of our employees who are on active service with the forces.

The report and accounts were unanimously adopted.

A final dividend of 10 per cent. (making 15 per cent. for the year), together with a bonus of 2½ per cent., less income-tax, on the ordinary stock, was declared.

The retiring directors (Mr. R. Beverley, Mr. J. Cartner, Mr. A. McKinsty and Mr. J. Ryan) were re-elected, and the auditors (Messrs. Hodgson, Harris and Co.) were reappointed.

A vote of thanks to the chairman, directors, staff and employees concluded the proceedings.

BEECHAMS PILLS, LIMITED

INCREASED TRADING PROFITS

The fourteenth ordinary general meeting of Beechams Pills, Limited, was held, on the 29th ultimo, in London.

Mr. Philip E. Hill (the chairman) said that for the tenth successive year their trading profits for the period under review at £1,175,646 showed a substantial increase. A particularly pleasing feature of that increase was the fact that the profits of their overseas business before charging foreign and British taxation were approximately £132,000 in excess of that of the previous year. Their contribution to the National Exchequer in taxation amounted for the year to £1,138,365, not including amounts paid in purchase tax.

Generally their products were deservedly increasing in popularity both at home and overseas. The company continued to pay particular attention to research and development and they had been fortunate in securing the assistance of some of the best brains in the scientific world.

This was the centenary year of the Beecham Pills business, on which their present organisation had been founded and developed. The manufacture of Beechams Pills by the late Mr. Thomas Beecham was started at Wigan in 1842. The business had succeeded from its inception. Mr. Beecham, who died in 1907, made no

attempt to merchandise anything but his pills. Since that time, however, there had been big developments, and today the company's products included foods, toilet soaps, tooth pastes, mineral waters, hair lotions, creams, shampoos, cosmetics of every description, agricultural and veterinary products, and medicines for dogs and cats.

It was the intention of the board as and when opportunity occurred to extend still further its operations in universal products of every description and to broaden the base of the group's construction with other than medicinal products.

The report was unanimously adopted.

GUEST KEEN AND
NETTLEFOLDS, LIMITED

HEAVY PRESSURE OF DEMAND

SIR S. R. BEALE'S STATEMENT

The annual general meeting of Guest Keen and Nettlefolds, Limited, was held at the Queen's Hotel, Birmingham, on Wednesday, the 29th ultimo.

The following is the statement of the Chairman, Sir S. R. Beale, K.B.E., which has been circulated with the report and accounts, and was taken as read:—

Once again I have to ask you to accept a rather brief letter instead of the longer review of the activities of the G. K. and N. group that was the pre-war custom.

During the past year there have been no changes on the Board of the company.

Pressure of demand has, of course, been heavy on all departments, and the only wish of everyone concerned is to continue to contribute to the limits of their individual capacity.

CONTROLLED PRICES AND RISING COSTS

The only comment that I need make on the accounts is that they record such a position as would be expected in present times, controlled prices and rising costs, coupled with taxation at a level with which we are all only too familiar.

Full provision has been made to meet taxation liabilities; you will see from the accounts that we have made purchases of Tax Reserve Certificates.

The last Finance Act held out hopes that the burden of the excess profits tax would be reduced, if certain conditions were complied with, from the rate of 100 per cent. to the rate of 80 per cent. It must not be forgotten that this apparent concession of 20 per cent. is reduced to a possibility of 10 per cent. with income tax at its present rate.

No provision has been made in the accounts for this possible concession in taxation, because it is impossible to say when the amounts conceded will be repaid even if it is found that the conditions qualifying the repayment when finally laid down can be complied with.

FUTURE EARNING CAPACITY

I referred above to rising costs and controlled prices; the former do tend to increase at a higher rate than the latter, and as long as the "Standard" rate of profit is earned the immediate result is to reduce the total of taxation payable. It must be remembered, however, that when in the future these increased costs cannot be offset by the increased output during the war, capacity to earn profits must be seriously affected.

As you would wish, I would record our great appreciation of another year of hard work by every workwoman and workman, and by every member of the staff and Board.

The report and accounts were unanimously adopted.

The retiring directors—Mr. T. S. Peacock and Lt.-Col. the Hon. C. H. C. Guest, M.P.—were re-elected, and the auditors having been reappointed, a vote of thanks to the chairman, directors, and staff closed the meeting.

GENERAL ELECTRIC
COMPANY, LIMITED

INCREASED PRODUCTION

The annual general meeting of the General Electric Company, Limited, was held, on the 30th ultimo, in London.

The Rt. Hon. Lord Hirst of Witton, the chairman and managing director, presided.

The following is an extract from the statement by the chairman circulated with the report and accounts:—

I can add but little to the directors' report of the company's activities during the year. I can assure you, however, you have every reason to be proud of your company and of the vital part it is playing. All our manufacturing organisations are doing their utmost to bring their full capacity to bear, and the whole knowledge and skill of the administrative, technical, and manufacturing staffs are engaged in development, design and production to meet the essential needs of today. We have managed to obtain an ever-increasing volume of production, the shortfall in some departments, due to Government restrictions, being more than offset by an increase in others. Our distributive and administrative organisation has maintained, in spite of shortage of staff, a high standard of efficiency, and every effort has been made to retain the good will of our customers. The activities of our research laboratories have continued with undiminished vigour—our expenditure in this direction has borne good fruit, both in the company's and in the national interests.

EXPORTS

As regards export, you are aware of the difficulties with which we have to contend, and I can only say I am amazed at the volume of shipments we have been able to maintain, thanks to the efforts of our export staff and the skill and courage of the officers and men of the Navy and Merchant Service.

The losses we have suffered in the Far East are naturally somewhat severe, though, foreseeing the danger, we considerably reduced our commitments in that part of the world. We have provided for all losses incurred in this year's accounts. Much as we regret the material loss, we regret still more that so many of our staff have lost their liberty and are now in the hands of the enemy, so far as our information goes. Those not serving with the Forces stayed at their posts to the end, but I am glad to say that our staff in Burma finally reached safety in India. All wives and children, too, were safely evacuated, save only the wife of our manager in Hong-kong, who, being a trained nurse, gallantly volunteered to stay on. We are seeing that suitable provision is made for all of them.

E.P.T. AND POST-WAR PROVISIONS

Whilst our efforts must necessarily be concentrated on the present needs, we cannot afford entirely to neglect the future, and we are doing what we can to plan for the post-war period. Financially, as I said last year, excess profits tax at 100 per cent. deprives us of the opportunity to provide, as we would wish, to meet the needs and difficulties which will follow the war. In a big company greater activity, such as we have today, inevitably means that we have to incur additional expenditure in many directions, which is not allowable as a deduction for tax, but which we, as prudent directors, have to write off from the year's profits. Such provisions as these fall, therefore, entirely on the net profits available for distribution amongst our stockholders, and in this year, coupled with increased taxation, have prevented us from placing any sum to provision for war contingencies as we did last year. We recommend, however, a continuance of the dividend at the same rate as last year, i.e., a dividend of 10 per cent., and a bonus of 7½ per cent.

The report was unanimously adopted.

CHARTERLAND AND
GENERAL EXPLORATION
AND FINANCE COMPANY,
LIMITEDMERGER WITH UNITED
EXPLORATION

The ordinary general meeting of Charterland and General Exploration and Finance Company, Limited, will be held, on the 6th instant, at 19, St. Swithin's Lane, E.C.

The following is an extract from the statement by the chairman (Mr. J. E. W. Lomas) circulated with the report and accounts:—

Revenue from interest and dividends on investments, etc., shows an increase of £2,362 over last year's figure, and difference on realisation of investments and depreciation written back shows an increase of £39,746, due largely to the recovery in market prices during the past year. The net profit for the year amounted to £67,853, as against £29,640 in the previous accounts.

The report shows that £25,000 has been transferred to general reserve, £15,000 to reserve for future taxation and a dividend of 10 per cent. is recommended.

In a circular accompanying the report the directors state:—

The Charterland and General Exploration and Finance Company and the United Exploration Company have for years past carried on closely similar businesses, at the same office and under practically the same direction. The directors of the two companies are now of opinion that amalgamation would benefit both companies.

At the ordinary general meeting of the Charterland Company the directors will seek consent to an increase of the authorised capital from £360,000 to £400,000 and, contingent thereon, confirmation of the offer made to the members of the United Company. If these resolutions are passed, the acceptance of the offer by the members of the United Company will be recommended at the meeting of that company.

VALUE OF THE ASSETS

A statement appearing in the circular, which had been examined and approved by the company's auditors, shows that (after excluding all unquoted assets and providing for the dividend recommended) the value of the ordinary shares of the Charterland Company on the basis of the underlying net assets at May 31, 1942, is equal to 6s. 2d. per ordinary share of 5s. fully paid.

A statement prepared on the same basis shows that the value of the capital stock of the United Company is equal to 4s. 10.8d. per 5s. unit of stock.

On the basis of these figures the Charterland Company has offered to acquire the whole of the assets of the United Company for 158,891 ordinary shares or units of stock of the Charterland Company, ranking *pari passu* in all respects with the existing ordinary shares. As the issued capital of the United Company amounts to £52,963 10s. stock in 211,854 units of 5s. each, the members of that company would receive three ordinary shares or units of stock in the Charterland Company in exchange for every four units of stock of the United Company which they hold.

So far as the Charterland Company is concerned, the proposals would materially strengthen its financial position and reserves, and with regards to the United Company its members would become members of a corporation having proportionately larger reserves, proportionately smaller dormant assets and commanding a freer market quotation. In the view of the directors, these last-mentioned benefits outweigh the slight advantage to the Charterland Company on the valuations given above.

MINING TRUST LIMITED

The thirteenth annual general meeting of the Mining Trust, Limited, was held, on the 28th ultimo, at Winchester House, E.C.2. Earl Castle Stewart, M.C., chairman of the company, presided. The following is an extract from the statement by the chairman which was circulated with the report and accounts for the year ended December 31, 1941:—

The accounts of the company are in their usual form and show that the share capital has been unaltered and that creditors are normal for the business. Investments at cost have been increased by the purchase of a further £100 of Eight per Cent. First "B" debenture stock of Mount Isa Mines, and £20,000 Two and a-Half per Cent. National War Bonds, and decreased by the return of capital amounting to £25,193 12s. 9d. made by New Guinea Goldfields, Limited, during the year with the result that the total under this heading is reduced by £5,093 19s. 9d.

Revenue for the year amounted to £121,493 2s. This represents a fall of £14,573 11s. 8d. as compared with the figure for last year. More than half of this fall in revenue is accounted for by the fact that the dividend upon shares held in New Guinea Goldfields, Limited, in respect of the year ending September 30, 1941, and amounting to £8,397 17s. 6d., was not declared until January, 1942, and therefore could not be included in this year's accounts of the Mining Trust. The remainder of the fall in income is due to a drop in the dividend received from Big Bell Mines, Limited, and to a small contraction in advisory and administration fees.

Expenses have been increased by £2,568 5s. 11d., due entirely to expenditure incurred on A.R.P. and the charge for income-tax deducted at source is increased to £39,929 2s. 3d. The balance of income over expenditure amounting to £58,839 7s. 11d. has been applied in reduction of the debit balance on income and expenditure account which is now shown in the balance-sheet at £679,309 17s. 2d.

NEW GUINEA AND MOUNT ISA

The Japanese invasion of New Guinea has necessarily brought to an end all operations upon the goldfield, at any rate for the time being, but the New Guinea Goldfields Company retains some £140,000 (Australian) in cash and Government securities which should be an ample reserve for opening up operations again as soon as hostilities cease. It is, however, not thought likely that the Edie Mine (including the Karuka vein) will be reopened. This will probably involve writing off some 35,000 tons of ore reserves located in the Edie area. On the other hand, the Koranga alluvial reserves have been recalculated and still stand at over 8,000,000 cubic yards averaging 1s. per cubic yard. The position of these reserves is considered very satisfactory when it is recollected that nearly 3,500,000 cubic yards had already been hydraulicked and treated up to October 1, 1941. Apart from the Koranga reserves, there are also other alluvial reserves calculated at 650,000 cubic yards with values estimated at between 4s. and 5s. per cubic yard.

Mount Isa Mines, Limited, is currently disposing of all its production of lead either to the British or Allied Governments, and is now disposing of substantial quantities of its production of zinc concentrates. Furthermore, it is expected this year that a moderate production of copper will be achieved. It is therefore hoped that the financial outcome for Mount Isa during the coming year will be somewhat better than for last year.

Cash at bankers increased during the year by £44,185. Our present cash and other liquid resources, including £20,000 Two and a-Half per Cent. National War Bonds 1946-48 and £10,000 Three per Cent. Savings Bonds purchased since the end of the financial year, amount to £541,000. Your directors feel that for the present all cash and other liquid resources must be rigorously conserved.

The report and accounts were adopted.

AMALGAMATED DENTAL COMPANY, LIMITED

The thirty-seventh annual general meeting of the Amalgamated Dental Company, Limited, formerly Claudius Ash, Sons and Company, Limited, and De Trey and Company, Limited, was held, on the 29th ultimo, in London, Mr E. Russell Polden (the chairman) presiding.

The chairman, in his statement circulated with the report and accounts, said: The results of trading, though greatly restricted in its world-wide operations, show further improvement, but having regard to the general situation and to the international character of the business, the directors feel that it would not be in the interests of the company to recommend an increase in dividend on the deferred

ordinary stock, which will remain at 5 per cent.

The profit from trading, etc., is £247,538, an increase of £55,385. After making full provision for taxation for the current year, the directors have decided to transfer to taxation and contingency reserve £40,000, and after providing for dividends the carry forward will be £63,088, an increase of £13,166.

The report was adopted.

GLOBE TELEGRAPH AND TRUST COMPANY, LIMITED

The sixty-ninth ordinary general meeting of this company was held, on the 28th ultimo, in London, Mr F. Alexander Johnston (the chairman) presiding.

The following is an extract from the

chairman's statement circulated with the report and accounts: You will have noticed with deep regret the passing of our late chairman, Lord Middleton. We deplore his death.

There is a further reduction in our net income which is chiefly due to excess profits tax and increased income tax—the present accounts show the full effect of an income tax of 10s. in the £. Our main source of revenue, Cable and Wireless, has again been very satisfactory. It would be foolish in these uncertain times to endeavour to make a forecast of the future, and I need only refer you to the remarks of Lord Pender and Sir Edward Wilshaw in the Cable and Wireless reports which have recently been issued for the position of our large holdings in that great company.

The report was adopted.

(Continued from page 153)

overseas business, and an excellent underwriting result in this department. Accident income also displayed a marked expansion but marine premiums are lower—a rare feature in 1941 accounts, pointing to a cautious policy. New life business at £1,118,000 showed a further contraction, the reduction being partly due to the cessation of life operations in Eire. Mortality from normal causes was favourable, but war deaths cost £36,000 out of total death claims of £273,000; the net rate of interest

earned fell from £3 13s. 1d. per cent to £3 11s. 7d. per cent.

Credits to profit and loss, including net interest of £66,000, amounted in the aggregate to £341,000. Outgo items include the sum of £72,000 for overseas taxation which, contrary to the more usual procedure, was not charged in the departmental accounts. Other expense charges, including £78,000 for income tax and NDC, absorbed £155,000. Provision for dividends (unchanged) requires £100,000 and the balance of £102,000 carried forward represents an increase of £14,000. There is a general reserve of £1,500,000.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

AFTER a dull close at the end of last week, a number of factors have conspired to prevent any notable recovery in market sentiment. News of the fall of Rostov has driven home an impression that, militarily, the present phase is critical. As at so many other danger points during the present war, no selling pressure has developed, but there has inevitably been a renewed decline in turnover. The gilt-edged market felt the full effect of the general malaise and a tendency to unload 2½ per cent National War Bonds 1945-47 and 1946/48 was inspired by the Chancellor's decision against the creation of a new series. For the rest, leading undated issues were markedly out of favour, old Consols, 3½ per cent War Loan and Conversion and Local Loans suffering daily losses in the order of ½. After the Chancellor's announcement, 3 per cent Savings were also offered. In the foreign bond market, there was a recovery in Brazilian, Chilean and Peruvian issues at the end of last week. This week saw a further setback in Egyptian Unified and some weakness in Chinese loans following the news of Japanese reorganisation of the Chinese customs. The home rail market showed no strong reaction to the interim announcements. Before the week-end, a somewhat bullish tendency developed with a gain of ½ for Great Western and of ¼ for LMS, ordinary. Later, interest fell away and price changes mainly reflected the marking of stocks ex dividend. Among foreign rails,

Canadian Pacific issues moved irregularly, the ordinary being offered before the week-end, and there was little business in South American rails.

As in other sections, the industrial market suffered from sporadic and irregular price movements. Heavy industrials enjoyed more business than of late, but scattered gains and losses in the order of ¼d. failed to produce a definite trend. Among miscellaneous equities, International Nickel and Brazilian Traction were both lower on balance, but there was a steady, if modest, demand for Murex and Metal Box. Shipping issues were in demand, especially P. and O. deferred on dividend prospects, while, in mid-week, Cunard recovered from recent profit-taking. Guinness and Gallaher led the brewery and tobacco groups respectively, and there was an improvement in leading electrical equipment stocks. In midweek, the shares of certain specialists in the heavy industries were in particular demand, while electrical equipment shares were mostly firm. Turnover in general remained below the average of recent weeks.

Mining markets suffered from lack of interest, although scattered improvements among *kaffirs* were not uncommon. Daggas and E. Daggas lost pre-weekend gains on Monday and losses were suffered by such leaders as Sub Nigel, "Sallies," Union Corporation and Johnnies. The oil market was generally dull, all market leaders being lower on the week. Shell Transport, which gained ½ against the trend on Tuesday, reacted the next day, while Anglo-Iranian ordinary was consistently out of favour and speculation on

the fortunes of Mexican issues ceased to be attractive.

New York

No recovery from the previous stagnation took place on Wall Street before the week-end. Taxation prospects continued to depress sentiment and irregularity, coupled with a failure to hold hesitant gains, was the dominant feature. Selective buying of rail issues was the most encouraging development, but this did nothing to promote a general improvement. Early in the current week, demand was more severely damped by the news of the fall of Rostov. At no time was there any selling pressure, but turnover fell away and the downward trend continued on balance. The effect of increased taxation on net earnings is becoming a factor of some importance.

Indian Coffee.—The 1941-42 Indian coffee crop just harvested was estimated at 16,500 tons, of which 3,125 tons were sold to the Ministry of Food, about 3,000 tons exported to other destinations, mainly the Persian Gulf, and the remainder retained for local consumption. In peacetime France was India's best customer, followed by the United Kingdom, Norway, Switzerland, Australia and the Persian Gulf. According to 1939-40 statistics the total area under coffee in South India was about 180,000 acres, of which more than half is in Mysore, giving employment to a labour force of nearly 100,000 natives. India ranks with Kenya as a coffee-producer, its average crop being about 16,000 tons.

Cotton Export Allocations.—At the end of last week, the Cotton Board issued export allocations to merchant shippers for the production and export of woven cotton and cotton mixture piece goods for the three months ending September 30th next. No commercial allocation has been made for South Africa, and only urgent orders, sponsored by the South African authorities, will be approved. It is thought undesirable that exporters should retain large balances of unused buying allocations which might, at some later stage, be placed in the industry to the detriment of more urgent orders, and any such balance held was cancelled on July 21st. Merchants were asked to inform the Board of their wishes concerning the disposal of allocations less than 1,000 square yards before July 31st. It is understood that rather larger allocations have been made for British West Africa, which is almost the only market with which Manchester firms can now trade.

Ophthalmic Optical J.C.—The ophthalmic optical industry has set up a joint industrial council to provide machinery for joint action between employers and employees on questions of wages, working conditions and the settlement of differences. The industry manufactures, assembles and distributes spectacle frames and lenses, and cases.

Shop Workers' Wage Increase.—The joint industrial council for the retail drapery, outfitting and footwear trades has decided to increase wages from August 10th. The increase is 5s. a week for branch managers and manageresses, 3s. for men over 21, 2s. for men between 18 and 20, and 1s. 6d. for youths under 18. Women's rates are to rise by 2s. for those

Shorter Comments

Shell Union Oil Corporation.—Gross operating earnings second quarter 1942 \$80,072,300 (\$70,720,300). Net income \$2,572,400 (\$4,208,200). Consolidated income account for first six months 1942 shows earnings \$7,228,950 (\$7,829,946) or 55 cents per share against 60 cents per share. Mid-year dividend 40 cents on Common Stock as before.

Brazilian Traction, Light and Power.—Gross earnings, June, 1942, \$3,961,926 (\$3,602,456). Net earnings \$2,144,888 (\$1,950,051). Gross earnings 6 months to June 30, 1942, \$22,661,378 (\$20,397,259). Net earnings \$12,012,158 (\$10,877,126).

Canadian National Railways.—Gross earnings, June, 1942, \$31,789,000

(\$25,642,352). Net earnings \$9,445,920 (\$6,828,442). Gross earnings 6 months to June 30, 1942, \$169,415,000 (\$141,715,488). Net earnings \$39,518,870 (\$32,108,211).

Transvaal Gold Mines Working Profit.—The total estimated working profit of the gold mines of the Witwatersrand for June, 1942, was £3,707,815. The estimated working profit for May, 1942, was £3,734,707.

Celanese Corporation of America.—Consolidated net profit first half 1942 \$3,357,820 (\$3,149,921). Condensed Consolidated earnings statement for year to June 30, 1942, shows gross income before depreciation \$29,022,785 (\$18,434,541). Net operating profit \$22,898,455 (\$14,510,449). Net income for year \$7,313,584 (\$5,182,025).

Charterland and General Exploration and Finance Company.—Gross revenue for year to May 31, 1942, £75,029 (£33,254). Profit £67,853 (£29,641). To general reserve £25,000 (£5,000). Dividend increased from 7½ per cent to 10 per cent. Forward £8,552 (£4,993). Resolutions for conversion into stock of the ordinary capital and the raising of the authorised capital to £400,000 by the creation of 160,000 ordinary shares of 5s. are to be proposed at the annual meeting at 19, St. Swithin's Lane, E.C.4, on August 6th, at noon. The increase in capital is for effecting amalgamation with the United Exploration Company, Limited.

COMMODITY AND INDUSTRY NEWS

over 21, 1s. 6d. between 18 and 20, and 1s. for those under 18.

Mercury Metal Prices.—The Control of Mercury (No. 9) Order, which came into force on July 28th, increases maximum resale prices of mercury metal. Until further notice the Ministry of Supply's price will be £68 10s. per bottle ex warehouse in the United Kingdom in lots of eleven bottles and over. The Order provides for a maximum price for quantities over one bottle but less than eleven bottles of £69 15s. per bottle, and for larger quantities £69 per bottle. There are higher prices for lots of under one bottle and for redistilled grades. Mercury was previously sold from £48 to £48 15s. per flask, according to quantity.

Control of Production.—In accordance with its memorandum on the control of manufacture and supply of consumption goods (outlined on page 89 of *The Economist* on July 18th) the Board of Trade has now issued a series of Orders (SROs

Nos. 1451 to 1461 and Nos. 1510 to 1512) putting the proposals set out in the memorandum into effect.

Finance

GOVERNMENT RETURNS

For the week ended July 25, 1942, total ordinary revenue was £48,508,000, against ordinary expenditure of £90,128,000, and issues to sinking funds of £150,000. Thus, including sinking fund allocations of £2,602,965, the deficit accrued since April 1st is £920,706,000 against £959,088,000 for the corresponding period a year ago.

General Strike?

THE Indian Congress Party is in session at Bombay, to decide whether or not the people of India are to be called upon to strike against British rule. For Britain, Sir Stafford Cripps and Mr Amery have made it plain that civil disobedience will be met by firmness. There is no alternative, because it is the war effort of the free world that will be threatened if this move to bring India to a standstill is carried out.

Congress is considering the resolution of its Working Committee which was drafted early last month. Its starting point is a demand for the British Government to abandon its status in India and to hand over Indian government to an unspecified body of Indians. In mid-war this is impossible. There is no agreement among the Indian communities themselves, no basis for the provisional administration which Congress wishes to see set up, or rather to set up itself. It was on the rock of disagreement among the Indians themselves that the mission of Sir Stafford Cripps, which offered India independence in its own way, foundered. Mr Gandhi himself has admitted that the result of a British withdrawal now might be anarchy.

Mr Gandhi is ready to take the risk. On Tuesday, his draft resolution, which began the discussions at Wardha last month, was revealed by the Government of India. It

went much further than the resolution which was finally agreed upon. It declared that India needed no foreign assistance, military or political, and that the presence of foreign soldiers in India was a menace. It declared that India had no quarrel with Japan, and that if India were freed, Mr Gandhi's first step would be to negotiate with the aggressor. Mr Gandhi did not get his way at Wardha. Significantly, perhaps, he was restrained, largely by Pandit Nehru. The resolution before the Bombay conference welcomes the presence of Allied forces in India to ward off Japan and to help China, and the claim that Congress has no wish to embarrass the British or the Allied Powers is repeated. This is a long step from the quietism of the Mahatma.

Clearly, there is a wide gulf within the Congress party itself. Mr Gandhi is a pacifist; and, in his ethics, he can see no difference in kind, only in degree, between Britain and Japan. Pandit Nehru and probably the majority of Congress leaders are firmly convinced that the real danger comes, not from the old "imperial" rule of Britain, but from the "new order" of the Axis aggressors. Up and down India, inside as well as outside the Congress party, there has been grave uneasiness since the Wardha resolution with its threat of civil revolt was made known.

Why then does Mr Gandhi still hold the lead? Why does Pandit Nehru, for all his apparent realism, fully associate himself with the blatant unreality of the Wardha demands? Why is Mr Gandhi to be given plenary powers to organise disobedience? In part, it is because Pandit Nehru, no less than Mr Gandhi, sees in the present state of India and the world a chance to force on the freedom of India, at whatever risk. It is blackmail—from the highest motives, perhaps, but blackmail none the less. And, if this chance is to be taken, Mr Gandhi cannot be jettisoned. There is no alternative leader of the Hindu masses. Mr Gandhi is an appeaser, because he is a root and branch pacifist—and the wildest of politicians as well. Pandit Nehru and others are in no sense appeasers; but they cannot rally round them support enough without Mr Gandhi. So, incredibly, they go Mr Gandhi's way. Such is the logic of Indian politics.

It is plain now, first, that Sir Stafford Cripps offered the only possible way-out of the Indian impasse and, secondly, that the main Indian parties are neither willing nor able to take it. Mr Rajagopalachari now asks for a Congress-Moslem coalition, and Sir Tej Sapru for a round-table conference. Both have worked unceasingly for agreement and civil peace.

But they should know better than anyone, from their

own bitter experience, how impracticable these suggestions are. The British Government cannot neglect the smallest chance of reaching an eleventh-hour agreement. But, so long as the call to quit India stands, there is no possible accord. The other Indian parties, watching the gathering storm, fear Congress control much more than British rule. But there is no rallying point for this disquiet. Mr Jinnah is no more helpful in his policy than Mr Gandhi. He stands on the sidelines to seize advantage from what may happen. They will fight Congress, in a "freed" India, as readily as they would fight Japan.

The recruitment and the fortification of India still go on unchecked; and if Congress calls its strike, then the authorities will act at once to save the Indian war effort from sabotage. The real rallying point for India should be the war effort itself and the common danger of all the free peoples, including China. At heart, almost every Indian knows this; the pity is that so many seem so likely to fall in behind Mr Gandhi in, perhaps, the maddest crusade that history has ever seen. An appeal from Mr Churchill or President Roosevelt, or both, might strike a chord of full-hearted welcome throughout the sub-continent. Such an appeal should be made. But there is no guarantee that even this would keep Mr Gandhi and his victims from the Gadarene descent.

Twice Blitzed

NOWHERE is precept running ahead of practice more than in planning. Nothing is more heartening than the zeal and detail of the blue-prints which one bombed town after another is preparing for its rebuilding. Nothing is more dispiriting than the actual prospect which seems to confront them. Over them all, Coventry, Hull, Southampton, Plymouth and the rest, hangs the same question, "Where is the money to come from?" And from the Government there is still no answer. Rightly, it has been argued, from the solid experience of war economy, that if the physical resources exist, the programme is possible; if there are the building workers, the steel, the cement and the timber to rebuild the bombed towns, there can be no real obstacle to their rebuilding. But the rôle of finance remains crucial. It is to make what is possible actual. Before they can start their rebuilding, these towns will need to have, or to be given, a financial claim to the resources they require; and they will need the power at law to use the resources allotted them in the right way. At present, they have been promised neither. There has been too much talk about humbug and too little talk about finance.

Financially, the bombed towns are badly off. Destruction and evacuation have cut down sharply their revenue from rates. They are faced in each financial period with deficits. It is true that the Treasury has given help. Three-quarters of the deficits of these towns are financed by Treasury grants, one-quarter by Treasury loans. But, for the purpose of these grants and loans, deficits are strictly defined. Accumulated balances must first be used, and standard overdrafts thrown in, before Treasury aid is forthcoming. The only certain thing known by the bombed towns about their future financial position is that they will end the war with their rate income seriously curtailed, their accumulated balances gone, their banking accounts overdrawn to the hilt and their obligations increased by a debt to the Treasury amounting to one-quarter of all their wartime deficits.

It is not surprising, therefore, that the local authorities look with caution at their own reconstruction projects. Until they are given some earnest of satisfactory financial aid, they will not lightly envisage the large capital commitments which rebuilding must involve. However reluctantly, they will be compelled to contemplate the quickest possible rebuilding of bombed sites in order to restore their rateable values and bolster their post-war budgets. The programmes of land purchase needed for

replanning are costly; and until the future is made clearer and more certain, they will inevitably be avoided.

Nor is it only financial guarantees that are lacking. If the chance of reshaping England's towns, which has been given by bombing, is to be taken, local authorities, singly or in regional groups, will need, on the nation's behalf and within the framework of a national plan, wide powers of land control and land purchase. So far—except, it may be, in the inner circles and committees, where central policy is presumably being shaped—there is no national plan, no provision for regional reconstruction, and no positive scheme for housing or industrial location. There is not even a planning authority. The Ministry of Works and Planning is an agent; and where the inspiration and initiative for the planning of New England are to come from, no one yet knows.

Under this pall of doubt and uncertainty, hearts will inevitably grow sick. That the Government is keenly interested in planning on paper is common knowledge. Local authorities are being encouraged and even pressed to draw up projects for the redevelopment of their areas, for the zoning of sites for housing industry and public works, for the allocation of costs and for the apportionment of priorities between one scheme and another. This might admittedly be taken to prove that, when the objectives have been set, the means will be found; and Lord Reith did once say that financial aid would be forthcoming for the reconstruction of blitzed towns. But those who are being called upon to plan are sceptical. They ask two simple questions. How is it to be paid for? How, *quo warranto*, is it to be done?

Nothing is more urgently needed than a statement from the Government, in explicit terms, on the ways and means of physical reconstruction. Rebuilding cannot start now, but replanning must—it has done. It is not possible to replan positively and with conviction while the main elements in reconstruction policy are still unknown. In the bombed areas, for instance, there will be a sudden large need for houses when the war ends, on their outskirts as well as in their devastated areas. There will be a serious danger of heavy overcrowding and tawdry makeshifts. The local authorities will need new houses, controlled rents and some means of apportioning accommodation, in order of urgency, as new houses are put up. Nor is there any case, in equity or in expediency, for laying these costs upon the bombed towns themselves, with an onerous rate charge superimposed upon their

blitzed finances. New housing, to say nothing of new planning at large, will need to be, by one means or another, a national charge within a national plan.

The suspicion is that the old financial orthodoxy is still in control, that the old inadequate mixture of rates and subsidies is to be relied upon to carry the weight of reconstruction. If this is true, the local authorities will plan large and, by necessity, act small. The issues are big. The Government must decide between outright grants, development loans (perhaps interest free) and the introduction of new local taxes, over whole regions and

on property or incomes, in place of local rating—which has broken down at every strain for a generation. It is a decision which will decide the shape of post-war government as well as the course of reconstruction. Almost certainly, if the job is rightly done, three tiers of government will emerge, central, regional and local, each with its own finance and allotted powers within a national plan, and each with its own form of democratic control. At least the outlines of the decision must be made now, or else the blitzed towns of to-day will be the depressed areas and shanty towns of to-morrow.

Time on Their Hands

IN last week's debate on civil defence, Mr Morrison deplored the possibility that, as a result of the attempts to give civil defence workers useful employment in their duty hours, they might come to regard civil defence itself as a subsidiary occupation. But it is easy to sympathise with their attitude. They have watched the calls on Britain's manpower become more and more insistent; they have heard the popular demands for offensive action and a second front grow louder day by day; they have watched and listened with an increasing sense of impatience and frustration, because, amid all this striving of a nation which has at last reached full mobilisation, they find themselves with nothing to do.

It is quite true that a similar period of waiting, in the first year of war did not prevent the civil defence services from carrying out their duties with efficiency and valour when the need at last arose. It is also true that if the need returned, present discontents would be dropped, and wardens and firemen, rescue workers and ambulance drivers, would once again show the same tireless courage night after night. But now, rightly or wrongly, most people, civilians and civil defence workers alike, feel that they have got the measure of air raids; the latter, in particular, are confident that they will be able to cope with the worst that may befall. But, as the Select Committee on National Expenditure pointed out in its report on the civil defence services,

nothing could be more damaging to morale and efficiency than that men and women should feel that they are being retained for duty at times when they are unnecessary.

That was written after nine months of continuous raiding; it has been abundantly justified after, for most places, a year of comparative immunity.

It is not easy to find a remedy. As the Select Committee suggested, more use should be made of the compulsory powers granted under Regulation 26A in order to secure a larger recruitment of part-time workers and thereby reduce the numbers employed whole-time. So far those

powers have only been generally used for fire-watching and restricted to men; Mr Morrison has now fore-shadowed an extension to women, and some places are beginning to compel able-bodied men and women to undertake part-time civil defence duties of all kinds. Auxiliary workers like this, however, would for the most part only be available at night, because most of them are already occupied by day; and it is the day shifts that the whole-time members of the civil defence service find so tedious. Moreover, even if the policy of releasing one-third of the general services and one-sixth of the National Fire Service were pursued to its practical limits, there would still be the problem of finding a use for those left behind. There is also the danger that the men transferred will be the best and keenest, for they are more likely to seize the opportunity of finding useful employment, though it has been laid down that the Ministry of Labour must consult the local authorities to ensure that the civil defence services do not lose those whose experience is essential for the maintenance of efficiency. The aim should be to leave behind a small but efficient nucleus of whole-time workers who can be called for service over a far wider area than that of a local authority, which would imply basing the whole of civil defence regionally instead of locally. It is not perhaps without significance that the morale of the National Fire Service, which is the only branch to be administered regionally, appears to be much better than that of, say, the rescue service, in spite of the longer shifts it has to work.

There are other reasons in favour of administering the whole of the civil defence services regionally. The nucleus that is left behind must still be occupied if it is to be contented. In fact, the more efficient it is, the more it is likely to resent having nothing to do. Moreover, there should be no cause for some of the current grumbles—poor sleeping and working conditions in the depôts, favouritism in promotion, and so on. It is felt, not with-

EQUITY & LAW
LIFE ASSURANCE SOCIETY
Established 1844

THE SERVICE OF LIFE ASSURANCE

● Life Assurance provides the means whereby your regular savings, year by year or month by month, may be converted into the form best suited to your needs. Provision may thus be made for your retirement, for the education of your children or for your dependants after your death.

● The service of Life Assurance cannot now be offered to you by personal approach owing to the absence of so many of the Society's staff on war duties. This service is, however, still available on request and will gladly be placed at your disposal.

Head Office: 163/4, STRAND, LONDON, W.C.2. Telephone: TEMple Bar 0381
(temporarily transferred from 20, Lincoln's Inn Fields)

City Office: 30, Coleman Street, E.C.2. Telephone: KELvin 5111/2

out justification, that if all civil defence were a national service administered regionally, many grievances could be eliminated.

There would still remain, however, the problem of occupation. Civil defence work depends so largely on improvisation that constant rehearsal is especially tedious because it is felt to be useless. Consequently, the employment of civil defence personnel must for the most part be in non-civil defence work, and since the whole-time force that is left behind after the transfer to industry takes place should be the bare minimum that is considered necessary, it cannot be moved far from its dépôt. Even within these limitations, however, there remain a number of jobs that it could be given to do. The important thing is to make the civil defence workers feel that the jobs are necessary and worth while, and not in the nature of unemployment relief works. There is, for instance, still a considerable amount of demolition work to be done in bombed areas; yet in some cases this is being carried out by building contractors, and apparently it is regular builders who alone can do repairs, although the heavy rescue service might very well be taught this sort of work.

Much more satisfactory would be bringing direct war work to the dépôts. Some firms have shown remarkable enterprise in obtaining machinery for making munition parts, and a little ingenuity on the part of the local or regional authorities should enable this to be done in the bigger civil defence dépôts. Mr Morrison was disappointing in this respect. He said that the Supply Departments considered the opportunities to be limited—surely rather a defeatist attitude, especially since such dépôts have the great advantage of a disciplined team of labour, ready to hand day and night. There is also the suggestion that each service might be made as self-sufficient as possible. The fire service, for instance, contains a number of tailors. Could they not make and repair the firemen's uniforms? Similar employment could be found for the cobblers and the hairdressers. The civil defence service has a fairly high proportion of the small shopkeeper class—people who opted for civil defence so that they could keep an eye on their businesses in their spare time—and each unit of civil defence could profitably be made into a small community. There would be the wage difficulty to get over. At present,

civil defence workers are allowed to do what they please in their spare time, and earn what money they can. But if they are employed on rush jobs for local authorities or private employers, such as clearing snow or delivering coal, they are only to receive their civil defence pay; in fact, the Ministry of Home Security only wants them to be employed on the sort of jobs for which the wage rate is less than this pay, in order to avoid any dispute. If they do direct war work in their dépôts, they will receive no additional payment, because it would place them in an invidious position *vis-à-vis* those civil defence workers who have no opportunity to earn it. Mr Morrison is considering, however, whether part of the contractors' payment could be available for the collective benefit of the service.

There is, of course, no case for treating civil defence workers over tenderly. Though unarmed, they are part of the forces of the Crown, and they cannot expect to be placed at an advantage, whether pecuniary or other, over the fighting services. Nor are they the only ones who, through the fortunes of war, must only stand and wait. But there are strong labour reasons for reducing the waste of manpower involved in civil defence to a minimum. No less urgent is it to prevent the complete demoralisation of what is, first and foremost, a citizen's service, and Mr Morrison ought not to have stigmatised those who are trying to prevent it as simply propagandists for the Fire Brigades Union. If the civil defence service has to have the disadvantages of the army, navy or air force, it has the right to expect the advantages—equality of conditions throughout the service, chances of promotion, and attention to welfare, which does not only mean periodic and preannounced inspections by Mr Morrison or his deputy. There is, too, more than a wartime importance in the maintenance of the civil defence service at the highest pitch of keenness and willingness. For in it there is the nucleus of the peacetime service which after the war will, it is hoped, be a permanent feature of democracy. If they are not allowed to rot, the men and women who saved English homes from burning, and rescued and restored their fellow citizens in a time of national peril, can be the foundations on which to base the new conception of service—by the people for the people.

Wartime Incomes—II

THE statistics of income distribution given in the House of Commons recently and discussed in *The Economist* last week (on page 132) have the defects of their merits. Being derived from income-tax returns, they are (or should be) close estimates. But, because of their origin, they entirely ignore the millions of small incomes which are never examined for the purposes of taxation. These small incomes have to be added to the figure given in the official statement before the complete picture of the distribution of individual incomes can be drawn.

Fortunately, this can be done within a narrow margin of error. The Budget White Paper (Cmd. 6347) gives estimates of the total of individual incomes, but for calendar years. There will not be any very great distortion if it is assumed that the total of individual incomes was the same in the twelve months ended April 5, 1939, as in the twelve months ended December 31, 1938, with a similar assumption for the later period. If this is done, it is possible, by subtraction, to get a figure for the total amount of income in the lowest range. (Actually, it is probable that incomes were slightly higher, in each case, in the fiscal year than in the calendar year. If so, this method will lead to a slight understatement of the total of exempt incomes. This should be borne in mind in what follows, but it should also be borne in mind that, since the error is present in both years, comparisons

between the two years are more likely to be correct than the actual totals.) By this method the following figures emerge:—

Range of Gross Income	GROSS INCOMES (i.e. Before Tax)					
	No. of Incomes		Aggregate Gross Incomes		Average Gross Income	
	1938-39	1941-42	1938-39	1941-42	1938-39	1941-42
Under £125	n.a.*	n.a.*	(£ Mn.)	(£ Mn.)	£	£
£125-£500	9,000	12,700	1,650	2,100	n.a.*	222
£500-£1,000	500	685	1,850	2,815	206	664
£1,000-£2,000	195	210	350	455	700	1,429
Over £2,000	105	105	270	300	1,384	5,048
			530	530		

*Not available

These figures reveal some curious movements. In the £125-£500 and £1,000-£2,000 classes, the average gross income before direct taxation appears to have increased during the war. In the lowest class, it has presumably also increased, and in the highest class it has remained stable. But in the £500-£1,000 class it has declined. This might mean either of two things—either that there has been a great migration across, but only just across, the £500 line, or alternatively that a large number of people who were in this class have lost income as a result of the war. Both these are likely. High wages and overtime may have given a number of wage-earners more than £10 a

week, but not much more. And there must have been a heavy proportion of young people in this class before the war who are now in the Services.

Figures of gross income, however, are less interesting than those of incomes after direct taxation has taken its toll. These are as follows:—

NET INCOMES (i.e. After Income Tax and Surtax)

Range of Gross Incomes	Aggregate Net Incomes		Average Net Incomes	
	1938-39	1941-42	1938-39	1941-42
Under £125	£ Mn. 1,650	£ Mn. 2,098	£ n.a.*	£ n.a.*
£125-£500	1,827	2,547	203	201
£500-£1,000	310	330	620	482
£1,000-£2,000	223	185	1,144	881
Over £2,000	330	205	3,143	1,952

*Not available

These figures illustrate very clearly the effect that wartime taxation has had on the distribution of incomes—though it should not be forgotten, of course, that the burden of indirect taxation is necessarily heavier on the small incomes. A final table sums up the whole matter:—

NOTES OF THE WEEK

Caucasus and Volga

The enigmatic feature of the past week's fighting in Russia is the striking contrast between the rapid German advance south of the lower Don and the almost stationary position inside the Don elbow to the north-east. The narrow break through from Rostov to Bataisk was broadened within a few days to an impressive salient, extending from the

shores of Azov in the west to the region of Voroshilovsk. Inside this salient are substantial stretches of the Rostov-Baku and Stalingrad-Novorossisk railways. If the German claim to have reached Voroshilovsk is true, the enemy's gain is twofold: the Armavir-Maikop-Krasnodar oil district may have become a battlefield sooner than had been expected; and the enemy will have won a point of vantage from which he may be able to stride the Kuban, one of the few rivers which still retains the character of an important tactical obstacle. Marshal Timoshenko's forces may find themselves in a difficult position in the triangle between Rostov, the Kuban and the Sea of Azov. But while the battle of the North Caucasus has moved rapidly, the battle of the lower Volga has so far hardly made any progress. Russian resistance opposite Stalingrad has been tremendous. It is possible that the Soviet High Command has decided to put more power into the defence of the Lower Volga than into the defence of the Northern Caucasus. Economically and strategically, the Volga is not only more vital; it is also more defensible. To keep the Northern Caucasus intact would involve tremendous difficulties of supply and reinforcement. Grievous as the loss of the Kuban steppes may be, their defence would be much more costly in man-

PERCENTAGE DISTRIBUTION OF PERSONAL INCOMES

Range of Gross Incomes	Distribution of Gross Incomes		Distribution of Net Incomes	
	1938-39	1941-42	1938-39	1941-42
Under £125	35%	35%	38%	39%
£125-£500	39%	45%	42%	47%
£500-£1,000	7%	7%	5%	6%
£1,000-£2,000	11%	8%	7%	3%
Over £2,000	100	100	100	100

The first pair of columns shows the effect of what may be called the economic changes of the war; the second pair shows the effect of the economic changes together with that of taxation. It would appear that 79½ per cent of the gross personal incomes of the community, and 86½ per cent of its purchasing power (the net personal incomes after direct taxation), is now in the hands of those whose gross incomes are less than £500 a year. During the war, the middle classes (£500 to £2,000) have had their share in the national purchasing power reduced by one-fifth, the rich by one-half.

power and equipment than the defence of the Caucasus mountains further south. The defence of Stalingrad is important for political as well as military reasons. It was at Stalingrad that Stalin's political ascendancy started during the Civil War. The defence of that town by Stalin has become a true legend. Stalingrad is not only a key-town; it is also a touchstone of Russia's high morale.

The New Capitulations

Too much exception need not be taken to the passing of the United States of America (Visiting Forces) Bill, which provides that all criminal offences on the part of members of the armed forces of the United States in the United Kingdom shall be removed from the jurisdiction of the British courts. Difficulties may arise. In particular, there are almost certain to be cases of joint offences by Americans and British subjects, where the defendants, unless the provision enabling the American authorities to waive their jurisdiction in certain circumstances is availed of, will be tried by different courts. One may be found guilty and the other not, or one may be given a severe sentence and the other let off with a caution. This possibility apart, the American Army code is probably extensive enough to cover all acts which would be considered criminal offences by the law of this country, and an assurance was given that, in the administration of the American courts-martial, the American authorities will give the necessary co-operation to ensure that witnesses will not have to travel long distances and so on. But the gravest exception must be taken to the way the Bill was passed. It was rushed through the House of Lords on Wednesday of last week and through the House of Commons on Tuesday of this week, just before the adjournment for the summer recess, with as little ceremony as if it had been providing drains for a municipality instead of in-

EXECUTORSHIPS AND TRUSTEESHIPS ACCEPTED

roducing Capitulations into Great Britain's judiciale system. Far-reaching Acts, affecting the lives and liberties of the British people, have been rushed through Parliament before now, but they were urgent for the defence of the realm—and they were not the ready-made and unalterable result of previous agreement with another state. It is difficult to see why there had to be such urgency for this measure since in any case it is to be retrospective to December 7, 1941. The impression gained from reading the exchange of Notes between Mr Eden and Mr Winant and the Government's speeches in Parliament is that the British Government has, after long negotiations, deferred to the American Government to some extent against its own inclinations and does not want the matter reopened by protracted discussion in Parliament and the Press. If this is so, it can only be said that such an attitude will do far more to disturb the good relations between the American and British peoples than the operation of the courts themselves, which need do no harm at all.

The New Socialism?

Last week, on pensions, forty-nine Labour MPs voted against the Government and fifty-seven, including eighteen Ministers, for the Government. There has been talk of a revolt or a split in the Labour party. It is true there is dissatisfaction among the rank and file about what they regard as the passive attitude of Labour members of the Government on social questions. But the talk of revolt is premature, to say the least. This is a family squabble. At a meeting on Tuesday, the Parliamentary Labour party approved a motion expressing full confidence in Mr Greenwood's leadership by sixty-six votes to four; and it was accepted that, in future, the leader of the party shall lay down the course of action to be adopted in the Commons. If this had been the rule last week, no Labour M.P. would have voted against the Government. This particular wound has healed very quickly. On the other hand, there is little doubt that the Labour party, as well as the Conservative party, will eventually be split up as a direct consequence of the conditions of wartime coalition. The question is what rallying-points exist outside the caucuses. One self-appointed rallying-point has just been set up. In a new movement, called Common Wealth, Sir Richard Acland's distaste for private property has been linked to the more sophisticated platform of the 1941 Committee. The programme of the new movement, which plainly steals a good deal of the Socialist thunder of the Labour party, will attract a good deal of scattered support. Sir William Beveridge, for instance, speaking to the Engineering Industries Association last week, stated categorically that

private control of the means of production, with the right to employ others at a wage in using those means, cannot be described as an essential liberty of the British people.

In a book just written by Mr Nicholas Davenport called "Vested Interests or Common Pool" (Gollancz, 8s. 6d.), the Common Wealth group will find a ready-made bible; it is property and inheritance, Mr Davenport says, with no little justice perhaps, which are the main causes of inefficiency and inequity.

At present, this movement is the only independent trend in politics with a positive programme. It is also a head without a tail, an élite rather than a movement proper; and it remains doubtful whether Sir Richard Acland, Mr J.B. Priestley, and, say, Sir William Beveridge and Mr Nicholas Davenport, both of whom are still lone wolves and members of no sect, can really win from the party machines the politicians who are looking for a new focus, or from the crowd the many individuals who are looking for a lead. In any case, the problem at the moment is to win the war; and it is difficult to see how, say, the putting of all property on lease with the state as owner would speed the war effort. Nor has it yet been proved that common ownership, in any of the forms favoured by these reformers, would necessarily make this country more enterprising, more prosperous or more decent in normal times. The state must not shrink from national planning, nor, as Sir William Beveridge has said, from the replacement of private enterprise by public enterprise in certain fields. But, in any pattern, private and public enterprise must exist side by side, working, as Sir William Beveridge also said, within limits set by a general design imposed by the state on behalf of the community. By far the most important aims, if democracy is to be rehabilitated, are, first, to secure the maximum output of goods and services; secondly, to guarantee efficiency and adapta-

bility in production and trade; thirdly, to ensure fairness in distribution; and, last but by no manner of means least, to find ways and means of associating the bulk of the people with the processes of democratic life. Common ownership and the like are means not ends; the question is how far they will subserve these aims. The basic problem is to reintegrate society. At present, the people are "We" and their governors and employers, whatever their politics, are "They"; and the rallying point in the new period will be probably found when the technique of democratic association, in industry and government alike, has been re-discovered.

First Principles

The Economist has been accused of crying for the moon. In an article called "Painless Prosperity" last week (on page 131) it was contended that, at bottom, the only way to increase world prosperity, now as in the past, is to increase world output and productivity, to restore long-term international investment for that purpose, and to expand world trade; there are no alternative short cuts. This truism has been taken by some readers to imply an intransigent demand to return, *simon pure*, to free exchanges and free trade, without any reservations—which would indeed be crying for the moon. It is perfectly true that, in the immediate future, all kinds of controls and devices may be needed. This has been so frequently admitted in *The Economist* as scarcely to bear repetition. "Neither in principle nor in practice is any return to the uncontrolled trade of past generations possible." It will be the responsibility of Governments in the future to secure certain minimum standards of living on principles other than those of the free market. The sterling area will be short of dollars; and some form of exchange control will be inevitable. In the transition period after the war, commodity and import controls will be unavoidable to keep reconstruction programmes in line with the relative scarcity of materials, shipping and foreign exchange. Plainly, it would be foolish to burke these facts. Plainly, too, it is all important that these devices should be worked out with the utmost possible co-operation with other countries, especially with the United States. But the crucial point still remains that, as one American writer recently put it,

the freest possible multilateral trade is so obviously in the long-run interest of a nation of 47 millions living in a small area, that this should be clearly formulated as the aim of British commercial policy.

The intention of last week's article was in no way to deny the need for controls and devices. It was rather to make it plain that controls and devices cannot be regarded as *alternatives* to freer trade and restored investment. It is in the interest both of this nation and of the world at large that controls should be regarded at the most as necessary evils. If the pragmatic relief measures which may be unavoidable in the transition after the war are treated as the right methods of long-term policy—if "outright grants" are regarded as a proper alternative to the restoration of investment and "trade equalisation accounts" as an alternative to the freeing of world trade from physical restraints—the consequences will inevitably be "poor, solitary, nasty, brutish and short." The measure of the success of controls and devices will be the extent to which they can be first relaxed and then abandoned in favour of freer trade and fuller investment. At best, they should be regarded as necessary evils—as distasteful means to more savoury ends. At worst—that is, if the overriding need to restore freer conditions and, even in the shortest run, to expand and not to restrict world trade is forgotten—their effect on world economy must be fatally damaging. In the long run, there is no way out of reconsidering, on the one hand, the American tariff and, on the other, the Ottawa agreements, and no other way of bringing national and international economies into balance than by restoring long-term lending and the freest possible flow of goods.

Still Distressed

Work on the United States naval bases in the West Indies is nearing completion. When it stops, the labour problem, already difficult owing to dissatisfaction about wages for this work and about the refusal to allow trade union representation in the original wage negotiations, will

become acute. Little attention was paid in this country to the recent riots in the Bahamas over the wages paid on the American projects; but they were a significant portent of what may happen elsewhere in the West Indies unless rehabilitation is undertaken in time. The trouble is that cessation of work on the naval bases will coincide with a food shortage, a rising cost of living—in Jamaica, it has risen 46 per cent since the outbreak of war, and wages have lagged far behind—and political discontent. It is quite true that steps have already been taken to overcome the food difficulties. Last week in Parliament, Mr Harold Macmillan gave a detailed account of the arrangements that have been made, first, to make the most economical use of shipping by co-ordination between United States, Canadian and West Indian lines and by import organisation, and, secondly, to increase the local production of food. Unfortunately, in the West Indies this has hitherto been hindered by the necessity of producing export crops such as sugar for the United Kingdom and by the shortage of labour owing to its diversion to work on the United States bases. It has now been decided that, if local circumstances demand it, food crops must have precedence over the cultivation of sugar, and the labour shortage will now be at an end. Nevertheless, as was clear from a debate on colonial affairs this week, opinion is not convinced that the questions of resettling the workers from the bases and of food production are being tackled vigorously enough. It appears that 83 schemes have been approved, under the Colonial Development and Welfare Act, in the West Indies, of which 21 are agricultural; but the total sum actually spent under the Act is only about £161,000. It is well known that the shortage of shipping and materials prevents many schemes from being carried out; on the other hand, ships and supplies are not necessary for increasing local food production, and it is believed that housing schemes could be accomplished with local materials. There is a growing suspicion that those responsible for carrying out the Colonial Development and Welfare Act are too much concerned with long-term schemes, which are admittedly most necessary, and have overlooked the immediate relief measures which are wanted here and now.

The Political Aspect

Speaking to the Royal Empire Society last week, Mr Winant said that, in the United States, there is a greater divergence of viewpoint on British colonial policy than on any other subject that divided them.

It has seemed to me for some time that there has been presented to both of us an opportunity to join together in a common effort to develop a policy that would give greater security to the peoples who live in the Atlantic islands off the coasts of the Americas, under one separate jurisdiction, but now in several instances with a degree of joint responsibility because of our Base Lease Agreements, and yet without interference with sovereign rights.

For some months, an Anglo-American Commission has been studying social and economic problems in the Caribbean, but little has been heard about its work or recommendations. In the meantime, a contrast has arisen, in the political sphere, between Puerto Rico, where the people have been promised that at the end of the war, if Congress approves, they will be given the right to choose their own Governor, and the British dependencies where constitutional reform is still hanging fire, although the people themselves are pressing for it. With the example of Puerto Rico before them, their demands will become more clamorous. Together with social and economic discontent, political grievances may lead to a recrudescence of the troubles of 1937-38 unless the Colonial Office proves itself determined to pursue a genuinely progressive and enlightened policy.

Ordnance Factories

The report of the Select Committee on National Expenditure on Royal Ordnance Factories contained very serious criticisms of their organisation and management, both at headquarters and in the factories themselves. Many of the criticisms and recommendations have been made before, and according to the report no effective remedial action has apparently been taken, for instance, in improving the status and salaries of superintendents; standardising costs; unifying methods and standards of inspection; combating absenteeism; introducing more labour managers; reducing hours of work; diluting labour; and upgrading

women. The most serious charge is that, owing to the Ministry of Supply's policy of "flooding" the ROF's with labour, without making corresponding increases in programmes at the same time, there tends to be a redundancy of labour—cases are quoted of two factories, one of which proposes shortly to discharge 6,000 workers, the other 7,000—and about three-quarters of the beds in hostels (built at a cost of £11 millions) are empty. This redundancy is attributed mainly to the division of responsibility at the top, and to the failure to plan with sufficient attention to securing a proper balance." The Committee recommends concentration on the most efficient factories, transferring surplus labour to meet urgent requirements elsewhere, and depriving the Ministry of Supply of its recruiting functions. It advocates the appointment of a single Director-General with four deputies, responsible for engineering, explosive, filling factories and labour respectively, together with the abolition of the regional machinery and the vesting of more direct responsibility in the hands of the superintendents. Surveys of this kind, because they concentrate, rightly, on the shortcomings, hardly give a representative picture. The Minister of Supply replied in the House of Commons on Wednesday to some of the criticisms, though not to the fundamental questions of direction and policy. He denied nearly all the charges of inefficiency—many of which, he said, could not be accepted as statements of fact—and pointed to the achievements of the past twelve months: gun output increased by 4½ times, output per individual filling operative by 40 per cent, and 98 per cent of the target set for filling factories in 1942 was reached in six months. It is important to remember that ROF's are but one piece in the pattern of production, and their organisation should be viewed in relation to that of production as a whole. One is disposed to wonder what an equally detailed examination of a similar number and type of private firms would show. One of the points on which the Select Committee lays stress, is that the status and remuneration of superintendents of ordnance factories should "be commensurate with that which they would receive in industrial establishments of comparable size." Undoubtedly the wide disparity between the remuneration of ROF managers and the managers of private firms is anomalous, and a higher

standard of managerial efficiency would probably be obtained if the post of superintendent carried with it a higher salary and greater responsibility. The report will naturally strengthen the hand of those who argue that state control and inefficiency are synonymous. But the fault lies not so much in the fact that these factories are state-controlled as in the manner and type of the control and the controllers.

Pacific Offensive?

After their first rapid and unimpeded advance through New Guinea, the Japanese have been held in check and have failed to seize the strategic Kokoda pass. The position at the moment is not very clear, but it is believed that the original landing force has been increased by some reinforcements and supplies, in particular of fighter planes. The chief operations in the South West Pacific zone have been in the air. The Japanese have continued their raids on Port Moresby and on towns on the Australian mainland ranging as far as Port Hedland in Western Australia, but without much result—the distance from their air bases is probably too great to risk any large forces on these expeditions. The Allies have replied by attacking Japanese positions in New Guinea and in the surrounding islands, and are believed to have damaged a cruiser in the Banda Sea. On the whole, the Allies appear to have the initiative in the air; but the presence of Japanese forces within 50 miles of Port Moresby, even though they are on the other side of the Owen Stanley mountains, constitutes a threat to the Allied forces, especially as they seem to have succeeded in consolidating their military position in the north of New Guinea and to be using the tactics of infiltration which were applied so successfully in Malaya. The sooner this “nest” of Japanese troops is cleared, the better. The New Zealand Prime Minister has declared his belief that “a most successful offensive can and will be undertaken,” and the Australian Premier has implied agreement by contrasting the preparedness of his country now with its unpreparedness last February.

A Warning

It is certainly unwise for wartime speakers to promise more than they can perform. But the German public may well be wondering whether the promise of Air Marshal Sir Arthur Harris is not already being put into operation. “We are coming by day and by night, we and the Americans . . . no part of the Reich is safe.” Since Sir Arthur Harris’s broadcast on Tuesday, July 28th, there have been large-scale raids on Hamburg (Tuesday and Thursday), Saarbrücken (Wednesday) and Düsseldorf (Friday), while single bombers have attacked Hanover, Frankfurt and Wilhelmshaven, as well as targets in Holland and along the north-east coast of France. The damage caused in the big raids appears to have been extensive—photographs reveal the destruction of several large engineering, chemical and textile works in Düsseldorf and Saarbrücken—while in Düsseldorf the defences seem to have been taken unawares, many bombs being dropped before the guns came into action. The figure quoted by the Air Marshal of 5 per cent losses in the bombers sent over Germany is a low one and compares favourably with the Nazi losses, estimated at 14 per cent in recent raids over this country. Actually, the Air Marshal’s broadcast has aroused a good deal of criticism—on strategic grounds that it is useless to say that bombers can be sent over in all weathers; on general grounds, that the effect of a “bombastic” threat of terror bombing will be to rally the forces inside Germany round the Government and not to spread disunity; and on political grounds, that an important pronouncement involving policy should have been made by a responsible Cabinet Minister and not by a Service Chief. The Government reply to the criticisms which were raised in the House of Lords on Tuesday was that a speech on bombing came well from the Commander-in-Chief, Bomber Command, and would probably carry more weight among the military-minded Germans than a similar talk from a civilian and that, in any case, the policy was not a new one but had been announced by the Prime Minister himself. The political aspects of the speech are, perhaps, another matter. The Air Marshal told the Germans that Britain did not seek a vindictive peace, but that the one condition of peace was the overthrow of the Hitler regime—not particularly a topic for Service opinion. Provided the bombing policy is implemented—which is the real point—it does not seem to matter so very much who announces it. Tales like this have been told before. Probably

it would have been better if Sir Arthur Harris had been left to give his warning to the Germans without it being publicised to the British people, who are, in any case, much more inclined, experience suggests, to expect the best than the German people are to fear the worst.

The End of Munich

“In order to avoid any possible misunderstanding,” Mr Eden has informed the Czechoslovak Government, on behalf of the British Government, that

At the final settlement of the Czechoslovak frontiers to be reached at the end of the war, they will not be influenced by any changes effected in or since 1938.

The sordid story of the Munich Agreement of four years ago has been formally brought to an end. The reason given is the same as the reason given by Mr Churchill in a broadcast to the Czechoslovak people in September, 1940, and in a communication to Dr. Benes in November of that year, namely, that the Agreement was “deliberately destroyed” by the Germans. This week’s interchange of notes between the Foreign Secretaries of the two countries is simply a re-affirmation of the British Government’s known view that the Munich Agreement is null and void and of its recognition of the fact that the Government of the Czechoslovak Republic occupies the same juridical position as that of the other Allied Governments in Britain. The real ground for the repudiation of the Munich Agreement, of course, is that, whether the Germans had destroyed it or not, it was a wrongful and coercive act on the part of all the Governments concerned. This is left unsaid, presumably on the principle of “no recriminations.” The new guarantee, which leaves the Sudeten problem to be solved by the Czechoslovaks themselves in cooperation with the full comity of free European nations, is not only Czechoslovakia’s rightful due. It is also an answer to German propaganda, which has repeatedly suggested that the Czechs will derive no benefit from an Allied victory; and it is a fresh blow to German hopes of negotiating a peace on the basis of their conquests in Europe.

Demand for Houses

The speech of the Minister of Health to the London Master Builders’ Association last week did not throw much light on the Government’s intentions with regard to housing, although it contained a hint that some housebuilding might be resumed even during the war. The speech was largely concerned with the achievements of the past and the Minister referred to the construction of four million houses during the interwar period, which has given a reserve to meet war requirements. It should be remembered, however, that a large proportion of these houses were built on private initiative and not according to Government plans. For the future, the Minister forecast that the Central Advisory Committee on postwar housing would insist on a far higher standard of housing and on the elimination of jerrybuilding and ribbon development. He hoped that the prewar rate of building would be doubled. There will be much leeway to make up in order to catch up on the present shortage, to restore or replace bombed houses and to meet the demand that will inevitably arise at the end of the war, with the demobilisation of men from the forces and the return of evacuated families and industrial workers. Apart from the completion of some 40,000 houses that were in course of construction when the war broke out and of houses for vital war purposes, normal housebuilding has ceased. The appalling conditions of overcrowding in the Glasgow slums described in the recent Scottish debate—with whole families living in one-roomed houses—might equally be found in districts of Tyneside, Merseyside, Lancashire and London. The recent alarming increases in tuberculosis and cerebro-spinal fever can be mainly attributed to overcrowding. A new war building programme has begun, but if it is at all physically possible there is more than a strong case for the lifting of the ban on essential works of slum clearance and rehousing.

Bread and Potatoes

Last year the potato crop came to an end before the new potatoes were ready for lifting. The gap, caused by a late spring and the absence of the usual supply of

early potatoes from the Channel Islands, involved the Ministry of Food in much criticism, largely unmerited, from the public, who had previously been asked to eat more potatoes, and so save bread and shipping. By husbanding supplies last winter, the Ministry succeeded in keeping a large quantity of old potatoes for sale at the end of the season, and was left with a few days’ supply on hand which the punctual arrival of the new crop, and the eagerness of the public to consume it, made impossible to sell. Now the Ministry is criticised for causing waste—not only the waste of the potatoes which could not find a buyer, but also the waste caused by holding potatoes in clamp till May and June. Waste in clamps is inevitable if the public is to have home-grown potatoes throughout the year; the unsold stocks represent only a small insurance premium against another late season and another gap in supplies. Wheat has to be imported; shipping space is scarcer than ever, and more urgently needed. The more potatoes people eat the less bread they are likely to consume, and the carry-over of a few thousand tons does not, in any way, diminish the need for still more potatoes to be grown and eaten in 1943.

Aid from Aliens

The Allied Powers (War Service) Act is intended to make it impossible for Allied nationals to avoid military service, either in their own or in the British Forces. It has been stated on behalf of the Government that the large proportion of Allied nationals who are technicians and highly skilled workers will not be expected to join the forces, but will be reserved for the kinds of war work for which they are especially fitted. Actually, it is doubtful whether the Government has yet found the right means of making the best use of expert professional and technical workers, of any nationality. The unsatisfactory nature of the present position is most marked perhaps in the case of persons of enemy nationality, who are regarded as friendly. On the one hand, it is stated that, through the International Labour Branch of the Ministry of Labour, the machinery exists for their employment in suitable work, and several Government departments have shown themselves anxious to secure the services of men who are often very highly proficient. On the other hand, all sorts of obstacles may, in fact, be placed in the way of their employment. A recent case may be cited. It is of an architect who until the beginning of this year was doing Government work on hostels. In April he was informed by a Director in the Ministry of Works and Buildings that his specialised knowledge and organising ability would be of great help. In May he was interviewed for an appointment, it being made perfectly plain that this particular department of the Ministry was very anxious to secure his services. Since then he has had something like fifty interviews, written a dozen or more letters, and had innumerable telephone calls to the Ministry of Labour alone without any result at all—until very recently, when it was stated that his Austrian nationality was an obstacle to his appointment. It seems that, whatever rules may have been laid down publicly, it remains the policy of the Establishments Branch of the Treasury—and possibly the policy also of the Home Office—not to employ enemy aliens, whatever their qualifications and trustworthiness; and it seems that the Ministry of Labour and the other Ministries concerned are willing to accept this line. Every care must be taken to prevent persons suspected of enemy connections from being in key positions with access to secrets. It would be vastly unfair to fill the place of British specialists, called up for military service, by alien specialists, unless the qualifications of the latter make the exchange a net advantage to the war effort. But the disturbing thing is the confusion between precept and practice. It is not true that the employment of aliens, Allied or enemy, has been regularised. It remains a matter of chance. The main point is that specialists and experts are left idle and unemployed. All that is needed is some general line of policy which will ensure that every specialist and every expert, of whatever nationality, is used to the maximum in a war which, above all other wars, requires specialised services.

A Hard Case

The strange case of Dr Curtis is an illustration of the odd and evasive way in which questions of nationality and work tend to be handled. Dr Curtis, the son of a British

subject by birth and a German mother, was born in Frankfurt in 1903. In 1914, his father acquired dual citizenship, German and British, and the son did also for a time. In 1933, Dr Curtis lost his job and was expelled from Germany. In England, he was given a British passport and worked as an architect and university lecturer. He became an Associate of the Royal Institute of British Architects, which only admits British citizens to membership. In February, 1940, he was given leave of absence for war work by the University of Liverpool and was employed by Sir Alexander Gibb and Partners, the Ministry of Supply giving him a permit to work under the Official Secrets Act. He was employed on the designing of Royal Ordnance Factories. In February, 1942, he was appointed to do urgent work for the Ministry of Works and Buildings, the basis of his appointment being that he was lent by Sir Alexander Gibb and Partners to the Ministry. He acted as deputy in the Ministry to the official who deals with the allocation of building labour. On June 5th, a letter was sent to Sir Alexander Gibb and Partners to say that, after June 30th, Dr Curtis would not be employed by the Ministry of Works. On June 30th, Dr Curtis duly left without any explanation in writing of his dismissal, and on July 2nd he received his calling-up papers—as a British subject, it should be noted. When the matter was discussed on the adjournment in the House of Commons last Thursday, it was stated that, although Dr Curtis did not satisfy the requirements regarding the nationality of those employed in Government service, it was decided to use him temporarily because the need was urgent and because there was no other suitable candidate; he was never a civil servant, being lent by his civilian firm.

The episode has many remarkable features. It is astonishing that, if there were doubts about Dr Curtis’s nationality—or, as it is now said, that of his father—he was employed for so long with the same access to official secrets as if he were a regular civil servant; and doubly astonishing that, when he was appointed to the Ministry of Works and Buildings, the Ministry did not know that there were any doubts about his nationality—inquiries were only instituted subsequently. In any case, it seems fantastic that there should be these belated doubts, when Dr. Curtis has held a British passport for so long, and has been allowed to join the Home Guard, has been enrolled on the Central Register and has been a jurymen at Liverpool assizes. The net effect is that Dr Curtis has been harshly and unjustly treated. The fact that he was nominally employed by Sir Alexander Gibb and Partners, and not by the Government, is only a stupid and irrelevant side issue. He was told of no bar to his appointment to the Ministry, and no inquiries were ever made about his attitude towards the war. Then, suddenly, he was dismissed. One of the many alternative excuses given on behalf of the Government in the debate was that, by June this year, a suitable British subject had been found to do Dr Curtis’s work. But, incredibly, the crucial question whether Dr Curtis himself is or is not a British subject is still undecided; apparently he is a British subject for purposes of military service, but not in the eyes of the Ministry of Labour or the establishments branch of the Treasury. For a long time he has done important and confidential work for the Government without the slightest suspicion of his capability or integrity. Under this and all the other friendly treatment which Dr Curtis has received since 1934, was an idiotic mistake; or else Dr Curtis has been made the victim of as flagrant a case of muddle and maladroitness as has ever been brought to light.

Shorter Notes

In announcing that in future civilians will not be expected to carry their gas masks everywhere, Mr Morrison has at last agreed to face facts. In spite of repeated appeals, propaganda and mock gas attacks, it is children alone who carry their gas masks regularly, because the education authorities have hitherto compelled it; the Government has now gracefully withdrawn in face of the passive resistance of the adult population, explaining its retreat by the necessity to conserve rubber supplies.

Canada has introduced tea and coffee rationing. The amounts allowed will be 1 oz. of tea or 4 ozs. of coffee a week, but not both.

AMERICAN SURVEY

The People of America

(By a Correspondent)

THE first American census was taken in 1790, eleven years before the first British census, and the population of the United States was then 3,929,214. Each decennial census since has shown a large increase in the numbers of the American people, and the sixteenth census, taken in 1940, showed that the population had risen to 131,669,275. At the end of 150 years, the inhabitants of the United States were nearly 34 times more numerous.

During the seventy years after the first American census, the rate of decennial increase was extraordinarily high, varying from 36.4 per cent in 1800-1810 to 32.7 per cent in 1830-40. In 1850-60 it was 35.6 per cent. In 1860-70, the decade of the Civil War, the rate fell to 22.6 per cent and continued to fall, though with fluctuations, until in 1930-40 it was only 7.2 per cent. It is noteworthy that, though the rate of population increase declined during the eighty years after 1860, the flow of immigration was maintained at a high level until the beginning of the first world war in 1914. In each of the six years 1905-7, 1910, and 1913-14, the number of immigrants exceeded the million mark. The entry of newcomers was checked by the war of 1914-18, and subsequently by the restrictions on immigration imposed in 1921. But the reduction in the number of immigrants contributed only in a very minor degree to the slackening in the rate of population increase that began about eighty years ago. The rate went down, not because fewer foreigners came into the country, but because American families went on becoming smaller.

The birth rate in the United States has been falling almost without interruption for over a hundred years. During the first thirty years of the nineteenth century, the birth rate—that is, the number of births per 1,000 of the total population, men, women and children—was over 50. By the end of the century, it had gone down to about 30, and in 1940 it was 17.9. The death rate also went down, so that, notwithstanding the decline in the birth rate, the population continued to increase, though at a reduced rate, by excess of births over deaths.

But the productivity and potential growth of a population cannot be measured by comparing "crude" birth rates and death rates computed on the total population. A community may have a considerable excess of births over deaths, and yet be on the way to die out. It depends upon the age structure of the population. A community may have a relatively high birth rate, simply because a large proportion of its inhabitants are at ages when they are capable of reproducing the species. And since people at such ages are capable also of putting up a good fight against the agencies making for death, their mortality is relatively low. The United States has a large proportion of persons at reproductive ages. As they grow older and incapable of reproducing their kind, their places will not all be taken by younger people, for the decline in the birth rate has diminished the supply of younger people. Thus as time goes on, persons of reproductive age will form a smaller proportion of the American population, and the persons past reproductive age a larger proportion. With the ageing of the population, the death rate tends to go up, and the birth rate to go down to still lower levels.

There are, of course, methods of measuring population growth that eliminate the fallacies attending the use of crude birth rates and death rates. The United States Census Bureau, reporting on the results of the 1940 census, uses an index that measures the combined effect of natality and mortality and shows whether a given population is on the way to increase, remain stationary, or fall—the net reproduction rate, which shows the numerical relation of female births in two successive generations. More precisely, it states how many daughters will on the average be born to a given number of newly born girls of this

generation during their lifetime, assuming that the present rates of natality and mortality remain unchanged. If the rate is 100 it means that a hundred newly born girls of to-day will, before they die, give birth to 100 daughters, and therefore that the population is on the way to become stationary. The US 1940 census returns show that, during the five years before the census year, the net reproduction rate, which ten years earlier was 111, had fallen to 96. It was, that is, 4 per cent below the rate required to maintain a stationary population, and it showed that the population of the United States is heading for a decline.

The net reproduction rate was far from being uniform all over the country. In the rural areas the rate was well above replacement level. In the urban areas, which contain 56.5 per cent of the total population, the rate was only 74, or as much as 26 per cent below the rate required to maintain a stationary population. Of the 92 American cities that had 100,000 inhabitants or over in 1940, there were 29 in which the population fell during the inter-censal period 1930-1940; and the list of such cities would doubtless have been longer had it not been for the flocking in of large numbers of young people from the country. The census returns show that, in the ten years between 1930 and 1940, there was a net migration of some million and a half young people from farms and villages to the towns. The citizenry of the Union is still being largely recruited from the rural areas—from the rural stock from which Lincoln came. In the period 1930-40 not only did the reproductive index of the rural areas fall from a relatively high to relatively low levels, but in the urban areas the index fell from a low level to a still lower level. Moreover, the lower the level reached in 1930, the steeper was the descent to 1940.

According to one estimate, by Dr. Warren S. Thompson and Dr. P. K. Whelpton, which the United States Census Bureau regard as "the most reasonable in view of the 1940 census data now available," the population will continue to increase, though at a diminishing rate, until 1980, when it will reach 153,022,000, compared with 131,669,275 in the 1940 census. There may be a slight additional increase between 1980 and 1985, after which an absolute decline in numbers may be expected. The estimate makes no allowance for emigration or immigration—or for any major social changes that may affect future population growth. It is an estimate of what may happen if natality and mortality follow the trends indicated by past experience, and so far those trends—which, admittedly may not continue—have been followed with remarkable accuracy. The estimate was made in 1936, and the population as estimated for 1940 was only 0.2 per cent higher than the number given in the census. That in the United States, a young country with enormous material resources, the reproductive index should fall so low that it presages an actual reduction in the American population within the next fifty years is a fact so momentous as to call for the closest attention.

American Notes

The Current of History

The force and the candour of Mr Archibald MacLeish's Rede Lecture at Cambridge last week are proof that the new US Office of War Information, to which he belongs, means to lead as well as to inform public opinion. Mr MacLeish made it plain that he is a whole-hearted supporter of Vice-President Wallace's Century of the Common Man. He had no hesitation in identifying and condemning the new isolationism:

Where the old isolationism opposed the country's determination to face the war, the new isolationism opposes the country's determination to face the peace . . . If they (the isolationists) must have war, they will have a war which will alter nothing and accomplish nothing; a war which shall have neither social effects nor political implications—a purely military exercise . . . The war they are fighting with so much noise and fury . . . is not the people's war to which the United Nations had committed themselves.

No other official speaker has sketched the development of American opinion with more skill or frankness, from the time in 1940 when the nation had "no stomach for the establishment of new worlds," through the days of bewildered but strengthening determination to win a war which had been thrust upon it, but was still the enemy's war, to the present, when it is possible to say that

The American people has recaptured the current of history and they propose to move with it. They are no longer willing merely to fight the Fascists' war. They propose, with the help of their Allies, to fight their own war, a free man's war having a free man's purposes. They are no longer satisfied to fight a war merely to prevent defeat . . . The people know that they did not make this war. They were troubled for a time by the feeling that this war was not theirs—that it was a thing done to them and not by them. They knew always, whether their leaders were willing to say it for them or not, that they had a cause—that they had, indeed, the one cause for which the war could possibly be fought and won. They propose to end it not by defeating the purpose of the enemies of the people only, but by realising a purpose of their own—a clear and forming purpose—a purpose to live with dignity and in freedom, and like men.

In Mr MacLeish, as in the Vice-President and Mr Perkins, in Mr Winant and Mr Welles, men have been found to outline and support a constructive and generous approach to post-war problems. But it is no use pretending that all groups in the United States are solidly behind them. The new Information Office, which has already had a not altogether successful encounter with the Services over the wording of communiques and the release of war news, will have an even stormier passage if it includes in its province the philosophy of the war and the peace—as indeed it should do.

Cargo Planes

Mr Henry Kaiser's proposal to build 5,000 70-ton air transports a year in his shipyards has taken the country by storm. Several Congressional committees and sub-committees have been busy taking evidence from experts, Mr Kaiser among them, on the practicability of the plan; and a Bill has already been introduced into the Senate providing for the creation of a board to provide for the construction of enough air transports to solve the supply problem of the United Nations. Mr. Kaiser has announced that he could go into mass production within ten months, and his reputation for achieving the impossible has gained him support that would not have been granted readily to anyone else. His argument is that a very substantial part of his shipbuilding organisation—that devoted to accounting, purchasing, auditing and supervision—could be turned over to plane production without any difficulty, and that even in the final stages, some of the buildings and tools used for ship construction could be employed on aircraft construction. Mr Samuel H. Arnold, Chief of the Army Air Corps, informed the Military Sub-Committee of the Senate last Wednesday that the Army was already using some of its long-range bombers for the transport of cargo and that, by the end of this year, nearly one-third of the output of multi-engined aircraft—the present proportion was just over one-fifth—would be transport planes. The crux of the problem is the scarcity of materials. Mr Nelson's endorsement of the Kaiser proposal carried the proviso that the provision of engines and components should not interfere with the military aircraft programme. It is difficult to see how this can be avoided; but opinion in Congress appears to be increasingly in favour of expanding the production of air freighters even at the expense of other branches of war production, on the ground that it is useless to produce munitions which cannot be transported in time to the battlefronts where they are needed.

The Small Producer

Mortality among small businesses has been one of the preoccupations of Congress. It is thought that, towards the end of 1942, a substantial number of small plants which are not suitable for conversion to war work will have to close

down, and already the scarcity of materials has made the position of many firms extremely difficult. There is a division of opinion about whether in fact more use cannot be made of many small concerns. The Smaller War Plants Corporation established by Congress last month was designed to facilitate the distribution of war contracts, by taking over contracts from the Army and Navy, breaking them down for distribution, and, if necessary, making loans to finance plant and equipment. The law puts pressure on the Services by providing that, when the War Production Board certifies a small concern or group of firms as competent Government contractors, the procurement officers are to accept such certification as conclusive. The War Production Board itself appears to be pessimistic about the ability of the majority of small firms to go over to war production, and Mr Nelson has emphasised that the controlling factor in distributing contracts must be the capacity of the manufacturer to do the job, rather than the need for relief. Nor will the \$150 millions put at the disposal of the Smaller War Plants Corporation by Congress go very far. A more promising solution which has been put forward by Mr Nelson himself appears to be for the smaller concerns to concentrate upon the production of essential civilian goods, where the specifications are less exacting than those for war goods. Even this is unlikely to provide a complete solution, and the War Production Board has suggested that Congress should appropriate \$200 millions annually to pay the maintenance costs of small firms forced out of business, and to make loans against inventories frozen by the Government.

Shorter Notes

The Maritime Commission has announced that during July, American shipyards set a world record for steel ship construction for the third consecutive month by turning out 71 ships of 790,300 deadweight tons. Production in 1942 so far totals 229 ships of 3,338,515 deadweight tons. To meet President Roosevelt's goal of 8,000,000 tons of shipping in 1942 an average of 932,000 tons must be turned out monthly for the rest of the year.

The latest statement on the rubber situation and its relation to petrol rationing is that of Mr Ickes, the Petroleum Co-ordinator, who declared that nation-wide petrol rationing was no longer needed to bring about larger petrol deliveries to the rationed eastern states, and that a new process for the production of butadiene would make possible an output of 240,000 to 250,000 tons of synthetic rubber annually above the present rubber programme.

Mr Morgenthau, Secretary of the Treasury, has told his press conference that he hopes to avoid any form of compulsory war bond purchases, at least during the current year, and that he would attempt to avoid "induced savings" for as long as possible. This is a retreat from Mr Morgenthau's determined opposition to forced savings and gives weight to reports that plans for a system of compulsion are already well advanced.

Manpower Crisis in Canada

(From Our Ottawa Correspondent)

July 15th

CANADA'S pool of military manpower is, in round figures, 1,200,000 men. That figure was established in the national registration carried out in July, 1940, which disclosed that the total number of Canadian adults under the age of 40 years was 1,694,670. Allowing a proportion of one-third likely to be physically unfit for military service, as experience has shown, the number of Canadian men fit for military service would be 1,129,760. This figure has suddenly taken on fresh importance, since Canada has reached the stage of acute shortage in manpower for military service and for other essential purposes in munitions and food production.

By the end of 1942, or shortly thereafter, the armed services of Canada will have absorbed well over half the absolute supply. The current objectives of the mobilisation of the army, navy and air force will bring the combined total to at least 610,000 by that time. Actually, there will be possibly as many as 100,000 more men in uniform, since the figure of 610,000 men in the armed services is the estimate of men that will be secured by voluntary enlistment. The Canadian draft, which has hitherto raised men only for service within Canadian territory, is being used more extensively than ever before. Draft quotas will call out for service at least 60,000 men in July, August and September, in addition to some 50,000 men already on home defence duty. Many of these men will voluntarily change their status in order to be eligible to serve anywhere, and a proportion of active army, navy and air force requirements can be expected to be drawn from this source, as they have in the past. Moreover, the new draft powers granted to the Government by Parliament permit the despatch of those drafted for home defence outside the country by Order-in-Council, if the necessity arises.

Under these circumstances, it is surprising that serious inroads upon available manpower for essential production have not produced an acute situation before this. But that situation is unmistakable at the present time. It shows itself in growing shortages of workers in heavy industries, such as mining, smelting, lumbering and shipbuilding, where women cannot be employed to any extent successfully. It shows itself in the difficulties that reserve army units, representing Canada's home guard of part-time soldiers, find in obtaining recruits. Obviously, the men who would normally undertake part-time training, with a few weeks in military camps, are fully employed, to the point of overwork in many instances.

From available information, which will not be complete until a manpower registration carried out in April and June, through the new nation-wide employment services of the Unemployment Insurance Commission, has been analysed, the following approximate picture of Canadian employment may be obtained:—

Canadian adults 16 years and over.....	7,882,920
Current objective of armed services.....	610,000
Munitions employment by 1943.....	910,000
Agricultural employment.....	1,350,000
Civilian industries and services.....	2,000,000
Remainder, including housewives, etc.....	2,992,920
Persons 60 years and over.....	1,163,010
Remainder under 60 years.....	1,829,910

These figures are approximate in many instances because up-to-date census material is not available. Chief attention centres upon the military manpower pool, which is now more than 50 per cent earmarked for actual military service. The probable distribution of 500,000 men, under the age of 40 years and still not in uniform, is half in agriculture and half in industrial and professional occupations. Whether agriculture and essential occupations should be stripped further of their best categories of manpower, which obviously include much of the remaining highly-trained

technical and professional skills, is the immediate question for the Government and its selective service officials.

Transfer of Workers

Current requirements for the armed services and war industries have been estimated by Elliott M. Little, national director of selective service, at 250,000 workers by the end of 1942. These workers, Mr Little said, must be taken from their present occupations.

We can plan ahead for the employment of workers who will be released because of new rulings and restrictions by material control agencies. We must also consider the necessity of closing down some industries altogether. Much of the increase in our industrial employment must consist of women.

He added that a more vigorous policy against absenteeism and for more efficient production must be put into effect.

The latest figures show that unemployment in Canada has practically disappeared. A registration of unemployed men carried out in June disclosed 80,000 persons in this category between the ages of 16 and 69 years. Not more than 60,000 of these are regarded as even partially employable; few of them are capable of working in the high-speed production of war plants.

Against this background, policies for the transportation of workers, housing and closer administrative control of the national labour supply have become necessary in Canada. Outlining these features of the problem, Mr Little recently reported on developments of what he called "an integrated national plan for the most effective use of our manpower."

Eire's Central Bank Bill

[FROM OUR DUBLIN CORRESPONDENT]

July 24th

THE Central Bank Bill has emerged from the Dail after several weeks of debate. The Senate has decided to postpone consideration of the Bill until the end of September. After it has been debated in the Senate, it will have to go back to the Dail for the consideration of the Senate's amendments. It is unlikely, therefore, that the Bill will become law for several months. In the course of the debate in the Dail, the Bill was criticised both by the official Opposition and by the Labour Party. Almost every objection that could be raised to the Government's proposals was raised in some part of the House. The Government was criticised for keeping the Irish currency linked with sterling; for not providing a variable instead of a fixed parity; for abolishing the Consolidated Bank Notes which at present form the only fiduciary issue in Eire; for not exercising a much greater degree of control over the commercial banks; and for failing to nationalise the distribution of credit. The Government stood up manfully to all these diverse criticisms. Mr de Valera and the Minister for Finance nailed their colours to the Banking Commission, on whose report the Bill was drafted. To have adopted any other course would have amounted to a vote of lack of confidence in the Commission which the Government had itself appointed. The findings of a majority of sixteen members out of a total of twenty-one could not be lightly rejected.

Important Amendments

The Government brought in three amendments of substance when the Bill reached its report stage. The first amendment refers to the type of security which the Central Bank has power to rediscount and hold. In the first place,

the type of bill which the Central Bank is entitled to rediscount has been slightly widened, and the currency of eligible commercial bills has been extended. In the second place, the provision that Government securities bought by the Central Bank must be not less than one year old must be removed. The Banking Commission strongly disapproved of direct lending by the Central Bank to the Government, and recommended that, with the object of preventing such borrowing, the Bank should not be authorised to purchase any Government securities less than two years old. The original text of the Central Bank Bill provided that securities should be one year old before being bought by the Bank. This provision has now been dropped. The amended powers are to purchase any securities of any public authority in the state which are authorised by law for the investment of trust funds, have been offered for public subscription or tender and are officially quoted on the Dublin Stock Exchange and on the Cork Stock Exchange. The present rule of the Dublin Stock Exchange is understood to be that a quotation will be given to any security if two-thirds of the issue have been taken up by the public. If this condition remains, it will be possible for the Central Bank to subscribe directly to one-third of Government issues in future. This is in direct contravention of the recommendations of the Banking Commission.

The second amendment introduced by the Government gives to the Central Bank the power to compel commercial banks to transact the whole or any part of their clearings through the Central Bank or an agent appointed by the Bank. Particular provision is made for the clearing of cheques, bills and notes payable outside the State, that is, in practice, sterling payments collected by the Irish banks for their customers. The banks object to these new powers on the ground that, if they are exercised, they will increase the cost of clearings. The present clearing system of the Irish banks is a highly complicated machinery evolved as a result of a century's experience. Many cheques are cleared locally, others in provincial centres and others in Dublin, whereas the sterling payments are cleared through the Clearing House in London. The whole machinery is calculated to produce the maximum expedition at the lowest cost. If the banks were compelled to clear through the Central Bank, a totally new machinery would have to be evolved necessitating considerable delay and duplication of accounting. The provision in regard to the sterling clearings does not appear to serve any useful object. So long as the right of convertibility between the Irish and British currencies is retained, any Irish balances which the banks acquire as the result of depositing sterling holdings in the Central Bank could be immediately reconverted into sterling, if the banks so desired. These new powers are, however, permissive, and the Government gave an assurance in the Dail that there is no intention that they should be put into immediate operation.

A Dangerous Possibility

The third amendment of substance is in regard to the assets held in the Legal Tender Note Fund. Under the original Currency Act of 1927, the only assets permitted to be held in the Legal Tender Note Fund were gold, sterling and British Government securities maturing within twelve months. An amending Act of 1930 widened the category of funds that might be held. The limitation of twelve months' maturity on British Government securities was abolished, and provision was made for the inclusion of other types of assets in certain contingencies. It was provided that other types of security could be admitted to the Legal Tender Note Fund on the unanimous vote of the Currency Commission approved of by the Minister for Finance and by the Dail and Senate. It is now proposed that the vote of the Board of the Central Bank need not be unanimous for this purpose, but that a majority vote will suffice. In view of the fact that the Central Bank Board will contain, in addition to the Governor, five members nominated by the Minister for Finance, against three representatives of the banks, this amendment clearly contains dangerous possibilities. The Banking Commission emphatically recommended the retention of 100 per cent sterling cover for the Legal Tender Note issue. The present amendment would enable that recommendation to be completely negated. However, there still remains the safeguard of the approval of the Dail and Senate before any change can be effected.

This is the condition of the Bill on its arrival in the Senate. The postponement of its consideration in that House for two months suggests that it will receive a considerable volume of new criticism when it comes to be debated. The Senate is in many ways better qualified than

the Dail to discuss such a Bill. An active part in the debate may be expected to be taken by the Governor of the Bank of Ireland, the two professors of economics and the other University representatives. In view of the criticism which the Bill has received in the country, it is quite possible that the Government may introduce further amendments before its final passage into law.

Price Difficulties in the Balkans

[BY A CORRESPONDENT]

July 20th

A NEW series of trade negotiations has recently been concluded by German representatives in the three "allied" capitals, Budapest, Bucharest and Sofia. The communiqués issued referred vaguely to a further intensification of the reciprocal exchanges of goods, but German press comment suggests that in reality Germany pressed for the deficiencies in grain deliveries to be made up by livestock, vegetables and other produce; in return, she promised to speed up deliveries of agricultural machinery. Both communiqués and comment must be read against the background of the disastrous harvest prospects throughout South-East Europe and German delays in delivering machinery.

Of more interest, however, are two other points raised in the course of the discussions, as they bring to light some of the difficulties under which the current exchange of goods is labouring. The Germans brought up a question which has been disturbing them for some time, that of the stabilisation of export prices, and also of internal prices. In all three countries, controls and regulations have failed to stem the steady rise in prices. Between September, 1939, and the end of last year, the index of wholesale prices in Roumania had risen by 190 per cent, in Bulgaria by 50 per cent, and in Hungary by 45 per cent. Although the rise has since then slowed down so far as is reflected in official prices, these have become fictitious even for many articles of prime necessity, which change hands in some

form or other, at greatly increased black market prices.

This situation cannot fail to impair Germany's position as a buyer. The fact that she has to pay higher prices in terms of Reichsmarks should not cause undue worry—although the Germans profess to press for price stabilisation on that account—for they can always recoup themselves by adjusting their own export prices. Indeed, it is known that German exporters, who now hold a quasi-monopoly position in the Balkans for whatever they are able to sell, have already substantially increased their selling prices, and it is perhaps significant that the rise in industrial goods has throughout been more marked than in agricultural prices.

A far weightier cause for German displeasure is that the government grain collecting centres, outbid by the black market, do not receive produce deliveries in anything like adequate quantities, and are, therefore, unable to fulfil the quota deliveries to Germany, even though the home rations for food have been reduced much below the German level. A new series of ration cuts has just been announced in the three satellite countries, and may have something to do with the German visits.

Wage Demands

The price chaos has also another, and in the long run not less important, implication. In spite of all the rises in prices, producers are clamouring for still further increases on the grounds that present prices are unremunerative. Wages, on the other hand, lag far behind prices, and this deepening clash of interests between agricultural producers and wage-earners not only slackens production efforts on both sides, but spreads social unrest.

Whether in answer to German representations about high prices and low deliveries or not, it appears that anxiety was expressed in the course of the negotiations, at least in Bulgaria and Roumania, about Germany's growing clearing indebtedness. This has been considerably increased—detailed figures are kept secret—by an item which lies entirely outside the control of the two small partners, namely, German official remittances to the German armies stationed in the two countries. In its effects at least, creating additional purchasing power and forcing an increase in the note circulation, it is tantamount to the occupation costs charged to countries like Belgium or occupied France.

The German reaction to these complaints was disarming in its frankness. The German representative explained in Sofia, in a press statement, that the accumulating clearing balances of Germany's allies must be looked upon as their contributions to the war effort—"iron savings," as he called them. He added that their ultimate liquidation after the war was not likely to cause difficulties, although Germany would extend preferential treatment to those who were now showing a spirit of understanding by increasing their food deliveries. To be on the safe side, Dr Clodius, who conducted the negotiations in Bucharest, actually laid down in the new agreement that no delivery should be withheld on the ground that the clearing account is "momentarily unfavourable to one of the clearing partners."

Metal Production in Australia

[BY A CORRESPONDENT]

July 23rd

CABLED reports from Canberra this week confirm that the arrangements for the transfer of workers from the gold mines to the base metal mines in New South Wales and Queensland have just been completed and that similar arrangements are about to be concluded for Tasmania.

The OCEAN

Accident & Guarantee Corporation, Limited
Head Office: 36-44, Moorgate, London, E.C.

FOR ALL CLASSES OF INSURANCE

These schemes are an extension of the arrangements for Victoria and Western Australia, which have been in force for some weeks and have already resulted in the release of several thousands of skilled miners for essential war work. With the new arrangements in Australia's leading base metal mining States, the way has been cleared for the production drive in the Commonwealth, which was announced by the Federal Government immediately after the Allied withdrawal from Malaya and the Dutch East Indies. This drive plays an important part in Australia's munitions production, and its results are likely to determine the expansion of Australia's new munitions industries.

For nearly a century, Australia has been one of the foremost non-ferrous metal producers of the world, but since the end of the last war production has been chiefly confined to lead and zinc. The Broken Hill deposit in New South Wales and the Mount Isa mine in North Queensland produce over 250,000 metric tons of lead and over 210,000 metric tons of zinc per annum. In lead, the Commonwealth is easily the largest producing area after the United States, while in zinc it vies with Greater Germany for second place after the United States. Apart from 25,000 tons of lead and 30,000 tons of zinc absorbed at home (including shipments to other parts of Oceania), the whole of Australia's production used to be shipped abroad before the war. To-day, Australia is using much larger quantities of lead and zinc for war purposes, but, even now, something like three-quarters of Australia's production remains free for export to Great Britain and the United States.

More Copper and Tin

It is not surprising, therefore, that the new production drive aims not so much at further increases in lead and zinc supplies, but at an immediate expansion of the output of copper and tin. Australia's copper and tin industries have passed through difficult times since the last war, and since 1921 their output, in spite of a recovery in the three years preceding this war, has never exceeded 20,000 tons of copper and 3,700 tons of tin, although in 1913 the Commonwealth produced 47,200 tons and 8,000 tons respectively.

The poor figures in recent years are not due to an exhaustion of ore reserves, although in the course of the past century most of the easily accessible and the richest copper and tin ore has been mined. There are, however, fairly extensive low-grade deposits of copper and tin in New South Wales, Tasmania, and Queensland, and, to a lesser extent, also in South and Western Australia. Elsewhere, these deposits would probably have been fully developed, but in Australia the shortage of miners and the relatively high wages for mining labour—factors which are mainly due to the strict Australian immigration laws and the exclusion of cheap native labour from most mining operations—have rendered this development unremunerative in normal times, especially as, in spite of its small production, the Commonwealth has been more than self-sufficient in copper and tin in the last fifteen years.

The establishment of a major munitions industry in Australia has naturally increased the Commonwealth's requirements. Moreover, the consumption of Great Britain and the United States has reached such proportions that any additional ton of copper and tin that can be made available is important. The minimum goal must, therefore, be the supply of sufficient quantities of copper and tin to meet Australia's own increased requirements, but there are good prospects that beyond this the Commonwealth will be able to spare at least small quantities for the United Nations' pool.

Shortage of Labour

Since Australia has sufficient smelting and refining capacity to treat roughly twice the amount of domestic ore mined recently, current difficulties are confined to the mines themselves. Here the Government has a twofold task: first, to secure the necessary supply of skilled workers, and, secondly, to make the increased production sufficiently remunerative to assure a maximum effort. The labour problems have been tackled by the transfer arrangements already mentioned, while the question of profitability has been solved by certain concessions regarding the taxation of non-ferrous metal mining companies for the duration of the war and the revision of Australian copper and tin prices. The tin price has been raised by £A51 to £A371 per ton from the end of April, 1942, and the copper price by £A18 10s. to £A105 per ton from the middle of last May. A sum of £A10 a ton of tin sold and £A5 a ton of copper is being transferred to a pool from which the development of new production, in particular of high cost mines, is to be subsidised.

Change Over in Egypt

[FROM OUR ALEXANDRIA CORRESPONDENT]

June 25th

THE advent of a 100 per cent Wafdist Cabinet under Nahas Pasha last February constituted much more than a change of the party in office, for it brought to an end the special régime which had been in force since the beginning of 1938. A new Chamber of Deputies came into being with the usual overwhelming Wafdist majority that follows free elections; nominations of Senators made during the 1938-42 period were cancelled, and others nominated in their stead; an Audit Department was created. Anglo-Egyptian feeling is now better than at any time since the start of the war—indeed, since the signing of the Treaty in 1936.

During the first weeks of Wafdist administration, an attempt was made to reverse the previous policy of growing restrictions. That policy had not been pursued with enough foresight or energy, and had but very partially achieved its ends, arousing much dissatisfaction. The requisitioning of wheat and maize was stopped, and their price increased by 50 per cent in order to induce hoarders to part with the remainder of the crop; the price of bread was reduced by 10 per cent, and the resulting loss borne by the State; substantial quantities of cereals were borrowed from the British military authorities in order to weather the difficult period up to the wheat harvest in May. An appeal was also issued to employers to adopt a minimum daily wage of P.T.5 (1s. 0½d.) for land and town workers.

By the end of April, however, it became necessary to revert once again to the policy of progressive restrictions, and, at present, State control is more stringent, and extends to a wider field than when the Hussein Sirry Cabinet resigned. About two-thirds of the new wheat crop has been requisitioned, while transactions in the remaining one-third are strictly regulated. The entire production of sugar has been requisitioned and will be rationed. Petroleum rations have been reduced by one-quarter. The rationing of some other articles is also contemplated. The price of bread has been increased to its previous level, but will still leave the State with a deficit of £E4,400,000 for the 1942-43 season. As for imports, the short-lived quota system has been superseded by a much more stringent system of licences that reduces the inflow of goods to a much smaller figure in order to save shipping space. The recent meeting of the Middle East Supply Council pointed out the necessity of making Egypt, and the adjoining countries, as self-sufficient as possible.

Meanwhile, the cost of living index has pursued its sharp upward course: April, 1940, 137; April, 1941, 164; February, 1942, 206; March, 1942, 212; April, 1942, 216. Trade and industry are more prosperous than ever, but the conditions of the salaried and wage-earning classes have deteriorated, as lack of organisation, together with the pressure of population, has prevented them from obtaining any substantial or widespread rise in incomes.

Restrictions in foreign trade have increased the already very great volume of idle funds, resulting from war profits and British military expenditure in the country, and part of these funds has been invested in securities. During the six months that elapsed between the entry into the war of the Soviet Union and the United States, the Stock Exchange experienced one of its most vigorous and sustained booms, and further big gains were recorded more recently:

	Mid-June, 1941	Late December, 1941	Early June, 1942
Unified Debt	£E. 7,530*	£E. 8,390	£E. 9,540
National Bank	2,400*	3,250	3,416
Credit Foncier	1,930*	2,824	2,850
Salt & Soda	225	408	458
Filature Nationale	810	1,480	1,590
Delta Light Railways	112	280	351
Egyptian Hotels	141	341	429
Behera	1,080	2,040	2,750
Heliopolis	1,002	1,540	1,700

* Nominal, frozen at minimum official price.

On the morrow of the fall of Tobruk, State Funds were not allowed to be quoted officially lower than 2 per cent, and other securities lower than 4 per cent, of the previous close, and buyers were not lacking at these levels for several lines.

In the course of the past winter, to finance its purchase of 50 per cent of the cotton crop, the Government issued a £E10,000,000 loan, at par, bearing 4½ per cent interest,

and redeemable within five years. It was fully subscribed, and has been quoted above par from the start. For the same purpose, £E500,000 of three months Treasury Bills have been issued by public tender every fortnight since the beginning of the year. In almost all cases, tenders were about three times the amount offered, and the average annual interest of the Bills allotted, which was 1.84 per cent at the first tender, gradually declined to 0.81 per cent at the latest (June 13th).

The Budget for 1942-43 will reach £E53,000,000, and it shows no deficit. It is thought that supply problems may make large unexpected demands on the Treasury, but receipts for the first nine months of 1941-42 exceed expenditure by £E8,507,382, and this large surplus may eventually provide the extra margin.

Shorter Notices

"The Bankers' Almanac and Year Book, 1941-42." Thomas Skinner and Co. (Publishers), Ltd. 2,130 pages. £3 net.

It has naturally not been possible for the compilers of this valuable publication to bring many of its figures for foreign banks up to date, and some of the balance-sheets consequently only refer to 1938 or 1939. But in its information on British banking, and as a general reference book on monetary matters, it is as complete and useful as ever.

Correction

In the review of "Democratic Advance" by Edward Mousley, on page 145 of *The Economist* last week, the quotation "the only alternative to war is the rule of systematised power, enforced where necessary by power," should obviously have read "the only alternative to war is the rule of systematised order, enforced where necessary by power."

War Damage

THE new programme of industrial concentration and the greater damage caused by the latest British bombing attacks have forced the German Government to supplement piecemeal its compensation and war damage policy. The complex war damage law, the administration of which is centralised in the *Reichskriegsschaedenamt*, distinguishes between "primary" or direct war damage to property and persons and "secondary" or indirect damage caused by the concentration of industries, the conscription of owners of businesses, loss of income in retail trade and so on. The assumption, formally, is that the state is responsible for compensating all losses, and there is, thus, no state or private system of insurance against war damage in Germany.

During the first year of the war, "primary" war damage was extremely small in Germany, and attention was chiefly focussed on "secondary" damage, that is on compensation for temporary loss of income and on the maintenance of closed-down factories. In practice, the maintenance of closed-down factories was made the responsibility of industry and trade themselves, and a system of "co-operative aid" for maintaining buildings and machinery was introduced. The necessary funds were accumulated by a levy on the model of the earlier export levy, and the administration and distribution of the funds was left to the self-governing federations. The system came into force on May 16, 1940, and the levy had accumulated at the end of June this year to Rm 72 millions, out of which some Rm 37.1 millions has been paid for the care and maintenance of factories and machinery—Rm 16.5 millions during the first six months of 1942, which is an index of the intensified policy of industrial concentration.

In retail trade and among independent artisans, the main difficulty has been to meet the rent of shops. In retail trade shopkeepers were paid 80 per cent of the rent if their turnover has been reduced by rationing. A great number of the shops run by independent artisans were simply closed by the conscription of the owner. Only "healthy" businesses are maintained, and a considerable number of small shops must have been closed down without any special assistance apart from the allowances for dependants. On the other hand, a guarantee has been given that small businesses which have been closed down can be reopened after the war.

In the case of compensation for "primary" war damage caused by bombing or other enemy action, there are three main classes of damage—personal injury, damage to property, and contingent loss such as the loss of interest income from capital investments. Personal injury, that is the death or disablement of the income-earning member of a family, is compensated according to the same regulations that are in force for the dependants of killed soldiers. The loss of income caused by the destruction of a factory or of business premises is almost fully compensated for a time, though there is no clear indication of how long these payments will continue. In theory, household goods and personal chattels are also fully covered according to a complicated system of assessment; but cash payments seem to be very small and compensation in kind must be accepted. In practice, there is hardly any information about the compensation paid for loss of household goods. The majority of bombed-out people are usually accommodated in emergency centres established by the local authorities. Families that have been evacuated are paid a regular evacuation allowance; but the payments seem to vary considerably from district to district.

In the case of damage to buildings and other real property, only minor damage can be repaired at once. After application has been made to the mayor of the town, a committee is responsible for assessing the damage. Whether or not any immediate compensation is paid is decided "according to the public interest" and to the possibility of repair or rebuilding. If the committee decides against immediate compensation, nothing is done, but assessment is made. If "the public interest" demands immediate repairs or rebuilding, the owner must accept material and labour supplied by firms working for the state. An important provision is that compensation for damaged or destroyed buildings and machinery is assessed according to the present value and not the original value. In urgent cases,

advance payments may be made to a general limit amounting to Rm 1,000. The little that is known about the actual operation of the compensation regulations suggests that only the most urgent cases are dealt with currently, and that the final settlement of much the greater number of cases of war damage is being left until after the war.

House Property.—The policy of cheap money and the impossibility of making normal repairs have led to abnormal financial liquidity among owners of house property. The total income from rents is at present estimated at Rm 8,500 millions. Before the war, normal repairs meant an annual expenditure amounting to roughly Rm 800 millions. Repairs have been reduced to one-third or even one-fourth of the figures for pre-war years. Owners of house property have had almost no losses; state compensation for loss of rents and the growing shortage of flats may have actually increased the income from rents. Owners of house property are more or less war profiteers; and the current movement into *Sachwerte* (real values) has singled out house property as the most attractive investment.

At present, the press is discussing schemes for making house property, which yields roughly one per cent above the interest from state loans, less attractive for investors. A general reduction in rents amounting to 10 per cent is suggested. The main preoccupation, however, is how to induce owners of house property to build up reserves for repairs after the war. Compulsory accumulation of reserves has been suggested, but it is difficult to lay down general regulations. House property is split up among millions of owners. Probably a scheme similar to the "iron savings" schemes in operation for industrialists and companies will be introduced. Owners of house property would then be able to pay their surplus funds into the Treasury, where they would be blocked until after the war. By this method, some Rm 500 millions would be put at the disposal of the State.

Machine Building.—The commissar for the machine building industry has prohibited the construction of all machinery which is not directly necessary for war production; the long list includes, for example, textile, building, printing and laundry machinery. Before these new regulations were issued, the construction of machinery was controlled by the departments allocating raw materials. Control now begins at the moment when an order is made. Special committees will decide whether the order can be executed. The controlling bodies are the industrial committees organised by the Minister for Armaments and Munitions, Dr Speer. The standardisation of machinery is being very much extended, and regulations forbid the former elaborate finish of machine tools and machinery.

Maximum Wages.—The trustees of labour have been empowered for some time to decree maximum wages. The Labour Court recently decided that a "trustee" may lay down that maximum wages shall come into force retrospectively. In other words, workers who have been paid increased wages for some time will lose the legal right to claim payments if the "trustee" fixes maximum wages retrospectively below the rate paid by the employer. This new pressure on wages is explained by the necessity of maintaining stable prices.

French Workers.—The French Ministry for Production is organising the dispatch of whole groups of workers to Germany. Managers, engineers, foremen and workers of one and the same factory may be transferred as a group to German factories. This, the German press declares, will enable the French workers to use their accustomed methods of production. The owners and employees of small businesses, which have been closed down in great numbers recently, may form new groups out of several businesses and transfer in a body for work in Germany.

European Price-Stop.—Dr Fischboeck, Germany's price commissar, recently spoke at the Hague on the problem of a European price-stop. The common aim of all European countries, he said, should be a price-stop in foreign trade between them; this aim could not, however, be reached if each country allowed changes in internal prices.

THE BUSINESS WORLD

Life Assurance

SO far life assurance has carried the strain of war well. There have been periods of anxiety—notably in the summer of 1940, when security prices fell heavily and depreciation became a serious problem, especially for those offices which had been least conservative in their investment policy; and in the winter of 1940-41, when heavy air raids caused considerable mortality among the civilian population as well as extensive damage to property in which the offices are interested, either as owners or mortgagees. But the value of assets in terms of sterling have, on the whole, been well maintained, and mortality experience has remained within expectation, despite the incidence of war deaths. Expenses have remained stationary, or fallen, except for the industrial offices.

The most disturbing feature has been the continuous downward trend in the net rate of interest earned on the offices' funds. But, even here, the average rate in most cases has not yet fallen to the point where the offices are faced with actual losses. In this, as in other factors which govern the results of life offices, the effect of the war has been rather to diminish profits than create losses. Because of the widespread transaction of life assurance on mutual or with-profit principles, the reduction in profits has been shared by the offices with their participating policyholders, and the security of basic contracts has not been impaired. Public confidence is clearly visible in the substantial volume of new business which continues to be transacted.

The indications for the future are necessarily obscure, but certain broad trends may be distinguished. In the case of assets, there are two processes at work. First, as the war goes on, steadily increasing proportions of investment portfolios are being placed in Government securities, thereby giving them a higher "gilt-edged" quality. Secondly, holdings of overseas securities are being requisitioned for war needs, thus causing the international character of the offices' investment transactions to tend to disappear. Actually, these two processes both work towards a safer investment policy. Insofar as certain offices have formed an investment policy which was unduly speculative, the need now, which they cannot escape, to take more and more gilt-edged securities is a gain. In the case of the other offices, however, it must perhaps be assumed that they knew their business, and that a mixed portfolio yielded a net advantage; the substitution in their portfolios of larger and larger proportions of Government stock will give the advantage of a more stable running yield, but only at the cost of a reduction in its amount, and of increased uncertainty about current depreciation after the war. So long as the rate of interest is kept down, the present position will persist, except insofar as the offices are permitted to readjust their holdings. If it rises, only a very rapid rearrangement of portfolios will prevent considerable depreciation, and it is doubtful whether such a rearrangement would be possible on any substantial scale.

The course of mortality is difficult to assess. Deaths from normal causes seem, if anything, to have been fewer in wartime than in peacetime, and deaths directly due to the war have been light by comparison with the last war—with the result that most of the offices have been able to point to an experience below that envisaged by the ordinary tables of mortality on which premiums have been based. But the most serious war casualties may be yet to come—and, even in the case of civilian mortality, it is perhaps as well to bear in mind that the influenza epidemic at the end of the 1914-18 conflict caused more deaths than occurred on the battlefield. Much greater attention is now being given to public health than during the last war. But the possibility that at some stage of the war, or in the immediate post-war period, the present margin between mortality experience and expectation will disappear and an actual loss develop cannot be ruled out.

Expenses are not likely to prove a serious aggravating factor. The reason for the generally lower expense ratios of the ordinary offices is to be found in the smaller volume

of new business transacted, with consequent reductions in the heavy initial commissions on first-year premiums. It is improbable that new business will revert to pre-war levels before the conclusion of hostilities, if only for the reason that the offices are deprived of the services of their sales staffs. These observations do not apply to the industrial offices which have been able to maintain their new business at high levels, partly because of relative prosperity among the classes for which they cater, and partly because the outdoor staffs called for service have largely been replaced. Such replacement was inevitable in view of the vast amount of door-to-door collection work which still has to be undertaken, if only for the sake of maintaining in force the pre-war contracts; and the remuneration of the new employees, mostly women, superimposed on the allowances which the offices are making to the staff in the Forces, has brought an increase in expense ratios which will no doubt continue for the duration of the war. Among factors affecting ordinary and industrial offices alike, which have tended to raise expense burdens, have been the cost of air raid precautions and of war damage contributions.

Finally, there is the question of interest earnings. This factor transcends in importance all the others. The longer the war lasts, the worse the position is likely to become; as the ratio of Government securities to total investments increases, so the average rate of interest earned in the offices' funds diminishes. The average net rate has already fallen in some cases to a point below the rate assumed in the past in calculating premiums, and is approaching the

The Yorkshire Post
leads the steady
North

Ask to see it at your Club, Library or Newsagent

rate used for periodical valuations; quite a number of offices, in fact, have deemed it prudent to lower the valuation interest rate, or otherwise make provision for loss under this head. One institution—the *United Kingdom Provident*—has gone so far as to reduce its valuation rate to $2\frac{1}{4}$ per cent, that is to say, below the rate of $2\frac{1}{2}$ per cent traditionally regarded as the hall-mark of the conservative life office. At the end of the war there may be a return to investments yielding a higher return. But this will be slow in making its effect felt, and the time lag, which is helping the offices now, will work against them then. Moreover, no immediate benefit will accrue from lower income tax because the standard rate will need to fall below 7s. 6d.—the rate at which the offices are at present assessed—before any relief is secured. All in all, the outlook for interest earnings is not too favourable.

To summarise, it is possible to envisage, first, reasonable stability of security prices so long as the war lasts, and afterwards some depreciation, which will depend on the extent to which the capital market is opened, and against which the large holdings of Government securities should prove a

useful buttress. Secondly, there is the likelihood of some mortality loss either during the war or immediately after. Finally, there is the virtual certainty of losses on interest earnings which will increase with the duration of the war, and only slowly be remedied afterwards. These considerations point to diminished profits on pre-war policies, and losses for some time to come on any new business transacted at current premiums. Yet many offices are pursuing as active a new business policy as a depleted staff permits, by offering special Savings Bonds policies, and accepting civilian war risks without extra charge. In the post-war period, there should be an abundance of new business for all to share, for the population as a whole is still greatly under-insured. Lower interest rates may tend to discourage the purchase of life policies for investment purposes, but this will not necessarily be detrimental if it focuses attention on their original and primary function—provision for dependents. And an extension of “planning” in industry, bringing with it greater stability of employment and an increased sense of responsibility by employer to employee, might lead to a substantial increase in group life assurance.

American Accounts

COMMENT on the articles which appeared in *The Economist* on April 11th and 25th, on the subject of company accounts, has more than once suggested that American practice might be looked to as a guide. No one can study the reports of the comparatively few large American corporations which are commonly available in this country without being impressed by the wealth of detail they contain. Although the actual information given may vary considerably from one to another, the least informative appears to be well ahead of all but the best in this country. It might, therefore, be thought that one had only to adapt American methods to secure a similar result here. Unfortunately, the matter is less simple than that. While the practice of many United States corporations shows that they consider publication of their results, in detail, as good, rather than bad, for their business, this is not general; and the background of American legislation, in fact, offers no very helpful suggestion as to how the British shareholder may obtain the information he requires.

There is nothing in the United States that corresponds at all closely to the Companies Act. Limited liability is obtained by incorporation, and this is achieved by Charter (Articles of Association), usually given by the state in which the new body is to be resident, although National and Federal charters are also granted. In no state is any statutory duty laid upon the officers of a corporation to publish accounts to shareholders. There are arrangements for at least one annual meeting, at which the president gives a general report on operations, and the treasurer may deal with the financial and accounting side of the enterprise. In New York State, holders of 3 per cent of the capital may call for the accounts, which have then to be presented. There exists a common law right to inspect the books of the corporation. Obviously, the ordinary investor cannot undertake this, while the right to such detailed information could probably be used by competitors to damage the business. In consequence, this right has been hedged round with restrictions by local statutes. For the most part, what the shareholder receives, he receives not of legal right, but by force of custom—backed, no doubt, by the fact that the court could usually grant the right of full inspection in a flagrant case.

It is impossible, without a wide experience of American conditions, to say how far this state of affairs is considered satisfactory; and it must be remembered that the machinery for the provision of equity capital is different in the USA from the British arrangements. The position seems to be that a corporation, which is for any reason much in the public eye, will publish excellent accounts, while others may not. The tradition of publishing really informative accounts to shareholders antedates the agitation which led to the creation of the Securities and Exchange Commission; and that agitation was concerned with the sale of and trading in securities, rather than with any question of giving accounts to proprietors.

In this country, it has been the practice to rely upon the law and public opinion to secure reliable administration.

On the North American continent, there has for long been a faith in the efficacy of official inspection of accounts: witness the Chartered Banks in Canada and the Federal Reserve system in the USA; and the control of railroads by the Inter-State Commerce Commission and of common carriers by similar bodies in both countries. Something similar was attempted in Britain by the Railway and Canal Commission, but that was effective neither in control of operation nor in keeping up to date statutory requirements as to published accounts.

Against the American background, it is not unnatural that the SEC should have produced the Acts of 1933 and 1934. The joint effect of these is that a corporation, with any security quoted on a national stock exchange, must furnish to the SEC, and to the exchanges giving the quotation, accounts providing a specified minimum of information, which must be kept up to date so long as dealings continue. It is obviously impossible to treat the requirements in detail—the forms which the large American corporations send to their subsidiaries to be completed for the annual accounts may run into a hundred pages. Some general idea of the requirements may, however, be given. They include balance-sheets, profit and loss accounts and a number of schedules for every parent company, and for each of its subsidiaries or group of subsidiaries which is of sufficient consequence to merit inclusion. These may be given separately, or in consolidated form, but the material must be provided. The information must normally be filed within 120 days of the end of the registrant's—that is, the parent's—financial year; but the date of accounts for any subsidiary in a consolidated statement may differ from that of the parent by as much as 93 days, provided that the date, and any change in it, and the reason for the difference are clearly stated. This, although superior to British practice, is a source of weakness. In addition, an acceptable certificate as to the adequacy of the accounts, and the soundness of the accounting practice, must be given by an independent auditor. It is also necessary to show the names of subsidiaries and sub-subsidiaries, the extent of the shareholding in each, and where control is not by voting rights, to explain how it is exercised.

The main headings of the balance-sheet are similar to those aimed at in this country by the improvements in the Companies Act of 1929, but sub-division within each main rubric is required. Cash must be split into three sections, according to the notice to be given to withdraw it. Trade debtors may be given *en bloc*, but the reserve must be separately stated, and non-trade debtors must be split into their main categories. Stock-in-trade must be classified under raw materials, work in progress, finished goods and supplies. There are elaborate provisions about securities, and, in so far as these are marketable, their nominal, balance-sheet and market value must all be given. The provisions for the classification of current liabilities are fully as satisfactory as those for assets, every main group of creditors, for example, wages, taxes, interest, being stated separately. To complete the picture, fixed assets must be

classified, and additions at cost, retirements or sales and other changes shown for each class. In passing, it may be noted that the schedules provide for similar detailed evidence with regard to all reserves.

The wealth of material required in balance-sheets is almost equalled by that demanded in the profit and loss account. This includes a trading account, showing gross sales, less discounts, returns and allowances. From this is deducted the cost of the goods, and a statement is given to show how this is obtained. Then follow operating revenues and expenses, selling and administrative expenses, provisions for doubtful debts and any other special item of substantial importance. Finally, as a note to the account, there must be stated the amount charged against costs, and to any other account, in respect of maintenance, depreciation, taxes, management and service contract fees, and rents and royalties.

In this wealth of material, there is enough to satisfy the most exacting, whether he be student, stockholder or statistician. As already indicated, the SEC requirements scarcely exceed what was voluntarily given before that date by some corporations. But, unfortunately, the Acts of 1933 and 1934 do nothing directly to improve the stockholder's position. The requirements are to be compared with the unknown demands by the new issues sub-committee of the Stock Exchange in London, when considering applications for permission to deal, rather than with those of the Companies Act. Whether the SEC requirements are the more exacting cannot be said. They have, however, two advantages, namely that there is an obligation upon all companies to present what are in effect *standardised* accounts, and that the obligation is a continuing one. This has meant a gradual improvement in the method of compiling accounts and in the value of the certificate submitted by the auditors—a matter which is in need of attention in this country as a means of increasing efficiency, quite apart from the question of giving information to the shareholder or the public. The SEC has thus prepared the ground for the publication of accurate and detailed figures. Although there is evidence of material improvement in the method of presenting figures to industrial managements, and some elucidation of the principles underlying their preparation, it is still the fact that in this country much improvement could still be effected.

The principal lesson to be learned from the position in America seems to be that many directors there are much

less timid about disclosing facts than their opposite numbers in this country. They provide all that has been asked for by the most exacting critics of existing practice here, starting with a statement of turnover, and showing the main outlines of the build-up of balance sheet and profit and loss account. Further they give, in many cases, very full quarterly accounts and progress reports. Whatever the reason for the difference of practice, the result is clearly not harmful to the companies giving it, while it is beneficial to all those interested. It is difficult to see why the accounts of Vickers should not be as informative—at least in time of peace—as those of US Steel. In point of fact, they are incomparably less so. If, however, it is to be desired that British directors should follow the practice of those in America with regard to disclosure, it is very doubtful whether British shareholders would have much to say in favour of placing in the hands of the stock exchanges a regular flow of information, which was withheld from them, the actual proprietors of the business. That it is accepted in the USA would seem to arise from the traditional reliance on inspection by authority—in this case the SEC, assisted by the quoting stock exchange.

Here, it would seem to be desirable to travel further, and more rapidly, along the line which has been taken by each amendment of the Companies Act, that is to say towards increased publicity, in the full sense of that term. The revision must, however, on this occasion, be much more radical than any yet attempted. It should begin by putting all accounting, for public companies at least, on a uniform basis, with proper allowance for differences between individual enterprises, and with some latitude for legitimate differences of opinion between individual accountants. It should then insist upon publication, in an agreed summary form, of such information as is necessary—an outline of most of the points was given in *The Economist* of April 25th. Finally, the auditor should be required to vouch for both the adequacy of the system of accounting adopted and the accuracy of the figures published, and for any comments on them. At present, he is too often only concerned to see that there is no contravention of the law, such as would render his clients liable to prosecution. This would, in practice mean a fundamental adjustment of the relations between the various branches of the accounting profession; but, as was indicated in an earlier article, a change of outlook is essential. Such an adjustment is, perhaps, the best way of securing this new outlook.

Finance and Banking

Heavy Note Withdrawals

Conditions in the money market have been rather less comfortable this week than is usual in the early days of the month. The credit position has in fact been subjected to a double strain in the shape of further heavy withdrawals of notes for holiday spending and a substantial immobilisation of funds on public deposits. The jump of £9,168,000 in the note circulation to the new record level of £833,316,000 is only slightly larger than in the corresponding week last year; but it completes a continuous expansion of over £40 millions in the past seven weeks, compared with less than £30 millions in the same period of 1941. It may be noted that to the Christmas peak a year ago a further £85 millions of notes were withdrawn, whereas the reserve, replenished only a week ago by an increase of £50 millions in the fiduciary issue, now stands at £48.2 millions. As a result of the note withdrawals, the credit base as a whole has been reduced by some £4 millions, notwithstanding an addition of over £5 millions to the Banking Department's holding of securities. Over £14 millions of credit having been absorbed into public deposits, bankers' balances have fallen by £18.7 millions to £118.1 millions. This movement is somewhat unexpected in view of the sharp decline in savings and the very moderate TDR issue of £15 millions, but may be an aftermath of the previous week's rush of National War Bond subscriptions.

Iranian Exchange Improvement

The fundamental change in the Iranian exchange position over the past year is discussed by Sir Henry McMahon in his statement to shareholders of the Imperial Bank of Iran. This year, the bank's figures have been converted into sterling on the basis of 140-142 rials to the £, whereas a year ago the rate employed was 68.80 rials. At first sight, this suggests a sharp depreciation of the Persian currency, but the reverse is, in fact, the case. The official rate of 68.80 in 1941 was almost wholly ineffective, while importers into Iran were in practice paying about 174 rials to the pound, and for many purposes sterling was wholly unobtainable. Owing to the increased importance of the Persian Gulf route as a channel of supply and communi-

**FOR ALL
INSURANCE
NEEDS**

Head Office:
LIVERPOOL LONDON
North John St. Lombard St.

cation between Russia and India, the demand for Iranian currency has greatly increased, and this has permitted both a return to greater exchange freedom and an improvement in the effective rates for the currency. This was reflected in an adjustment of the artificial official rate to 140 buyers and 142 sellers, the rates in force when the Imperial Bank's accounts were closed on March 20, and it has since been possible to lower these rates to 128 buyers and 130 sellers. The effect of the exchange adjustment would, of course, be to reduce almost by half the sterling equivalent of the bank's figures. The actual expansion shown by the balance-sheet is therefore the more impressive, and is a further indication of increased activity in Iran. Deposits have more than doubled, with a rise of over £5,000,000 to £9,508,000, while acceptances have increased from £629,000 to £2,490,000.

Spain Suspends "Free Pesetas"

Spain's decision to suppress the so-called "free rates" for a number of currencies (sterling, US dollars, French and Swiss francs, escudos and Argentine pesos) may also be interpreted as a reflection of that country's improved exchange position. In order to attract foreign exchange, especially in the form of remittances home from Spanish nationals abroad, remittances for purposes falling outside the various clearing agreements were permitted to be sold at more advantageous rates ruling in the free market, instead of the rates applicable to merchandise trade. With the general curtailment of imports into Spain as into other neutral countries, Spanish exchange balances are no doubt increasing, and it is not surprising that this concession has been withdrawn. The effect will be that British nationals in Spain, for example, will henceforth have to convert their sterling at 40.50, instead of 46.55, and nationals of the other countries concerned will experience a similar reduction in the peseta proceeds of their remittances. The Controller of the Anglo-Spanish Clearing Office has announced the payment of a second instalment of arrears. This amounts to 10 per cent, except for small debts not exceeding £30 at the time of the first instalment of 50 per cent, the balance of which will be paid in one instalment.

East Asiatic Monetary System

Japan's plans regarding the monetary system in the East Asiatic area of "co-prosperity" are at last beginning to become evident. Until recently, complete chaos reigned in this respect in newly-conquered countries. The notes of the original issuing authorities remained in circulation but at the same time "military yen" notes were also issued, and there was much talk about the establishment of new banks of issue under the control of the Bank of Japan. Now it is evident that the original banks of issue will continue to operate. Their reserves will consist of yen, just as those of the central banks of German-occupied countries consist of Reichsmarks. Each central bank will have a clearing account with the Bank of Japan, through which transactions between various parts of the "co-prosperity sphere" will be financed. In other words, just as Berlin aims at becoming the centre of the European unilateral clearing, so it is Tokyo's ambition to become the centre of an East Asiatic multilateral clearing. In practice, the working of both Berlin and Tokyo as clearing centres will be handicapped by the fact that the conquerors have debit balances in relation to the conquered peoples.

There are, however, several noteworthy differences between the German and Japanese systems. For one thing, while the "occupation marks" are purely temporary, the "military yen" are to remain in circulation for a long time. Another difference is in the degree of the devaluation of the currencies of the conquered peoples. In this respect, Japan is even more self-seeking than Germany, in that she is seeking to obtain an even higher degree of overvaluation of the yen, in order to secure favourable terms of trade. Indeed, the Japanese press now frankly states that the period of cheap Japanese exports is coming to an end, at any rate as far as the area of "co-prosperity" is concerned. Japanese exporters will henceforth charge more remunerative prices; and if, as a result of the overvaluation of the yen, these prices become prohibitive for the conquered peoples, it simply means that Japan's trade with them will become more one-sided than during the last few months. There is no point in exporting too much to the conquered countries, since Japan can buy from them without having to sell to them.

Workmen's Compensation Expenses

It is announced that the allowance for expenses and profit in the rates charged by the tariff offices for workmen's compensation insurance is to be reduced to 30 per cent of premiums. The original agreement between the Accident Offices' Association, representing the tariff companies, and the Home Office on this subject dates back to 1923, when the ratio of losses to expenses and profit was fixed at 60:40, with provision for rebates to employers on the basis of any margin between the actual and agreed loss ratios. In 1927 the proportion was amended to 62:37, and in 1940 there was a further change to 65:35. At that time rates were increased by 10 per cent to cover the cost of the additional benefits provided by the Workmen's Compensation (Supplementary Allowances) Act, and it was felt that expenses would not rise proportionately with the increase in premiums. This 10 per cent increase has, incidentally, been discontinued with effect from March 1st of this year. The present further cut in the expenses and profit allowance, which applies retrospectively to the year 1941, will no doubt be appreciated by employers. From the point of view of the offices, there may be wartime factors justifying the change; the increase in industrial activity has brought a high volume of premiums; and the process of concentration has eliminated a great many of the small businesses whose insurances form a large proportion of the portfolios of the tariff companies, so that costs are likely to have fallen. But it seems unlikely that workmen's compensation can remain a profitable field for tariff companies if they continue in their accounts to charge it with a full share of the branch and head office expenses which are common to it and numerous other classes of risk. The whole arrangement providing for the limitation of the expense ratio, is, in any case, a negative and a bad one, since it fails to encourage the offices in collective measures to reduce industrial accidents—any outlay in this direction will bring no reward but, on the contrary, if successful in its object will eventually reduce premiums and the amounts retained for expenses and profit correspondingly.

Investment

Equities Maintain the Lead

It would perhaps be unfair to say that July has been a month of disappointments in the field, but it has, at least, shown that Germany is still immensely strong: strong enough to make the neutralisation of Russia a distinct possibility. The one bull point is that Rommel has been halted, but that is only to be regarded as a brief respite, unless he can be thrown back. Possibly the mere fact that the enemy has been kept west of Alexandria is a factor in the strength of markets, but the circumstance that the net demand has been for equities, and that these have continued to rise ahead of both the Funds and other fixed interest securities, suggests strongly that factors other than the immediate course of the war, or even the duration of the conflict, are at work. The accompanying

FIXED INTEREST AND EQUITY SECURITY MOVEMENTS (July 1, 1935=100)

Financial News indices of 20 fixed-interest securities (converted to new base) and 30 ordinary shares

chart of the indices of fixed interest stocks and industrial ordinaries, compiled by *The Financial News*, shows an almost continuous rise in the latter, accompanied by fluctuations in the former which do little more than achieve a tentative upward trend. Industrials appear to have established the position, reached for a short time in January, and just touched early in June. The rise in equities is the resultant of very conflicting movements, including some important falls. *The Actuaries' Investment Index* shows, however, that out of fifteen classes of industrials, twelve have risen on the month while one, shipping, is unchanged. The general impression of the shipping market would certainly be that prices were higher. The two falls are in electrical manufacturing and distribution. Outside industry, bank and insurance shares have been risen, while investment trusts are a trifle down.

Short Term Influences

The detailed figures of *The Actuaries' Index* go some way to dispose of the theory that the rise in equities is due, in any considerable measure, to expectations of an early end to the war. The heaviest rises are in home railway stocks, in brewery shares and in building material concerns. The first are admittedly the reverse of post-war recovery stocks, the last must reap some benefit from the modified building boom which the Government has promised; while the second are doing extremely well while bombing neither destroys their property nor restricts their sales. Coal and cotton were also favoured last month, although it is very far from clear what will happen to the former under the new plans, while the latter must continue to suffer severely from shortage of raw material. Turning to fixed interest sections, the index shows virtually no change on the month in any of the major items, although there are very modest rises in the price indices for most classes of preference shares. The fall in yield is, however, only from 4.55 to 4.54 per cent, which is 2s. per cent above

the end-May figure. Meanwhile, the total price figure for 159 industrial equities is the highest since pre-war days. The yield is still higher than in any of the three months, November, 1941, to January, 1942, both inclusive, but with those exceptions it is a low record in recent history. Despite the fact that the improvement is largely due to the excep-

tional rises of the month, the general strength of equities remains impressive. It is to be noted that, according to this index, the rise in iron and steel shares is also well above average, 2.3 points to 55.4 against 1.7 to 62.1. The rises are all in the staple industries, but they are split between those which work predominantly for the home market and those which rely in large measure on export. They appear to be based almost entirely on short term considerations.

Palestine Conversion Alternative

Holders of the 5 per cent Palestine loan, who have just been offered the choice of repayment on November 1st, or of conversion into a 3 per cent stock running to 1962-67, may now be able to avail themselves of an alternative which appears, at first sight, at least, more attractive. The old Palestine stock, being now a definite maturity, is suitable for the money houses, who have bid it up to a point at which it can be sold for 102. The seller can put the two points premium, less selling expenses, in his pocket, and apply for the new 3 per cent Savings bonds, 1960-70, now on tap. On these, he will obtain almost 2s. 6d. per cent net at the end of this month, and 15s. net every six months thereafter. If he converts, he obtains, it is true, 25s. on November 1st, but has to wait until May for his next instalment, which is equally 15s. net from then on. The exchange seems advantageous, despite the fact that the Savings bonds have a maximum life three years greater than that of the new Palestine stock. Against this, they will probably enjoy in the long run a freer market. The price offered by the money houses is so high that it seems to call for a word of caution. It seems certain that they will have to accept conversion, and not be allowed to demand cash. A long-dated stock is not attractive to them to hold, so, presumably, they expect to be able to dispose of the Palestine stock at a small premium, against which Savings bonds cannot rise above par until the tap is turned off.

Partington Steel Option

Holders of the second and third preference capital in the Partington Steel and Iron Company, now in liquidation, will be pleased to learn that an ideal arrangement has been reached, in so far as the distribution of the Lancashire Steel second preference shares are concerned. It may be recalled that, in the liquidation, these were to be distributed in specie. It has now been arranged that holders of either class may receive Lancashire Steel shares equivalent to seven-tenths of their present holdings and the remainder in cash. It is, however, open to any holder to apply for these proportions to be varied to suit his convenience. In consequence, he is able to have all cash or all specie or any variant, subject to the supply of Lancashire Steel second preference shares being sufficient to meet all demands, and to the avoidance of fractions of ten shares. Should all of their security not be absorbed by this means, the remainder will be offered in cash at par to those holders of either class of Partington preference capital who have elected to accept more than their due proportion of the payment in kind and not in cash. The framing of the proposal suggests that no difficulty is anticipated in disposing of the shares. These carry 5½ per cent non-cumulative dividend, and rank after £1,400,000 5 per cent cumulative first preference capital. The dividends on the two classes has been covered some five times by the net earnings of recent years. Dividends have been paid on nearly £3,500,000 of ordinary for seven years, during which period earnings on that class of capital have averaged some 10 per cent. The first preference stand at some 22s., so that there is a very fair chance that the second will be worth at least their par value, under conditions of active employment for the steel industry. The price of both might well be higher, but for the fact that both are redeemable at par at any time on three months' notice.

Company Notes

Richard Thomas Earnings

When dealing with the increased dividends recommended by Richard Thomas in *The Economist* of July 25th, the view was expressed that the gross profits would probably have fallen on the year. This is proved by the full accounts to be the case for the group, which shows a decline of over 11 per cent, and, although the figures of the parent company are up on the year, it is the group figures which matter. Virtually all the more important costs, including taxation, are, however, lower on the year, while the special writing down of assets takes only £100,000 against £363,677, and War Damage contribution £95,000 compared with £217,000. There is, in consequence, a marked improvement in earnings for ordinary capital, and a larger addition to carry forward, despite the increased distribution. Particulars are set out in some detail for the last three years in the following table:—

	Years to last Saturday in March		
	1940	1941	1942
<i>Consolidated Figures</i>			
Trading profits	3,171,296	4,000,172	3,542,159
Depreciation (a)	829,591	830,383	836,531
Taxation	1,159,704	1,671,036	1,425,000
Interest, etc.	552,565	562,233	519,552
Fees, staff funds, etc.	40,439	52,482	58,541
Outside shareholders	22,326	22,210	22,113
Surplus	566,871	861,809	680,422
Special charges	(b)177,500	(d)590,677	(c)195,000
Preference dividend	Nil	101,411	156,017
Ordinary shares:			
<i>Earnings</i>	Nil	169,721	329,105
Paid	Nil	Nil	121,875
<i>Earnings %</i>	Nil	6.9	13.5
Paid %	Nil	Nil	5
To reserves	352,634	100,000	100,000
Carry forward	(c)454,759	524,480	632,010
(a) Including amounts written off. (b) Commutation of amounts due under agreements and compensation. (c) Including £41,118 special credit. (d) War Damage contribution, £217,000; written off stocks, March 29, 1941, £363,677; agreements and compensation, £10,000. (e) £100,000 writing down Redbourn coke ovens; £95,000 War Damage.			

The report includes no statement as to the year's results, but the consolidated balance-sheet is not uninformative. After providing depreciation and writing down of £836,531, fixed assets of the group at £15,376,000 odd are reduced by only £823,510, but the suspense account in connection with outlays at Redbourn, amounting to £1,106,035, has been written off out of reserve, which is reduced to £286,478 after the year's allocation. Meanwhile, liquid assets are up by £466,049, against a fall in current liabilities of £218,993, in addition to which some £440,000 of debentures have been redeemed. There is, thus, a very marked improvement in the cash position, there being now net liquid assets of over £5,000,000. The fall in creditors is paralleled by a larger drop in debtors; stocks are up by £534,424, to £4,910,000 odd, while cash is materially increased, and £500,000 of Tax Reserve Certificates have been substituted for £345,000 of War Bonds. The figures suggest some falling off in output, coupled with a sharper decline in demand, a state of affairs which must continue until supplies are more readily available. The market gave the report a good reception; the prices of the preference and ordinary now stand at 29s. and 6s. 9d., giving yields of £6 17s. 6d. and £4 18s. 9d. per cent, respectively.

Conssett Iron Setback

Total profits of Conssett Iron for the year to March 31, 1942, are some £60,000 higher at £690,375. In the latest accounts, provision for taxation is shown inclusive of tax on dividends which are themselves shown net. Adjusting the earlier figures the rise in disclosed tax provision is from £225,000 to £255,000. The decline in equity earnings from a rate of 10.6 to 5.9 per cent must be attributed to the necessity of paying £111,150 against nil for war damage. Depreciation absorbs £125,000 as in the previous year. Consequently, the ordinary dividend, maintained at 7½ per cent, is underearned. Nothing is written off investments, against £30,000 in the previous year, and the carry forward is reduced from £214,448 to £192,713. The Chairman, Mr. Clive Cookson, provides no clue to the cause of the setback, but there is little doubt that Conssett Iron has suffered from the general narrowing of profit margins responsible for a widespread reduction of surplus earnings among heavy industrial companies. There has been considerable capital expenditure during the year, amounting to £501,187 against £85,343. The whole of this addition has already been written off, partly by transferring £444,364 from reserve for improvement of plant—leaving the total of this fund at £355,636—and partly by means of depreciation provided from current profits. Among liquid assets, there is a rise in stocks from £1,365,124 to £1,418,107 and a reduction in investments from £122,777 to £27,924. Debtors are virtually stable, but there is an increase in creditors, including taxation, of some £500,000 to £1,728,981. The directors have redeemed £175,113 against £144,411 of 4 per cent debentures and a further £31,976 was repaid since the close of the financial year. Share premium account has been eliminated by the transfer of £278,849 to reserve fund, bringing the total of this account to £900,000, and of £93,994 to write down holdings in subsidiary companies to £339,906. It remains doubtful whether the ordinary dividend can be maintained in the current year. The 6s. 8d. ordinary stock, at 7s., yields £7 8s. 1d. per cent.

Two Brewery Results

The latest accounts of *Barclay Perkins* and *Threlfalls* Brewery are a good omen for the forthcoming brewery season. Profits, both gross and net, for each company are above those of the previous year, while gross receipts of *Barclay Perkins*, in the year to March 31st last, have attained a new record for the past decade. Despite the transfer of £60,000 against nil to deferred repairs, there is a jump in equity earnings from £88,138 to £121,309, representing 8.5 against 6.4 per cent, so that the 1½ per cent increase in the ordinary payment to 5 per cent is amply covered. The *Threlfalls* ordinary dividend is maintained at 18 per cent, covered by a rate of 18.6 against 18.3 per cent. Both companies have realised a small increase in the carry forward, but in the case of *Threlfalls* there is no transfer to reserve against £30,000 in each year for *Barclay Perkins*. On the other hand, *Threlfalls* in each of the last two years has transferred £40,000 from profits for war damage, while *Barclay Perkins* has drawn an amount of £69,000 over the past two years from contingencies reserve for this purpose.

Years ending Mar. 31 for Barclay Perkins and June 30 for Threlfalls Brewery	BARCLAY PERKINS		THRELFALLS BREWERY	
	1941	1942	1941	1942
Profits*	406,309	586,580	435,111	438,868

* After tax for Threlfalls Brewery.

† Including £60,000 special depreciation for Barclay Perkins in 1942 and £10,000 for Threlfalls in 1941 and 1942.

Last year's improvement is most probably to be attributed to the reduction in bombing and the consequent ability to maintain retail sales. The heavy London interest of *Barclay Perkins* presumably accounts for the fall in 1940-41. The chairman, Lieut.-Colonel Robert Wyvill Barclay, indicates that the decision to control the price of malting barley, which soared to abnormal heights last year, may affect the supply from subsequent harvests. Clearly, the future of supplies is the most important factor determining the ability to maintain current rates of profit. For the present, balance sheets show an increase in stocks from £355,325 to £387,935 for *Barclay Perkins* and from £249,804 to £308,457 for *Threlfalls*. In both cases, surplus liquid assets have risen from £588,750 to £653,865 and, slightly, from £151,538 to £193,204, respectively. Yields are sound, amounting to £5 2s. 11d. per cent at the current price of 70s. ex dividend for *Threlfalls* and to £4 10s. 11d. per cent at 22s. ex dividend for *Barclay Perkins*.

Profits from Milling

While the public and the shareholders of Ranks and Spillers continue to wait for any information as to results since the inception of control, the directors of McDougalls, and of the trust which controls it, continue to publish accounts. It is true that the figures of the operating company

are subject to adjustment, but it will be surprising if the tentative figures give a really misleading picture. It is a pity that the figures are after depreciation, EPT or NDC and contingencies. Even so, they show a slight rise for the year to March 31st last, which is increased by a cut in the income-tax provision from £39,206 to £30,870. In consequence, the usual dividends are maintained with a larger addition to carry forward than usual, after resuming allocations to reserve with the transfer of a modest £10,000. The trust, whose shares are publicly held, pays the usual 10 per cent dividend on the ordinary with a slightly less exiguous margin, the cover being almost 10.3 per cent. The balance sheet of the operating company shows a more marked expansion than ever in creditors, which are almost doubled on the year at £367,188, against £60,000 odd in 1939. The year's increase in stock-in-trade exceeds 40 per cent, and that in debtors is even more marked, but the largest rise is almost £100,000 in gilt-edged, in addition to which cash to the extent of £100,000 has been placed in tax reserve certificates. A statement accompanying the accounts of the trust company explains that, once again, all records have been broken. With regard to the effects of the recently concluded agreement, it is stated that the cushioning effects of EPT are likely to ensure that the net figures of the companies will be little affected. This is likely to prove the case in the future also, provided that the further agreement, to run from September next, and still to be concluded, is not markedly less favourable.

Tootal Broadhurst Lee

Profits of Tootal Broadhurst Lee, after all charges except income tax and interest, rose from £221,184 to £274,363 in the year to June 30th last. The profits are in each case after providing, *inter alia*, £40,000 for staff bonus. Despite an increase in the transfer to tax reserve from £150,000 to £191,000, equity earnings are up from £59,786 to £72,241. After allowing for the fact that the employees are entitled to a bonus, equal to twice the rate paid on the ordinary shares, between 7½ and 15 per cent, the percentage earned on that class of capital appears to have risen on the year from some 13 per cent to approximately 13.8 per cent, while the actual payment is unchanged at 12½ per cent. There is as before, no transfer to reserve, and the whole of the surplus goes to raise the carry forward from £104,056 to £120,933. The vice-chairman, Mr. J. E. P. Stevens, sounds a warning note when he points out that sales in the first six months of the period under review were stimulated by the increase in demand for branded goods, following the announcement of clothes rationing. In the last six months, however, the necessity of producing only utility goods for the home market has not only disorganised the company's system of output, but has also minimised the value of its goodwill. Consequently, it is possible that, in the current year, sales and profits may be lower. The balance sheet shows a substantial increase in cash from £598,287 to £702,993 and in trade investments from £291,250 to £536,300, financed by a fall in debtors, and a rise in creditors of some £200,000 to £1,252,506. Stocks are some £120,000 higher at £1,425,719, while sundry loans are reduced from £68,838 to £71,424. Whatever difficulties Tootal Broadhurst Lee is destined to encounter during the remainder of the war, it will not be forgotten that it has quite exceptionally rosy recovery prospects. The £1 ordinary shares, at 50s., yield £5 2s. 6d. per cent.

Industry and Trade

Control of Motor Fuels

The abolition of the basic petrol ration for private cars at the end of June inevitably led to an increase in the demand for substitute fuels by those who could not pass the new needs test for petrol, and who were unwilling to give up private motoring. The Ministry of War Transport has rightly decided to block this avenue of escape. It is essential to conserve the scarce supply of alternative fuels for essential purposes. Rubber is now in too seriously short supply to be used by private motorists. In view of the forthcoming abolition of private car manufacture, and the curtailment of the production of lorries, the existing stock of vehicles is too precious to be frittered away. Quite apart from the question of fuel, the use of vehicles for any but the most essential purposes can no longer be justified.

Control of substitute fuels is to be exercised by two Orders under the Defence Regulations. The first, which will come into force on September 1st, will prohibit the running of vehicles on fuels other than motor spirit or diesel oil, except under licence. Licences will be obtainable from the regional transport commissioners of the Ministry of War Transport, but they will only be issued if applicants can pass the needs test applied to users of petrol and diesel oil, and if the fuel demanded is, in fact, available. The second Order, which is yet to be issued, will embody the details of an "alternative fuel" scheme. Meanwhile, the Ministry of War Transport has intimated that owners of vehicles who intend to convert them to the use of alternative fuels should first obtain a licence from the regional transport commissioner. These measures are designed to ensure that the consump-

tion of alternative fuels will bring corresponding economies in the use of imported oil. The success of the effort now being made to economise motor fuels of all kinds will depend on the degree of ruthlessness with which the needs test is applied to consumers.

Organisation of Road Transport

Efforts continue to be made to strengthen the organisation of road transport. According to the annual report of the President of the National Road Transport Employers' Federation, the officials of the seven national associations, which are constituent members of the Standing Joint Committee have proposed a scheme which provides for the creation of four new organisations on a functional basis. Under the scheme public hauliers, private hauliers, and passenger vehicle operators would all have their own autonomous associations; the work of the three organisations would be "co-ordinated insofar as may be practicable and desirable" by a federation comprising them. The President of the Transport Employers' Federation admitted, however, that there was a certain divergence of opinion about the measure of autonomy to be granted to the three operators' associations. Indeed, there are no indications of an early agreement among the various, and frequently conflicting, interests of road transport.

Furniture Prices Controlled

It is not expected that utility furniture will be in production before the autumn, and the President of the Board of Trade has made the Furniture (Maximum Prices, Maximum Charges and Records) Order (SRO, No. 1530), the effect of which is to impose greater control on current furniture prices. The Order replaces the Furniture (Maximum Prices) Order (SR & O No. 828) of May 5, 1942, which froze prices at those current on May 1st, and limits the price to be charged by a manufacturer to his costs, plus a margin of 6 per cent on his costs, or to the current price, whichever is the smaller. The retailer is permitted a margin of 50 per cent on his cost price, including purchase tax, but excluding charges for delivery to him from the manufacturer. Delivery charges are limited to 10 per cent of the manufacturer's price (in Northern Scotland and Northern Ireland it is 20 per cent), in order to keep prices down, and to eliminate long hauls. Retailers may charge for delivery to their customers. The new Order also deals with second-hand furniture, and replaces the Second-hand Goods (Maximum Prices and Records) Order (SR & O 815) so far as furniture is concerned. The dealer is now made subject to the 33½ per cent margin. His selling price may not, however, be more than the current price, as laid down in the Order. Furniture made before 1831 is excluded from the Order; furniture made between 1831 and 1900 is subject to the margin provision only. The Order may have the effect of reducing prices when it comes into force on August 17th, since the margins fixed are the lowest customary in the trade. A large part of the great rise of furniture prices may be attributed to costs of materials and manufacture, but in no small measure the rise has been due to a shortage of furniture in relation to the demand. For this reason, price control alone is not sufficient. Some needs test or licensing system seems necessary to distribute equitably the short supplies. Such measures have been taken with other goods similarly placed, for example, motor-bars, certain sports goods, rubber boots and gloves, and should not be impracticable in the case of furniture.

Hire Purchase Control

A substantial quantity of furniture is bought on hire purchase terms, and in fixing furniture prices, this service has not been left free from control. A section of the Furniture Order discussed above deals with hire purchase terms,

and for the first time, prices which may be charged will be controlled. Before a hire purchase agreement is made, the price at which each article may be bought for cash must be stated in writing. An initial deposit equivalent to at least 12½ per cent of the total cash price of the furniture must be made, with a minimum of £5. The balance must be paid in not less than six instalments, spread over a period of between six months and two years. The charge for hire purchase facilities is limited to a maximum of 20 per cent of the balance due after payment of the initial deposit. These provisions relate to both new and second-hand furniture, and are designed to keep prices of furniture bought on hire purchase terms in line with the cash prices laid down by the Order.

Caterers and Conditions

The Minister of Labour has stirred up an angry buzz among caterers by his proposal to set up a Trade Board to control hours, wages and conditions in all sections of the catering trades. The Minister's view is that he cannot leave trades and industries "unregulated for the post-war period" and that provision must be made for them "in order that there can be a settling back . . . on regulated . . . conditions." Opposition is being organised by the Hotels and Restaurants Association, which maintains that the proposals have no connection with the war, and are "so political that they cannot fail to raise contentious discussion." By a peculiar twist of thought the Association declares the proposals to be "contrary to the political truce." The Minister's proposals are represented as an instrument which may split national unity. Some trades have always been difficult to organise, both from a trade union point of view and from the employers' point of view. Retail distribution was one of these trades, but when Mr Bevin had set the ball rolling, agreements were made by joint industrial councils which were welcomed by all those engaged in retail distribution. Admittedly, the catering trades present a set of problems different from those of other trades, but trade boards cannot avoid taking cognisance of special conditions. *The Caterer and Hotel Keeper* talks of a "wages board threat to catering industry." It has even been said that a wages board would kill the country inn. The trade's protestations that working conditions and wages have so improved in the last decade that control is neither necessary nor desired are somewhat too loud. If prevailing conditions are so good that they cannot be improved, it is unlikely that the proposal to set up a trade board could make them either better or worse, in which case it is unlikely that anyone in the trade would suffer. The various trade organisations concerned have set up a committee to deal with the proposals, and Mr Bevin has talked to the 1922 Committee.

Industrial Caterers' Wages

One section of the catering trade has made an agreement independently of any official action which may be taken. The agreement has been made between the National Society of Caterers' to Industry, on behalf of the employers, and the National Union of General and Municipal Workers and the National Union of Distributive and Allied Workers for the employees, and governs minimum wage rates and working conditions for factory canteen workers in the war industries, and came into operation in the first pay period after August 2nd. Minimum weekly wage rates are as follows:

Male charge hand cooks in London and the provinces, 72s. 6d.; assistant male cooks, 62s. 6d.; female charge hand cooks, 47s. 6d.; female assistant cooks, 42s. 6d. In the London-Metropolitan area: male kitchen porters, 57s. 6d.; cashiers and clerical workers, 40s. 6d.; cleaners, 35s. 6d. Outside London the rates for kitchen porters and clerical workers are 2s. 6d. less and for cleaners 1s. 6d. less.

The rates are subject to an increase of 5s. a week for women and 7s. 6d. for men for five nights worked in any one week, or pro rata for any night worked. The normal working week is one of 48 hours, but is subject to special conditions arising from fluctuations of activity in the working day. The agreement provides for overtime pay, annual holidays with pay, sick pay, free standard meals on duty, and other emoluments valued at 10s. a week. It applies to employees in industrial canteens in factories, as defined in the Factories Act, 1937, or established under

the Factory (Canteens) Order. It is probable that wages paid to canteen workers are considerably in excess of the minima laid down. For example, some male chargehand cooks are paid as much as £10 a week.

Increased Fire Losses

Ordinary fire losses have shown a sharp increase during the first six months of this year; at £8,552,000, they were nearly twice as high as during the corresponding period a year ago and almost as high as those recorded for the whole of 1939. True, the figures available are only estimates—they are calculated by adding 60 per cent to the cost of the principal losses—and they have no doubt been inflated by the rise in prices. Moreover, in view of the expansion in production, the employment of large numbers of unskilled operatives in industry, the dispersal of commodity stocks and the black-out, some increase in fire losses has probably been unavoidable, in spite of the efforts made to prevent their outbreak, with the assistance of the fire insurance offices and the extension of the system of fire watching. But since every factory and every ton of materials destroyed by fire represents an irreplaceable physical loss to the country as a whole, still more attention might be paid to the tightening up of preventive measures.

Earnings in Metal Trades

The changes in the relative earnings of workers in sixteen industrial groups between October, 1938, and January, 1942, revealed by the Ministry of Labour's inquiries, were shown in a table on page 118 of *The Economist* on July 25th. The most striking feature revealed by the table was the marked improvement in men's earnings in the metal trades, which are well above the average for all industries. The accompanying table shows, for the same dates, the changes in the relative earnings of men and women within the metal trades. While comparison of the average earnings in the various branches of engineering and metal manufacture is affected by the proportion of skilled to unskilled workers, by the length of the working week, and by other factors, the table discloses a number of interesting relative movements. For example, average earnings in the aircraft and motor group are well above the average of all metal trades in the case of both men and women; last January men's earnings averaged nearly £7 a week. The relative improvement of earnings in this group

since 1938 is no doubt partly a reflection of its rapid expansion, and of its ability to pay high wages. Women's wages, in spite of their increase, remain well below men's earnings, which explains the renewed pressure of their representations for improvement.

INSURANCE NOTES

COMMERCIAL UNION; NORTH BRITISH AND MERCANTILE; NORWICH UNION LIFE; NORWICH UNION FIRE; LEGAL AND GENERAL

The Commercial Union enjoyed a satisfactory year in 1941. Premiums were considerably higher in the fire, accident and marine departments and excellent profits were made, with the result that the company has been able to add substantial sums to its free reserves. The chairman (Sir Bertram Hornsby, CBE), in the opening remarks to his review of the year's operations, made mention of the company's extensive and long-standing interests in the Far East; he indicated that the interruption of trading consequent upon Japan's entry into the war had but slight effect in 1941, so that the loss of income will only become manifest in 1942. The profit in the fire department reflects an improvement in the experience both at home and in the United States, and operations in the Dominions and other overseas countries are stated once again to have given encouraging results. A larger accident income arises mainly in the United Kingdom and the United States and falls chiefly in the employers' liability section, due to increasing industrial activity through the expanding war effort; motor income was well maintained, but commercial and civil defence vehicles now represent a considerable portion of the business. In the marine department there has been a falling-off in cargo business both at home and abroad, but increased war premiums, surcharges on cargo and increases in hull rates required to meet additional hazards and higher costs of repairs, have brought a further expansion in income; after releasing £250,000 the marine fund stands at 142.2 per cent of premiums. Net life new business at £3,807,000 was considerably augmented by comparison with 1940 and about 60 per cent of the pre-war (1938) figure; premium income for the first time passed the two millions mark. Death claims, including those due to enemy action, were within expectation, but net interest earned fell by a further 2s. 11d. per cent to £3 2s. 9d. per cent.

The accompanying table shows underwriting profits totalling £1,538,000, but by reason of the transfer of round sums the

actual credits to profit and loss amount to £1,549,000. Net interest on the general funds of £535,000 and £3,000 for trusteeship and other fees contribute to aggregate credit transfers of £2,087,000. The company charges Dominion, Colonial and foreign taxes in profit and loss instead of the departmental accounts, and these amount to £207,000; ARP and other war expenses absorb £70,000, and UK taxes on profits £564,000. Debenture interest takes £31,000; £25,000 is written off freehold premises and £100,000 transferred to guarantee and pension fund. A transfer of £380,000 is made to the general reserve, bringing this fund up to £5,000,000, and after providing £607,000 for dividends, which are unchanged, the balance of £1,977,000 carried forward is higher by £103,000. Additional reserves in the fire and accident funds amount to £7,694,000, a small reduction of £10,000. The company has created a contingencies and taxation fund, which appears in the balance-sheet at £521,000; this fund includes a provision of £250,000 for future taxation, as well as miscellaneous exchange and other reserves, and it is the intention that the various accretions and diminutions formerly charged to the general reserve shall in future be carried to the new fund. Up to the end of 1941 just short of £5,000,000 had been invested in war issues and a further £1,500,000 has been similarly invested since the beginning of this year. During the year the company administered policies under the Government War Risk Insurance schemes involving premiums of £10,000,000.

The North British and Mercantile writes accident business through the Railway Passengers, marine through the Ocean Marine, and, in addition to its own major fire account, a small volume of this class through the Fine Art and General. The figures in the table show the aggregate premiums and profits as reported in the accounts of the various companies, although the accounts of the parent company include only the dividends received from the subsidiaries. In his statement to the shareholders the deputy-chairman (the Hon. Arthur O. Crichton) indicated that the improved fire results were contributed to by business both at home and in the United States and that the general foreign account also yielded a satisfactory profit. Accident underwriting produced an excellent profit on an enhanced income. Marine operations are complicated by delays in notify-

FAMOUS SINCE 1795

J. TARD'S
COGNAC BRANDY

ing losses and effecting repairs, but after releasing £60,000 the reserve in hand is considered ample for the running off of claims on 1940 and previous accounts. The net volume of new life assurances completed at £1,945,000 is slightly lower than in 1940, but an upward trend was noticeable towards the end of the year. Death claims of £1,028,000, although including war deaths costing £167,000, were well within expectation; the position in regard to the rate of interest earned is not so satisfactory, there having been a further decline in the year under review. The profit and loss account of the parent company includes underwriting profits of £279,000 and £35,000 from its fire and life departments respectively; net interest income on the general funds at £399,000, a reduction of £45,000, embodies as before tax-free dividends of £170,000 from the subsidiaries—well within their actual earnings—and aggregate credits come to £715,000. An item of £14,000 for foreign and Colonial taxes not chargeable to other accounts, United Kingdom taxes of £173,000, and miscellaneous expense charges of £76,000 together absorb £263,000. After payment of the January dividend on the preference shares, costing £18,000, and making provision for the ordinary dividend at the same rate as before, costing £355,000, the balance carried forward is £2,614,000, an increase of £56,000 on the corresponding figure a year ago. There is an additional reserve of £3,000,000 in the fire account, as well as a contingency fund of £1,000,000. A valuation of investments at the close of the year discloses a considerable increase in the market value by comparison with the previous year, with a comfortable margin over book values. With its associated companies the NB and M has subscribed since the outbreak of hostilities nearly £6,000,000 to Government War Loans, and at the end of 1941 holdings of Government securities represented about 44 per cent of the total Stock Exchange investments.

The Norwich Union Life transacted net new life business in 1941 of £6,683,000, virtually no change on the previous year's total and 57 per cent of the pre-war (1938) figure. Premium income, which is slightly lower, is composed of United Kingdom and overseas business in proportions of two-thirds and one-third respectively. Net interest earned fell by 2s. 7d. per cent to £3 7s. 9d. per cent; the rate is about 3s. per cent lower than it would otherwise be by reason of the temporary exclusion from the figures of interest in respect of securities in enemy-occupied countries. Death claims amount to £1,267,000, of which £209,000 is directly due to war deaths at home and abroad, but even so the cost is below expectation.

The society invested in 1941 over £950,000 in British Government securities, and these now stand in the balance-sheet at £6,759,000; in addition, about £400,000 of War Bonds were purchased during the year for individual policyholders under special Savings Bonds schemes and £600,000 was invested in Dominion and Indian Government securities. Other assistance includes placing at the disposal of the Government since the beginning of the war nearly £1,000,000 in overseas currencies and £500,000 in overseas securities. Stock Exchange securities increased in value considerably during the year, but are shown in the balance-sheet at prices on December 31, 1940; securities in enemy-occupied countries are included, with the corresponding liabilities, at prices on December 31, 1939, and the president (Mr Ernest Hicks) indicated in his address that the two items are practically equal.

Reference is made in the president's address to the society's holding of the shares of the Norwich Union Fire, which appear in the balance-sheet at a figure of £6,088,000. Mr Hicks stated that at the time of purchase in 1925 the total assets of the Fire Society were £5,700,000, while at the end of last year these had increased to £7,600,000; moreover, the shares carried an uncalculated liability of £493,000, not reserved for, which has since been entirely discharged out of the profits of the Fire Society, and the shares are now fully paid. Throughout the period the gross dividend on the investments has been £4 6s. 8d. per cent on the balance-sheet figure. The asset total of £7,600,000 is, of course, in part held against reserves for liabilities; the capital and apparent free reserves amount to £2,435,000, so that the balance-sheet value of the shares, after allowing for any margins in reserves, must include a substantial sum for goodwill.

The accounts of the Norwich Union Fire show substantial additions to premiums in all three departments and a larger aggregate profit. The improved fire result has been secured notwithstanding a loss from the American business. Overseas oper-

ations again contribute to excellent accident figures, and the marine account is considered to be progressing satisfactorily. Combined underwriting profits of £301,000 are augmented by net interest earnings of £111,000 and the total credits to profit and loss come to £412,000. Income and other home taxes take £168,000; directors' remuneration £9,000 and provision for bad debts, etc., £5,000; £75,000 is transferred to the pension fund. There is a net charge of £8,000 for debenture interest and the balance carried forward is £335,000 before providing for the dividend, which is unchanged and costs a gross figure of £264,000. In the balance-sheet Stock Exchange securities are taken "at or under market value," and the chairman stated that there remains a satisfactory undisclosed appreciation.

Chief interest in the accounts of the Legal and General centres in the results of the quinquennial valuation. This has been made on more stringent lines than five years ago, the interest rates employed for life assurances being 2½ per cent in the case of with-profits assurances, on a net premium basis, and for without-profits assurances—which represent the bulk of the contracts—3 per cent, with an ample margin for future expenses. The result is a surplus in the life and annuity funds of £705,000, against the figure of £2,042,000 which would have emerged had the valuation been made on the same basis as before. Under the society's Act of Parliament with-profits policyholders are entitled to a maximum rate of reversionary bonus of 38s. per cent per annum compound, and if this rate is not paid at the end of one quinquennium policyholders cannot be compensated by a higher rate at the next distribution. Taking this and other circumstances into account, the directors have decided to allocate the maximum rate of reversionary bonus; the cost is £509,000, and of the remaining surplus £68,000 (one-tenth of the divided profits, plus interim bonuses paid during the quinquennium) is transferred to profit and loss account and £127,000 is carried forward in the life and annuity fund. The valuation of the sinking fund account produces a deficit of £12,000, which is met by transfer from profit and loss; in respect of permanent sickness contracts there is a surplus of £50,000, £20,000 of which is transferred to profit and loss, the balance being carried forward.

The assets, which are not hypothecated to the several assurance funds, have also been valued. The following sums have been written off investments: Stock Exchange securities, £555,000; shares in subsidiary companies £155,000; freehold and leasehold properties, £35,000; other investments £82,000. These items aggregate £827,000, against which the value of reversions has been written up by £229,000, so that there is a net depreciation of £598,000; £500,000 of this has been provided by a reduction in the investment reserve, and £98,000 is met from profit and loss. The investment reserve fund of £1,500,000 is further depleted by an amount of £500,000, being a re-transfer to the life fund of a sum transferred in the other direction in 1939, and the remaining balance of £500,000 has been consolidated with the general reserve of £500,000 into one reserve of £1,000,000. After making these adjustments the market values of Stock Exchange securities exceed the book values, and assets in the aggregate are certified to be fully of the value stated, less the reserve fund.

Operations during 1941 produced net new business in the life department of £10,133,000, an increase of about £500,000. Life premiums at £5,487,000 are higher by £352,000. The net rate of interest earned fell by 9s. 7d. per cent to £3 9s. 7d. per cent. With the inclusion of war deaths there was a small mortality loss on ordinary business, but under the society's large group assurance account mortality remained favourable. The life and annuity expense ratio was lower at 11.1 per cent of premiums, against 11.3 per cent for 1940. Fire and accident business produced higher premiums as well as increased profits, which amounted to £70,000. With interest income on the general funds of £51,000, the transfers already mentioned of £68,000 and £20,000 from the life and permanent sickness funds respectively, and a profit on investments realised of £65,000, the aggregate credits to profit and loss amount to £274,000. Outgo items include the sums of £98,000 written off investments and £12,000 transferred to sinking fund account to which absorb £12,000 and £10,000 is transferred to staff pension reserve. The balance carried forward is £379,000, from which will be paid the dividend of 3s. per share (unchanged), involving a gross cost of £150,000.

COMPANY MEETINGS

IMPERIAL BANK OF IRAN

IMPORTANT EXCHANGE ALTERATION

The following is an extract from the statement by the Chairman (Colonel Sir A. Henry McMahon, G.C.M.G., G.C.V.O., K.C.I.E., C.S.I.) in lieu of the customary address at the annual meeting.

The official rate of exchange in Iran has undergone an important alteration. When we closed our accounts on March 20, 1941, the official rate was 68.80 rials per pound sterling, based on the rate of 17 rials per U.S.A. dollar which had been in force since December, 1939. This official rate was maintained until September, 1941, but as an index of exchange value it was effective only in a very limited and arbitrary way. Importers of commodities to Iran were paying in practice about 174 rials to the pound sterling and holders of Iranian currency who desired simply to remit their funds abroad were debarred from doing so at any rate. We ourselves suffered from this disability in respect of much of our own requirements. As bankers whose business it is to lubricate the wheels of trade, we welcome the greater freedom of exchange movement, and we support, under modern conditions, the policy of stabilised and controlled rates of exchange now generally adopted throughout the world.

RECORD FIGURES

The effect of converting the Iranian figures, incorporated in our balance sheet, at 142 as against 68.80 in the preceding year, would naturally be to reduce their sterling equivalent by more than half. Actually, instead of reduction, the total figures of the balance sheet show an increase. They are, in fact, the largest in our history. Deposits have grown by £5,000,000. This expansion calls for a high degree of liquidity, and the cash item is accordingly over £2,800,000 higher than last year. Investments are up by £1,200,000 and advances have risen by £1,000,000. The contra accounts under the heading of acceptances show a welcome increase from £629,000 to £2,490,000. This increase is mainly in documentary credits opened by us for Iranian customers to finance imports from India, America and elsewhere. It reflects higher prices, but in the main it represents greater freedom of import for the basic necessities of tea, sugar and textiles, to a country where the demand for consumption had increased owing to better employment, where stocks were low, and where some other channels of supply were closed.

We have latterly been able to remit our sterling requirements from Teheran to London, though at the higher rate of exchange they have yielded us only half the amount at which they were valued at March 20, 1941. As a consequence, we have been able to release our reserves against unremitted profits, which have more than covered our loss on exchange

conversion. We are pleased to show an increase of £35,388 in the net profits. This result enables us, after providing for the usual dividend, to place £40,000 to reserve account, which had been increased by only £10,000 in the previous 4 years, and to add £2,828 to the carry forward.

TRADE INCREASINGLY ACTIVE

The statutory limit of the note issue in Iran was further raised on April 1, 1942, to 2,700 million rials, equal to some £20,000,000. This increase was overdue and the amount is moderate. Trade has been increasingly active since last autumn. The cost of living has got rather out of hand, and there is so far no effective check on prices or wages.

Economic conditions in Iran, apart from the cost of living and the shortage of transport, are prosperous. The textile, sugar and other factories are thriving, and these local enterprises, which are all of recent growth and which owe a great deal to the constructive energy of Reza Shah, have proved a godsend.

OHLSSON'S CAPE BREWERIES, LIMITED

INCREASED PROFIT

The ordinary general meeting of Ohlsson's Cape Breweries, Limited, was held on the 6th instant in London.

Mr Geoffrey Dent (the chairman) said that once again the profit from trading and rentals showed a substantial increase of £128,016, or 32 per cent, on the figure of the previous year. During the year under review the stimulation of production due to war conditions and the presence of large numbers of troops had resulted in a very large demand for beer, and their breweries had all been working to maximum capacity. Shipping difficulties had made it imperative to rely as far as possible on materials and goods produced in South Africa, but they were still dependent on imports from overseas for a part of their requirements.

How far their output might be reduced during the current year by increasing restrictions on such imports he was unable to say, but some reduction seemed certain. Already the supply of Crown corks was severely rationed, and the restriction of other commodities was to be expected.

The profit on trading and rentals amounted to £537,937, and they proposed to pay a final dividend of 10 per cent. on the ordinary shares, less tax, making 15 per cent. for the year. It had been necessary to provide £325,000 to cover the total tax liabilities, which was £115,000 more than required in the previous year. That provision, which covered all their known tax liabilities, was equivalent to over 54 per cent. on the ordinary share capital. During 1941-2 the company had paid £610,932 to the Governments of South Africa and this country—a very considerable contribution towards the cost of the war. A transfer of £50,000 from profits to contingencies reserve had been made, bringing the total up to £135,746.

The report was adopted.

LUNUVA (CEYLON) TEA AND RUBBER ESTATES, LIMITED

SOUND POSITION

The 35th ordinary general meeting of the Lunuva (Ceylon) Tea and Rubber Estates, Limited, was held on the 5th instant in London, Mr. H. J. Welch (the chairman) presiding.

The following are extracts from the Chairman's address circulated with the report and accounts:—But for the large sums which had to be provided for taxation the year's profits would have been eminently satisfactory. The costs of all our three products were increased by causes arising out of the war, but the prices obtained were also higher. The profits per lb. of tea and rubber were greater than in the previous year. They amounted to nearly £17 per planted acre for tea and £6 13s. for rubber. Upon the coconut production, however, there was unfortunately a loss amounting to £1 6s. per planted acre. The directors propose to transfer a further £46,000 to reserve for British taxation and to pay a final dividend of 6 per cent., making 10 per cent. for the year. Owing to the relief to which the company is entitled in respect of Ceylon taxation, the 10 per cent. becomes equal to a dividend of 13.73 per cent., subject to deduction at the standard rate.

Our very valuable buildings, machinery and plant still stand at the nominal figure of £1, and cash and British Government Securities amounted to over £400,000. The issued capital is equal to about £53 13s. per planted acre of tea, rubber and coconuts, and if the amount of the net surplus assets is deducted therefrom, such planted areas and equipment, etc., stand at less than £40 per acre.

During 1942 we estimate to produce increased crops of tea, rubber and coconuts, but at increased costs. If all goes as well as now appears probable, it will still not be possible to pay any larger dividend, owing to the operation of the excess profits tax.

The report was unanimously adopted.

HARLAND AND WOLFF, LIMITED

ANNUAL MEETING

The fifty-seventh annual general meeting of Harland and Wolff, Limited, was held, on the 30th ultimo, at the Grand Central Hotel, Royal Avenue, Belfast.

Sir Frederick E. Rebeck, D.L., J.P., chairman of the company, presided.

The Secretary (Mr A. T. Marshall) having read the notice convening the meeting and report of the auditors, the Chairman intimated that he was again unable for obvious reasons to make his usual speech embracing the company's activities. He therefore formally moved the adoption of the report and accounts.

Mr John Craig seconded the resolution, which was carried unanimously.

The retiring directors (Mr F. G. Dunlop and Mr Wm. Strachan, Jr.) were re-elected, and the auditors (Messrs Price Waterhouse and Co.) were re-appointed.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

In view of the gravity of the situation in Russia, it was not surprising that the passing of the holiday brought little improvement in business, most investors tending to await developments. Interest, however,

continued to centre on industrial equities, particularly some of the heavy industrial issues and textiles, with their higher yields and possibilities of capital appreciation in the present condition of the market. Funds and other fixed interest securities were neglected. The number of bargains marked shows a decline against the previous week, but prices were generally steady, and responded to quite small transactions owing to the shortage of stock. The almost complete absence of any quotable changes among the funds reflected the relative inactivity of the gilt-edged

market, where markings averaged just over 400 daily. Further falls of ½ for the National War bond issues expressed the market's adjustment to the Chancellor's decision not to create any new short term issue. At the re-opening, however, Old Consols and 5 per cent Conversion both added ½, while the following day 3 per cent Conversion gained the same amount. There was no expansion in activity in the latter part of the week, and very little change in quotations. This is the more remarkable in view of the slump in demand for "tap" bonds.

Although business in the foreign bond market, as revealed by the number of markings, was light, some interest was displayed in South American issues, and on the whole prices were well maintained. Brazilian issues indeed showed substantial advances on the definite signing of trade agreements with the USA, a movement in which Brazilian Traction joined. Chilean bonds displayed firmness at the re-opening, and both Mexican and Peruvian stocks received light support. Among Japanese stocks, which generally remained steady throughout, the 6 per cent issue of 1924 was prominent with a gain of $\frac{1}{4}$ in mid-week.

With the passing of the interim dividend season interest in home rails subsided, and the very light turnover had little effect on quotations, although there was some easing of prices in mid-week. GW ordinary fell $\frac{1}{4}$ and Southern deferred $\frac{1}{4}$ on Wednesday, when the Berwick First and the LMS 1923 4 per cent preference stocks lost $\frac{1}{4}$ and $\frac{1}{2}$ respectively. In the foreign rail market, prices were maintained in quiet conditions, although mid-week witnessed a general easing among Argentine stocks on the unfavourable crop outlook. Elsewhere, Canadian Pacific ordinary advanced strongly on steady support, rising a point on the week, with a very fair volume of both buying and selling.

Business in the industrial market was confined to particular issues with topical interest, investors generally preferring to await developments. Thus, while the bargains marked averaged almost 1,000 daily, the actual volume of business was insufficient markedly to affect quotations, which generally fluctuated narrowly and without trend. Among brewery issues Watney deferred enjoyed steady support, and on the bonus announcement was marked up 3s. While most issues were steady, both Distillers and Guinness eased slightly. In the motor and aircraft section, Leyland was sold, losing $\frac{1}{4}$ at the re-opening, but Rolls-Royce gained the same amount in mid-week, although most issues showed little change. The Richard Thomas report attracted some support to the heavy industrial market, where the number of bargains marked was around the previous week's figure. While the ordinary and preference issues of Richard Thomas reacted slightly in mid-week after some earlier improvement, Baldwins, Dorman Long, South Durham and Colvilles all advanced. The textile section also enjoyed steady support, Tootal Broadhurst advancing 9d. on the annual report, while in the all round improvement both Fine Spinners and Calico Printers were prominent. Shipping issues fluctuated within narrow limits, but Cunard, after an earlier advance, reacted on profit-taking in mid-week. Stores shares, however, generally remained steady, while Gallaher was the only feature in the tobacco group, advancing $\frac{1}{4}$ on the week. Brazilian Traction provided the chief interest in the miscellaneous section, advancing steadily, while International Nickel also improved. Later

on an even brisker business developed in Brazilian Traction, but without price change.

The dull conditions prevailing in the *kaffir* and other mining markets before the holiday continued into the current week. In the absence of any lead from the Cape, interest was at a low ebb and prices fluctuated without any great change, although most movements were downward. The tea market was rather more active, and while the real volume of business was not large, small improvements were frequent. Rubber shares, however, were dull with an easier tendency, but Ceylon issues remained firm in view of the efforts to increase output. Conditions in the oil market were without interest, trading prior to mid-week having little effect on quotations. But with the news of further German successes in the Caucasus, most issues were marked down in sympathy with Anglo Iranian, which lost $\frac{1}{8}$ on Wednesday.

New York

RECENT news has not been of a character to inspire a recovery on Wall Street. After some irregularity on the Friday, markets closed fairly steady before the week-end, but the underlying easiness again made itself apparent on Monday. Later, a moderate burst of buying, inspired by genuine investment demand and centred on rail issues, did something to revive turnover, but sentiment remained diffident. The absence of selling pressure must be attributed to general discounting of the continued reverses in Russia, but lower company profits and tax fears at home remain sufficient to discourage any real recovery in business until the future is clearer.

COMMODITY AND INDUSTRY NEWS

Rye 1943 Prices.—The Government is anxious to encourage the growing of rye in lighter soils which are not suitable for wheat, since rye can be used for human food and for certain industrial purposes. An acreage payment of £3 per acre is therefore to be paid for rye of the 1943 crop that is fully ripened and threshed as grain. The maximum price will be 14s. a cwt. (63s. a quarter). For a crop of 3 quarters per acre the total return will be 83s. a quarter, an increase of 13s. 3d. a quarter over the 1942 price.

Canned Meat Representative.—The Ministry of Food has appointed Mr W. G. Giron, managing director of Messrs Swift

and Co., Ltd., to represent the Ministry in Argentina, Uruguay and Brazil in the importation of canned meats from those countries. He will be responsible for all local matters relating to the preparation and export of the canned meats and will work in collaboration with the representative in South America responsible for frozen meat shipments.

Belgian Congo Rubber.—The Government has reached an agreement with the Belgian Colonial Ministry under which the Belgian Congo rubber output is to be purchased at a price which has been calculated to bring forward the maximum quantities available. A Commission has

Shorter Comments

Commercial Bank of Australia.—Preliminary statement shows net profit for year ended June 30th £241,813 (£258,110). The ordinary dividend (payable in Australian currency) is 6d (7 1-12) per cent.

Canadian Pacific Railway.—Gross earnings, June, 1942, \$21,244,666 against \$18,496,265 in June, 1941, and \$21,522,075 in May, 1942. Net earnings, June, 1942, \$4,174,365 against \$4,068,304 in June, 1941, and \$4,233,560 in May, 1942.

Kuala Muda Rubber Estates.—Postponement of debenture interest payment was unanimously agreed by a meeting of the debenture-holders held on July 28, 1942.

Hiram Walker-Gooderham and Worts (\$000's).—Cons. profit quarter ended May 31st, \$4,458 (\$3,636), other income \$18 (68). Depreciation \$249 (\$208), deb. int. \$190 (\$142). E.P.T. \$2,228 (\$1,624), leaving net profit \$1,798 (\$1,717,45).

Page and Overton Redemption.—The company is to redeem the whole of the £227,595 outstanding 4½ per cent. debenture stock at 110 on February 1, 1943.

been established by the Belgian Colonial Government to administer and stimulate the production of plantation and wild rubber. Abandoned plantations will be reopened and labour will be transferred from less essential work.

Food Prosecutions.—During June there were 2,983 prosecutions under the Food Control Orders. Of the 2,738 convictions, 139 were against wholesalers and 1,250 against retailers. Offences against maximum price Orders accounted for 794 convictions; imposing conditions of sale, 19; failure to display prices, 64; illegal

(Continued on page 192.)

GOVERNMENT RETURNS

For the week ended August 1, 1942, total ordinary revenue was £66,915,000, against ordinary expenditure of £119,490,000, and issues to sinking funds of £150,000. Thus, including sinking fund allocations of £2,752,965, the deficit accrued since April 1st is £973,432,000 against £1,013,030,000 for the corresponding period a year ago.

In the Balance

THERE was no doubt that this summer, the third of the war, would be tempestuous; the storm is now near its height. The Russians are still retreating; there is disorder in India; in Africa the Germans are lodged little more than a day's journey from the Nile; in Europe, watching grimly for deliverance, the deadlock is unbroken. The only place where any headway is being made by the Allies, apart from the blows struck from the air against Germany, is in the Pacific, where the Americans are striking at the rim of Japanese power.

There is fear among the people that the Allies may be too late into action. Only a few deny that action must wait upon the deployment of men and machines; and those who say that the rulers of this country will not move because they do not like Russia speak what they know to be lies. But by no means all are sure that the minds and methods in charge of Allied policy are fitted to devise the right deeds and time them rightly. There is, in brief, a mood of frustration, born of impatience—and born, too, of remembrance of the mentality which, in almost every one of the United Nations for nearly ten years, has invited disaster.

Two years ago, Mr Churchill spoke of this country's finest hour. Today, 1940 glows through the darkness of doubt. In that year appeasement was ended; all persons and property were placed by law at the disposal of the

nation; Mr Churchill's call for blood, toil, tears and sweat did not go unheeded; every man, woman and child in this island thought and acted "no surrender." The day and the war were saved. The question now, two years later, is whether the promises of 1940 have been fulfilled. Materially, no doubt they have been. Britain is incomparably stronger. The industrial vigour of the United States is in the fight. With unequalled valour, the Russians are holding the fort of freedom against grievous blows. Yet the Allies are still not strong enough in any one place to seize the chance of victory. The question still remains whether, in spirit and in approach, the pledges of 1940 have been met. Sometimes it seems that the mood of those dogged, dangerous days has been lost, that the virtue which was disclosed in this nation then has waned again. A few days ago, the President of the United States said that, materially, his people were only ankle-deep in war. Spiritually, is this charge true of Britain? Sir Stafford Cripps, back from Russia, said that the people of this country gave him the impression of being still only spectators in the struggle. Visitors from other countries have been vastly impressed by the hard work which is going on in Britain; but they have had similar doubts.

Nor are these doubts confined to visitors. At the back of the frustration which finds expression in anxiety about

the next months of the war, there is a sense among the British people that there are still brakes upon the wheel, that the defensive mentality of 1939 has not been wholly discarded, that the Maginot-mindedness, which would wait for certainty, still lingers. Two recent books* are symptomatic. One, by Nicholas Davenport, is called significantly "Vested Interests or Common Pool?" It complains that the fervour and efficiency of war making are lost by the system of government by bargaining and exhortation; it calls for a state lease during the war of all capital, and for state pay and compensation for every individual and interest in the war economy. The other book, by J. P. W. Mallalieu, attacks the Civil Service. It is called "Passed to You, Please," and indicts the checks and balances which impede administrative action. Civil servants, it claims, are so responsible to Parliament for their mistakes, to the Treasury for their extravagance and to the holders of property for their inroads, that they are inhibited from action; they are more inclined to shun responsibility than to act. The argument of these books is an illustration in particular of the general uneasiness which is abroad, an uneasiness which is the soil from which new political movements are striving to spring. Since 1940, a cloud of doubt has settled down like the dust after a scatter of wind. In varying accents, according to the closeness of the complainant to the conduct of the war, the questions are being asked: Are we fit to win? Are we efficient enough to win? Inevitably, in this mood, there tend to be signs of scepticism at the higher and middle levels of thought and apathy below.

All this can be, and is, vastly exaggerated. Amazing results, in terms of war output and mobilisation, have been achieved since 1940. The unity which has been achieved in British politics is a standing example to the whole world and, particularly perhaps, to the politicians of the United States. The point is that production and hold-fast defence are no longer the most pressing problems. The problem now is action, the deployment of Allied strength in the right amount at the right time and in the right place. The emphasis is shifted from organising output to the military matters of strategy, tactics and logistics. The question is whether there are brakes on the wheel here, too—not whether the politicians agree, as they most certainly do, but whether what they agree upon is likely to be the right policy.

Lately there have been many complaints of lack of unity—lack of unity between land, sea and air forces; lack of unity between Britain, the United States and Russia in the shaping of strategy and equipment; lack of unity between three fronts, western, central and eastern. Again there has been vast exaggeration. That Mr Churchill, President Roosevelt and Premier Stalin are personally agreed about the strategic objectives to be sought is beyond doubt. The degree of success in co-operation between Britain and the United States has not been equalled by any alliance in history. If there are flaws in one country or the other in the execution of agreed plans, in the delivery of goods, or in the speed of military movement, it is due to inexperience, incompetence, or misguided improvisation, not to any discord or ill-will. If there is a lack of standardisation in the weapons and equipment of the three Great Powers, it is because of decisions which were taken in the past,

when neither the United States nor Russia were at war. The real question is whether, in the background of decision, there still lingers a defensive and divided mentality which will prevent action from being taken in time to stem the aggressors.

Popular sentiment, which puts these queries, is as shrewd in 1942 as it was in 1940. Then the call was to hold out, and it was done. Now the call is to "get on with it." Will this be done—in time? Plainly there is need for the makers of the Allied war effort to go into the sternest spiritual training. Plainly there is need for a psychological purge, to root out every obstacle of attitude which threatens to impede success. In this sense, although his radical suggestions invite a cautious scepticism, Mr Davenport is right: the time has come in 1942 to make the socialisation of all persons and property a reality, wherever the war effort requires; to remove every vested obstacle which may remain, in fact or in attitude; to make impossible, that is, the scandalous fiascos which have marked the Government's efforts to deal effectively, during wartime, with such problems as coal and shopkeeping. Mr Mallalieu, too, is right. It is wrong and dangerous, as a committee of the Liberal party has just pointed out, that the Civil Service should tend to be held in public contempt; within its self-imposed bondage, the Civil Service is as efficient as any in the world. But the bonds are tight to choking point. The task is to make the Service work with as full effectiveness as its heritage of exclusive recruitment and narrow training will allow; to bring in young men of talent and experience to take charge of policy; to vest all civil servants of ability with power to act and with full responsibility for their actions; and to cut out all needless forms and procedure.

The problem now, in the decisive days of the war, is to create the machinery of action and the machinery of attack; to make sure of the change of heart and of habits which is indispensable if the war is to be won. In a single week all this could be done—above all by Mr Churchill, who commands as no other man the following of the people. He could remove the last vestiges of a mere social and political bargain from the ways and make-up of his Government. He could settle at a stroke the problem of coal output and fuel consumption. He could institute, by his own prestige, a real wages policy. He could superimpose upon all war work the principle of compensation for unearned losses. He could make every employer and every worker, not their own self-seeker, but the agent of the nation in the same sense as every soldier. Above all he could weld the fighting forces of the Crown into a single entity; he could create the Combined Command of all three Services, which is called for, to make triply certain that decisive air-power is never absent from any item of training, from any programme of equipment, from any manoeuvre or from any operation.

The task goes beyond these frontiers. The problem of deployment is a problem of alliance. The first aim is to insist upon pooling as the be-all and end-all of all Allied co-operation. Only if the right minds and the right methods are at work in each of the United Nations will success in unison be achieved; if the Civil Service, the trade unions, industrialists and farmers here must waive all trace of obstructionism, so must all interested groups, political, economic or propagandist, in all the other Allied countries. The relationship is very good already. The problem is to make good better at every point. There must be frankness between friends. The greatest need to raise up free hearts is not assurances of victory, but assurances of efficiency in planning and in action.

It is right that these things should be asked for, if only because suffering and starving Europe must not be betrayed at the crucial hour. At bottom, it is not a material problem, but a moral one. The need is for men of faith, of skill and of vision, acting swiftly together. There is no time to spare or to waste. This hour can be the finest of all—finer even than the lone-handed stand of Britain two years ago. It will need to be.

Civil Disobedience

THERE have been ugly disorders in India this week, but no revolt or breakdown. Civil disobedience in its first burst has been planless and scattered. Most violence has been in Bombay, though there has been one savage outbreak in New Delhi. It is too early to strike a balance. The danger of spreading violence is not past; riots and shooting are no aid to the war effort or to civil peace. But, in its first stages, at least, this is not a great popular movement of passive resistance but the disorderly violence of an unruly minority. It is reported to be "completely in hand."

It is claimed that civil disobedience was hamstrung before it started by the prompt arrest and complete segregation of all its leaders. This surely proves too little. Mr Gandhi and his colleagues expected arrest; they must have planned their movement with the knowledge that they themselves would be put away. The real reason for the ragged tempo of civil disobedience this time appears to be that the heart of the rank and file is not in it. The intended blaze has only spluttered because, it seems, there is no mass support for political incendiarism.

Some people in this country have said that the arrest of Mr Gandhi and his colleagues was a blunder. They suggest that to make these men martyrs has only added fuel to the feeble flames. These arguments are disingenuous. They come from men who, like most Englishmen, cannot easily stomach the strong arm. Actually, the Government of India could have done no less. They have in trust the stake of all the United Nations in the defence of India. They have the duty of every government to maintain law and order; and Mr Gandhi will only be a martyr in his Poona palace if he decides himself to fast "unto death."

It is, of course, true that repression is not enough. It is the knowledge of the chances which have been lost in the past, by the British no less than by the Indians, which disturbs the critics of repression now. They have in mind the might-have-been, the accord which might, they believe, have been reached in 1939 or 1940, if the Indians could have been consulted about the war they were brought into—and if a great gulf had not widened for decades between the two races in India. It would be foolish to disguise the omissions and stupidities of the past, but it would be still more fatal to allow these unforgotten faults to hide the need of the moment, which is simply to save Indian life and work in wartime from deliberate wrecking.

Nevertheless, the need for some programme more positive than the putting down of disorder is unmistakable. The call for Britain to quit India is widespread, if resistance is not. It is wrong to suppose that Congress is

playing a lone hand in its bid for independence. Mr. Jinnah, of the Moslem League, has made this quite plain.

Indian Moslems have not the slightest objection to make if the British withdraw from India today. What they fear is that the British may commit the blunder of appeasing Congress at the expense of Moslem India.

Mr Jinnah opposes the Congress proposals as a challenge to Moslem India rather than as a challenge to British rule. He is the Ulsterman waiting on the sidelines for partition. The President of the Hindu Mahasabha, the party of orthodox Hinduism, also made clear a few days ago that he agreed with the "quit India" slogan.

If Congress were to make a declaration upholding the demands of the Hindu Mahasabha, the Hindu Mahasabha would support Congress in any movement launched to attain the freedom of the country.

The problem of India remains, whatever success or failure the present movement may gain. Congress was not alone in its refusal of the Cripps offer. The position is still that all politically conscious Indians earnestly desire early independence, but cannot agree among themselves. Nor, in any of the United Nations, is there any wish to keep the Indian people in unwanted bondage. This is above all true of British opinion, which would back no effort to rivet chains upon India; the Cripps offer was a clear proof to the eyes of all the world.

Where is the solution to be found, as found it must be, if disorder and disquiet are not to be the chronic lot of India? It has been suggested by liberals and by moderates, in India and outside, that the solution is still to be found round the conference table. But this approach has only lately been tried, with utter failure, by Sir Stafford Cripps, by Mr Rajagopalachari and by Sir Tej Saprú. The way of agreement has been completely blocked by the Congress demand, in effect, for total Congress rule and by the Moslem demand for complete partition.

Again, though civil disobedience must be put down to prevent civil war, it would be disastrous to put down civil disobedience by means of civil war. To call in, say, the Moslem League to aid actively in the campaign for law and order would invite unknown dangers. The Government must win back civil peace itself, while the Moslems and other millions watch in quiet. Then the search must be resumed for an agreed basis of a free government for India. There can be no going back.

It is said that, before their seizure, the Congress leaders intended to appeal to President Roosevelt, to General Chiang Kai-shek and to Premier Stalin. A summons might well still go out, this time from Mr Churchill. American opinion sees the need for the firm action which has been taken, but is deeply anxious about the upshot. Chinese

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

opinion is alarmed about the arrests and repressive measures. The views of Russia have still to be made clear. In the context of peace as well as war, this is the affair of all the United Nations. It is an unalterable fact that there is no longer any wish in Britain to claim a proprietary right in the destiny of India.

If a conference could be called, with the international authority of all the leaders of the free world, to find a viable road for Indian freedom, once the Congress challenge has been defeated, a new hope might dawn. An agreed India, with civil disobedience put down relent-

lessly and civil war avoided, might again be offered a free place in the United Nations to be the base and bastion of eastern freedom. But agreement may not be possible. Too much history may lie between the contestants. There may be no prompt solution. If so, order may return, and the war effort may go on, as it must do; but there will only be distrust and resentment between the unhappy Indian people and their reluctant rulers. It would be a defeat for Allied—and Indian—statesmanship ranking with the worst that the Axis can do by force of arms.

Women for Industry

THE substitution of women for men in industry is still urgent. It is the last lap of the total mobilisation of manpower. The women are available. The pressing problems are training, which the Minister of Labour has called "the greatest problem we have had to face"; and payment, which means, broadly, the relation between men's and women's wages.

The problem of payment was thrashed out in the last war, when the principle of "the rate for the job" was laid down (if not always applied in practice). In this war, the principle of equal pay for women doing equal work with men has been widely accepted, and it is only a question of applying it fully and effectively. The Ministry of Labour has not set a good example; it assesses the value of women trainees over 21 at 43s., rising to 49s. 6d., compared with 65s. 6d., rising to 75s. 6d., for men over 21, though both are engaged on the same courses and reach the same standards of proficiency. The Amalgamated Engineering Union and the Engineering Employers Federation agreed, a long time ago, that if, after a period of 32 weeks, women are able to carry out the men's work without additional supervision or assistance, they should be paid the full men's rate, and those who come in already qualified to do men's work should receive the full rate immediately. On railways and in passenger transport, women receive the full men's rate and bonus after a probationary period; a London bus conductress may earn up to 99s. a week—the male conductor's rate—after a qualifying period. Women employed on skilled men's work in Royal Ordnance engineering factories are paid the full men's rate, if they work without supervision or assistance, and from 75–85 per cent of the rate with supervision or assistance.

The recognition in these agreements of the principle of equal payment is an important achievement. But, in practice, its application is not easy. If "de-skilling," that is, the breaking down of processes which require skilled workers into simpler processes which can be done by less skilled workers, is introduced, it is difficult to determine what proportion of the skilled man's job is represented when the work is split up. New processes are constantly being introduced for which no rate is laid down; and it has to be decided what the rate would be if the work were performed by a skilled man. The bargaining power of women, especially of new entrants to industry, is weak and they may therefore tend to be awarded lower rates than a man employed on the same job could command; as they are not admitted to the AEU, the interests of women engineers are not directly catered for. The anomalous position arises that a woman may be doing a job of engineering which she has performed in peacetime and for which she is paid the women's rate, while a war-time entrant may replace a man on a similar and no more skilled job and be paid the higher rate, because it was previously performed by a man. It is to close this gap that an increase in the women's minimum rate in engineering from 43s. to 55s. a week, about 85 per cent of the appropriate men's rate, is being sought.

An alternative to "de-skilling" is surely to improve the skill of women recruits. There are very few skilled jobs which women, given training and experience, cannot perform, apart from exceptionally heavy work; indeed in

some, which require exceptional lightness of touch, they may be more skilled than men. In the industries covered by the Iron and Steel Control, 13½ per cent of the employees are now women, compared with 3-4 per cent before the war. They are engaged on 954 specific tasks, many of which were previously thought unsuitable for women. The experience of a firm engaged in the assembly of hydraulic aircraft equipment has been that

women can be trained effectively and speedily for a wide variety of accurate machining and for intricate assembly. Trainees are now responsible for a high proportion of the firm's output, and their contribution is on a continually increasing scale.

The proportion of women to the total labour force in Royal Ordnance Factories is 60 per cent, and in the engineering ordnance factories about 20-25 per cent. The railways have taken on some 50,000 women since the beginning of the war, not only as porters, ticket collectors and cleaners, but also as engineers, linesmen and signallers. Similarly, in the area covered by the London Passenger Transport Board, where 10,800 women have replaced men, many are employed in the engineering and maintenance grades.

The rate at which women can be substituted for men must largely depend upon the rate at which they can be trained. Miss Megan Lloyd George, a member of the Ministry of Labour's Women's Consultative Committee, was perhaps unduly pessimistic when she said last October that it would need "a thirty-year war to produce the requisite number of skilled women." But, though the situation has been greatly improved since that date, the training and upgrading of women is still lagging behind the potential supply of women. Some training is done in Government training centres (recently reduced in number to 24) and in the emergency training establishments organised by technical colleges. The bulk of the training, however, has to be provided in the factories. There is much to be said in favour of training on the job, as opposed to pre-training; it accustoms new entrants to factory methods and conditions and can be more satisfactory from the point of view of individual employers. The Government, under the Essential Work Order, has powers to compel employers to produce adequate training schemes. But these powers do not seem to have been effectively exercised, and the slowness of employers to make arrangements for training has been the subject of criticism by the Commons Select Committee. The AEU production report remarked:

It is evident that there is a resistance to regarding the question (of training and upgrading) as vital to production.

More recently, the Select Committee criticised the slow rate at which dilution was taking place in Royal Ordnance factories and found that "practically no action has been taken" by the authorities, who continued to recruit fresh labour rather than utilise their existing forces. It is true that many employers have neither the facilities nor the time to train women. But they also seem to fear the possible consequences after the war of upgrading women; and the idea that "as soon as a girl becomes any use she goes and gets married, so why waste time training her?" is difficult to kill.

When it comes to training part-time workers, an urgent need, the reluctance is even more pronounced. More powers should almost certainly be given to Labour Supply Officers to see that new labour is being adequately trained in the factories; that upgrading is being consistently pursued; that firms which have facilities beyond their immediate requirements should undertake training for outside firms; and that trainees from Government

centres are used in the capacities for which they have been trained.

The machinery for training is there, the potential skill is there, and the need for skilled women workers is there. It is a question of relating these three factors to one another, to achieve the maximum release of men for the forces and the most efficient utilisation of woman-power.

Underground Politics

THE European underground movement against the common enemy is a fact; its growth and organisation were discussed in an article in *The Economist* on June 13th. The overt rôle of the Churches in resistance was outlined on April 18th. The bearing of Europe's uprising upon military possibilities on the continent is plain. What is less plain, and perhaps less definable, is its ideological aspect. The objectives of the churchmen who are standing fast are clear enough. But what are the ideals that inspire Underground Europe? What are the aims to which its efforts are directed?

In each of the occupied countries, it has been the Left that has had to bear the brunt of the struggle. Liberals, democrats, socialists and trade unionists have everywhere been—by vocation as it were—the main enemies of the Third Reich. It was on their organisations, on their programmes and political traditions that National Socialism declared war, before it set out to destroy, no longer this or that particular ideology, but whole nations. Without the workers, the members of labour organisations and trade unions, no mass resistance, and certainly no successful industrial sabotage, are conceivable.

Yet there is nothing especially Left in the immediate aim of all these movements—the restoration of national independence. The fact is that the Left in Europe now makes the main contribution in a sphere that used traditionally to be regarded as the domain of the nationalist Right—the maintenance of the spirit of national unity and the stirring of national consciousness. And it was actually among the circles of the conservative and nationalist Right that the chief hotbeds of defeatism and quisling intrigues were found. But the underground movement embraces a range of ideals and aspirations very much wider than can be reduced to any common denominator, apart from the common struggle for national freedom. Even spokesmen of quasi-fascist movements have found their place in Underground Europe side by side with liberals, socialists and communists. National interests have, for a time, pushed sectional ideals aside. The kinship of some native political groups in Belgium, Holland and Poland with the principles of National Socialism has not prevented them from sharing in the resistance to the subjugation of their peoples by German National Socialist conquest. The Belgian pro-fascist *Légion Nationale*, which was, for a time, connected with Degrelle's group, has been banned by the Germans. In Holland, the *Nederlandsche Unie* has come into conflict with the invaders. Extreme nationalism of the Right has its voice, beside progressive and democratic views, in the Polish underground press. The De Gaullist movement in France includes people from all political quarters—Left and Right.

Ideological divisions have, in fact, been blurred and hidden by the fog of Nazi cruelty and oppression. And this lack of an ideological backbone accounts for the strength and weakness alike of the underground movement. It has helped to mobilise the sentiments of the widest possible range of social groups in invaded nations against the invaders, when many might have been scared away by political or social dogma. On the other hand, it has perhaps hampered the crystallisation of any distinct ideas or programmes for the future of Europe.

This is not a revolution committed to the overthrow of a legally established, and psychologically approved, social order. In this, it differs from most of its forerunners. Here is not the unknown revolutionary rising from the

bottom of the social pyramid to lead the peoples of Europe to revolt. This time the summons to revolt comes from the recognised political élite of pre-war Europe, driven to use "revolutionary" methods for "moderate" political purposes. It is this contradiction that has brought together both revolutionaries and moderates in a common movement. No less a person than Seyss Inquart has acknowledged it.

In Dutch political life, [said Seyss Inquart in a press interview] there are only two radical groups left which side with the former Queen and the Bolshevik Allies. These are the Orange Bolsheviks, as they are called by the healthy-minded Dutch. They are mostly former Social Democrats and Roman Catholics. The German authorities strongly oppose them, but the people are nevertheless sometimes influenced by these agitators.

The anti-German coalition in Holland ranges from the close adherents of the Dutch dynasty through Social Democrats and Roman Catholics to Communists. Another German source, *Die Donauzeitung*, affords a glimpse into the social composition of the anti-Nazi front in Jugoslavia:

A regular revolt was organised, and priests, fugitive ex-officers, and independent Chetniki fought together. The peasants of the whole region were mobilised into companies commanded by well-known Communists or other elements capable of imparting instruction such as lawyers, teachers, priests or ex-officers.

Similar passages could be quoted about almost every occupied country. In a great many of the descriptions, two figures stand out: the ex-officer and the Communist or Left-winger. The former, because of the destruction of his national army, has become *déclassé*. By tradition, social upbringing and cast of thought, he is conservative and nationalist. He has brought into the underground movement his capacity for organisation and his military skill. Since June last year, his odd ally, the Communist, has become very active. His propaganda, like the ex-officer's, has remained within the limits of a demand for national restoration. In eastern and southern Europe, the Communist slogan has been pan-Slav solidarity; in western Europe, restoration rather than revolution has been the cry.

It might be inferred from all this that the aims of Underground Europe are confined to a return to the position as it was before the war. In a sense, this is true. Hitler's New Order has grown old and decadent within the short spell of two years. In the light of its dismal lessons, the old order of national sovereignties and parliamentary democracies, with all their faults and defaults, probably looks to most European peoples like a lost paradise. Ideals that seemed to be fading amidst the pre-war political *mêlée* have been rehabilitated by the conqueror's senseless derision and heavy-handed changes. The following words, taken from a description of the ideological outlook of the Norwegian Students' Movement, are perhaps typical:

These old and outworn ideals—ideals of liberty, humanity and democracy—used to appear all too often as empty phrases. To-day, they have got life in them as never before. Norwegian students to-day feel it a pleasure to rally around them. The weapons of the spirit are in our possession; no one can take them from us.

The result may be a disposition to hallow the recent past indiscriminately. An aureole may come to surround both the progressive and the retrograde features of European social life as it was before the war. The danger,

of course, is a revival of an unsound and perilous nationalism all over Europe. The German New Order has destroyed every practical trace of national independence; the reaction to this may well be to restore again the ideal of absolute national sovereignty. There are indeed signs that this tendency is growing in strength. The concept of some federal or international organisation of European nations certainly has not struck deep enough roots in Underground Europe to overcome the older nationalist outlook. The programme outlined in the Atlantic Charter has no doubt aroused high hopes in the occupied countries; but the need for some more concrete scheme for post-war organisation seems to be felt everywhere. Inevitably, nationalism remains the most tangible ambition among the enslaved nations.

But against the danger of revived nationalism another and more hopeful tendency may be set. The disastrous

consequences of national divisions have become too plain to be easily effaced from the memory of Europe. In the age of the tank and the bomber, national seclusion has provided no national security. Common suffering, too, tends to unite the suffering nations. Nobody can foresee yet which tendency will prove the stronger in post-war Europe. Much will depend on the direction in which the influence of the other Allied nations, which have not known the taste of foreign domination, is to be exerted. The restoration of independence to all the oppressed nations is indeed a pre-condition of any rational and stable peace settlement. But the pre-condition is not the settlement. The re-establishment of national states can be the one step back which may enable the nations of Europe to make two steps forward—towards some solid and coherent international organisation. It should be a process of *reculer pour mieux sauter*.

NOTES OF THE WEEK

Strategical Dilemma

The battle of the Northern Caucasus has passed the decisive stage. The German columns are now fanning out west and east to complete the conquest. The main objective in the west now is the naval base at Novorossiisk, which seems hardly tenable, though the approaches to Novorossiisk are a relatively difficult terrain for the German tanks. The surrender of Novorossiisk and Tuapse would force the Soviet Navy to seek refuge in the Transcaucasian ports to the south. It would consolidate German control over the Black Sea. The drive in the east is directed towards the Grozny oil fields, the Terek steppe and the port of Makhach Kala; the capture of Makhach Kala would provide the Germans with their first foothold on the Caspian coast. But, in spite of its lightning victories, the German High Command is confronted with the difficult decision where to strike next. A drive across the Caucasus mountains would involve much precious time and it would pin down for a time a substantial section of the Luftwaffe. Reports speak of a concentration of Alpine divisions experienced in the Greek campaign. But the Russians are vastly better prepared to defend the few Caucasian gorges and passes, particularly the military road to Tiflis, than were the Greeks when they were faced with a similar danger. And even a successful conquest of Transcaucasia, grievous as it might be for the Russian oil position, would still fail to deliver the knock out blow to Marshal Timoshenko's forces on the Volga. The next phase of the campaign is most likely to hinge on the Stalingrad-Astrakhan line. The latest moves on the approaches to Stalingrad are a prelude to one of the most tremendous battles of the war. Neither side will be sparing in men and material to gain or keep this key position. The German advances from Kletskaya in the north and from Kotelnikov in the south have so far been brought to a standstill by the stubborn Russian defence. But the most critical phase of the battle is still ahead. It will be reached when the Germans are able to move up reinforcements from the Northern Caucasus or from elsewhere. Some Russian initiative has been reported from the Voronezh and Rzhev regions. The successes scored have been local and limited; they are still short of the large-scale diversion needed to relieve pressure on the southern front.

Clearing the Way

The extent of success gained by Allied forces attacking the Tulagi area of the Solomon Islands remains in doubt. Although the attack was first launched on August 8th, heavy fighting is still going on. All that is known for certain is that there have been naval and air losses on both sides; that footholds have been gained on three islands and that the Japanese have put up stiff resistance since the first surprise passed. Premature optimism in this, as in all other campaigns, is unhelpful. But it is not too early to realise the very timely and vital nature of this Allied move. Australian opinion has been increasingly alarmed by the Japanese occupation of Papua, the northern coast of New Guinea and the islands between New Guinea and Timor. The possession of these areas had enabled a threatening offensive arc to be drawn round the northern shores of Australia, while bombing

attacks have recently been extended as far south as Port Hedland on the west and Townsville on the east. The Allied attack on the Solomon islands is designed, first, to arrest the extension of this menacing semi-circle, and, secondly, to place a strong Allied base between it and the Fiji Islands to the south-east, which lie on the American-Australian supply route. The simultaneous bombardment of Kiska in the Aleutians was not necessarily jointly conceived; American bombardments of Japanese bases on the USA-USSR supply route have been the object of intermittent air attack and shelling during the last three weeks. But, clearly, eviction of the Japanese from the Aleutians is as necessary to the maintenance of close communication between America and Russia as their eviction from the Solomon Islands is to the safety of communications between the United States and Australia.

The Future of Farming

The Scott Committee was set up last October to consider the conditions which should govern rural developments "consistently with the maintenance of agriculture"; its report is expected any day now. To judge from the overture of articles and letters in the press with which the report is being piped in, the crucial point is going to be the one of definition. What does "the maintenance of agriculture" mean? The farming interests and all the well-meaning friends of the countryside have no doubts about the answer. It means a "healthy and balanced" agriculture; it means increased wages, stable prices, assured markets and adequate returns. But these are not definitions; they are merely the framework for a definition. The real question is how big or how small post-war agriculture is to be. Question of size never seems to enter into these stirring pleas for a healthy and balanced farming. The nation must, it is said, keep "a due proportion" of land in production; it must keep "a higher proportion" of land than before in arable cultivation in order to feed more livestock; it must accept "some reduction" in imports; it must maintain "a reasonable level of prices." What exactly "a due proportion" or "a higher proportion" or "some reduction" or "a reasonable level" means is not stated. All these aims, maybe, are desirable; but without some quantitative definition they beg the question—indeed, they obscure it. The choice before the nation is a choice between a prosperous agriculture and a large agriculture. Whatever the sum of money which the public will be prepared to spend on agriculture, in subsidies or in higher prices, after the war

it can either be used to secure high wages and high prices for a limited volume of production or less high wages and less high prices for a larger volume of production.

[The Economist, November 29, 1941.]

Obviously, if farming is made more efficient, which is presumably everybody's objective, and the costs of production are lowered, the larger is the agricultural industry that can be maintained for a given price. But the precise size of the agriculture which the friends of farming have in mind is crucial; and, in view of the comparatively high costs of farm production in this country compared with the rest of the world, it seems quite certain that a prosperous agriculture

in this country must be a small one. Unfortunately, it is probable that most people who will talk about a healthy and balanced agriculture after the war are thinking in terms of a large agriculture—which either means that the nation is going to be called upon to impoverish itself in other directions by diverting resources to farming which could be much more economically and productively used in other pursuits, or that post-war agriculture will be sprawling and poverty stricken. The basic fact is that agriculture in this country is relatively unproductive, compared with other callings, and one chief reason why the British standard of living is high is that such a small proportion of British people are engaged in farming.

Wartime Policy

Even more urgent than the future of farming is the feeding of the British people in wartime. The Minister of Food has announced that, in view of the growing demand for shipping space for war purposes, he is reducing the claim of food imports. The problem of making the maximum use of the resources available in wartime has become more acute than ever. An interesting memorandum has just been published by the Communist Party of Great Britain; in it there appears the significant assertion that "It is the maintenance of the beef herd which is the really serious question." This is sound sense. No precise figures are known; but it seems pretty certain that the largest increase in yield from the acreage which has been brought into arable cultivation during the war has been food, not for human consumption, but for livestock. The consequence is that correspondingly more food for human consumption, mainly wheat, has to be imported. It has seemed obvious for a long time that much more control by the Government over the crops grown on new acreage is needed, in order to ensure the maximum possible output of crops for human consumption, such as wheat and potatoes, and in order to see that feeding stuffs go first to dairy cattle and not to meat cattle; and that one of the most urgent means of saving shipping and economising home production is to cut down sharply the size of beef herds—a policy which is, admittedly, not easy in view of the balance of forces in farming politics. It is worth while perhaps restating some of the basic economic facts about agricultural production in wartime. The best use of domestic resources, land and labour, is the production of crops for direct human consumption. If crops are grown to be fed to animals and converted indirectly into human food, the best use for them is in the production of milk; in conversion, the production of milk is from 2½ to 5 times more efficient in terms of nutritional values than the production of meat. There is no argument of any kind to justify the use of feeding stuffs merely to maintain livestock numbers. It would now be reasonable, when the question of allocating shipping space is becoming so critical, for the authorities concerned to answer every request from the Ministry of Food for space for cereals by asking what the Ministry of Agriculture intends to do in order to make the most efficient possible use of its own resources.

Non-Aggression ?

Stories of Japanese preparation for attack on the Siberian frontier multiply. Chinese sources suggest that as many as 31½ divisions may have been recently transferred from Japan and Indo-China to the Manchurian frontier, and that a considerable number of independent brigades have been expanded into operational divisions. General Yamashita, who commanded the fighting in Malaya, has arrived to take command in the north. From the Russian side, there is little news, but the cordiality which followed the conclusion of the non-aggression pact with Japan is now less marked, and Russian support for the cause of Free China is somewhat more evident. The decision whether or not there is to be a clash between Japan and the Soviet Far Eastern army will in all probability be taken by the Japanese, with developments in the Caucasus and Volga regions and in India in mind. If the Russians can hold Stalingrad, Japanese enthusiasm for an adventure in Siberia may be sensibly diminished. If internal dissension in India spreads, the attraction of a campaign in India will be increased. It would be foolish to disregard the informed warnings that, whatever the ultimate intention, Japanese forces do appear to be massing on the Soviet frontiers. Japanese military spokesmen have themselves touched on the issue, pointing out that American pressure might

demand action by the Soviet forces against Japan. The technique has the familiar Axis ring. The fact that a Japanese attack has not materialised so far probably owes much to the experience of the quality of the self-supporting Soviet Far Eastern army which the Japanese gained in frontier clashes in 1938, 1939 and 1940.

Bricks

Brickmaking is an industry which has suffered a sharp wartime fall in demand and been unable to convert its plant to the manufacture of war materials. The consumption of bricks, which was some seven thousand million units in 1938, was almost halved by the end of 1941, as a result of the virtual cessation of house building, and it has since shown a further reduction. Production, too, has been curtailed; by the end of last year, 384 undertakings had closed down. But the rate of curtailment in output has not kept pace with the shrinkage in demand. Stocks have been piled up in excessive quantities. In September last year, a committee was appointed by Lord Reith, then Minister of Works and Buildings, to investigate the position and suggest ways and means of overcoming the difficulties. In its first report, last December, the committee recommended cuts in production; the compulsory closing of redundant brick works; and a care and maintenance scheme financed by a levy on the sale of bricks. Its second report, issued early in May, went much further. Apart from proposing drastic cuts in output and the compulsory closing down of brickworks, it recommended a quota plan for the allocation of trade; the fixing of statutory minimum and maximum area prices; and the introduction of a scheme of compensation, by which concerns producing above the general average for the country as a whole would pay a levy on "excess" sales to be distributed among those whose output was below the national average. To carry out these recommendations, the committee suggested the creation of a National Building Brick Council, which

should be representative of manufacturers of building bricks . . . and should include in a non-voting capacity representatives of research organisations and nominees of the operatives.

The committee, in fact, baldly and blandly put forward a scheme which would leave the administration of the control of prices and production largely in the hands of the owners of brickworks. The familiar representation had been made to the committee that

to place these important duties in the hands of an official nominee would constitute an affront to the industry.

On Thursday, last week, Mr Hicks, Joint Parliamentary Secretary to the Ministry of Works and Planning, informed the House of Commons that the Government had accepted the recommendations of the committee concerning periodical adjustments of production by means of

quotas; the fixing of minimum and maximum area prices; and the payment of compensation to concerns producing below the national average out of a levy on "excess" sales of other works. The Ministry has also agreed to the setting up of a National Building Brick Council. But, very rightly, it has decided that the status of the council shall be that of an advisory body and that the administration of the quota and price-fixing schemes must be the Ministry's own responsibility. The adoption of a system of minimum prices is itself highly undesirable in principle; the handing over to the industry of control over prices and production would have been the negation of both efficiency and democratic government.

Head of the Service

Discussion has broken out again about the post of Head of the Civil Service. The Lord Chancellor has made an official statement of the position. The supreme head of all the Crown's services is the King. The Ministerial head of the Civil Service is the Prime Minister, who is also first Lord of the Treasury. The principal officer of the Civil Service, under the Prime Minister, is the Permanent Secretary to the Treasury, a title introduced in 1867; this post has carried with it, for 75 years, the headship of the Civil Service, a fact which was formally recognised in 1919, when the Treasury was reorganised. The Permanent Secretary directs the work of the Treasury, including that part of the work concerned with the supervision of administration and the oversight of the machinery of government. Most of the discussion, in Parliament and in the press, has not had much to do with most of these facts. The point at issue is that the Head of the Civil Service advises the Prime Minister on appointments to certain higher offices which require the Prime Minister's approval—permanent heads of departments and their deputies; principal finance officers and principal establishment officers. The argument is that this function of advice has been used to place the wrong men in key positions and has stultified progress in the making of policy and in administrative methods. It is really an argument, not against the post itself, but against the use which has been made of it by two recent incumbents. It is, of course, plain that the men who are responsible for administration have a very large influence, direct and indirect, upon policy. It is wrong that these influential officers should be selected according to narrow considerations of finance or seniority, just as it is wrong that personnel and policy should be constricted in every Ministry by Treasury rules and regulations operated by finance and establishment officers who have no yardstick but parsimony. But this is not to criticise the system so much as to criticise the use which has been made of it. There is no reason why the Head of the Civil Service, whether attached to the Treasury or not, should not be as farsighted and flexible in his choice of men as any other individual. There is no reason why finance and establishment officers in the various Ministries, should be, on the whole, of such poor quality. Some close and regular check of the finances of administration is essential. It would probably be a gain if the Head of the Civil Service were attached to the Cabinet Secretariat and not to the Treasury; but the need for effective Treasury control would still remain. Indeed, there is a case for saying that if the Head of the Civil Service did not exist, he would have to be invented. The real problem is to find the right kind of men to fill, not only this post, but also all the other key positions which are in Treasury hands. Nor is it true that, say, Sir Horace Wilson was too much a slave to Treasury tradition and seniority. Actually most of his own personal experience lay outside the Treasury; and one of his main shortcomings was, not that he did not bring any recruits from outside, but that, like his predecessor, Sir Warren Fisher, he chose the wrong ones.

Aid for Mr Lyttelton

Mr Garro-Jones has been appointed Parliamentary Secretary to the Minister of Production. The appointment seems a good one. Mr Garro-Jones is the youngest member of the Labour front bench in the Commons; and the fact that he, a Welshman, sits for a Scottish constituency, Aberdeen itself, suggests that he possesses the quality of "intrusiveness" which, perhaps above all other qualities, Mr Lyttelton's staff requires. It may be that the office of the Minister of Production was set up too late. When Mr Lyttelton started work a hard crust had already formed around the organisation of production. An older system was dug in. Moreover, the emphasis of policy had necessarily shifted

from production—which, despite all disadvantages, had done surprisingly well—to problems of strategy and military movement. This is not to say that Mr Lyttelton's organisation is not needed. Probably it can never be the directive force in war production which it might have been had it been set up when the need first became apparent. But there are at least three crucial tasks which Mr Lyttelton and his staff can carry out, in parallel with the supply departments. The first is a task, not of direction—perhaps unfortunately—but of coordination; it is to be the link by which production plans and military requirements are kept in line. The second task, for which nobody has ever been responsible since the war started, is to raise standards of technical efficiency among the main mass of war producers by insisting upon the utmost expertness in management and engineering practice. The third task—the only real reason indeed which Mr Churchill recognised for the appointment of a Minister of Production—is to be the integrating factor in the combined production of Britain and the United States. The appointment of Mr Garro-Jones, by relieving Mr Lyttelton of many parliamentary duties, will enable the Minister to concentrate all his energies on this and the other tasks in hand.

Laval at Compiègne

The criminal goes back to the scene of his crime. Laval has just been to Compiègne, the place of France's deepest humiliation, to proclaim Vichy's crime as a virtue. "The hour of France's liberation (he said) is the hour when Germany wins the war." The strange occasion chosen for this utterance was the return of 1,000 French prisoners of war, whom Laval somewhat impatiently tried to win over to his policy of collaboration at the very moment of their return. Laval admitted that Hitler's "magnanimity" towards France "belonged to the past" and that his, Laval's, reason for being in power lay in the attempt to "revive that policy." Thus, the returned prisoners straightway learned what was Laval's concept of "liberation"—flattering and begging the favour of the "whimsical" victor. They had also learned the price of their personal liberty: three French skilled workers for one sick and exhausted French prisoner. No Shylock could conceive a more extortionate deal. The fact that the new "prisoners" are "volunteers" and will earn wages in Germany matters very little; they will work just the same to strengthen France's conqueror. The insignificance of the German "concession" is revealed by Laval's own admission that 1,200,000 prisoners still remain in German camps. Pétain's and Laval's reiterated complaints about the lack of popular response to the Montoire policy have done very little to further that policy. The number of French workers in Germany is still well below the 200,000 mark. Unrest has recently grown in both occupied and unoccupied France. Last week-end's conferences in Vichy were devoted to measures intended to counteract "all attempts to disturb internal peace." Simultaneously, a decree was published imposing the death penalty for the possession of explosives, arms and ammunition. The police apparatus is being strengthened. New branches and auxiliary organisations are being added to it constantly; the most recent creation is the SOL—the *Service d'ordre Légionnaire*—a clumsy imitation of the Black Shirts and of the German SA. The SOL was recently sworn in at Lyons; the setting of the parade was an attempt to translate into French the German mystique of obedience and death. But the impetus and fanaticism of the original German pattern was lacking. The symbolic feature of the Lyons celebration was the moment when, before the oath-taking, the SOL were given the order "*A genoux.*"

Vichy's Plan

The Vichy Government is tightening the economic screw. Up to now producers were allocated raw materials according to their consumption during a standard period. They were free to produce what they liked, though the manufacture of a number of low utility articles was forbidden. At most, the control of production was indirect. The situation is now changing. More and more, the Government (that is the Central Allocation Office for Industrial Products) ascribes definite tasks to manufacturers, to be fulfilled in a prescribed time. For instance, the *Journal Officiel* has just announced that a general production programme will be drawn up for the shoe industry. The allocation of raw materials will be made according to the production quotas ascribed to each firm. For the rubber industry, the official in

charge of the raw materials specifies the quantities allocated to the manufacture of the most important articles. He has the power to prescribe the production of these and other articles in priority to any other production. The reason for the new policy is, of course, the growing scarcity of raw materials—though the desire to free French workers for German factories is playing a very important part in shaping the new programme of control.

Enlisting the Jews

Jews and Moslems working together, as Members of Parliament were reminded in last week's debate on a Jewish fighting force, gave the world algebra among a number of other blessings. Since the last war, they have not been able either to work together or to live together, with the result that the Palestine Administration, striving desperately to maintain the balance and show favour to neither side—or else to both sides at once—was compelled to exercise what five years ago the Peel Commission called "government by arithmetic." This war has apparently proved that the two communities cannot even fight together. Proposals, however, to create a separate Jewish Army, either recruited from Jews all over the world, or merely as a defence force in Palestine itself, have been resisted. In its attitude towards the first proposal, the Government is easily justified. As the one Jew who spoke in the debate emphasised, the Jews are a religious community. They are not a separate people, and the majority do not wish to be identified with Jewish nationalism, but prefer to remain subjects of whatever country they are living in, with the same rights and obligations as their fellow-citizens. Thus, Jews are liable to serve in the armed forces of Great Britain and the United States, and have, of course, discharged their obligations willingly. But in Palestine it is a different matter. The Jews' complaint that there they have not been allowed to exercise their willingness to serve have a considerable amount of justification, although—such is the exasperating difficulty of the Palestine problem—the Government's anxiety not to offend Moslem opinion by allowing them to serve was not without justification too.

Now, however, a Palestine regiment of the British Army is to be created, consisting of separate Jewish and Arab infantry battalions for general service in the Middle East, which will incorporate the present Palestinian companies of the Buffs as a nucleus. The most significant development in this is that there will be no insistence on an even balance between Arab and Jewish recruits; if 9,000 Jews volunteer, and only 1,000 Arabs, they will all be accepted. Sir James Grigg did not say who will command the new regiment, but it may safely be assumed that he will be neither Jew nor Arab. The second measure will be the expansion of the Palestine Volunteer Force, whose function is to help the regular forces and assist in maintaining internal security, from its present strength of about 400 to a maximum of 2,000. This measure represents the Government's adherence to Palestinianism—the attempt to create a Palestinian unity out of the different elements in the country—since the Volunteer Force is drawn from all sections of the community. Thirdly, 1,500 additional recruits will be enrolled in the Jewish Rural Special Police, and, lastly, the training and equipment of existing units will be continued as rapidly as possible. These proposals, which are the usual sort of compromise that marks Palestine policy, will certainly not satisfy the extremist Jews in Palestine and outside it. But the most important thing at the moment is not the satisfaction of Jewish ambitions, or even the righting of Jewish wrongs, but the defence of Palestine and the Middle East. The weight of this defence cannot be borne by a Jewish force, even if expanded to the maximum. It will fall on British and Empire troops; and the Jewish genius can best serve the interests of Palestine and the war effort by directing itself to the question of supplies, in which, as a Jerusalem correspondent points out on page 207, it has already made some extraordinary achievements.

Building Programme

The entire available labour force in the building industry is to be mobilised to provide accommodation for the American fighting forces. A gigantic programme, involving

the construction of aerodromes, camps, hostels, port facilities and the like, is being set on foot. Mr Bevin has issued an urgent appeal to building workers to "go to it" and to employers to co-operate; he said that every builder must be prepared to work on any job, whatever his craft. From his speech and from the account of a rush job, in which offices for the American General Purchasing Board were completed in eight days instead of eight weeks, it might be imagined that the Government was taken by surprise. Yet one would have thought that the demand by the Americans could have been anticipated long ago. One of the obstacles to efficiency in the past has been divided control and lack of co-ordination between departments. It is to be hoped that in the fulfilment of this programme, in which so many departments have a direct interest—the Service and Supply departments, Labour, Works and Planning, Health, Transport—sectional or departmental considerations will not play a part. The chief bottleneck has been labour. It was estimated that there were 820,000 operatives in July, 1941, against 1,350,000 before the war, and since the British war construction programme has passed its peak and was assumed to be nearing completion, a further and more rapid decline in employment was expected. The transference of building workers to the Forces will now be postponed until the American programme is completed; already 28,000 workers who were due to be called up have been deferred until October. There was in February, and probably still is, too large a "garrison" force, that is, the builders engaged on civilian repair and maintenance work. There are also at the present time a number of skilled operatives who are unemployed. The Ministry of Labour will need to draw on both these sources without delay.

Success or Failure?

The fate of the Government's coal plan remains wrapped in secrecy. The Government continues to exhort the public to save fuel. Major Lloyd George has expressed his belief—or is it hope?—that there will be no need to resort to a compulsory rationing scheme. In a speech at Guildford last week, he gave the now familiar instances of how large savings could be effected by an accumulation of small economies; thus if every household saved 2 lb of coal a day, 2 million tons a year would be economised nationally, and if every household put away one 60 watt bulb some 320,000 tons would be saved, and so on. Offices and blocks of flats are also being urged to economise in the use of lifts. It is a pity that no time limit has been set for the voluntary saving experiment and that no target figure, to be reached within a given period, should have been stated. This would have given an opportunity to see how the voluntary scheme was working and would forestall opposition to the introduction of rationing at the end of the period, if voluntary saving failed to achieve the desired results. In the meantime the example of Guildford in organising a "Fuel Economy Week" on the same lines as National Savings Weeks, displaying a target figure and publicising methods of saving coal, might with advantage be adopted by other towns. It also seems a pity that double summer time could not have been extended, at any rate until the end of the month.

ever reductions are brought about by domestic consumers, it is, however, clear that the bulk of the economies must come from industrial users, who consume about three-fifths of the total coal output. It was stated in the White Paper that a system of allocation to industrial users, similar to that for the allocation of raw materials, was being worked out; the establishment of regional machinery has since been announced, but it is already mid-August, the winter is approaching, and no progress has been reported. The view has been expressed that in the iron and steel industry "considerable economies, in most cases at least 10 per cent, would follow the appointment of a Fuel Officer definitely responsible for fuel control." On the miners' side, the Federation has pledged itself to increase output, and the establishment of national minimum wages and wages machinery has swept away at least some of the impediments to production. But the fact remains that no evidence has yet been given either that the plan to push up output by control is working or that consumption is being successfully cut by exhortation. Until a plain statement is made in Parliament, in precise terms, on what is happening, which should be done as soon as Parliament meets again, the gravest doubts will be entertained.

Integration in Steel

The trend towards closer integration in the iron and steel industry has again been emphasised this week. It is announced that the chairmen of three leading steel companies have joined the board of directors of the Davy and United Engineering Company of Sheffield, a concern which specialises in the manufacture of heavy machinery and rolling mill equipment and has an arrangement with the United Engineering and Foundry Company of Pittsburgh in the United States. The three steel companies now represented on the Board of the Davy and United Engineering Company are Stewarts and Lloyds, the tube specialists, and the United Steel Companies and the Lancashire Steel Corporation, both large vertical combines. In so far as this move is designed to secure greater technical efficiency in production methods by bringing three large users and a producer of steel machinery, with access to the latest developments in the United States, into closer contact, it may be welcomed. But the trend towards closer integration, stimulated by the reconstitution of the British Iron and Steel Federation in 1934, has very real dangers. There can be no doubt about the Government's responsibility for ensuring that integration does not bring restriction in the post-war period as it has done in the past.

Fire Watching for Women

A new stage in the defence of Britain against fire has now been reached. After the first disastrous fire raids at the end of 1940, an obligation was placed on occupiers of business premises to make arrangements for fire prevention, and on male employees at the premises to do fire prevention duty. In residential areas, the local authorities were left to make adequate arrangements by calling for volunteers, but, since the arrangements in these areas were far from satisfactory, all men aged 18-60—with certain exempted classes—living in areas where the Fire Prevention (Business Premises) Order was in force, that is, all built-up areas, had to register for fire prevention duty last September. They could be compelled to do such duty in any part of their local authority area, unless they were already doing 48 hours a month at their business premises. Now, women, aged 20-45, are to be brought into both schemes at one step. In about a month's time, all women in this age-group—with the usual excepted classes, such as members of the auxiliary services, doctors and lunatics—will have to register. Those, whether married or single, who work at business premises, will be liable for duty at those premises. Married women not covered by the business premises scheme will only be liable for duty near their homes; if single, they will be liable to serve in any residential part of their local authority area, but, unlike men, will not be posted to business premises where there is a shortage. At present there are, of course, many women doing voluntary fire guard duty at their homes. Those within the age limits will be brought within the compulsory scheme, and whether they continue to do duty at home or are posted to their business premises or elsewhere depends on the numbers

available in each place. Those over the age limit will almost certainly be retained as volunteers, unless the registration of women, together with the supplementary registration of men, produces enough to make them unnecessary. This, however, is very unlikely, since, although there are over nine million women in this age-group, after deductions have been made for those living in rural areas; those in the services or doing more than 55-hours' work a week; the large number of those with children under 14 in their care; expectant mothers; those doing fire guard duty already; and those who will apply for exemption on grounds of hardship, or because they are unfit, the net increase in the strength of the Fire Guard will probably not be very great.

Training the Fire Guard

Even more satisfactory than the measure to increase the strength of the Fire Guard is the proposal to make training compulsory—if it is enforced. At present, under the second Fire Prevention (Business Premises) Order, it is provided that all arrangements made for fire prevention shall, so far as practicable, secure that persons to whom specified fire prevention duties are allotted, shall receive sufficient instruction to enable them to perform those duties. This provision is lax enough for the minimum of training to be given; but members of voluntary fire watching parties serving under local authorities have apparently been under no obligation to be trained at all. In any case, what training there has been has generally been given by the wardens, and has often gone no further than practice in the use of the stirrup pump. Training, in fact, is based upon the sort of incendiary bombs that were dropped in the first raids. More than a year has elapsed since then, and it cannot be assumed that the Germans have not started to use different bombs and different methods. The very success of the fires caused by RAF raids is a sign that technique has improved considerably in the last year. It is therefore extremely urgent, now that raiding, on however small a scale, has started on this country again, that fire squads should be told what they must expect and not be allowed lightly to prance out of bed with stirrup pumps and sandbags. And the people to tell them and train them should surely be the NFS—not the wardens—since fire prevention and fire fighting should go hand in hand.

Checking the Peasant's Flight

Hitler has issued a decree restricting the sale of agricultural land and forbidding all changes in the ownership of landed property. The official explanation is that changes of ownership invariably result in some decrease in output, and any possible interruption of agricultural production must be prevented. The German wireless has stated that a number of people having no connection with agriculture had been buying agricultural property to increase their personal food rations. It was also stated that people were buying agricultural land and property as an investment. All these explanations are true. Landed property, such as house property, jewellery, valuable paintings and furniture are classed *Sachwerte* (real property); and the German public is very interested in *Sachwerte* just now; one purpose of the decree is to prevent people who fear currency inflation from acquiring agricultural land and property. But who are the sellers of agricultural land? There is an exceptional financial liquidity among landowners. There has been a further reduction of agricultural indebtedness. Most of Germany's farms are subject to the hereditary farm law, which makes sale exceptionally difficult. The small peasant farms, however, are not covered by this law; and there is no doubt that small farms have derived no benefits from the Nazi policy of self-sufficiency. Since 1936, peasants have left the land for work in industry in great numbers and their small property has been bought either by big land owners or by industrial concerns. Wartime conditions have accelerated this process. A great number of peasants unable to cope with the work under wartime conditions may have been forced to sell out. The great masses of peasants owning small farms might well become opponents of the regime if this continued unchecked. Thus Hitler's new decree tries to stabilise the present ownership. Definite promises have been given to the peasant soldiers that their property will be safeguarded; and the decree is intended to dispel any fear among soldiers that they might lose their farms while fighting.

AMERICAN SURVEY

Policing the Price Level

THE immediate threat to Mr Henderson's Office of Price Administration appears to be receding. The House of Representatives, at odds with the Price Administrator over the need for rationing and over questions of political patronage in the new organisation, cut his appropriation from the \$195 millions requested to \$75 millions—which would have made it impossible for the OPA to enforce price ceilings. The Senate has raised the appropriation to \$125 millions, and relaxed the provision which would have transferred power over the fixing of prices on processed agricultural products to the Secretary of Agriculture. It is not certain that the House will approve the increased appropriation authorised by the Senate, and there is a strong disposition in Congress to keep the reins in its own hands by making appropriations for as short a period as possible. But the flood of protests which Congress has been receiving make the financial crippling of OPA less likely than it seemed. Mr Henderson has been successful in manoeuvring Congress into the unenviable position of appearing to want to play politics with the cost of living.

Mr Henderson's survival does not mean that the problem of price control is solved. The OPA has never blinked the fact that the most generous grant of funds and powers will be useless to maintain ceilings, if effective action is not taken to narrow the inflationary gap caused by the increase of purchasing power, at a time when the supply of consumers' goods is decreasing. Mr Henderson himself has been tireless in urging the extension of rationing, and drastic increases in taxation. He has incurred the wrath of the labour unions by steadily opposing wage rises. Nor are his powers adequate. There is as yet no control of wages, and the regulation of agricultural prices is specifically excluded from the province of OPA.

The impossibility of keeping a lid on prices without mopping up excess purchasing power is increasingly realised by the general public. The July issue of *Fortune*, for example, contains an article on "General Max" (the General Maximum Price Regulation), in which the case for heavy increases in taxation and forced savings, accompanied by rationing, is put with great force. A companion article describes the system of price regulation in Canada, and in a table, which is reproduced on the next page, the serious lag of American direct taxation behind that of Britain and Canada is set forth.

The fact that the need for controlling inflationary movements is at bottom the same in every country at war makes a comparison of the progress made in Britain, Canada and the United States both interesting and instructive. National differences and the pressure of events have made each country approach the problem in its own peculiar way. Britain has had three years in which to devise means of dealing with the "inflationary gap." Dependence on imports made rationing inevitable from the first; it was a political and physical necessity. Heavy increases in taxation, subject to post-war credits, and voluntary savings have been the main instruments by which it was hoped to control price rises, and no effective stop has been applied to wages. Price control, as such, has only been piecemeal. Although the Treasury has undertaken to stabilise the cost of living there has been no movement to make the freezing of prices the main weapon against inflation that it is in Canada and the U.S. Prices of essential foodstuffs have been held down by maximum price orders and the granting of subsidies; some raw material prices have been controlled, and recently, with the creation of standardised lines in such articles as clothing and crockery, it has been possible to attempt regulation by the fixing of profit margins for manufacturers, wholesalers, and retailers, and the setting up of price ranges. No attempt has been made to fix prices of armaments, but the control of production costs has been tightened, and EPT has put an effective ceiling on profits. By the increase in subsidies, the Treasury has been successful in stabilising the cost of living index over the past year.

Such success as Britain has achieved has in part been

due to the bleak necessity of cutting its coat according to its cloth; and Britain enjoys certain distinct advantages over countries like Canada, and particularly the United States, in the imposition of controls. Britain is a far more compact administrative unit; experience derived from the last war has been invaluable, particularly in rationing; the Civil Service in this country is much more highly developed and prepared to administer the controls of consumption. Even so, the rising tide of wage demands may still overflow the barriers which have so far prevented a runaway inflation.

The Canadian "Squeeze"

Canada lies halfway between Great Britain and the United States in the sphere of price control. Although Canada had been at war for two years, it was not until the autumn of 1941 that the rise in the cost of living threatened to become unmanageable. There was more time to make the adjustments to a war economy than there has been in the United States. Canada was better prepared psychologically for drastic measures. On the other hand, there had been no noticeable reduction in consumers' goods, such as has been experienced in Britain. In October, 1941, however, the cost of living index had risen to 115 from 107 in March; the national income at about \$6,000 millions was \$2,000 millions greater than it had been before the war; and it was increasingly obvious that, despite sharp increases in taxation, purchasing power was outrunning the supply of goods.

The Canadian solution was simple, drastic, and so far it has been effective. Mr Donald Gordon, Deputy Governor of the Bank of Canada, was given power to freeze retail prices, including the prices of services, and wages at existing levels. A provision for wage increases of 25 cents a week for every point rise in the cost-of-living index was included, but it has not been necessary to invoke it. The "squeeze" resulting from the fact that increases in wholesalers' and manufacturers' costs were not yet reflected in most retail prices was absorbed by agreement between the manufacturers, wholesalers and retailers. In general, the manufacturer absorbed 50 per cent, and the rest was divided between retailer and wholesaler. Costs were cut by drastic simplification and standardisation. Deliveries were reduced, fancy packaging outlawed, the number of styles and models was cut. No ceiling was imposed on goods for export or on war goods. The greatest danger to Canadian price control lay in the dependence of some industries on raw materials imported from the United States, where prices were rising steadily. There were also a few industries where costs could not be cut sufficiently to permit the industry to operate under its ceiling. For these special cases, subsidies were instituted, but so far they have been insignificant in amount—only \$2,128,981 for the period ending on April 21, 1942—and provisions exist for the recapture of subsidies which prove unnecessary.

"General Max"

The Canadian price control experiment was watched with the greatest interest in the United States, and "General Max" admittedly follows the Canadian model in many respects. This is as Canada hoped, for the success of Canada's system of control depends primarily on keeping down the subsidies required by industries dependent on imports from the United States. Like Canada, the United States froze prices of goods and services as at a given date—the highest level reached in March, 1942. But in two essential respects the powers of the Price Administrator were more limited than in Canada. Wages were not included; nor were prices of unprocessed farm products. At least 30 per cent of the average food bill is thus excluded from the cost-of-living controls. In another respect, the scope of price control is far greater. The OPA was given powers over prices entering into military production, such as parts and machinery, and it is said to be at work on price schedules for finished military equipment. But the Services have not been sympathetic to price regula-

tion, which in their view deprives manufacturers of incentives to increase production.

The unwillingness to put an effective stop on wages is evidently the greatest danger to a system of control where prices are based on wage rates paid last year. Mr Henderson has testified that general wage increases, similar to that granted to the workers in little steel, would make necessary annual subsidies of \$3-4,000 millions if the price ceilings are not to be punctured.

It is too early yet to reach any final conclusions about the success of the American price freeze. The precarious existence of the whole Price Administration during the last two months has not provided an atmosphere favourable to progress. Already, however, the price ceilings for tinned fruit have had to be increased about 15 per cent, despite early assurances that every ceiling would be maintained. This does not augur very well for a solution of the "squeeze" on the Canadian model. The alternatives for the distribution of the "squeeze" are the absorption of increased costs within the industry (the roll back); the raising of ceilings (the roll forward); subsidies; and what may be called "hidden inflation," that is, deterioration in standards and concentration on higher price lines. Already all four are being employed by industry and OPA. The absorption of costs has met with success in the soap industry; subsidies have been instituted to meet increased transport costs in the oil industry; and the regulation covering women's clothing appears to be an invitation to manufacturers to abandon low price lines for those where hidden savings in materials and trimmings can recompense them for rising costs.

The form which American price control has taken is obviously less effective than that of Canada, because of the omission of wages and agricultural prices from the regulation. The difficulties of enforcement are also substantially greater. In large measure, this is the result of the American division of powers between Congress and the Executive which all too often allows pressure groups to play off one against the other and holds up or emasculates urgent legis-

lation. The speed with which the United States has been put on to a war footing has allowed less time for adjustment to the necessities of war. There are as yet no serious shortages of essential consumers' goods. The job of policing to be done is also much more formidable than that in Britain or Canada. There are 1,800,000 retailers, 650,000 service establishments and landlords in 366 rent areas to be kept under observation, and the enforcement staff has in the main to be built up from scratch, as there is no civil administration in existence in the 48 states which is capable of taking over the work of price control.

Rations and Taxes

The need for other controls to support price fixing is widely acknowledged, but in the short time since Pearl Harbour very little has been achieved in the combination of rationing, taxation and saving. The OPA has worked out systems for rationing a number of commodities, and the use of points rationing has received a great deal of attention in Washington. In time a great extension of rationing will be inevitable; and it would be desirable now to conserve stocks of goods which cannot be replaced. But the complexities of rationing on a continental scale are very great. A clothing ration adequate for Florida would be suicidal in a Minnesota winter; some method must be devised of reconciling hand-to-mouth buying in the great cities with the monthly or even yearly getting in of supplies by ranchers in the War West. The solutions will be found probably by dividing the United States up into regional areas based on the similarity of needs and customs, but it will take time.

The most effective measure, and equally the most painful to apply, lies in the field of taxation. The new American Tax Bill is still held up in Congress. But there are signs that the need for using it as an instrument to mop up purchasing power is making some headway. Most recent reports suggest that the Senate may increase the revenue it is designed to produce from \$6,000 millions to about \$8,000 millions. With excess purchasing power in 1942 estimated at about \$17,000 millions after voluntary savings, this will not do a great deal to close the gap.

Neither Great Britain, Canada or the United States has been able to devise a completely satisfactory solution to the pressing need for control of wartime purchasing power. But at least the nature of the problem is no longer a mystery. The main instruments—taxation, forced savings, rationing and price fixing—have, to varying extents, been tried out in each country, and an invaluable store of experience in the administration of different measures is being built up. What is needed now is the determination to apply an adequate combination of them all before it is too late.

American Notes

A Guarantee for India?

The acceptance of British action in India as a regrettable necessity—but necessity none the less—is already undergoing some modification. Outright advocacy of the Congress position has almost entirely disappeared except in some Socialist and labour quarters; and there will not be much support for Mr Norman Thomas's characterisation of the arrests as a "dastardly blow at the four freedoms." The increasing sense of involvement developed by eight months of war has brought about a much more cautious and realistic approach to the Indian problem. But the new consciousness of responsibility makes it difficult for Americans to accept the rôle of spectators for long. A number of individuals and newspapers have begun to argue openly that the United States and perhaps China should intervene to guarantee Indian independence after the war, demanding in return the end of civil disobedience. The Marshall Field papers, the *Chicago Sun* and P.M. have persistently advocated this line. The most recent cables suggest that the demand that the United States undertake some sort of constructive action is spreading. The idea of a guarantee for India by the United States and perhaps the United Nations has been very widely canvassed in recent months. It was temporarily damped down by the insistence of Congress on immediate independence. Now that violence has broken out there will be very great disappointment if attempts are not made to open negotiations aimed at a compromise. It would be a mistake to count on unqualified support from American opinion if no further attempts are made to work out a solution.

Concentration in Industry

Mr Nelson has announced a scheme for the concentration of civilian production in order to free labour, factory space, and machines for war purposes. Two experts of the War Production Board's Office of Civilian Supply have recently visited Great Britain, and the programme to be followed makes substantial use of British experience. The intention is to turn essential civilian production over to small plants in the industry, which would be difficult to convert to war production, and to convert the facilities of larger units. The small plants to be chosen must be located in areas where there is no strain on labour, transport, and power, and where compensation is to be paid it will be borne by the nucleus firms. There will be simplification and standardisation of products; great interest has been shown in the development of utility goods in this country. It is understood that steps will be taken to avoid the growth of monopolies. As yet there is no information about the scale on which it is proposed to concentrate industry, or the types of products which will be affected. In view of the fact that the greatest immediate bottleneck in war production is materials rather than facilities, it seems likely that emphasis will lie rather on the saving of materials and skilled labour rather than on the release of factory space for armament output.

* * *

Ankle-Deep

Last Sunday's broadcast, in which the Office of War Information brought to the microphone such outstanding figures as Admiral Nimitz, General Eisenhower, Mr Batt, Admiral Leahy, and the two main leaders of organised labour, was tangible evidence of the skill and determination with which it is handling American information policy. President Roosevelt's warning that American production was only beginning to get into its stride, in terms of what is needed to defeat the enemy, was reinforced by a galaxy of talent seldom assembled for any programme. It was a brilliant stroke to bring into American homes the voice of General Eisenhower, from Britain, and of Admiral Nimitz, from "Somewhere in the Pacific," to appeal for increases in the supply of arms. Admiral Leahy, making his first public address since his appointment as Chief of Staff to the President, spoke with salutary bluntness:

We have suffered grave defeats. Our casualties have been severe. Our country has been invaded. . . . This will be the toughest, hardest and most merciless war we have ever fought.

The programme was timely, not only because of the news from the battlefronts, but because of the disappointing lag in war production in June. According to the Office of War Information, the production of aircraft, tanks, naval vessels, and most types of artillery fell behind schedule in that month, and Mr. Tolson, chairman of the House Defence Committee, charged that "war production is faltering badly." More serious than a temporary hold-up in war production is the easy fallacy that the war is almost won. By pointing out that the United States is as yet "not ankle-deep in the war," and that the victories of the Coral Sea and of Midway were only triumphs of defence, the Office of War Information has done much to cut the ground from under the optimists who profess to believe that the war will be over this year and that further sacrifices are unnecessary. The reorganisation of the Information service has already more than justified itself.

* * *

Labour Unity

Mr William Green, president of the American Federation of Labour, has accepted the suggestion of Mr Murray, the head of the Congress of Industrial Organisations, that he should appoint representatives to confer on ways and means of establishing "organic unity" between the two trade union bodies. In January, peace proposals were put forward by John L. Lewis without Mr Murray's knowledge. They were regarded as a bid by Mr Lewis to recapture the leadership of the labour movement and they did not survive Mr Murray's disavowal and President Roosevelt's disapproval. With a stable agreement between the two groups, the risk of jurisdictional disputes will be greatly lessened; rivalry over wage increases should diminish; a number of unnecessary and, in some cases, unsavoury officials, might be dispensed with; and a united front would be presented to John L. Lewis. There is no doubt that the prospects of a merger are popular with the rank and file. Co-operation between the AFL and the CIO, in the War Labour Board and in local matters has been steadily

increasing since the outbreak of war. Indeed the main split lies not between the AFL and the CIO, but between John L. Lewis and the rest of the labour movement. It seems likely that if a merger is brought about without Mr Lewis's participation, Mr Lewis may make the break with the CIO which has been prophesied for so long. Whether he will carry with him the bulk of the Mine Workers is uncertain. His hopes of capitalising any labour unrest to his own advantage would certainly be greatly diminished if he had to face a solidly united trade union movement throughout the country.

Shorter Notes

President Roosevelt has vetoed the bill providing for the creation of an independent Rubber Supply Agency to supervise the production of synthetic rubber from agricultural and forest products.

*

The electrocution of six of the eight German saboteurs landed on the American coast by German submarines, and the news that Max Stephan, the restaurant keeper who was convicted of aiding an escaped German airman, is to be hung, are signs of the increasing sternness with which the United States is dealing with spies and saboteurs.

*

The War Production Board has decided to sanction the production of 500 Martin Mars flying boats. Mr Henry Kaiser is to receive an initial order for 100 from the Navy. Interference with the military programme makes it unlikely that the programme will be expanded in the near future to the 5,000 aircraft suggested by Mr Kaiser.

*

In a note on "Cargo Planes" in *The Economist* last week (page 171), by a regrettable printer's error Lieut.-General H. Arnold appeared as Mr Samuel H. Arnold.

THE WORLD OVERSEAS

North American War Economy

(From Our Ottawa Correspondent)

July 28th

THE first general report of the US-Canada Joint Committee on War Production, covering the first six months of operations, indicates the measure by which a policy of economic integration has assisted the expansion of war production in both countries. More than any other agency, this joint committee is, by its work, rubbing out the national boundary between Canada and the United States. Its original declaration, forecasting the maximum use of labour, raw materials and factory capacity of both countries, provided the foundation for a North American war economy.

The report that, for purposes of comparison, US munitions production for the second quarter of 1942 has increased nearly four times over the same period in 1941, while Canadian munitions production has increased nearly three times in the same period, immediately set at rest Canadian fears that Canada's production might suffer after the United States entered the war if access to US sources of supply were curtailed. Nothing of the kind has happened. Approximately one-third of Canadian requirements for steel frames and plates for merchant shipbuilding is obtained from the United States. Prompt deliveries have been maintained. At the same time, to assist the movement of iron ore on the Great Lakes from US mines in Michigan to blast furnaces in eastern industrial areas, Canada has diverted a considerable part of its Great Lakes grain carrying tonnage to the ore routes. The increase in ore movement this year is estimated at 2,500,000 tons.

Though details are obscured by wartime restrictions, the practical achievements of economic integration may be seen in many instances. Strategic and scarce materials and metals are pooled between Canada and the United States. Canada's war-born optical glass industry was able to supply 30,000 pounds of glass for sights to the US Navy at short notice, when no other source was immediately available. The production of aeroplane propellers has been rationalised on a continental basis, with Canada concentrating on one type, the United States on another. Problems of plant expansion to provide new demands are considered by the Joint War Production Committee in the light of facilities in both countries as if they were one. Canada supplied on one occasion 500,000 shell bodies and fuses to the United States, for filling there and for use by US troops. On the other hand, the United States supplied 150,000 shell castings for filling in Canada.

International Division of Labour

The practical economies of co-ordination are self-evident. Drawing on the resources of a continent, instead of two separate economies, the plan of integrated production brings with it the extra margins of an international division of labour. In the matter of tariffs and border restrictions, Canada permits duty-free entry of all war production goods, while the United States, by executive order of June 1, 1942, suspends all tariff barriers on war supplies ordered by any Washington department. The latest example of co-ordination in this field is the arrangement whereby US war materials may move freely in bond through Canada on highway trucking routes originating in the United States and destined for the United States.

Though many examples are known to exist in which action has been taken recently to revise specifications in order to increase the number of common types of weapons, the sole example disclosed by the committee relates to the Canadian gun carrier. This has been altered in its specifications to permit the use of facilities on both sides of the border in identical production. In this instance, may be seen the growing integration of Canadian war production with American standards. The difference was noted by Lieut.-General A. G. L. McNaughton, Canadian army commander, during his visit home last March, when he said: "In England the emphasis is on careful craftsmanship, hand-

tooling and strength of design. In the United States and Canada, weapons can and are being turned out in vast numbers by use of new processes which stress simplification of design and speed of production."

The beginnings of a practical integration of Canadian and American war production were made early in 1941. As a corollary of joint action in military strategy provided in the Joint Defence Board (August, 1940), the Hyde Park Agreement of April, 1941, recognised the principle, as then stated by Mr Mackenzie King, that:—

In mobilizing the resources of this continent, each country should provide the other with the defence articles which it is best able to produce, and, above all, produce quickly, and production programmes should be co-ordinated to this end.

The Joint Economic Committees (June, 1941) operate in the field of general economic relations. They originated, for instance, a plan of free seasonal movement of farm labour and machinery between Canada and the United States, which is in operation this year. The Joint Materials Committee (January, 1942) operates in the field of primary materials. Finally, the Joint War Production Committee (November, 1941) operates in the field of production of war materials. All these committees stemmed from the original principle adopted at Hyde Park by Mr Mackenzie King and President Roosevelt.

A joint statement on war production policy, issued on December 22, 1941, set out seven principles:—

1. Victory will require the maximum war production in both countries in the shortest possible time; speed and volume of war output, rather than monetary cost, are the primary considerations.
2. All-out war production in both countries requires the maximum use of the labour, raw materials and facilities of each country.
3. Achievement of maximum volume and speed of war output requires that the production and resources of both countries should be effectively integrated and directed towards a common programme of requirements for the total war effort.
4. Each country should produce those articles in an integrated programme of requirements which will result in a maximum joint output of war goods in minimum time.
5. Scarce raw materials and goods should be so allocated between the two countries that such materials and goods will make the maximum contribution towards the output of the most necessary articles in the shortest period of time.
6. Legislative and administrative barriers, including tariffs, import duties, customs and other regulations or restrictions of any character which prohibit, prevent, delay or otherwise impede the free flow of necessary munitions and war supplies between the two countries, should be suspended or otherwise eliminated for the duration of the war.
7. The two Governments should take all measures necessary for the fullest implementation of the foregoing principles.

A Guide for the Future?

The work of the Joint War Production Committee offers a practical example of economic integration that will persist until the post-war period. "The hope of survival of liberty in the United States and the world," said Wendell Willkie, "is directly dependent upon the creation after this war of conditions under which trade can flow as uninterruptedly as possible in the largest possible areas and among the largest number of people." The conditions outlined by Mr Willkie will be, when peace comes, no strange new pattern to the people of Canada and the United States.

Industrial Palestine

[FROM A JERUSALEM CORRESPONDENT]

July 10th

ONE of the outstanding features of wartime economy in Palestine is the conspicuous development of local industry. Already, it is playing a major part in Palestine's war effort, and its importance has been stressed by a recent order, introducing for all essential factories a continuous seven-day week, and a 60-hour week for all labour concerned. Military orders placed with local manufacturers rose from about £P1 million in 1940 to £P4 millions in 1941, and are running at a level of £P8 millions per annum this year. For a country whose total industrial output in 1939 was only about £P10 millions, this is considerable, even if the difference in price-levels is taken into account. In addition, a big local demand for most commodities was created by the fall in imports, and, in spite of the difficulties, industrial exports have also been greatly expanded, the bulk of them serving for essential war needs (potash, petroleum derivatives, and so on).

Yet only to a comparatively small extent was this expansion carried out by establishing new factories. By far the greater part of the growth is due to the fuller use now made of plants already existing. The surplus capacity of most factories established by Jewish immigrants during the last decade, which encumbered them heavily in the pre-war days, has proved in present circumstances to be their greatest asset. Moreover, ample resources of skilled labour were available owing to the unemployment which had accumulated during the pre-war disturbances; and they were further increased by the sharp reduction of work in the citrus plantations. Jewish unemployment figures fell from about 13,000 in the middle of 1940 to almost nil, and, furthermore, some thousands of immigrants and Arab labourers were also absorbed. The number of workers employed in industry has risen since 1939—according to Jewish Agency indices—by about 55 per cent, the number of man-days worked by about 70 per cent, and the value of production by more than 120 per cent, which indicates an increase of about 50 per cent in the physical volume of production. The most important increases—by more than 100 per cent of man-days—have taken place in the metal, textile, food and leather industries, while wood, paper and printing trades, which depend mostly on local demand, are scarcely above peace-time levels or are even depressed. But it should be borne in mind that these indices do not reflect the development of the new factories which started production during the war, and they do not cover the important concessionary concerns, the Arab producers, and so on, which have also substantially increased their output. Most factories now work nearly at full capacity, and a shortage of labour is already evident. Nevertheless, a further rise of production is expected by about one-quarter over and above the level of 1941, which has been estimated at £P20 millions. Of this, more than one-half is being taken up by military orders and by exports, while a further 10 per cent may be accounted for by the individual consumption of the soldiers stationed in the country.

Special Mentions

Some achievements of Palestine industry deserve to be specially mentioned. The oil refineries of the Iraq Petroleum Co. have already a military record of their own; but little is known about the speeding-up of potash production by means of a new method of colouring the water in the solar ponds in order to accelerate evaporation. Phosphoric fertilisers, produced from rock deposits in Trans-Jordan, are already on the market, and the output is to be brought up to 500 tons per month. Sulphuric acid, calcium carbide, dry pectin, ether and various medicines, are among the new products of the chemical industry, and the production of starch and glucose is to begin in the near future. Cotton weaving and spinning are being greatly expanded and the new wool-weaving industry is meeting with fair success. Considerable progress has taken place in the metal industry, which is now delivering a great variety of articles, from agricultural and manufacturing machines to automobile spare parts, and from surgical instruments to harbour constructions. The output of the diamond factories (which are at present paralysed by a wage strike) has reached about 1,800 carats a month.

Portugal's Finances

[FROM OUR LISBON CORRESPONDENT]

July 24th

WITH a wealth of detail, Dr Costa Leite has laid before the country the official accounts covering 1941. Receipts, in round figures are £30,260,000; disbursements £28,310,000. Thus, the established custom of retaining a substantial balance is continued; extraordinary outlay called for by defence is some £7,000,000, or 160 per cent above the 1940 amount, and, because of the balances from past years, there was no need to have recourse to credit as a means of meeting this unproductive expenditure. Also noteworthy is a table showing how the Floating Debt has in thirteen years been turned from a liability of £21,000,000 into an account carrying a credit balance equivalent to some £5,000,000. Attention is also drawn to the rise in the quotation of the external debt (first series), which in June, 1932, stood at 47½ in London and in May of 1942 at 78½.

Dr Costa Leite was not content with this seemingly satisfactory position. The reason for the warning he gave about "difficulties" ahead is the abnormal nature of the trade position. An import surplus of 1,161 thousand contos in 1938 has been converted into an export surplus of 504 thousand contos in 1941, largely because the value of exports has increased by more than 150 per cent, although their volume has been halved. The volume of imports fell by 29 per cent; bank deposits were nearly 68 per cent higher in 1941 than in 1938; and the note circulation was 57 per cent higher. It is unnecessary to lay stress on the danger dormant in further expansion on these lines.

Letter to the Editor

Pooling Resources

TO THE EDITOR OF THE ECONOMIST.

SIR,—I should like to congratulate you on your notes on the problems arising from the changes in the geographic distribution of the troops of the United Nations. All these nations accept the principle that the whole of their resources are to be pooled and used to the utmost to gain victory. Yet the dire experience of the social and economic consequences of the higher pay and rations granted to British troops in France does not seem to have been assimilated. The troops in Malta or in Tobruk did not expect as high rations as they were used to in their homeland and in peace. The shipping position and the problem of morale urgently demand a general agreement on this question. The enlightened approach to the attendant psychological difficulties shown by the US Government in the issue of a pamphlet to their troops is a welcome beginning of a realistic and open treatment of "awkward problems." But it seems wholly contrary to their declared policy to use over a million extra tons of shipping per annum on maintaining peacetime standards of feeding (on the hypothesis that eventually a million US troops will be stationed in this country). At the same time, demand for semi-luxuries which are, or should be, in ever-decreasing supply, is to be increased by not less than £150 millions, or at least 20 per cent. The result will inevitably be either further dissipation of energies on increasing their supply or serious local shortages.

President Roosevelt has shown himself a real statesman in his approach to problems of inter-allied organisation. It is to be hoped that he will propose a general agreement whereby the standard of rations and pay of the armies of all United Nations will be fixed uniformly on the basis of the needs of the moment and available supplies in each theatre of war (it would be foolish to decrease rations in, say, New Zealand or Australia). The difference in pay (and perhaps the money value of the difference in rations) should be credited in their own currency at their free disposal to those who are entitled to more at home (not blocked). Without such agreement neither the full mobilisation of our resources, nor the maintenance of a truly united front, seems possible.

Yours faithfully,

T. BALOGH.

Balliol College, Oxford.

German Europe

Ruhr and Rhine

A LIST of British bombing attacks, covering the first seven months of 1942, shows that the towns of the Rhenish-Westphalian industrial area (*Rheinisch-Westfälisches Industriegebiet*) have been the major objectives. The area, which covers a considerable part of the two Prussian provinces of Rhineland and Westphalia, has its greatest concentration of industry in the Ruhr area, the chief coal mining area in Europe. To the south of the Ruhr is the *Bergisches* and *Sauerland*, with an old-established metal and textile industry. Further to the south is the *Siegerland*, with iron ore mining. From north to south, on the left bank of the Rhine, there is the Lower Rhenish district, which the textile industry dominates; the Cologne district, with large lignite deposits; and the Aachen district, where coal mining is again the main industry. (These areas are indicated by roman numerals on the map below.)

Before the incorporation of Austria, this Ruhr and Rhine region, with roughly 11 million inhabitants, produced three-quarters of Germany's total output of coal,

RHENISH-WESTPHALIAN INDUSTRIAL AREA

The shaded part indicates the geographical extent of the whole industrial area, which is divided into six different districts:—

- I. The Ruhr area proper, the territory of the rivers Ruhr, Lippe and Rhine (heavy shading).
- II. The *Bergisches* and *Sauerland*, the territory of the river Wupper.
- III. The *Siegerland*, the territory of the rivers Sieg and Lahn.
- IV. The Lower Rhenish area.
- V. The Cologne area.
- VI. The Aachen (Aix la Chapelle) area.

Scale of the map, prepared by the German Business Research Institute, is in miles.

and four-fifths of its output of steel. In Greater Germany, including the incorporated Polish provinces and Czechoslovakia, the Rhenish-Westphalian industrial area accounts for roughly half the total output of coal and lignite, and three-fifths of the total output of steel. Every kind of industry has been developed; and the Ruhr area is particularly unique in its combination of heavy and light industries. A particular feature of the Ruhr area is the integrated steel and heavy engineering plants. A considerable number of them are concentrated in the towns of Duisburg, Essen, Dortmund, Hamm, Oberhausen, and Mülheim, which are to all intents and purposes one town with

roughly 900,000 inhabitants. Ruhrort is at the same time the largest inland port in Europe. In this district, the Thyssen steel works have been damaged; rolling mills have been hit, and power houses destroyed. The Ministry of Information also reports that smelting plants, engineering works, and even a coal mine have been hit. Extensive damage has also been done to warehouses. Hardly two miles to the east from Duisburg-Oberhausen starts Essen, the seat of the Krupp works, and the leading town of the Ruhr area. Here the damage done has not been stated in detail.

Gelsenkirchen, the biggest centre of coal mining in Europe, with 42 pits and synthetic oil plants; Bochum, with large heavy engineering plants; and Dortmund: these towns stretch out to the east until, near Hamm, the eastern end of the coal area is reached. The northern and eastern parts of the Ruhr area are mainly coal-mining districts. Single pit-heads, screening plants, farm buildings and villages, with long rows of uniform miners' cottages, are not easy targets for night bombers. Düsseldorf, however, in the south-west corner of the Ruhr area, provides a better target; and the Ministry of Information reports damage to the Mannesmann tube works and the machine tool factory, *Schüss-Defries*. Extensive damage to the *Schüss-Defries* plants, specialising in heavy machine tools, would probably mean difficulties for many armament works awaiting the delivery of machinery.

Concentrated bombing of all these towns can hardly fail to damage some of their works. There is no clear dividing line between the industrial and residential districts of these towns. A familiar sight in these towns is streets flanked at one end with a huge chimney stack and at the other with the steeple of a church. In Gelsenkirchen, pit-heads overlook the main street of the town.

The Lower Rhenish district is the western continuation of the Ruhr area; and the main centres are Krefeld, Neuss, and Muenchen-Gladbach. A considerable part of Germany's textile industry is concentrated here. Light and heavy engineering, particularly railway wagon and chemical works, come next in importance. These towns have not been mentioned in reports on bombing attacks. Cologne, the object of the 1,000-bomber raid, is a separate region, and must have sustained heavy damage, though detailed information only specified an important rubber-yarn factory. Cologne is a typical centre of the kind of engineering works which usually develop in old-established centres of communications. The important textile centre Wuppertal, formerly Elberfeld-Barmen, and the centres of light engineering, Solingen and Remscheid, which were famous long before the Ruhr area was developed, have not yet been mentioned as having been bombed, though Aachen has been repeatedly visited.

A detailed map reveals an amazing network of communications in this area, to which were added before the war some *Autobahnen*. The main weakness of the system of communication in the area is the lack of clearly cut trunk lines. The railways are probably the most vulnerable spot in the whole Rhenish-Westphalian industrial area. The electricity grid system and the gas works, with pipe lines feeding even towns outside the area, are equally promising targets.

There is no doubt that concentrated and sustained bombing attacks on the area might cripple a considerable part of Greater Germany's industry. The industries of the area were rebuilt and modernised between 1925 and 1929. After Hitler came to power, the area was in good working order, and output could be increased without additional construction. This explains why the new industries built under the armament programme were located in central Germany; new centres of heavy industry were built in central Germany, and the greater part of the light alloy industries is also situated there. The lignite deposits of central Germany are the main source of the synthetic oil industry. The conquered industries of Poland and Czechoslovakia have been fully used since the beginning of the war, and the importance of big towns like Berlin, Leipzig, and Vienna as centres of light and heavy engineering has certainly increased during the last ten years. But the Rhenish-Westphalian industrial area remains the most important and most heavily concentrated industrial region of Germany.

Russia at War

Before the Winter

AFTER the heavy industrial losses recently sustained, new adjustments are being made in Soviet industry. Their general trend is not new; it is actually a continuation of the "realignment" effected in consequence of last year's retreat. The aim is more intensive use of the resources and productive capacity still intact. The means are a higher output in the mines and factories of the industrial hinterland of the Urals and Asia; a stricter economy of raw materials, fuel and transport; and a still more intensive use of the labour reserves available.

The grim news of territorial and industrial losses is being set off in the Soviet press by the remarkable successes scored by all war industries in July. The latest results of "socialist emulation" are reported to have been much better than those of a month ago. From the tenor of press accounts, the impression is that, while during June there was a weakening in the rhythm of production, the effort made during July to regain the lost tempo was rewarded with success. An announcement by the People's Commissariat for Ammunition says that the number of its factories which fulfilled or exceeded their plans in July was double the number in June. "Labour productivity" in the Commissariat's establishments increased by more than 10 per cent. Similar statements were issued by the Commissariats for Tank Building, Aircraft Production and Armaments. Emphasis is laid on the fact that some of the previously "backward" plants caught up. Thus, the first place in iron and steel production was this time won, not by the big and modern Magnitogorsk furnaces or Kuznetsk foundries, as the case had been in May and June, but by the medium-sized and old Serovo factory. Serovo produces important ferrous alloys which were previously turned out by electric furnaces on the Dnieper. The first place in production of tanks was obtained by the Kirov plant; this is the new name for the old and famous Putilov factory of Petrograd which in 1914-17 was already the biggest Russian armament plant. Last year, the entire "Kirov"-complex was evacuated from Leningrad to the Urals and converted to tank production; the fact that it was an evacuated plant that could show the highest increase in production of tanks is stressed as a hopeful illustration of the scope still left for a further expansion of output.

The reports about current production are good. But there is no lack of concern about prospects for the autumn and winter. An all-out campaign of preparation has already started. Industrial managers, fuel producers and transport directors are being urged to work out winter plans immediately and to adjust their establishments in advance to all the shortages and difficulties which the cold season holds in store.

The fuel position is the main preoccupation. The loss of the Donbass coal has left the industries of European Russia largely without European coal. The only remaining mining district is the Moscow basin with an output of 7-8 million tons. The coal pits of that province suffered much by flooding during the retreat in 1941. It is reported that the damage has since been repaired and that output has again risen to the pre-war level. Even so, the coal of the Moscow basin provides only a fraction of the normal coal consumption of Moscow's factories alone. The industrial centres on the Volga, with a great number of evacuated plants, will have to rely on coal supplies from Asia. The problem is whether sufficient transport facilities will be available; and whether the Urals, Kuznetsk and Karaganda will produce enough to keep going the eastern industries as well as those of the Volga region. The output of the three mining districts may be about 60-65 million tons yearly.

The main remedy for the shortage of coal in European Russia is a vast switch-over from coal to peat and firewood. This has been the first and most urgent demand in all the appeals for winter preparation. The pre-war output of peat was about 28 million tons, most of it concentrated in European Russia. Already this year—says *Pravda*—

large numbers of electrical power stations and hundreds of varying types of enterprises have used peat as their fuel.

The output of peat is now being feverishly expanded. The obligation has been put on factory directors to lay in stocks of peat and wood sufficient to keep their enterprises running until next spring. The stern words, "the

country will not forgive"—which were used in the "Not a step backwards" orders to the Red Army—have also been used in appeals to industrial producers:

The country will not forgive non-fulfilment of the plan for collecting and drying peat. Not at some time in the future, but now, the leaders of every enterprise and every district must take steps to ensure reserves of fuel for the winter. They cannot, and must not, count upon imported fuel.

Strict time limits have also been set by the Government for the preparation of stocks of raw materials by directors of factories. All managers of iron and steel plants have been ordered to have their reserves of iron ore and fuel brought up to the required standards by the first days of October. The railway managers, too, have been reminded of the popular Russian proverb: "Make your sleigh ready in the summer." Last winter's shortcomings, it is said, must not be repeated this year; repairs of engines and tracks must be completed early; and preparations must be taken in time to cope with snowdrifts in the winter. The chiefs of the railways leading from Asia to Europe have been made aware of the new responsibilities which have fallen upon them after the loss of important European transport facilities. At the same time, some hold-ups in the production of coal in Asiatic districts and of oil in the "Second Baku" have been attributed to the failure of the railways to carry away in time the coal from the mines and the oil from the wells.

Thus, amidst difficulties which stagger the imagination, Russia is preparing betimes for a second war winter with the unparalleled and grim determination to make its war industry and war machine work in spite of frost, shortages and war-weariness. Everything has been geared up for that purpose. Preparation for the winter has become the main item on the agendas of party—and Soviet—meetings throughout the country. Labour discipline has been increased, and nothing that is possible is being left undone to muster the last ounce of strength in Russia's gigantic struggle for survival.

THE BUSINESS WORLD

Copper Supplies

COPPER and its alloys rank among the most important of munition metals. Nearly half the total copper consumed goes into munitions proper—such as shells and cartridges—and the bulk of the remainder is needed in the manufacture of electrical equipment and for mechanical parts which must be able to resist corrosion or act as heat conductors. The importance of the metal was illustrated by Mr Donald Nelson during a speech on June 13th, when he said:

One type of bomber that is now defending our freedom requires more than two miles of copper wire to keep it flying. Another type of plane that we are using requires 500 lb. of copper. A battleship uses two million lb. of copper. If there were no copper, our big guns all over the world would be silent and helpless.

The Axis is deficient in copper. Before the war the countries controlled by Germany produced only about 150,000 metric tons, or 7 per cent of the world's output. Both Germany and Italy were then large importers and consumed some 450,000 metric tons per annum. Germany may have contrived to step-up production a little and to reduce the deficiency in ore supplies by extensive substitution and scrap recovery, and by eking out stocks accumulated before the war. But as Germany's present needs can hardly be much smaller than before the war, the prospect of a serious shortage must have been ever present. Apart from the small deposits in Cyprus and Turkey, the only really large source of supply not overseas is in Russia. Although the major part of Russia's resources are in the Urals and beyond, some of the most highly developed mines, significantly, are in the Southern Caucasus. Japan, too, produced less than half the copper it consumed before the war; but the deficiency, which cannot be made good from the countries its armies have overrun, will not become a serious problem for some time, as Japan started the war with a full cupboard.

The Allies, then, possess the overwhelming share of the world's supplies, and the American *Engineering and Mining Journal* estimated last year's world output at 2,500,000 metric tons. Until the summer of 1941 it appeared that the current rate of output in the countries tapped by the United Nations would meet prospective requirements. But the vast demands of munitions factories of the United States have necessitated a considerable expansion in supplies. Two months ago, Mr Donald Nelson hinted at a shortage:

Not so long ago we had plenty of copper—all that was needed for our army and for our peaceful civilian population. But now everything is changed. I can tell you frankly that there is a shortage of copper. We shall need every bit that we can get to win this war.

In one sense, Mr Nelson's statement is encouraging. It is an indication of the phenomenal expansion in the war production of the United Nations. But the copper consumption of the United Nations is so much higher than that of the Axis that copper can hardly be used alone as a yardstick of comparative munitions production. Germany has made a fine art of the eking out of scarce resources and has probably resorted to substitutes much more extensively than Great Britain and North America. Fortunately, the scope for further expansion in the copper supplies of the United Nations, and for economies in the use of copper, remains substantial. Both in Great Britain and in the United States, not only internal output and allocations, but also copper imports, are strictly controlled. In this country, the Non-Ferrous Metal Control of the Ministry of Supply introduced a Government import monopoly at the beginning of war, and since October, 1939, it has acquired all the copper required under bulk buying agreements with the large Empire producers in Canada and Northern Rhodesia, and, since last year, also with the *Union Minière du Haut Katanga*, the only supplier in the Belgian Congo. Producers in the United States are compelled to sell their output according to the directions of the War Production

Board, and all imports have been the monopoly of the Government-controlled Metals Reserve Company since December 28, 1941. The Metals Reserve Company has concluded a number of agreements by which the whole of the Latin-American copper surplus is at the disposal of the United States Government. In short, the production of all major producing countries accessible to Britain and America is acquired by one or other of the two Governments.

The prices paid by the British Government to producers in Canada, Rhodesia and the Belgian-Congo are based on pre-war rates; they allow only minor additions for increases in production costs. As a result, the Ministry of Supply has been able to keep the British maximum price for copper since December, 1939, at the reasonable rate of £62 per long ton for electrolytic copper, delivered at consumers' premises, which compares with an average price of over £138 per ton in 1916. The American Government has recently been paying slightly over 11 cents per lb. for Chilean copper free United States ports, and the domestic price "ceiling" has been held at 12 cents per lb. since September, 1940, compared with an average price of 27.20 cents per lb. in 1916. As the accompanying table shows, production has shown a rising tendency since the outbreak of war; this is ascribed to the fact that virtually

all producers in Canada, Chile, the Belgian Congo and Northern Rhodesia are operating at costs which, despite increases since the beginning of the war, are on the average probably not much higher than half the prices they receive from the British and United States Governments respectively. These satisfactory profit rates—which in the case of the Rhodesian producers, however, have been reduced by comparatively low EPT Standards—together with a guaranteed market for the whole output, have had a stimulating effect on production. Supplies are being directed through the Government control organisations, that is to say, by the War Production Board in the United States and the Non-Ferrous Metal Control of the Ministry of Supply in this country, into the desired channels.

Essential though they are, further curtailments of civilian consumption—even if they touch uses so far regarded as indispensable—are not enough to meet the growing military needs of the United Nations. Nor is the remedy likely to be found in substitution; apart from the 40,000 tons of silver accumulated in the United States, the potential substitute metals are in even shorter supply than copper. Only additional supplies can help to reduce the present shortage.

In both countries an intensified collection of scrap metal has been initiated, and the United States Government expects to add approximately 300,000 tons of recovered copper to its supply this year. For this country comparable estimates are not available. In both countries, too, domestic metal production drives have been initiated; this will

hardly lead to a sizeable production in this country, which lacks major copper deposits, but offers substantial opportunities in the United States, especially as the American Government has introduced a production premium of 5 cents per lb. for any copper produced in excess of last year's output. The energy with which the United States Government is working to raise its copper production is shown by the fact, quoted in a recent speech by Mr W. L. Batt, the WPB's vice-chief, that 15 mines to-day supply 98½ per cent of the United States copper output, while over 270 mines, most of which are dependent on the production premium, are producing the remaining 1½ per cent. The United States Government is spending over \$180,000,000 on domestic copper developments, and private capital is supplying an additional \$40 millions.

The additional quantities which can be obtained in Great Britain and the United States, however, are far smaller than those which are likely to be obtainable from the young producing areas of America and Africa. The Canadian copper output will automatically increase with the huge nickel expansion programme now in full swing. In Chile, copper production can be expanded without difficulty, in view of the enormous ore reserves and favourable mining conditions, although production there has already passed the rate of 500,000 tons per annum. Actually the

recently concluded agreement between the United States and Chile, whose copper mines are largely controlled by United States mining concerns, aims at the maximum output, and besides guaranteeing the purchase of the whole of Chile's output, provides for the reconsideration every six months of the price paid to producers. In the Belgian Congo the newly formed *Direction de la Production Minière de Guerre* has taken charge of the copper development programme in order to raise production to its potential maximum, which almost certainly entails the resumption of the development work at the new Ruwe and Kolwezi copper deposit in Katanga, which was interrupted early in the war. In Northern Rhodesia, too, there is scope for considerably greater production through the full development of the N'Changa Mine, which was initiated in 1937, but, like the development of the new Congo deposits, was interrupted in the early months of war.

Less than two years ago it appeared that the war would hardly result in any new and major changes in the output and structure of the international copper industry. These calculations have been upset by the remarkable expansion in demand. The superiority of the United Nations over the Axis in copper supplies, already a crushing one, will be further raised by new expansion programmes, and will assist in securing a growing flow of munitions.

Finance and Banking

Another Circulation Record

Helped by some Government borrowing from the Bank of England, and by relatively small TDR payments, the banks have found themselves well supplied with cash during the past week. It has, however, been evident that they have preferred to use their resources by making additional loans to the market rather than in purchases of bills. The imminence of substantial transfers of tax money to Government accounts probably accounts for this decision. The discount market which obtained a 38 per cent allotment at last week's Treasury bill tender has therefore found little difficulty in taking up its generous quota of bills, though a small amount of special buying of bills was reported on Thursday. The Bank return reflects the prevailing conditions in the short loan market, and illustrates the factors at work. The rise in Government securities amounts to £5,115,000, while Public Deposits have been run down by £3,659,000. The main counterpart of these movements is to be found in a rise of £7,935,000 in bankers' deposits which have thus recovered to the comparatively comfortable level of £126,073,000. The recovery in bankers' deposits would have been more marked had there not been a further expansion of £1,158,000 in the note circulation carrying the total to the new record figure of £834,472,000. This extension of the holiday demand for currency is typical of the blurring of seasonal factors which has been evident since the outbreak of the war. The seasonal influences are still at work, but they operate beneath a strongly rising secular trend in the demand for currency, and in the case of the August Bank Holiday period there is no longer the concentrated impact of work stoppages and holiday spending which occurred before the war. Nevertheless, the effect of holiday spending has been clearly marked this year. The expansion in the note circulation over the three weeks embracing the bank holiday amounted to £19,216,000 as against a comparable increase of only £15,523,000 last year.

Dearth of Commercial Bills

The almost complete disappearance of commercial bills from the London discount market must not be taken as a reliable index of the reduction in the volume of sterling commercial bills being created. The reduction in international trade and the increasing extent to which the movement of commodities to and from this country is handled by one or other of the Ministries or other Government agencies have inevitably led to a considerable curtailment in the volume of bills drawn to finance import and export trade. But it is undoubtedly true to say that to-day a smaller proportion of the reduced volume of commercial paper being created finds its way to the discount market than was the case before the war. There are two main reasons. In the first place, the vagaries of the convoy system and the uncertainties which it has introduced in the duration of voyages to and from this country, have made it impossible to classify

any merchandise shipment within one or other of the normal tenors of a bill of exchange. The two or three or six months bill can no longer be expected to fit the approximate duration of the commercial transaction which it underlies. The practice has thus grown up for bills against shipments of goods to be drawn payable at sight after receipt of advice that the goods in question have reached their destination. Such bills are of indeterminate currency and thus wholly unfitted for normal negotiation in the discount market. The tendency is for the banks which first negotiate these bills in London to keep them in their own portfolios and not to rediscount them in the discount market as would have been the customary procedure before the war.

The second reason why such commercial bills as are drawn do not reach the discount market is to be found in the abundance of resources at the disposal of the banks in

this country and in the dearth of genuine commercial assets available for the employment of these resources. This factor is also in part responsible for the practice, mentioned above, of banks keeping in their own portfolios such bills as may come to them for negotiation. But the process has gone further. Although such a course would have been considered wholly unorthodox before the war, it has now become fairly common practice for accepting banks to discount their own acceptances and thus earn interest as well as acceptance commission. Where this occurs, it is, of course, but a step to cut out the acceptance credit altogether and replace it by a cash advance by the bank concerned. In other words, wherever acceptance houses are allowed to do so by the volume of resources at their direct disposal, they will lend their money rather than their credit, and in the process the discount market is deprived of even the meagre trickle of commercial paper to which the present volume of international trade should be giving rise.

Credit Still Expanding

The July clearing bank returns reveal that the trend towards expansion of bank credit is still in full swing. Admittedly, the total of deposits shown in the aggregate return is only some £1,000,000 above the June figure, but in making this comparison allowance must be made for two factors. The first is that the June figures relate to the closing

(In £ millions)

	July 1941	Mar. 1942	Apr. 1942	May 1942	June 1942	July 1942

Loans and Advances	853.4	837.7	821.2	810.7	800.3	795.9
Investments in affiliated banks	23.8	23.8	23.8	23.8	23.8	23.8
Cover for acceptances, premises, etc.	142.5	145.3	141.1	139.1	135.3	132.7
Total assets	3,230.8	3,315.7	3,321.1	3,368.9	3,497.3	3,495.6

day of the half year when the seasonal and artificial expansion of bank credit is at its highest. The second is that between June 30th and the July making-up days the amount of cheques in course of collection and items in transit decreased by some £28,000,000. To this extent, the element of duplication in bank deposits was reduced, and it follows

that the true expansion in bank credit in July over and above the abnormally inflated June 30th figure was in the neighbourhood of £29,000,000. The movements among assets show an exceptional redistribution of funds. The shift from bills to Treasury deposit receipts made further considerable headway last month, the former declining by £19,500,000 and the latter rising by £64,500,000. The fall in bills, read in conjunction with the increased allocations of Treasury bills to the market during July, explains the considerable sales of bills to official quarters which the discount market was forced to make last month. Perhaps the most surprising movement in the return is the further increase of £16,500,000 in investments. This movement owes its inspiration to no warships week compulsion and is an uninstigated response of the banks to the call of maintaining earnings over a period when credit was still expanding and when advances the most remunerative type of asset, were still falling. This last movement amounted to £4,000,000 over the month and left the total of advances some £172,300,000 below what it was a year previously, and £279,000,000 below the latest total of investments. The cash position last month showed its customary seasonal contraction after the June 30th window dressing. At £341,900,000, the total was some £12,700,000 below that for June 30th, and the ratio of cash to deposits had declined from 10.9 to 10.5 per cent.

Indian Troubles and Bullion Prices

For once, the outbreak of civil disturbances in India has left gold and silver prices untroubled. The Bombay bullion market has been wisely kept closed, and it is, of course, in that market that the most marked reactions to the disturbances would have been experienced. The latest quoted prices in this market were Rs 57.26 per gold tola and Rs 84.3 per roo tolas silver. These are way below the records reached when the threat of a Japanese invasion of India appeared most immediate, though they remain well above the London parities. Meanwhile, the London silver market continues to be exceptionally quiet and uneventful. A steady but modest, trade demand has to be satisfied, and when supplies of newly mined silver are not available to meet it, official sales of Indian Government silver serve to bridge the gap. These are still made at the "ceiling" price of 23½d per ounce and it is at this price that the metal is now regularly quoted day by day. Now that silver is quoted in the New York market at ½ cent above the Treasury's buying price of 35 cents for imported metal, rather more newly mined silver is being diverted to that market. With Burmese production out of the running for the time being, and with the difficulty of shipping Australian silver to this country, it follows that the satisfaction of trade requirements may come to depend increasingly on sales of official silver. Fortunately, London holdings are ample after their replenishment by shipments from India in 1941 and, in case of need, further transfers of the metal could readily be made.

Investment

India and the Market

The decisions of the Indian Congress Party, and the rioting which has followed upon them, have proved only a minor cause of disturbance to the stock market. Added to the steady advance of Germany into the Caucasus, they have proved sufficient to produce a generally weaker tone, but the falls are, so far, very modest, even in those Indian securities which would feel the full repercussions of any extended period of civil disobedience. Having regard to the fact that a resumption of the offensive by Japan may be expected any time after the end of the month, the attitude of the investor in local securities seems to argue confidence which contains a large element of optimism. More generally, the effect appears to have been felt most severely by fixed interest securities. According to the indices of *The Financial News*, the fall in these is of the same order of importance as that in equities. That is to say, it is much more marked than would be expected from the greater stability of the former class. Whatever may be the cause, it is the fact that the number of bargains marked in the Funds has fallen sharply, while the total from all sources has risen. This doubtless accounts for the fact that the market complains daily of a falling off in turnover. Evidently, such business as there is being left to the small man, for the average daily number of bargains, received in the last five business days, is a trifle above that for the pre-

ceding month. In war, sudden changes in the position are to be expected at any time, but, in the absence of some very favourable development, the immediate outlook is grave. Apart from the very slight general weakness, the only indication that the investor is adjusting himself to this is the recent demand for South American Government and railway stocks.

Setback for Savings

It would be foolish to overestimate the importance of the latest relapse in the small savings total. At £8,566,000 for the week ending August 4th last, small savings are, however, approximately back at the level of a year ago, when the week ending August 5, 1941, yielded no more than £8,564,000. The total for the past four weeks, at £38,019,000, is indeed slightly below that of the corresponding period in 1941, which amounted to £38,904,000. Moreover, last week's total is the lowest since the corresponding week of a year ago, with the exception of the setback in the Christmas fortnight. The small savings figures provide a unique statistical guide to fluctuations in national thrift, and it is becoming obvious that the end of July and the first week in August is an important seasonal trough, which even staggered holidays have not been able to obscure.

There is a strong probability that, within the next fortnight, the figures will begin to pick up again; that they will return to normal in September, and may rise to a high level in early December immediately before the season of Christmas disbursement. The latest relapse is not in itself a cause for disappointment or recrimination—indeed, it might have been forecast. But seasonal explanations are unfortunately not enough to dissipate discontent with the general results of the small savings campaign. The fluctuation is inevitable, but the absolute height of the totals since early April is very much at fault. It is a grave reproach that weekly totals are not in general above those of a year ago—that, since the special spurts engendered by warships weeks have ceased, the average is so far below Lord Kindersley's target figure of £15,000,000 weekly. The suggestion that the failure to increase small savings is due to the incidence of higher taxation on wages may well be true, but it provides no justification. In the face of rising incomes and a diminishing total of consumable goods, an ever higher proportion of personal income must be sterilised by one means or another. If voluntary savings are merely to act as a buffer on which taxation can draw, the aim of the campaign, which is to complement, and not to act as a substitute for, fiscal measures, is not achieved. There is no direct measure of the proportion of incomes which is neither taxed nor saved, but there is good reason to believe that, in spite of everything, this must have risen in very many cases during the past year. Some of it appears to be going into additional holding of notes, but more is probably used in raising prices.

South American Bonds

The latest member of the South American group of countries to resume debt service is Paraguay, which is proposing to commence, as from January 1, 1943, interest payments at the rate of 3 per cent on its two outstanding sterling loans. The interest is that agreed under the arrangement of 1924, which was carried out until 1932 as regards sinking fund and until July, 1933, as regards interest. The first interest payment to be made under the

new plan will be that for the January, 1934, coupon. The Paraguayan Government expresses regret at not being able to resume the full service, but the move is in the right direction, and monthly remittances are to commence forthwith. The Council of Foreign Bondholders urges acceptance of the offer and will, in due course, advise bondholders of any action they should take. The stocks in question are 3 per cent loans of 1886-96 and 1915, the total amount outstanding being some £650,000. The announcement is principally of interest as stressing the spread of the good effects of Anglo-American demands upon the Central and South American republics for war materials. The price of the two loans has recently risen from around 12 to some 22 points, and jumped a further 9 points on the announcement. At 31 the yield on a regular 3 per cent payment would be approximately 10 per cent, a sufficient indication as to the uncertainty of the outlook. The other recent feature of this market has been fairly active buying of Mexican bonds, in the belief that some arrangement may shortly be concluded. Meanwhile, there is a reaction in Brazilian bonds, which, however, still stand at anything from 50 to well over 100 per cent above the lowest of the year. Chilean stocks have so far experienced little recovery and there is no direct evidence that their position is greatly improved although the exchange position is eased, largely by increased exports of copper. The bonds of Argentina and Uruguay are in a class by themselves. The former Government is now offering an internal loan of 300 million pesos, running for 41 years and carrying interest of 4 per cent, with a 1 per cent accumulative sinking fund. The offer is open for ten days, at a price of 93.80 for the first five days and 93.90 thereafter.

Railway Capital Charges

In a note which appeared in *The Economist* on July 25th, the authorities were criticised for not having published the full terms of their agreement with the railway companies, with the result that holders of Transport "C" stock had been led astray as to the effect on their immediate prospects of the conversion of the TFA loan. This criticism was

Standing the test of fire!

"You will no doubt be interested to learn that another of your safes has stood the test of fire. A serious fire occurred at the offices of this Society last September. Although the intensity of the fire was sufficient to buckle the outer casing of the safe, the contents, mainly valuable papers and documents, did not show even the slightest trace of scorching."

From one of the innumerable letters testifying to the amazing fire-resisting qualities of Milners' Safes.

MILNERS

THE SAFEST SAFE INVESTMENT

MILNERS SAFE COMPANY LTD., 21, HAMPSTEAD LANE, LONDON, N.6 Telephone: MOUntview 6655

unwarranted. The particular point was covered by Article 4 of an Appendix to Statutory Rules and Orders, 1941, No. 2074. The relevant paragraph reads:

"Where capital is raised or redeemed by a controlled undertaking subsequent to the end of the base period, there shall be debited or credited (as the case may be) in the net revenue accounts of that undertaking the amount of the interest or dividend incurred or saved by the raising or redemption of such capital."

It is to be regretted that a matter of such importance should not have been included in the summary, and that little or no official action was taken to draw attention to the publication of the paper in question, which, in the difficult conditions of to-day, escaped the attention of both the press and the market.

Company Notes

Record Profits for Ford

As was to be expected from a firm engaged in the manufacture of tractors, the profits of the Ford Motor Company increased further last year. The increase is, moreover, far greater than that of 1940, and the new figure constitutes a record. Only a part of the increase is absorbed by larger EPT appropriations, and most other charges, including income-tax, are lower, with the result that instead of a debit of £37,321, there is a credit of £350,454, before bringing in the various amounts written back. This year the only substantial item brought back is £102,500, previously provided for war damage contributions, and no longer considered as being required, since it can be charged against any refund of EPT which may be payable after the war. Profits and appropriations of the past three years are set out below.

	Years ended December 31st,

† After bringing in from past profits £20,000 in 1939, £325,000 in 1940 and £108,671 in 1941.

NOTE.—The figures are in each case those shown in the report for the year, not the later adjusted figures which show minor changes only.

The figures include no receipts from subsidiaries, and the balance-sheet valuation of holdings in these is unchanged, although their value cannot be ascertained. The cash position shows a marked improvement on the year, stock in trade being up by £808,903, and total liquid assets—among which is included £178,374 for war damage contributions—by £2,390,043, while creditors are up by £988,752, and tax provision by £832,833. These calculations include the relatively modest inter-company debts. Bearing in mind that the results show no receipts from subsidiaries, both the immediate and the longer term outlook for the group appears good. This is reflected in the price of the £1 stock units of 26s. 6d. ex dividend, which gives a yield of only £4 10s. 7d.

Royal Mail Earnings

The announcement in March of a payment of 6 per cent in respect of 1941, against 5 per cent for the preceding year, suggested an improvement in the position, if not in the earnings, of Royal Mail Lines. The full accounts no longer disclose operating expenses, but they give tax appropriation as £175,000, after which there is a profit of £733,420 compared with £729,862. The rise is, however, more than accounted for by an increase in revenue from investments from £49,823 to £70,574. Depreciation of the fleet receives £360,000 against £345,000, while £253,000 against £100,000 is placed to fleet replacement, which draws £99,000 from other sources, presumably excess of realisation, of ships

lost or sold, over book values. Actually, the value of the fleet is up by some £583,800, after depreciation owing to deposits on new tonnage building. After the appropriations mentioned, the dividend is covered with a very modest margin, whereas last year £60,000 was written off investments, and some £118,000 added to carry forward. The cover for the ordinary dividend is 18.7, against 18.9. Creditors are up by almost £250,000, and loans down by nearly half as much, while rises of £1,523,319 in cash and £201,000 in investments are rather more than offset by a fall of £1,795,175 in debtors. Thus, the net balance is a trifle reduced, but it is held in more liquid form. The market value of the investments is some £33,000, or some 1½ per cent, above the book value. The GTR account is reduced from £317,825 to £309,336. The fact that earnings from operations were almost maintained, despite the fact that the fleet was operating throughout under Government requisition, is satisfactory, although the company does not appear to have done so well as some others. In his comments, Lord Essendon gives unqualified approval to the scheme for the acquisition by the industry of ships being built for the Government, and voices once more his opposition to anything in the nature of a National Fleet. The £1 stock units, at 22s. 6d., yield some £5 7s. 10d.

Watney Combe Reid Improvement

The full accounts of Watneys for the year to June 30th last fully bear out market expectations of a bumper brewery season. Total profits are some £300,000 higher at £2,694,492. The whole of the increase is not reflected in the rise in equity earnings from £694,934 to £848,860, since rates, taxes and insurance are up from £313,902 to £378,618, while repairs and depreciation require nearly £100,000 more at £347,833. None the less, there is a rise in the earned rate from 28.7 to 35.3 per cent, which amply justifies the payment of a 3 per cent cash bonus, making 18 against 15 per cent for the year. Property improvement reserve receives £250,000, against £200,000, and the carry forward is raised from £328,961 to £354,448.

The chairman, Colonel O. P. Sercolod, states that sales were higher during the year in question, but that the increase in duty imposed at the last Budget does appear to have restricted consumption. It is possible that this influence may prejudice gross receipts in the current financial period. For the present, total income still appears to be limited by the supply position, which remains inadequate to meet potential demand. The company has exercised its option to convert the whole issue of 5½ per cent debenture stock, 26 per cent of which has fallen to be taken up by guarantors. The new 3½ per cent issue will be redeemed by sinking fund purchases by 1968. The balance-sheet shows a sound liquid position, with beer, malt, hops, etc., up from £684,756 to £930,305, and cash holdings nearly £400,000 higher at £861,049. Debtor items and investments in gilt-edged securities are also slightly higher. Creditors and deposits are up by only some £300,000 to £2,562,666. Property improvement reserve has risen from £525,455 to £555,455 after a draft of £170,000 for special depreciation, and after the transfer from current profits, while there is a provision for deferred repairs of £280,000 against nil. The chairman suggests that the problem of restoring damaged property is concerning the management less than the problem of acquiring licensed premises in newly developed areas. The yield on the £1 deferred stock is £5 7s. 11d. per cent at the present price of 65s. 6d. ex dividend.

International Stores Earnings

The accounts of the International Tea Company's Stores for the fifty-three weeks to May 2nd show a further expansion in trading profit, the figures of the past three years being £794,662, £843,504 and £927,194. The chairman reveals that the last of these is after providing £60,000 for deferred repairs, but presumably repairs have, in earlier years, been carried out more promptly than is now possible. In each year, the increase is more than absorbed by rising tax requirements, including tax on dividends, but other charges show little change, and the dividend is maintained at 12 per cent in all, while the percentage earned on ordinary capital has risen from 23.5 to 24.8, and 25.2 last year. This permits in each year a contribution of £100,000 to reserve, and on the latest occasion an increase in the carry forward from £119,062 to £121,450. The consolidated balance-sheet shows a modest decline in fixed assets. No adjustment has been effected for damage to properties, provision having been made for war damage contributions. The excess of liquid assets over current liabilities is up by £178,568 to £2,468,853. Government securities are higher by £640,588, and stock in trade by £265,917, while cash and debtors show falls of approximately half these two sums, respectively. Although no benefit accrues to the shareholders from the expansion in profit, the fact that it arises from an increase in turnover is sufficiently remarkable, and is in direct conflict with the view expressed by Mr. Guy Collier, the chairman, a year ago. This, he explains, is due largely to food sent under Lease-Lend by the USA. It is also due in part to the additional week covered by the accounts. Mr. Collier has a good deal to say about the properties of the group, and points out that the specially created subsidiary, ITS Properties Development Company, has been wound up, and its assets reabsorbed by the parent on account of the legislation, "almost confiscatory in its effects on the owners of properties," which the war has brought. The report had no effect on the 5s. ordinary shares, which at 13s. yield £4 13s. 6d. per cent.

Great Universal Stores

Changes in the retail trade, for which war conditions are responsible, are proving definitely favourable to Great Universal Stores, which reports a rise in consolidated earnings from £489,001 to £685,602, and in the earnings of the company from £328,236 to £493,994 in the year to March 31st last. After an interim payment of 5 per cent, less tax, the directors are distributing a final dividend of

7½ per cent, tax free, so that the total ordinary payment is raised from 12½ to 20 per cent, less tax. Despite this increase, it is possible to place £22,000 to general reserve, against nil in the two previous years, and to raise the carry forward of the group from £32,744 to £72,378. The main increase in disclosed expenses is a jump in tax provision from £246,346 to £395,214.

	Years ended March 31,

<i>Earned %</i>	12.6	14.1	32.3
<i>Paid %</i>	12½	12½	20½

General Reserve.....	...	...	22,000
Carry forward:—			
Of subsidiaries.....	2,719	23,081	63,230
Of G.U.S.....	21,417	9,663	9,148

* Including shares of subsidiaries not held in the group. † Including change in carry forward of subsidiaries. ‡ 5 per cent. less tax, plus 7½ per cent. tax free. § On present capital doubled by bonus in 1940.

The secret of the improvement is not disclosed by the chairman, Sir Archibald Mitchelson, other than by reference to the wide geographical spread which the group possesses, and to its pioneer work in the production of utility furniture. It is clear, however, that war conditions do favour the chain store against the one-man shop, and, indeed, any form of retailing where quick turnover can still be combined with low profit margins, in spite of rationing. The consolidated balance-sheet shows little change in the movement of net liquid assets, which are up from £1,639,396 to £1,662,160. The company's balance-sheet shows a decline in net loans to subsidiaries and sub-subsidiaries from £403,617 to £347,496. Stocks of the group are slightly lower at £1,390,581, against £1,406,476, the decline being reflected in a rise in cash and gilt-edged stock from £299,884 to £519,702. The 5s. ordinary stock, at 12s. 3d., ex dividend, yields £8 3s. 3d. per cent, less tax, a level which does not imply great confidence that the present rate of dividend can be maintained.

Industry and Trade

U S Steel Mission

In pursuance of the policy of allocating the resources of the United States and Great Britain to the best advantage and of pooling technical information, the Combined Production and Resources Board has announced the appointment of an American Steel Mission to this country. The Mission is to make an exhaustive study of British methods of production control and allocation, of collecting scrap, and of the progress achieved in reducing steel consumption by substitution, simplifying design, eliminating wasteful machine operations and in curtailing civilian consumption. Further, it will inquire into the scope for an increase of production in both countries, how their steel-making capacity can be brought into better balance, what products can best be made here and in America, and whether it would be desirable to send more ingot steel and less finished weapons from America to Great Britain or the reverse. The wide scope given to the Mission is an indication of the magnitude of the spadework still to be done if the steel industries of the two countries are to be integrated for war. It is understood that a British Steel Mission with similar functions may be sent to the United States when the American Mission has completed its task.

Re-opening of Closed Shipyards

The urgent need for merchant ships has recently led to a recrudescence of criticism of the shipbuilding in-

dustry's decision to reduce excess capacity by the closing of redundant yards during the depression of the early 'thirties. The industry can hardly be blamed for not taking into account strategic needs which are the responsibility of the Government. In any case, as the Admiralty recently announced, twenty-three of the yards closed down by National Shipbuilders' Security, Ltd., have since been reopened, a few of them actually before the war. Some of the yards have been developed as separate ship-repairing establishments or incorporated in an existing repairing unit, and in twelve cases the old site is now in use for the purpose of building various types of craft, including vessels exceeding 10,000 tons deadweight. A further yard is now being prepared for the construction of the larger vessels and another is under consideration for reopening. The Admiralty pointed out that it has been its policy to provide additional berths and plant "in most ample time ahead of the likely labour supply." In fact, the main difficulty appears to have been a

shortage of labour rather than a shortage of plant and materials.

Coal Economy in Steel Industry

The problem of coal economy in industry has a particular as well as a general aspect, and there is a danger that the manufacture of war munitions itself may suffer from reduced supplies of suitable coals. At the request of the Mines Department, the British Iron and Steel Federation early this year investigated the possibilities of effecting improvements in fuel consumption, with special reference to the Sheffield area; in the report prepared by panels appointed to examine fuels, steam generation and utilisation, and furnaces and control, it is emphasised that while there is undoubtedly scope for economies, it is becoming increasingly essential to keep the industry supplied with the coals most suitable for the various processes of manufacture. A striking fact revealed in these reports is that it is common to find that 30 per cent, and sometimes even 50 per cent, of the steam generated is wasted after it has left the boiler stop valve, and that of this loss roughly 50 per cent might be attributed to worn or faulty valve gear. Suggestions have been made for the prevention of this leakage, and the view is expressed that "considerable economies, in most cases at least 10 per cent, would follow the appointment of a fuel officer definitely responsible for fuel control." In recent years, the industry has devoted considerable attention to the subject of the efficient utilisation of fuel, and large economies have already been effected. Thus, in 1913 the coal consumption of its blast furnaces was 21.2 million tons with a pig iron output of 10½ million tons, and that of other iron and steel works 10.2 million tons for a steel ingot production of approximately 7.7 million tons. In 1937, however, the blast furnaces produced 8½ million tons of pig iron with a coal consumption of only 14½ million tons, and steel and other ironworks 13 million tons of ingots and castings with a coal consumption of less than 9 million tons. It is complained, however, that since the war the task of maintaining production has been handicapped by a deterioration in the quality of coal supplied. The case is mentioned, and stated to be typical, where the coal delivered to the works contained at least 4,000 tons more ash per annum than before the war, involving a corresponding waste in transport and aggravating the labour problem. In the light of these and other considerations, it has been recommended that every effort should be made to maintain the delivery of such qualities of coal as have been found necessary in the light of long experience; that if the use of other fuels became unavoidable every endeavour should be made to inform consumers of the qualities of the coals allocated to them; that the commercial size names of coal should be rationalised; and that every effort be made to remove as much ash as possible at the pithead. Similar considerations apply to other coal-using industries, and it would appear, therefore, that in the future conduct of its economy campaign the Ministry of Fuel and Power must seek saving in consumption primarily and chiefly among the inferior classes of coal.

Unemployment

The number of unemployed registered at employment exchanges in Great Britain on July 13th was 107,005—825 more than a month earlier. The increase was accounted for by the greater numbers of men, boys and girls wholly un-

REGISTERED UNEMPLOYMENT IN GREAT BRITAIN

	Wholly Unemployed	Temporarily Stopped	Persons Normally in Casual Employment
June 15, 1942			
Men	54,097	1,846	2,994
Boys	8,669	15	8
Women	28,758	1,715	255
Girls	7,716	94	3
Total	99,240	3,670	3,260
July 13, 1942			
Men	55,953	1,710	2,173
Boys	10,163	18	7
Women	26,767	1,431	124
Girls	8,553	105	1
Total	101,436	3,264	2,305

employed. The increase in the wholly unemployed was 2,196, in spite of a drop of 1,991 in the number of women in this section. There was a substantial decrease, amounting to nearly 1,000, mainly among men, in unemployment among persons normally in casual employment. The increase in unemployment was concentrated in Scotland and in the North-Western region, with a slight rise in the Midland region. It may, therefore, have been due to local conditions prevailing on the day of the count which are not necessarily recurring. So far as boys and girls are concerned, the rise in the figures was due to the registration of school-leavers. Including women in the 1899 age group, who registered last Saturday, eight millions have now registered under the Registration for Employment Order. The Minister of Labour has made the Essential Work (General Provisions) (No. 2) Order, which consolidates previous general provisions Orders and amendments, and makes further regulations of minor importance. The Order has been applied to certain undertakings in the clothing industry. The Ministry has recently issued a leaflet on part-time work for women designed to stimulate the employment of women in this way and to encourage recruits. The reservation age in building and civil engineering occupations has been raised to 41, but it is not proposed to call up these men for the Forces at present for reasons given on page 201.

Retail Trade

The Board of Trade Journal for August 8th contains the retail trade report for June and the Bank of England's index numbers of the average value of daily sales. In peacetime, a fall in the index between May (if Whitsun falls in that month) and June of five to ten per cent is expected. This year the decline in the index (1937 = 100) was only from 109 to 108. The food component of the index declined sharply, from 119 to 111, and other merchandise moved in the opposite direction, from 98 to 106. Compared with June last year, sales of food and perishables rose by 4.2 per cent, and other merchandise showed a negligible rise of 0.8 per cent. The release of coupons for the new clothes rationing year caused apparel sales to rise from 101 in May to 116 in June. In May, 1941, the index stood at 124 and fell to 110 in June. Figures for various departments are shown in a table on page 224. Since last August the movement of the value of apparel stocks has been calculated and is given in the following table:—

	Dress Materials	Women's Wear	Men's and Boys' Wear	Boots and Shoes
1941 -				
August	100	100	100	100
September	99	104	103	103
October	97	103	102	103
November	94	103	105	107
December	90	90	97	90
1942 -				
January	82	83	91	97
February	82	87	94	97
March	95	93	95	98
April	97	97	94	91
May	99	102	98	98
June	95	103	96	80

The outstanding decline in stocks of boots and shoes may be due to the high level of sales. Compared with a year ago, the value of stocks of all non-food merchandise fell by 5.1 per cent. The only rises were in women's wear (1.4 per cent), fancy departments (5.3 per cent) and miscellaneous (0.7 per cent). The rise in value of fancy department stocks may be a reflection of the rise in prices rather than any increase in volume.

War Damage Repairs

In order to prevent haphazard reconstruction and non-essential repairs in blitzed areas, it has become customary, among local authorities, to make use of Section 7 (2) of the War Damage Act, 1941, whose object is to ensure that payments by the War Damage Commission shall have regard to the public interest. The usual procedure is for the local authority of a blitzed area to apply to the War Damage Commission, asking it to issue notices specifying upper limits to the expenditure on individual properties which it will re-imburse under the Act. Persons desirous of executing repairs exceeding the specified upper limit

(Continued on page 219)

COMPANY MEETINGS

UNITED SIA BETONG RUBBER ESTATES, LIMITED

RUBBER SUPPLIES TO THE U.S.A.

SIR JOHN HAY'S STATEMENT

The thirty-third annual general meeting of the United SIA Betong Rubber Estates, Limited, will be held in the Council Room of the Rubber Growers' Association, 19, Fenchurch Street, London, E.C., on Tuesday, the 18th instant.

Sir John Hay, in his statement to stockholders to be submitted at the annual meeting, briefly reviews the company's affairs and then proceeds to deal with the question of rubber supplies to the U.S.A. with particular reference to "The Truman Report."

THE TRUMAN REPORT

At the last annual general meeting I had occasion to say something regarding the special efforts that were then being made to increase supplies of rubber to meet the abnormal war demands of ourselves and our Allies, and particularly for building up a large reserve stock in the U.S.A. The fall of Malaya and the Netherlands East Indies was a contingency which was evidently regarded as too repellent seriously to contemplate and provide against, and consequently the measures taken for accumulation of stocks and for their conservation have proved inadequate to meet a situation under which we are totally cut off from the main sources of supply of rubber. This serious problem in all its military and civil implications has aroused widespread concern in the U.S.A., and has been made the subject of investigation by a Senate Committee, which has recently issued their Report come to be known as The Truman Report. According to this Report, the purpose of the Committee was primarily "fact finding, not fault finding." Its object was "to release to the public as much of the truth as possible without giving comfort to the enemy," in the belief that "co-operation of an informed public is much more important than the pretence of keeping from the enemy information so generally known in the trade." The Committee, no doubt by way of disposing of captious criticism, observes drily that "hindsight is always better than foresight," and after bringing under frank review the evidence heard, reaches certain findings.

Viewed from our angle in one particular respect, its findings seem rather less than fair. Unlike the other parties concerned, the International Rubber Regulation Committee and the British and Dutch Rubber Producers were singled out for special criticism without any evidence having been called on their behalf. Subject to limitations of space available and of the reticence seemingly to circumstances, I shall endeavour to answer very briefly the criticisms directed against us, and at the same time touch upon matters affecting the future of the rubber plantation industry. I hope, too, that I shall succeed in helping to promote further the Report's declared object, namely, "to release to the public as much of the truth as possible."

An American official testified before the Committee that from statistics that were available it appeared that in either 1940 or 1941 the railroads covered 25,000,000,000 passenger miles, the buses 15,000,000,000 passenger miles, while the passenger miles travelled by private automobiles were estimated at not less than 200,000,000,000. As Mr. Knudsen succinctly observes, it is truly a country where "everyone wants to go somewhere sitting down." Menton is also

made of an instance where, out of 30,000 employees in a factory engaged upon urgent defence work, only 350 travel by means other than automobile. What rubber means to the U.S.A. is aptly summarised in this sentence of the Report: "Rubber . . . cuts into the way of life of millions of our citizens." If we bear in mind that in addition to these enormous civil requirements there is the growing and urgent need for rubber in the manufacture of defence equipment, we begin to form some idea of what a rubber shortage implies to the U.S.A. in the present circumstances. The problem is not merely an economic one, but also has a social and political significance. And it is against that background we must consider with sympathy and understanding the matter of rubber supplies to the U.S.A.

The Truman Report states that the three principal causes behind the partial failure of the Stock Pile Programme were:—

1. The Quota restriction of the International Rubber Regulation Committee.
2. Failure to take full advantage of shipping facilities.
3. The most important reason. Industrial consumption was permitted to absorb most of the rubber brought into the country; the loss of vital stocks might have been prevented had there been a central authority to deal with the situation.

Shipping was provided and managed by the U.S.A., certainly as far as British territories were concerned, and therefore 2 as well as 3 are domestic matters, and they are admitted to be the main causes of the partial failure.

A REPLY TO CRITICISMS OF THE INTERNATIONAL RUBBER REGULATION COMMITTEE

As regards No. 1, it is stated that efforts were made by the International Rubber Regulation Committee to obtain "monopolistic profits for the Far Eastern producers at our expense," and, as a result, American stock piles decreased to very low levels.

Over the period June, 1934, to August, 1939—that is, from the commencement of the present regulation scheme until the outbreak of war—there was exported from all territories very nearly 5,000,000 tons of rubber at an average price per lb. of 7.35d., or 15 U.S.A. cents. The average cost of production to our own company over that period is calculated to be 9.83 U.S.A. cents per pound, including the cost of some replanting, but excluding any allowance for amortisation, and the average profit earned on the capital employed in the business was less than 6 per cent, out of which we had to provide for obsolescence and taxation and set aside the sums to reserve which general prudence dictated. The net average sum left for distribution to Stockholders was therefore extremely modest. To the average producer the result was much less favourable. If our efforts were to obtain monopolistic profits, then these efforts were indeed feeble, and failed lamentably in their purpose; but that, of course, was never our purpose. Our object was to equate supply to demand, to introduce a measure of stability into the price and prevent, if possible, the excesses of shortages and surpluses which prove so unprofitable in the end to producer and consumer alike. The criticism that might be directed against us was that in our eager-

ness to please our main consumer and to avoid giving cause for criticism, we kept the price at a level which was barely profitable to the average producer. There could be no dispute about the fact that the extent of the American manufacturers' stocks was a matter which they determined for themselves according to their interests, and had they chosen to increase their stocks rather than decrease them, more rubber would have been readily released at a moderate level of price.

But these are somewhat distant events, and I am more concerned to justify our actions under the grave circumstances of war, particularly from the time when America decided in 1940 on the policy of accumulating a stock pile against contingencies. To achieve the purpose as rapidly as possible, we sought by agreement to make only two simple conditions. First, to fix the price at such a level as would stimulate production from all classes of producers in all territories; and second, to remove apprehensions regarding the possible misuse of stocks should the contingencies against which they were being provided never arise. It is not only inaccurate, but also irrelevant, to state, as the Report does, that large plantations produced rubber at about 7 cents a pound, while the native could produce it at 3-4 cents a pound. To produce the rubber necessary for current requirements and at the same time accumulate a stock, it was essential to bring in every class of producer, whatever his category, and that could only be done by fixing the price at a level which was profitable to every producer. The price, in fact, was fixed at 18½ to 20 cents per pound c.i.f., despite the fact that prior to that it had risen to 25 cents. But for the fixation of price at this moderate level, the price under the increasing urgency of demand would have risen far higher. In other words, the effect of the agreement on price was to protect America against the rise which would have otherwise occurred, and not to protect the producer against a fall which, in the circumstances, could never have occurred. It is significant that since the fall of Malaya and the Netherlands East Indies it has been necessary to increase the price by at least 25 per cent. to the territories still operating under the scheme; but more significant is the statement made in the Truman Committee Report, namely, that on March 3, 1942, an agreement was signed by the Rubber Reserve Company and the Brazilian Government for the purchase of all Brazilian exportable rubber up to December 31, 1945, at 39 cents f.o.b., which is equivalent to more than double the price given to the Eastern producer, and in addition to that a system of bonuses has been established for production in excess of the given amount, and a fund of \$5,000,000 for the encouragement of production.

The extent of the stock pile and the time by which it should accumulate were matters which were quite naturally and properly settled by the U.S.A. authorities and were not determined by the Regulation Committee; but once determined and agreed upon, the Committee, backed by producers of all the territories, gave full support and willing and active co-operation. In the circumstances then existing in the producing territories, it was essential to succeed that approach to full production should be made by stages, but it was only after a lapse of a few weeks after the first agreement became fully operative that permitted export was raised to 100 per cent. A very important fact not mentioned in the Truman Report is that all decisions on the matter of export releases were made on the advice and in full agreement with the American representative on the Panel of Consumers. In the period December, 1937, to November, 1939, total exports from all territories were 1,891,000 tons, of which 925,000 tons were exported to the U.S.A., or 49 per cent. of the total. From December, 1939, to November, 1941, the period over which the stock pile was being accumulated, total exports were as high as 2,909,000 tons, of which no less than 1,880,000 went to U.S.A., or 65 per cent.

of the total. This enormous increase in volume of production and export was accomplished in circumstances of great difficulty, the details of which I cannot now enter upon. By way of example, I might mention that in our own particular case, out of a staff of 28 Europeans, only about 10 were available to us over long periods, the rest being on military training, to supervise the operations of a labour force of over 7,300 over an area of nearly 40,000 acres, and that at a time when the chief producing territories were subjected to recurring and increasing threats of attack, producing unrest and disturbance in the labour forces.

THE RUBBER REGULATION COMMITTEE VINDICATED

From the foregoing figures read in conjunction with the facts briefly mentioned here, the only fair conclusion that can be drawn is that in the time and circumstances production and exports were raised to and maintained at the highest level practicable, and despite the urgent demands from many other territories, priority was given to U.S.A. requirements. For participation in these efforts the producers registered on this side had no commercial reward, for any surplus profit was taken from them under the operation of the Excess Profits Tax. The spirit that permeated the industry was never one of "business as usual," but one of service to the common cause.

Despite the admitted "failure to take full advantage of shipping facilities," and despite the fact that U.S.A. manufacturing companies, in the words of the Report, "indulged in an orgy of consumption," described on another page as "sky-rocketing consumption for non-defence purposes culminated in the all-time high rate of over 900,000 tons per annum," the Truman Committee are able to report that the U.S.A. became "possessed of the largest stock pile of rubber ever accumulated at any time anywhere in the world," and claims with some justification, that U.S.A. "had exercised more foresight than its Allies." That this result should have been achieved despite such faults and shortcomings, and at such moderate cost, amply vindicates the International Rubber Regulation Committee and Eastern Rubber Producers. That result also served to demonstrate that the Regulation Scheme, too commonly but quite erroneously regarded as merely a device to restrain exports, possessed all the flexibility and adaptability suitable to rapidly changing demands, and that in this instance it was used as an effective instrument of expansion. Had not such a scheme then been in existence it would have been necessary to improvise one to stimulate production and direct exports. Such improvised machinery would have functioned with all the faults and deficiencies incidental to hasty improvisation, and would have resulted in less rubber being produced at greater expense from an industry seriously impaired by unrestrained and unregulated competition.

DEVELOPMENT OF SYNTHETIC RUBBER

The vital part which rubber supplies play in the fabrication of the modern implements of war made it imperative that as soon as there was any doubt of the continuance of regular and adequate supplies from Eastern territories, other sources should be sought. Sufficient is known of the limitations of supplies of crude rubber of other territories to make it abundantly clear that the rubber shortage could not be made good except by resort to the production of synthetic rubber on a scale never hitherto undertaken. The fall of Malaya and the Netherlands East Indies underlined in a dramatic way the need for carrying out such developments as speedily and on as large a scale as possible. The major part of the Truman Committee Report relates to synthetic rubber and brings under review past investigations, the measures now being taken to meet the emergency,

and stresses the need for speedy development and increasing production. It will be the earnest wish of every one of us that the energetic and active measures now being taken for producing synthetic rubber on a large scale will be entirely successful, and that in consequence neither the Allied war effort will be hindered or handicapped, nor essential civil needs denied because of a shortage of rubber. It should be appreciated none the less that success in that direction will create a problem which will confront rubber producers in the future when they are free again to resume operations in occupied territories. An opinion regarding the probable cost of synthetic rubber must necessarily at this stage be highly speculative. On that point the Truman Committee expresses itself thus: "We can expect that the cost of producing synthetic rubber will ultimately be lower than the average price we have been forced to pay in the past for natural rubber." Speaking before the Senate House in May last, the Hon. Harry S. Truman expressed himself as follows: "I am just as sure as that I am standing here, that if we go into the synthetic rubber programme as we should, and use all the brains which this country is capable of producing, when we come out of the programme we will have synthetic rubber which will be on such a basis that it will forever compete with natural rubber."

I should have liked from this point to have proceeded to consider this important and necessary development of synthetic rubber and its probable effect upon the Eastern plantation industry, but that is a subject which I must postpone until another occasion. I shall make only one final observation. I have too pleasant a recollection of the friendliness which was extended to me when I visited the United States in 1940 and again in 1941, to have entered upon a review of the Truman Committee's Report in any spirit of contention or even of debate. There is nothing unfriendly implied in a frank reply to criticism; on the contrary, I believe it is only by a frank exchange of views that we can reach that friendly understanding the maintenance of which is of such supreme importance in the present crisis and which will continue to be no less important if we are to co-operate successfully together in dealing with the many complex and difficult problems arising out of a war affecting profoundly all continents and every country.

MILLARS' TIMBER AND TRADING COMPANY, LIMITED

The fortieth annual general meeting of this company was held, on the 10th instant, at Winchester House, E.C., Lt.-Colonel Clive E. Temperley, O.B.E., M.C., B.Sc., presiding.

The following are extracts from the chairman's statement circulated with the report and accounts: The investment in our Philippine subsidiary is now in enemy-occupied territory. This stands in our books at £150,251, but a substantial part of the assets of this subsidiary being British Government loans and cash is in Great Britain and the United States of America. The Philippine subsidiary earned a very satisfactory profit during 1941, the best for several years, but in view of all the circumstances, no part of this profit has been brought into our accounts. The liquid positions of the company and its subsidiary companies remain satisfactory.

Taxation has again made a serious inroad upon the profits available for distribution to the shareholders. The exact liability cannot yet be determined, but an estimate based on existing legislation makes it appear that £110,000 will be payable, and provision for this has been made. Taking our business as a whole, trading so far in the current year has been fairly well maintained.

The report and accounts were adopted.

RICHARD THOMAS AND COMPANY, LIMITED

RESUMPTION OF ORDINARY DIVIDENDS

The ninety-third ordinary general meeting of Richard Thomas and Company, Limited, was held in London on the 12th instant, Mr E. H. Lever, the Chairman, presiding.

In his speech the Chairman drew attention to various changes on the balance-sheet designed to show more clearly the financial position. The balance of excess expenditure incurred many years ago at Redbourn amounting to £1,106,035 had now been written off against a corresponding amount from general reserve. In addition, the old coke ovens now demolished at Redbourn which last year stood in the books at £200,000 had been completely written off by supplementing ordinary depreciation by a special allocation of £100,000 and sundry capital profits.

The sum of £500,000 had been invested in the new Tax Reserve Certificates to meet accruing liabilities for taxes. Part of this amount had been provided by the realisation of the investment made last year in National War Bonds.

WAR DAMAGE LIABILITY

Full provision had been made for war damage liability which was substantially less than in the previous year.

The prior lien debenture stock and first mortgage debenture stock had been redeemed to the extent of £248,655 and £189,286 respectively. After careful consideration of the financial position the board had decided that it was not in the interests of the company to call up the unissued balance of the prior lien stock and this balance, amounting to £864,803, had therefore been cancelled.

No credit had been taken for any refund of Excess Profits Tax that might become due after the war.

With regard to the resumption of dividends the board hoped to continue the practice of paying the fixed preference dividend half yearly, and when this fixed dividend became cumulative at the end of the current financial year to make the payments thereafter on the scheduled dates October 1st and April 1st.

The board considered that the recovery in the financial position now justified a resumption of dividends on the ordinary share capital and they were recommending a payment of 5 per cent., less tax; the payment of this ordinary dividend would under the articles of association entitle the preference shares to a further dividend of 3½ per cent.

In conformity with war-time practice no detailed information could be given about the operations of the company, but so far as the current year's trading was concerned there was no reason to expect any marked change in the company's financial position.

GENERAL POLICY

It was the policy of the board to do everything possible to derive the utmost benefit from Ebbw Vale; despite war difficulties they had succeeded in materially increasing the output from that plant while maintaining quality of product and economy in production costs.

In the course of their present activities when the national interest seemed to clash with the immediate financial interests of the company they had not hesitated to put the national interest first.

With regard to the future the board considered it imperative that the company was to play its part in assisting post-war recovery of trade they must strengthen the financial position of the company and maintain strong liquid reserves.

He again desired to pay a tribute to the work of their managing director, Mr G. H. Latham, their deputy chairman, Mr J. E. James, and the directors and officials. To their staff and workpeople of every grade, he once again extended their grateful thanks and good wishes.

The report was adopted.

HUDSON'S BAY COMPANY

SUBSTANTIAL INCREASE IN REVENUE

The 273rd annual court of the Governor and Company of Adventurers of England trading into Hudson's Bay was held, on the 7th instant, in London.

Mr Patrick Ashley Cooper, the governor, presided, and in the course of his speech said: The revenue side of the profit and loss account totals almost £950,000, an increase of nearly a quarter of a million pounds as compared with last year. This figure is one of the largest, if not the largest, for revenue receipts in the history of the company. In the past such results would have been followed by the distribution of a large dividend, but in consequence of the times in which we live no less than £711,000 has had to be provided for taxation in the United Kingdom and Canada. This is in addition to the municipal and other taxes on real estate.

And now let me say a few words about the future. So far we have no reason to be dissatisfied with the current year; but it is only half way through, and the second half of the year is always more important from the point of view of our final results. The maintenance of profits at their present high level is, of course, unlikely, and whatever the profits may be the burden of taxation, so long as the war lasts, is likely to become greater rather than less.

There is, however, one overriding reason for my closing on a note of subdued and conservative optimism. Whatever may be the actual results of one year as compared with another, whether dividends are greater one year than they are in another, I believe

(Continued from page 216)

must first notify the Commission, which, in turn, will consult the local authority concerned to ensure that the proposed works conform to its plans and are in the public interest. Where permission is granted, the Commission is empowered to impose conditions about the nature of works, the materials to be used, and the time for their execution. The scheme is a flexible one in its application, for the upper limits of expenditure vary not only from area to area, but are subject to change within any given area. A local authority may even decide that no work should be done at all in any one area without prior notice to the Commission. Examples of its use were given by notices issued by the War Damage Commission in the *London Gazette* on July 31, in respect of the county boroughs of Tynemouth and Southamton. The notice relating to Southamton specifies that any person proposing to execute works for the repair of war damage, other than temporary works, whose ultimate cost will exceed £100 on any one hereditament, must first inform the Commission; it cancels a similar notice issued a year ago which fixed an upper limit of £1,000. The scheme enables local authorities to exercise effective control over repairs and reconstruction in their areas.

American Cotton Crop

The first estimate by the United States Government of the cotton crop for the 1942-3 season has caused surprise; the figure of 13,085,000 bales, with a yield of 266.7 lbs. per acre, is larger than expected, and compares with a crop of 10,744,000 bales last year. During the past few weeks very favourable advices have been received about the condition of the plants, but it was not expected that the official forecast would exceed 12,500,000 bales. The publication of the official estimate caused an appreciable fall in prices on the New York market. The Liverpool futures market has been closed for over twelve months; had it been open there would have been excitement and speculation, which might have had an adverse effect upon trade in yarn and cloth. Since the beginning of this year there has been a decided improvement in raw cotton stocks in this country. Although most of the larger imports have been Egyptian and East Indian descriptions, receipts from the United States have been more encouraging than for a long time past.

that never was the underlying position of the company stronger than it is to-day.

The report was adopted and resolutions were passed approving a dividend of 3 per cent. and a further 2 per cent. on the ordinary shares from the proceeds of land sales, and also the proposed further repayment of preference capital.

McDOUGALLS TRUST LIMITED

RECORD RESULTS

MR KENNETH MOORE'S STATEMENT

The ninth annual general meeting of McDougalls Trust Limited, was held on Wednesday, 12th instant, in London.

Mr Kenneth A. E. Moore (chairman of the company) presided.

The following statement by the chairman had been circulated with the report and accounts and was taken as read:—The operating company—McDougalls Limited—has again had a busy and successful year in spite of difficulties in connection with packing materials, transport, shortage of labour, etc. Up to the present they have been surmounted, but they continue to be a constant source of anxiety to the management and are not likely to grow less in the current year.

Once again all production, sales, and profit records were broken. The profit of £254,949 shown in the accounts of McDougalls Limited, is arrived at after making a substantial provision for Excess Profits Tax and contingencies, which is reflected in the increased figure appearing in the balance-sheet under the head of "Credi-

tors and Accrued Charges, including provision for current taxation and contingencies."

You will see from a note on the face of the balance-sheet that the accounts are subject to adjustment by reference to the terms of the agreement recently concluded with H.M. Government in relation to the control of flour mills. This agreement covers the three years ending September 3, 1942, but it has not yet been possible to determine the extent to which it will affect the figures of the last three financial years. Having regard, however, to the cushioning effect of the amounts already reserved for Excess Profits Tax and contingencies, it appears unlikely that the net profits of McDougalls Limited, as shown by the accounts of the last three years will be materially affected.

DIVIDEND MAINTAINED AT 10 PER CENT

It is for this reason that the directors have felt able to transfer to McDougalls Trust Limited, the same amount by way of dividends as for the six previous years. This enables the directors of McDougalls Trust Limited, to recommend that the total distribution on the ordinary shares be maintained at 10 per cent. for the year ended June 30, 1942.

Apart from the foregoing remarks the accounts do not call for any comment on my part. The figures reflect the great and useful activities of the business in keeping the housewife well supplied with McDougalls Self-Raising Flour wherewith to augment rationed foods by home cooking, and thus to maintain a palatable and satisfying war-time dietary.

The report and accounts were unanimously adopted.

Inquest on Rubber

The loss, by the United Nations, of their main sources of natural rubber, and the inadequate provision made for this contingency by the accumulation of stocks, and by the timely provision of synthetic rubber-producing facilities, have given rise to a good deal of concern. As usual in such circumstances, it has been asked why adequate precautionary measures had not been taken. In the United States a committee of the Senate recently carried out a special investigation to ascertain the causes of the apparent lack of foresight. In its report—the so-called Truman Report—the committee gave three major reasons: civilian industry was allowed to absorb too much rubber before Japan's entry into the war; insufficient use was made of available shipping facilities; the export quota system of the International Rubber Regulation Committee tended to restrain shipments. In a statement to the stockholders of United Sui Betong Rubber Estates, Limited, the chairman, Sir John Hay, who visited the United States in 1940 and in 1941 on behalf of the IRRC to discuss the terms of the agreements enabling that country to import large quantities of rubber as a reserve against a stoppage of imports, vigorously defended the IRRC's price and quota policy before Pearl Harbour. He pointed out that prices had to be fixed at a level which would bring forth the additional quantities of rubber needed to meet America's reserve requirements. True, the figure of 18½-20 cents per lb, c.i.f., was very profitable to the low cost producers, but British concerns, being subject to EPT, were not able to retain profits in excess of the pre-war level. Sir John Hay pointed out that in the absence of a fixed price the heavy demand for rubber before the war would have driven it up well above 20 cents per lb. So far as export releases were concerned, he said that these were made on the advice of, and in full agreement with the American representative on the panel of consumers. As Sir John Hay rightly remarked, the real reason for the failure to accumulate larger stocks is probably to be found in the fact that the loss of the whole of the far-eastern sources of supply was hardly contemplated. In any case, the search for scapegoats is an unprofitable one at this stage, when every effort should be made to avoid a shortage of rubber for essential purposes by eking out existing supplies of natural rubber and by speeding up the production of synthetic rubber.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

REPORTS of allied offensive operations in the Pacific tended to offset the news from Russia, while the measures taken to counter the Congress campaign in India helped market sentiment to improve after a rather dull opening. Markings were rather increased at around 3,300 markings daily. Prices were generally steady throughout most sections, apart from some weakening of stocks with Indian interests and a fall in kaffir issues at the opening of the week, main interest continuing to centre on industrial equities. The few changes in the gilt-edged market were small and without significance, activity in this section showing little improvement on the previous week's low level. The undertone, however, has remained distinctly firm throughout. In the foreign bond market, South American stocks were less generally strong, but support in the current week was sufficient to offset some light profit-taking in Brazilian and to raise Mexican issues appreciably. The announcement that payments were to be resumed on the Paraguay loans resulted in a sharp marking-up of those stocks, the 3 per cent issue jumping several points. The home rail market was without interest, and, in the absence of support, both junior and preference stocks tended to ease slightly early in the week, but midweek witnessed some slight improvement. Absence of any marked movement in the foreign rail market reflected the generally quiet conditions prevailing, while elsewhere Canadian Pacific ordinary was firm on quiet support.

preference and ordinary issues. Fine Spinners and Courtaulds all enjoying small gains, while Patons and Baldwins was outstanding with a rise of 1s. 3d. on the week. Stores shares were quiet without any particular feature, "Gussies" improving slightly on the annual report. Tobacco stocks were in demand, BAT rising 3s. on the week and Imps $\frac{1}{2}$ over the same period. In the miscellaneous section, both Brazilian Traction and International Nickel continued in favour, while "Emmies" and Dunlop were supported. Murex and Turner and Newall were both prominent, with good gains in midweek.

The kaffir market opened the week with a general decline on the rumour of the probable 10 per cent. cut in output, but some Cape support on a denial of the report later occasioned a rather firmer tendency. Tea shares were marked down slightly on the Indian news, although there was no pressure to sell. In the rubber market, conditions were dull, Labu losing $\frac{1}{2}$ on Tuesday while United Sua Betong eased $\frac{1}{8}$. There was a distinct improvement in the oil market after a dull opening, and leading issues reflected light support with small advances. Shell was firm, rising $\frac{3}{8}$ on the week, while Ultramar fluctuated slightly, but advanced 1s. over the same period.

Turnover in the industrial market was well maintained, markings averaging some 1,000 daily, while among leading equities prices tended upwards. Brewery shares were firm throughout, Guinness rising 1s. 9d. at the week-end, while Benskins and Distillers both registered rather smaller advances, although Watney deferred was subject to some realisation after the recent advance. Among motor issues, Ford improved on the annual report, but Rolls-Royce fluctuated narrowly. The heavy industrial section enjoyed a slight but fairly general improvement, Baldwins and Guest, Keen among others advanced, while colliery issues were also supported. Indian Iron, which weakened on the initial reports from India, partially recovered in midweek. The shipping group remained firm throughout, Clan Line advancing sharply at the week-end, while Cunard and P. & O. deferred both improved. Textiles issues were firm on continued support, both British Celanese

New York

In view of the critical situation in Russia and India and of the absence of definite news from the Solomon Islands, the general stability displayed on Wall Street is remarkable. At last week's close, markets were quiet and irregular, with turnover falling daily, but there was no land-slide in prices. This week has shown a firmer tendency with an increased demand for selected steel and rail issues, raising a number of prices fractionally. Technical conditions appear to favour a more general improvement, but this remains virtually out

COMMODITY AND INDUSTRY NEWS

Traction Gas Bags Standardisation.—The British Standards Institution has issued specifications relating to fitting valves and hose connections for traction gas bags. The object of standardisation is to ensure interchangeability between the connections on motor vehicles and on the supply pipes at filling stations.

E.W.O.—The Essential Work (General Provisions) (No. 2) Order, which is a consolidating Order, provides for some new principles. For the purpose of calculating wages in order to make up the guaranteed wage, overtime or Sunday work is to be

reckoned only to the extent of ordinary rates. Workers will not be disentitled to the guaranteed wage for the time spent in attending appeal board hearings if their appeals against suspension or dismissal are successful. If temporary employment is obtained between suspension or dismissal and reinstatement, any difference between the guaranteed wage and the amount so earned may be claimed by the worker.

Board of Trade Accountant.—The President of the Board of Trade has appointed Mr R. E. Yeabsley, who is a chartered accountant, to be his adviser on account-

of the question until the military situation improves. The basis of market sentiment remains a steady, if slight, investment demand.

August 15, 1942

(Continued from page 220.)

Food News.—For the next four-week food rationing period, the sweets and chocolate ration is to be raised from 2 oz. to 3 oz. a week. The output needed to meet this ration will be about half pre-war production. Biscuits will be added to the list of foods on the points rationing scheme, but the point value has not yet been announced.

Allocations of dried fruit and sugar to confectioners are to be reduced, so that the shipping space needed for the import of meat has been effected by ship without bone. The importation of milk and eggs in powdered form and the national loaf have also saved shipping space. During the coming year 80,000 tons of dried egg are to be imported; to produce its equivalent in eggs at home would mean importing over two million tons of feeding stuffs.

Mission to Moscow

THE announcement that Mr Churchill had flown to Cairo and to Moscow came as no surprise. The Prime Minister's wartime habits are by now well known. There had been many signs that Mr Churchill was on his travels again. The Germans themselves knew, in general terms, where he was and what he was probably doing.

But the Germans do not know what plans were laid by Mr Churchill and Premier Stalin in Moscow. This secret will not be revealed, to friend or to enemy, until it bursts into action. The objectives of the plans laid, however, are plain enough. The prime aim of Allied strategy in the next crucial weeks and months must be to dovetail supplies and operations so that Russia will be sustained, whatever may happen on the Volga, in the Caucasus or in the Far East. The goal must be to make whatever gains Germany may achieve Pyrrhic in character, and to render the sinister plotting of Japan abortive. Allied forces in the Middle East have their part to play by Russia's side, by the defence of Egypt and by co-operation in the defence of the Southern Caucasus. Mr Churchill and General Smuts met in Cairo. The entire Middle Eastern command has been remodelled. General Wavell, who commands in India and has commanded in the Near and Middle East, flew from India to Moscow. The products of Allied industry will nourish Russia until the tide turns, and after-

wards. The Allied air barrage, which has been acclaimed with such faith and fervour by British and American air chiefs in the last few days, will enfeeble the enemy in his vitals. Perhaps sooner than the most sober dare to expect, an Allied attack in all elements will strike to the Axis heart. It is a race against time, not between German weakness and Allied strength, but between German and Allied might.

Mr Churchill did not fly east to exchange assurances of victory with the Russian leaders. He went to Moscow at a moment of high danger and great difficulty. The pressing need is to ease the danger and lessen the difficulty. "Close friendship and understanding between the Soviet Union, the United Kingdom and the United States, in entire accordance with the Allied relationship existing between them," was expressed; both Governments declared themselves, surely needlessly, except as a reply to insidious Axis propaganda, "determined to carry on with all their power until the complete destruction of Hitlerism and any similar tyranny has been achieved." But the occasion of the meeting was, not these formal statements of what should be axiomatic, but immediate ways and means. This time there was no tantalising "pledge" of a Second Front. But no one, least of all the Germans, can be sure that the Second Front will not start

tomorrow, or indeed, every time the coast of Europe is approached, that it has not started already.

By going to Moscow, Mr Churchill has recognised in his own characteristic way the debt of the entire free world to Russia. He has affirmed the world's duty to support the Russians to the utmost of human endeavour. He has scotched the scepticism which said that co-operation between the Soviets and their Allies was halt and lame. He went to Moscow, in his own words, to "speak his mind," to lay the dust of any doubts that may still linger. It was a frank meeting; and the answer to charges that there is still no unity in Allied strategy is now unmistakable: Roosevelt, Stalin and Churchill are agreed—and the peoples of Britain and the United States are wholeheartedly with their leaders in their efforts to seize advantage, for Russia and all the United Nations, of the historic chance which Russian resistance and Russian suffering have offered. The Communist Party of Great Britain has stated that, after the Moscow conversations, it will intensify its campaign to rouse public opinion for the speedy establishment of a Second Front. But surely, if the British and Russian Governments have proved their accord and decided jointly, if secretly, on action, this is absurd. As the *New York Herald-Tribune* suggests, the Moscow meeting should put an end to "popular clamour-parades and pressure politics"—unless those who clamour and press believe that the meeting

ended in disagreement and failure. If this clamour does develop again, in any of the United Nations, and especially if it is expressed, in any of these countries, in quarters which are assumed to be informed or in organs which are supposed to be in touch with those who know, cynics will not be lacking to draw this melancholy, and unjustified, inference.

The task and duty of the leaders and commanders of the United Nations is to translate this majestic accord into joint action and success before the German bid to divide and win can score another triumph. There are difficulties and problems. Words and the best intentions are not enough. Each fighting Ally has still to work out the best means, in command, training and equipment, of welding land, sea and air power into a single decisive instrument. Distance, as well as time, is the Allies' foe. Mobility is the great need; mobility of men, supplies and weapons, to bring them with the utmost speed to distant fronts. Chungking has not yet been visited; but China as well as Russia must be held against the common enemy. At the top there is agreement. It is to the application of the common programme, in planning, in production, and in operations, that every energy and effort of ingenuity must now be turned. The will to find a way has been symbolised by Mr Churchill's visit, the first of any English Prime Minister, to Moscow. It is a will that can move mountains.

Odi Profanum Vulgus

"YOU must not ask a horse in blinkers for a wide view of the landscape." The words are Walter Bagehot's. It is the nature of interested groups to look first at their own special interest, and the agricultural industry is no exception. The report of the Scott Committee on land utilisation in rural areas, which was published a week ago, is not the impartial examination of the future of rural Britain that such a report should be. In effect, although the future of agricultural policy was not the Committee's province, it is a plea for the maintenance of a large, protected and subsidised agriculture—on a par with the proposals which have come from such bodies as the Federation of British Industries, pleading for the preservation of sectional claims and privileges. It is a prime example of the muddle-headedness which is the curse of well-meaning planners and the vice of vested interests. More disturbing, perhaps, even than the report itself, is the chorus of welcome with which it has been greeted. One member of the Committee, Professor Dennison, in a minority report, has attempted to face facts impartially; but, almost without exception, the press has preferred the comfortable words—and the nonsense—of the majority to the single voice of commonsense. It is not too much to say that the future of this country, urban and rural alike, will depend upon whether this report is remembered and worked into policy as the Scott or the Dennison Report.

The argument of the majority is simple and familiar. It is an unusually fine specimen of the "vague romantic flubdub" which has been noted before, in discussions of agriculture, by *The Economist*. Briefly, the thesis is that the Government is committed to the maintenance of an agriculture of at least the same size, in acreage, employment and output, as at present; and that, moreover, the farming methods used must be "traditional." The object of policy, it is claimed, should be to preserve the "traditional" amenities of the countryside, by which is meant the rural pattern which has been the product of the way in which the land has been farmed in the past. The "balanced" type of farming made necessary by the siege conditions of wartime is approved as a welcome restoration of old-time practices. It almost appears to be the belief of the majority report that, in the manner of farming, Britain must be kept perpetually at war, as it were, condemned, at whatever cost, to an endless self-siege.

It is true that the majority report states specifically that "much that we propose requires goodwill rather than money." This astonishing claim is due either to deliberate self-deception or to sheer incompetence of thought. It is the virtue of Professor Dennison's report that he makes this plain. The large and prosperous agriculture taken for granted by the majority report, at every stage of its argument and in every proposal it makes, could only be maintained at the expense, in large subsidies and high prices, of the rest of the community. If these assumptions about the future scale and character of farming were to become fact, the material standard of life of the entire community, including the farming section, would inevitably be kept below what it might otherwise have been. The essential fact about British economy, in Professor Dennison's words, is that

more food can be obtained by employing labour and capital in manufacturing goods which are exported and by importing food in return than can be obtained by using the same amount of labour and real capital in agriculture to produce the food directly.

It is a question of relative efficiency in the use of resources. The output of labour and capital is higher in overseas farming than in this country; the output of labour and capital is higher in British industry than in British farming—and no conceivable increase in efficiency, which is in any case impossible in the large traditional agriculture sponsored by the majority report, can alter these basic facts.

There are values which are not economic. Some people do argue, like Marshal Pétain, that it is "better" to be poor and rural than rich and urban. But this is not the Committee's argument. They assume that the nation can have it both ways, rural and rich, which is misleading nonsense. The people of this country have the right to be told how much is being asked of them, and what for. The nation can indeed have the swollen and protected farming which is asked for, but only in return for high prices and high taxes; only in return for an inferior use of a great part of the nation's resources; only in return for a lower standard of living. It is even possible for the large agricultural army which the majority envisage to be given high wages, good houses and improved services, but only at the cost of onerous subsidies and heavy charges upon every other citizen. But it is not possible for the nation to make the advances in nutrition which the majority report

itself desires by means of this protected, "museum piece," traditional, "balanced" and extravagant farming. For British agriculture to serve the needs of good nutrition it must be specialised not balanced, efficient not traditional. There is not a single thinking citizen in the country who does not agree that better standards of living for agricultural workers and those who live in the countryside are imperative. Villages fit to live in; community centres; access to the countryside; footpaths; national parks; open spaces; all these are aims with which every right-minded person must agree. The Scott Committee has done well to set them down. Higher wages, better housing and improved services must be first charges on policy. But all these can only be secured by means of a prosperous and efficient agriculture, small enough to carry its own weight—an agriculture, that is, in which the rural worker, without becoming a pensioner dependent on the charitable sacrifices of his urban neighbour (as the Committee, in effect, suggests), is individually well enough off to pay for better conditions and better services. If employment is deliberately kept artificially high, either wages will be low and living conditions poor or the community will be called upon to make prohibitive sacrifices in order to "preserve" the countryside.

There is only one reasonable policy for agriculture, economically and communally. That is for the Government to guarantee farm prices over a period, so that farming is not thrown into confusion by fluctuations. But, and this is the crucial point, the guaranteed prices must be so fixed that, in broad terms, the average price over a period is no higher, and the supplies available, from home and overseas, no less than they would have been in conditions of competition. With this aid, farming, like other industries, must stand on its own feet, small, specialised and efficient; it must genuinely pay its way. It has a right, and a duty, to be placed upon its feet. What is needed from an official committee is not this hotch-potch of vague and benign recommendations, which show not the slightest realisation of their effect on the British economy as a whole, but rather an authoritative inquiry into what extent, under what conditions and by producing what products, British farming can be made as productive as other, mainly industrial, uses of the nation's resources. Instead, the Scott Committee—partly because of its impossible terms of reference, which are based on the extraordinary idea that planning can be worked out piecemeal, section by section, in watertight compartments—has produced this anarchy of general statements about "the encouragement of industry and commerce, the maintenance of a prosperous country life and the preservation of amenities," all of them phrases which, when defined according to the Committee's assumptions, are either flatly contradictory or else mere verbiage. There is not a single sentence in the majority report which succeeds in shaking in the

slightest the rightness of the view once well expressed by Lord Astor and Mr Rowntree that

the aims of our agricultural policy should be to promote a happy marriage between nutrition and agriculture rather than to shut out overseas competition, to improve the conditions of the agricultural labourers rather than to increase their numbers, to treat agriculture as an industry or group of industries, possessing peculiar features indeed, but existing for the purpose of satisfying human wants with the minimum of toil, rather than as a way of life to be preserved with the minimum of change.

Change is the majority's bogey. They even wish to add physical protection to financial and fiscal protection; they have strong views about planning, their principle being, in effect that agricultural land must be left intact—that, even if fertile land can be used more productively for other purposes, it should be sacrosanct. Apart from this principle, although they sketch an elaborate planning machinery, they at no point make plain who is to plan and what for. They hardly agree that landowners or farmers should be permitted to alienate their land for non-agricultural purposes. They half believe that farm workers should be tied to the land. They wish to give the Ministry of Agriculture a veto on every planning scheme. They insist, when the transfer of farm land to other uses arises, upon the onus of proof being laid upon would-be users for non-agricultural purposes. Their thesis is a vast disservice to devoted planners like Mr F. J. Osborn, who have tried so hard to bring urban and rural interests together communally, on a business footing, which is the only possible basis for the finer and more spacious days which these friends of the countryside claim so speciously that they are planning to establish. Mr Osborn is told that industry must stay in the cluttered towns; or else, if garden cities or satellite towns are allowed, they must never be situated on the good land which alone would make possible practical and economic association between industry and agriculture. The whole process of conscious and collective action in national planning is compromised by such *bêtises*.

There is no malice in the special pleading of the Scott Committee. It is on a par with the attitude of Trollope's Miss Thorne, who always looked longingly back on her pseudo-Saxon forebears. It is antiquarianism of the worst kind. All industries are addicted to it. It is agreed by economists and statesmen that the objective of economic policy in the future should be "full employment." By full employment is properly meant the optimum use continuously of all resources, land, labour and capital, so that the maximum output and interchange of goods and services is achieved in the national interest. As Professor Dennison has pointed out

the essential point is that the full measure of economic progress and the improvement of standards of living

EQUITY & LAW
LIFE ASSURANCE SOCIETY

Established 1844

THE SERVICE OF LIFE ASSURANCE

● Life Assurance provides the means whereby your regular savings, year by year or month by month, may be converted into the form best suited to your needs. Provision may thus be made for your retirement, for the education of your children or for your dependants after your death.

● The service of Life Assurance cannot now be offered to you by personal approach owing to the absence of so many of the Society's staff on war duties. This service is, however, still available on request and will gladly be placed at your disposal.

Head Office: 163/4, STRAND, LONDON, W.C.2. Telephone: TEMple Bar 0381
(temporarily transferred from 20, Lincoln's Inn Fields)

City Office: 30, Coleman Street, E.C.2. Telephone: KELvin 5111/2

can take place only if, as technique and economic conditions change, resources are not deliberately impeded in their movement from uses which yield a small return of goods to those which yield a larger return.

The industrialists and farmers mean something very different. They mean simply the maintenance at all costs of the numbers at present on their pay rolls, an argument which is the negation of progress. As Professor Dennison points out, if it had been applied at any earlier point of time, it would have congealed and ossified all economic development and made impossible the growth of wealth and welfare by which the people now live. It spells stagnation.

The friends of the countryside are meeker and milder

than the spokesmen of industry. Their nature and intentions are good; in general terms, their objectives—better living conditions for the rural population—can be denied by no one. But they are bigots. When they think of rural Britain, their eyes sparkle, their hearts burn, their words whirl and their reason flies out of the window. They hate the common herd of townsmen and, if they can, would hold it aloof. They would mulct it and tax it to restore and preserve Merrie England; they would keep it in its crowded streets, except on sufferance or ticket-of-leave; they would even deprive countrymen themselves of the benefits of economic progress by insulating them in a sterilised fortress. It is a restricted and exclusive attitude which should be resisted à outrance.

Test in Africa

ONE of the compensations for the fall of Singapore has been the public interest it has stirred in the colonies. There has probably never been a time when there was less self-satisfaction about British imperial rule or a more genuine and widespread desire for a completely new outlook on colonial affairs. More specifically, this feeling has crystallised in the suggestion that there should be a Colonial Charter which would embody peace aims for the colonies in the same way that the Atlantic Charter embodies them for the rest of the world.

In a debate in the House of Lords last May, the Colonial Secretary showed himself sympathetic to this suggestion. But he made no concrete statement of policy on the Government's account. And the only references to the colonies in other Ministerial speeches on the post-war world have been a statement by Mr Eden at Edinburgh last May that the country must be prepared to make sacrifices for them and the declaration by the same Minister at Nottingham in July that "any form of assistance or guidance given to a country unpractised in the art of self-government must be such as to help it to achieve its own development."

These vague generalisations are unlikely to satisfy public opinion in this country or the advanced and politically conscious sections of the colonial peoples. But what is even more disquieting than this apparent vacuum in policy at the centre is the growing tendency in certain colonies to introduce measures which are the exact antithesis of what public opinion is looking for. The colonies of East and Central Africa are being drawn more and more into the war—militarily, by the Japanese threat to the Indian Ocean, economically, by the supply demands of the armies of the Middle East. Yet, the result has not been to associate the whole people of these colonies more closely with Great Britain in the war effort, to give Europeans and Africans a common basis for working together and to promote in both races a feeling of responsibility. Instead, the opportunity has been taken, whether unconsciously or not, to advance the interests of the Europeans.

The first sign of this attitude was the announcement last March that in Kenya and Northern Rhodesia conscription was to be applied to Africans to work on European farms. The safeguards to be adopted have already been discussed in *The Economist* (on March 14, page 352, and on April 4, page 462), and there can be no doubt that the local Governments and the Colonial Office honestly believe that conscription is necessary for the war effort and that it will not be harmful to the natives. Nevertheless, although the natives may not suffer, they can hardly be said to gain, whereas the benefit to the European farmers is obvious.

There might have been a better excuse for the imposition of forced labour on Africans if at the same time an attempt had been made to associate them more closely with the direction of the war effort in their colonies. Unfortunately, the very opposite is the case.

In Kenya, hard on the adoption of conscription for Africans came the announcement of the establishment of a Civil Defence and Supply Council with the object of speeding up decisions on urgent questions with the help of "unofficial" experience. The Council is presided over by the Governor, and the Attorney-General and the Financial Secretary are responsible for civil emergency services and manpower, and finance respectively. But the other members include a former managing director of the Kenya Farmers' Association—a European concern; Major F. W. Cavendish-Bentinck, a prominent settler, who is in charge of agricultural production; the managing director of the Magadi Soda Company; the managing director of a local motor concern; another settler who is in charge of supply; and an Indian who looks after Indian affairs. Not only is there no African on the council—it may justifiably be claimed that there is none suitable for the purpose. But there is not even a member specifically charged with African affairs. It is, therefore, most disquieting to read a report from the Nairobi correspondent of the *Times* in which it is said that "the Colony will watch keenly the progress of the experiment, which has the seeds of a political change valuable after the war." Once again, vested interests appear to be entrenching themselves in the name of wartime efficiency.

The new development is not confined to Kenya. In Northern Rhodesia, too, the Europeans are taking over executive posts. Here, the position is possibly more dangerous, for the Europeans support amalgamation with Southern Rhodesia, whose native policy is restrictive consequently, anything which puts them in a more powerful position is particularly regrettable. The influence of the Europeans had in any case been strengthened by the recent change in the electoral boundaries which added an electoral area to the copper belt. But though the number of unofficial members of the Legislative Council, representing the Europeans, was thus increased, there is still only one representative of the Africans. Moreover, that representative, a European nominated by the Government, has hardly identified himself with native interests. No very long ago he made a speech in the Legislative Council in which he defended Southern Rhodesia's native policy and supported amalgamation. He claimed with some justification, because in many ways he is an enlightened, progressive man, that much of his life is given up to the furtherance of the native cause. And yet, in the same breath, he declared that "it should be clear that the white man should be protected in this country from undue competition." He might have been quoting Sir Godfrey Huggins, Prime Minister of Southern Rhodesia, who said in his published statement on native policy that it is necessary "to protect the European standard from being pulled down by cheap unorganised labour and to prevent unfair competition." Thus the European member representing native interest in the Legislative Council of Northern Rhodesia. And

thus the Prime Minister and Minister of Native Affairs in the self-governing colony of Southern Rhodesia. Both are apparently convinced that the policy of segregation or parallel development is right both for the native and the European; it will prevent, they argue, the latter from degenerating, as the "poor white" has already degenerated, and it will enable the African to rise to the European level. But neither of them realises that a policy which is based on restraint of agriculture and restraint of labour, besides being inhuman—for it really implies a belief in the inevitable and permanent superiority of the white man—is contrary to the interests of the colony as a whole. As Dr. S. van der Horst points out in her detailed and valuable study of South Africa's native labour,* restrictive and discriminating measures reduce national productivity, impede the progress and growth in the wealth of the whole community, raise costs and, in general, prefer "the convenience of the present generation of the European population to the prospects for prosperity and peace of their descendants."

This conclusion about the failure of the Union's native policy is interesting in view of General Smuts's condemnation of it early this year, when he repudiated segregation, which he said had brought nothing but division and strife, and upheld instead the principle of trusteeship. Already before the war, the growth of secondary industry in South Africa had revealed the possibility of a shortage of labour, especially of skilled labour, in a country whose white population only numbers some two millions. The munitions programme, and performance, has intensified the demand for labour, and now the native worker in the towns is welcomed. It will probably be a long time before the white workers agree to the training of natives to become skilled and to competition on equal terms with themselves, but it is apparent that the Union's leaders have realised that their country's prosperity depends on the free and unrestricted use of its labour supply.

NOTES OF THE WEEK

Experiment

The objectives of the raid on the Dieppe area have been officially stated. Two gun batteries, an ammunition dump and a radio-location station were destroyed; more important, "vital experience" was gained in the employment of substantial numbers of troops in an assault, and in the transport and use of heavy equipment. Only part of the balance sheet can be made public. Losses, in men, equipment and aircraft were severe on both sides; but, even if only the known air losses are counted—98 German to 92 British—they are a striking contrast to the balance of casualties in the Battle of Britain. The final account, in terms of material, morale and experience, will be struck in secret by the High Command. The symbolic value of this raid, the largest yet, is plain. For the first time since Dunkirk, British tanks have been in action in France. For the first time for nearly twenty-four years, American troops—a token few—have been in action in Europe. After their long vigil, the Canadians, who formed the bulk of the landing force, have been given work to do. Inevitably, Goebbels has made clever use of the raid. He was probably successful in his efforts to present it to the German people as an invasion foiled—the French people were told by the B.B.C. from the outset that it was only a raid. But Goebbels and the rest must be worried. The descent on Dieppe was the most important link so far in a chain which began with raids on the coast of Norway. It will end with a great offensive who knows where.

Diminishing Returns

The law of diminishing returns asserts itself powerfully in offensive military operations. The pace of the German advance has slowed down on all the sectors of the southern Russian front. Even in the northern Caucasus, where Marshal Timoshenko has obviously not attempted to make a firm stand, the "mopping-up operations," as the

British colonial policy in East and Central Africa, therefore, is in process of being overtaken by General Smuts in the Union of South Africa. It is quite true that the latter's change of heart may have been induced by the necessities of war as much as by sympathetic considerations for the native, and in any case it is by no means certain that he has the country's support for a new native policy. But the developments in Kenya and Northern Rhodesia, and the Dominion Office's ready acquiescence in anything which the Southern Rhodesia Government proposes in its native legislation, can hardly be described as an earnest of a change of heart at Whitehall. Hitherto, British policy in East and Central Africa has been negative. In the interests of the Africans, it has opposed amalgamation between the Rhodesias and Nyasaland and it has attempted to be a bulwark between them and the white settlers. But no positive policy had been offered in return before the course of the war raised the well-known obstacles—and excuses.

It is probably true that at the present stage of the war far-reaching schemes of reform cannot be carried out. But even if they must be deferred for the time being, there is no reason why they should not be made known. The Government should first of all restate its adherence to the doctrine that native interests are paramount—this is necessary since there is a party in Northern Rhodesia calling for the abrogation of this doctrine—and its determination that the wartime expedients, which have interfered with it, will be abolished as soon as is practicable. Secondly, it should declare what it intends for the future of those parts of East and Central Africa still within its jurisdiction. There are, it is true, other parts of the colonial empire where the need for a policy is no less urgent than in the colonies of East and Central Africa. But it is there, caught between the reactionary views of the white settlers and the Southern Rhodesian Government on the one hand and the apparent enlightenment of the Union Government on the other, that the worth of the British people's new outlook on the colonies will first be tested.

Germans call them, have been prolonged. The Grozny oil fields have not yet been seized; and Novorossiisk has not yet been reached by von Bock's forces operating from the Krasnodar region. The strategic dilemma—whether or not to attempt a crossing of the Caucasus mountains—confronts the German High Command in an even more acute form than before. In laying their plans, the Germans will now have to reckon with the likelihood of close Anglo-Russian co-operation in the defence of Transcaucasia. The participation of General Wavell and of the Middle East Air Force chiefs in the Kremlin conferences was, no doubt, significant. Should the Germans decide to strike across the mountains, they might offer the Allies an opportunity to open up a "second front" in this theatre of the war—a prospect which may well deter them. Stalingrad remains the pivotal sector of the front, and here the defence has already proved incomparably stronger than anywhere else in the course of this year's campaign. There has been a slight German advance in the region of Kletskaia and alternating retreats and attacks around Kotelnikovo. The decisive phase of the fighting is still to come. Whatever the ultimate results of the battle of the Lower Volga, it is certain that Stalingrad will pin down von Bock's forces for a considerable time. Meanwhile, the summer is drawing to a close; and, in spite of all the territorial and tactical gains scored, the German High Command is almost certainly behind schedule in its attempts to force a strategic dénouement. The war of attrition in the East cuts both ways. For the time being, the drain on Russia's forces and resources is still heavier. This has again been illustrated by the recent official Soviet figures of losses sustained in three months' fighting. These have been more than 600,000 dead, wounded and missing, more than 2,000 tanks, 3,000 guns and 2,000 aircraft.

Latest Model

Once more the Middle East Command has been remodelled. General Alexander, with an outstanding reputa-

tion from Dunkirk and Burma, succeeds General Auchinleck as Commander-in-Chief. Lt.-General Montgomery becomes Commander, Eighth Army, in succession to Lt.-General Ritchie, who was jettisoned after the grave tank defeat in Libya in June. So the kaleidoscope takes yet another turn. First, General Auchinleck replaced General Wavell, then Major-General Ritchie replaced Lt.-General Cunningham in charge of the Eighth Army on the battlefield; then, again, on the battlefield, General Auchinleck himself took over from Lt.-General Ritchie. It is idle for any layman to speculate on the merits or demerits of all these chops and changes. Obviously, whatever advantages may have been secured must have been appreciably offset by the marked elements of discontinuity—which is in striking contrast to the long tenure of Rommel's command. The latest team is excellent. The Egyptian front and the hinterland in Palestine and Syria are vastly more important even than they were, now that the Germans are surging into the Caucasus. Obviously, the British aim in early summer was to clear this flank by driving Rommel back to Tripoli or beyond, before the German offensive in Southern Russia was set in motion. But Rommel struck first; he advanced into Egypt, and every effort to dislodge him from what seemed a precarious position has so far failed. The task of the new Commanders is not a light one. They have not only to defeat and destroy Rommel, but also to plan and time their blows and their disposition so as to give the maximum aid to their Russian Allies at the crisis of their stand.

Outlook in India

The past week's disturbances in India, though still serious, have been on a reduced scale. Unrest is scattered and sporadic. In the Central Provinces it has died down. Apart from Calcutta and Dacca, Bengal is quiet. The most disturbed area is still Bihar and the Madras Presidency. There is no sign of any mass movement of national revolt, and Mr. Gandhi's principle of organised passive and non-violent resistance has been ignored by the leaderless rioters from the outset. Nevertheless, Indian opinion of all shades remains concerned and anxious. Even those who agree that the Indian Government had stern measures forced upon it not unnaturally regard the reintroduction of the punishment of whipping as a deep humiliation. All sections, including members of the large Indian majority on the Viceroy's Executive Council, seem eager for a settlement in the direction of greater independence at once and full independence later. The Hindu Mahasabha has asked for a declaration of India's free and equal status in the British Commonwealth, and for the decisions of the Executive Council to be made binding upon the Viceroy—which is a crucial point. In its conference at Bombay, the Working Committee of the Moslem League was said to be considering a resolution to authorise Mr. Jinnah to negotiate with Mr. Gandhi for the formation of a National Government to conduct the war effort against the Axis, a condition which would be the acceptance by Mr. Gandhi of the partition of India into Hindu and Moslem States if a plebiscite of Moslems voted for it. The report has, however, since been questioned. The efforts of Mr. Rajagopalachari and Sir Tej Sapru to bring the various political factions together continue. There is talk in some quarters of a fresh offer from the British Government, and even of mediation by the United States. Plainly, both the United States and China, to say nothing of Russia, have an obvious interest in an Indian settlement. Such a settlement might well be made under international auspices. But, for the moment, this is not the immediate problem. In present circumstances Britain can neither repeat the Cripps' offer nor go back on it. The onus rests upon the Indian parties themselves. They must come together of their own accord to establish an agreement, including all the major political groups. This is the prior condition for any definite move, whether sponsored by Britain or by the United Nations at large, and it is a bright patch in the dark sky that efforts to achieve this seem to be in train.

Success in the Solomons?

There is still little precise news from the Solomons. The two restrained communiqués issued by Admiral Ghormley, Commander-in-Chief, South Pacific, show that the shore positions captured on August 10th have been held and developed and that heavy fighting is still going on. The scene of the battle is apparently the islands of Guadalcanar,

important for its potential landing grounds, Florida and Tulagi. The land fighting is being sustained by United States marines. There was a naval action on the night of August 8th-9th between surface vessels. Both sides sustained losses, but the action was terminated by an enemy retreat. This is, virtually, all that is known, yet even from this meagre information, it is already clear that the Allied attack is no mere commando raid. Fighting has now been in progress since August 7th, and, throughout this time, the Japanese have been on the defensive. If the Allied forces have succeeded in securing a bridgehead, the achievement is very valuable, strategically and psychologically. Mr. Fraser, New Zealand's Prime Minister, has pointed out that the fighting now in progress may well decide the fate of Fiji, New Caledonia and New Zealand itself. But more is implied in the Solomons battle than the curbing of the Japanese advance. The process of reconquest may have begun at last. Japanese pressure may well be diverted from China and Siberia. It is for these reasons that the Japanese are not likely to be content to regard the Allied attack as a side issue; they will almost certainly seek to exact a high price from the Allies for their progress. Meanwhile, the threat to Port Moresby has been renewed by a heavy raid on August 17th and by fresh fighting in the Kokoda area.

Mediterranean Warfare

The Admiralty have announced further details of the results of the attack on the Mediterranean convoy which last week succeeded in reaching Malta. The cruisers *Marchester* and *Cairo*, the *Foresight*, and the aircraft-carrier *Eagle* were lost, but it is estimated that at least 66 enemy aircraft were destroyed, and a number of E boats and U-boats were sunk. No details have been given of the losses of merchant ships which, in view of the extreme difficulties of the passage, can hardly have been negligible. Official circles describe the operation as a "limited success." The Germans had made wild claims of sinking or damaging the greater part of the convoy and its escort; the Italians also claimed their share of the glory, and Mussolini boasted of the "annihilation" of the British in the "Roman sea"; an Italian radio commentator, who admitted that the English fought with "courage, obstinacy and fury," implied that the brunt of the battle in the Western Mediterranean was borne by Italian forces. In the Eastern Mediterranean, a British naval squadron carried out an eminently successful operation against the Italian base of Rhodes, in which the defences seem to have been completely taken by surprise. The importance of holding Malta can be seen from the desperate efforts of the Axis to prevent reinforcements from reaching the island. The concentration of enemy naval and air forces in the convoy battle, which lasted for several days, appears to have been tremendous, involving large forces of torpedo-carrying and dive-bombing aircraft, packs of U-boats and numbers of E-boats, as well as a force of cruisers which never came into action. The attack again emphasises the importance of providing adequate air protection for naval forces—the lesson which emerged so disastrously from the sinking of the *Prince of Wales* and the *Repulse*—and the Fleet Air Arm fighters appear to have done remarkable work in repelling the enemy bombers. The Axis undoubtedly have a great advantage over the British in the possession of numerous shore bases for aircraft; Malta itself is isolated; and the losses sustained by the convoy can be primarily attributed to these facts. The price of holding Malta is high. But from the point of view of pinning down Axis planes and pilots, and as a base for intercepting reinforcements to Rommel, it is a price which must be paid.

Open Confession

The cat is out of the bag. It has been released by the agricultural correspondent of the *Times*. Last week the Minister of Agriculture spoke in Yorkshire about the importance of meat production. On Monday, the agricultural correspondent of the *Times* excitedly revealed how Mr. Hudson's speech had been anticipated by the farmers. The numbers of cattle, he boasted, have been fully maintained in most districts. It seems, he went on, astonishingly,

that farmers knew better than Whitehall when at one time they were urged to cut down their cattle, and somehow they have managed to carry them through.

Proudly, he told how the farmers had achieved this by using home-grown crops in place of the official rations of

feeding stuffs which were now prohibited for fattening cattle or sheep. The worst suspicions of those who have been sceptical about wartime agricultural policy are thus confirmed. Simply to maintain the number of cattle, food for livestock has been given precedence over food for direct human consumption; and this has been done apparently against Government orders. It cannot be too often stated that the best use of land and labour in wartime, as distinct from peacetime, is the production of crops for human consumption; it is certain that nothing can justify the use of acreage and crops simply to maintain livestock numbers. The consequence has been a greater demand for shipping to carry food imports; and, at a time when the shipping bottleneck is crucial for all the United Nations, this little outburst of praise for the wrecking tactics of the farmers is a confession of grave abuse on their part and a serious negligence on the part of the Government, which has failed to control the situation.

The Consumers of Coal

The distribution of coal consumption provides an indication of the cuts that have to be made by the various classes of consumers if supplies are to be available for all essential purposes. Before the war, in 1937, when 240 million tons of coal were produced, some 44 million tons more exported, a further 12 million tons more shipped for the use of steamers engaged in overseas trade and 184 million tons were available for consumption in the United Kingdom. Since exports and bunker shipments have already been cut to a minimum—they probably represent no more now than five per cent of current output—the economies necessary to achieve a balance between supplies and essential needs must be made at home, by industrial and other consumers. While there are no published estimates of the distribution of home consumption, it is possible, roughly, to indicate the rate of consumption by industry and transport, on the one hand, and by the remaining consumers, on the other hand. According to the White Paper on Coal (Cmd. 6364), issued last June, about three-fifths of the total output of coal is consumed by industry and transport, either directly or in the form of electricity and gas, leaving two-fifths for all other uses. In his report on Fuel Rationing (Cmd. 6352), presented to Parliament last April, Sir William Beveridge calculated that, by cutting non-industrial consumption by one ton in eight, ten million tons could be saved a year. This means that non-industrial consumption—in which Sir William included the use of fuel for the purpose of keeping human beings warm, clean, fed and lit in the places in which they live and in places, other than industrial, where they go to work, shop, eat, study or be entertained—was then running at the rate of 80 million tons a year, and consumption by industry and transport at the rate of 120 million tons a year. An overall cut in consumption of 7½ per cent, yielding 15 million tons a year, and a 5 per cent increase in output, adding approximately 10 million tons a year to supplies, would solve the coal problem. But in view of present trends in production, an increase in supplies during the next few months certainly cannot be taken for granted, to say the least. Consequently, if a serious maldistribution of the limited supplies likely to be available is to be avoided, cuts must be enforced now in all categories of consumption. To cut, say, 20 million tons off non-industrial consumption—or twice as much as Sir William Beveridge originally suggested—would involve serious hardship among civilian consumers. Clearly, industry, which uses three-fifths of the coal, must contribute to the saving required by improved methods of consumption and by the introduction of a system of allocation, foreshadowed in the Government's White Paper. That there is scope for substantial economies in industry without hampering war production or transport has been admitted by the Government.

Rationing Now

No statement has yet been made about the precise position in the coal industry, though the Mine Workers' Federation, after consultation with the Government on the rate of output and the state of consumption, regards the position as serious. Indeed, the inference from every fact which has leaked out about the coal position is unmistakable. Rationing is imperative if the war industries and the home fires are to be provided with sufficient fuel this winter. It was an extraordinary error of judgment which caused the Government to regard the control of coal production plus voluntary saving as an alternative to rationing. In fact, it was not an act of judgment at all, but merely a political

bargain. By next year, the control scheme may produce solid and satisfactory results in terms of increased output. But its effect is necessarily delayed. The important time is not next year but the coming winter; and, during the transition, when the control plan, with some needless lack of speed, is being run in, it is most unlikely that voluntary saving can achieve the cut needed or the fair distribution which is essential. The Mine Workers' Federation has re-proved its members for the fall in output per man employed, for their lack of regularity in attendance and for unnecessary stoppages. This is welcome frankness. It should be taken by the rest of the community as an indication, not that the miner alone is to blame for the present crisis, but rather that all consumers, industrial and domestic, in the country have also a vital part to play—a part which can only be played, with any guarantee of effectiveness, under orders, that is, by rationing.

War?

The news that five more Brazilian ships have been sunk by Axis raiders follows the announcement of the sinking of an Uruguayan vessel at the beginning of August. In both cases, public opinion was considerably incensed, and demonstrations have taken place in Rio de Janeiro and Montevideo. At Rio, President Vargas addressed the demonstrators, announcing that Axis ships and the property of Axis nationals would be impounded in compensation. The sinkings have aroused speculation throughout Latin America. There is wide recognition that the sub-continent as a whole is being driven steadily nearer to war, and that a decision to fight by the Brazilian Government would make the retention of neutrality, even by Argentina and Chile, the most neutral-minded of the South American states, much more difficult than at present. It has not been forgotten that Axis provocation, in the form of repeated sinkings, was the cause of the Mexican declaration of war. The total of the Brazilian sinkings now amounts to 19, and public indignation appears to be running ahead of the Government. In the circumstances, the decision to set up a joint United States-Brazil Defence Board is highly opportune. A further determining circumstance is certainly the progress of the Solomons fighting, which is being watched with keen interest throughout South America. If Brazil decides to take the plunge, there is, of course, no reason to suppose that the position in Argentina and Chile will be decisively affected. No doubt much hitherto inarticulate political feeling would be crystallised, and the demand in Argentina for intervention on the side of the Allies might be reinforced. But geography is as an important influence as internal politics. For the present, Argentina would remain a long way from the various fighting zones, and Brazilian belligerence might still be insufficient to break the political deadlock in Buenos Aires.

Norwegian Church Crisis

The Norwegian bishops have won a victory. The Church Department has announced that no more

LLOYDS BANK

LIMITED

EXECUTORS AND TRUSTEES

The appointment of individuals as Executors and Trustees imposes on them heavy burdens and duties which they are not always in a position to fulfil. Especially is this the case in wartime, when life is so uncertain and so many difficulties arise in the administration of estates.

When the Bank is appointed, continuity is assured and a Testator can count on his estate having the benefit of skilled and experienced management in the disposal of securities, the payment of duties and taxes and in the many other matters incidental to its administration.

A pamphlet giving terms and particulars will be sent free of charge on application to any Branch.

Head Office: 71 Lombard Street, London, E.C. 3

"Quisling" bishops are to be ordained. This is the culmination of a long and tenacious struggle by the clergy against the attempts of the Quisling authorities to regiment the Church. During the first months of the occupation, the Church was quiescent, relying on the assurances given by Terboven that the guarantees of religious freedom laid down in the Hague Convention would be respected. But, with the growing lawlessness, persecution and acts of violence perpetrated by the new regime, in particular the suppression of the courts of justice and the interference with the ministers' "pledge of silence," the Church could no longer hold aloof. In January, 1941, the Bishops of the Norwegian State Church sent a letter to the Department of Church and Education, demanding a clarification of the position of the Church vis-à-vis the state; no satisfactory reply being forthcoming, they authorised their letter to be read in all churches, which was done widely, despite the authorities' orders to the contrary. All seven bishops were deposed, and some, including the Bishop of Oslo, Dr Berggrav, were imprisoned. The great mass of the clergy resigned in protest, and only two out of 1,100 withdrew their resignations upon pressure by the authorities. A deadlock resulted; and, though the Quisling Government has nominated bishops and clergy to fill the places of the loyal clergy and has been busy ordaining new clergy from the members of the Nasjonal Samlung, the population has boycotted their services and sermons—and the Norwegian clergy have refused to accept directions, or even to open correspondence from the puppet bishops. The deposed bishops held a conference in Oslo last month and issued a manifesto instructing the local pastors to carry on, even if they had been deposed, and to pay no attention to the quisling leaders; it enjoins them to wear their clerical robes and to perform their usual offices; it tells the deans to keep in touch with their rightful bishops; and it lays down as a condition for the resumption of negotiations with the state department the recognition of the Church bishops, headed by Dr Berggrav. The lead of the Church is bound to have an important effect in stimulating the national opposition movement, already formidable and daily growing in strength. A pamphlet just issued by the Interallied Information Committee in London shows that the Norwegian clergy are not alone in standing up to persecution, but that clergy in nearly every country of Europe—whether Protestant, Catholic or Orthodox—are determined to resist the attempts to nazify religion.

Finnish Prospects

Of all Germany's allies and co-belligerents, the Finns must be among the most unhappy. The economic situation in Finland appears to be desperate. Already in December, 1941, the paper *Social Demokraten* reported that the country was threatened with starvation. A review of the Finnish press during the last few weeks shows that the measures taken by the Government to avert inflation, to control profiteering, and to safeguard food supplies, have not been successful. "Evidence of real hunger" is reported, with shortages of milk, fats, vegetables and fish; rations are "painfully small"; clothes and shoes are unobtainable; prices are soaring, and the prices of butter and milk have risen since the war by more than 100 per cent; there are "fantastically high prices on the black market," and profiteering in berries; shops and property have been looted by organised gangs of boys; the harvest may be ruined by bad weather and the shortage of labour to gather it in; political tension is said to be acute. It is no wonder that rumours of a separate peace are again prevalent. In May this year, President Ryti is said to have informed Berlin that Finland, in view of its heavy losses—estimated by the Nazis at one-seventh of the original strength killed, and many thousands wounded and missing—could not continue fighting. It is not known what promises were made, or what pressure was brought to bear upon the Finns, when Hitler himself visited Mannerheim in June; but they were apparently sufficiently tempting to induce them to continue. When M. Paasikivi was asked during his recent Copenhagen visit about the possibilities of peace, he said that the "question had been much discussed in Finland, but we see no chance of it." He added, plaintively, "If only the world would understand that we are waging our own fight for existence and nothing else." He is also quoted as saying that Finland had now recaptured the territory lost to Moscow in 1940, and as much additional territory as is considered "strategically necessary." It will be recalled that the Finns were informed last August, through Mr Cordell Hull, of Russia's willingness to

negotiate a peace, making territorial concessions; they have been pressed by both the Americans and the British to content themselves with the recovery of lost territory. Their reply was to dispatch their Foreign Minister to Berlin to sign the anti-Comintern pact. That Finland is not a free agent, and can have no independent aims and interests, apart from those of the Axis, is shown by the fact that Finnish troops are apparently now fighting on the southern front. It is true that this has been indignantly denied by the Finns themselves, and Field-Marshal Mannerheim recently declared that "Finnish soldiers would fight only in the north." But Finnish papers have admitted the presence of some "volunteers" in the Don valley, and the *Frankfurter Zeitung* has referred to the "endurance and persistence" displayed by Finnish detachments on the southern front.

Merseyside Dockers

Last week *The Times* published a report, based on the observations of a dock supervisor, which contained strong criticisms of organisation and labour discipline at the Liverpool docks. Mr Gibson Jarvie, the Regional Port Director, replied forcibly, protesting against the article and denying most of its charges, though he admitted they contained a "small element of fact." The report stated that the rate of absenteeism is very high; that many dockers work till they earn the guaranteed minimum of £4 2s. 6d. and not beyond; that, because control and supervision are loose, work-dodgers "get away with it"; that work is badly distributed among the stevedores; and that the Mersey Docks and Harbour Board has not kept pace with modern developments. A number of these criticisms are almost certainly exaggerated; stories of men coming drunk to work, knocking off to make cups of tea, leaving their jobs without permission and the like, tend invariably to be magnified into general statements from isolated instances that may actually have occurred. But it is hard to believe that there is no basis at all in the allegations, and it certainly seems that the facts of the situation should be impartially examined and made known. Mr Jarvie's disclaimers tend to be somewhat more forceful than convincing, and a further letter to *The Times* from three Liverpool supervisors has supported the criticisms of the original report. One reason for dissatisfaction among dockers is probably that the older men—the average age, according to Mr Jarvie, is 47-48—have not yet become accustomed to the new method of work. This is natural; and the opposition on Clydeside to the decasualising scheme was in itself symptomatic of the "conservatism" of dock workers. Yet the scheme has hitherto been held to be working well in Liverpool, where the recent "Honours Week" was alleged to have been a great success. The latest allegations are so serious, and the need for removing obstacles to efficiency and ensuring the maximum speed in turn-round of ships is so urgent, that an immediate investigation into the whole position on Merseyside by an independent and authoritative body seems essential.

The Middleman

Many merchants, brokers, dealers, factors and other types of middlemen have been, or are likely to be, squeezed out of business by the exigencies of the war. In many cases, their services are either not needed at all, or only to a small extent. For example, the recent decision to dispense with the grading of cocoa at ports, owing to the need for saving time in the discharge of ships and in the removal of goods from quays, has made redundant the services of the experts hitherto used by the Ministry of Food and deprived them of their remuneration. At the beginning of the war, the Government undertook to use the existing channels of trade in so far as that was compatible with the war effort. In the event, as the London Chamber of Commerce has pointed out in a letter sent to the Ministers of Food and Supply and to the President of the Board of Trade, the same type of trader may be reasonably employed and remunerated by the state in respect of one commodity and threatened with virtual extinction in trading in another. There is, of course, no reason why middlemen should be employed by the Government if they are not needed, and discrimination among them is no more iniquitous than it is among the rest of able-bodied men and women who are directed into the Services or other war occupations, often at considerable loss of income, and with no guarantee of reinstatement after the war. Like the Retail Trade Committee, in its second report, the London Chamber of Com-

merce suggests that the future of middlemen, driven out of business during the war should be safeguarded by "some form of licensing" giving them preferential rights of re-entry into the trade. The "closed shop" offers no satisfactory solution of the problem, which is by no means confined to middlemen. Britain cannot prosper under a resuscitated gild system, but only by providing full freedom to individuals to choose their calling, trade or profession. The real remedy for the distress of financial war victims—and it is a very serious fault that, in three years of war, no consistent attempt to apply a remedy has been made—is the adoption of the principle of deferred compensation, subject to immediate relief in necessitous cases.

Restraint of Trade

Restraint of trade thrives on wartime soil. All middlemen and merchants, to say nothing of manufacturers, hope that their reward for being at war, or the remedy for wartime distress, will be the right to close their occupation against newcomers when the war is over. The National Federation of Building Trades Employers has just appointed a committee to consider a statutory scheme for the registration of builders on what they call a qualitative basis. There is every sign that this body, like so many other similar associations in all sorts and kinds of trades, is hard at work producing the blue prints for a rigid gild system, with qualification tests, registration, control of trade—and probably control of prices—and all the other paraphernalia of restriction. It is a movement which deserves the closest scrutiny from everybody who has faith in the industrial and mercantile future of this country, because hopes will be rudely dashed if this kind of restraint is laid upon British enterprise. Restraint by no means always waits for an opportunity after the war. A trader in Lewes, selling from a hand barrow from door to door, presumably with the appropriate licence, has been told by the authorities that he must conform to a local traders' scheme for restricting deliveries; he must cease to push his barrow and stand motionless in some central place. Why a scheme designed to save petrol and rubber tyres should be turned to the peregrinations of a handbarrow is not explained; perhaps the leather control, to save boot leather, will finish off the Lewes trader altogether. It is obvious what has happened. The traders who drafted the delivery scheme are afraid that it may give an advantage to ambulant traders; hand barrows become "unfair competition." Shopkeepers have always disliked shopless competitors. Bakers resent the sale of bread in shops that are not bakers' shops. Coffee stalls are anathema. At one time in Bavaria, special taxes were introduced on hawkers and the vendors of bottled beer in order to protect shopkeepers and beer gardens. The war should not become an excuse for allowing these restrictive and self-interested practices to take root, let alone riot.

Third Party Law

The House of Lords recently gave judgment in the case of Miss Merle Oberon's chauffeur, and so brought to an end a legal episode which is perhaps as fantastic as any scenario in which Miss Oberon will ever be cast. The episode starts when Miss Oberon is being driven through London in her own car by her own chauffeur, Mr Digby. There is a collision in which Miss Oberon is somewhat seriously injured. She brings an action against the driver of the colliding car, and the court finds that both drivers were to blame—Digby to a very small, and the other driver to a very great, extent. As Digby was Miss Oberon's servant, his trifling contributory negligence prevented Miss Oberon from recovering any damages from the other far more blameworthy driver; but she had prudently included Digby as one of the defendants, and (as the defence of contributory negligence put up by the other driver was not open to Digby) she got judgment against him for the whole amount of £5,000. But could Digby pay? And if he could not, was he covered by insurers who could? That was just the question that came before the House of Lords. It was admitted that he had no policy of his own; but Miss Oberon's policy, in its third party section, covered the liability of any one who was driving her car with her consent, for injury done to any person. Digby argued that the words "any person" included Miss Oberon, although she was the policy-holder, and that, whenever he was at the wheel and she was a passenger, she had a dual personality, being (a) the insured party so far as

damage to the car was concerned, and (b) a third party as far as Mr Digby was concerned. If the car was smashed she was the insured. If she was injured she was the third party. In the Court of Appeal, he lost his case, and the General Accident, who had issued the policy to Miss Oberon, won. In the House of Lords, out of five judges, two were for the General Accident and three for Digby, so Digby wins on the post by a short head, and gets back his £5,000. The moral for motorists seems to be—never drive your own car, but get a friend or chauffeur to drive it for you. By doing this, you will always be in the position of a third party on your own policy, and one way or the other you get your insurers every time. You win impartially on swing and roundabout.

Shorter Notes

The Committee set up in April to consider ways of removing "the reluctance of juvenile workers to enter the coal-mining industry" has reported. National minimum wage rates for juvenile miners are advocated. Proposals are made for the comprehensive training of juveniles in working hours, at training centres and in production units. It is suggested that youths of 18½ in other industries, called for military service, should be able to opt for coalmining, and that attention should be paid to the upgrading of older youths.

The following table gives the number of civilian casualties in air-raids since September, 1940:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept. 1939-Aug. 1940..	1,407	1,624	3,031
Sept.-Dec., 1940	21,740	27,312	49,052
Total, 1941:—	20,520	21,451	41,971
1942:—			
January	112	61	173
February	22	21	43
March	21	13	34
April	938	998	1,936
May	399	425	824
June	300	337	637
July	368	803	1,171
Totals to date....	45,827	53,045	98,872

Of those killed in last month's raids, 167 were men, 160 were women, 40 were children under 16, and one was unclassified.

An announcement in a recent issue of *Le Temps* stated that henceforward the German authorities would not accept parcels of potatoes sent from people in France to prisoners of war. It is easy to read too much into news items of this sort from German Europe, but it does suggest, first, the miserable condition of French prisoners of war, since their relatives wish to send them potatoes; and, secondly, the strain on the transport system of German Europe, since the Nazis have been compelled to stop the traffic.

The result of South Poplar's by-election was a victory for the official Labour candidate, who obtained a majority of 2,834 votes. The election provided a good illustration of the unsatisfactory state of the electoral register and the apathy of those electors who remain, for out of a pre-war electorate of 46,000, only 3,916 turned out to vote.

AMERICAN SURVEY

Shortage of Metals (From an Industrial Correspondent)

Cleveland, August 6th.

THIS middle-eastern industrial province, seat of most of the steel industry, a large part of the aircraft industry, and what was once the automotive industry, now has to contend with a harassing unbalance in the supply of materials. This is in part the result of "too much too soon," and in part of failure to imagine in time the bites which war would take out of metal supplies.

The squeezes in materials have now gone considerably beyond the congestions and shortages which in peace time would have brought on, from the physical side, an industrial depression and stock market panic. Their correction is in the hands of the War Production Board, which is using various types of priority orders and quotas to smooth out the flow of the essentials. As the *Iron Age* says, "WPB frantically is attempting to restore order."

Several Ohio and Michigan plants have had to slow down their output, usually by shortening the length of the working week. The decision of eight Government agencies, including the War and Navy Departments, to recommend to industry the general return of the 48-hour week from such working schedules as 56 and 60 hours, is suspected by some observers of being aimed at bringing the fabricating industries in general into line with the supply of raw materials, especially of metals.

Donald M. Nelson, chairman of the War Production Board, won his long argument with Lieut.-General Brehon B. Somervell, head of the new service of supply, over the command of materials. General Somervell had held out for military prerogative in deciding the allocation of these materials. But Mr Nelson convinced him that certain civilian needs also had to be met, particularly the supply of industrial goods, and that the WPB should continue in charge. Supplies of consumer goods in metals, and a few other materials, have been or are being almost entirely suspended, but the turn in the European outlook led to the conviction that a diminution of industrial capacity could not be safely risked.

The output of agricultural machinery, heavily centred in Indiana and Illinois, is being cut from the 80 per cent of 1940 volume to 25 per cent. The programme of expansion in electricity generation is being cut 40 per cent.

The Causes

Contributing to the shortages and unbalances in the supply of metals, chiefly steel, are the following:

(1) The withdrawal of several millions of tons of steel for shipment to Britain, including the steel which would become mill scrap or "home" scrap if it were finished in this country, thus leading to shortages of steel on the finishing end as well as shortage of scrap. Among these exports has been a quantity of high-grade alloy steel for Soviet Russia.

(2) A continuing, though rapidly diminishing flow of steel into civilian goods, some of it non-essential.

(3) Unexpected efficiencies in the new munitions plants, including both the large works recently built west of the Allegheny Mountains, and former civilian-goods industries converted. Expectations for their output had been based in part on experience in Government arsenals, which had been making the same products in small quantities, and in part upon the estimates of the manufacturers themselves in taking the contracts. Most manufacturers sought to be conservative in their promises, and many of them overdid their modesty.

(4) Unexpected inefficiencies of a number of the sub-contractors, many of them marginal and poorly tooled, trained, or managed, these leading to delays in delivery of essential parts. (Several hundred of these plants will be closed.)

(5) A too-rapid accumulation of stocks of materials by concerns stepping up their production, and seeking to en-

large their stocks of materials to the former relationship between stocks and production.

(6) Overdue repairs in plants which have been running "around the clock" and on Sundays and holidays.

(7) Many incidental reasons, such as strikes and the growth of absenteeism among factory workers.

The demand for warehouse space has been inordinately great, not only for reasons familiar to the British, but also because of the existence of these surpluses. Some factories which cannot be converted to war production are now being used for storage, again as in Britain. Component parts of ammunition, artillery and other goods, which had been turned out far in advance of parts which go with them into the assembled product, are also being stored in these warehouses. Many acres of new warehouse space are under construction.

What civilian production remains, as in stoves and farm implements, is now being concentrated in nucleus plants, following the British example. In problems relating to manufacturing, the United States employs British experience in many instances, and in matters of price control and the like, Canadian experience, which in turn draws on British experience.

American Notes

Ham Fish Again

The renomination of Mr Hamilton Fish as a Republican candidate in New York and the success of a substantial number of other candidates with records of pre-Pearl Harbour isolationism were the disappointing, but not entirely unexpected results of the primaries held last week in five states, New York, Ohio, Nebraska, Idaho, and Arkansas. The returns have been interpreted in some quarters as a rebuke to the President and Mr Willkie. It may be doubted, however, whether registered Republicans and Democrats went to the polls with any clear idea of chiding the outstanding figures in both their parties. The case of Ham Fish is the most striking of all, and illustrates the weight of the influences opposing any radical reform of either party. Mr Fish was concerned in the trial last year, of the Nazi agent, George Sylvester Viereck, who, it was disclosed, had used Mr Fish's office and franking privilege, although apparently without Mr Fish's knowledge. Sensational charges were brought against Mr Fish only last week, when the *Washington Post* published allegations that he had accepted a secret \$25,000 dollars fee from the dictator of the Dominion Republic, General Trujillo. Mr Willkie had made an appeal for the defeat of Mr Fish at the primaries. The deaf ear turned by Republican electors was the result of a number of factors. The vote was light; only about one-third of the registered Republicans in the district participated. Those who troubled to go to the polls to support Mr Fish were probably swayed by some resentment of the interference of national figures in what was considered to be primarily a local matter. But even more persuasive was Mr Fish's devotion to the interests of his constituents over a long career in Congress. The ability of an assiduous Congressman to do small favours for his supporters, both in the dispensing of patronage and in other ways, is very great. There is also evidence of a generous disposition to pardon errors of judgment on the part of candidates, on the grounds that they were widely shared by the electors themselves. The main test, the November elections, may show something more inspiring than the apathy and indifference to the record that have characterised so many of the primaries. What the present contests prove most emphatically, in view of the fact that only one Senator and 15 out of 250 Congressmen running for renomination have fallen by the wayside, is the way in which the scales are tilted in favour of those who have had the opportunity of building up their position in office.

Storm Over Higgins

The Maritime Commission fell into a hornets' nest when it cancelled its biggest single contract for Liberty ships, granted to Andrew Jackson Higgins. The reasons put forward by the Commission were the shortage of steel and the fact that the new yards would not go into full production until 1934. It was argued that existing facilities were proving so efficient that no further plant construction was necessary to fulfil the shipbuilding programme, and that the steel required was needed for the ships themselves. According to the Commission, the projected \$60 million yard, on which \$10 millions has already been spent, would need "vast new facilities, such as shipways, shops, machine tools, railways, and transportation and housing for workers." The reaction of Mr Higgins—and his Louisiana Congressmen—was fierce enough to prompt a Congressional Investigating Committee to look into the case. The wildest allegations have been made: that the steel shortage was just a pretext, which would vanish if the big steel companies would allow the development of Southern ore deposits; that steel could easily be obtained on the black market; and that the decision was the result of racial prejudice, as Higgins was planning to use negro labour to a very large degree. In answer to the Commission's characterisation of the Higgins yard as that "with the highest cost per ship to be constructed under any of the Commission's contracts," Mr Higgins is reported to have said, darkly, "Perhaps the trouble is that we were going to build too many ships too cheaply." The resentment of Mr Higgins and New Orleans is understandable and his regrets are certainly shared by the Maritime Commission, which is under the strongest pressure to produce every possible ship. It seems likely that the enthusiasm with which the case has been taken up is based less on its merits than on the fact that it is a convenient stick with which to beat the Administration. There is singularly little proof of Mr Higgins's efficiency as a builder of big ships. His reputation was built up on the provision of small surf-landing boats and tank lighters for the British and American navies and stories about him dwell less on solid achievements than on the colourful tale of how on one occasion he closed off a city street without permission, and covered it with tarpaulins to improvise a workshop for a rush order of Navy lighters. His initiative and aggressiveness are unquestioned, but a record of three bankruptcies is not altogether reassuring. It is probably significant that the order for 100 Mars flying boats went to Henry Kaiser in spite of Higgins's attempts to secure it. But the main reason for the cancellation seems to have been simply a lack of adequate foresight last March, combined with faulty allocation and control of steel supplies; and it is little use crying over spilt steel.

Grey Markets in Steel

The most sensational development in the investigation into the cancellation of the Higgins contract for Liberty ships was the allegation that the firm had relied on "boot-leg" steel. Andrew Jackson Higgins, the New Orleans shipbuilder, who in March obtained a \$385 million contract for 200 Liberties, told a Congressional Committee that he had been offered steel from various sources for which he would not have to provide priorities. Instructing his son to name these sources, Mr Higgins commented, "We will kill the source of our supply, but the tallow might as well go with the hide." The War Production Board has hastened to assure the public that there is no black market in steel "as the term is popularly understood"; the steel in question had not been diverted from war production, but had been legitimately acquired by warehouses which should, of course, have reported the existence of their stocks to the proper authorities. This attempt to whitewash black markets will convince no one. The steel may not have been acquired illegally; but, at a time when war factories are shutting down for lack of steel, when lend-lease allotments are being cut and the Kaiser shipyards producing at less than capacity because of the shortage, the fact that supplies were being distributed outside the priorities and allocation controls cannot be explained away so easily. Nor does the explanation appear to cover all cases. The temporary injunction obtained by the Office of Price Administration against Willard Markle, a Cleveland steel operator, prohibits him from purchasing and reselling steel in excess of the OPA maximum price. The amounts involved may, of course, be small, but there appears to be more fire behind the smoke than WPB is willing to admit.

The Case Against the "Tribune"

Proceedings have now been instituted by the Government against the *Chicago Tribune* for having published on June 7th, a story that the US Navy had advance knowledge of the strength, disposition, and composition of Japanese naval units at the battle of Midway. The question at issue is whether the *Tribune* and its two satellite papers, the *Washington Times Herald*, and the *New York Daily News*, which also published the dispatch, are guilty of violating the 1917 Espionage Act. According to cabled reports, the charge is not so much that information was given to the enemy, as that the report contained indirect indications about the methods of American naval intelligence. The *Tribune* insists that its dispatch was based on expert deduction rather than secret information. Action against the accused group of papers is a delicate and explosive political issue for two reasons. Before Pearl Harbour, they followed an irreconcilable isolationist line and, since the declaration of war, their tactics have been consistently obstructionist and anti-Administration. A number of Isolationist Senators from the Middle West have already raised the cry that the Administration is using the Midway report as an excuse for suppressing opposition newspapers. A further complication is introduced by the fact that Colonel Knox, the Secretary of the Navy, was the publisher of the *Chicago Daily News* before he joined the Government. A denial has had to be issued to the charge that Navy releases were timed to favour the *News*, which received other unfair advantages; and the *Tribune* has even hinted that it was Secretary Knox's interest in its rival which led to the institution of the present trial. It is excellent news that the Government has not been intimidated by such scurrilous suggestions, and that the facts are to be investigated by a Federal Grand Jury.

rationing of sugar. In defence of its restrictions, the Food Rationing Division has announced that the object of rationing is to have sufficient supplies on hand on January 1, 1943, to guarantee the current half-pound a week for the first nine months of next year; it has, however, held out the hope that, if shipping conditions improve, bonus allowances of sugar may be granted. The campaign conducted by the industry has been vigorous and persistent, although it has never attained the acrimony surrounding petrol rationing. OPA rationed sugar at the manufacturers' level and to consumers with the aim of holding consumption to 5 million tons in 1943, on the grounds that only 5.3 million tons would be available. The anti-rationing bloc has been arguing, more and more loudly, that supplies in the USA and Hawaii, Puerto Rico and Cuba, instead of falling to that level, are in the neighbourhood of 8½ million tons; that warehouses are bulging and refineries operating at one-third of capacity because they cannot sell their stocks; that imports have been 100 per cent over what was expected; and that shipping—the heart of the problem—must be found to bring away the West Indies sugar crop, because failure to do so would have disastrous economic and political repercussions in the islands. On these questions of fact, the OPA has presented a strong case for its policy. What is harder to combat is the suggestion that the Administration rationed sugar unnecessarily as a means of testing the technique of distributing consumers goods in short supply; and the even more damaging insinuation that ration books were introduced as an effective means of bringing the war home to the American public. The case made out for rationing by OPA is that recent sinkings in the Caribbean make it impossible to count on supplies from that area; that in any case ships are needed for more urgent purposes; that supplies in the US are not as great as the industry contends; and that finally the bulging warehouses are not general, that in fact there are regions of real shortage, principally in Indiana, Illinois, and Ohio. As in the case of petrol, the scarcity is to a large degree the result of internal transport difficulties, and the bulging of warehouses is due more to the shortage of storage than to excesses of supply. To a certain extent OPA has undermined its own position by promising increases in the ration if shipping conditions improve. Allowances for jams and preserving are already generous; syrups and honey are un-

rationed; sweets are plentiful, and "invisible hoards" of housewives and industry are probably substantial. In view of the need for ships for other purposes and the fact that two-thirds of the American sugar supply must be imported, there would seem to be a strong case for husbanding available stocks.

Shorter Notes

William Dudley Pelley, leader of an American Fascist organisation known as the Silver Shirts, has been found guilty of sedition, and sentenced to 15 years' imprisonment in the Federal Court in Indianapolis. This was America's first major sedition trial of the war.

Two steps to expand steel capacity in the Western Hemisphere have been made known this week. Mr Henry Kaiser is constructing California's first steel plant, with a daily capacity of 1,200 tons; and an agreement has been reached between the United States and Mexico for a loan of \$6 million to establish a steel plant at Monclova, Mexico.

The War Production Board has announced that precision radio detection equipment is to be manufactured by the chocolate industry. The reasons given are that the plants are exceptionally clean, and the employees skilled hand-workers.

The meat shortage in certain parts of the United States, particularly the East, has become so acute that rationing of meat or meatless days may be necessary. The supply of meat is above normal, but consumption by the Services and the effect of higher incomes for workers has created regional scarcities, particularly in big cities. Even in Chicago butchers have had to close. An attempt is now being made by the Government to stimulate the consumption of cheese, milk, and poultry instead of meat.

Because of "unsafe conditions abroad," the Chicago and Eastern Railway has announced that its round-the-world tours are cancelled until further notice.

THE WORLD OVERSEAS

Iceland's Problems

(By a Correspondent)

August 10th

POLITICAL excitement flared up in Iceland recently. Before last January, there was a national government in power, formed by the three leading parties, the Independence Party (also called the Conservatives), which stands for complete independence from Denmark, but also for social reforms; the Progressive Party, which is primarily concerned with the interests of the farmers, and the Socialists. In January, the Socialist member Stefansson, a trade union leader, resigned as a protest against a law prohibiting strikes for the duration of the war. This changed the Government from a national one into a coalition of the remaining two parties, which had to face Socialist opposition when the Althing met on February 15th. At its opening, the Socialist Party proposed the amendment of the electoral law, which all parties, except the Progressives with their country constituencies, disliked because they considered themselves inadequately represented in the Althing. When the Socialists, therefore, introduced the amendment, they found they had the support of the Independents and of the Communists, who had three seats. When it was evident that the Bill would be passed, the Althing dissolved itself and the Prime Minister resigned on behalf of the Government, but was asked by the Regent to form a new Government after negotiations with the Socialists and the Communists. As their support was essential for the passing of the Bill, the Socialists and Communists agreed to give their neutral

support to an Independence Party Cabinet which undertook to pass the Bill, call new elections, and then have them confirmed at by-elections held according to the terms of the new law.

The present Government of the Independence Party is the first one this party has formed for 15 years; after its defeat in 1927, it had only taken a minor part in various coalition governments. It is headed by Olafur Thors, who combines with his Premiership the duties of Minister for Foreign Affairs and Minister for Communications. Professor Jonsson is Minister for Education and Minister for Commerce, while the offices of Finance and Justice are held by Mr Moller.

The most noticeable event at the recent elections, which were held according to the old system, was the substantial increase in the Communist vote. The elections showed the following results:

	Percentage of Votes Cast		No. of Seats
	1937	1942	1942
Independence Party	41.3	39.6	17
Progressive Party	24.9	27.6	20
Communist Party	8.5	16.2	6
Socialist Party	19.0	15.3	6

The Althing will be re-assembling in the near future. Immediately afterwards, fresh elections will be held in accordance with the new system, and another Government

will be formed. The new Government will have to cope with complicated questions, as, in spite of the present prosperity, the economic situation of Iceland is by no means secure.

Iceland's Lend-Lease

As Iceland's production is one-sided and its natural resources poor, the country needs machinery, materials for shipbuilding and ship repairs, electrical goods and building materials—in short, industrial goods in return for fish and fish products. It was, therefore, clear that as Great Britain needs Iceland's fish and fish-oil, concessions had to be made regarding British exports to the island. It was accordingly decided to include Iceland in the lend-lease agreement, so that Great Britain could re-export lend-lease goods to Iceland under a special agreement between Great Britain and the United States. Later on, when it became evident that in the long run Britain could not cope with the demand from Iceland, the United States agreed to buy the whole of the Icelandic fish catch until June, 1943, on behalf of Great Britain, and to pay for it in dollars, which could be used for the purchase of Icelandic needs in the United States. Icelandic requirements are, under this agreement, going direct to Iceland from America. This new agreement also covers America's purchase of the herring-oil production of Iceland, half of its cod-liver oil, and 25,000 tons of herring and other fish meal. The Icelandic authorities estimate that they will be able to sell 300 million kronur worth if the catches are normal. As a result of this agreement, there is a tendency for imports from Great Britain to Iceland to fall, whereas imports from the United States are increasing.

It cannot be denied that prosperity has also brought certain dangers. Insufficient taxation and inadequate control of prices have made inflation possible. The note circulation in April, 1942, amounted to 62 million kronur, compared with only 12 millions in April, 1939. The cost of living index for June was 183, compared with 100 in January to April, 1939. This index is based only on absolute necessities. The index for food alone was 226 in April. The price of home produce has risen much more than that of imported commodities. Meat has more than doubled in price, milk is about two and a half times as much, butter three times and eggs about five times the pre-war price.

The problem facing the Icelandic authorities is what will happen after the war. Iceland has lost a high percentage of its fishing and merchant fleet during the war and, being dependent on imports, is suffering from a shortage of tonnage. Wages are continually rising, and even youths of 16 or 17 are earning nearly as much in one week as their fathers earned in a whole month before the war. What will Iceland do with all those now working for the armies of occupation, and how will the increased cost of production affect Icelandic exports after the war?

Inflation in France?

[BY A CORRESPONDENT]

THE Vichy Ministry of Finance has recently resumed the publication of monthly reports about Treasury operations and the national debt which had been suspended since the outbreak of the war. The first figures, which were published in July, gave an account of developments during the first quarter of 1942. The total sum of the debt rose from 875,125 million francs on January 1, 1942, to 921,890 millions on March 31, 1942. During the same time the advances of the Bank of France rose from 227 to 241.5 milliard francs, that is, by more than 14 milliards. Thus, the actual debt increased from 648 to 680 milliards, or by 32 milliards.

The changes in the composition of the debt are very interesting. The irredeemable debt went down from nearly 54 to 44 milliards. The redeemable debt increased from 216 to 233 milliards. These changes are explained as the effect of debt conversion. The debt which is redeemable by annuities remained unchanged at about 57 milliards. Medium and short term indebtedness rose by 27 milliards, from 320 to 347 milliards.

The accompanying table gives the comparison between the French national debt as it was at the outbreak of the war (August 31, 1939) and the recent figures.

Comment is hardly needed to explain the significance of the figures. Newly created bank money and the floating debt have provided almost the whole of Vichy's credit—

445 milliard francs. The funded debt rose by no more than 32 milliard francs. The indemnity to the German occupation authorities was paid from the advances of the Bank of France. Consequently, the currency in circulation was nearly 310 milliards in June, 1942, about 135 milliards more than it was at the time of the armistice. In 1939, the medium term and floating debt accounted for only one-fourth of the total state credit; by 1942, they made up more than half. The inflationary trend of the whole development has become unmistakable. Only a high output and circulation of goods could prevent such an expansion of currency and short-term credit from exerting a strong inflationary pressure on prices. The French economy of scarcity, with its shrink-

	August 31, 1939 (in milliards of francs)	March 31, 1942 (in milliards of francs)	Difference (in milliards of francs)
Total Debt	445.7	921.8	+476.0
Bank Advances	36.0	241.5	+205.0
Actual Debt	409.7	680.0	+271.0
(a) Irredeemable	54.0	44.0	-10.0
(b) Redeemable	185.0	233.0	+48.0
(c) Redeemable by annuities	62.5	57.0	-5.5
(d) Medium and short term	107.0	347.0	+240.0

ing production and circulation of goods, can hardly preserve its equilibrium against the rising tide of money. The other brake on inflation—control over prices—has been strikingly ineffective in the hands of Vichy.

Until the beginning of this year, the Vichy Government benefited by the abundance of money. Rates of interest on all kinds of loans, long, medium and short term, were considerably reduced; and large scale loan conversions were effected. During 1941, the sum converted was about 50 milliard francs. A series of conversions has also been undertaken this year. It has affected the loans with a currency guarantee, the 1939 5 per cent *rentes*, the 1932 4.5 per cent Treasury obligations, obligations of the Paris municipality, Algerian Government bonds, and so forth. The

THE Works Canteen fills the need. Canteen efficiency depends on specialist experience. That is why so many front rank firms, as well as Departments of H.M. Government, employ specialist catering contractors who are members of this Society to operate Works and Staff Canteens.

NATIONAL SOCIETY
OF CATERERS TO INDUSTRY

83, PALL MALL, LONDON, S.W.1.

total sum of converted loans is expected to reach 100 milliard francs during the next months; and the Vichy press continually advertises the conversions as a great achievement in financial policy. It has, however, been difficult to conceal the discontent aroused by these measures among the broad mass of rentiers who have been hit by Vichy's "economy," at a time when the cost of living has been rising steeply. The reduction in debt service will amount to about 1 milliard francs at best—the cost of three days of occupation. There has hardly ever been a more scandalous instance of a penny-wise and pound-foolish policy; the pennies are being taken from the small rentiers and the pounds pocketed by the Germans.

It seems, however, that the plethora of money and the consequent easiness in obtaining credit has come to an end during recent months. There have been many symptoms that warrant the view that in the near future the Government will have to meet deficits and occupation payments more and more from bank advances, i.e. by direct money creation, than from actual credit. There are several factors which work in this direction. But the most important one, which has been discussed with much anxiety in the Vichy press, is a fundamental change in the distribution of the national income among the various classes of the nation. The proportionate share of the countryside in the national income has greatly increased at the expense of the town. This has nothing to do with any actual improvement in the economic position of the peasantry. The peasant cashes in higher prices for his agricultural produce, but he is unable to exchange his money against industrial goods. His purse is getting full only to conceal his actual impoverishment. But the impoverishment of the townspeople, industrialists, shopkeepers, clerks and workers is growing at a quicker pace, unhidden by pecuniary appearances. Until recently the industrialist was the main investor in Government securities and bonds. The supply of credit grew as stocks were sold out and could not be replenished, and as factories closed down or restricted their output. But this source of "freed" capital is drying up. The long and sustained boom on the French stock exchanges, which had lasted more than one and a half years, has—since the spring—given place to a general decline in quotations. The peasant, on the other hand, is an unwilling investor. Unable to buy industrial goods for his money, he prefers hoarding to investment; he prefers to keep heaps of banknotes—the

traditional money—rather than exchange them for bonds, the title to money. No wonder that the cry against the countryside's hoarding has recently grown very loud in Vichy's press. To induce investment by the peasants a special type of *bons d'épargne* has recently been issued on favourable conditions. The bonds are for four years, but in a number of cases (marriage, agricultural contingencies, etc.) they may be redeemed earlier; the rate is 3 per cent, tax-free; and in order to allay the peasants' suspicion the strictest secrecy of investment has been guaranteed by the Government.

On the face of it, the hoarding of banknotes by the peasants seems to contradict the inflationary trend. But the whole experience of currency inflation in peasant countries shows that money hoarding by peasants has itself frequently been nothing but a peculiar phase of inflation. Confronted with a scarcity of industrial goods, the peasant sticks to his banknotes as the real value for which he has exchanged his foodstuffs. For a time, hoarding veils the development of inflation; but, by reducing the amount of credit available, it forces further currency expansion. It takes some time before it dawns upon the peasant that his banknotes, too, are losing in value; and only then the critical point is reached; the peasant rushes to spend his money and thus adds—by de-hoarding—to the growing volume of currency.

Vichy's desperate appeals to the peasant's purse are not only a sure indication of the difficulties in obtaining credit which have recently arisen; they also point to the fact that France has already passed through the stage of a "normal" wartime inflation, and that it is now threatened by that type of inflation which was known to many European countries during the early twenties.

Bolivian Tin

[BY A CORRESPONDENT]

IN an article on Bolivia published in *The Economist* on July 25th last (page 109), reference was made to United States assurances regarding an increase in mineral prices. These assurances have now been followed up by an increase in the buying price for Bolivian tin ore paid by the United States Metals Reserve Company. When this company concluded its five years' buying agreement for Bolivian tin ore on November 4, 1940, the price to be paid for ore deliveries within the first year was fixed at 48.5 cents per lb. of fine tin. It was later raised to 50 cents, and it has now been arranged that, with retrospective effect from January 1, 1942, Bolivian producers should be paid at a rate of 60 cents per lb., which is 8 cents more than the current United States tin price "ceiling." As the British tin smelters in agreement with the Ministry of Supply undertook in December last to pay not less than the United States for their tin ore receipts from Bolivia, the higher US buying price automatically affects British purchases in Bolivia. Moreover, a price of 60 cents per lb. corresponds to a sterling price of roughly £335 per long ton, which is £60 per ton more than the Ministry of Supply's current selling price to authorised British buyers; it is not unlikely, therefore, that the revision in the price for Bolivian ore will sooner or later be followed by an increase in the British price.

The economic effects on Bolivia of the increase in the prices for tin ore are obvious from the fact that Bolivia is the only country in the world which is entirely dependent on tin. Normally, about four-fifths of Bolivia's exports consist of tin, and this proportion is likely to rise. For many years, Bolivia was the world's second largest tin producing area (Malaya being the largest), and not until 1936 did the Dutch East Indies succeed in wresting the position from Bolivia. Since the loss of Malaya and the Dutch East Indies, it has become the chief source of Allied tin supplies, and its prospective 1942 shipment of between 40,000 and 45,000 long tons will amount to roughly half the total Allied supplies of newly mined tin. Although all Allied tin-producing areas (Cornwall, Australia, South Africa, Nigeria, and the Belgian Congo) have started intensive tin production drives in recent months every ton of tin that can be obtained from Bolivia is urgently needed.

It is, therefore, important that Bolivia has extensive tin reserves which were estimated by the US Bureau of Mine in 1939 to contain about 500,000 long tons of metallic tin. Bolivia's maximum output so far was reached in 1929, when 46,338 long tons were produced. By a determined effort

Bolivia could exceed its 1929 output. There are, however, considerable technical difficulties in the way, and a high price for Bolivian tin ore is the preliminary to overcoming these difficulties.

Mining Problems

Unlike the rich tin resources of the Far East, which are found in the form of alluvial tin in low-lying soft ground, Bolivia's tin occurs in the form of narrow veins in siliceous igneous rock, found in some of the highest regions of the world. The Bolivian tin belt extends from the Peruvian border in the north to the Argentinian frontier in the south, and most of the mines are situated at heights ranging from 12,000 to 17,500 ft. above sea level. There are considerable transportation difficulties involved in getting the Bolivian tin down to the usual ports of shipment—Antofagasta and Arica in Chile, and, to a lesser extent, Mollendo in Peru. Most of the larger mines have road connections with the Bolivian railway system, which links up with the railways of the neighbouring states; but many of the smaller mines employ llamas for transport to the railheads.

But transport conditions are not the only difficulties of the Bolivian tin mining industry. In some areas, there is water shortage, and in all mining districts there are labour difficulties, especially as, owing to the difficult climatic conditions, only native labour can be employed and the supply of native labour was greatly reduced by the heavy Bolivian casualties in the Chaco war. Nevertheless, after having been stable around 25,000 tons a year from 1935 to 1938, Bolivian output rose to 27,215 tons in 1939, 37,940 tons in 1940, and 42,884 tons in 1941.

Under the new price agreement with the United States, a further rise in production is called for. So far the Bolivian signatories of the supply agreement with the United States, that is, virtually all producers, with the important exception of the Patino Mines and Enterprises, had been under the obligation to sell annually ore containing 18,000 tons of tin to the Metals Reserve Company. The new agreement is reported to refer to an annual minimum of 25,000 tons, but sets 30,000 tons as the annual target. As the Patino Mines, which in 1941 supplied 20,963 tons of tin, or virtually one-half of Bolivia's total production, have a ten years' agreement with the British smelters, under which the whole output of this group will be available for treatment in this country, the other Bolivian mines must raise their output considerably if they are to reach the minimum supplies promised to the United States.

The new price of 60 cents per lb. offers considerable profits to Bolivian producers, despite their high costs of production. As the United States Government has given priority treatment to shipments of mining equipment to Bolivia for some time, the shortage of materials is likely to be eliminated before long. The United States is also prepared to give Bolivian tin producers technical advice and assistance, but there remains one important obstacle—the labour supply position. Perhaps the ability of Bolivian mines to offer better wages may ease this, but it is doubtful whether this will overcome the difficulty.

Roads to Victory

Today two things stand out as vitally necessary for victory. [1] Increased output. [2] Restriction of personal spending to release labour and shipping.

We have ample evidence that both these aims are furthered by "Group Savings" in places of employment.

[a] Those who are saving do better work because they have the satisfaction of knowing that they are directly helping their friends in the Fighting Services, and

[b] As their savings grow they have a sense of increased security.

The development of the savings habit in itself tends to produce a progressive restriction of spending.

Time given to the development of "Savings Groups" far from being wasted, leads positively to a higher level of production.

I urge Managements to interest themselves individually in their "Savings Groups" and to give their active and sympathetic support—co-operating fully with Workers and Works Councils.

The National Savings Committee is always at the disposal of those who seek its help and advice, either through its Local Savings Committees, its Regional Offices or Headquarters.

The matter is urgent —
the time is now.

Handwritten signature
PRESIDENT,
National Savings Committee.

On Active SERVICE

The Canada Life Assurance Company reviews with pleasure a position achieved by its sound and progressive policy which, after 95 years of active service, is enabling it to maintain a traditional service to policy holders and to assist the war effort to the fullest extent. The following figures are extracted from the 1941 Report, a copy of which will be sent on request.

Total Business in force	-	£154,147,800
Assets increased to	-	£58,483,004
New Policies issued for	-	£9,014,184
Payments to Policy holders	-	£4,997,459
Surplus Funds and Special Reserves	-	£2,870,233

Incorporated in Canada as a Limited Liability Company.

Russia at War

Mr. Churchill's Visit

SOVIET press comments have added very little to the official communiqué about the Kremlin conferences. *Pravda* described Mr Churchill's visit as an "important landmark on the road to the further consolidation of the forces of the freedom-loving peoples." Recounting the recent history of British-Soviet relations, the paper reminded its readers that it was Mr Churchill who had acknowledged that "Russia's danger is our danger." The paper also recalled M. Stalin's words about "the feeling of gratitude in the hearts of the Soviet peoples" for the aid rendered to Russia.

These reminders were, no doubt, very timely. The campaign for the "immediate" opening up of a Second Front launched by the Soviet press after M. Molotov's return from London could, naturally enough, have no influence upon the course of military operations. But it probably had a harmful influence upon the mood of the Soviet people. It tended to let loose over-optimistic illusions, and impatience was liable to change into a feeling of frustration and suspicion towards the Allies. The damaging effect of the Second Front clamour on public morale in Russia was tacitly admitted by the Soviet press itself, when it stopped the campaign some time ago. For many weeks, there was no trace of the Second Front slogan in the columns of Soviet papers. Instead, the papers called up a feeling of supreme national pride; and the famous Russian writer, Alexey Tolstoy, compared the Soviet people's task in this war to that of Atlas lonely supporting the whole globe on his shoulders. Mr Churchill's visit must have dispelled any impatience and suspicion. It should also have lessened somewhat the feeling of loneliness of which M. Tolstoy's article was a typical expression. The wording of the communiqué on Mr Churchill's visit has given no ground for any renewal of the Second Front campaign; it contains no vague promises about matters in which only strategical considerations can count.

The Soviet press has so far not committed itself to any specific comments. Instead, it has given much prominence to the pro-Second Front campaign in Britain and the United States. The impression is that the intention is to reassure the Soviet public that, however the matter of a Second Front stands, there exists a powerful section of public opinion in the Allied countries which is working for the speeding up of an invasion of Europe. This is the implication of the press reports, which carry the explicit warning that for some time the Russian people have still to rely entirely upon their own forces. This warning was reiterated by M. Alexandrov, the head of the propaganda department of the Communist party, in his comment on Mr Churchill's visit.

* * *

Harvesting.—The harvest is now in full swing in most parts of Russia. Preliminary reports speak of this year's crop as a bumper one, in spite of adverse weather conditions in various regions. The expansion of the sown acreage in Eastern Russia, and particularly in the Asiatic republics, seems to have been considerably larger than was estimated before. No global figures, covering the whole of Eastern Russia, have been published. But some fragmentary data suggest an astonishing effort, and great success. M. Udasinov, the Vice-Premier of the Kazakhstan Government, has stated that this year Kazakhstan alone will harvest over 12.5 million acres more than last year. According to the 1939 census, the total area under various crops in Kazakhstan was 15 million acres; the increase is therefore nearly 85 per cent. Should this remarkable rate of agricultural expansion be typical, the prospects of this year's harvest may be much better than was expected. The difficulty in making any definite estimates is that no global figures are being published, and M. Udasinov's statement was the first to show such an enormous rate of expansion. In Kazakhstan, spring wheat accounted for more than half of the crops before the war.

How has this success been achieved? The Kazakhstan Vice-Premier's explanation, modest and matter of fact as it is, offers the Soviet version of "toil and sweat":

We are using all our resources, from combines to simple agricultural implements and our own bare hands, to gather in the crops.

The number of the "bare hands" has been greatly increased by the mobilisation of Kazakhstan's townspeople for farming. No fewer than 225 thousand town-dwellers of the republic have been working on the fields since early summer. Kazakhstan's agricultural machinery consisted (in 1938) of more than 25 thousand tractors, 9.5 thousand combines, and 11 thousand trucks.

Another glimpse into the effort made in the Soviet countryside has been provided by the *Pravda* statement that about 2 million teachers and schoolchildren alone have been mobilised for harvesting throughout the country. The call-up of housewives, clerks, etc., must have been not less extensive.

Much emphasis is laid upon the quick delivery of grain to elevators and collection centres. The delivery of part of the crops to the state is made right from the fields. Transport shortages are still prevalent, and special transport brigades have been organised by the farmers to cope with the difficulties. A special decree has empowered local authorities to mobilise for agricultural purposes 50 per cent of urban motor transport, provided that no obstruction to military traffic is caused.

* * *

The Volga Waterway.—The defence of Stalingrad is the defence of Soviet Russia's greatest inland waterway—the Volga. About 30 million tons of goods were transported on the Volga in a year in peacetime. The great Volga scheme provided for a development of Volga transport which would allow for an increase of the traffic up to 120 million tons. The scheme has till now been in its initial stages. Criticisms of the backward state of the Volga transport, as well as of the transport on other rivers, have been made very frequently by the Soviet press during recent years. Before the war, the average intensity of goods traffic per kilometre of river in Soviet Russia was about one-fifth of that in Germany, and less than a half of the intensity of French river traffic. In wartime, however, Russian river traffic has been greatly intensified; and transport on the Volga has grown more important because of the strained railway position. The Volga alone now carries at least 75 per cent of Russian water-borne freight (against about 50 per cent before the war). The main goods shipped in peacetime were oil (about 7 million tons), timber (about 14 million tons) and grain (more than 3 million tons). Since the outbreak of war, the river has also been extensively used for military traffic. The importance of the Volga's lower reaches, and particularly of the stretch between Astrakhan and Stalingrad, can be gauged from the fact that traffic from south to north has been twice as big as that from north to south.

The main harbour towns and industrial centres on the Volga are Gorky, Kazan, Kuibyshev, Saratov and Stalingrad. The industrialisation of the Volga region is illustrated by the following growth of the population of those towns during the Five-Year Plans:—

	Population	
	1926	1939
Gorky.....	222,000	644,000
Kazan.....	179,000	461,000
Kuibyshev.....	175,000	390,000
Saratov.....	219,000	375,000
Stalingrad.....	151,000	445,000

Astrakhan is the only Volga town which shows only a slight increase in population; it numbers about 253,000 inhabitants.

*

Oil Output.—The July figures for oil output have so far not mentioned any results for the Caucasian oilfields. A substantial increase in production outside the Caucasus has been reported. It is said that the total output in the "Second Baku" area and in Central Asia was 10 per cent higher in July than in June. The Buguruslan Trust alone recorded a 30 per cent increase. The oil refineries have made further progress in producing high-octane petrol for the air force; and special processes have recently been developed by which oil with a low-octane index is being turned into aviation spirit.

German Europe

Iron and Steel.—The reorganisation of Germany's arms industries is still continuing. This is a period of transition in the iron and steel and non-ferrous metal industries. Two points are obvious. First, the output of coal and pig-iron is insufficient to keep the production of steel at its present level during the coming winter and spring. Secondly, the present system of allocating raw materials had become an obstacle to changes in production programmes. The cumbersome system of allocation by quotas has now been replaced by a system of cheques in the textile, iron and non-ferrous metal industries. From October 1, 1942, onwards, there will be in use, in addition to textile cheques, iron and non-ferrous metal cheques.

The factory with which orders are placed draws the cheque and allocates material to sub-contractors. The Reich Co-operatives, which have partly absorbed the Reich Control Boards (which are departments of the Ministry of Economic Affairs), are technically an improvement over the Control Boards. The Co-operatives are a combination of industrial federations, cartels and parts of the state economic administration, and they cover whole industries. The Control Boards were concerned with one raw material; the Co-operatives deal with all the materials for a whole industry. The former General Commissioners for whole industries in the Ministry of Economic Affairs are superseded. Goering has dismissed General Hanneken, who had been commissioner for the iron and steel industry for five years, just as the commissioner for the coal industry was dismissed when the Coal Co-operative was set up at the beginning of 1941.

The shortage of coal and labour has set definite limits to the output of iron and steel in Germany and occupied countries; and the transport difficulties prevent the equalisation of the old and new industrial areas. This explains why the Minister for Armaments and Munitions has called up all iron and steel reserves by decree. The decree ordering the collection of iron and steel is a lengthy document of ten paragraphs; and it reveals more than any other decree how the different organisations are used for a concerted effort to deal with bottlenecks. The first paragraph gives an outline of the material to be collected:

1. Normal scrap available in factories, shops and agriculture.
2. Semi-manufactures of unusual measurements not likely to be used.
3. Castings and iron and steel which have already been machined for manufactures whose production has been stopped.
4. Manufactures which have been kept in stock as spare parts for the army, but which are no longer necessary because of changes in design.
5. Installations and machinery of closed down plants and factories.

These five points suggest, first, that there have been many changes in design; and, secondly, that the immediate demands of war production are to be met without any regard to the post-war considerations.

The industrial chambers in each district are responsible for the collection of scrap. Himmler has ordered the police to support the collection. For the transport of the material from factories to railway stations, the army and ARP services are being called upon. The labour for breaking up the material will be supplied by Russian prisoners of war. Not all the scrap will be melted down. Material that can be used in the coalmining industry will be put at the disposal of the mines.

The German press discusses the decree as a precautionary measure, largely designed to provide enough material for the winter 1942-43. Last winter, transport difficulties caused a serious falling off in the output of pig-iron. Ore and coal must be carried over great distances in Germany, and the unusual cold last winter stopped the transport of ore and coal on the inland waterways. The collection and transport of scrap is confined to the summer months when inland waterways can be fully used and when the railways are free from the transport of cereals and root crops.

* * *

Gas Generators.—Minister Speer has set up a Central Department for the adaptation of motor-cars for gas

generators. The main object of the new department is to speed up the changeover from petrol to substitute fuel. Lieutenant-General von Schell, the special commissar for the motor-car industry, who was responsible for the promotion of the use of solid fuel for motor-cars, has been relieved of this work. State Councillor Dr Schieber, from the Ministry of Armament and Munitions, will be the head of the new department.

*

Steel Machinery.—A decree issued by the special commissar for the machine-building industry limits the construction of installations and machinery for blast furnaces and rolling mills. The decree virtually prohibits the manufacture of any new designs. Recently, a great number of similar decrees have been issued, beginning with the prohibition of work on any engineering and constructional designs which are not needed for war industry. At the same time, the different types of machine tools and machinery have been reduced in almost every section of the engineering industry.

*

Fuel Engineers.—The Minister for Armaments and Munitions has decreed that all factories using great quantities of coal, gas and electric power must employ a fuel engineer, who will supervise the economical use of fuel and power. Besides the supervision of the boilers, the fuel engineer must prevent machines from running idle. Factories using gas or electric power will have to organise work in such a way that the hours of the greatest load on gas and electric power are not used for rush work.

*

Krupps.—The annual report of *Krupps A.G., Essen*, for the business year ending September 30, 1941, has now been published. The balance-sheet of Germany's greatest armament concern values total plant and machinery at Rm. 322 millions, against Rm. 192 millions at the end of 1938. This figure shows the tremendous expansion of the concern during recent years. Unfortunately, the profit and loss account cannot be compared with pre-war years. The depreciation and reserve policy indicates that there was a substantial increase in profits. During the last year before the war, the concern's steel output amounted to roughly two million tons.

Skoda.—*Skoda Pilsen*, the leading Czechoslovakian concern, reports that output increased considerably during 1941. The concern was mainly engaged on orders of the German *Wehrmacht*. Exports to European countries remained at the level of the previous years. Gross profits increased from Kr. 397 millions in 1940 to Kr. 627 millions in 1941. Tax payments rose from Kr. 74 millions to Kr. 147 millions during the same period. Capital expenditure amounted to Kr. 195 millions, against Kr. 169 millions in 1940, which shows that productive capacity has been expanded. Very few German concerns reported an expansion of productive capacity in 1941. It may be assumed that the Skoda Works have been expanded because they are situated out of effective bombing range.

*

Cartels and Prices.—In agreement with the Minister for Armaments and Munitions, the price commissar has decreed that a number of cartel prices must be reduced. Investigation into cartel prices has shown that price reductions are possible because of rationalisation and higher turnover. Reductions must be effected before December 1, 1942.

* * *

Fuel Rationing in Hungary.—For the period from May, 1942, to April, 1943, fuel for household consumption will again be reduced by from 20 to 30 per cent, compared with the period 1941-42. The coal ration for a two-room flat inhabited by three persons amounts for the whole year to roughly 7 cwt.

THE BUSINESS WORLD

Agency in Insurance

AMONG the many problems facing British insurers in the post-war world is the question of agency. There is a view that the present system of agency in insurance fails to give the public a standard of service in keeping with modern ideas. It may be taken as axiomatic that the more the practice of insurance is disseminated and the wider its scope becomes, the better it is for the community. The greater the number of risks the manufacturer or trader, by payment of a premium, can reduce to fixed costs, the better he can concentrate on the development of his business. The more hazards of life against which the householder, for a known outlay, can protect himself and his family, the better he can plan the outlay of his income. Compared with the position fifty or even twenty years ago, a tremendous amount has been achieved. But further progress postulates two things: education of the public to the security that insurance can bring; and ready access to a higher standard of professional advice.

The agency system must be explained in terms of history. Like so many English institutions, it has "just grown." In the early days of insurance, it was rare to find an office transacting more than one of the then known classes of insurance—marine, fire and, later, life—each of which was exceedingly simple in operation by comparison with the complexities of to-day; and originally no agents were employed. But, from about the beginning of the eighteenth century, fire and life offices began to enlarge and broaden the scope of their operations by establishing agencies in provincial centres. Since the volume of available business did not justify full-time representatives, it became the custom to appoint as agents persons in other walks of life who, by their daily work, came into contact with prospective assured. An auctioneer might be an eminently suitable representative for a fire office or a banker for a life office. For a modest 5 per cent of premiums, the agent undertook a host of duties, including such matters as attendance at fires and assistance in extinguishing them and the selection of lives for life assurance. This system lasted until after the middle of the nineteenth century. Then, with growing technical requirements, resulting largely from industrialisation and the progress of actuarial science, local managers began to take over some of the agents' functions in the more populous areas. The agents became little more than media for introducing business and collecting premiums. There were only two exceptions to the rule of the part-time non-professional agents: the brokers, who enjoyed a virtual monopoly in the placing of marine insurance, and whose other main function was to act as feeders to Lloyd's after that body of underwriters commenced operations in fire and other lines; and the business of industrial life assurance, which required a large staff of full-time agents for the purpose of door-to-door soliciting and collection.

The later years of the nineteenth century and the first decade of this saw the inception of many new classes of insurance. Companies were established to cover death and personal injury due to railway accidents; loss from burglary and the dishonesty of employees; breakage of glass and bursting of boilers; liabilities to the public; contractual obligations to workmen in respect of industrial injuries; accidents to motor-cars; and many other risks. These companies needed agents to sell their policies and a great increase in part-time representation resulted. Where possible, the choice fell on men to whom business would come naturally as part of their occupation—the railway booking clerk, for example, for accident insurance or the motor salesman for motor insurance. But there was scarcely a solicitor, estate agent or bank manager without a number of insurance agencies, and many a commercial traveller had a sheaf of prospectuses in his bag along with his other samples. In a period of experiment and development this was probably the only possible way, and the urge to earn a commission spread the new forms of cover over the length and breadth

of the country, and brought benefit to many a home and business. But, since the only qualities required of the agent were opportunity and ability to sell, the day could not be long delayed when the individual or firm with numerous insurances to place on its own account found it advantageous to take an agency appointment itself in order to secure an economy in cost. "Own-case" agencies and "rebating" are now well-established practices.

These tendencies have doubtless been stimulated by the development in the last thirty years of the "composite" insurance company transacting all classes of insurance. From the point of view of public service, this was a step forward; it meant that one company could now cater for all insurance requirements and would adopt a broad outlook to risks which, considered on their own, might not be attractive. From the agency standpoint, this has meant two things. First, practically all insurance agents now become agents for all classes of risk, and competition is more intense. Secondly, and more important, the composite company controls a much larger volume of business in any area than the specialist office, and can therefore afford a more extensive branch organisation. Branches were first established to furnish technical assistance to agents and policy-holders, and the staffs consisted of experts of various kinds—underwriters, actuaries, surveyors and claims investigators. Subsequently, under stress of competition, they began to assume also a "business producing" function, and offices appointed full-time "inspectors of agents" to visit the agents and assist them to secure business; in country towns, small sub-offices were opened with "resident inspectors" in charge. These inspectors have left the agents with still less to do, and it is now not uncommon for the agent to serve no other purpose than supply an introduction which the inspector develops. The public naturally prefers to negotiate with the insurance company's qualified representative. The case for the part-time agent has grown weaker.

This is the situation which now confronts the industry. It is by no means certain that insurance will remain content with representation by amateurs. Radical change, such as the elimination of the part-time non-professional agent, might require legislation—similar, perhaps, to that in force in many American states, where candidates are called upon to pass examinations and satisfy the authorities concerning their trustworthiness before being licensed to act as insurance agents. Whatever the theory of the matter, the replacement of part-time agents would not be easy. There must be some kind of local sales organisation—offices acting without intermediaries have never succeeded in building up an extensive connection among the general public. One possibility is the American system, with its nation-wide network of professional agents, but the human material with which to create such a system is not readily available. The brokers have the requisite standard of professional competence. But, outside the marine market, they cannot be fitted easily into the company form of legislation; Lloyd's underwriters—who would be helpless without them—naturally have first claim on their loyalty. In place of agents, the offices would have to consider direct representatives and the wider use of advertising. A programme of collective newspaper advertisement, aimed at stimulating public interest in the service provided by insurance, rather than the virtues of this or that office, might, with the assistance of publicity through the post and otherwise, bring inquiries which would be followed up by travelling representatives. The nucleus of such a body of men already exists in the present inspectors; and, as a result of the progress made by the educational facilities of the Chartered Insurance Institute during the last twenty years, insurance offices now possess many thousands of fellows and associates. The new representatives would be salaried employees and not mere commission hunters. They would be able to analyse and advise upon

genuine insurance needs rather than merely upon the sale of policies.

There might also be a greater degree of localisation of the branch office system. At the moment there may be as many as fifty offices in a city of half a million inhabitants—all located in the centre of the city—and nearly as many sub-offices in the country town with a population of 50,000. But a small town or suburban area may have no insurance office

at all, apart from the branches of the industrial companies. The cost of a widespread network of dignified offices may well be beyond the purse of any single company. Indeed, it is the obvious objection to a programme of reform on the lines outlined in this article that it would show no monetary saving, to say the least, by comparison with the present system. But it is probable that both the industry and the public would be much better served.

Finance and Banking

Reflux and Credit Glut

Throughout the week, the money market has enjoyed an exceptional abundance of credit. The large increase of £18.9 millions in bankers' balances to the unusually high figure of £145 millions is clearly no fortuitous movement, due to the state of accounts between the market and the authorities on a single day. It reflects a marked easing of the underlying credit position. A variety of influences have contributed to bring this about. After an interrupted rise of over £41 millions in the note circulation in eight weeks, notes are at last beginning to return from circulation after the bout of holiday spending. The week's reflux of £4,139,000, indeed, compares with no more than £2,802,000 in the corresponding week of 1941. But this year's withdrawals have, of course, been considerably heavier. Secondly, bankers' deposits have benefited by a net release of £11.4 millions of credit from public deposits. To some extent this is no doubt attributable to the release of the funds accumulated in advance of the August 15th dividend payments. But in addition, there is evidence that the authorities had under-estimated their current borrowing requirements. In view of the low level of public deposits at only £8.2 millions, it seems a safe guess that the increase of some £4 millions in Government securities is due to ways and means borrowing. It is, of course, this under-estimate of borrowing requirements, and not the suspension of TDR borrowing in itself, which has contributed to the ease of credit. As the combined result of the addition to securities and the recovery in the reserve, the credit base shows an expansion on the week of £8.4 millions. Against this background, it is not surprising that the clearing banks have been consistently good buyers of bills, including some November maturities. The market has, consequently, had no difficulty in financing its fairly heavy Treasury bill allotment of 44 per cent; in fact, it has probably seen a reduction in its portfolio rather than an addition.

* * *

Banking in Shanghai Under Japanese Rule

At the beginning of August, the Nanking quisling Government made arrangements for the reopening of the Shanghai offices of the Bank of China and the Bank of Communications. Since the head offices of both banks have been transferred to Chungking, new companies had to be formed in Shanghai. The capital of the Shanghai office of the Bank of China is 20,000,000 Nanking dollars, that of the Bank of Communications 10,000,000 Nanking dollars. Holders of shares of the genuine Bank of China and Bank of Communications are given an opportunity to exchange two of their shares for one new share. This offer is confined, however, only to holders who are "friendly to the Nanking Government and have severed their connections with the Chungking Government." The new banks will not be authorised to issue notes, but will confine their activities to commercial banking. Later, possibly, their other branches situated on Japanese-occupied territories will be reopened, including the branches outside China. The latter are hoped by the Japanese authorities to provide useful channels for the remittances of Chinese living abroad. The reason for the decision to re-create these two banks in Shanghai is probably that the Nanking authorities want to benefit by the goodwill represented by the prestige of these banks. It is characteristic of the lack of prestige of the Nanking régime itself that it has to approach the Chinese people under the disguise of Chungking banks.

Hongkong Dollar Demonetised

While the population of recently conquered Chinese territories was given the option of exchanging its Chungking dollar notes against Nanking notes at the rate of 2 to 1, the population of Hongkong received a less generous treatment. The Hongkong dollar was first devalued by 50 per cent, and then again by 50 per cent, so that eventually its value was 25 per cent of its pre-invasion parity. From August 1st the Hongkong dollar notes have been declared invalid. No information is available whether the population was given an opportunity to exchange the notes against Nanking or Japanese currency. Even if this was done, the exchange would have had to be made at the ungenerous rate of one-quarter of the old value of the Hongkong currency. The chances are that, as in the case of Chungking dollars in Shanghai, a much too brief period was fixed for the exchange, so that a large proportion of the notes could not be presented in time.

In order to provide additional "security" to cover the increase of Nanking note circulation in connection with the withdrawal of Chungking notes, the Japanese authorities have granted to the Central Reserve Bank of Nanking

**Security and Adaptability

ASSURANCE**

For over 220 years the Head Office of the
Corporation has been at the
ROYAL EXCHANGE, LONDON

a loan of 100 million yen. That bank has been placed entirely under the supervision of the Bank of Japan.

Change in Rate for Dollar Notes

An interesting change has been made in the rate at which British banks will exchange dollar notes. Instead of purchasing at \$4.11 to the pound, less $\frac{1}{4}$ per cent commission, the banks will pay 4s. 10d. net per dollar. Both the change in the method of quotation and the abandonment of the commission charge betoken that the new arrangement has been made to suit the convenience of the American troops stationed in this country. The previous rate was equivalent to about 4s. 10 $\frac{1}{2}$ d. per dollar, so that the change is at first sight unfavourable to the holders of dollar notes. But the fact that the rate is less favourable is more than offset by the abandonment of commission, which had previously borne hardly on those who wished to exchange a small number of notes. Since the minimum commission was 1s., the seller of a single dollar only received about 3s. 10 $\frac{1}{2}$ d. Now that every dollar will fetch 4s. 10d., there can be no discontent among sellers of small amounts. The change in the banks' buying rate involves no alteration in the rate at which dollar notes are subsequently sold to the Control. This remains at \$4.11 to the pound, and the banks' remuneration for their business in dollar notes will thus take the form of a turn between their buying and selling rates, instead of a commission charge. This is an interesting departure in view of the wartime arrangement whereby the banks are acting as agents for the Bank of England, instead of as principals, in their foreign exchange dealings. In all other cases, the employment of the banks as agents has been reflected in the charging of commission instead of the making of a turn. This isolated modification of the wartime principle has, however, only been made as a matter of convenience in this particular instance.

Ban on Swiss Gold Arbitrage

The news that the Swiss authorities have banned the export of gold arising from arbitrage transactions appears at first sight to provide one of the most baffling financial paradoxes of this war. The Swiss franc is at an appreciable premium in terms of all currencies which can still claim any relation with gold, including the US dollar and the Argentine peso. Moreover, the uncontested evidence of the weekly returns of the National Bank of Switzerland over the past year has shown that Switzerland has been a persistent and considerable gainer of gold and not a loser of the metal. Why, therefore, is there a ban on arbitrage exports of gold, since on the face of it no such exports should be feasible? The answer will probably be found in the fact that the various national quotations for gold taken as the basis for calculating arbitrage parities are not only the official prices quoted by the central banking authorities, but the prices quoted in the open—and often black—markets. If gold is quoted at the equivalent of £10 an ounce in Bombay, then assuming gold shipments to be possible, it follows that the arbitrage parity from Switzerland will differ very widely from that indicated by the current official exchange rates and gold price. An open black market for gold has for some time past existed in Lisbon, and it may well be that the Swiss edict is intended to stop a leakage to that destination. It may also be questioned why a ban should be necessary when the National Bank of Switzerland should have control of the whole trade in gold. The answer is that there remain appreciable holdings of private gold in Switzerland. That country was one of the main repositories of "funk money" during the pre-war decade, and at times considerable amounts of gold were deposited there for safe keeping. Most of that gold had gone to the United States before Switzerland became a precarious island of neutrality in an Axis occupied Europe. But enough of it probably remains to feed a modest arbitrage traffic towards the black bullion markets and to justify the steps taken to arrest it.

Investment

Boom in Equities

The markets made a rapid recovery from the modest setback induced by the combination of bad news from India and the Caucasus and, this week, staged a strong advance over a broad front. The *Financial News* index of industrial ordinary shares—July 1, 1935 = 100—at 82.8 reached a new high level for the year, although it is still below the level of the beginning of December last, prior to the attack on Pearl Harbour. The rise in turnover has not been marked. Indeed, business has been limited by an acute shortage of stock in most sections which has been one of the most potent influences in raising quotations. The cause of the advance at a time when the military situation, on which everything hangs, holds more promise than realisation, is perhaps not very easy to explain. An underlying belief, which keeps on coming to the surface, that there will be a speedy finish to the war, is probably the main influence. Drawing comfort on Tuesday from the news of the successful Allied talks in Moscow, markets went ahead and for the first time in some weeks there was also a general improve-

ment in gilt-edged issues. By midweek, the news of the Dieppe commando raid suggested caution pending information on its progress, but the announcement probably served to strengthen the impression that things are moving. In point of fact, Second Front or no Second Front, an early end to the war remains unlikely and its assumption is certainly a poor foundation on which to base investment demand. Unshakable optimism and a tendency to speculate freely on military possibilities are, of course, not the only foundation of the present boom. There is a great deal of money about, which is seeking investment with good income prospects, and, incidentally, driving down industrial yields.

Tax-Free Fees

A decision taken at this week's Watney Combe Reid meeting has raised the first test case on the question of tax-free payments to company directors since the passage of the Finance Act, 1941. The directors of Watney Combe Reid are entitled by the articles of association of the company to a tax-free annual sum of £15,000 and, in addition, such further sums as may be determined from time to time by the general meeting. This right was modified by the Finance Act, 1941, to permit the enjoyment of remuneration tax free up to 5s. 6d. in the £ only, unless the contract is varied subsequent to September 3, 1939. After some discussion, a resolution initiated by a stockholder was passed at the general meeting which proposed that:—

the directors be paid in respect of the year ended June 30, 1942, and thereafter until otherwise determined such further sums as might be required to indemnify them to the extent of 4s. 6d. in £ against the operation of Section 26 of the Finance Act, 1941, in relation to the sum of £15,000 mentioned in the articles as the remuneration of the board.

Thus, the directors are to continue to receive £15,000 net, costing the company £30,000 gross, instead of £10,345 net costing the company £20,690 gross. It is, of course, plain

that there is nothing illegal in the resolution—the Finance Act, 1941, permits the variation of contracts relating to the payment of tax free fees. But it is equally clear that the intention of the Act has been, at least partially, defeated. The legislation was intended, not only to release certain parties from the fulfilment of contracts in circumstances other than those foreseen when the agreements were originally concluded, but also to prevent certain recipients of income from being insured and indemnified against the burden of rising taxation. Thus, there are two points involved: the undesirability, particularly in war conditions, of protecting the net receipts of directors when no such protection can be afforded to labour or to the equity holder; and the unsuitability of permitting any class to remain unaffected by the wartime rise in the tax burden. There is, of course, no objection to the directors receiving higher remuneration. What is clearly undesirable is the provision that the management shall be indemnified precisely by the amount of the rise in tax burden.

More Brewery Conversions

The steady stream of industrial conversions, which has followed the lifting of the Treasury ban last May, continues unabated, with breweries still holding pride of place. After *Bass, Courage, Portsmouth and Brighton and Watney Combe Reid* come *Barclay Perkins* and two subsidiaries of *Walker and Homfrays, Manchester Brewery* and *John Taylor and Company*. Neither of the latest conversions, whose details are set out in the accompanying table, contemplates any repayment. The *Manchester Brewery* conversion, however, contains the novel feature that its offer of £653,664 4 $\frac{1}{2}$ per cent debenture stock replaces its own previous issue of £550,351 5 $\frac{1}{2}$ per cent guaranteed mortgage debentures, together with the existing 5 $\frac{1}{2}$ per cent *John Taylor* guaranteed first mortgage debenture stock. As with the earlier conversions, there is the now usual provision that, in both cases, stock not covered by the conversion shall be taken up and retained by the guarantors. In the

Name	Amount Repayable	Rate %	Repaid at	Amount Offered	Rate %	Date Final	Issue Price
Manchester Brewery	550,351	5 $\frac{1}{2}$	102 $\frac{1}{2}$	653,664	4 $\frac{1}{2}$	1977	100
John Taylor	103,313	5 $\frac{1}{2}$	102	408,353	3 $\frac{1}{2}$	1985	99
Barclay Perkins	408,353	5 $\frac{1}{2}$	105				

Note.—Issue prices net of cash payment to those accepting new stock; date, the latest possible.

case of the *Manchester Brewery* conversion, the commission amounts to £4,000 and in the case of *Barclay Perkins* to £2,550, both inclusive of brokerage, representing 0.61 and 0.62 per cent on the money. The yield on the *Barclay Perkins* issue price is some 3.787 per cent and the maximum life of the stock is forty-three years. Repayment by sinking fund begins, however, in the year ending October 1, 1945, and the company has an option of repayment in full from October 1, 1955. This offer should prove attractive if not quite so tempting as that of *Bass*, where only some 8 per cent of the issue was left for the guarantors. The results of the *Army and Navy Stores* conversion of £484,900 5 per cent stock into 4 per cent debentures, 1960-70, show that the usual proportion of nearly 25 per cent was left to be taken up at par by the Prudential Assurance.

Richard Thomas Meeting

On the whole, the Richard Thomas meeting was less stormy than usual. A number of the customary objections were raised, but the fact that the report and accounts were passed on a show of hands suggests that the bulk of the ordinary shareholders are mollified by the resumption of ordinary dividends with the 5 per cent payment. Whether or not sound finance would permit the distribution of a higher rate in present circumstances, the statement of the chairman, Mr E. H. Lever, makes it probable that the directors have no intention of raising it in the immediate future. He takes the view that "we should continue to strengthen the financial position of the company and build up and maintain strong liquid resources." The concern now enjoys an assured position in the sphere of war production, and Mr Lever is able to report that output has been increased, costs lowered and quality improved at Ebbw

Vale. Moreover, he implies that the report of the Ministry of Supply committee of inquiry into the problem of concentration in the tinplate industry is unlikely to affect Richard Thomas at all substantially. This is all encouraging news as far as post-war prospects are concerned. For it is on the ability of the concern to compete successfully in post-war markets with both domestic and overseas competition that the present financial policy of the management will be judged. To some extent, delayed blessings are still being relied upon to buoy up the ordinary shareholders. Only time can show whether postponement is in their best interest.

Company Notes

British India Steam Navigation

The accounts of BISHN for the year to September 30th last show a decline in net profits from £207,268 to £203,737. After adding back disclosed charges, including directors' fees, there is, however, a rise in earnings, after deferred repairs, taxation and contingencies, from £1,728,316 to £2,031,067, so that it appears probable that gross income was higher last year. Depreciation of fleet receives £1,124,463, against £1,022,984, and pension fund reserve £500,000, against £300,000, bringing the total to £800,000. Equity earnings are down from £62,268 to £58,737, representing 6.2 against 7.0 per cent. Ordinary capital receives 6 per cent as before, and the carry forward is raised from £61,271 to £62,576. These results were, of course, realised before the entry of Japan into the war, and the directors point out that the fall of Burma has already restricted normal services in the Bay of Bengal. The balance-sheet shows an important increase in net liquid assets excluding inter-company items, from £4,325,844 to £6,352,516, while net loans to subsidiaries of £71,328 have replaced net loans from subsidiaries of £72,178. The main increases are in gilt-edged holdings of nearly £3,300,000 to £7,922,224, and in debtors from £1,465,742 to £3,137,767. On the liabilities side, creditors

are up from £2,619,678 to £6,047,130. Book value of fleet amounts to £1,858,900 against £2,117,850, while Government tonnage replacement account, now excluded from the calculation of assets, has risen from £142,500 to £422,600. The company's tonnage replacement account stands at £1,703,500 against £842,500. The position is strong, but it is evident that the company's fleet is now infinitely more vulnerable than it was a year ago—a fact which may prejudice earning capacity in 1941-42. The ordinary shares are all held by the controlling concern, P and O, to whose prospects British India provides a useful pointer. The £100 5½ per cent cumulative preference stock, at 99½, yields £5 10s. 6d. per cent.

* * *

C. & E. Morton Preference Payment

Despite a reduction in total income for 1941 from £93,658 to £65,235, due in part to the need to provide for losses on shipments in the Far East, the directors of C. & E. Morton have recommended the payment of one year's dividend on the 7 per cent preference capital. This leaves arrears outstanding for the decade 1931/40 inclusive and arrears on the 8 per cent cumulative preferred ordinary capital for the period 1931/41 inclusive. The company suffered last year through the loss of its Java subsidiary, necessitating the provision from profits of £19,116 for transfer to investment reserve. Since the balance of reorganisation expenditure on the Millwall Factory, at £8,699, is also written off from profits, there is a decline in net income from £35,289 to £10,941, despite a fall in total tax provision from £35,433 to £10,160. It has, however, been decided to recover £22,196 EPT liability from subsidiaries, so that the total disposable balance amounts to £68,426. After providing £14,000 for the preference payment, the carry-forward is raised from £35,289 to £54,426. The company has suffered from further restrictions on exports last year, reflected in the balance sheet in a rise in stock from £262,169 to £331,208 and in bank overdraft from £22,000 to £32,000. A decline of rather over £100,000 to £200,349 in debtors and nearly £100,000 in creditors to £154,151 indicates a contraction in business, for which rationing is no doubt mainly responsible. The resumption of preference dividends in these circumstances if, of course, a matter for considerable congratulation. The equity holders remain, however, almost as far as ever from receiving a dividend, and the need for a suitable capital reorganisation scheme which commands the confidence of all parties, remains obvious. The £1, 7 per cent, preference shares, at 18s. 6d. ex dividend, yield £7 6s. 4d. per cent on the latest payment.

* * *

Low Temperature Carbonisation

Total profits of Low Temperature Carbonisation reached a new record level in the year to March 31st last with a rise of nearly £10,000 to £133,049. Thus, for the third year in succession, the recovery from the low level of £42,943 touched in 1938-39 has been steadily continued. The latest accounts show an increase in tax pro-

vision, including £10,000 transferred to tax reserve, from £45,180 to £73,512, while depreciation is also somewhat higher at £10,845 against £10,022. Consequently, there is a decline in equity earnings from £51,342 to £32,132, representing 4.0 against 6.4 per cent. Ordinary capital receives 3½ per cent, as in the two previous years, and £4,111 is added to the carry forward, bringing the total to £32,873. These excellent results have been achieved despite the fact that the loss of one subsidiary has been charged against profits, whereas in the previous year a loss of £47,335, £36,687 of which was in respect of 1940-41, was charged against general reserve. It has not yet been possible to make good this draft, so that general reserve remains unchanged at £24,011. Tax reserve stands at £35,000, against £25,000. The liquid position is fortified by a rise in net liquid assets from £231,556 to £325,541, although net loans from subsidiaries are up from £26,127 to £59,511. Debtors and creditors are both lower, as are stocks at £10,340, against £14,131. Cash holdings have more than doubled at £134,404, £100,000 is still lent free of interest to the Treasury, and £30,000 against nil has been invested in Government securities. The concern is now beginning to profit from the considerable capital development which took place in 1938-39, and there can be no doubt that its products have found a ready sale. Prospects for the current year depend very largely on the extent to which supplies of coal continue to be available. The 2s. ordinary shares at 1s. 7½d. ex dividend yield £4 6s. 1d. per cent, a level which implies considerable faith in post-war prospects.

Amalgamated Metal Corporation

In his speech at the annual meeting of *Amalgamated Metal Corporation*, the holding company which controls *British Metal Corporation* and *Henry Gardner*, the chairman, Mr Charles V. Sale, reveals that the total commitments of the latter concern in respect of tin and rubber at the date of the combined balance sheet amounted to over £2,100,000 of debtors and bills payable and £500,000 temporarily advanced to a subsidiary. Since then, notes to the combined statement indicate that the whole of bills receivable and 98 per cent of debtors have been collected and the temporary advance repaid in full. Thus, it is clear that the group has suffered the minimum of avoidable misfortune through the territorial losses in Malaya and the Netherlands East Indies. Mr Sale points out that it is still impossible to place any valuation on the German and Belgian interests, standing in the combined account at £794,536, but is able to report that proceedings against the *Société Suisse pour Valeurs de Métaux*, against which *Amalgamated Metal* has a claim for re-exchange of holdings in *Metallgesellschaft AG*, are at last going forward. The profit position of the group and the constituents over the past three years is analysed below.

The decline in income of the constituents of £62,470 to £264,364 is, of course, partly due to the tempo of payment by the Ministry of Supply, for which the concern acts as Non-Ferrous Metals Control and partly to the extension of hostilities to the Far East, all loss in connection with which has been written off in the latest accounts. Excluding inter-company items, the combined balance

sheet shows a reduction in net current assets from £1,983,736 to £1,619,732. The replacement of net loans from subsidiaries of £397,931 by net loans to subsidiaries of £23,925 at December 31st is rendered obsolete by the repayment of the temporary loan of £536,238. From the national and the group's standpoint, the decline in stocks from

Tea Company Results

The reports of leading tea companies recently issued indicate that 1940-41 was, from the investors' standpoint, a satisfactory year. The following table analyses profits and allocations over the past three years for the four concerns of the James Finlay group and for two independent companies chosen for their geographical disparity. The selection, which is representative, shows that in all cases, except that of *Ceylon Tea Plantations*, crops were higher last year. Prices are not generally revealed, but, for the Finlay companies, the management states that the average of the three years 1936, 1937 and 1938 adjusted to an f.o.b. Eastern port basis and increased by 1d. per lb. for India and 1½d. per lb. for Ceylon was paid by the Ministry of Food. This basis must certainly have covered the major proportion of the output. The chairman of the James Finlay concerns, Mr R. Langford James, points out that even the increase in the export quota from 90 per cent in April last to 125 per cent at the present time has not prevented an undesirable spurt in the price of teas available for markets outside the United

Kingdom. Of the six companies in question, only one, *Ceylon Tea Plantations*, experienced a setback in total

income, and for this modest decline from £410,612 to £396,504 the lower crop is probably responsible. The decisive influence on equity earnings was, of course, tax liability, and all concerns have had to face a severe rise in this charge, to which must be attributed a fall in the earned rate from 9.2 to 7.8 per cent for *Amalgamated Tea Estates* and from 17.1 to 14.1 per cent for *Kanan Devan*. Only in the case of the latter company, however, is the ordinary payment reduced or under-earned. The cut of 2½ per cent to 15 per cent is overdue, and perhaps insufficiently drastic, there having been an over-distribution also in each of the two previous years, reducing the carry forward from £108,629 in 1937-38 to £89,931 in 1940-41. The prospects of these companies in the current year are of national and even international interest. Their earning capacity is determined by the future of military operations against the Japanese and by shipping conditions. The loss of plantations in Malaya and the Netherlands East Indies renders their output increasingly valuable, while the loss of Burma places the Assam plantations in a position of considerable vulnerability. Yields, which range from 6.40 per cent for *Ceylon Tea* to 10.52 per cent for *Assam Dooars*, suggest considerable market confidence tempered by appreciation of the military factors.

Industry and Trade

Railway Wage Negotiations

Negotiations on the demand of the National Union of Railwaymen and of the Railway Clerks' Association for an increase of 10s. a week in wages have been continued. The railway companies have now made what has been stated to be their final offer; broadly, this consists of an additional 4s. a week for adult males, and 3s. a week for adult women operatives and an additional £10 per annum for the adult salaried male staff. The proposal will be considered by the NUR at a special meeting convened for September 1st. If the offer is rejected, the case will go to the railway staff national tribunal, the final court of appeal. Whatever the details of the compromise, there will be an increase in wage rates, which bodes ill for any attempt to call a halt in the upward movement in other industries.

* * *

Silver in Industry

The Canadian Government this week introduced a ban on the export of silver. The official explanation is the

growing use of silver in the Dominion's war production, and the order follows a similar ban introduced by the United States War Production Board early last May. In the United States, according to the last annual report of Messrs Handy and Harman, no fewer than 80,000,000 oz of silver were used in 1941 for industrial purposes. Since then the United States Treasury department has announced that, with the concurrence of the US Attorney-General, the Secretary of the Treasury has full legal authority to lend-lease the country's silver stocks not immediately used for currency purposes to war industry, and the Treasury has prepared a scheme under which Government silver can be made available to war plants; after the war, it must be handed back to the Treasury, which in the meantime retains the title to it. It is estimated that this use of the Government's surplus silver stock may release something like 40,000 tons of copper for other purposes. Silver has valuable mechanical and chemical properties. But an obstacle to its extensive use in industry is its price, which, though very low, is still too high to make it competitive. It is, therefore, of interest that the United States Government is preparing legislation under which the Treasury will be allowed to release newly-

COMMERCIAL UNION

ASSURANCE COMPANY, LIMITED

TOTAL ASSETS EXCEED £75,000,000

mined domestic silver—bought at 71.11 cents per oz—at the price of foreign silver, that is, 35 cents per oz, for use in war factories. Such price adjustments, together with the scarcity of many other vital metals, are likely to assure silver an important place in industry during the war. Nevertheless, in spite of the fact that the American Continent supplies about four-fifths of the world's silver and that the US and Indian Governments hold the bulk of the world's silver stocks, it must not be forgotten that the world output of silver even in its record year, 1937, when roughly 275 million oz were produced, was very small compared with that of the more common metals. A total of 275 million oz equals roughly 8,500 metric tons, compared with the present world copper output of about 2,500,000 tons and world lead and zinc production of just under 2,000,000 tons per annum respectively.

East African Imports

Shortage of shipping has led to further restrictions on imports from overseas into Kenya, Uganda, Tanganyika and Zanzibar. A large number of licences to import from the United Kingdom will have to be cancelled, contracts may have to be regarded as frustrated, and in future imports will be graded in three priority ratings. The new restrictions should not, however, lead to any real hardship either for the European population or the African. Unlike the West Indies, where the food situation is really serious, three of the East African dependencies are self-supporting in food for the native populations, and though European foodstuffs used to be imported in large quantities, they were not essential. Zanzibar is the only dependency in this part of the colonial empire which used to import essential foodstuffs both for natives and non-natives, and is still dependent for some of them on outside sources of supply, in spite of the efforts that have been made since the war to expand local production. Nevertheless, it should be possible for Zanzibar's essential needs to be provided by the neighbouring territories. Rice, for instance, is now being obtained from Tanganyika, whose production has increased considerably, and before the war Uganda was an exporter of sugar. Moreover, it has just been announced that 100,000 acres of the Athi plains in Kenya are to be cultivated for wheat production. But the growing demands of the armies of the Middle East will leave the East African dependencies with little to spare after their own and neighbouring needs have been met. It may, therefore, be taken for granted that first priority in import policy will be given to agricultural machinery and other imports necessary to raise local production to the maximum. It is said that for the new wheat-growing scheme in Kenya it is hoped to obtain tractors and implements from the United States under Lend-Lease.

Tightening of Shop Control

In order to prevent the opening of unnecessary new shops, the Government issued Orders last year—the Location of Retail Businesses Orders, 1941—prohibiting, except by special licence, the starting of new businesses for the sale of a wide range of commodities from January 1st this year. No licence was required if the goods specified were sold at the premises concerned during any part of a base period, defined as the period from December 1, 1940, to October 23, 1941. Provision was made whereby a trader could sell, or in any other way assign, the business to another person, who could then carry on without a licence. It was found, however, that some firms who wished to open new businesses in competition with existing shops realised that, if they applied for a licence, it would probably be refused, and consequently sought to achieve their object by

using the goodwill clause. They looked for empty shops which, at some time during the base period, had been used for the sale of goods they wished to retail; they sought out the owner of the business or his representatives, offered a paltry sum for its goodwill, and began to trade on the pretext that they had acquired the goodwill, and, hence, needed no licence. In order to stop this loophole, a new Order has now been made by which all traders in the goods specified will have to apply for a licence if they wish to start a new business. In future, it will still be possible for traders to sell their shops, and, where there is a genuine transfer of goodwill, a licence will not be refused.

Potatoes

There was an increase this year of 50 per cent in the home production of early potatoes, and the Ministry of Food has taken steps designed to ensure their consumption. In April, a scheme of distribution for new potatoes was announced, which was operated until July, when supplies were sufficient to make special control unnecessary. Potatoes were lifted at a rate which exceeded expectation and prices were reduced substantially in mid-July in order to accelerate consumption. This was done by paying a subsidy of £2 per ton to licensed first-buyers on their purchases from growers from July 19th to August 1st. These measures were not sufficient to clear accumulations. It is a pity that new potatoes were not issued to the Forces earlier. They were still eating the potatoes which had been stored during the winter as a safeguard against a late crop this year. The Ministry of Food is acquiring any surpluses of first and second early varieties which remain, or are likely to remain, in the hands of growers. The price paid will be 10s. a ton less than the growers' fixed price at the time of the Ministry's inspection. The surpluses will be clamped and later used for processing and seed. King Edward VII, Red King, and Gladstone varieties may now be lifted, but their sale is prohibited until August 29th, in order that they should not compete with the remaining supplies of early potatoes. Apart from administrative measures, the Ministry of Food is conducting a lively campaign to persuade the public to eat more potatoes. Lord Woolton has said that a 25 per cent increase in consumption is required in order to enable the Government to reduce wheat imports and save shipping.

Retail Costs and Profits

The Drapers' Chamber of Trade, the National Association of Outfitters and the Retail Distributors' Association collaborated to produce an analysis of the operating expenses of retailers selling cloth and apparel in the trading year 1941-42. The investigation was made to provide data for the consideration of profit margins for utility cloth and apparel. Apart from men's wear specialists and retailers mainly trading on a weekly payment basis or against credit checks, the sample comprised 916 returns from 1,161 establishments engaged in drapery and general business. In spite of the inclusion of the latter, the figures are fairly representative of the retail cloth and apparel trade. The analysis gives figures for eight groups, divided according to annual turnover. Gross profit margins on turnover vary from 28.01 per cent in the £10,000-£25,000 group, to 31.71 per cent in the £250,000-£500,000 group. The unweighted average gross profit margin of all the groups is 30.12 per cent. The weighted average, obtained by multiplying the groups so that each is represented in a proportion corresponding approximately to its proportion over the whole trade, is 29.53 per cent. Total expenses are highest, at 26.32 per cent, in the £250,000-£500,000 group and lowest in the £5,000-£10,000 group, where they are 21.43 per cent of the turnover. The net surplus, or profit, is greatest, according to the figures, in the lower turnover groups, but this may be due to the fact that in these groups profits include wages of management and interest on capital not separately shown. Profits are lowest in the highest turnover group (4.64 per cent) and in the £25,000-£50,000 (4.91 per cent). The unweighted average of expenses in all groups is 24.96 per cent, and of profits 5.16 per cent. The corresponding weighted averages are 24.02 and 5.51. A detailed analysis of profits and expenses in the various turnover groups, as well as other interesting data, are given in a table on page 254. Exactly comparable pre-war figures do not exist, but comparison can be made for two groups. In a paper read before the Manchester Statistical Society in December,

1938, Professor A. Plant and Mr. R. F. Fowler gave, *inter alia*, the gross margin, expenses and profits of department stores in the year ending January 31, 1938. Two of their turnover groups coincide with two of the present survey: £100,000-£250,000 and £250,000-£500,000. The gross margin in each case was 30.15 per cent, which compares with 31.19 and 31.71 per cent respectively. Total expenses were 25.20 and 24.69 per cent against 25.29 and 26.32 per cent for 1941-42. Profits were 5.95 and 5.45 per cent, compared with 5.90 and 5.39 per cent. Wartime conditions have probably made little difference to trading margins. The comparisons must be viewed with caution, however, since the numbers of stores in the present sample is larger than in Professor Plant's and Mr Fowler's.

Utility Margins

In arriving at their conclusions for a fair retail margin for utility cloth and apparel, the Drapers' Chamber of Trade and the Retail Distributors' Association have taken

INSURANCE NOTES

EAGLE STAR; EMPLOYERS' LIABILITY; GENERAL ACCIDENT

THE *Eagle Star* 1941 accounts show higher premiums and improved profits in both fire and accident departments. In the marine department premiums are substantially lower; this is attributed by the chairman (Sir Edward M. Mountain, Bt.) to the loss of cargo business from countries overrun by the enemy, but is so much at variance with the common experience as to suggest that the department is being administered with special caution. The chairman's statement contains some interesting observations on the marine market; it is his view that because of the problem of deferred repairs it will be necessary to keep the 1939 hull accounts open for six years, i.e., until the end of 1944, and in regard to cargo rates, he considers that cargo by liners should now pay the same premiums as cargo by tramps, since liners are frequently trading outside their regular routes, and equally with tramps are exposed to increased hazards. New life business was at the very high net figure of £12,318,000, an increase of £4,674,000 on the previous year; 1941 was a good year for group life and pension business in which the company specializes. The quinquennial valuation of the current life and annuity funds was made on December 31, 1941; the rates of interest employed were 2½ per cent for participating insurances and 2½ per cent for non-participating insurances, a special reserve of £65,000 being set aside as a provision towards the cost of reducing the latter rate to 2½ per cent at a later date. The surplus of £179,000 in the participating section is being carried forward without any general distribution of profits but interim bonuses will continue to be paid on policies becoming claims by death or maturity.

In profit and loss account underwriting profits of £277,000 are augmented by net interest earnings on the general funds of £216,000 and trustee and other fees of £33,000, bringing aggregate credits of £526,000. Various expense charges—including £93,000 for Colonial and foreign taxes, which most companies debit to the departmental accounts—absorb £195,000 and the reserve for British taxes takes £40,000. £25,000 is transferred to contingencies account and after providing for the dividends, which are unchanged and cost £234,000, the balance of £554,000 carried forward is higher by £31,000. There is an additional reserve of £100,000 in the fire fund and a general reserve of £2,500,000.

The *Employers' Liability* is dependent for 85 per cent of its accident income on its United States' branch, and the much reduced profit reflects conditions in that sphere of operations; the chairman (Sir Courtauld Thomson, K.B.E., C.B.) explained in his address to the shareholders that the company's workmen's compensation experience in America was much less favourable than in the previous year and motor business was also less satisfactory. In Canada, Australia, South Africa and India, and at home, operations were generally profitable. The

into account certain factors which do not appear in the analysis discussed above. They take the weighted average expense figure, excluding interest charges, of 23.17 per cent, on which to base their discussion. This, they say, includes some expenditure on delivery and publicity which cannot properly be charged against the utility margin. A deduction for this reduces expenses to 22.23 per cent. Money turnover will be less in 1942-43 for three reasons: the exemption of utility cloth and apparel from purchase tax; the limitation of margins on non-utility cloth and apparel; and the increased proportion of utility cloth and apparel. A reduction in money turnover of at least 10 per cent can be expected to follow, accounting for an increase in expenses of at least 2½ per cent of net sales. Credit must be taken for discounts received; an allowance of 3 per cent made for stock losses and mark-downs; and provision made for a net surplus of 3 per cent. The effect of these adjustments, according to the DCT and RDA, is that the retailer must be allowed an average margin of at least 29 per cent on utility cloth and apparel. The Board of Trade's fixed margins actually amount to an average of slightly over 28 per cent.

underwriting profits of £85,000 are supplemented by net interest earnings of £161,000—a reduction of £25,000, due to higher income tax—making total credits to profit and loss of £246,000. Sundry expenses take £14,000 and provision for British taxes £110,000; the cost of the dividend, which is unchanged at 3s. 6d. per share, less tax, is £138,000, and the balance of £523,000 carried forward is lower by £16,000. The company has a general reserve of £2,500,000.

Marine business is transacted through the *Merchants' Marine*, and the premium income of £369,000 is higher by £53,000; after making a substantial addition to the marine fund a profit of £14,000 is released. The medium for transaction of life insurance is the *Clerical, Medical and General*; net new business at £1,096,000 is £267,000 higher than in the previous year, but only about 40 per cent of the pre-war (1938) level. Premium income fell by £25,000 to £933,000 and the net rate of interest earned by 8/10 per cent to £3 1s. 0d. per cent. Death claims of £663,000 included war deaths costing £92,000, but resulted in only a small loss on mortality.

The accounts of the *General Accident* show increased premiums in both fire and accident departments coupled with highly satisfactory underwriting profits. Marine premiums are lower, pointing to a cautious policy in this department, and the fund at 116 per cent of premiums is considerably strengthened. New life business at a net figure of £1,128,000 shows an increase of £341,000 from the figures for 1940 and was about two-fifths of that written in 1938. The speech of the chairman (Sir Francis Norie-Muller, Bt., J.P.) was not very informative about conditions affecting the company's business in the year under review, but in view of its outstanding interest in motor insurance included a warning of a downward movement in premiums in 1942.

Net interest earnings on the general funds at £207,000 are £12,000 lower than in 1940, and aggregate credits amount to £921,000. The company does not follow the usual practice of debiting Dominion and foreign taxes in the revenue accounts—a feature to be borne in mind in comparing its profits with those of other offices—but includes these with home taxes in a single item in profit and loss, the amount involved being £453,000. Other miscellaneous expense charges absorb £71,000; there is a loss on sale of investments of £110,000, and £9,000 is transferred to the reserve for depreciation of investments and adjustment of exchange. £25,000 is again added to the additional reserve in the fire account, which now amounts to £350,000. After providing for the dividends at the same rates as in 1940, costing £186,000, the balance carried forward is £957,000, an increase of £68,000. As already reported in *The Economist* of April 11th, £500,000 of the carry-forward has been utilised to increase the paid-up value of the ordinary shares from 5s. to 10s. The company's position is strong, there being a general reserve of £2,000,000 as well as additional reserves totalling £600,000 in the fire and accident funds.

For Barclays Bank (Dominion, Colonial and Overseas)
C. D. ALCOCK, Manager.

Circus Place, London Wall, E.C. 2. 13th August, 1942.

The Thirteenth Ordinary General Meeting of Ford Motor Company Ltd. was held on August 19 at 88 Regent Street, London, W.1, the Rt. Hon. Lord Perry of Stock Harvard, K.B.E., LL.D., the Chairman, presiding. The following are points from the Chairman's Statement.

The year has been very busy and our various activities noteworthy and successful. At some future date it will be my pleasure to tell you many things of interest.

The Balance Sheet and Profit and Loss Account again reflect the Company's true position, without qualifications and reservations, financial matters requiring official negotiation having been satisfactorily settled.

The Company's financial strength is fully maintained. Excess of liquid assets over current liabilities is considerable and provides a strong reserve. The Directors have consistently followed a conservative policy, having made large but necessary annual provisions for depreciation and obsolescence of buildings, machinery, and equipment. They considered it necessary to keep a large proportion of these provisions in cash to finance renewals when required. The wisdom of this policy is emphasized in wartime when exceptionally heavy taxation demands have to be met. Such demands, including Excess Profits Tax at 100%, are based upon computed profits at a much higher level than those shown by the Accounts to have been earned. This anomaly is chiefly due to inadequate depreciation allowed for taxation as a charge against profits. The consequence is a heavy drain on cash resources. The position is common to industry generally.

The Company was the pioneer in manufacturing agricultural tractors. The famous Fordson Tractor was produced during, and assisted the National Food Campaign of, the last world war. Since then the Company so developed the business that farmers owned many thousands of tractors and had become "power-farming" minded. We are proud that the Fordson Tractor has been the keystone of the Nation's Food Campaign of this world war. A considerable number of the new American Ford Tractors, with Ferguson System, have also been distributed through the Company's organisation.

Our Dealer organisation further increased its reputation for efficient service in spite of undiminished difficulties. We appreciate all their efforts to keep essential transport running and every tractor at work. Prices of replacement parts have of necessity been advanced, but such increases are lower than rises in material and labour costs.

We have little information concerning Continental Associated Companies. The few operating in countries not occupied by the enemy are adapting themselves well to changed conditions and with the exception of the Spanish Company have earned profits during 1941.

Wage rates and hours of work are always of utmost importance. Our peace-time policy was to pay straight wage rates graduated upwards according to skill or ability from a high minimum hourly rate and to avoid overtime work. Our personnel thus enjoyed good employment with sufficient means and leisure time for personal and social activities; the high quality of our products is largely attributable to this policy. In wartime, circumstances and conditions are different. We still practise a policy of straight high-average wage rates but have increased working hours. Ford workers' efforts are truly described as personal unselfish patriotism for no premium overtime has been paid at Dagenham or our other Southern Works.

Rates of remuneration have been periodically reviewed in the light of increasing living costs and we have maintained the wartime Family Bonus Scheme. Our principle of two weeks holiday with pay has been continued; payment in lieu of holiday being made to those who, because of present conditions, are unable to take the full period.

Employees in H.M. Forces exceed 1,900 and the policy of assisting their dependents from the special Trust Fund, to which the Company contributes, has been continued. I regret to inform you that 28 employees have been killed on Service and 23 other employees killed in air raids on this Country. A.R.P. Services are maintained at a high level of efficiency and large numbers of our personnel are members of the Home Guard.

I commend the efficiency and keenness of our loyal band of employees—men and women. In their interests we have extended and maintained at customary high standard our feeding, hospital, sports and social facilities and amenities. We have continued contributions to our Pension and Benevolent Fund and to the Air Raid Relief Fund which was formed and is administered by employees themselves.

Many employees save regularly in our own old-established Savings Scheme. Nevertheless our War Savings Group is remarkably strong, over 80% of employees contributing regularly—the total in this form of National effort now exceeding £325,000. We have been commended by Lord Kindersley on our efforts. Increasing numbers contribute to the Red Cross Penny-a-Week Fund, the total subscribed now exceeding £3,500.

I advise you with regret of the death of one of our original Directors, Lord Illingworth, a very valued colleague of us all.

I offer to our General Manager, Sir Patrick Hennessy, congratulations on the honour of Knighthood which has been conferred upon him.

Because of the necessity of holding the Annual General Meeting at a later date than is usual in normal times, the Directors decided to declare an interim dividend of 3% in March last. Your Directors recommend that a final dividend of 3% be now declared, making 6% for the year, subject to Income Tax, which is the rate of dividend paid each year of the war. I suggest that Stockholders and the Company are entitled to the reflection that they are serving their Country well.

COMPANY MEETINGS

WATNEY COMBE REID AND COMPANY, LIMITED

LARGER SALES OF BEER

COL. O. P. SEROCOLD ON TAXATION

The annual general meeting of Watney Combe Reid and Co., Limited, was held on the 18th instant at the Windsor Castle Restaurant, London, S.W.

The chairman, Colonel O. P. Serocold, C.M.G., presided.

That portion of the chairman's speech circulated with the accounts having been taken as read, the chairman dealt briefly with the year's figures, which, he said, were largely influenced by the increases in trade, beer duty and the continued rising trend of the cost of all commodities and services.

DEFERRED REPAIRS

The restriction imposed upon expenditure on properties had contributed to the increased cash and investments, and at the same time had necessitated a provision in the profit and loss account of £200,000 for deferred repairs, which amount was calculated by reference to the average annual expenditure, plus a percentage increase to meet the estimated additional cost of materials and labour.

No alteration had been made in the properties figure for damage sustained by enemy action, compensation for which would presumably be paid ultimately by the Government in return for the company's contributions under the War Damage Act. Certain properties had, however, been specially written down by applying a part of the sum transferred from property improvement and contingency reserve, as stated in the report.

Customers' trading deposits showed a considerable increase, but not incommensurate with the enhanced amounts due from them, a large proportion of which represented beer duty.

TAXATION AND BEER DUTY

Referring to the increased provision for taxation and beer duty owing, the chairman stated that an indication of the extent to which the company acted as tax-gatherers for the Revenue was given by the fact that during the year there had been paid in income-tax, N.D.C., and beer duty just under 6½ million pounds, which included only two and a-half months at the increased rates of beer duty imposed by the Budget in April last.

INCREASED TRADING PROFIT

The increase in trading profit could be considered as satisfactory. Rental income, although up compared with last year, was still considerably below the level of pre-war years, but reflected the improved conditions for trading which had existed during the period under review as compared with the previous year, when allowances to tenants had been necessary.

The proposed allocation to the property improvement and contingency reserve for the year would help to build up that reserve against the time, at present unpredictable, when expenditure on properties, which must of necessity be heavy, could be resumed.

STAFF AND EMPLOYEES

A large number of the staff and employees had answered the call of National Service, and consequently an immense amount of work and responsibility had devolved on those senior members who are left. The directors wished to record their thanks and gratitude to these key men and women for their exemplary services as well as to the newcomers for their valuable assistance in carrying on the work of the company, and to send greetings to all those of the company absent on National Service.

The report, balance-sheet and accounts were adopted.

AMALGAMATED METAL CORPORATION, LIMITED

MR CHARLES V. SALE'S SPEECH

The thirteenth annual general meeting of the members of the Amalgamated Metal Corporation, Limited, was held at Princes House, London, E.C., on the 19th instant. Mr Charles V. Sale, Chairman, presiding said:—

Gentlemen, before proceeding to business I have to record with deep regret the death on November 24th of our friend and colleague Mr William Murray, a member of the board of Henry Gardner & Co., Limited, since its formation; also a member of the board of this corporation since 1930. His cheerful presence and shrewd judgment will be greatly missed.

I ask you to give your attention in the first place to the combined balance-sheet of the constituent companies for the year ended December, 1941.

BALANCE SHEET CHANGES

Current liabilities are less by £1,342,000 than in 1940, chiefly owing to a decrease of £554,000 in creditors and accrued charges, and the repayment of a loan—£758,000. Current assets show increases in cash and Government securities by £503,000; likewise debtors and bills receivable by £111,000. On the other hand, there are no payments in advance, which last year amounted to £2,076,000, and stocks of merchandise have decreased by £321,000.

Investment holdings show a net increase of £487,000, chiefly arising from a temporary advance to a subsidiary company. This temporary advance—about £500,000—together with over £2,100,000 of the debtors and bills receivable, represented the total outstandings at the end of 1941 in respect of the trade overseas in rubber, tin and so forth in which Henry Gardner & Co. had been so largely engaged. Since then, as you will observe from the notes on the balance-sheet, these items have been liquidated. As a result of the policy of caution, prompted by the trend of events in the East, the tonnage of merchandise at risk in the danger zone—mainly tin—had been greatly reduced by the time the invasion of Malaya and the Netherlands East Indies took place, and provision was made in the accounts before you for losses arising from enemy action.

It is not possible to place a value on the shares in German and Belgian companies representing a book value of £794,536. The proceedings in Switzerland against the Société Suisse pour Valeurs de Métaux, the trustees for its debenture holders and the Schweizerische Bankverein, Basle, mentioned in previous reports, move slowly; recently, however, we have received the Defence and our legal adviser will shortly lodge the Reply.

I cannot leave these remarks without apologies for the omission of an explanatory footnote relating to the comparative figures of profit. The fall in 1941 appears to be £136,107, but, as mentioned last year, the 1940 accounts included receipts of

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

THE rather better reports from the war fronts and the announcement of the Moscow meetings provided the background to a further advance in the markets. Although chief attention was still centred on equity stocks, the ordinary share index of the *Financial News* reaching the highest level of the year, interest showed a tendency to broaden in the current week. Average daily markings were a little short of 3,800, and Monday's figure of 4,633

£73,637 attributable to the year 1939. Thus the comparable figures are £326,834 in 1940 and £264,364 in 1941; therefore the actual fall is £62,470.

DIVIDEND OF 3½ PER CENT.

Turning from the combined balance-sheet to the profit and loss account of your corporation, you will see that credit has been duly taken for £217,562 received by way of dividends from the constituent companies. After deduction of the preference dividends already paid, your directors recommend a dividend of 3½ per cent. upon the ordinary shares, leaving £36,026 to be carried forward against £33,054 brought in. If this be your pleasure, the reserves and undivided profits for the whole of your undertaking will then total £1,332,875 against £1,283,101 last year—an increase of £49,774.

The report and accounts were unanimously adopted.

WILLIAM HANCOCK AND COMPANY, LIMITED

SUBSTANTIAL PROGRESS

The fifty-fifth annual general meeting of William Hancock and Co., Limited, was held, on the 13th instant, at Cardiff, Col. J. Gerald Gaskell (chairman and managing director) presiding.

The chairman said that the company had made very substantial progress during the year. In fact, the trading profit had reached the figure of £249,963, a larger figure than any which they had attained during any previous year of the company's 55 years of trading. The result would be still more gratifying if a larger amount of that trading profit could be distributed to the shareholders. They had, however, been able to maintain a dividend on the ordinary stock of 10 per cent., which they had now been able to pay for five years. The balance-sheet seemed to him to be a good one and the company's financial position much stronger than in previous years.

It was not unusual to read that the results of trading concerns had been attained under great difficulties. That of course was obvious, and must be so under war conditions. For instance, the sum paid in Beer Duty alone had amounted to rather more than ten times the total profit shown available for distribution. Then again the cost in the price of materials used in brewing had risen to a figure last year of something like five times the pre-war cost.

There remained an exceptional demand for their products, a demand that was well beyond their capacity to fulfil on account of the difficulty of obtaining materials, and for the reason that they were now, and had been for some months, brewing to their maximum capacity. As a consequence it had been necessary to introduce a system of rationing which they thought had been fairly based on a percentage well above pre-war requirements.

The report was adopted.

W. J. BUSH AND COMPANY, LIMITED

DIVIDEND OF 10 PER CENT.

DR ISHERWOOD'S STATEMENT

The forty-fifth annual general meeting of W. J. Bush and Co., Limited, was held on the 17th instant at the Great Eastern Hotel, Bishopsgate, E.C.

Dr P. C. C. Isherwood, O.B.E., Ph.D., F.I.C. (chairman and managing director), presided.

The Secretary (Mr D. E. Arnold, F.C.I.S.) read the notice calling the meeting and the report of the auditors.

The following is the statement of the chairman circulated with the report and accounts.

Your directors have decided that, under existing conditions, it is again desirable to dispense with the usual review of the past year's working by the chairman at the forty-fifth annual general meeting of the company, and for me to provide a brief report to accompany the directors' report and statement of accounts for the year 1941.

In November of last year the company suffered the loss of Mr James Mortimer-Bush, who had been a managing director since its incorporation in 1897 and chairman since 1903. Mr J. M. Bush had devoted his whole working life to the interests of the organisation at home and abroad. Both directors and staff throughout the world have lost a great leader and friend.

I have worked in close association with Mr Bush for over 40 years, and was honoured by the board asking me to accept the office of chairman, made vacant by his death, while Mr H. B. Bush accepted the appointment as a managing director. Owing to the great expansion of the company's business your directors consider it desirable to enlarge the board, and Messrs. C. F. Bush and A. J. McIntyre were appointed directors. Recently the managers of our subsidiaries in Canada and the United States of America, Messrs M. St. Alphonse and R. R. Webb respectively, were appointed to the board.

During the year under review, the company obtained a net profit of £163,278, after providing for debts in all enemy occupied countries. Of this figure it is estimated that in addition to amounts already provided a sum of £84,085 is required for taxation, leaving £79,193 as the net earnings for the year. This, added to the amount of £153,398 brought in from the previous year, less preference dividend, makes a total of £226,341 to be dealt with.

Your directors recommend that this be disposed of as follows: By the payment of a final dividend of 6 per cent on the ordinary shares, making (with the interim dividend already paid) 10 per cent. for the year, £25,000; by adding to reserve against possible plant obsolescence £15,000, and by carrying forward the balance £178,341.

The report was unanimously adopted.

home rail market, junior stocks enjoying small but steady gains. Daily markings in the foreign rail market showed some improvement, South American issues hardening on light support, and Argentine ordinary stocks gaining several small advances.

Both markings and prices showed steady improvement in the industrial market. Although leading equities were in demand, shortage of stock, together with the low yields obtainable, turned investors' attention to some of the lesser-known stocks. Persistent buying of textile shares on the immediate prospects of the industry occasioned an all-round advance in this section. Heavy industrial issues attracted steady

support, William Cory, Firth Brown, Whitehead Iron and Hadfields all improving. In the shipping section, the results of British India Steam Navigation drew attention to the prospects of P. & O., while both Clan and Coast Lines were prominent. Statements on the extent of the increased tobacco consumption prior to the last Budget gave rise to considerable activity among tobacco shares. Imps was outstanding, rising $\frac{3}{8}$ at the re-opening, while Gallaher and Carreras also advanced. BAT, in contrast, showed little change on the interim dividend announcement. Brewery stocks were particularly strong, Bass, Guinness and Watney deferred leading the general advance, which included several provincial brewery shares. The general upward trend was not fully reflected in the motor and aircraft group at the beginning of the week, when a rise of $\frac{1}{8}$ for Rolls Royce overshadowed many narrow movements, but there were several small improvements in midweek. Among stores issues, leading shares were bought, while in the miscellaneous section, International Nickel, Sudan Plantations, Hudsons Bay and International Paint were all in demand.

cipated in the general advance. Anglo-Egyptian provided the exception with a fall of $\frac{1}{8}$, but recovered in the current week. Among South American issues, VOC and Trinidad Petroleum Development enjoyed support, while Anglo-Iranian remained firm.

New York

The *kaffir* market reflected the improved war news with a revival of investment demand for dividend paying mines. Prominent in the general improvement were Sallies, Rand Mines, Sub Nigel and Crown Mines, but Blyvoors, among other developing mines, was barely steady. Among *diamond* issues, De Beers deferred was in demand, rising $\frac{1}{8}$ point on the week. Activity in the *tea* and *rubber* markets was slight, although some support for leading tea issues was reflected in good gains for Nuwara Eliya and Pabbojan at the re-opening. The oil market was distinctly firm at the close of last week, some late support raising Burmah and Anglo-Iranian $\frac{1}{8}$, while Shell and Mexican Eagles parti-

THE initial success in the Solomon Islands, together with reports of strong Russian resistance and Mr Churchill's visit to Moscow, provided the incentive for a general advance on Wall Street throughout the past week. Rather bullish sentiment encouraged widespread buying, attributed largely to investment demand, raising many quotations to the year's highest level. Aircraft and other war specialities led the upswing before the weekend, gains of two points being general, while despite some light profit taking, the advance continued in the current week.

Total share dealings: Aug. 13, 317,000; Aug. 14, 380,000; Aug. 15, 127,000; Aug. 17, 294,000; Aug. 18, 557,000; Aug. 19, 504,000.

* Two-hour session only.

COMMODITY AND INDUSTRY NEWS

British Overseas Cottons.—About two years ago, under the Defence (Encouragement of Exports) Regulations, 1940, the Board of Trade imposed a levy of 5d. per 100 lb. of raw cotton bought by spinners for the purpose of defraying expenses in the promotion and financing of export trade in cotton goods, and it is now announced that the levy is to be suspended for the time being. The object of the fund created was to finance British Overseas Cottons, Limited, and it has been stated in Parliament that about £50,000 had been lost by the company. There is still a considerable surplus, and the work of British Overseas Cottons, Limited, will continue. In Lancashire this organisation has been criticised, but some favourable results have been achieved. Many small merchant firms have benefited owing to this organisation being in a position to deal in bulk with the numerous small allocations which would have been difficult to work on individual lines.

Utility Scheme Allocations.—Arrangements are now being made for some revision of the system of granting allocations for cotton and rayon goods under the utility scheme. The original allocations have resulted in some anomalies and discussions have taken place between the Cotton and Rayon Merchants' Association and the Cotton Board. It has been generally agreed that some modifications are necessary in determining a basis of qualification for converted-merchants. A meeting of all converters concerned in utility allocations is to be held in Manchester, where a more equitable basis of qualification will be outlined.

Domestic Pig Ration.—Rations for pigs kept for fattening by domestic pig keepers are to be reduced. From September 1st a

ration will be allowed for only one pig instead of two, and two instead of four for members of pig clubs registered with the Small Pig Keepers' Council. Rations will continue to be issued on the present basis during September and October, provided that the larger number of pigs continues to be kept during that period. New registrations will only be allowed on the new basis from September 1st. The scale of rations per pig will remain unchanged at $\frac{1}{4}$ unit of cereals per month with a small allowance of protein in addition for members of pig clubs registered with the Small Pig Keepers' Council.

Export Control.—Under the Export of Goods (Control) (No. 33) Order (S.R. and O. No. 1598), which comes into force on August 31st, licences will be required to export lace and lace net, wholly or mainly of cotton, artificial silk or both, and articles made wholly or mainly of such lace or lace net other than hair nets; manufactures

THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

CAPITAL (PAID-UP) - £3,000,000
RESERVE FUND - £3,000,000

Branches and Agencies throughout INDIA and the EAST
AFFILIATED BANK IN INDIA

THE ALLAHABAD BANK LTD., with 15 Branches & 30 Sub-Agencies

The Bank offers a complete Banking Service and provides exceptional facilities for financing every description of trade with the East.

Deposits for Fixed Periods or repayable at call or at short notice are received at rates which may be ascertained on application.

The Bank also undertakes Trusteeships and Executorships.

Head Office: 38, BISHOPSGATE, LONDON, E.C.2

London: 117/122, LEADENHALL STREET, E.C.3

Branches: 28, CHARLES II STREET, HAYMARKET, S.W.1

Manchester Branch: 52, MOSLEY STREET

New York Agency: 65, BROADWAY, NEW YORK CITY

THE UNION BANK OF AUSTRALIA

ESTABLISHED 1857 LIMITED

Capital Authorised and Issued ... £12,000,000
 Paid-up Capital ... £4,000,000
 Reserve Liability of Proprietors ... £8,000,000

(Not capable of being called up except in the event of and for the purpose of the bank being wound up)

Reserve Fund ... £3,250,000
 Special Currency Reserve ... £1,600,000

Head Office: 71 CORNHILL, LONDON, E.C.3
 West End Agency: 15 CARLOS PLACE, W.1

Drafts are granted on the Bank's Branches throughout the Australian States and Dominion of New Zealand. Telegraphic Remittances are also made. Commercial and Circular Letters of Credit, and Travellers' cheques issued. Bills are purchased or sent for Collection. Deposits are received for fixed periods on terms which may be ascertained on application.

THE BANK OF AUSTRALASIA

(Incorporated by Royal Charter, 1835)

Paid-up Capital ... £4,500,000
 Reserve Fund ... 1,500,000
 Currency Reserve ... 2,000,000
 Reserve Liability of Proprietors under the Charter ... 4,500,000

£12,500,000

Court of Directors:

D. F. ANDERSON, Esq. HON. GEOFFREY C. GIBBS.

Three Years

WITH this issue, *The Economist* enters its rooth year and World War II its fourth. On Saturday, September 9, 1939, a statement was issued by the War Cabinet:

At their meeting this morning, the War Cabinet decided to base their policy upon the assumption that the war will last for three years or more. Instructions are being issued to all Government Departments to ensure that plans for the future shall at once be prepared on this assumption.

In 1914, Lord Kitchener had called for recruits "for three years or for the duration of the war"; Mr. Chamberlain and his advisers, three years ago, followed suit. It may well be asked what progress has been made, and what achievements registered, by the Three Year Plan. It may even be asked whether the pattern of World War I is not being repeated. Again, the enemy has won almost all the battles for three years. Will he again lose the war in the space of another twelve months? The analogy is tempting.

General Sikorski has expressed what is the hope of many sober people.

The war will not end in 1942 as some believe. It will

be drawn out through a fourth winter. The present period and the beginning of 1943 will be the period of gradual exhaustion for the enemy; it will weaken him in a moral and physical respect. It will prepare the way for the final triumph by increasing and concentrating the forces of the anti-German coalition and by the planning of decisive blows.

Hitler has spoken, almost simultaneously, in the same vein.

If, in this greatest struggle of all times, the German soldier is making sacrifices and undergoing privations that can hardly be imagined, then in this year the homeland is more than ever bound to make the greatest possible sacrifices.

Compared with August 4, 1917, when Lord Kitchener's forecast of three years had been fulfilled, the outlook is not worse, to say the least. Then, Russia was being beaten down in battle and on the verge of collapsing from within. Nivelle's earlier offensive in the West had ended in bloody frustration. Another offensive had been opened with less hope and, as it proved, equal futility. The French army had been rendered scarcely fit to fight by the sacrifices it had made. The United

States was at war but still on a peace footing. Shipping losses had run as high as the losses of this year; and the volume of Allied shipbuilding was vastly smaller. There seemed no way of breaking the impasse; the trench stalemate across France and Flanders seemed an impassable barrier.

Now, at the end of another third year of world war, visibility is better. France fell two years ago, but Russia is still fighting, taking this time an even heavier toll of German life and material than the slaughter of the last war's western front. The United States is on a war footing as well as at war. Britain has reached a stage in war production never touched in 1914-18. In every item of war equipment, the Axis powers are outdistanced by Allied factories. To win his long chain of military triumphs, Hitler brought in the new air weapon; already, it has taken the shape of a boomerang. No one who coldly considers the statistics of British air raids upon Germany will question the Fuehrer's claim that the German homeland is "more than ever bound to make the greatest possible sacrifices." The Anglo-American Second Front is in active preparation; and, to quote General Sikorski once more:

One of the chief factors in winning victory is the enslaved nations. Never before in history has the hatred of invaders been so overwhelming as the hatred of the Germans in the Europe which they have conquered.

1943 may be 1918. But history only repeats itself if men make it do so. The years of the war are not yet measured. In terms of arms and fighting men, the free peoples are better ready to make victory theirs in another year, for all their much greater losses in territory and their wider-flung foes, than they were at the three year mark in World War I. This is no assurance that it will happen; it is not determined. Germany is armed *cap à pied* this time against material shortages or an internal breakdown. There is no shortage of output from Allied factories; but because of the great distances which link the battlefronts, there are still sore shortages, geographically; and, in the recent past, there have been shortages of quality in equipment and of skill in their use.

President Roosevelt put the issue to his people a few days ago:

Today in distant places we are fighting battles the like of which has never before been known . . . to carry such battles to a successful conclusion, the men who fight on land and in the air must work in perfect unison with the men who fight above the sea, on the sea and under the sea.

More than in 1917, the Allies can command the strength for victory. But the problems of deployment and strategy, of transportation and of leadership, behind the lines as well as in the field, remain open, "Unison" is indeed the master-key: unison among all the Allies in their plans and deeds as well as between all arms in every action; and unison among all the parties and all the classes in each United Nation.

The special task of Britain is to be the bridge between Russia's great resistance and the vast fighting power which is being developed in the United States. The enemy's hope is to cut off and cripple the Soviet before the other Allies can strike; and then, by battering the British base and severing the ocean lifelines, to hold off the American menace. He has not yet failed.

There is neither profit nor sense in prophecy. The kind of confidence which pins its faith, alternately, upon calendar prognostication and figures of production is perilous stuff. The end has not yet begun. It is still possible for the enemy to strike tremendous and grievous blows before the true weight of the Allies can be thrown against him. Russia is the pivot of Allied and Axis hopes alike. Whether the position today is better or worse than it was in August, 1917, depends crucially upon whether Russia stands or falls; and Russia is still in great danger. Britain's best aid immediately to Russia and to the logistics of forward strategy is to hold the enemy back from the Middle East and to free the Mediterranean for Allied movement. The clock could be

set back grievously by fresh defeats in Russia or in Egypt.

It is unwise to regard even the solid successes of the Americans and the Australians against the south-eastern tentacle of the Japanese advance in the Pacific as victory already in the making. The aggressor has been bloodily checked in a series of brilliant actions; the first steps on the long road to redress disaster in the Indies may have been taken. But Japan's great contribution to Axis hopes, the spreading of Allied strength over thousands more miles of land and water, still stands. Despite Japan's recent losses and reverses, the danger of a further contribution, in the form of a pounce upon the Soviet rear while the Volga battle is at its crisis or upon India while political murmurs are muffling the Indian war effort, has not been removed.

When war broke out in 1939, a Three-Year Plan was made in Britain which, for all the sloth of its early stages and the patchwork and pasteboard of its final form, has worked miracles. More properly it should be regarded as a Two-Year Plan. The period of sluggishness until May, 1940, was a false start. After the fall of France and the disastrous losses at Dunkirk, a fresh beginning had to be made in the worst conditions of haste and danger. There was at least a decade of unreadiness and stupidity to undo; and disasters went steadily on as the plan grew. But the battle of Britain was won, and the seas kept open. Britain is now virtually fully mobilised for fighting and the manufacture of arms and munitions. Man for man, more war material is being produced than anywhere else in the world. No other country has equalled the fullness and fairness, in relation to available supplies, of British food rations. The programme of curtailment which began with the limitation of supplies of material to civilian manufacturers, and went on, often haltingly and often reluctantly, to the concentration of manufacture, clothes rationing and utility production, has not been rivalled. For a long year, Britain was the lone base and arsenal of freedom. The process has been inveterately piecemeal. The conception of a rounded war economy, binding the entire community in a single wartime association of efficient effort, has never been seen as a whole. But the achievement has been immense.

What is needed now is a supercharger, a One-Year Plan with pace enough to make up for the time lost earlier and vision enough to capture the next twelve months for the Allied cause. Never before has the call for "lucidity and daring" been more imperative. The time has come to remove every inhibition of old-fashioned habit from the planning of campaigns and the fighting of battles; to weld the war measures of Britain and the United States, severally and jointly, into a single project, stripped of national prepossessions or social compromises. A combined command of all arms and all Allies is needed in every theatre, and a single strategy. Behind the fronts the only yardstick should be swift efficiency. It is a remarkable commentary on the false peace which Russian resistance has given the leaders and citizens of the other Allied countries that neither Britain nor the United States should have been able to work out a policy for wages against inflation and inequity; that the British Civil Service and its best servants should be hobbled by old ways and routine; that politics, openly in the United States and by tacit agreement in Britain, should still be based upon the ancient push-and-pull of interests; that the cumbersome and stratified organisation of the American war effort should seem beyond simplification; and that Allied technicians should still seem to lag behind Germany in the economy of scarce resources.

Wartime journalism is a dangerous trade. Necessarily, it is carried on by civilians no closer to war facts or war experience than other civilians. Inevitably, it is the product of the arm-chair, remote from the noise of battle. It is a fortunate and humble writer who can refrain from laying down the law. But, after three years, this much can be said by any journalist who knows his trade and his neighbours, as well as his own limitations in matters of high policy: the war can now be won by the Allies,

but it can only be won on two conditions. The first condition is that the problem of the swift and sure deployment of forces can be solved in time. The second is that the brakes are taken off the restless ingenuity and will to win which surge steadily beneath the strained, anxious, frustrated surface of wartime life and work. Tradition has been strong in this war so far. Never once, except in Russia, have the bounds of respectability and decorum been overstepped, even in aid of salvation and victory. The pledge of May, 1940, to take over all persons and all property in this country for the prosecution of the war was vastly more drastic in sound than in consequence. Now, the hour has struck for an order

of the day to sweep all this away, wherever needful, and for every citizen in Britain and the United States, like every man, woman and child in, say, the Russian battle areas, to be given the duty and privilege of working for no other aim but the winning of this war. If for a year all the committees, all the bargains, all the checks and balances and all the safeguards for peacetime place and prospects could be set aside; if it could be made plain that every citizen is a soldier with no more than the soldier's right to care and maintenance and no less than the soldier's duty to sacrifice everything for his country: then there would be a One-Year Plan indeed, and 1943 might well be 1918 again.

The First of the Free

ALMOST exactly three years ago, the whole military might of the Third Reich was thrown against Poland. In the words of Mr Eden's message on Tuesday to the Polish Ambassador,

It was her fate and her privilege to be the first among the nations of Europe to accept the German challenge.

On the German side, there were some sixty divisions of infantry, eight motorised divisions and seven Panzer divisions; they were supported by 3,500 planes. On the Polish side there were thirty divisions of poorly armed infantry, eleven brigades of out-moded cavalry, two small motorised brigades and 300 light tanks; no more than four hundred obsolete aircraft were available. The fact that Poland dared to take up Hitler's challenge in face of such overwhelming odds will for ever remain an outstanding instance of courage and resolution.

It is sometimes said that this daring was due to the proverbial romanticism of the Polish people. After three years of war, this "romantic" spirit appears much more soberly realistic than the outlook of the nations which stood passive and Maginot-minded during the first stages of the fight. Only a nation which knew its very existence to be at stake and could draw upon immense moral resources of its own could afford anything like the "Polish folly" of 1939. There was, admittedly, no lack of inefficiency and political blindness in the ruling cliques of Smigly Rydz and Beck. Had the issue depended upon these politicians and commanders, the campaign might have lasted three days instead of three weeks. The stubbornness of Polish resistance was due to the sense of a holy war which took hold of the entire nation.

The holy war has never stopped. The purpose of German policy in Poland has been to absorb or to destroy

the Polish people. Economically, Poland was first given the rôle of an agricultural hinterland for industrial Germany. Militarily, after the outbreak of war in Russia, Poland became the vital corridor between East and West. Poland is Germany's eastern outpost; and its subjection to the economic and military needs of total war has been carried through with all the brutality of primitive tribal strife, made worse by the employment of the most efficient modern technique.

The exploitation of Poland by Germany is most sharply seen in the numbers of Poles taken as slaves to work in Germany. In addition to 750,000 Polish prisoners of war, more than one million Poles have been forced to work in German industry or agriculture. Nor is slave labour a mere phrase in this context. No labour exchanges have drafted these Polish hands; there has been no exchange of workers for prisoners of war. All that happens is that the streets of Warsaw and other Polish towns are swept by press gangs.

At first, the open aim was to de-industrialise Poland. Later, the requirements of war compelled the Germans to make full use of Poland's industrial capacity. The main aim then was to integrate the coal and iron industries of South-Western Poland with the resources of both parts, German and Polish, of Upper Silesia into a vast combine. But the development of Great Upper Silesia has been hampered by the disproportion between the manufacturing capacity of its metal industries and the supply of raw materials. A substantial increase in coal output seems to have been secured; but the target figure of 100 million tons of coal annually from the whole area, half of which was to come from Polish mines, has not been reached. The region is poor in iron ore. Out of 84 Silesian rolling mills, about half are said to be redundant. Even so, this

EQUITY & LAW
LIFE ASSURANCE SOCIETY

Established 1844

THE SERVICE OF LIFE ASSURANCE

● Life Assurance provides the means whereby your regular savings, year by year or month by month, may be converted into the form best suited to your needs. Provision may thus be made for your retirement, for the education of your children or for your dependants after your death.

● The service of Life Assurance cannot now be offered to you by personal approach owing to the absence of so many of the Society's staff on war duties. This service is, however, still available on request and will gladly be placed at your disposal.

Head Office: 163/4, STRAND, LONDON, W.C.2. Telephone: TEMple Bar 0381
(temporarily transferred from 20, Lincoln's Inn Fields)

amalgamation of German, Polish and Czech industries is a factor which will influence the economy of the entire region after the war. It is comparable only to the integration of the complex of Ruhr industries with the annexed industries of the West.

The infiltration of German capital into Polish industry in support of these industrial plans has been perhaps the most brutal chapter of all in modern economic *Raubrittere*. In Western Europe, the Germans still preserve some law-like financial manners in securing controlling shares in key industrial concerns. In Poland, these standards were discarded altogether. French shareholders in Silesian businesses have merely been "induced" to sell their shares; Polish owners have in most cases simply been expropriated.

Attempts have been made to prop German rule in Poland by creating vested interests in the occupation among certain sections of the population. Success has been negligible. One way was the aryanisation of industry and trade, to throw Jew and Pole into rivalry. Economic competition between Jew and non-Jew has always been strong in Poland; it provided the basis for political anti-Semitism among the Polish middle class. But the German attempt to play the anti-Jewish card has been defeated here, as in many other cases, by the excessive greed of the Germans themselves. Mostly, it was not the Pole but the German settler who stepped into the shop or office of the expropriated Jew. Nor was the attempt to bind the peasantry to German rule by economic links more successful. As in all Eastern European countries, the peasantry in Poland was exhausted and impoverished before the war by the protracted slump in agricultural prices and by high taxation. The war opened up wider markets for farm products. At the outset of the occupation, the peasants must have felt some relief; a gulf threatened

to open between town and countryside in Poland. But the peasants' rewards turned to ashes; their illusory nature became evident. The increase in peasant incomes was brought to nothing by monetary inflation. Massive requisitions of produce and the confiscation of land drove the peasants to despair. A special concentration camp was set up exclusively for Polish peasants who offended against the decrees dictating deliveries of foodstuffs to their German masters.

The Poles can say with pride, after three years of occupation, that their country has produced no quislings. This and all the rest of Poland's contribution to the fight since the "folly" of 1939 entitle the Polish people to expect that the position of their country when the war is over will be better than it was before. All the political documents of underground Poland, where relentless resistance is carried on, stress two main foundations for the post-war settlement—full employment and national security. Poland will end this war more ruined and impoverished than any other European country. Twice it has been ravaged, first in September, 1939, and then in June, 1941. Who knows when Polish soil may become a battlefield again? Vast efforts in work and planning will be needed to enable the Poles to rebuild their houses and to attain a tolerable standard of living. This will not be possible without substantial help from the other United Nations. The problem of security will be no less difficult. For Poland, more perhaps than for any other country, security is not compatible with the existence of spheres of influence allocated to stronger neighbours; but it is no more compatible with national seclusion or undue nationalism. Only a wide and coherent framework of international organisation can point the way out for Poland from the maze of difficulties which will make up post-war Europe.

Reward of Service

THERE are perhaps some four to five million men in the Armed Forces. All of them are under discipline; most of them are conscripts; the majority of them have the inescapable duty to risk their lives for their country. The complaint that these men are underpaid compared with civilians, in terms both of pocket money for themselves and of material security for their families, has grown as the war has lengthened. From the start of the war, there was obvious irony in the situation which called upon the men in the Forces to fight and die for perhaps as little as 2s. 6d. a day, with their dependants almost certainly worse off than before the war, while industrial workers and salary earners retained the right to bargain for higher remuneration. But, in the first year of the war, the earnings of munition workers had not yet been swollen by the general working of overtime or by general increase in wage rates. Moreover, the British army in France, fighting beside French soldiers with their sou a day, felt comparatively well off. Since then, however, the inability of British fighting men to keep pace with the spending of Dominion and now American troops or even to match the spending money of girl munition workers has thrown the discrepancy into relief. For some time this question has been a major political issue. It is about to come to a head in a Commons debate.

There has been some tinkering. Improvements have been made in allowances for Service families. A small increment in basic pay has been granted. Extra remuneration for trade skill and proficiency has been extended. Indeed, there are almost as many rates of pay in the Forces as in industry; and the average pay and allowances of non-commissioned men in all grades would compare more favourably with a cross-section of industry than the minimum rates. Nevertheless, the conviction remains that those who risk most are paid least. Only relatively few actual combatants are Service tradesmen. The acid test is the status of the Army private or his equivalent in the other Services.

The Government's intentions are not known; but they can perhaps be guessed. The tenor of the White Paper on Pay and Allowances is to prove that the members of the Armed Forces are better off than public opinion credits. In narrow terms of statistics, this contention is probably correct. As the White Paper points out, it is not possible to make more than a rough comparison between the entirely different systems of remuneration in Service and civilian life. The soldier is "all found" by the state and paid pocket money; the civilian has to fend for himself on a larger money income. To compare the pay of one with the wages of the other is misleading. If comparison is to be made in money terms, a figure must be added to the soldier's pay for his board and lodging.

The White Paper is an attempt to make this calculation. The basis of its arithmetic is not the actual money value of the food, clothing, shelter, and so forth which the War Office provides. Instead, an attempt is made to assess the civilian expenses from which the average soldier is freed by the board and lodging which he is given—a sum which is highest for unmarried men without dependants. The married man is not freed from the expenses of a home; he is saved the cost of his own clothing, food and travelling expenses, but not his rent and other overheads. It is for this reason that, in the official calculation, a higher sum is added to the cash earnings of bachelors without dependants than to those of married men with families, to arrive at an estimate of the total value in money terms of receipts in cash and kind. In so far as this kind of statistical calculation is relevant, there is no doubt that it is the right working basis.

The actual increments which, the White Paper suggests, cover civilian expenses escaped by these receipts in kind are 35s. for bachelors without homes to keep up and between 23s. and 25s. for men with family responsibilities. Thus, the "notional" income of the unmarried man becomes 52s. 6d. a week, made up of 14s. basic

pay, 3s. 6d. war pay and 35s. received in kind. The married man with no children is estimated to receive an income of £3 2s. a week, made up of 17s. 6d. pay, 18s. marriage allowance and 23s. receipts in kind; and this minimum income is computed to rise to £3 17s. if there are two children and by 5s. for each additional child. A glance at current earnings in industry, assuming for the moment that these calculations for Service benefits are correct, shows a wide gap. The average industrial earnings of men over 21 last July were £5 6s. 5d. over the whole range of industry; they were highest in the war trades, the metal industries, engineering and shipbuilding, with an average of £5 11s. 5d., and ranged around £4 or more in the lowest paid sections. This comparison, however, though illuminating, is not exact. The income of the lowest paid soldier, however computed, cannot fairly be contrasted with the average earnings in any industry, which include the highest as well as the lowest paid of workers. The Army average is not known; but, inevitably, it must be nearer to the industrial figure than the Army minima—as calculated on the basis of the White Paper's reckoning.

But are the calculations of the White Paper reasonable? It is hard to escape the conclusion that the "notional" Service income they arrive at is exaggerated. The crucial figures are the estimates of 35s. and 23s., respectively, as the value of receipts in kind enjoyed by bachelors and family men. Whether the soldier is a lance-corporal, a Class A tradesman or a private with three years' service and proficiency pay, the value put upon his board and lodging determine, statistically, whether he is underpaid or overpaid in relation to an equivalent grade of civilian. The difficulty about the two White Paper figures is that they cannot both be right. The estimate of 35s. for the unmarried man without dependants is held to cover all benefits not received in cash, that is, food, clothing, shelter, heating and lighting, medical attention, free travel warrants, daily expenses from which the soldier is free, and so on. The married man's receipts in kind, computed at 23s., presumably exclude from this list all of his civilian expenses which cannot be avoided, such as rent, heat, light, possibly life insurance and domestic help. The difference between 35s. and 23s. is 12s. This means that rent, heat, light and the rest are apparently estimated at as little as 12s. a week, which is absurd; the married man would be fortunate if his rent alone came to as little as this. It seems certain that the difference between the value of receipts in kind to the single man and to the married man has been under-estimated.

The figure of 35s. for the single man is probably too high. It is based on the Government hostel charge of 27s. 6d. for partial board and lodging, with an addition of 7s. 6d. for food, clothing and other costs. But many unmarried men without dependants live neither in hostels nor in lodgings, but as part of households, possibly those of their parents. To the upkeep of these households, they do contribute; but they are unlikely to pay more than their actual share of the cost. A clue to the actual size of the weekly housekeeping contributions made by unmarried men is provided by a Survey of Working Class Budgets which was made by the Ministry of Labour in 1937 and 1938, on the basis of an average household containing 3.77 persons. The weekly "board and lodging" expenditure of the average household, divided by 3.77, discloses an individual weekly cost of 16s. 2d. If 7s. 6d., the estimated cost of additional expenditure on clothing, food and travel, is added to this figure, the total is 23s. 8d.—which means that the average expenses of an unmarried member of a working-class household, even allowing for the increase in prices since 1938, should be well below the figure of 35s. used in the White Paper. The value of receipts in kind for the married soldier, that is, the value of the smaller proportion of his civilian expenses of which he is relieved, can hardly be less than 15s. below their value for the unmarried man. If the average for the unmarried man, to allow for increased prices and miscellaneous items, is raised to 27s. 6d., this would reduce the value of receipts in kind to married men from 23s., the White Paper figure, to 12s. 6d.—which is again borne

out by the survey of working class budgets which suggests a figure of 11s. 6d. for expenditure on food and clothing when the man is living as part of a household.

The inference of this very rough and ready reckoning is that, although the authors of the White Paper may have gone about their statistical task in the right way, the value they have placed on the soldiers' receipts in kind is definitely too high. This means that the disparity between the incomes of soldiers and civilians, while perhaps not so great as is generally supposed, is considerably larger than the White Paper would suggest. Where soldiers have large families, the payment of family allowances, which is absent in civilian methods of remuneration, does progressively reduce the disparity as the size of the family increases. But, in the case of the private who draws only basic pay, the gap is very wide. Traditionally, Service rates of pay have been based on an attempt to equate the gross receipts of soldiers with those of agricultural labourers—a revealing commentary on the status of fighting men. The minimum wage for agricultural labourers now is 60s. a week; even the War Office estimate of total receipts by unmarried privates, which is almost certainly too high for the average case, because of the exaggerated value given to receipts in kind, is only 52s. 6d. If the intention of the White Paper was to prove that, by and large, all is well, it has signally failed.

The gap exists. Moreover, whatever statistical niceties are argued on this or that side of the controversy, the question cannot surely be settled in this way. The fighting man, very naturally, is not interested in "notional" and academic figures. He is interested only in two things: first, in the cash he has to spend; secondly, in the standard of living of his family. The basic pay of a private is 17s. 6d. a week, reduced in the case of a married man to 14s. by the deduction of an allotment towards his wife's allowance. The spending power of civilians, that is, the margin left after household expenses have been met, is indeed reduced by taxation and saving and in other ways; but it can very rarely fall as low as 14s. a week on drinks, tobacco, entertainment, postage, and so on. No precise statistical yardstick can be found; but, when the arithmetic has been done, however ill or well, the public's feeling that, all in all, the soldier, and particularly the soldier's family, is worse off, still seems soundly based. The disadvantages of the soldier's life compared with the civilian's—the discipline, the absence from home, the discomfort and the danger—cannot be calculated away. In wartime, the nation is divided, half bond and half free. It is admittedly impossible to compensate the soldier in full for these disadvantages; but there should be no rest to efforts to improve the soldier's lot until the soldier and his family can be reckoned, not merely as well off as civilians, but better off.

As the war spreads into its decisive stages and casualties mount, the sore will fester. Millions of men will have an account to render when they come home—they or their bereaved families. The Government should tear up its apologia and use its imagination. It should cease at once and for all to regard its responsibility to serving men and their families as being the simple removal of hardship. Equality in wartime either of sacrifice or of remuneration is not possible. But less inequality is always possible—and urgent. Much has been done by rationing and taxation to spread civilian consumption more equally; the real rewards of civilian service have been steadily curtailed. But the time has come to face the fact squarely that, in money terms, civilian rewards are too high and service rewards too low.

What is wanted is a three point plan: to raise the spending money of the lowest paid fighting man to, say, £1 a week; to raise the money incomes of soldiers' families nearer to the level of their civilian neighbours; and, at the root of the problem, to put an end at last to the upsurge in civilian earnings from wages and salaries which is economically perilous no less than socially. The ground would then be stronger for requesting more restraint upon the spending power of visiting troops while in this country; and, more important, both social justice and war economy would be better served.

NOTES OF THE WEEK

Action in Africa

Whether the Battle of Egypt has, in fact, restarted, and, if so, how the battle is going, is, at the moment of writing, wrapped in some mystery. The enemy has probed the Allied lines in full strength. In one sector in the south, his forces have pushed forward some miles through the minefields, and in this area, between Hemeimat and the Ruweisat Ridge, at least one large-scale tank engagement took place on Tuesday. But the action was apparently broken off. The crucial clash of armour has not developed; and General Montgomery has stated that the enemy has not penetrated the Eighth Army's organised defence areas anywhere. The uncertainty about what is going on is due in great measure to the fact that, after the bitter lessons of former campaigns, when comments and forecasts went badly awry, Cairo's lips are almost completely sealed. But, from the scale of the air and artillery activity which has been reported, it seems likely that this crucial battle has been joined again; and it may be that this time a simultaneous thrust may come from Crete and the Balkans to support Rommel's attempt to unlock the Middle East for the Axis, at the moment when von Bock's armies have reached the Caucasus in the north. For all the Allies, the defence of Egypt, Palestine and Syria is vital; and, if Rommel could be driven back and air and sea power be restored in the middle Mediterranean, it would be a major victory.

The Air Weapon

It is suggested in an earlier article in this issue (on page 289) that the air weapon, first used decisively by the enemy, is proving a boomerang. Whether in fact the engineer will be hoist with his own petard has still to be seen. But obviously he can be. The output of aircraft from Allied factories, this year and next, is a measure of the decisive part which air power can play in the final stages of the war, if it is properly used. The question whether air power can be decisive as an independent arm need not be debated. Only the event will tell; and whatever the answer, the bombing offensive against German Europe is an integral part of a combined offensive in all elements, whether that offensive ends in the occupation of Germany or in its collapse among its own ruins. The real root of the controversy between those who oppose air power to land or sea power, and vice versa, is the problem of allocating scarce resources and limited manufacturing capacity. If the building of big bombers precludes the construction of aircraft to work with military or naval forces or the construction of transport planes, a wholly unjustifiable distortion results. Without their decisive air component, land and sea forces are wasted. This has been proved time and again in the past three years. To take the chance of leaving the great armies, navies and merchant fleets of the United Nations stripped of their essential air arm and air artillery, for the problematical possibility of winning by bombing alone, would be suicidal. The fact that large Allied resources are in part immobilised for lack of air carriers is one of the most serious gaps in Allied strategy. There are welcome signs that these pitfalls are at last to be avoided—shadowy signs of a real three-Service mind in strategy and output as well as in single tactical operations. Here, as in every other department of the united war effort, the need is for the combined use of every weapon regardless of sectional controversy. It can be admitted that air power, whatever course the war takes, will, in one sense or another, be decisive. But this does not mean that the decision will be registered by air power alone. It means rather that air power is the decisive factor in every operation on land or on the water, as well as in the air. Nothing has happened in the war so far to suggest that the work of invading and reducing enemy territories, in Europe or in the Far East, will not be needed, with all the paraphernalia of naval and military might. The air bombardment of Germany, when weather allows it, has now reached a pitch where the damage done, in its effects on morale and output, is in a different category from the bombardment of Britain two years ago. It is an essential part of the process of enfeebling the enemy. But it is still the preliminary barrage, the prelude to the assault. The armies which follow must still have their air weapons,

singly commanded, just as the United States Navy could not have held and thrown back the Japanese in the Pacific Islands without its air arm, brilliantly handled.

The Battle of Russia

The Russian resistance at Stalingrad is still tenacious, although the southern arm of the German pincer movement, from the Kotelnikovo area of the Don bend, is making dangerous progress. The position to the north-east in the Kletskaya region has also deteriorated, the Germans claiming to have reached the Volga north of the city. Soviet troops in the Caucasus are holding their ground before Grosny, and have prevented enemy attempts to cross the river Terek south-east of Prokladnaya; but the Germans on Tuesday claimed the capture of the Black Sea port of Anape. Near Rzhev, the counteroffensive launched by General Zhukov, now promoted to be Stalin's first deputy as Commissar for Defence, has met with considerable success. The initial attack resulted in a swift local victory for the Russians, largely owing to the element of surprise successfully employed—the use of a feint zero hour which deceived the Germans. It is too early yet to say how far this offensive will succeed in directly diverting German resources from the attack on Stalingrad, but almost certainly it must divert some reinforcements which would otherwise go to the southern front. The Russian advance in terms of territory has been relatively slight, but in terms of cost to the enemy it has been significant. The ferocity of the fighting in the central sector, described by press correspondents who have visited the front, can be judged from the fact that, in a fortnight, the Red Army is reported to have smashed eight German divisions, including the second Panzer division, and badly mauled six others, including the first and fourth Panzer divisions. The object of the Russian fighting, whether in offence, defence or retreat, is to make the enemy pay, and to compensate for any inferiority in their own supplies by wearing down his manpower. To kill Germans is the order of the day. Thus Mikhailov, Secretary of the Central Committee of the Young Communist League, told young Red Army men:

There is only one criterion of a young soldier's devotion to his fatherland—"tell me how many Germans you have killed and you will be told whether you are a real patriot or not." That man today is of the greatest value to his people who kills Germans day in, day out. . . . Remember that if you have not killed the enemy, no one will kill him for you.

Setback for Japan

A communiqué issued on August 27th by the United States Navy Department revealed an Allied naval victory off the Solomon Islands with the brief announcement that the Japanese surface forces had withdrawn. The details of the action are still awaited. There is no more news than there was a week ago of the damage inflicted on either side. All that is clear is that the Japanese totally failed to achieve their object of regaining control of the Solomon Islands, five of which are completely, and one—Florida Island—partially, dominated by the Americans. Meanwhile, the enemy landing at Milne Bay in New Guinea, in an attempt to turn the right flank of the Allied forces defending Port Moresby, has also completely failed. The Japanese in this area have now reverted to their former tactics and are attempting, with some vigour, to push forward from Kokoda in order to gain possession of the tracks leading across the Owen Stanley Ridge. The Japanese are still fighting hard and menacingly in spite of their sharp reverses; but the setbacks appear to have caused some indecision in Tokyo regarding the course of higher strategy. The resignation of Shigenori Togo, the Foreign Minister, and last civilian in the Japanese cabinet, may well be symptomatic of a divergence of view on the problem of Russo-Japanese relations. Clearly, the threat to Japanese expansion to the east, which the recent Allied successes have provided, makes more hazardous the opening of a fresh major offensive on the west.

Chinese Successes

The Chinese have won a series of important victories in the provinces of Chekiang and Kiangsi. In the course of the six weeks' counter-attack since July 13th, the Japanese have been driven out of the greater part of the territory which they had captured in the course of an arduous and costly campaign, now more than three months old. The most important successes are the recapture of a considerable stretch of the Hangchow-Nanchang railway and of the air bases of Chuhsien on the railway and Wenchow on the coast. And the Chinese are still pressing home their attacks in an attempt to retake Nanchang on the east, one of the termini of the east-west railway, and Kinkwa on the west. The campaign for Kinkwa is regarded as important, since it will provide a buffer territory between the Japanese and the recaptured air bases. The frustration of Japanese progress in Chekiang and Kiangsi is the more important because an enemy success would certainly have been the prelude to an attempt to gain control of the whole of the Hankow-Canton, north-south, line—a vital link in the grandiose Japanese project for completing a Shanghai-Singapore railway. The Chinese successes have been notably assisted by the support of the United States Army Air force. The arrival in China of a RAF unit implies that Allied air support for the armies of General Chiang Kai-shek will be substantially increased in the future. The Chinese have abundantly proved how much they can achieve with how little assistance. Their prowess has placed a heavy obligation upon the Allies; it has also provided opportunities for striking where Japan is weakest. As General Stilwell has pointed out, the signs that the Japanese are preparing for a defensive war in China may herald a fresh offensive elsewhere. The Allied victory in the Solomons and the Russian offensive on the Moscow front may have reduced enthusiasm in Tokyo for a Siberian campaign. But the danger of an attack on Russia is not yet past. The Allies must continue to press the initiative which the Chinese have regained. The possession of the Chekiang air bases will eventually make possible severe raids against the Japanese mainland, and, even before it is possible to mount a full-scale air offensive in the Far East, they will enable serious damage to be inflicted on Japanese shipping. The limiting factor is the rate at which Allied air units can arrive on Chinese soil.

Labour at the Crossroads

The report of the General Council of the Trades Union Congress deals with a wide variety of subjects, but seems to slide over too many of the questions which are causing concern throughout the Labour movement, as the war enters its fourth year. What has been the effective rôle of Labour in the coalition? What has been its influence in shaping policy? Has it not been too content to be the Jorkins of the partnership? These are the live issues. Labour, it is argued, had all the cards in its hand when it joined the Churchill Government in May, 1940; its leaders held the key social and economic positions in the Administration. But in the two years that have elapsed, there has been little evidence that it has wielded its influence in the direction of securing a unified economic policy, a plan for winning the war and winning the peace. Certainly no such plan has been made evident, from any quarter. Labour has not even succeeded in revoking the much-hated Trades Disputes Act, imposed by the Baldwin Government in 1927. Labour, it is alleged, has been subjected to one-sided compulsion, while the captains of industry, who man the Ministries and Controls, are more securely entrenched than ever—the Restoration of Prewar Practices Act, which applies to Labour and to no other interest, is conveniently forgotten in this argument. As an example of Labour's acquiescence may be cited the fact that the Central Joint Advisory Committee of the Production Executive met on five occasions only; nor has the Ministry of Production, which was welcomed by the General Council as a means of "avoiding the enormous waste in man-power and materials which has taken place through interdepartmental competition and overcentralisation," been vested with sufficient powers to achieve real co-ordination of effort. The value, on the other side, of the unique political peace which has prevailed is seldom recognised. It is the *quid pro quo* that is missed—and the chances to make a better and fairer Britain which have been ignored.

The dissatisfaction with this state of things and the sense of urgency felt by many of the unions are expressed in a number of resolutions submitted for the 74th meeting of

the TUC next week. No union has tabled a resolution about the illegal and needless strikes which, though organised by small, uncontrolled minorities, do so much undeserved harm to the Labour movement as a whole. But the Amalgamated Engineering Union makes the inevitable call for a Second Front, and, generously, pledges its members to full production. Rather more pertinently, the National Union of Railwaymen calls upon the General Council to report on the structure of affiliated unions with a view to such alterations as would render them more effective in achieving progress "both now and in a visualised Socialist Economy," a resolution which is opposed by the more conservative General and Municipal Workers Union, which would stand to lose by the substitution of sectional organisation by industrial unionism. The Construction Engineering Union observes that the Essential Work Orders are being used one-sidedly to control workpeople only, and urges the Government to take over essential war industries. These and similar resolutions run counter to the General Council's policy and may cause embarrassment. There are many other thorny issues—some of them hardy perennials—such as the repeal of the Trades Disputes Act, and the withdrawal of Circular 16, the anti-Communist Circular. The lifting of the ban on the *Daily Worker* has saved the Council from facing a defeat on this issue. But the General Council has forged a weapon for hamstringing opposition. It asks for powers to make such alterations in Standing Orders between Congress meetings as it deems necessary, such alterations to be binding until over-ruled—note the use of the word *over-ruled* and not *confirmed*—by the next Congress. Far too little attention has been paid by the press to the full import of this resolution. The Standing Orders are to trade unionists what the United States Constitution is to Americans, and the resolution, if carried, would mean the weakening of the democratic basis of the movement.

Foresight

Considerable attention is to be paid at next week's meeting of the TUC to questions of post-war reconstruction. A constructive memorandum on education has been put forward and the General Council proposes an inclusive scheme for social security. This would cover all contingencies, including death, with a flat rate of benefit of £2 per week, plus dependants' allowances; a scheme for re-training and moving unemployed workers is suggested; the establishment of a single Social Security Ministry and of a national medical service is envisaged. So far so good. But it is strange, in this company, to find a recommendation that old age pensions should be conditional on retirement from work, and financial proposals which recommend, instead of a non-contributory scheme, a flat tax on wages to cover 25 per cent of the cost, with a further 25 per cent to be met by a tax on employment, which is perhaps hard to reconcile with an objective of maximising employment after the war. Many other problems have to be thrashed out, both national and international—of which not the least important is that of the relations with the American Federation of Labour,

More than a century's accumulated business experience and conservative progress form the background of the comprehensive service which the Westminster Bank is able to place at its customers' disposal.

The Bank's vast resources, its constant touch with current affairs and its extensive system of branch offices in England and Wales and agents elsewhere, combine to enable it to offer a wide range of facilities, details of which will gladly be given on request by the manager of any branch.

WESTMINSTER BANK
LIMITED

Head Office: 41 Lothbury, London, E.C.2

whose vice-president is attending as a fraternal delegate. The trade unions have become a state institution during the war, which is the real reason for the caution of Labour men in wartime office that has so much disquieted so many of their followers; and what they say, or do not say, about the future will be important for the whole community.

Deputy for Mr. Casey

Another result of Mr Churchill's visit to the Middle East is Lord Moyne's appointment as Deputy Minister of State—with Cabinet rank, but not as member of the War Cabinet—to assist Mr R. G. Casey in Cairo. The appointment also emphasises the enormous amount of work which has accrued to the office of Minister of State in recent months. Although a separate command has now been established in Persia, the jurisdiction of Mr Casey presumably still extends there as well as to Palestine, Iraq, the Sudan, and Egypt itself. Moreover, although it stops short of East Africa, those territories come within his sphere of influence since, as Sir Henry Monck-Mason Moore, Governor of Kenya, pointed out last week, they are all, but especially Kenya, going all out to produce food and other supplies for the Middle East. To a very large extent the work of the Minister of State must be concerned with supplies and transport, and Lord Moyne's experience as Colonial Secretary, which brought him into close contact with conditions in Palestine and East Africa, will be an invaluable asset to Mr Casey. With Lord Swinton, whose jurisdiction reaches to Lake Chad, in West Africa, and Mr Casey and Lord Moyne in the Middle East, the British Government is now directly represented in the vast territory which stretches almost continuously from Freetown in the west to the Caspian and Afghanistan in the east.

Reprieve and Recrimination

Of the six young members of the IRA sentenced to die in Belfast on September 2nd five were reprieved. Of these, four received life sentences and one a sentence of fifteen years' penal servitude. The execution of the sixth provoked demonstrations in the north and south, while in Belfast and London the police took effective preventive measures. Despite the emotional sympathy, it is very doubtful whether IRA propaganda to the effect that the execution of all six of the condemned men would have been preferable to discrimination between them commands much support in Eire or even among the Roman Catholic minority in the Six Counties. It is axiomatic that there can be no coming to terms with the IRA, nor is any question involved of buying off recrimination by concessions. Meanwhile, the circulation of the "special manifesto" of the IRA Army Council in Belfast last Sunday and the subsequent discovery of two arms dumps near Hannahstown has placed the question in a somewhat sinister light. The avowed intention to evict the British and American forces from Northern Ireland must, however, sound more encouraging in German ears than it sounds convincing to the Allies. But, whatever happens, it remains desperately important that the British and the Irish should continue to recognise the modern IRA for what they are—a quisling sect prepared to exploit minority grievances in the interest of a foreign power. Deriving their strength from the adherence of a few single-minded, if misguided, patriots, they derive their weakness from the general recognition that their success would imperil the future independence of Eire for a very long time to come.

Miners' Bonus

The recommendations of the board set up early in June under the chairmanship of Lord Greene, to investigate wages in the coal-mining industry, fell into two parts. First, they provided for an immediate increase in wages in order to reduce the disparity between the earnings of coal miners and munition workers. A national minimum wage of 83s. per week for workers below ground, and of 78s. per week for other workers aged 21 years and over, plus a flat rate increase of 2s. 6d. per shift for underground workers of 18 years and over, and for other workers aged 21 and over, came into force on June 1st. Secondly, the Greene award provided for a bonus scheme designed to give an incentive to increased output. After discussions between miners, employers and the Govern-

ment, agreement has been reached on the details of the scheme, which is expected to come into operation on September 6th. While the scheme embodies the principles of the Greene proposal—described in *The Economist* on August 1st—there are important differences in detail. Whereas the individual pit was to be the basis of the bonus scheme in the Greene proposal, the scheme now adopted is based on the district as the administrative unit. Both plans provided for bonuses in respect of output in excess of a standard, but while the Greene scale expressed them as a proposition of earnings, in the plan actually adopted, they are to be calculated on a shift basis. As the district standards have been calculated on the basis of output in recent months, it should not be too difficult to exceed them; special provision is made to ensure that workers are not penalised by "abnormal interruption of production through causes outside the control of the workers." The bonus is at the rate of 3d. per shift for every 1 per cent by which output exceeds the standard, with a maximum of 3s. 9d. per shift. Underground workers will receive the full bonus from the age of 18, and other workers from the age of 21. The bonus scheme is necessarily experimental and subject to review. It has been welcomed by the miners' leaders. Mr W. Lawther, president of the Mineworkers' Federation, pointed out last Sunday that it would be the concern of the district controllers and the pit production committees. Within a few hours after each shift, the miners will know whether they have reached their target. Delays in production will be investigated by the committees, but cases of absenteeism will in future be dealt with by the officers of the Ministry of Labour, a welcome change in procedure. It is to be hoped that the scheme will be worked as a genuine bonus scheme, yielding additional income for additional output, and that its object will not be defeated, as in the case of the attendance bonus, by subsequent adjustments.

Agent Provocateur

The public will welcome Lord Woolton's assurance that Ministry of Food inspectors have clear instructions not to incite shopkeepers to break the law when they are making test purchases. But it will not be convinced that these instructions are obeyed, unless full investigations are made into the very circumstantial stories that are going round about the methods used by inspectors both of the Ministry of Food and the Board of Trade. A particularly bad example was related by Mr Harold Nicolson in the *Spectator*. A man, the story went, asked a village shopkeeper in Devon if he could sell him a new pair of socks and shoes, stressing the dangers he ran if he sat in a train with wet feet on his journey home. The shopkeeper asked him if he had the right coupons, whereupon the customer confessed he had left his card at home, but he would leave his name and address and post the coupons immediately he got back. Clearly, if he had been an honest man and his story a true one, public opinion, though perhaps wrongly, would have upbraided the shopkeeper if he had refused to sell the socks and shoes and condoned his action if he had agreed. But the customer, if the story is to be believed, was a dishonest man, an impostor and a spy, and public opinion very rightly denounces him and supports the shopkeeper who believed his tale, allowed him the socks, and was then prosecuted and fined. It may be that he was suspected with good reason of frequently selling things off the ration, and evidence, in the case of a small village concern, must be difficult to obtain. Nevertheless, even if it is necessary for the Departments concerned to employ a special staff to track offences, instead of relying on the police, they can at least observe police rules. The position of the police force in this country would be quite intolerable if its members were to impersonate thirsty travellers and try to persuade landlords to sell them drinks after hours, because there was no evidence on which to obtain a conviction for offences suspected in the past. The ordinary processes of British justice have had to be severely modified in wartime, but not to the extent that confidence tricksters and other impostors on the guileless must be taken into the service of the state. The public would be far happier if the authorities would see that the energies of their inspectors were devoted to black market racketeers instead of inventing dishonest tricks to catch small offenders.

War Potential

Mr Richard Stone's analysis of the national income, output and expenditure of the United States in the current

issue of the *Economic Journal* and the White Paper on the sources of British war finance issued last April provide the raw materials for a comparison of the economic war effort and potential of the two countries. The main features emerging from such a comparison are set out in an article on page 299. One of the most striking differences between the two countries is the reserve of productive power which was available to them before wartime industrial mobilisation—a point which is underlined by Mr Kaldor's estimates of the real sources of war finance, also published in the current issue of the *Economic Journal*. Between 1938 and 1941, Britain was able to increase its output by 12½ per cent; the United States, as Mr Stone shows, achieved an increase of 23-29 per cent in production between 1939 and 1941. In broad agreement with the estimates made in *The Economist* on January 3, 1942, Mr Kaldor has computed that, in 1941, about a quarter of the increase in Government expenditure since the outbreak of war had been furnished by increased production, another quarter by reduced consumption, and no less than one-half by sources which involve "a burden on the future," that is, by drafts on capital at home and abroad—not allowing for the post-war value of assets created at home by the Government. According to Mr Kaldor, Britain may approach the ceiling of its economic mobilisation this year; the United States, on the other hand, still possesses a very substantial margin of resources that can be absorbed into its war effort.

Post-war Exports

If Britain's imports of foodstuffs and industrial raw materials are to be maintained at anything like their pre-war level, merchandise exports must play an important part in the post-war economy, especially as the income from overseas investments and other services will be smaller. In an address delivered at the annual meeting of the Royal Economic Society, last June, and published in the current issue of the *Economic Journal*, Mr Henry Clay made an attempt to forecast the trend of exports in the light of pre-war tendencies. These tendencies made for a restriction of Britain's exports. The growth of protectionism, especially in primary producing countries anxious to enter the field of manufacture, tended to hamstring Britain's established export industries. On the other hand, since this was not accompanied by a reduction in their exports, the terms of exchange moved in favour of this country; between 1913 and 1938 average import prices fell by 6 per cent, whereas average export prices rose by 35 per cent, a tendency which

released income for expenditure on domestic demands and thus facilitated the transfer of resources from export to home production.

As a result, the proportion of the value of Great Britain's industrial output sold abroad fell from more than a third in 1912 to 27 per cent in 1924, 17 per cent in 1935, and 15 per cent in 1938. In Mr Clay's view,

there is little doubt that in the absence of special measures to reverse it, the former trend will be resumed and strengthened, and exports become an even less important element in our economy.

Three conditions, he suggests, must be fulfilled if this tendency is to be reversed. First, the expansion of exports must be adopted by the Government as an object of policy which would involve, among other things, the relieving of exporters of some of the risks which are not within their control. Secondly, other Governments would have to collaborate in a policy of expanding international trade as a whole. Thirdly, there would have to be closer integration of marketing with manufacture. It is difficult to accept Mr Clay's analysis as a full and balanced explanation of the inter-war trend of British exports. According to the calculations of the League of Nations, the volume of world trade rose by 30 per cent between 1913 and 1929, and, in spite of the economic depression and the obstacles put in the way of the international exchange of goods in the thirties, it moved to within four points of the 1929 level in 1937. If British exports have shown a lagging tendency, this cannot be ascribed entirely to the growth of protectionism in other countries. It was due, in no small measure, generally, to the rigidities of the British economy in the inter-war period. The conditions which Mr Clay postulates, especially the first two, are indeed necessary to a revival of British exports; in fact, they are truisms. But trade can only flourish if British industry makes the best of its opportunities, that is to say, if it shows imagination, drive, and a willingness to adjust itself readily to changes in

demand. If it again tries to sell the same staple goods abroad as in 1913, it is admittedly not very likely to be successful.

Latin American Reactions

It is still early to assess the effect upon Latin America as a whole of Brazil's entry into the war. The immediate reactions are shown in declarations of solidarity by the countries not already at war rather than of their intentions to become active participants themselves. The nations now at war with the Axis (Costa Rica, Cuba, Dominican Republic, Guatemala, Haiti, Honduras, Nicaragua, Panama, Salvador and Mexico) will presumably provide Brazil with all facilities for mutual co-operation; the majority of those in the non-fighting group have extended non-belligerent rights, in accordance with the "solidarity in continental defence" clause of the Havana Conference, 1940, while Venezuela has stated its readiness to collaborate in the defence of Dutch territorial waters round Aruba and Curaçao. A declaration of war by Uruguay is still regarded as likely; the Government is waiting for the German reactions to its protests about the sinking of the *Maldonado*, and, in the meantime, is tightening up its control over aliens and Axis sympathisers. Peru has broken relations with the Axis, but has not entered into any specific commitments. In Chile, support for Brazil is very strong; but there is no sign yet that any departure from strict neutrality is contemplated, though the position will probably be clarified after President Ríos' return from his visit to the United States. In Argentina, the situation is still somewhat obscure. One has the impression that the isolationists are losing ground. *La Prensa* stated on August 26th that "no Argentine must now think that the conflict which has been loosed over the world is no concern of his country." President Castillo, whose personal sympathies lie with totalitarianism, is nevertheless becoming a keen student of public opinion, which is overwhelmingly pro-Ally, with an eye to the presidential elections in 1943. Señor Justo, who has been tipped as future President, is reported to have offered his services to Brazil. The situation throughout the continent may be described as one of animated suspension—if the Allies were to win any more decisive victories, such as Milne Bay, or if the Axis were to sink many more neutral ships, the possibilities would be greatly increased that more states would decide to take the plunge.

Wartime Incomes—A Correction

The second article with the title "Wartime Incomes," which appeared in *The Economist* on August 8th (page 164), fell into a statistical trap which should have been obvious. It will be recalled that the first article had recorded the figures of the aggregate of incomes assessed to income tax which were given by the Financial Secretary to the Treasury in answer to a Parliamentary question. The second article pointed out that, in order to obtain an estimate of the distribution of all personal incomes—not merely of those that were large enough to be assessed to income tax—it was necessary to relate these figures to the estimates of total personal incomes given in the Budget White Paper. Unfortunately, it was overlooked that, when the Inland Revenue speak of "incomes assessed to tax in respect of the year 1941-42," they mean, in the main, the incomes of 1940-41. The correct "White Paper" year to relate to the Inland Revenue figures is therefore not the year 1941—as was done in the article—but the twelvemonth ended March 31, 1941. This is pointed out in an interesting article in the current issue of the *Banker*, which also contains a number of detailed

The MERCANTILE BANK of INDIA LIMITED

Branches and Agencies throughout the East
Correspondents in all parts of the World
LETTERS OF CREDIT AND DRAFTS
ISSUED

tables. The correction of this error alters very few of the figures, and none of the general conclusions, of the article. For those who may wish to refer to the tables, however, it may be recorded that the aggregate gross incomes in the "Under £125" class (the only one affected) should be corrected from £1,650 millions to about £1,750 millions in the earlier year (that is the year in which were earned the incomes that were assessed for income tax in 1938-39—i.e., for most purposes 1937-38) and from £2,100 millions to about £1,600 millions in the later year (that is, 1940-41) a change which resolves the dilemma posed by a correspondent in a letter which is printed on page 305. (The figure for the earlier year is very speculative, as there is no White Paper estimate of personal incomes for that year.) The figures of aggregate *net* incomes in this class should similarly be altered to £1,750 millions and £1,598 millions respectively. The third table is more extensively altered, and should now read as follows, the 1937-38 columns being regarded as very speculative:—

PERCENTAGE DISTRIBUTION OF PERSONAL INCOMES

Range of Gross Incomes	Distribution of Gross Incomes		Distribution of Net Incomes	
	1937-38	1940-41	1937-38	1940-41
Under £125	36½	28	39½	33
£125-£500	39	49½	41	52½
£500-£1,000	7½	8	7	6½
£1,000-£2,000	11½	5½	7½	3½
Over £2,000				4½
	100	100	100	100

The chief changes, it will be noted, are to alter the relative magnitude of the first two figures in each column; the remainder are almost unchanged. Of the total of *net* incomes in the later year, 85½ per cent are shown as accruing to those with incomes of less than £500 a year. This accords very closely with the figure of 85 per cent mentioned by the Chancellor of the Exchequer in his speech at Dundee last week-end.

German Health

According to official statements and occasional statistics, the health of the German people is good and medical services are adequate; and there is no doubt that during the first two years of the war particular care was taken in maintaining the health of Germany's war workers. A shortage of doctors was partly offset by an improvement in the organisation of health and medical services. There is evidence that the ordinary civilian not engaged in war work was at a great disadvantage right from the start of the war. During last winter, the situation changed rapidly. More doctors were called up for the army and for service in military hospitals. The rate of sickness in war factories increased considerably, because of the large number of women, old age pensioners, and physically weak persons who were brought in. Large scale migration, evacuation because of bombing, big concentrations of conscripted labour and millions of foreign workers and prisoners of war presented tremendous problems for the health and medical services. Regulations which have been issued for the distribution of drugs, medicines and other medical supplies show clearly that the supply situation is strained. Scattered statistics have revealed that tuberculosis, dysentery, scarlet fever, diphtheria, and venereal diseases are undoubtedly on the increase. It now seems that the tremendous demands of the *Wehrmacht* make it impossible to maintain adequate health and medical services for the civil population. The ordinary administration of these services under Dr Conti, the Health Leader, Secretary of State in the Ministry of the Interior and chief of the Department for Health in the Nazi Party, is no longer able to cope with these problems. Overriding powers for the concentration of medical services where they are most needed have become necessary. Hitler has, therefore, appointed a special commissar for medical and health services, Dr Brandt, the new commissar, is responsible only to Hitler, and his decisions are binding for military as well as civilian services. The free choice of doctors by civilians, which is already restricted, will probably be brought to an end; and the system of mass medical examinations of all civilians will probably not be continued. Dr Brandt has the enormous task of concentrating all available services for the *Wehrmacht*—and for any civilian emergency that may arise during the coming winter.

Two-Thirds of a Man

The Markham Report on conditions in the three women's Services was published on Thursday. It is a valuable and detailed survey of organisation as well as of conditions of life and employment; and will be dealt with at length in a forthcoming issue of *The Economist*. Many of its practical suggestions will surely be adopted, where they have not already been set in train; and a quick glance suggests only one important problem that has been entirely ignored—the question of women's pay. It would be interesting to know on what grounds so many of the women who participate in the war effort are rated at 66 2/3 or thereabouts of the value of the men who work beside them. In war industry, women are, in theory, paid the rate for the job when they can do it. In the Services, and in Civil Defence, there is not even this pretence. Even when women are directly replacing men, the rate of pay is at best two-thirds; and the rate of compensation for injuries sustained is correspondingly inferior. It is a fantastic anomaly that this state of affairs should persist; and it is significant that no single Minister has attempted to justify the difference in public, though several are willing to admit in private that it is all the Treasury's fault. One of the contributory reasons to the maintenance of this unjustified and unjustifiable situation is the reluctance of women who occupy leading positions in the war effort, especially in the women's Services, to "make trouble"—and so presumably to endanger the smoothness of their tenure of office. One astounding piece of irrelevant irresponsibility is said to have been uttered by one high-placed Service woman, who is alleged to have stated that, if the women officers under her command stopped smoking and drinking, they would find their pay more adequate—an argument which, if it is taken seriously for a moment, which is difficult, surely applies equally well to men officers in the services, all other ranks, munition workers and indeed to every gainfully occupied person. The women of this country have done an unprecedentedly big job in this war, even allowing for the blatant defection of one tiny well-to-do minority, which is more than matched by the devoted work of other well-to-do women. But the women have not been rewarded, on balance, with even bare justice; and not the least reason for this, apart from the stupid assumption of male superiority which still conditions the outlook of men in high positions, the very men who in all honesty should be pressing for the required changes, has been the bland timidity of too many of those of the women themselves who have risen to positions of dignity and authority. What is really wanted is a new suffragette movement to get rid of this two-thirds idiocy in pay and compensation.

A Doctor's Certificate

One of the trials of the doctor left in general practice in wartime is the ever-growing demand for a doctor's certificate. In addition to the routine national health certificates and so on, he may now be asked to certify that a person is suffering from one or other of certain named diseases so that bigger rations of food and milk can be drawn; that a woman is pregnant and can qualify for extra clothes coupons; that she has visceroptosis (dropped stomach) and can have corsets made to measure instead of having to buy them off the peg; that someone is bedridden and can reasonably expect to have his windows mended with glass instead of opaque material; that someone else is delicate and can claim exemption from firewatching; that yet another has fits and his family can put in a plea for a petrol ration; and, seventhly but certainly not lastly, that a person is ill and, on the assumption that fuel rationing comes in, will need a fire in his bedroom. It is probably true that this multiplication of medical certificates cannot be avoided. If, like children, the sick are to receive special privileges and have special claims on the country's reduced resources—as they should—then safeguards must be provided to prevent abuses. Unfortunately, it is by no means certain that a doctor's certificate gives this safeguard. The busy doctor may be too harassed to argue with his patient; the unscrupulous doctor may be too anxious to oblige. The conscientious doctor, therefore, who wishes to refuse a certificate, may find himself faced with the possibility of losing a patient if he does.

The question is not so much how to reduce the demand for a doctor's certificate as how to prevent it from being abused. Clearly, if the medical profession were a salaried

one, and the livelihood of each doctor completely independent of the number of his patients, the incentive to fall in with the wishes of patients would be greatly reduced. But, equally obviously, the merits and demerits of a salaried medical service cannot be decided by the question of medical certificates alone. Moreover, though it might be desirable to remove a doctor from the position of acting for his patient in such matters, as a solicitor acts for a client, it would be a waste of medical manpower to send each applicant for a certificate to an independent medical tribunal. There are, however, some possible ways of checking the abuse. The first is by awakening the medical conscience to the fact that in signing a certificate too easily a doctor may be signing away the nation's resources. Secondly, there should be some standardisation of fees for such certificates—though it would, of course be easy for a black market to grow up. Most important of all, the nature of a doctor's certificate should be changed. It should be accepted for what in most cases it appears to be—a statement of fact and nothing else. If, for instance, a man is certified to be an epileptic, the petrol authorities should not read into that statement—as they seem to do at present—a medical opinion that he cannot travel by train. A doctor's certificate should state quite baldly that a person is suffering from a certain illness; it should not absolve the authorities concerned from the responsibility of deciding on their own account, with the help, if necessary, of their own medical advisers, whether or not his claim to special privileges should be accepted.

Shorter Notes

The conditions and finance of schemes for productive work in duty hours in National Fire Service stations and

civil defence depots have now been settled. Arrangements will be made by fire force commanders and local authorities in conjunction with the regional boards who will inform Government contractors of the facilities that exist. Contractors will pay the fire service or civil defence authority the price that would be paid to a sub-contractor, and, after a deduction of 5 per cent for overhead expenses, transport and insurance, the net proceeds will go half to the Exchequer and half for the collective benefit of the staffs of the service. Now that these problems have been settled, it is to be hoped that the authorities concerned will do all they can to see that facilities for doing such work are available in fire stations and civil defence depots and to obtain sub-contracts.

Sir Earle Page, former representative of Australia in the British War Cabinet and on the Pacific War Council in London, whose position became somewhat anomalous after Mr Fadden, who appointed him, resigned in favour of Mr Curtin, has now been co-opted to the Australian War Council on which the Opposition is represented. Mr Curtin has also announced that Sir Earle will attend meetings of the War Cabinet, so that the knowledge and experience he gained overseas will be available to the Government.

Professor Ayalla Gabre, the new Ethiopian Minister to this country—the first since the restoration of Ethiopia's independence—arrived in London last week-end. In the meantime, the withdrawal of British troops from Ethiopia, with the exception of small areas specified in the treaty, continues.

AMERICAN SURVEY

British and American Incomes

ONE of the most remarkable phenomena of the war, both in Britain and in the United States, is the great advance in economic education that it has brought in its train. The last war, on the whole, bred a crop of economic delusions. This war—unless the present appearance of things is grossly deceptive—has taught some lessons of real value among the prevalent fancies. The chief lesson, and, if it sticks, the most valuable, has been the recognition of the importance of the national income—the realisation, that is to say, that there is a finite, though expandable, volume of production out of which the community must satisfy all its needs. An earlier generation used to call it the national dividend, and in a sense that is an apter description. But whatever the title given to it, the concept of the national income is one which has advanced in a very short span of years from the academic playroom to the centre of the political stage. Both in the United States and in this country there have been enormous strides in perfecting the statistical apparatus for studying the national income. In America, the pioneers have been a group of statisticians working under the National Bureau of Economic Research, now led by Professor Simon Kuznets,* and a second group of resourceful researchers in the Department of Commerce. In England, the honours are also equally divided between private researchers, such as Professor Bowley and Mr Colin Clark, and an anonymous team of Government servants whose work appears in the annual Budget White Papers.

Unfortunately, "national income" may have a variety of different meanings for different persons. And when the nation's war efforts begin, under Presidential encouragement, to be compared by reference to the proportions of their national incomes that are engaged, it is time to attempt to bring a little order into the present chaos of meanings and definitions. This task has been accomplished by Mr Richard Stone in an article in the *Economic Journal* for June-September, which recalculates and adjusts the American figures in accordance with the nomenclature of the British White Papers. Mr Stone is careful to disclaim any superior qualities for the British definitions, and it would be a great pity if any controversy were to arise on that score. Mr Stone himself, indeed, is rigidly scientific; he never permits himself a guess, and rarely an opinion; but his tables (for the full details of which the reader must be referred to the *Economic Journal*) will be of enormous assistance to all those who, for any reason, wish to compare the economic structures of the two countries.

Mr Stone's figures (which are based on the estimates of the Department of Commerce) extend over the whole series of years from 1929 to 1941. Net national income at factor cost in 1929 was \$87.6 billions. From there it fell to \$41.9 billions in 1933, and climbed again to \$72.6 billions in 1937. There followed a recession to \$66.1 billions in 1938, and then a steady recovery to \$72.0 billions in 1939, \$79.8 billions in 1940, and the record figure of \$99.1 billions in 1941. British figures on a strictly comparable basis exist at present only for the three years 1938, 1940, and 1941. Table 1 presents the total figures for the comparable years. It also gives the rough figures per head. For full comparability, of course, the figures should be converted into a single currency. Unfortunately, there is no warrant for thinking that the market rate of exchange in 1938 adequately measured the real relation of value between the two currencies; and there is even less reason to suppose that the pegged rate of wartime is a true reflection of real parity. For what it is worth, however, the conversion has

been done at these rates, though the results should be approached with all due caution.

TABLE 1.—NET NATIONAL INCOMES

	1938	1940	1941
Net national income at factor cost—			
1. United States (\$ billions)...	66.1	79.8	99.1
2. United Kingdom (£ millions)...	4,595	5,585	6,338
per head—			
3. United States (\$)	500	604	751
4. United Kingdom (£)	95½	116½	132
5. " (\$)	468	469	532
6. Rate of exchange (\$)	4.89	4.03	4.03
7. Ratio of 5 to 3	94%	78%	71%

The obscurity surrounding rates of exchange makes it impossible to draw a direct comparison between the real average national incomes of the two countries. The ratio between them, indeed, varies from year to year, owing to the greater volatility of the American national economy. The ratio for 1938, for example, was undoubtedly influenced by the fact that the recession of trade in that year was far sharper in America than here, and it may be that in some years, such as 1933, the average British income is actually higher, in real terms, than the American. On the average of years, however, it seems probable that the average British income lies somewhere between three-quarters and seven-eighths of the American—80 per cent might be a fair average figure to take for *prima facie* comparisons.

Distribution of Incomes

Another most interesting set of comparisons relates to the distribution both of income and of expenditure. Table 2 gives the data; 1938 is given for the United Kingdom, and 1939 for the United States since it is not possible to find a single year which can be taken as typical of pre-war conditions for both countries at once.

TABLE 2.—DISTRIBUTION OF INCOME AND EXPENDITURE

	United States (\$ billions)		United Kingdom (£ millions)	
	1939	1941	1938	1941
Rent, etc., of land	3.5	4.1	373	379
Interest and profits	22.0	31.5	1,351	1,722
Labour income	46.8	63.1	2,871	4,237
Net National Income at Factor Cost	72.0	99.1	4,595	6,338
Consumers' expenditures ..	63.5	77.4	4,056	4,689
Government expenditures ..	14.1	23.5	833	4,182
Private net investment at home	3.0	9.6	406	—493
Public and private net in- vestment abroad	0.8	0.9	—55	—798
Net National Expenditure at Market Prices	81.4	111.4	5,240	7,580

According to these figures, the peacetime distribution of net income in the two countries was broadly similar. Both labour income and the total of interest and profits were slightly smaller in Great Britain, and the income from land larger. What is of far greater interest to the economist is that the distribution of expenditure between consumers' expenditures, Government expenditure and net investment, so far as the comparison of these two peacetime years is any guide, was almost identical. Net investment was actually a rather larger proportion of total expenditure in the United Kingdom in 1938 than in the United States in 1939. Per head savings, at the current rate of exchange, were \$52.30 in the United States and \$46.45 in the United Kingdom. Moreover, the allocations made by businesses for depreciation of capital (which, though not counting as part of net income, have to be matched by physical investment if equilibrium is to be maintained) do not appear to be proportionately any larger in the United States than in Great Britain. These figures do not lend any support to the doctrine, which is fashionable on both sides of the Atlantic, that the volume of savings in the United States is so high as virtually to defy the efforts of the community to find investment outlets. It is true that 1939 was a less prosperous year in America than 1938 was in Great Britain, and that savings in the boom year of 1929 (let alone in the war-boom year of 1941) were half as large again as in 1939. Nevertheless, in view of the vast physical size of the American Union and the vast potentialities of expansion that still remain, there would not seem to be any insuperable obstacles to the absorption of the national savings. If Great Britain, with its inherently greater difficulties, can still (as it did throughout the later '30s) find fruitful investments for its savings, it should not be very difficult for

the United States to do likewise, find an outlet for savings which are proportionately no larger, or very little larger. The American economy is now fully mature, in the sense of being adult, but not in the sense of being naturally stagnant.

War Economy

A third comparison—in present circumstances the most interesting—is that of the changes that war has forced on the economic structures of the two countries. Unfortunately, to quote money figures is of very little avail owing to the considerable change in the value of money. An informative comparison therefore involves an estimate of the allowance that should be made for the rise in prices. This has been done in Table 3, though it should be emphasised that the results are necessarily very approximate. The figures have been given in the form which is already familiar in the columns of *The Economist*, in which all the quantities are expressed as percentages of the national income in the base year. The figures for the United States are, for 1939, 1940 and 1941, based on Mr Stone's re-arrangement of the official estimates and, for the financial year 1942-43, on an article by Mr Milton Gilbert in the March 1942 issue of the *Survey of Current Business* for the financial year 1942-43. The figures for the United Kingdom for 1938, 1940 and 1941 are estimates, and those for the financial year 1942-43 are guesses, by *The Economist*. In all cases the conversion from money terms to real terms is somewhat speculative.

TABLE 3.—DISTRIBUTION OF NATIONAL INCOME IN REAL TERMS
(Net national income of base year = 100)

	Base Year		1940		1941		1942 43*	
	U.S. (1939)	U.K. (1938)	U.S.	U.K.	U.S.	U.K.	U.S.	U.K.
Personal expenditure ..	78	77½	82½	71½	88	69	76½	64
Govt. expenditure	17½	16	18½	49	26½	61	69	67
Net investment	4½	6½	8½	16½	11½	19	2½	17
Net national income at market prices	100	100	109½	104	126	111	148	114

* Fiscal year in each case—i.e., July-June for U.S., April-March for U.K.

The total of Government expenditure in the current year will, if the estimates are reached, form about the same percentage of pre-war national income in each country. But the ways in which resources are provided to meet this increase in expenditure are very different. The United States had the possibility of a very large expansion in total output, and as a result the war expenditure can be accommodated by bringing consumption back to the pre-war level (or slightly lower) and by cutting in half the pre-war rate of additions to capital. In the United Kingdom, the extent to which the national income could be increased was much smaller, for a variety of reasons, such as the smaller volume of unemployment, the disturbing effects of black-out, blitz and blockade, and the higher proportion of men in the relatively unproductive occupation of soldiering. Consequently, the required increase in Government expenditure could be attained only by a severe cut in consumption and by converting the pre-war rate of investment into a very heavy draft on accumulated capital. If the cost of the war can be measured by the increase in Government expenditure, then it has been distributed as follows (the figures being, as in the previous table, percentages of the net national income in the base year):—

	U.S.	U.K.
From increased output	48	14
From diminished consumption	14	13½
From reductions in net investment (or from drafts on capital)	24	23½
	51½	51

It should not be necessary to add that figures of this nature (which are very approximate in any case) do not provide any basis for criticisms or invidious comparisons. In particular, it should not be forgotten that Britain would not have been able to meet its needs by drawing on the accumulations of the past (or could not have done so to the same extent) if there had been no United States to draw on. And the candid observer will record that the heavy restrictions of civilian consumption in the United Kingdom were as much due to the compulsions of the Battle of the Atlantic as to any voluntary national stoicism. But the figures do illustrate very clearly the difference in the economic circumstances of the two countries. Fortunate is the nation that can make so gigantic an effort at such little cost either to its present welfare or to its future wealth.

American Notes

Alibi's End

A further reorganisation of the War Production Board's priority controls over scarce materials, and in particular of its steel branch, is taking place. On his return from a week's holiday, Mr Nelson announced that there would be no more alibis; any one who crossed his path would have his head taken off. The first heads have rolled. The Deputy Chief of the Iron and Steel Division has resigned, and it is expected that the resignation of Mr Taylor, chief of this Division, who has been under fire recently, will also be accepted. Cables to the British press report that many of the powers over production exercised by the Services are now to be assumed by the War Production Board, especially the authority to grant priority ratings for raw materials, which is to be transferred to WPB after September 9. "Priority inflation" has been at the root of much of the materials chaos. The Board has admitted that in June priority orders for steel were issued for almost twice the amount of steel available, and Mr Taylor, testifying before the Senate, conceded that he could not say what had happened to 1 million tons of steel—nearly one-fifth of the month's output—although he "assumed it went into the war effort." Naturally there has been an immense depreciation in the value of priorities; the A-1a rating allotted to aircraft a few months ago is now almost worthless and has been superseded by AA ratings. Last month, Mr Murray, head of the Congress of Industrial Organisations, alleged widespread mismanagement on the part of the steel companies; and one of WPB's steel experts, Mr Libbey, has gone on record as agreeing that a thorough reorganisation of the industry is necessary. Congress has heard witnesses testify that many companies, particularly established ship-building yards, continue to keep peacetime stocks of materials desperately needed elsewhere. Nor are the Services immune from charges of lack of balance and co-ordination in their planning of production. The August 17th issue of *Time* suggests that a single Steel Controller may be appointed, on the model of the last war, from whose decisions on allocation, stocks, and production, appeal would lie only to Mr Nelson. The significance of the materials controversy should not be exaggerated. Vigorous action on Mr Nelson's part to limit allocations and priorities to available supplies should bring the materials position under control with the third quarter. If he is successful there should be no difficulty in maintaining civilian direction of the production programme. A House Committee has censured Mr Nelson for allowing the Services to continue to exercise so much control over production and for allowing control over the distribution of manpower to be transferred to the War Manpower Commission.

Wage Magnets

The most serious immediate consequence of the failure to develop a co-ordinated wage and manpower policy is the continuing drift of workers from the coal and copper mines and the lumber industry into higher-paid jobs in aircraft and shipbuilding. The copper shortage is so serious that the policy of paying premiums above the ceiling price is being extended by the War Production Board, but nothing has been done as yet to end the drain on mining manpower caused by the lure of weekly earnings of \$46 in aircraft and \$53 in shipbuilding, compared with about \$37 in metal mining. In the first five months of this year, Anaconda's Butte mine lost 1,000 men, of whom it could replace only 400; and in June, because of man-power shortages, the tonnage produced at some pits fell 50 per cent. One sore point is the continued employment of 7,000 miners in mines producing gold alone, while it is estimated that only 5,000 additional men are needed to ensure capacity production in the copper mines. Very much the same situation exists both in anthracite and bituminous coal mines, which are losing men to steel mills and shipbuilding, and in the lumbering industry. It is now reported that the War Labour Board has agreed to consider 37 wage claims from the copper miners "on an industry-wide basis" in order to end the man-power drain; and recent voluntary wage increases in the lumber industry have had the same purpose. The raising of wage-rates creates new complications, however, as many companies will then be unable to operate under present price ceilings. One solution would be the closing of gold mines, and the transfer of miners to more essential work; but here inadequacy of powers and their

distribution among various Government agencies prevents decisive action. What is needed is agreement on a policy which would employ both the instrument of wages and man-power controls, and concerted action by the Labour Board, the Man-Power Commission and the War Production Board. It is to be hoped that the President's Labour Day address, which is to cover problems of wages and price control, will also propose methods of dealing with the way differences in wage rates are disrupting the production programme.

Bomber City

Detroit, the converted automobile city, will be responsible for about one-sixth of America's war production in 1943. Yet *Life*, which in its issue of August 17th carries a memorable series of pictures of wartime Detroit, has hard things to say about the sit-downs and wildcat strikes, material shortages and poor planning which have cut into production, and concludes that Detroit's morale situation is perhaps the worst in the U.S. The charge has aroused Detroit's mayor to call *Life* "scurrilous and yellow," but the *Detroit Free Press* admits that "to much of this harsh indictment Detroit must plead guilty." A WPB study of 192 automobile plants made in May, found that only 123 were doing more than the quarters of their manufacturing area to war work; 55 devoted less than 50 per cent to war production. Shortages of materials and skilled labour are responsible for much of the failure to use plants to the utmost; but there are also menacing tensions between the unions and managements, and explosive possibilities in the city's mixture of races and religions. Of its 2 million inhabitants, 100,000 are Polish Catholics, 150,000 negroes, and 200,000 are Southern whites, almost equally anti-negro and anti-foreigner. In this atmosphere, the acute housing shortage is dangerous; and it is unfortunate that a long drawn-out conflict between Detroit's private builders and the Federal Public Housing Authority could not have been avoided. There was open violence last winter when negro families attempted to move into "Sojourner Truth," a Government housing project, and *Life* prints an unforgettable page of pictures of the trailers and shacks in which highly paid war workers still are compelled to live.

Houses for Detroit

The acuteness of the housing shortage in Detroit is likely to increase. Employment at Willow Run, which was expected to provide an immense demand for new homes, is expected to be only 40-50 per cent of the original forecast, but Mr Kanzler, regional War Production Board chief, has estimated that the 565,000 workers on armament payrolls in July will increase to 630,000 by the end of September and reach 740,000 next year. Peak automobile employment in 1941 was only 430,000. An attempt is being made to bring Detroit women into the factories, but the attraction of new workers into the area seems inevitable if Detroit's plant resources are to be fully employed. The expansion in housing that they will need is to be provided by private builders. It is now thought that the WPB will provide materials for the completion of 4,000 homes and for an additional 12,000 units, on which work will start immediately. The defeat of the Federal Public Housing Authority, which has been insisting on the construction of a "Bomber City" to house Willow Run employees, appears to be due both to local pressure and to the shortage of materials. The strongest

The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States.

pressure came from Henry Ford, who ordered Government surveyors off the land and their stakes torn out. His opposition was ostensibly on the grounds that the project would be wasteful, extravagant, and not ready in time (a case of too much and too late); but other sources suggest a further reason—that after the war it might have to house a whole community of unemployed workers, a tremendous centre of industrial unrest. It is also said that the housing centre of Willow Run workers near the plant might upset Republican control of the county, and increase taxation. The Ford Company is convinced that its proposal to recap workers' tyres with Thiokol will solve the transportation problem; this appears to dismiss almost too casually the absence of housing within easy commuting distance, and the waste of workers' time and energy—and assumes, perhaps naturally on the part of Ford, that every worker has access to a car. Whatever the reason, Government housing near Willow Run apparently will be cut to the provision of a few barracks for temporary occupants; and the Government's contribution to Detroit's sorest problem is likely to remain the two small projects already completed. Whether private industry, within WPB's material allocations, can provide the solution is problematical. Construction of 20,000 homes does not seem unduly generous, and the labour disputes with which Detroit's building industry has been plagued may not have been finally disposed of under the agreement reached in July.

If Winter Comes

Forecasts that further rationing programmes would be left till after the elections are being falsified by events—in the case of fuel oil by the fact that the heating season in the Eastern seaboard starts in October. Mr Nelson has confirmed reports that a decision on fuel rationing has been reached; and the President has induced anticipatory shivers by suggesting that some regions would get 25 per cent less fuel than has previously been used for house-heating. The prospective shortage is the result of the same transport difficulties which made petrol rationing a disagreeable necessity. Despite the efforts of the railroads, oil reserves in the Atlantic states fell from 82 million barrels in December to 46.5 millions in April. Since then the figures have been a military secret, but the Petroleum Co-ordinator has warned that after April "the situation did not suddenly and drastically improve." New and relaid pipe lines will alleviate the shortage, but will not overcome it. One of the greatest obstacles to the imposition of a rationing scheme which would assure supplies to war industry and the fair distribution of the remainder is the lack of information on the kinds of heating plant employed. The only official statistics available

are those in a sampling study made by the Federal Housing Authority in nine eastern cities, which showed that about 61 per cent of the homes investigated burned coal, 7.6 per cent used gas, and 31.3 per cent depended on oil. Householders have been energetically following the Government's advice to build up coal stocks during the summer; so much so that demand, increased by conversion of industrial and domestic oil-burning furnaces to coal, has outstripped production. The weakest spot on the home front is the suggested 31 per cent of families dependent upon oil for their heating. It is unofficially estimated that less than 20,000 of the 1,400,000 domestic oil-burning furnaces were converted to coal by mid-summer. It has been stated that plans for meat rationing will take about four months to prepare. There is less time to establish fuel rationing before the winter comes; and British experience suggests that, of the two, fuel rationing is more difficult to establish and to sell to the public. Rationing of fuel oil alone will not be well received by those who, shivering themselves, see more fortunate neighbours enjoying adequate supplies of coal.

Shorter Notes

Owing to a regrettable error, the failure of United States production to meet the June schedules was given in a Note on "The Production Crisis" last week (on page 268) as 70 per cent instead of 7 per cent. The figure given was so fantastic that few readers will not have recognised the error for themselves.

One result of the brilliant action at Milne Bay will be to strengthen the movement to bring McArthur back from the Australian war zone. There have been a persistent campaign for his appointment to a more spectacular rôle and suggestions that he had been relegated to Australia precisely because of fear of his popularity.

The meat shortage has brought a statement from Washington that plans for meat rationing will be complete in about four months. In the meantime, the Food Requirements Committee has recommended the creation of a quota system for wholesalers which will substantially reduce the amount of meat available for the civilian consumer. A figure of 2½ lb. of meat a week has been suggested as the prospective ration. This is still well ahead of British pre-war consumption, which was 1½ lb. per head. American consumption has been on the increase recently owing to higher incomes in the lower wage brackets.

THE WORLD OVERSEAS

Canadian Munition Costs

(From Our Ottawa Correspondent)

August 21st

ACCURATE figures on the cost of production of munitions and weapons in Canada have only rarely been available. A mixture of reluctance to give information that business men would not wish to disclose to a competitor and considerations of wartime secrecy has conspired to shroud the fact that Canada has scored a great success in cheap and efficient war production. A recent examination of a number of selected items of production led officials of the Department of Munitions and Supply to estimate that production costs have been reduced by between 30 and 50 per cent over the whole range of Canadian munitions production in the past two years—the period in which the munitions programme has advanced from the blue print to peak output. Since expenditures on munitions in Canada, representing Canadian, British, American and certain other allied orders have exceeded \$5,000,000,000, the savings to taxpayers could be placed conservatively at around \$500,000,000. This is the rough estimate of economies obtained in contract prices by a process of continuously

levelling off unit costs, as the results of mass production warrant.

Canada possessed virtually no munitions industry or experience in 1939. Plans to produce the Bren machine gun were under way when the war started. The initial price agreed upon with the John Inglis Company, Limited, of Toronto, was \$450 per unit. Recently, Mr Howe, Minister of Munitions and Supply, said that during the first quarter of 1941 the cost of this weapon to his department was \$390, and that in the first quarter of 1942 the cost had been reduced to \$192. The productive equipment of the plant is now owned by the Government, and the company receives a management fee for operating it. This is because from time to time the Government has furnished the capital for plant expansion.

Moreover, during the three months ended June 30th, Mr Howe disclosed, the Canadian output of Bren guns was equivalent to a third of the entire previous production extending back to 1940. This statement indicated the extent by which production has been multiplied, after the original problems of organisation were solved. The Canadian Bren

gun, in use on all the battlefronts of the world, is typical of many other instances in the munitions programme.

Big Reductions

The original price of an artillery piece was \$35,000. Its current price to the Canadian taxpayer is \$20,000, and a further shrinkage in cost is believed possible as production gains efficiency. A certain type of fuse was produced in Canada at a cost of \$3.05 each. That price held only for the first 50,000. At present the department is paying \$1.52 for the fuse, and, by use of a new alloy, the cost can be reduced to 68 cents. An anti-tank gun cost the department \$3,300 at first, whereas the current price is \$600.

Interest has been shown in Canada in re-negotiations of contracts by the US army and navy, in which savings of millions of dollars have been secured. By comparison, Canada is a low-cost producer of munitions, utilising on a relatively smaller scale the same technique of mass production. Scarcely any re-negotiation of contracts, in which, after review, the price is scaled down, has been carried out in Canada. The Canadian system has been based largely upon the so-called "target price contract."

This system has developed in this war. Most items of munitions produced in Canada were based on British models. Usually, the price of the British manufacturer was converted into Canadian dollars. The Canadian contractor was allowed the target price—normally the British price plus a small profit—as a basis upon which to get into production on a portion of the initial contract, say 10 or 20 per cent. The price was subject to audit by Mr Howe's department. If manufacturing became more efficient and costs were found to be falling, the contractor was allowed his costs plus profit—the prevailing profit has been 5 per cent. In addition, as an inducement to efficiency, he was allowed a percentage of the spread between the original target price and his actual cost.

Patriotism and Profit

This system, combining patriotism and profit, has resulted in notable reductions of contract prices, at a time when costs generally have been rising. Its major variation in the Canadian munitions programmes has been the management fee contract, which has become a standard form in industries for which the Government has furnished most or all of the capital. A fee of so much per unit, including actual cost and a margin of profit, is paid to the management under this form of contract. Approximately 50 per cent of Canadian munitions contracts are at present performed on a management fee basis.

In 1939 and early in 1940, the department employed cost-plus contracts, but few of this type are left to-day. It originated at the time when there was no yardstick of competitive prices upon which to write a contract. So the department agreed to pay cost plus 5 per cent. This form has been supplanted by the target price contract, allowing a percentage of profit that increases as unit costs are lowered.

One of the most expensive items of cost in war is ship repairs, for which the customer is normally the British Admiralty or the Canadian Naval Department. Formerly, when a ship put in to a Canadian port, a bill was presented and the customer paid. But the Department of Munitions and Supply has evolved, on the basis of British experience, the "time and material" contract for ship repairs, by which the customer pays actual costs plus 5 per cent. The saving accruing has already run into millions of dollars. A similar contract form has been adopted in the United States.

Canadian experience in munitions contracts has led to standard practice, contained in a memorandum Munitions and Supply No. 443. This is a comprehensive summary of cost accounting principles, directing that payment of munitions contracts shall cover the sum only of direct materials used, labour, expenses and indirect costs, plus a reasonable profit. Costs such as advertising, allowances for interest on bonds, unreasonable compensation, and, altogether, eighteen specified items, will not be accepted. All contracts are subject to review, and several hundred continuous audits are in effect. Naturally, an immense amount of cost auditing is under way at all times.

These facts regarding Canadian cost practices furnish a reply to questions that have been raised from time to time regarding possible profiteering. The Canadian public, remembering the profiteering record of the last war, has maintained an attitude of suspicion that dies slowly. Recently, practice with regard to contracts was placed upon public record by the special parliamentary committee on war expenditures.

Portugal and Brazil

[FROM OUR LISBON CORRESPONDENT]

August 22nd

THE direct reaction to Brazil's entry into the war differs according to the leanings of the Portuguese public. To the great majority, the news can scarcely be called a surprise. Indeed, one might almost say that it has been received with pleasure by at least 95 per cent of the population, though this does not mean that the people as a whole fully realise all the implications of Brazil's act. *Zé povinho*—the people, as distinguished from the bourgeoisie, and the *fidalgos*, or persons of admitted aristocratic birth—these, it can be said with certainty, are delighted. They feel, more than almost any class in Portugal, the innate justice of the Allied cause and the horrors of the German method of conducting totalitarian war. The middle classes and business generally are uneasy; they fear that this new development may mean a reduction in the excellent profits that have come their way during the past twelve months; the numerically small but politically influential upper classes are sharply divided. It must be remembered that Axis propaganda in this group has been almost wholly based on a sort of *Kulturkampf* mentality; the stories of shootings of hostages, ill treatment of Jews and Poles, Czechs and Jugoslavs are frankly admitted, but brushed aside as being events incidental to an all-out war effort—an effort necessary to ensure the safety of Western Europe and Latin civilisation, threatened by the Communism of the Tartar hordes.

This line of argument appears to have made a special appeal to a limited number of leading personalities who freely declare that they desire to see a German victory, because any other end to the war would mean the downfall of all the scientific, artistic and technical skill, the thoroughness and the discipline which have always been associated with German thought and action in their minds. It should be remembered that Germany, and of recent years Italy as well, have consistently fed and flattered Portugal with accounts of German and Italian progress in science and in

Production charts in the war industries prove the importance of feeding your workers well. A good works canteen reduces fatigue and absenteeism, and contributes to the better health of war workers.

That is why so many front rank firms, as well as Departments of H.M. Government, employ specialist catering contractors, members of this Society, to operate their works and staff canteens. The Society's members stand ready to operate canteens for workers wherever they are engaged along Britain's industrial war front.

**NATIONAL SOCIETY
OF CATERERS TO INDUSTRY**

83, PALL MALL, LONDON, S.W. 1

social uplift, at the same time endeavouring to implant Axis systems on local soil. With the recent stress laid on Portuguese-Brazilian confraternity, more particularly in respect of literary and artistic relationships, the small pro-Axis group of *literati* were brought much to the fore, being encouraged, if not actually aided in some ways, by German direction. How matters will now stand for the Portuguese friends of the Axis it is impossible to say at the moment.

The Shipping Outlook

What effect on shipping to and from Portugal will follow from war between Brazil and the Axis? That is the question predominant in Lisbon to-day. Portuguese tonnage, taken from the African colonial service to earn better freights on the North and South American routes, is very limited in amount; if Brazil, being at war, refrains from sending ships here, will they be partially replaced by Portuguese vessels and how will these be treated by Axis submarines? Two Brazilian boats, the *Bagé* and *Cuyaba*, which ought to be on their way here, have not been allowed to leave Rio.

Meanwhile, a rather ingenuous argument for continuing Brazilian shipping on this route has appeared. Such boats, it is said, are consigned to a neutral country; furthermore, the bulk of their cargo is for Switzerland, another neutral. This is hardly convincing for the Allies. Great Britain might even in justice argue that Brazil's belligerency affords Portugal an opportunity to give greater facilities to her own colonies, since lack of tonnage rather than blockade restrictions is the chief handicap on their trade to-day.

Anglo-Soviet Trade

[BY A CORRESPONDENT]

August 31st

DURING the first years of the war, trade between Great Britain and the USSR was at a standstill owing to the political situation. But the trade negotiations carried out by Sir Stafford Cripps's economic mission paved the way for the big exchange of raw materials and goods which has taken place during the last year.

After Germany had attacked Russia, the problem of supplies to the Soviets was split into two parts. On the one hand, there was the question of direct military supplies. On the other, it was important to help Russia to expand its industries and reconstruct those evacuated to the east. The need for replacing essential consumption goods was also recognised.

Towards the end of last year, a Russian trade delegation arrived in this country headed by the leaders of the machine tool and electrical equipment import trusts. The delegation made it clear that the Soviet Union would require large quantities of machinery, machine tools, electrical equipment and raw materials (especially non-ferrous metals). An initial credit of £10 millions was opened. This was quickly exhausted, and an additional credit for £25 millions was opened; arrangements for further credits are in progress.

The procedure for placing and accepting Russian orders was simplified. The Ministry of Supply became the central office for all Russian requirements, and placed them with different manufacturers according to the availability of labour, tools and raw materials. All payments, as well as the shipping arrangements, are carried out through the Ministry of Supply and the United Kingdom Commercial Corporation, which acts on behalf of the Ministry.

British manufacturers had considerable experience in the execution of Russian orders, for in pre-war days machinery was one of the chief commodities in British exports to the USSR. There were, however, many difficulties to overcome before the British industries started to work smoothly on carrying out the Soviet orders. Many manufacturers, who had a choice between accepting domestic orders and Russian orders, naturally preferred the easier task of fulfilling home demands. Workers, on the other hand, are usually enthusiastic over Soviet orders, which in many instances, when the raw materials were available, were executed in record time.

In addition to new machinery and tools especially ordered for Russian requirements, large quantities of second-hand machinery, electrical parts, motors, boilers, etc., were shipped to Russia from available stocks. Apart from machinery, Soviet Russia has bought large quantities

of medical equipment and supplies, non-ferrous metals and other materials, especially hides and skins and leather; in the case of some of these, though the orders were placed with the Ministry of Supply, they were fulfilled from other, mainly Empire, sources. Requirements are growing, and a new programme for supplies during the coming winter is now being discussed in Moscow. American experts are participating in these discussions, and the programme for expanding the shipment of goods to Russia will be carried out with the full co-operation of the United States.

Simultaneously with the expansion of British exports to Russia, imports into this country have also grown. The main items in Russia's exports to Britain, timber and flax, were put at the disposal of Great Britain soon after Russia entered the war. The Soviet authorities instructed the export departments of the Ministry for Foreign Trade to make all surplus timber and flax available for Great Britain, and large quantities of these materials reached this country. Payment for imports was recently arranged on a basis of adjusting prices according to the general trend of prices for different commodities, and these imports increased the Soviet credits for purchasing supplies, other than military supplies, in this country.

Letters to the Editor

Wartime Incomes

TO THE EDITOR OF THE ECONOMIST

SIR,—The two articles on "Wartime Incomes" in your issues of August 1st and 8th are of such general interest that I would raise the following points.

From the table on page 164 it is seen that a total of £2,100 millions is received by persons whose incomes are less than £125, which at an average income of £100 would mean that the number of such incomes is 21 millions. By addition from the same table we have 13.7 million incomes over £125, making a grand total of 34.7 million incomes, which appears too many. The population of this country is estimated in the White Paper, Cmd. 6358 for 1941, as 46.6 millions, with 9.6 millions under 15. I believe the two million old-age pensioners would not be in your total, and of some nine million wives a good proportion will still not be in receipt of any income. Taking four millions, we have 30 million possible incomes.

A further point on which information would be valuable would be an estimate of family incomes. The average man in receipt of an income of, say, £400-£1,000 is probably the only member of the family receiving an income, whilst it is obvious from your figures that most of the people earning less than £125 are not the head of a family, but are boys and girls in their teens living at home or are wives who go out to part-time work, whose earnings are not included in their husband's income-tax return.

Until the man in the street has a clear picture of the distribution of gross income and real income it is doubtful if any wages policy such as you have advocated for the last few years can even be hoped for—the Government prides

itself on being democratic and doing what the country wants.

Yours truly,
R. H. COATES.

Sheffield.
[Mr Coates's first point is dealt with in a Note on page 297.—EDITOR.]

Income Tax

TO THE EDITOR OF THE ECONOMIST

SIR,—In your issue of August 15th you gave a comparative table of the incidence of income-tax in the US, Canada and the UK. The comparison shown in the table below gives an easier understanding of the effect in the US and UK.

Income	Amount left to the Taxpayer	
	U.S.	U.K.
\$	\$	\$
1,000.....	916	811
1,500.....	1,329	1,100
2,500.....	2,155	1,650
5,000.....	4,125	3,025
10,000.....	7,705	5,375
15,000.....	10,779	7,163
20,000.....	13,379	8,650
50,000.....	24,684	13,425
100,000.....	36,354	15,800
500,000.....	90,379	25,800

Yours faithfully,
C. B. COLSTON.

German Europe

Financing Arms Production

NEW rules for financing armament and other public orders have been issued by the *Wehrmacht* and the responsible Ministries, on the recommendation of the Minister for Armaments and Munitions, Dr Speer. From October 1, 1942, onwards, the *Wehrmacht* and the Ministries will stop advance payments as well as interim payments to manufacturers who receive orders. With these measures, the latest reorganisation of Germany's war economy has been extended to the financial sphere. The new concentration of industry and the greater effort which have been evident since the first winter of war in Russia were carried without much regard to financial considerations. Although the average monthly increase in the national debt hardly altered during the April-June quarter of 1942 compared with the first quarter, there was an alarming rise in the short-term debt. During the three months from April to June, the short-term debt increased by Rm. 9,150 millions against a rise of only Rm. 6,000 millions in the long-term debt. The first aim of the new rules is to arrest the further rise in the short-term debt. It is estimated that advance payments amount on an average to Rm. 5,000 millions. The idea is that industrialists should finance the orders by drawing on their bank balances or ask for advances from the banks. The greater part of German industry will have to use again the method of self-financing which was a feature of the rearmament period. The banks, on the other side, have been trying for a long time to find an outlet for their exceptional liquidity. The Reich will be relieved of the necessity of advancing payments amounting to Rm. 5,000 millions on new orders. Once the orders have been delivered, of course, the total Reich debt, and particularly the short-term debt, will again increase at the old rate.

For a long time, even exceptionally liquid firms demanded payments in advance, which were probably used for financial transactions on the bourse. The *Wehrmacht*, on the other hand, developed extensive machinery to effect these advance payments. The new rules are intended to restore financial self-responsibility of the private industry. The recent changes in industry itself and in the economic organisation had the same aim of restoring "private responsibility"—a somewhat euphemistic term which actually means greater and more immediate control of production by the special committees set up by Minister Speer.

The new measures must be seen in the wider context of the policy of keeping the costs of war as low as possible and maintaining the stability of prices and of the currency. Fixed prices for armaments were the first step in this direction; and the price commissar's attack on cartel prices, which started a short time ago, is a logical extension of the system of fixed prices as against the cost-plus profit prices enforced by a number of cartels. But these measures cannot hide the fact that prices in Germany are slowly becoming unbalanced. Agricultural prices, for example, are entirely artificial, being the result of a very complicated system of compulsory marketing and subsidies. But the constant threat of unregulated price movements in occupied and dependent countries has not yet been effectively countered. Moreover, there is the unquestioned pressure which is exercised on prices by the movement into *Sachwerte*, that is, into real property. The price reductions which have been affected by decree are relatively unimportant compared with the actual price increases which have taken place. The staple remedy of the authorities is the policy of mopping-up excess purchasing power.

An interesting example of this policy is the abolition of the rent tax. This tax has been levied since 1926 on all house property built before 1918. House owners who were able to keep their property during the inflation, 1919-23, were in an advantageous position after the inflation because of the general reduction of mortgages. A special tax was therefore levied on them, and the revenue from this tax was used by the communes for financing house building. This tax has now been abolished; but the house owner is required to make an equalisation payment amounting to ten times the annual tax. No doubt this is mopping-up some money; but a great part of the house owners will not be able to pay this equalisation amount. Mortgage banks, savings banks and insurance institutes have therefore been empowered to grant equalisation loans at 4.5 per cent interest and 4 per cent amortisation. The banking institutions will

at the same time issue mortgage bonds to finance these loans, and it is estimated that mortgage bonds amounting to at least Rm. 1,500 millions will be issued. Vagrant money estimated to amount to Rm. 8,500 millions is thus being mopped-up.

Wages.—According to the official German statistics, hourly and weekly wages showed a slight increase during 1941 because of longer working hours; the general wages stop prevents a rise in wage rates. The wages index (1936=100) was as follows:

	Nominal Wages		Index of Cost of Living (1936=100)
	Per Hour	Weekly	
June, 1939.....	109.7	114.5	101.6
September, 1939.....	107.3	110.6	101.0
December, 1939.....	109.2	114.0	101.5
December, 1940.....	114.5	120.8	105.1
December, 1941.....	117.9	124.3	106.8

The rise in gross nominal wages has thus been continuous since October, 1939. It appears from the table that the workers in German industry are actually enjoying higher real wages because of the slightly smaller increase in the cost of living. Apart from the effect of rationing, the net wages are, however, considerably smaller than they seem because of additional taxation. The statistics relate to a selected number of industries, and it must be doubted whether the index gives a real picture of the wages situation in Germany. An important factor in the increase in nominal wages, apart from longer working hours, is the shift of workers into the armament industries, where wage rates are above the average. Moreover, the earnings of foreign workers are included in the statistics, which means that the wages received by German workers are above the average shown in the index figures. Officially, foreign workers are paid the same rates; but their efficiency is said to be below the standard of German workers. Detailed figures show that the increase in wages from September to December, 1941, was smaller than during the same period in 1940. It is officially explained that the early frost put a stop to outdoor work, caused an interruption of work in factories because of lack of fuel and increased sickness among the workers. During the winter daily hours of work fell appreciably. A particularly interesting feature is the fact that the percentage of workers receiving separation allowances rose from 5.3 per cent in September, 1941, to 7.1 per cent in December, 1941.

The wages stop and the frequent changes in production programmes have produced the problem of bonuses, which are still paid for punctuality, for keeping tools in good order, for regular attendance, for suggestions leading to improvements in production, for economising in material or fuel, and so on. Frequent attempts to prohibit these bonuses have failed, and they are now regularised by the trustees of labour. The so-called health bonus, which was widely paid during the winter, has been prohibited. The trustees of labour declared that a worker who is in good health and arrives regularly for work does his duty and deserves no bonus. Labour hoarding by employers and payment above the wage rates for the purpose of keeping and getting workers, under conditions of a general shortage of labour, have created serious problems of labour discipline. After several attempts, these practices have now been generally prohibited by the labour dictator, Sauckel.

Independent Artisans.—The small shops of the independent artisans have been forced either to close down or to combine in co-operatives, since labour shortage became the most important problem in Germany's war industry. This process began before the war and was accelerated from the beginning of 1941. Usually independent artisans formed co-operatives aided by their economic organisations. In the building industry the guild of the building artisans formed an "employment company of independent artisans." This central company replaces regional and local co-operatives in the building industries. It takes public orders and organises the combination of small firms for large-scale orders. The distribution of material, costing and the distribution of payments are centrally handled by the new company.

THE BUSINESS WORLD

Coal Mining Companies

LARGELY because of the upward trend in coal prices, the coal-mining industry enjoyed a steady improvement in its financial position during the years preceding the war. This improvement was reflected in the rise in profits and wages recorded by the quarterly assessments issued by the Mines Department. Since the publication of statistics showing the trend of costs and profits was suspended three years ago, it is not possible to ascertain the financial effect of the impact of war upon the industry as a whole with any degree of accuracy.

Broadly, the financial position of the industry has been influenced by three factors. First, the industry has suffered a decline in output since the defeat of France, when the Government allowed many export collieries to shut down. Secondly, when the winter of 1940-41 disclosed a shortage of supplies, the Government introduced a scheme designed to maintain closed pits in working order, and to compensate

June 20th, disclosed a decline in aggregate profits available for dividend from £5,825,000 in 1939 to £5,700,000 in 1940, and £4,363,000 in 1941. But the number of concerns whose shares are quoted on the stock exchanges is comparatively small, and their record is not necessarily typical of the experience of the industry as a whole.

Quite recently, half a dozen fair-sized colliery companies, working in different districts, have published their accounts for the year ended March, 1942, and, since they provide a sample to the investor, it may be of interest to examine their fortunes during the past four years. In the absence of any quantitative information, comparison must be in terms of disclosed profits, and these are subject to important changes in the incidence of taxation, whose effective extent can only be broadly estimated. On the whole, the directors of coal-mining concerns are not among the foremost in willingness to divulge information, during wartime, of earnings before taxation. This may be seen from the table opposite, in which particulars of income for the six companies before and after depreciation and taxation, are summarised for the last four years, together with figures of ordinary share earnings, dividends, prices and yields.

Of the six concerns, it will be observed, only Butterley

collieries which had suffered a reduction in demand out of a fund financed by a levy on the industry. Thirdly, the Government has maintained strict control over prices, though it has allowed the industry to pass on to the consumer the greater part of the increase in its costs.

While the experience of different collieries has probably been anything but uniform, there is some reason to believe that its profits have shown a downward trend. The financial results of 59 colliery companies with a paid-up capital of £76 millions, analysed in the *Investor's Chronicle* on

publishes complete figures of depreciation and taxation, although Manchester Collieries shows its income before tax. If the returns of each of these companies for the last year which fell clear of the war (i.e., the twelve months to March 31, 1939) be expressed as 100, the following interesting comparison is revealed:—

Years to March 31	BUTTERLEY			MANCHESTER COLLS.	
	Income Before Deprec. and Tax	Income After Deprec.	Income After Deprec. and Tax	Income After Deprec.	Income After Deprec. and Tax
1939	100	100	100	100	100
1940	117	121	102	72	64
1941	112	113	85	49	38
1942	114	115	86	80	65

Though the fluctuations in general earning power of the two companies have been different there are two factors common to both—a much less satisfactory comparison between existing and pre-war profits after tax deduction, and a tendency to reduced earnings in the year to March, 1941, after the over-running of Europe and the closure of export markets—from which the latest results afford evidence of a certain recovery.

If the earnings of all six companies, after depreciation and tax, are aggregated, the totals for each year from 1939, respectively, come out at : 100, 98, 72 and 78. In 1940, compared with 1939, three companies showed an increase and three a reduction. In 1941, the profits of all six companies were down. In 1942, four showed an increase (relatively small in two instances) and two a decrease. Allowing for tax factors, therefore, it seems fair to generalise by saying that, after approximately maintaining their earning-power in the earlier months of war, all the companies were hit by the events of the summer of 1940. Last year, however, they lost no further ground on the whole, but slightly improved their position. The totals are somewhat distorted, however, by the figures for Doncaster Amalgamated, whose earning power, for special reasons, was relatively low in the pre-war year. If this company's figures are omitted, the earnings of the other five, after depreciation and tax, for the four years, come out at 100, 90, 64 and 71. The correction leaves the general direction of changes in earning-power between different years unaltered, but somewhat increases the scope of the fluctuations.

Judged by these figures, the total drop in earning-power of these companies since the war, apart from their increased contribution to the revenues of the state, has been less—probably considerably less—than 30 per cent. Some companies have lost more while the Butterley Company, as has been shown, has actually increased its gross earnings, but the average may not be wide of the mark, for the whole slice of the industry which these companies represent. And of the five companies whose shares are directly dealt in on the Stock Exchange two have reduced their dividends, while three have maintained or increased them.

This, it must be admitted, is a relatively good showing for businesses engaged in an industry whose difficulties have been so much in the public eye. Admittedly, some of the companies have always been interested more in the domestic than the export market. But that certainly does not apply to Powell Duffryn Associated—the largest coal-producing unit in the country which before the war had an enormous export business, with selling organisations covering every part of the world. The four-year earnings figures for the holding company are: 100, 103, 76 and 87. Thus, they conform broadly to the general pattern and are, if anything, more favourable than the average.

Possibly the coal industry, with all its tribulations, is less

affected by the severe forms of war taxation than some other trades. Companies paying EPT may be exceptional. And as the "tax" deducted in the companies' accounts generally means "company's tax," as distinct from "shareholders' tax," the heavier incidence of income tax since the war is partly cushioned by the figures. But the testimony of earning-power to the relative success of most of the companies in coping with adverse conditions is striking. For the difficulties have been substantial. In the latest year, the number of workers has decreased and the proportion of older to younger men has increased. Official efforts to bring miners back from other industries have not had particularly impressive results, to judge by the experience of the Butterley Company, which, by the end of June, had been offered 191 underground men and had accepted 177, only 50 per cent of whom had actually resumed work. Up to the same date, the company, which had applied for 255 men from the Army, had had only 45 returned (which "unfortunately were not of the type most likely to increase production"), with six men from the RAF ground staff.

The Government's White Paper made it clear that the industry cannot expect any appreciable accretion to its present labour force or any downward adjustment of workers' average age. Indeed, it may be hard put to it to replace the inevitable wastage on the labour side. Here again, however, the experience of the most progressive companies may be an antidote to extreme depression and an example of what a deliberate efficiency-seeking national policy may achieve. The Butterley Company has increased its production in the latest period, and its collieries are running about 5 per cent, on the average, above the target figures fixed by the Coal Production Council in August, 1941—although at that time not a single colliery was producing the target tonnage "based on previous outputs obtained."

The reason for the improved performance is revealing, and might be written in great capital letters on the walls of the new Ministry of Fuel and Power. The increased output was obtained "as certain development work undertaken some months previously came into production." Have other collieries undertaken similar development work since the war? Again the question may be asked: What might be done if the standard of all collieries were brought up to that of the best?

Meanwhile, the investor's attitude to coal mining shares is highly selective. He attests his recognition of efficient management and assured wartime home demand by valuing some of the coal shares shown in the table on a relatively moderate yield basis as compared with an average of nearly 6½ per cent for coal shares generally, according to the Actuaries' Index—a figure comparing with little under 5 per cent for the general run of industrial shares.

The immediate prospect for the industry as a whole must be conditioned in large measure by the Government's production and price policy. If the efforts made to expand production are successful, its gross return will probably show an increase. But the experience of individual companies is unlikely to be uniform, especially if the Government carries out its declared policy of concentrating output on the most productive seams and pits. There are indications, however, that the Government will extend the application of the Coal Mines (War Levy) Scheme of December, 1940, and that its coal price policy may be modelled on the "central fund" principle adopted in the case of steel, whereby part of the increase in prices will be payable into a fund used for compensating collieries which have suffered, or are likely to suffer, a fall in earnings. In other words, the marginal colliery is to be financed by the more profitable ones. As was pointed out in *The Economist* on August 29th, Mr Dalton, President of the Board of Trade, strongly favours the creation of a central pool from which individual undertakings and districts would be financially relieved according to proved needs. That this is likely to be the Government's policy is suggested by its decision to take over the whole of the proceeds, amounting to £30-£35 millions, of the recent 3s. per ton adoption of such a policy would have a levelling effect on the profits of individual collieries.

After the war, the industry will be faced with a fresh set of problems. What will be the relative demand for coal and temporarily disappeared? What will be the industry's relations, on the administration and capital side, with a State which may be bent on increased control of "essential resources"? But in foreseeing what answer will be given to those perplexing questions, contemporary investors are in no better position than most men.

Finance and Banking

Back to Abundance

With the passing of the clearing banks' making-up period and the distribution of the September 1st dividend money, whatever signs of localised scarcity of credit which may have been apparent last week have disappeared. All the banks have been keen buyers of bills this week, and credit has been in abundant supply, with a certain amount of ¼ per cent money available most afternoons from non-clearing banks. The position has been further eased by the reduced allotment of Treasury bills to the discount market. Its quota at last week's tender fell from 39 to 31 per cent—though this was offset by a rise in the average rate of discount from £1 os. 0.7½d. to £1 os. 2.8½d. per cent. The market syndicate decided to hold its application price unchanged at £99 14s. 1½d., despite the shorter currency of the bills, and following the comparatively successful outcome of the latest tender it will probably adhere to this price during the ensuing three months of 91-day bills. The ease in the short-loan position indicates no further expansion in the bank cash position. This was affected during the week by particularly heavy TDR payments. The banks were called upon to pay £35 millions in this form during the week. The current maturities were appreciably smaller than the nominal figure of £15 millions, as substantial pre-encashments of the current maturities had taken place. The consequent drain in bank cash is reflected in a fall of £14,690,000 in bankers' deposits at the Bank and offsetting an increase of £7,838,000 in public deposits and a reduction of £8,470,000 in Government securities. The seasonal reflow of notes has quickly spent its force, and the latest Bank return shows a further increase of £1,454,000 in the active circulation.

Floating Debt in August

Out of the total debt creation of £257,178,000 for the five weeks to August 29th, covered by the latest monthly debt statement, £142,670,000 was raised on floating debt and £142,670,000 by longer term borrowing. The increase in the floating debt is largely accounted for by the rise of £87,625,000 in ways and means advances from public departments. This movement corrects the fall in this item which occurred over the two preceding months, and must be connected with some rearrangement of assets held by public departments, such as occurs on the occasions on which the National Debt Commissioners effect substantial funding of assets held by the savings banks. The movement in Treasury bills is now confined to the "tap" issue, since the tender bills outstanding are held steadily at £975,000,000. Last month's rise in tap bills amounted to £14,045,000. This item in the floating debt has now ended its persistent and substantial expansion which lasted from the outbreak of the war until last May. The main reason is to be found in the much reduced pace at which sterling area assets are accumulating in London. The new financial agreements with Canada, the virtual cessation of sales of gold and securities to the United States, the abrupt termination of sterling accumulations by Malaya and the Dutch East Indies and the reduced tempo of such accumulations by India, have all contributed to reduce the special investment demand which in the first two and a-half years of war was largely satisfied by the issue of tap Treasury bills. The banks subscribed to £75,000,000 of Treasury deposit receipts in the five weeks covered by the latest return, but in the same period there were £34,000,000 of maturities. Of these £16,500,000 represented pre-encashments. The heavy pre-encashments of TDRs over a period which included no special public demand for Government issues must be connected with the persistent demand for tax reserve certificates. Of these, £44,810,000 were issued in the five weeks to August 29th, while the total redeemed during this period was £9,399,000, the largest monthly figure yet recorded. The mechanism of these tax reserve certificates is now in full operation, but it is evident that the attractiveness of the terms on which they are issued is causing an ever-increasing volume of funds to be invested in them. The total outstanding on August 29th was £346,880,000. The net receipts from this source, £35,411,000 in the last preceding five weeks, were larger than those provided by

any other tap medium or long term loan of the Government.

Financing Expenditure

The following table summarises the Exchequer returns of the financial year to date (August 29th) and shows the respective shares of revenue and borrowing in meeting expenditure:—

£000			
Total ordinary expenditure ..	2,157,625	Total ordinary revenue	979,813
New Sinking Funds	3,223	Loans raised:—

		Public Dept. Adv.	199,000
		Treasury deposits	199,000
		Miscellaneous receipts (net) ..	1,679
			£2,163,550

The items shown as net are given after allowing for repayments and receipts.

US Silver "Lend-Lease"

The past week has been an eventful one in the world silver situation. From last Monday the US Treasury's price for imported silver was raised from 35 cents to 45 cents. The expected adjustment of the New York open market price for foreign silver duly followed, from 35½ cents to 44½ cents per fine ounce. Last November the New York open market raised its buying price for foreign silver from 34½ to 35½ cents, and its selling price increased correspondingly from 35 to 35½ cents. The Treasury's price remained at 35 cents, but whereas before last November much of the silver bought by the open market was resold to the Treasury, no purchases of foreign silver have since then been made by the Treasury. The industrial demand for silver has been more than adequate to take from the open market all the silver it could offer at 35½ cents. That figure became the "ceiling." The new ceiling, as fixed by the Office of Price Administration, is 45 cents. That means that the open market's bid price must be ¼ cent below if the normal turn between buying and selling quotations is to be maintained. The point which remains to be decided is whether, under the new arrangement, any foreign silver will make its way to the open market. As things stand at present, it looks as though all the imported silver will make its way to the Treasury—thence to be lent-leased to American industry. The Treasury has already had to come into the picture as provider of silver for industrial uses. This week it announced that its entire stock of non-monetary silver—1,350,000,000 ounces—was being lent-leased to industry. This is the silver which is not at present used as backing for silver certificates. The position may well arise when even this huge stock of silver will have been fully used and when the silver used as backing for silver certificates may be urgently required for industrial purposes. It is known that the authorities concerned are already racking their brains to devise the means by which monetary silver could be lent to industry and yet remain technically available for its monetary purposes. The easiest solution of this problem would be to withdraw silver certificates from circulation and replace them by Federal Reserve Notes for whose backing there is more than enough surplus gold. The opposition of the silver bloc in the Senate may, however, prove too strong for this comparatively simple solution, and we may yet see US soldiers mounting guard over the war factories in which the Treasury's stock of monetary silver is being temporarily utilised for electric wiring or in some other fairly easily recoverable form.

Mexico and the Silver Price

The US Office of Price Administration, by whose order the increase in the import price of silver was announced,

**FOR ALL
INSURANCE
NEEDS**

Head Offices:
LIVERPOOL LONDON
North John St. Lombard St.

has issued an interesting explanation of this move. "The purpose of this increase," it was explained, "is to permit the Mexican Government to levy a special emergency tax and to provide a larger return to the Mexican silver industry to stimulate production, thus increasing the output of Mexican silver available for purchase by the United States." The special tax and the increased dollar proceeds from the sale of silver will thus serve to finance both in their domestic and external aspects whatever payments the Mexican Government is to make in respect of expropriated oil properties. The tax will not be equal to the whole of the increase in the price, and this should appreciably stimulate the production of silver in Mexico. This should make it possible for that country to sell to the United States more than the quota of 6,000,000 ounces a month (not 60,000,000 ounces as was printed in *The Economist* last week) provided by the Mexican-American agreement of last November.

A Landmark in British Banking

The publication of the separate clearing bank returns for August opened this week with an interesting record.

Investment

August Records

Right to the very last, the prices of industrial equities soared upward during August. The *Financial News* index of 30 ordinary shares moved to 83.7 on the last day of the month and to 83.9 on September 2nd, successive new high levels since June, 1939. Meanwhile, gilt edged, which have generally stagnated for the past few weeks, staged advances

FIXED INTEREST AND EQUITY SECURITY MOVEMENTS (July 1, 1935-100)

Financial News indices of 20 fixed-interest securities (converted to new base) and 30 ordinary shares

this week for selected undated issues which raised 3½ per cent War Loan and Local Loans to the highest levels of the war, and 4 per cent Victory Bonds to the highest level since 1937. Market ability to look on the bright side of news which continues to be distinctly two-edged has been reinforced by a number of highly generous dividend announcements, notably those of Burmah Oil and Guinness.

The Midland Bank figures show, for the first time in the case of a British joint stock bank, deposits in excess of £700,000,000 and assets of more than £750,000,000. Last month's expansion in the case of this bank does not appear, on the evidence of the returns available so far, to have been the universal experience. The counterpart of the increased resources is to be found mainly in an expansion of TDRs, cash, bills and short loans. In other words, the liquidity of the position has considerably increased compared with the July 29th figures. The Midland Bank has for many years waged friendly competition with the Chase National Bank of New York for the distinction of being the largest bank in the world. Unfortunately, since the beginning of the war, the rate of exchange has moved so sharply against any sterling institution as to deprive the competition of much of its previous keenness. The latest Chase figures, those for June 30th last, gave totals of \$3,595,000,000 for deposits and \$3,869,000,000 for total assets. At the current rate of exchange this gives sterling equivalents of £899,000,000 and £967,000,000 respectively—well out of reach of the latest Midland Bank figures. But at the nominal parity the Chase totals would give sterling equivalents of about £720,000,000 and £775,000,000 respectively, at which levels the competition would still have reality.

The general impression that the existing level of taxation is not, after all, going to prevent a number of solid, and not so solid, concerns from raising distributions to the shareholder has done at least as much to keep the trend going up as has analysis of the war situation. Serious, potentially dangerous, news, such as the new Rommel offensive, is met by relative stagnation and some marking down. Good news, news which is good on balance or news which is indifferent has, since the end of last June, been sufficient to restart the upward movement, temporarily checked by the fall of Tobruk. With closed markets, minimum prices and a shortage of stock, only a severe shock to confidence can halt the upward trend. The recent advance in leading gilt edged issues is once more reviving speculation as to whether the Treasury may not find the times apt for a new Government issue.

* * *

Lower Industrial Yields

The details of the general upswing in industrial equities last month are provided by the *Actuaries' Investment Index*. The movement was steady rather than spectacular. The biggest rise in the price indices was no more than 4.9 for coal; the smallest, excluding banks and insurance companies,

was as little as 0.3 for gas. There were three falls during the month of 2.0 for building materials, 1.7 for electric light and power, and of 1.3 for home rails. After coal-mining shares, the next biggest rises were realised by

Company Notes

Higher Guinness Dividend

The restoration of the total Guinness payment to the pre-war level of 29 per cent was a pleasant surprise for the market. Ordinary stockholders are to receive a final dividend 2 per cent higher at 13 per cent and a bonus 1 per cent higher at 5 per cent, making, with the 11 per cent interim, a total for the year to June 30th last of 29 against 26 per cent. Stockholders received 29 per cent in each of the four years up to June 30, 1938, 26 per cent in 1938-39 and only 25 per cent in 1939-40. The rise in the distribution is not, however, based on any improvement in disclosed earnings, after tax which are reduced from £1,568,972 to £1,430,447. The transfer to maintenance and depreciation is some £50,000 lower at £223,715, so that the fall in equity earnings is less marked, and the earned rate is reduced only from 30.5 to 30.2 per cent. The following table shows three years' trend of earnings and allocations:—

	Years to June 30,		
	1940	1941	1942
Profits after tax	1,721,971	1,568,972	1,430,447
Maintenance and depreciation	222,488	273,721	223,715
Fees, etc.	14,240	13,903	14,679
Preference dividend	69,000	64,500	60,000

Ordinary shares:—

	1940	1941	1942
Earned	1,416,243	1,216,848	1,132,053
Paid	1,140,000	1,036,875	1,087,500
Earned %	31.1	30.5	30.2
Paid %	25	26	29

Contingencies	275,000	200,000	100,000
Carry forward	877,554	857,527	802,080

The balance-sheet shows a decline in stocks from £2,169,245 to £1,950,477, accompanied by a rise in debtors of more

Defence Bonds—New Series

The latest issue of 3 per Cent Defence Bonds—the third since the bonds were first placed on sale in November, 1939—is now on offer. Its advent draws attention to the remarkable decline in the popularity of Defence Bonds during the past year. It is understood that a drive to bring the new series back into public favour is to accompany its issue. A year ago, the total sales of defence bonds had brought in £330 millions, and National Savings Certificates £348 millions. But up to August 25 this year the totals were £486 millions and £601 millions respectively, a much greater disparity. In the week ended August 26, 1941, the sale of 3 per Cent Defence Bonds brought in £2,805,000, while that of National Savings Certificates yielded £3,201,000. In the latest week, that ended August 25, 1942, Defence Bonds brought in £1,670,000, and Savings Certificates £4,186,000, an even more striking gap. The results in the latest week are not exceptional. It is six weeks since the yield from the sale of Defence Bonds exceeded £2,000,000, while in none of those weeks did the sale of Savings Certificates bring in less than £3,887,000. Nor was the greater popularity of Defence Bonds a year ago an exception. Only once in the months of July and August, 1941, did the spread between receipts from the two classes of issue exceed £1,000,000, and on one occasion, the week ending July 8, 1941, the yield from sales of Defence Bonds exceeded that from sales of Savings Certificates. It is possible that the comparison is obscured by an increase in the amount of principal repaid on Savings Certificates during the past year—the total is some £79,000,000 since the issue of the current series in November, 1939—so that net investment is substantially lower than the weekly figures suggest. The reason for the apparent shift in taste is less easy to find than the reason for the existing preference for Savings Certificates. It is generally recognised that Defence Bonds, although admittedly a bargain among Government issues for investors who hold the limit of Savings Certificates, have, from the standpoint of the large investor, the disadvantage of not being marketable. For the investor who does not hold the limit of Savings Certificates, Defence Bonds are unquestionably less profitable, since the yield is only 1½ per cent, tax free, against some 3.36 per cent, tax free, on certificates held to redemption. The absolute decline in subscriptions to Defence Bonds does suggest a shift in public taste. Probably, the recent official propaganda to drive home the realisation that certificates are tax free is preventing any small saver not holding the limit from buying Defence Bonds. It is also possible that the small savings movement is now supported by more new and genuinely small savers, while those who have reached the £375 limit for certificates tend to rest on their oars.

A Complete Banking Service

THROUGH its widespread organisation, Barclays Bank offers the fullest possible facilities for the transaction of every kind of Banking Business, at home and abroad

Full particulars of the various services provided may be obtained from any Branch of the Bank

BARCLAYS BANK LIMITED

Head Office:
 54, LOMBARD STREET, LONDON, E.C.3

FOREIGN BRANCHES:

LONDON	-	168, Fenchurch Street, E.C.3 1, Pall Mall East, S.W.1

than £400,000 to £2,678,865, and in the total of cash and investments from £6,995,116 to £8,854,116. On the liabilities side there is a rise in current items of less than £2,000,000 from £5,629,772 to £7,557,353. It is probable that the decline in disclosed income for the sixth year in succession is again due mainly to increased tax liability. Despite the effect of the increase in the beer duty last spring, it is unlikely that there has been any decline in demand. Transport costs must have increased further in the past year, but the concern is fortunate in being less seriously affected by the labour shortage than a number of its competitors. The increase in dividend, despite the fall in the free surplus, implies considerable optimism about the future. The £1 ordinary stock jumped 5s. 6d. on the announcement. At the current price of 103s. 3d. ex dividend there is a yield of £5 12s. 4d. per cent.

* * *

Morris Motors—No Change

The announcement of a final tax-free payment of 7½ per cent, making a total of 17½ per cent tax free for the calendar year 1941, gives away no secrets. The payment is the same as for 1940, when the directors changed from a less-tax basis of payment of 40 per cent in the previous year. Recent motor results have suggested that, despite lower profit margins last year, turnover has generally increased sufficiently to permit net earnings to be approximately maintained. The announcement was not, however, a foregone conclusion in the case of Morris, the 1940 payment having been under-earned after providing for ARP expenditure. There was, in consequence, a draft of £100,000 on dividend equalisation account, reducing it to £75,000. The 5s. stock, at 33s., yields £2 15s. 6d. per cent, tax free.

* * *

Whitworth and Mitchell Progress

The Whitworth and Mitchell accounts to June 30th last make a rather better showing than those of other recent textile results. The jump in total income from £112,572 to £167,553 understates the improvement, since receipts from investments are shown net at £1,531 against a gross sum in the previous year of £4,143. In the latest accounts, all dividends are also shown net, whereas in previous years only the final ordinary payment was shown on this basis. This change in practice accounts in part for the jump in disclosed tax liability from £45,000 to £125,000, including an increase in EPT from £40,000 to £100,000. There has, of course, been a real rise in liability due to the increase in gross income. The total payment on ordinary capital, maintained at 7½ per cent, is covered by an earned rate of 8.6 against 9.1 per cent, so that there is a modest addition to the carry forward, which is raised from £9,222 to £10,620. The balance sheet shows a small decline in net liquid assets from £710,036 to £696,670, due mainly to a reduction in debtors from £271,557 to £138,712. Stock is also lower at £299,093 against £333,936. The cash position is very strong, with cash holdings at £107,594 against £76,884 and tax reserve certificates of £200,000 against nil. The decline in debtors is due, as the chairman, Mr L. E. Walsh, points out, in part to prompter payment, but in part to a contraction in turnover in the latter half of the year. The fact that turnover was higher for the year as a whole is due to the variety of the company's output and to the relatively slight restriction on rayon production, while exports absorbed a higher proportion of total output. Mr Walsh considers that turnover will be lower in the current period, and it is clear that the standardisation of fabrics for the home market, imposed by the utility scheme, will not work to the advantage of concerns with good will derived from branded lines. As far as the ordinary shareholder is concerned, the accounts show an adequate margin of cover for the equity payment. The £1 ordinary shares at 19s. 4½d. ex dividend yield £7 14s. 10d. per cent.

NATIONAL BANK OF INDIA LIMITED

NOTICE IS HEREBY GIVEN that the Transfer Books of the Bank will be closed from the 9th September to 22nd September, both days inclusive.

By order of the Board,
R. L. HIRD, London Manager.

26, Bishopsgate, London, E.C. 2.
1st September, 1942.

Calico Printers' Arrears

The preliminary statement of Calico Printers for the year to June 30th last shows a reduction in net profit from £220,564 to £174,925, after meeting debenture interest and providing £315,091, against £335,395, for depreciation and repairs. Despite this reduction, the management has decided to distribute a dividend for the one and a-half years ended June 30, 1939, on the 5 per cent cumulative preference stock. This payment will absorb a gross sum of £226,207, so that the carry forward is reduced from £110,953 to £59,670. The payment leaves three years of preference arrears outstanding, requiring £452,416 gross, before the ordinary stockholders are within sight of a dividend. The last payment on ordinary capital was the 5 per cent distributed for the year 1928-29. The decision to pay off one and a-half year's arrears, the highest distribution on preference capital in the last decade, despite the decline in net earnings, is in line with a number of recent increases in dividends. The governing factor is probably the absence of a further rise in the standard rate of tax for the current financial year. Concerns which last year conserved undistributed profits at an unusually high level against a fresh increase in tax liability now feel justified in reducing their carry forward. In the case of Calico Printers, the increase in the preference payment is at the expense of a repetition of the transfer of £50,000 to war contingencies reserve, provided in each of the two previous years, and the liability for war damage insurance is again drawn from reserves. The £1 ordinary stock now stands at 8s. 9d.; the £1, 5 per cent cumulative preference stock, at 16s. 6d., yields £9 10s. 5d. per cent on the latest 7½ per cent payment.

* * *

Anglo-Iranian Higher Profits

The Anglo-Iranian preliminary statement shows a rise in net profits for 1941 from £2,841,909 to £3,292,315. Extra depreciation receives £625,000 as in the previous year, so that, after meeting preference service, there is a jump in the surplus for ordinary capital from £1,145,675 to £1,596,081, representing an earned rate of 8.3 against 6.4 per cent. Thus, the decision to raise the ordinary payment from 5 per cent, paid in the two previous years, to 7½ per cent, is fully justified, and the carry forward is raised from £1,101,351 to £1,187,119. No doubt the concern profited last year from higher demand in the Middle East. The announcement of the increase in dividend caused less surprise and enthusiasm in the markets than the Burmah Oil announcement that the final payment would be cut by as little as 2½ per cent. The Burmah Oil decision probably owes much to the rise in payment announced by Anglo-Iranian, of whose ordinary stock the Burmah company owns more than £4,000,000. The yield on the £1 ordinary stock at only £3 4s. 2d. per cent on the current price of 47s. 6d. argues considerable confidence in post-war prospects.

* * *

Burmah Oil Final

The unexpected news that the Burmah Oil final dividend is to be cut by only 2½ per cent caused a spurt in the market price of the ordinary stock of 3s 1½d. With a final of 7½ against 10 per cent, the total payment for 1941 amounts to 12½ against 15 per cent in 1940, and 21 per cent in 1938 and 1939. There is, of course, no reason to expect a severe drop in the profits earned last year. The disturbance to trading conditions in the Far East only started with the Japanese entry into the war last December, and, throughout the year in question, the company remained in uninterrupted control of its oilfields and installations in Burma. Total income is, however, unlikely to exceed the £3,769,498 earned last year—the lowest level since 1935. Since the close of the financial year, all the company's interests in Burma have fallen into enemy hands, and a statement issued last April announced that substantial destruction had been carried out to prevent exploitation by the enemy. Receipts in the current year will be limited to investment income—the concern has large holdings in Shell Transport and Trading and in Anglo-Iranian—and possibly to profits earned before the Japanese occupation. Thus, the payment of more than nominal dividends, until the war is won, remains doubtful despite the generous distribution in respect of 1941. The £1 ordinary stock, at 36s. 3d. ex dividend, yields £6 17s. 11d. per cent.

Industry and Trade

Taking Stock

After three years of war, British industry stands mobilised and is delivering munitions and other goods of war at a rate never achieved during the last war, greater than that of any other country per head of the employed population and only just surpassed in total by the giant strides of the American colossus. The target of industrial mobilisation in war economy is high: all the available resources, human and material, save those needed for the provision of the essential needs of the civilian consumer, must be turned over to war work. It has now been virtually done. The last reserves of able-bodied men and women are now being rapidly absorbed, civilian production has been cut almost to the bone. "We are reaching the stage," Mr Dalton said to members of the Manchester Chamber of Commerce last Wednesday, "when further cuts in civilian supplies are becoming less and less possible." Compared with the danger confronting Great Britain, especially in the days when it was the only large arsenal of the democracies, the progress of industrial mobilisation often seemed dreadfully slow and unmethodical. But, looked at in retrospect, the blending of the empirical approach with the plans hastily conceived three years ago has produced remarkable results. For example, manpower policy was designed to produce the men and women needed by the Services and by war industry with a minimum of dislocation. The initially crude list of reserved occupations, revised as needs changed and finally superseded by the method of individual deferment, provides evidence of careful and successful planning. Again, the method of allocating scarce raw materials and machine tools on the basis of a national production programme has been fairly successful. The construction of more factories, the adaptation of existing plant and the concentration of civilian production into fewer units have proceeded smoothly, on the whole. Both production and transport showed remarkable resilience during the heavy air raids of 1940-41. Yet, in spite of all the achievements on the industrial front, there have been many shortcomings and serious delays which might have been avoided; before the fall of France the pace of mobilisation was lamentably slow. Even now, there are many ragged edges that remain to be smoothed. During the fourth year of war, which may well be the decisive one, British industry must harness all its ingenuity in delivering munitions at top speed, with the emphasis on flexibility and an increased yield per man hour.

* * *

Railway Wages

Reports that the National Union of Railwaymen would follow the example of the Railway Clerks' Association by accepting the Railway Executive Committee's wage offer were wrong. Last Tuesday, the special national delegate conference of the NUR rejected the companies' offer which, with certain exceptions, provided for an additional 4s. a week for men and 3s. a week for women. Apparently some of the delegates described the offer as "quite inadequate, having regard to the responsibilities of railway workers in war conditions." The reason given for the rejection is as ingenious as it is vague, and it offers a vista of large possibilities for other unions. How about the sailors who are responsible for the transport, at great personal risk, of a large part of the nation's food and of the raw materials needed to feed the munition factories? And how about the workers in many other essential industries, and the members of the fighting forces who have to keep the enemy at bay? The case is now to go to arbitration by the Railway Staff National Tribunal at which the NUR will presumably press its full claim of an additional 10s. a week.

* * *

Fatal Industrial Accidents

The entry into industry of large numbers of inexperienced workers has, not unnaturally, brought with it a substantial increase in the incidence of accidents. Unfortunately, there is no evidence revealing the extent of the increase in non-fatal accidents, but the numbers of fatal accidents, classified by industry, are published monthly in the *Ministry*

of Labour Gazette. The totals for the first seven months of the years 1939, 1941 and 1942 are shown in the accompanying table. The increase in the war years is large, but not, perhaps, as great as might have been expected. The remarkable fact emerges from the totals of a decline in

FATAL INDUSTRIAL ACCIDENTS

	Jan.-July, 1939	Jan.-July, 1941	Jan.-July, 1942
Mines and quarries.....	481	667	548
Factories and workshops.....	580	1,026	857
Railway service.....	126	197	180
Total.....	1,187	1,890	1,585

1942, compared with 1941. The figures speak well for the efforts which have and are being made to reduce industrial accidents, although they provide no excuse for relaxation of the measures taken.

* * *

Coal for Electricity

During the year 1937/38, the consumption of coal and coke by the generating stations of authorised undertakings was 14 million tons, equivalent to less than eight per cent of total home consumption. In addition, the electricity supply industry used small quantities of oil and other fuel. In view of the need for economy, the distribution of the electricity sold by authorised undertakers among the principal categories of consumers is of considerable interest. In the absence of current statistics, the distribution of consumption is given below for 1937/38:—

DISTRIBUTION OF ELECTRICITY SOLD IN 1937/38

	Million Units	% of Total
Lighting, heating, cooking.....	7,348	38.1
Power.....	10,422	54.1
Public lighting.....	341	1.8
Traction.....	1,151	6.0
	19,262	100.0

The table shows that less than two-fifths of the total number of units sold was used for domestic purposes and that well over one-half was used for power by industry.

* * *

World Cotton Consumption

The New York Cotton Exchange Service has published tentative estimates of world cotton consumption for the season which ended last July. These are given in the accompanying table, together with figures for the three

COTTON CONSUMPTION
('000 bales)

	1938/9	1939/40	1940/41	1941/42
United States.....	6,858	7,784	9,722	11,300
United Kingdom.....	2,690	2,993	2,110	1,742
Europe, excl. Russia..	5,679	4,177	1,984	685
Russia.....	3,765	4,011	3,289	3,000
Orient.....	7,984	7,576	7,170	6,327
Others.....	1,531	1,945	2,267	2,752
World Total.....	28,507	28,486	26,542	25,806

preceding seasons. In view of war conditions, world consumption has been remarkably stable. The decline in European consumption has been partly offset by the expansion in American consumption. The United States consumed almost exclusively domestic cotton—only quite recently consumption of "outside growths" has shown a certain improvement. World consumption of American cotton has increased: in 1941/42 the total was 12,355,000 bales against 11,249,000 bales in 1938/39. World consumption of "outside growths" fell from 17,258,000 bales in the last pre-war season to 13,451,000 bales in 1941/42.

(Continued on page 315)

COMPANY MEETINGS

FURNESS, WITHEY AND COMPANY,
LIMITED

DIVIDEND MAINTAINED

LORD ESSENDON'S STATEMENT

The fifty-first ordinary general meeting of Furness, Withy and Company, Limited, was held, on the 2nd instant, at Furness House, London.

The Rt. Hon. Lord Essendon, J.P. (chairman of the company), presided.

The following statement by the chairman, circulated with the report and accounts, was taken as read:—

The position as disclosed by the accompanying accounts will, I feel sure, be satisfactory to stockholders. The net profit, after making provision for taxation, amounts to £603,383, a decrease on the previous year of £61,688, which is accounted for by a corresponding reduction in the earnings of the ships as compared with those of the previous year.

After providing £300,000 for depreciation, and transferring £100,000 to the fleet replacement account, the directors recommend the payment of a dividend on the ordinary stock of 6 per cent., less income-tax, which is the same distribution as the previous year, leaving a balance of £172,097 to be carried forward to next year's accounts, as compared with a similar amount brought in.

CHAIRMAN'S VISIT TO U.S.

A few weeks ago, whilst on a hurried visit to the United States, I had the opportunity of seeing our New York organisation under the guidance of Mr Henry B. Whitely, our resident director in that country, and I am glad to report that they were in full swing and doing a huge volume of work most useful to the war effort. In regard to other matters, I noticed amongst those with whom I came into contact a grim determination to leave nothing undone which could further the ultimate victory of the Allies. A justifiable consciousness of their power of production seems to be growing, and as you will without doubt have read, their peace-time plant is everywhere being converted to war-time needs. This, and the building of their ships, is being carried out with a rapidity and thoroughness which is both arresting and amazing.

AGREEMENT WITH GOVERNMENT

It has been customary for me to make some remarks on the general shipping situation, but I am sure you will agree that this is not the time to indulge in any forecast as to the future of the industry. As I mentioned last year, shipowners are wholeheartedly devoting all their energies towards the quick turn round of ships, and so far as the industry itself is concerned, they rely on the promise given by the Government that they will recognise "the necessity of maintaining the British Mercantile Marine in adequate strength and in a position of full competitive efficiency."

As a step in this direction, the Ministry of War Transport have agreed that the industry should acquire from the Government the ships which have been, and are now being, built in this country on Government account. Objections to this policy have been voiced in certain quarters. From the shipowners' point of view it is perhaps unfortunate that under the scheme, notwithstanding the fact that the purchase price will be reduced by the appropriate amount of depreciation applying to the intervening period, delivery to the shipowner is deferred until after the cessation of hostilities. Had they been allowed to take delivery forthwith it would have been possible to accumulate additional funds towards the further replacement of lost tonnage. I think the objections to this scheme, to whom I have referred, are somewhat inconsistent, because after the war the general criticism was that

shipowners sold out instead of putting the proceeds of vessels lost into new ships. And now it is objected that the reverse policy of allowing the industry to utilise the money they have available for the purpose is equally incorrect.

REPLY TO CRITICISM

The criticism, to which I have referred, after the last war is only partially correct, because whilst it is true that a few owners sold their ships, the industry generally did go in for a large replacement policy, so much so that, as a whole, shipowners spent £280,000,000 on fresh building as against £150,000,000 received for ships that were lost, and this unexpected increased cost was entirely due to the pernicious cost and percentage contract, which, at that time, was the only basis under which it was possible to get vessels constructed. The effect of this policy was that owners had to pay a fixed amount for profit and establishment charges and be responsible for all increases in costs after the date the contract was entered into. It was in order to eliminate any possibility of shipowners selling out after this war that an agreement was entered into with the Ministry of Shipping, as it then was, and the shipping industry that when vessels were lost by war risk the amount to be paid to the owner over agreed periods would only represent the pre-war entered value of the vessel in his War Risk Association, and the difference between that amount and the value of the ship at the date of loss should be held by the Treasury to the credit of the owner, only to be released when that sum, plus the amount originally received in cash, is invested in new tonnage. Therefore, as I say, the agreement in regard to acquiring Government ships is only carrying out the policy above referred to.

NATIONALISATION OR PRIVATE ENTERPRISE

Any policy for the retention of the ships by the Government to be operated in competition with the British shipping industry would be a poor return for all that it has done in past years in face of tremendous difficulties to maintain the standing of the British Mercantile Marine. I have always maintained, and I make no apology for repeating it, that nationalisation of any industry is only justified:—

- (1) if it can be shown that the industry in question has failed to provide for national needs;
- (2) if the Government can do this more efficiently and more economically than individual enterprise.

Are we to say that private enterprise, as in the case of public companies, ceases to be private enterprise when applied to the individual in his efforts to improve his remuneration and station in the ordinary walks of life, and that it is to be condemned in the one case and glorified in the other? In any walk of life a lack of initiative means a corresponding lack of efficiency, and human nature is so constituted that whenever lack of incentive comes in at the window, efficiency and initiative go out of the door.

However, the deliberation of these matters and the controversy for the preservation of private enterprise must be deferred until the war is won.

I desire in closing to voice once again the deep admiration which we all feel for the manner in which our merchant seamen carry out their duties. The courage they display in the face of constant danger arising from enemy action in the air, on the sea, and under the sea, is beyond praise. The report and accounts were unanimously adopted.

ASSOCIATED BRITISH
PICTURE CORPORATION,
LIMITED

INCREASED NET PROFIT

The fifteenth ordinary general meeting of the Associated British Picture Corporation, Limited, was held, on the 3rd instant, in London, Mr A. G. Allen, D.S.O., M.C. (the chairman), presiding.

The following is an extract from the statement by the chairman circulated with the report and accounts:—

The net profit of the group applicable to the corporation has increased by £214,403, from £192,263 to £406,666, as a result of the increase in trading profits and the decrease in the charge for interest.

The available profit, after providing for all charges and expenses, and bringing in £109,351 brought forward, is £515,946. The recommendation of the directors is that £100,000 should be transferred to general reserve and that a final dividend of 7½ per cent. actual, less tax, be paid on the ordinary shares, making 15 per cent. for the year, leaving £175,946 to be carried forward to next year.

IMPROVEMENT IN BUSINESS

As a whole, the entertainment industry has made a splendid recovery from the effects of air raids, and public demand for healthy recreation is continuing to assert itself. Motion pictures are generally acknowledged to be rendering a major contribution in supplying this essential service, and it is also gratifying to know that the cinema is playing an ever-growing part in the life of every community by co-operating to the fullest extent with such national and local campaigns and drives as are launched to further the war effort. I am pleased to report that our cinemas have derived their full share from this improvement in business.

The recent doubling of the Entertainment Tax had an initial reaction on attendances throughout the entire industry, but the adverse effect is already wearing off.

A serious problem with which we have to contend is that of repairs and of maintenance of the cinema properties. We are fortunate, however, in having a department with a skilled staff whereby the best results are obtained from the limited amount expended. It is in this connection that your board has again considered it prudent to provide a substantial sum for a deferred repairs account.

At no time has there been any interruption in our film supplies from American producers, and there is no indication that America's entry into the war will lead to curtailment in production in the United States for some time to come.

PRODUCTION ACTIVITIES

Notwithstanding all difficulties, we have carried on our production activities at Welwyn Studios and we intend to do our utmost to keep the studios in operation. We have secured several important screen properties, but no picture will be undertaken without careful analysis of its revenue-earning possibilities in comparison with cost. We shall pursue a vigorous policy, combining the creative ability of our production organisation with our exhibiting organisation's knowledge of audience requirements, and in this way we look forward to producing a number of high quality British pictures with real box-office value.

It is gratifying to report that the trading results of the corporation during the current financial year have been fully maintained. As to the future, we must all be conscious of the dangers and hazards which lie ahead, but insofar as our business is concerned, I have no doubt that our best insurance against all risks will be to pursue a balanced policy of careful management and to do everything in our power to build up the financial stability of this great enterprise, so that, whatever problems we are called upon to face, we shall have the requisite reserve of strength to overcome them. The report was adopted.

(Company Meetings continued on page 316)

(Continued from page 313.)

This country has, however, relied to a great extent on American cotton. There is every likelihood that the trends in international cotton consumption apparent in the last three years will be maintained during the war. In the United States, consumption is still forging ahead and preliminary estimates for the current season exceed 13,000,000 bales. In Britain, consumption may have almost reached its minimum, but on the European mainland, cut off from all major sources of supply and with its reserves almost exhausted, staple fibre has taken the place of cotton. Russia's chief producing regions are still intact, but some of the most important manufacturing centres have been either lost or isolated. In the Far East, Japan's entry into the war has yet to exert its full influence, and consumption in other areas continues upward. On the whole, world consumption of American cotton will continue to be favoured despite the shrinkage of United States raw cotton exports. The prospects for outside growths are bleaker than ever. Despite the high United States estimate for the current cotton crop, world production of cotton in 1942/43 is expected to fall by more than 4,000,000 bales to just over 23,000,000 bales and may even prove smaller than the current world consumption. In view of the record stocks of outside growths, such a development would not be unwelcome.

Children and the Clothes Ration

Children of certain ages are to be given extra coupons in addition to the normal clothing ration of 60 coupons. The effect of the additions will be to make a child's ration vary according to age, in the following manner: Children born between June 1, 1924, and December 31, 1925, will have 70 coupons; between January and July, 1926, 80 coupons, and between August, 1926, and December, 1928, 90 coupons. All younger children have their 70 coupons, and those who weigh 7 st. 12 lbs. or more, or who are 5 ft.

3 in. or taller, on or before October 31, 1942, may claim an extra 20. Like adults, children have, on the whole, fewer coupons to spend in the current period. In the first year of rationing, most of those of comparable ages had 106 instead of 90, and some had 86 instead of the present 80. Children of the June, 1924, to December, 1925, group are getting four coupons more than those of similar age did in the previous rationing period. Presumably the experience of last year has led to this comparative increase. Last week the date on which the third block of coupons becomes available was made known. They may be used from April 1, 1943. A warning was issued at the same time that new coupons may not necessarily be issued on August 1, 1943, which was the date originally announced for the beginning of the third rationing period. It will be unfortunate if the current period has to be extended; but the coat must be cut according to the cloth.

No Flowers By Rail

Mr Middleton, in giving good advice to the allotment holder and gardener on vegetable-growing, exhorts his listeners not to give up entirely the raising of flowers. After November 1st, when the ban on the transport of flowers by rail comes into force, the few cut flowers in shops of large towns will be within the reach only of the very rich. Small towns and villages where flowers are locally grown will probably be in a favourable position. Growers for the market have had their flower acreage cut by half, and a further cut is to be imposed on November 1st, which will reduce acreage to a quarter of the pre-war size. Fortunately, flower-growers can turn to the production of vegetables without undue difficulty. Those who will suffer most are the middlemen and retailers who sell nothing but flowers. Most of them will inevitably be forced to close down. The public will accept the new loss cheerfully, but the lack of flowers for weddings and other celebrations, and for funerals, will cause many pangs.

ALTHOUGH the opening of the new campaign in Egypt restricted activity in the markets, the outstanding influence in all sections continues to be the acute shortage

COMPANY MEETINGS—Continued

GREAT UNIVERSAL STORES,
LIMITED

The twenty-fourth ordinary general meeting of the Great Universal Stores, Limited, was held, on the 26th ultimo, in London.

The following are extracts from the statement by the chairman, Sir Archibald Mitchelson, Bt., circulated with the report and accounts:—

During the past year we have experienced the benefit of the developments which have taken place over a number of years under the present management of the company. We believe, however, that the full results of this policy are yet to be realised when the war is over and we return to more normal conditions.

The combined trading profit for the year amounts to £685,602 as compared with £489,001 in the previous year. We recommend a final dividend which makes a total distribution for the year equivalent to 10 per cent. free of tax.

Coming to the outlook for the present year, I can only say that up to now the company has done satisfactorily.

The report was unanimously adopted.

of stock. Even the slight easing of quotations on the news failed to increase the supply of stock and quite a small volume of business sufficed to raise the *Financial News* ordinary share index to a new high level for the year. Steady investment demand for irredeemable, long and medium dated stocks occasioned a general advance in the *gilt-edged* market early in the week, where the shortage of stock is particularly marked. Outstanding were gains of ½ for Victory Loan and of ¾ for 3½ per cent War Loan, which raised these stocks to their highest levels since 1937 and for the current year, respectively. For other securities, the advance was less marked, but was generally out of all proportion to the actual business done. Short dated stocks, however, remained quiet and steady. Quiet and rather dull conditions prevailed in the *foreign bond* market, where Brazilian stocks continued their downward trend, chief losses being suffered by the 5 per cent Funding Loan of 1914 and the San Paulo Coffee loan. Chilean issues were steady, while elsewhere Egyptian 4 per cent Unified weakened on the war news. In general, however, turnover was small. There was a marked expansion in business in the *home rail* market which gave rise to an all round improvement in junior stocks, while, later, buying extended to the prior charges. After some improvement, LMS ordinary and Southern deferred weakened slightly in midweek, but Southern preferred and GW ordinary held their earlier advance, while London Transport "C" coming for the Havana line debentures, while among Argentine prior charges Central Argentine and BA Western issues improved slightly. Declining support for the funds in the latter part of the week led

to an easier tendency, while selling of Brazilian stocks continued.

Despite the considerable interest displayed in the funds, daily markings of over 1,000 bargains indicated that there was no slackening in the quest for good industrial equities, and prices continued to advance steadily. Activity among brewery shares was moderate, although apart from a rise of 2s. on the week for South African Breweries and a sharp jump of 5s. 6d. for Guinness on the increased dividend, prices showed little change. Tobacco shares, too, were quiet, Imps and BAT remaining steady, although Godfrey Phillips and Gallaher improved slightly. The heavy industrial section was firm throughout on steady support, with Beardmore outstanding with a rise of 1s. on Tuesday. Colliery issues were firm on the output bonus decision, William Cory advancing steadily. Among shipping shares, Cunard and P & O deferred were prominent in a firm market. Textile issues recovered from the Crosses and Winkworth results and small improvements were fairly general, Patons & Baldwin gaining ¼ at the reopening, when Tootal Broadhurst also rose a few pence. In the stores group, leading issues were firm on some buying. The miscellaneous section reflected the general improvement, International Nickel rising ½ on the week, while Murex, London Brick, Spillers and Brazilian Traction all advanced. The general firmness of the market was quite well maintained in midweek, although dollar stocks reacted slightly.

Both home and Cape demand in the kaffir market combined to raise prices at

the reopening, when gains ranged from 1/2 to 1, the latter amount being gained by Sub Nigel and East Geduld, while Sallies and West Wit Areas, among others, were both 1/2 better. Later, the tendency became slightly easier, although selling was negligible. There was a slight improvement in turnover in the rubber market, but losses generally outweighed gains. Kuala Lumpur and Tamiang fell 1s. and 1s. 3d. respectively on some selling this week. Tea issues were distinctly firm in the early part of the current week, British India advancing 2s. among other smaller gains. The slightly reduced Burmah Oil dividend provided a pleasant surprise for the oil market, which marked the shares up some 3s., while Anglo-Iranian also improved. Although business was maintained, prices showed little important change, but both Burmah and Shell suffered small losses early this week. Anglo-Iranian remained steady in midweek on the dividend announcement, but Anglo-Egyptian weakened on the Egyptian news.

New York

In spite of the more favourable war news, sentiment on Wall Street over the past

week has been restrained. Uncertainty regarding the Tax Bill and the anti-inflation measures to be taken restricted both speculative and investment buying, and trading in consequence was slow. A few selected issues improved slightly, but in general prices fluctuated narrowly with small gains and losses evenly spread throughout all sections.

COMMODITY AND INDUSTRY NEWS

Standard Specifications.—The British Standards Institute is drawing up a series of specifications for various non-ferrous castings, as a result of a request from the directorate of economy of the Ministry of Supply. Their purpose is to economise in the use of tin for cast-copper alloys. Four specifications, providing for two qualities of phosphor-bronze ingots and castings, have been issued this week. The use of one (B.S. 1058-9) of the qualities is restricted to essential purposes, such as for aircraft work. The other (B.S. 1060-1) provides for a leaded phosphor-bronze of lower tin content, which is suitable for much general engineering and maintenance work.

Night Ploughing.—The increase in the number of tractors since the war has been very large. Nevertheless, if farmers are to get the bulk of the increased wheat acreage sown by the end of October every tractor must be used for the maximum number of hours during every day on which it is possible to plough. The Minister of Agriculture has suggested that some ploughing will have to be done during the hours of darkness. Advice has been given to farmers on the right use of tractors, and instructions have been issued on the use of lamps.

International Sugar Scheme.—The International sugar agreement, which has been in operation for five years, expired at the end of August. Its extension for a further period has been proposed. It is reported that the Government of India may not participate in the new agreement.

Catering Wages.—The Minister of Labour is to reconsider his plans for the establishment of a Central Wages Board for the catering industries. This move has been dictated by the opposition against Government regulation of wages and conditions. No details of the modified plan are available, but a meeting is to take place shortly

between Mr Bevin and representatives of the catering trades.

Fertilisers for Allotments.—Gardeners and allotment-holders are now allowed to acquire small quantities of phosphatic and potassic fertilisers without permit or licence. This permission is given by the Control of Fertilisers (No. 24) Order, issued by the Minister of Supply. It came into force on September 1st.

Cotton Overtime.—The Cotton Controller has directed about 100 spinning mills to continue working overtime. The rest of the mills, estimated at about 200, have reduced the working week from 52 to 48 hours. The present arrangement is to last for two months, and it is expected that all overtime in both spinning and weaving branches will cease at the end of October.

Milk Production Contests.—The first results in the "League tables" of the Ministry of Agriculture's "Victory Churn" Contest have been announced. The tables were compiled from sales returns of the

Shorter Comments

Brazilian Traction, Light & Power (U.S. \$000s).—Gross earnings in month of July \$4,039 (\$3,731), net earnings before depreciation \$2,168 (\$2,044). Aggregate gross earnings since January 1st \$26,700 (\$24,127), aggregate net earnings \$14,180 (\$12,921).

Canadian Pacific Railway (\$000s).—Gross earnings in July, 1942, \$21,926 (\$19,359), net earnings \$3,268 (\$3,195). Aggregate gross earnings January-July, inclusive, \$142,959 (\$119,200), aggregate net earnings \$25,216 (\$23,115).

Milk Marketing Board for last June, and they show that 48 out of the 61 counties have increased their output of milk compared with a year ago. Some of the increases were substantial. Only six counties produced less than last year and the changes were negligible in seven. The competition is to run for a year, and will close at the end of next March. Further league tables will be compiled from returns for September, December and March.

Finance

GOVERNMENT RETURNS

For the week ended August 29, 1942, total ordinary revenue was £50,854,000, against ordinary expenditure of £109,833,000, and issues to sinking funds of £19,000. Thus, including sinking fund allocations of £3,222,965, the deficit accrued since April 1st is £1,181,035,000, against £1,223,945,000 for the corresponding period a year ago.

Compensation in War

WAR cares nothing about life and property. It strikes blindly, singling out victims at random. Some have to forfeit their lives, others lose their possessions, and yet more their incomes. It is the community's duty, so far as is practicable, to mitigate the effects of these haphazard blows by spreading their burden. The agency upon whom the ultimate responsibility must fall for protecting individuals against indiscriminate hardship is the Government; and the chief instrument to hand is money.

Broadly, there are two ways in which civilians may be hit by the war. They may be struck by enemy action in their persons or property, or their purses may be shortened by the economic upheavals of wartime. Both kinds of blow are inflicted by the war. If the community accepts responsibility for the one kind of casualty, it cannot, in justice, neglect the other.

The principle of communal responsibility for the victims of bombing found statutory recognition in the Personal Injuries (Emergency Provisions) Act, in the War Damage Act and in the War Risks Insurance Act. Generally speaking, where the risk affects the community as a whole, compensation is paid by the Government, but where it affects only a section of the community, it is borne jointly by that section and the Government, or entirely by the former. Thus the Personal Injuries Scheme provides for medical treatment for all civilians who have

suffered war injuries and for injury allowances and disablement benefits, as well as for payments to dependants during disablement or in case of death. The cost of the scheme, which is administered by the Ministry of Pensions, is borne by the Treasury—that is to say, by the community as a whole. The War Damage Act and Part II of the War Risks Insurance Act (dealing with the insurance of commodities) are, in a sense, counterparts of the Personal Injuries Scheme. Both these Acts provide for compensation in respect of loss of property caused by enemy action; but there are interesting differences in administrative detail. The Commodities Scheme, while administered by the Government, is financed by the owners of commodities in that the premiums collected from them are designed to pay for the losses sustained. Part I of the War Damage Act, providing for compensation in respect of damage to property and land, is financed partly by property owners—though there is an anomalous discrimination between different classes of property owners—and partly by the Government, on a fifty-fifty basis. Again, the Business Scheme of Part II of the Act, giving cover for plant, machinery and business equipment, is on a contributory basis. At the other end of the scale, there is the Private Chattels Scheme, also of Part II of the Act, which, like the Personal Injuries Scheme, provides for compensation by the Government without contribution but with an upper limit, above which contribu-

tions are payable by persons who desire higher cover.

Similarly, the Government has recognised the justice of paying compensation to individuals or institutions whose property has been requisitioned under the Defence Regulations. The basis and conditions of the requisitioning of property were laid down in the Compensation (Defence) Act. The main principle of the Act is that, while the state takes the benefit of a depreciation in letting values, it gives no credit for any appreciation due to the war. Mr John W. Morris, K.C., who was asked to report on requisitioning a year ago, saw no reason why the state should pay an inflated value, but he agreed that there was more merit in the contention that it should not pay a deflated value. There has been no consistency in the actual practice of the Government as between different kinds of requisitioned property. In the case of ships, for example, a special agreement with the shipowners has been made providing for a five per cent return on capital and five per cent for depreciation; for the railways, again, compensation is slightly above the pre-war level of profits. With the notable exception of ships, the property temporarily requisitioned by the Government is covered against damage or destruction through enemy action by the War Damage Act, which provides for physical restitution or, in certain cases, for financial compensation after the war on the basis of the market value of the property in March 1939. Ships are insured for their pre-war value—which, in contrast to compensation for destroyed buildings, is payable immediately after loss—as well as for their increased value since the outbreak of war, payable only after the war.

Nor has there been uniformity of practice in the case of property purchased outright by the Government. Foreign exchange and securities have generally been taken over at current market prices, whether above or below the pre-war price. Owners of dollars requisitioned after the depreciation of the £ have reaped the benefit of the alteration in the rate of exchange. The sale of Messrs Courtauld's American subsidiary, the American Viscose Corporation, is an example where compensation has been paid well in excess of the amount realised by the sale: the compensation ultimately fixed by arbitration was more than double the amount obtained by the Treasury, though even that was held to take inadequate account of the potential, if problematical, earning power of the concern.

As an article on Compensation in Practice by Mr Thomas Balogh in the current issue of the Bulletin of the Oxford Institute of Statistics shows, the Government's compensation policy bristles with inconsistencies in the case of persons who have been called up or directed to war work or of industries and individual firms which have become financial war casualties. Central and local government officials, if called up, continue to receive their former salaries. Many business firms, too, have adopted the policy of making up the income of their called-up employees; since salaries are allowable as an expense for taxation purposes, these payments are more often than not paid, in effect, by the state, either in whole or in part—and, in so far as they affect the costs of firms, they may be partly borne by the consumer in higher prices. But there are many members of the Forces whose pre-war incomes are not made up and who are dependent on their Service pay which, in spite of various allowances, is very often only a mere fraction of their former income.

As a matter of principle, the Government has refused to accept any direct communal responsibility for financial war casualties among businesses. Two years ago Mr Churchill said:

Damage by enemy action stands on a different footing from any other kind of loss or damage, because the nation undertakes the task of defending the lives and property of its subjects and taxpayers against assaults from outside. Unless public opinion and the judgment of the House were prepared to separate damage resulting from the fire of the enemy from all those other forms of war loss, and unless the House was prepared to draw the distinction very sharply between war damage by bomb and shell, and the other forms of loss which are incurred, we could not attempt to deal with this matter;

otherwise we should be opening up a field to which there would be no bounds.

In manufacturing the need for direct Government assistance has as yet scarcely arisen, because the majority of trades affected by concentration schemes have been able to earn profits large enough to pay compensation to closed down firms. In general, compensation schemes have been arranged among the industries concerned privately, though a small number of industries which cannot switch over to war work and cannot continue to manufacture goods for civilians may be left with virtually no income at all. Their problem can hardly be solved without direct Government assistance. In any case, even the sectional schemes whereby the "runners" raise a fund to defray the overhead and maintenance costs of the "closers" ultimately involve the consumer and the Government with both as contributors; the price paid by the consumer may be raised to the extent of the levy or the Government may receive less in taxation.

There are many walks of life where there is not even provision for sectional pooling arrangements. Of these the retail trades are among the most important. Retailers unable to carry on just fall by the wayside. Hitherto the number of casualties among them has been limited, because the value of total turnover, as distinct from its volume, has been fairly well maintained. But the rate of casualties is likely to grow next year, with the further reduction in the volume of sales and the extension of price control. Again, there are many service trades without sectional compensation schemes which have had a high rate of financial casualties in certain districts; of these, seaside landladies are a stock example. Last, but not least, there are the investors whose gross income has been reduced by the adverse effect of war on the dividend paying capacity of the concerns in which they have a stake.

To top it all, there has been, on the other side, a substantial measure of "betterment" for a large number of individuals, which can only be attributed to the war. As *The Economist's* quarterly analyses of industrial profits show, business earnings, after allowing for EPT, have been stabilised; wages and salaries, on the other hand, have registered a substantial increase, on the average. This makes the fate of the victims of war economy stand out still more. Fortunately, they are the exception rather than the rule; this is no reason why they should be neglected. Indeed, the fewer the financial war casualties, the easier it is for the community to come to their rescue.

Perfect justice in war is impossible; but a measure of rough justice is practical politics. In spite of their deficiencies, the schemes designed to compensate individuals and institutions for losses caused by enemy action have achieved a measure of fairness. But the treatment of economic casualties still shows a degree of variation which it is hard to justify. In practice, the principle of compensation has been widely recognised. It is the extension and rounding-off of principles which have already been accepted piecemeal rather than the introduction of new ones, that is now needed.

The need for compensation will not end with the war. As the remarkable Final Report of the Uthwatt Committee on Compensation and Betterment (Cmd. 6386) published on Thursday shows, it will also be a major problem in the post-war period when the task of social and economic reconstruction will overshadow all others. The Uthwatt Committee has produced an expert, authoritative, lucid and statesmanlike document, outlining the conditions that must be fulfilled if physical reconstruction and land development are to go forward in the national interest after the war. The purchase by the state of the development rights in all land outside built-up areas, and the actual acquisition of such land, as well as built-up sites, as and where required, together with a heavy tax on betterment: these are the essential preconditions of planned reconstruction and development. The principles of compensation for state interference with the use of private property laid down in this report (which will be discussed in detail in a subsequent article) are a model of practical justice.

Spain's Plight

LAST week's changes in the Spanish Cabinet are perhaps the most significant since General Franco formed his Government in August, 1939. They have given rise to the usual wave of optimistic speculation. In the eyes of the world, Señor Serrano Suñer has become identified with the predominance of Axis influence in Madrid, and now he has been dismissed. The deduction is too easily drawn that German influence is on the wane; and that General Franco has finally asserted the neutrality of Spain. But such an explanation outstrips the evidence. The fundamental determinants of Spanish foreign policy remain unchanged. There are still German forces on the Pyrenees; the shortage of bread is still acute. To a point, Germany is still able to guide the foreign policy of Spain; yet Hitler is still unwilling to exploit this advantage by attempting to force Spain to go to war. The attitude of the Spanish Government on diplomatic issues is determined by those facts, and will be so determined until the balance of power in Western Europe or in the Western Mediterranean is radically altered.

The most reasonable interpretation of last week's Cabinet changes is that they represent, not a change-over in foreign policy, but a bold attempt by the Caudillo to achieve a working unity in domestic matters. It was clear from the start of the Franco regime that the Spanish victors of the civil war owed their unity to a common distaste for the Republic rather than to any positive agreement on matters of political theory and practice. The lines of division between the Falange, the Monarchists, the Traditionalists and the Army became apparent very early. The main problem of General Franco's regime has been to maintain a common front between these divergent groups capable of supporting a stable government. Submerged and in the background, there remain many hundreds of thousands of supporters of democracy. Guerilla bands still hold out in the mountains. The ghost of the Republic has not been laid. In these circumstances, the revival of political antagonisms within the *cadres* of the Right is untimely and unwise, to say the least; and their intensification in recent months has led to a definite decline in internal solidarity. In his speech at Vigo at the end of August, the Caudillo discussed the matter frankly.

All Spaniards must subordinate their egoisms and interests to Spain, great and free. . . . Complete unity in Spain is imperative. No purpose is served if we are strong in the military sphere and powerful industrially if our political unity fails.

The recent crisis was no doubt brought to a head by the clash of personalities between Señor Suñer, a Falangist

and president of the Falangist political junta or executive committee, and General Varela, the former Minister of War, who has recently drawn closer to the Monarchists. The Falangist bomb outrage at Bilbao, when General Varela narrowly escaped with his life, revealed that the feud had reached an advanced stage. The question was the line which General Franco would take. Clearly the existing set-up of the Cabinet had become unworkable. In the event, the Caudillo has taken steps against both factions. The resignations of both Suñer and Varela are accompanied by those of Señor Luna, the Vice-Secretary of the Falange, and Colonel Galarza, the former Minister of the Interior, of Monarchist sympathies. General Franco remains impartial; in effect, he cries "A plague on both your houses." The vacated offices are filled with moderates. General Jordana and General Asensio, who go, respectively, to the Foreign Office and the War Ministry, are experienced soldiers. Don Blas Perez Gonzalez, the new Minister of the Interior, becomes a member of the political junta of the Falange; but the Caudillo himself has taken up the presidency of this body.

The crisis was not caused simply by personal differences. The divergencies in policy between the extreme wing of the Falange and the conservative elements in the Government, the Traditionalists and the Monarchists, are incompatible. An article on page 335 discusses in detail the recent evolution of Falangism with its growing emphasis on the need to achieve a national syndicalist revolution. On the other side, the reopening of negotiations for the restoration of the monarchy have become an open secret. The Varela-Suñer struggle is symptomatic of a growing cleavage within the uneasy team of right wing parties which General Franco drives. Spain to-day is only very nominally a one party state; and there is no guarantee that the elimination of a number of the most notable figures will stabilise the position.

The internal struggle is not, of course, without its influence on foreign policy. Señor Suñer was notoriously willing to go to the limit in collaboration with the Axis. He was identified with the German standpoint and in the past has owed much of his influence to Axis support. But his dismissal is evidence that the Germans have seen fit to dispense with his services rather than that Axis intrigue in Madrid has suffered an open reverse. Señor Suñer's unpopularity, even among the staunchest supporters of General Franco's regime, had become increasingly embarrassing to his German masters; and his removal from office does not necessarily run counter to Germany's true interests in Spain.

Spain remains a not unwilling member of German-dominated Europe. But Spanish interests, for which the

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

Caudillo has consistently stood in the past three years, is predominantly to stay at peace. That Spain has not been forced into full belligerency is, of course, due solely to Axis calculations of expediency. Economic impoverishment in the peninsula would severely limit the benefits of occupation; and Spain is already virtually integrated within the New Order. The receipt of positive assistance from Spain in the form of the Blue Division for service against Russia and of industrial raw materials has so far bought off more drastic interference by the Germans. The striking difference between the ability of Spain and of Portugal to play truly neutral and independent rôles in the present struggle is, of course, the legacy of the Spanish civil war. In a sense, Spain was the first of the conquered nations of Europe. The Germans have already fought their war in Spain; and, as the reward for their intervention, they exercise the right to exploit Spanish resources for the Axis cause without further military effort. The price they pay for their intervention is the reduction of Spain's material contribution to a minimum, because of its total and unrepaired economic collapse.

Spain's own counter to the preponderance of German influence in Madrid and to the grave problems of starvation, mass unemployment and desperate housing shortage has been an attempt to foster the remaining trade links with the outside world. The new Spanish-Argentine Trade Agreement, although only a temporary arrangement, is the precursor to an attempt to foster a permanently higher level of barter exchange between the

two countries. The agreement, signed in Buenos Aires early this month, covers the exchange of goods to a value of some 150 million pesos. Argentina is to provide Spain with 1,000,000 tons of wheat and some tobacco, while Spain is to supply, within one year, 30,000 tons of iron and steel, within thirty months, two 9,000-ton merchant vessels and, in an unspecified time, one destroyer of the *Cervantes* class and supply facilities for 60,000 tons of petrol. Even more important, the agreement provides for reciprocal scaling down of import duties and the facilitation of trade by private interests in a long list of the products of the two countries.

The situation in Spain remains extremely precarious. Territorial integrity is at the mercy of Germany and the requirements of high strategy. Economic recovery is dependent on the extent to which German exploitation can be sidetracked and trade connections forged with nations outside Europe. Political stability in Madrid rests on General Franco's ability to combine increasingly incompatible elements in his Government. The end of the civil war brought no basis for stable government, for the Right wing factions are scarcely less difficult to run in harness than the Popular Front combinations of the Republic. The Cabinet reshuffle is just one more step in the struggle for stability; and it would be idle to speculate on its success. But one thing is certain; that both the foreign and economic problems are unaffected by the removal of Suñer and Varela. They remain as obdurate as ever.

Restraint of Retailing

"WHAT is notable among British consolidations and associations is not their rarity or weakness so much as their unobtrusiveness." The quotation is from the report of the Committee on Trusts which sat after the last war. Now the trend is not even unobtrusive. It is blatant. Both industry and trade are strongly clutched by "consolidations and associations." Except in certain sections of heavy and large-scale industry, monopoly in the sense of the sovereignty over the entire market by a single producer or supplier may indeed be rare. But monopoly in the sense of a working policy to restrict competition and to control both supplies and prices, determined by an association of the largest and most influential firms, is rife. The pervasive influence of quasi-monopoly of this kind is a political as well as an economic phenomenon of the first importance. Before the war, restrictive cartels and associations were increasingly given the blessing of the state; after the war, it is the avowed purpose of the private monopolists and their associations, in their pleas for industrial self-government, ordered trade and "just" prices, that the economic activities of this country should be controlled by corporations with the tacit or explicit sanction of the law itself. There is no more important task in post-war policy than the state's duty to devise ways and means of arresting this trend which, if successful, will distort democracy no less than it already restrains trade.

It has been the life-work of Professor Hermann Levy to be a bloodhound in these matters. A third of a century has elapsed since Professor Levy revealed how the industrial combination of producers had become a characteristic feature of free trade Britain; now, in his latest book,* he shows that trade associations of distributors have come to dominate retail trade, despite its multiplicity of traders and its appearance of super-abundant competition. The burden of his new book is that

Quasi-monopoly organisation is no longer confined to industry; it has invaded retail trade, and has been fostered by manufacturers' organisations so far as the latter have been in a position to link up cartels with retail

trade associations to uphold or introduce price fixing agreements and trade practices.

Professor Levy sketches the morphology of retail trade associations in scholarly detail. Their aim is to regulate competition between their members and outside traders. The effect of their activities is to "limit the access of traders to producers and of consumers to traders." They impose their will by the familiar weapons of the stop-list and the boycott.

More and more, retail trading has become the mass distribution of standardised goods. More and more, it is carried on by large-scale units, the department store, the chain store, the multiple and the co-operative. The key to the growth of retail trade associations is this growth of the big firm because of the increased scale of retail operations. Small shopkeepers are still, by numbers, vastly in the majority; but the big firm, which is the small shopkeepers' rival, is also almost invariably the leader of the trade association which, by one means or another, determines the conditions on which the small man must carry on his business. The unit of retailing is still small, on the average, but control is concentrated. There are many thousands of dairymen in London; but, in normal times, two huge firms and the co-operatives dictate the terms on which milk is sold. In many trade associations, the interests of large manufacturers, allied to those of big retailers, are overwhelming and decisive. The trade in tobacco, motor-cars and proprietary articles, for instance, is stringently ruled by a powerful few; prices are fixed and heavy penalties are enforced for infringement.

The sanction against offenders is, at bottom, always the same—the withholding of supplies. In the old days, the retailer bought and sold as an independent trader. Now the suppliers of the goods which he must stock are organised to control his business. He must stock these goods because large-scale publicity has created a "consumer insistence" for them. The characteristic feature of the new retailing is the branded article, for which mass-advertising has created a special reputation. It is because the shopkeeper's choice of stock has been limited by these means that the manufacturer can follow him into his shop to dictate the prices he charges. He must

be content with the margin of discount allowed him.

Restraint goes further than the fixing of prices and margins. Competition is restrained in many trades by the banning of new entrants. In the newspaper trade, a distance limit is enforced to prevent the number of sellers in a given area from growing; in the motor and book trades, newcomers must satisfy the association that they possess certain financial and other qualifications. All these are remarkably repressive powers to be exercised by private bodies; an argument that restrictions like these are needed for orderly and efficient trading was answered long ago by Adam Smith.

The pretence that corporations are necessary for the better government of trade is without any foundation. The real and effectual discipline which is exercised over the workman is not that of his corporation, but that of his customers.

The war has given a marked fillip to quasi-monopoly in trade as well as in industry. It is the business of the state in wartime to restrain trade. The policies of private monopolists become public programmes. Prices are controlled, shops licensed and distance limits imposed against new traders. Wartime rules and regulations require the use of trade associations for their administration. This stimulus has not gone unappreciated by the trade associations. They frankly wish to build upon this wartime foundation a post-war regime of rule by corporations.

It is unhelpful to emulate King Canute. It is inevitable that retail trade should increasingly take on the large-scale aspect of all contemporary economic activities. It is natural and perfectly proper that traders should seek to band together for the furtherance of their interests. Customers must be left quite free to prefer branded and fixed-price articles for their convenience. The tide cannot be turned back. But there is no reason why trade associations should be permitted, by the tacit or open connivance of the law, to possess the legislative, administrative and even judicial functions they already exercise and wish to

extend. The old common law doctrine of restraint of trade can and should be given the life of which it has been sapped during the past generation. The easy argument that the agreements by which this protectorate over retailing is maintained are freely entered into by individual traders who have their livelihood to find omits to notice that the consuming public is not a party to these restrictive measures, but a victim. It ignores, too, that for private associations to possess the coercive power which is represented by stop-lists and boycotting is wholly contrary to public policy.

Professor Levy, whose book is a signal contribution to the economics of democracy, has defined the goal of trade associations.

It aims at a change of the entire structure of retail trade by the institution of a comprehensive and strict system of rules relating to entrants into the trade and the specific duties of every member of the trade in his professional behaviour; it sets out prices or margins; it bases the right to exercise a trade on rigid qualification tests; it limits shops; and it imposes almost destructive fines where the rules are not obeyed.

Such an *imperium in imperio* is intolerable. The technique to combat monopoly has still to be worked out in effective practice; when it is found, it will probably be a compound of provisions for open and accurate accounting, legislative measures against abuses and executive agencies to track down and disclose malpractices, such as the tribunal suggested by Professor Levy. But the duty of the democratic state is already plain: first, to give no more extra-governmental power to trade associations; secondly, to take away from the associations the extra-governmental powers which they have already been allowed to assume; and thirdly, to punish with the utmost rigour all trade practices which restrain the commerce by which the nation lives and restrict the freedom of every citizen to buy or work at will. The very stuff of democratic freedom is involved.

Service Women

JUSTICE has hardly been done to the valuable Markham Report on conditions in the women's Services which was published last week. The flowers of its literary style, admittedly unusual in a document of this kind, and the high and worthy sentiments of the more general passages on the merits of education, have been singled out for special praise. But the notable shrewdness with which the Committee has realised that conditions of life in the Services must be determined by conditions of work, and not *vice versa*, has gone almost unrecognised. The truth is that the public is too accustomed to discuss the problems of women in the Services as if they were, say, patients in hospital, pupils at school, guests in hostels, prisoners in gaol or even the inmates of asylums; the fact that they are, first and foremost, auxiliary members of the Army, the Navy or the Air Force is far too little heeded.

The purpose of the Auxiliary Services is to release serving men for other duties. Their dominating aim must be the efficient performance of the Service duties they take over. In order to perform efficient work, they must be, not only well trained and well led, but also reasonably well housed, well fed, well clothed and well doctored. That is as far as the question of living conditions can logically be taken if these women are to make their full contribution to the war effort in the station to which they have been called. The Markham Committee fully realises this, which is the greatest virtue of its report. Its comments on the organisation of the three Services, on the economy of effort and personnel which can be secured by extending the system of "component" or mixed units, on the replacement of men by women in headquarters posts and on the need for severe sanctions for women's discipline, are sound and practical. They put first things

first. Within this framework of duty, the report describes the standard of living conditions to be sought as one of spartan decency; the object is to lay down minimum conditions which are practicable, according to the exigencies of the Service, and then to see that these standards are generally applied and enforced.

It is this compliance with standards which is the key-point. Rightly, the Markham Committee has fastened upon the chain of responsibility from the Service Departments to the unit officers as the crucial factor. Everything, the report contends, turns upon the officers; "to care for their women properly" is the primary duty—a duty which applies, not simply to the company and section officers which the report seems to have chiefly in mind, but also to the higher women commanders with group or regional responsibilities, a minority of whom may be too reluctant to impose their authority for fear of prejudicing their position in relation to the men officers with whom they and their subordinates have to work. The suggestion of the Markham Committee that the number of inspectors on the staff of the ATS should be increased, and that inspections should be freely made without prior notice, goes to the root of this problem of translating precept into practice. It might well have been accompanied by a recommendation that explicit responsibility should be laid upon the higher women officers, and not simply upon the lower women officers who are directly in day-to-day contact with troops, to see that minimum standards are not evaded. Indeed, it is probably a weakness of the Markham Report that it seems to throw too much emphasis upon the responsibility of junior officers, which is necessarily restricted by the importance and self-importance of the commissioned men with whom they work, and too little upon senior women officers who

* Retail Trade Associations. By Hermann Levy. Kegan Paul. 265 pages. 15s.

sometimes tend too easily to fall into the routine of military administration and headquarters life.

Nevertheless, the Markham Committee cannot be criticised when it lays its emphasis upon the importance of officer personnel. Indeed, the crucial rôle of all officers and the importance of their basic responsibility for the well-being, as well as for the efficiency, of their troops, is a truism which applies to all the Services, male or female. The great difficulty in the case of the women's Services has been their rapid rate of expansion. The supply of officers has had to be "evolved and maintained in circumstances of acute pressure." The Markham Committee repeats that more should be recruited from the ranks and that more specialists should be brought in with almost direct commissions. Actually, their suggestions boil down to the common-sense recommendation that the net should be cast as widely as possible in the most selective way; by implication, the haphazard recruitment of officers for social, personal or other reasons is repudiated. But even the Markham Committee does not seem to see quite straight in this matter. From their investigations, its members have become, not unnaturally perhaps, very apprehensive of the "new barbarism," which produces among young people, and especially among young women, an "indifference to education" and an "abysmal ignorance of national and international affairs." They tend as a result to put what seems to be an exaggerated value upon the qualifications given by merely academic education. They would admit one year at a university as a sufficient qualification for commissioned rank, equivalent to the qualifications possessed by what they call "a woman of good personality, capable in her own sphere, domestic, industrial, business or professional"; and in the training of officers, they would replace much of the present factual instruction in Service technique by what they describe, somewhat broadly, as "talks with older and maturer minds who can open up vistas of thought previously unrealised and unexplored." The fact is that the only possible basis for producing the "efficient and understanding officers" for which the Markham Report so rightly calls is contact with and understanding of the troops themselves; and it is an error, much resented by efficient and experienced junior officers, to appoint young women with the conventional educational qualifications directly to relatively high ranks, whether as education officers or not.

The concern of the Markham Committee for education in all its aspects is understandable and welcome. If the women in the Services can, at the same time as they perform their Service duties with efficiency, be made into better citizens or more sober and more righteous females, it will indeed be a valuable contribution to the common weal. But this is no more true of the women in the Services than it is, say, of girls in factories—or, indeed, of men and women alike in war jobs everywhere. It is not a Service problem but a problem of society, and the bulk of the difficulties experienced in this respect in the Services are due to society's earlier failures. But in the Services as in the war factories, the job's the thing; the

insistence of war demands it. Nor is it a reasonable view of education or religion or culture or what you will that regards these as doses which can be given by a kind of inoculation. The suggestion that officers' training courses should be extended by two weeks, and that good civilian lecturers should be brought in to provoke thought and arouse intellectual curiosity, in order to "broaden the mental horizon" of would-be officers, appears vastly to over-simplify the problem. Education is a process which comprehends every aspect of the individual's experience; and it is surprising to find in so admirable a report even a hint of the fallacy that "leaders" can be made by prescription and short courses of instruction.

This is not to say that the proposals of the Markham Committee concerning the uses of education should not be closely studied and, where possible, applied. It is rather to suggest that too sharp a dichotomy is accepted between the work of these women and their educational rights and duties. Actually, these are parts of the same whole; and there can be no better basis for an improvement in the mental and moral stature of the rank and file than the consciousness of work well and truly done. Indeed, the Committee might well have laid much more stress even than they have done upon the central importance of these women's jobs, not only in their present contribution to the war effort, but also in their future contribution, as housewives and workers, to the society to which they belong. There are a few women in high Service positions who are so obsessed by the present fear of creating jealousy among men against the women who are "usurping" their work and by the further dread that a generation of women may be being produced who will be "unwomanly" that they still fail to see that the key to the development of self-respect and self-reliance among Service women is to concentrate on their capacity to perform vital duties with efficiency. One extract from a speech which, according to rumour, was recently made by a high woman officer to a group of officer cadets is perhaps revealing:

If you come to me and say that you have done better than Mabel, I will say: "Well done." But if you come to me and say that you have done better than Tom, I will be angry, because it is not possible.

The quotation may be misleading or inexact. But if there is even the suspicion of a deliberate inculcation of a sense of inferiority, the education (using the word in its truest sense) of the officers and auxiliaries of the women's Services as better and more valuable citizens must be seriously held back. It has been sufficiently proved that Service women can do Service jobs efficiently, often as well as men and often better. The real gain to them and to the community of their war experience will come from their learning to do a job properly and doing it without inhibitions of this kind. The nation owes a debt to its Service women, which it can best repay by securing for them the conditions of work, the conditions of living—and the conditions of pay—which are their due.

NOTES OF THE WEEK

Travelogue

Mr Churchill's tale of his eastern journey on Tuesday in the House of Commons was the fullest, and in some ways the most encouraging, statement on the war for a long time. It was encouraging for the glimpse it gave of an active strategy in the making. The Anglo-American meeting in London last July, which presumably met to work out the details of the plans made earlier by the Prime Minister and the President, may have ushered in a new stage in the conduct of the war by the Allies. The Second Front, wherever it may fall, is plainly in train, though its timing and direction must remain uncertain. The attack on Dieppe Mr Churchill described as a "reconnaissance in force," a "hard, savage clash" of the kind likely to become increasingly numerous "as the moment of full-scale operations approaches." The air bombardment of German Europe, with the notable aid already of high-flying American Fortresses, is going steadily on its set way. Ships, men, supplies and aircraft are mustering at many points for action. In the Far East, there are the beginnings, through the air and sea successes of American and Australian forces, of the process of restoring Allied power in the Pacific. In a sense, Mr Churchill's journey can be described as a Second Front in itself. He went everywhere and saw everybody; at Cairo he ordered a fresh start. But Mr Churchill was frank as well as encouraging. The war at sea is going somewhat better, but still very badly—the Prime Minister might have added that, in many ways, raw material difficulties are worse than ever. The critical campaign of the war, overshadowing all other operations, is the one in Russia; and Stalin and his colleagues have not been satisfied that Britain and the United States have done enough to take the weight off Russia. Mr Churchill's mission to Moscow was to clear away doubts. He believes that he has done this. He believes that the Anglo-American war plan will prove in deeds that the Allies are determined to come to the aid of Russia

as quickly as possible without regard to sacrifices and losses involved so long as the contribution is towards victory.

But deeds alone will tell. It is to be hoped that the newly formed Army of Persia will be fully free to fight beside the Russians in the defence of the Caucasus; if the Russians were defeated it is unlikely that this force could hold Bock alone. In Africa, Rommel must be beaten, and not merely held, if the use of shipping to take 50,000 fresh troops and equipment to Egypt is to seem justified in Russian eyes. Stalin, as Mr Churchill has discovered, has no illusions—but he does believe firmly in a Second Front. It was a great pity that the situation should have been reached where the *bona fides* of the Anglo-American war effort was doubted in Russia. The accord between Britain and the United States is now so unprecedentedly close that there is every reason for drawing Russia, too, so closely into the network of Allied decision that this kind of misunderstanding can never recur. So long as Stalin—or, indeed, General Chiang Kai-shek—seem, in terms of consultation and weight in Allied counsels, to be associates rather than Allies, the gears of Allied war-making will remain liable to slip.

Nothing to Say

There has been much talk about the fact that the two days' debate on war policy, which was to have followed the Prime Minister's statement on the war, petered out in a few hours. The most common explanation is that Members were fully satisfied by what the Prime Minister said. In a sense, this is true; most of the questions which had been in the minds of ordinary MPs were answered. But it is not a sufficient explanation. If the House was satisfied, it was the duty of the Prime Minister's former critics to get up and say so, simply as a matter of decent political propriety. If, on the other hand, they were not satisfied, it would have been helpful to the democratic people of this country to know why some reservations still persisted in the minds of certain of their representatives after the Prime

Minister had said his say. It almost appears as if the new definition of the rôle of Parliament in wartime, with which Mr Churchill has seemed to be playing for some time, is beginning to have some effect. This is not happening because of any pressure from Mr Churchill or his colleagues. Indeed, Sir Stafford Cripps expressed himself disgusted with Members' dereliction of their duty on Tuesday. More likely, the reason is that the present superannuated House of Commons is much too tired, and too light in weight, to do its job properly, constructively and responsibly, through all weathers. In his speech on Tuesday, Mr Churchill drew attention to the difference between his position and that of President Roosevelt and Premier Stalin; he, as he put it, is "liable to dismissal at a moment's notice by a simple vote," and—Mr Churchill made this quite plain—he can only do his wartime job if his plenary powers are continuously renewed. For some time, Mr Churchill has argued that, since all parties are represented in the Cabinet, and since there is no alternative government, which is usually the mainspring of parliamentary debate and procedure, most criticism is out of place, and no more than the carping of individuals. It would be unfortunate if this view were to prevail, and if the Commons were to surrender the duties and responsibilities to which on other occasions Mr Churchill himself has paid eloquent tribute. It is, of course, true that the present position gives an opportunity for cantankerous critics or careerists to advertise their personal discontents. But it is even more true that, if the parliamentary method is to be preserved, a strong, responsible, constructive and critical opposition is essential—even in wartime—not to turn out the Government, which would be fantastic, but to help the Government on its way to victory, and to make certain that no undertone in public opinion goes unheard at Westminster.

Distinctly Satisfactory

Pressed, the Prime Minister admitted to the Commons that the situation in Egypt after the repulse of Rommel's recent attack was "distinctly satisfactory." Mr Wendell Willkie, who has been on tour in the Middle East on President Roosevelt's behalf, has called last week's battle—which he claims resulted in the destruction of about 40 per cent. of Rommel's first-line tank force, as "a resounding victory." General Smuts has laid stress upon the crucial importance of North Africa in Allied strategy and logistics. Mr Willkie believes, so it is reported, that the Second Front may start eventually in Italy or the Balkans, while General Smuts is convinced that the most obvious quick contribution which the Allies can make in Russia's aid is the clearing of North Africa and the Mediterranean. For the moment, Mr Churchill is content to say that Egypt is now safe for several months—which is not enough, if a genuinely offensive strategy by the Allies is now starting, and if the mass of shipping supplies and men used to nourish the Nile Delta is to be justified by its works. Unlike last time, Rommel has not come on again after his initial reverse, which now appears plainly as a major setback for him. So far, a wise reticence has been preserved by the military authorities on the spot. They have made no attempt to define their victory in quantitative terms; but they must be well satisfied with the way in which their defensive system, organised against precisely the out-flanking and encircling tactics which Rommel again adopted, threw the invader back decisively. On the other hand, again differently from earlier campaigns, there has not yet been any follow up by the victor in the first round; Rommel has not yet been thrown back in the usual shuttlecock way to Tobruk or Benghazi. The biggest battle of all has presumably still to come. But two things are clear: first, that Mr Churchill's conferences in Cairo may mark the beginning of a new and possibly luckier phase of the North African fighting; and, secondly, that if the good fortune which may be hoped for prevails, the next battle may be, as it should be, the beginning at the eastern end of the North African front of a campaign, not only to open the Mediterranean, but also to uncover the soft underside of German Europe.

Backs to the Volga

All that the Prime Minister would say on Tuesday about the war in Russia was to point to the date. At the end of the second week of September, for all his successes, the enemy is still frustrated. The Russians counter-attacked last week-end against the German Kletskaya pincer attacking Stalingrad from the north-west. Over the week-end, the fighting there went in favour of the defenders, and the German reply, when it came, was in the centre of the offensive arc due west of the city, where the Russians were forced to give some ground. The defence goes on, desperate, spirited and incredible, with complete lack of freedom of manoeuvre and with enemy superiority in the air. The failure to reduce the city last week is causing the German propagandists some difficulty. Bock's troops have been fighting in the narrow sector between the Don elbow and the Volga since the first week of August without decisive success, and the tenacity of the defenders has surprised even the victors at Kerch, Kharkov and Sebastopol. On the Black Sea and Caucasus fronts, early and optimistic German statements have also had to be modified. Novorossisk and Grozny remain in Russian hands, although the former is gravely threatened, and may be partially occupied. In the central sector, between Rzhev and Kaluga, General Zhukov is attacking in force, and slowly gaining ground. For the last week, no conclusive results have been achieved on any of the four battle fronts. The great strategic, economic and psychological issues which hang on the fate of Stalingrad are undetermined. The city's plight has become no less grave. But German reports from the front show that the first signs of autumn are already in the air. The priceless time which the defenders of Stalingrad have won, and the cost which they have inflicted, are already having their repercussions in the Reich. The German need to take Stalingrad, to sever the Russian armies, to free the way perhaps for a northward movement against Moscow, or for operations further afield, and to eliminate the possibility of counter-attacks against their offensive salient, is very pressing. The situation remains critical for both parties, and marks a climax.

Bottlenecks

Whatever plans have been laid by the United Nations for the deployment of their strength in the next critical campaigns, transport is still the obstacle to generous planning. The Prime Minister has told the House of Commons that it was difficult to make the Russians comprehend the difficulties of ocean transport, a problem which may have arisen in part from doubts in Moscow as to whether the shipping available for war supplies was yet distributed or allocated in the most effective way. The shipping consumed by the Middle East, apart from aid to Russia, might well be a subject for controversy, in spite of the undoubted fact that, if North Africa can be rolled up, this tonnage will have earned very ample dividends, according to any criterion—and in spite of the fact also that, if Egypt had been lost, the difficulties and dangers of Russia, and, indeed, of India and China as well, must have been much multiplied. Again, it might be argued, especially this time by the Americans, that the predominant influence of meat farmers in British agricultural policy and practice still prevents this country from working out the food policy which would be most economical of shipping. There are these arguments within the framework of the tonnage available. But the outstanding fact is that the tonnage available is not enough to transfer the full strength of the Allies from factory to front. The First Lord of the Admiralty, as well as the Prime Minister, has spoken about the shipping position. Mr Churchill's statement that the months of July and August showed a definite improvement in merchant losses on the months that went before does not quite square with reports from America that July was the worst month yet—unless Mr Churchill's remarks referred to the sinking of British and British controlled vessels only. But, it seems to be an undisputed fact that the rate of construction of new merchant ships by the United Nations is now in excess of the rate of sinkings; for the moment at least, the total fleet available to the Allies is not dwindling, as it was for a period in spite of the output of American shipyards. It is another encouraging sign that the destruction of enemy submarines has been more frequent than at any former period in the war. But, and Mr Churchill made this quite plain, sinkings of submarines have not nearly kept pace with the construction of new submarines; the bombing of German ship-building yards has still not affected the output and assembly

of U-boats sufficiently to prevent a steady increase, in spite of losses, in the U-boat fleet. This means that the danger at sea will remain at a peak for a considerable time to come. The protection of merchantmen, especially in American waters, is vastly better than it was some months ago. A heavy toll will be taken of all attackers. But, in spite of the rising output of Allied shipyards, shipping bottlenecks will remain. Production and strategy will both be narrowed by it; and the raw material position, made more serious by the loss of Far Eastern supplies, by the mounting demand of Allied war factories, and by the relative inexperience of Allied technologists in the economical use of materials, and the development of substitutes, will continue to be a drag and hindrance.

The Pool

A key fact in the progress of the war is the immense shipbuilding capacity of the United States. It is so important that it tends to obscure the fact that the British merchant fleet is still very much larger than the American. When Notes were exchanged between the British and United States Governments last week, stating the basis on which lend-lease aid is given by this country to the American war effort all over the world, some illustrations were given of the kind of assistance which this country has so far rendered; and high in the list is the lend-leasing of merchantmen. In January, the United Nations pledged themselves to employ their full resources in the prosecution of the war against the common enemy. In February, they pledged themselves to pool those resources in order to make the most effective use of them at the points where they can be most effectively applied. Since the beginning of the year, a series of boards has been set up to pool the raw materials, food, finished munitions, industrial capacity and ships of Britain and the United States. The reciprocal lend-lease procedure, which has now been rounded off, is ancillary to this process of joint planning and physical pooling. It is designed to balance the accounts between the two countries as far as possible in mutual aid so as to reduce the need for currency offsets to a minimum. It is no longer true to speak of lend-lease simply in terms of American aid. Indeed, even before Britain was in a position to match American aid by the transfer of supplies and services in the reverse direction, the British Empire had paid cash for a considerably greater value of American goods and services than had been allocated under the Lend-Lease Act. Now the whole process is on a basis of mutual aid; American forces in Britain, in Australia or in New Zealand (separate Notes last week covered these two Dominions) will receive supplies and services free of charge; and in America itself, and elsewhere where military works are in progress, British materials and British devices are already in use on a considerable scale, with barrage balloons on the Pacific Coast, anti-aircraft guns on the Atlantic Coast and British defensive devices everywhere where American forces are to be found. The essence of lend-lease is not, as some glib minds have suggested, the application of the principle of something-for-nothing to international trade. It is rather the application of two other principles: that financial considerations should never be permitted to stand in the way of the interchange of goods and services; and that, at bottom, the principle of payment is goods for goods. A strict account is being kept on the British and American sides; but, in the case of all the United Nations, the only price they really require for the effort they are jointly making is the defeat of the enemy.

Sauve qui Peut

The round-up of Jews which has been going on in both occupied and unoccupied France since the middle of July is still in full swing, and has been extended to include non-Jewish naturalised Frenchmen. The pretext is apparently the need to make up the quota of French labour required for use in Germany, on which there is a very large deficit. And there is no evidence that Laval has found the proposal unwelcome. The German and Vichy Governments appear, however, to have overlooked the fundamental fact that France is not Germany. In Germany, it is apparently possible to subject Jews to inhuman brutality, to deport them, and to break up their families without kindling burning resentment. In Germany, the Churches can apparently be relied upon not to take up the issue. The events of the past six weeks have, however, raised French

resentment against the occupying power, and against the Vichy collaborationists, to a high pitch. In numerous cases, the French authorities have refused to carry out the distasteful orders. General de St. Vincent, the military governor of Lyons, was dismissed at the end of August for non-compliance, and riots have been reported from this district. The Roman Catholic hierarchy, supported by a protest from the Vatican, have also taken a strong line, and numerous priests are in trouble with the authorities. The whole incident displays a curious lack of foresight on the part of the German Government, since many of the unfortunate beings now deported to Germany and eastern Europe were driven from Germany in the course of the last few years. Their persecution will have served the vital purpose of bringing home to many of the relatively sheltered Frenchmen of the unoccupied zone something of the horror of German domination—and something of the moral prostitution of collaboration.

Trade Unions Together

The keynote of the opening days of this year's meeting of the Trades Union Congress, apart from a strongly phrased, needless and somewhat inappropriate excursion by the President into the current controversy about the nature of the German people, has been the manifestation of a strong desire for working-class unity and for bringing the machinery of the trade union movement up to date, in order that it may play a more effective part in the conduct of affairs. The resolution put forward by the National Union of Railwaymen, requesting the General Council to report to the next Congress on the structure of its affiliated unions, with a view to determining "where competition and overlapping exist, where such structure is uneconomic, and where policy is diverse within an industry," was vigorously opposed by Sir Walter Citrine, on the ground that it was impracticable; but it received considerable support, especially from some of the larger industrial unions. These urged the labour movement to put its own house in order first; to present a united front in negotiations with capital; and to adapt itself to the conditions and requirements of modern, large-scale industrial technique. The fact that no fewer than 232 unions attended the Congress, many of them representing less than 1,000 members, is in itself an indication of the sectionalism that prevails today. The defeat of the railway workers' resolution, although by an unexpectedly small majority, means that this sectionalism, with inter-union competition and feuds about lines of demarcation, will continue to rob the movement of its full potential strength. The same evidence of a desire to mobilise the greatest possible force was shown in Monday's discussion. The appeal to let bygones be bygones, and to reaffiliate the Chemical Workers' Union, which had been guilty in the past of "poaching" on other unions' preserves, was rejected by a narrow majority. So was the resolution demanding the withdrawal of Circular 16, banning Communists from election to Trades Councils. The General Council approves the principle of maximum national unity—as witnessed by the President's frank and timely tribute to the leadership of the Prime Minister—but it is apparently not prepared to carry the principle without reservations into its own ranks. The eagerness of the bulk of the working-class to co-operate to the full in the war effort, and to achieve 100 per cent production, was shown in the carrying—much to the surprise of the General Council—of an important resolution calling for more active participation by trade unionists in the management of vital war industries.

Liberals Confer

The Liberal Party Conference last week-end was the scene of lively discussions on a wide variety of issues, national and international, short-term and long-term. There was general agreement about the necessity of planning and for the continuation of some form of Governmental control during the immediate post-war years; it was realised that planning must be international and not purely national, and that post-war security could not become a reality with a return to the pre-war "international economic anarchy." There was, however, considerable division of opinion about how planning should be organised and by whom, what the rôle of the state should be, and what should be the limits of its intervention in the economic field. Liberalism has not lost its voice; but it tends to speak in rather confused accents. The Executive defined the purpose of the state as

to provide the framework, with the aim of freedom and not restriction; state action should be designed to equalise opportunity, minimise social barriers, prevent exploitation and ensure the fullest use of the nation's resources; it agreed in principle to the establishment of an advisory economic general staff. Mr T. L. Horabin went a good deal further; he moved a resolution urging the setting up of a Ministry of National Planning, with the object of securing full employment and with the nationalisation of joint-stock banking and the basic enterprises as a necessary concomitant. Lord Samuel was against a Ministry of Planning, but in favour of a Ministerial Committee; Mr Harcourt Johnstone thought it was impossible to plan for the export trade. The resolution and its seventeen amendments were finally referred back to a special Committee. The complete lack of agreement, even on the more fundamental issues, shows up the great weakness of the Liberal Party at the present juncture. When Lady Violet Bonham-Carter outlined the goal of Liberalism as "Left and Forward," it was clear that many present disagreed. When Lord Meston said that now was the Liberal opportunity, when the revolt against appeasers and the dislike of state control was bringing in new recruits, it might have been commented that a more positive policy than anti-totalitarianism is needed to rally support. The Liberal Party prides itself on its toleration of minority and dissident views, and the mass of the British people have strong liberal instincts; but the virtue of catholicism, when it tries to be an active political force, may prove a weakness.

The New Education?

The Conservative Party has issued an interim report on education, presented by a sub-committee to its Central Committee on Post-war Problems. It is in some respects an extraordinary document. Most educational reformers think first and foremost of the child. They are disturbed about a system which allows the vast majority of children to leave school and stop all their education at the age of 14, which even while they are at school often allows them to be taught in inferior buildings by inferior teachers, and which allows a few children, favoured with adequate means, to obtain the benefits of the public school. It is clearly a disadvantage to the State that most of its citizens should be only half educated and that most of its leaders should be drawn from the small moneyed class which goes to the public schools; but educationists think of the child as father to the nation, and therefore concentrate on what is best for him. The Conservatives apparently think otherwise; the educational aim—"the fullest possible development of the individual"—is criticised as inadequate. What is wanted is the development of a strong sense of national obligation in the individual citizen; he must be encouraged to have "an ardent understanding of the State's needs," and must be rendered capable of serving those needs; national education must benefit the nation no less than the individual. Nobody will question the argument that a will to service should be fostered in individual citizens; indeed, it is generally felt that the will and the patriotism which have been born of the war must be encouraged to persist in the peace. But the tenor of the

Conservative report savours far too much of the aims of the Nazi youth movement. It is true that the secular bias is counteracted by a section on religious instruction, but the whole report arouses justifiable misgivings. These may be dispelled by the more practical reports which are to come on the public schools and on the 14-18 age group; but the impression gained from this one is that the Conservative sub-committee has adopted a mystical approach to education as a cover for maintaining the present system, especially the public school system, whose "special contribution" to the education of talent and the development of leadership is

too valuable to be jeopardised; and that it would be jeopardised if [these schools] were to lose their independence and become a mere part of the state system.

Bringing up Reserves

The call-up of both men and women is going forward. Speaking last week-end to the Women's Engineering Society, Mr. Ince, of the Ministry of Labour and National Service, lifted the curtain a little on future developments. The limit may not be reached even with the registration of men up to the age of 50 and of women up to the age of 45. The call-up of men for combatant service will take in older men than at present, and will require a further expansion of the women's Services and an acceleration in the process of the substitution and up-grading of women in industry. All remaining reserves of women will have to be tapped. The needs of the women's Services, which are to be met predominantly from the age groups 20-23, will make necessary a further comb-out of these classes. But it is very doubtful whether these steps alone can solve the problem. If industry is not simply to be starved to supply the Services, there is an urgent need to bring all women not actively employed on work of national importance within the scope of the Ministry. There remain two important reserves: part-time workers and the childless wives of Service men. Mr. Ince put the total of part-time workers at 250,000 and urged that the figure should be raised to 1,000,000 by 1943. This recommendation is crucial and will need to be supported by still more co-operative effort on the part of employers, as well as by increasing vigilance to secure that no part-time job is done by anyone capable of performing full-time work. The second reserve was indicated in the Markham Report on conditions in the women's services. Officialdom is right to be chary of breaking up homes; and the provision that wives of serving men may be directed into industrial employment near their homes already covers a great many cases. But there remains the *lacuna* that wives who choose to set up, or already have, homes in areas where no work is available, possibly, though by no means necessarily, in order to be near their husbands, make no essential contribution to the winning of a war which is everyone's responsibility. In the case of women who cannot live near their husbands, or for various reasons are not doing so, there is every argument for considering them as mobile and compelling the adoption of some form of national service. In the case of wives living with Service husbands, local labour exchanges should examine all the possibilities of finding local employment which could release mobile women. There can be few inhabited places where the direction of childless wives to care for evacuated children or to provide genuinely needed domestic help would not release more highly skilled labour for transfer elsewhere. It may not be possible to solve this problem by wholesale means; but it can and must be tackled firmly by local initiative and resource, with every regard for individual circumstances.

* * * *

Australian Austerity

The day after the Australian Budget for 1942-43 was introduced, Mr. Curtin launched an austerity campaign. He showed himself to be under no illusions about the danger that still faces Australia in the Pacific. At the best, he regarded the Solomons battle as the means of providing "a further breathing space"; at the worst, its outcome "may mean disaster, swiftly followed by a direct Japanese threat of a thrust at the Australian shores." Normal living standards, therefore, must be cut by one-third. Mr. Curtin then announced what measures the Government is taking to bring this about. Race meetings are being further curtailed; theatres and other entertainments are to be taxed; luxury meals are to be abolished; and there will be additional liquor restrictions unless consumption is drastically

reduced. The Budget imposes increases of 1s. 7d. a gallon in the duty on beer, and 15s. 6d. a gallon on spirits; 2s. 8d. a lb. on manufactured tobacco, 8s. a lb. on cigarettes and 11s. 4d. a lb. on cigars; and there are also increases in the taxes on playing cards and matches. But for the most part Mr. Curtin is relying on the new taxation imposed in the previous financial year, when severe company taxes were imposed and heavy increases in the taxes on high incomes, and on the controls he introduced last February. It is not certain, however, that these go far enough either to solve the purely budgetary problem or to ensure the success of the austerity campaign. Total expenditure for 1942-43 is estimated at £A549 millions, of which war expenditure, at home and overseas, accounts for £A440 millions. Total revenue is estimated at £A249 millions, leaving £A300 millions to be borrowed, of which 80 per cent is to come from the Australian people. The enforced savings resulting from the austerity measures will hardly do more than nibble at this sum. Nor has rationing gone nearly far enough. Tea, petrol and newsprint are severely rationed since the war has cut off sources of supply, but the effect of clothes rationing has been blunted because it has been announced in advance. Unless he can control spending more effectively than any Australian Government has hitherto been able to, Mr. Curtin will be forced to reconsider the position of the lower incomes which are at present exempt from income-tax. The reduction in normal living standards must apply to them too; this is not a matter for political argument, but is determined by the strict and inescapable logic of war economy.

Travel Cuts

Transport remains one of the scarcest of wartime commodities, and the growing volume of military and other essential traffic inevitably involves a further restriction on private travelling by rail and road. In explanation of the forthcoming restrictions announced last week-end, the Ministry of War Transport pointed out that at least 250 more trains than a year ago will be needed each day for essential purposes in the coming winter, and that still further economies are necessary in the consumption of rubber tyres and petrol. The case for the elimination of all unnecessary movement is unanswerable. The measures adopted to secure this end are partly physical and partly financial. The Green Line Coach services of the London Passenger Transport Board will be withdrawn at the end of September, but, where necessary, feeder services to and from railway stations are to be strengthened. Other long-distance coach services will also be discontinued, except that portions of the routes may be retained in districts where no alternative facilities are available. Curtailment of travelling by rail is apparently to be secured chiefly by financial measures. From October 5th, cheap day tickets and cheap tickets for pleasure travel will be discontinued, though monthly return tickets will continue to be available and the limitations of distance will be suspended. During the six winter months ending next March, vouchers to travel at reduced fares issued to parents or relatives of evacuated children or families will be issued for three visits only; evacuated civil servants will not be allowed to make free or assisted journeys home more than twice during this period; free travel by members of the Civil Defence Services will be restricted; free travel warrants for seven-day leave in the Army and Royal Air Force will be confined to two journeys, and special concession fares for 48-hour leave will not be available for distances of over 50 miles. By increasing the cost of travelling the Ministry of War Transport may indeed succeed in curtailing travelling, but the method amounts to discrimination between rich and poor. The physical means of restriction is, on every count, preferable to the financial, though the administrative difficulties of any scheme for rationing travel are obvious.

* * * *

Scientists and the War

There has been a growing volume of criticism from scientists that the Government was not making the best use of their services. Lately their views have crystallised in the suggestion that it might be possible to attach to the Cabinet offices a central scientific and technical board analogous to its statistical and economic sections. This suggestion appears to have found only partial adoption in the decision of the Minister of Production—whose office already has the task of relating output programmes to

strategic requirements by joint planning—to appoint to his staff three eminent experts in the capacity of full-time scientific advisers. In the announcement issued a week ago, it was stated that the field of activity of these advisers will be co-extensive with the responsibility of the Minister of Production, that is, it will presumably include the co-ordination of production plans with military requirements and technical design, as well as production problems proper.

They will keep in close touch with the scientific advisers of the Service and Supply Departments, and will be able to assist the departmental organisations of scientific research and technical development.

The three advisers will be responsible to the Minister of Production, but they will work under the immediate supervision of Sir Stafford Cripps, the Lord Privy Seal. A meeting of the Parliamentary and Scientific Committee at the House of Commons, while welcoming the appointment of the new staff as the nucleus of a scientific and technical board, criticised it on the ground that its field of activity is apparently to be limited to the sphere of production, and suggested that the Lord Privy Seal should exercise his supervising functions over the new body directly on behalf of the War Cabinet, the aim being to give scientists direct contact with the actual makers of strategy at the highest level of decision.

* * * *

You Have Been Warned

Simultaneously with the reappearance of the *Daily Worker*, a warning was issued by the national executive committee of the Labour Party to members of the party, telling them to eschew the Anglo-Soviet friendship committees or other activities of the British Communist Party. How far the rank and file of the Labour party are being won over by the wiles of the Communist party it is impossible to say. The party is certainly artfully capitalising the intense sympathy and admiration for the Russians in their struggle for their country, which is felt to-day among all sections of the British public, and also the underlying revolt of the great mass of the people against the parties and their caucuses. In point of fact, of course, the Communist party is as bankrupt as any of the other political parties if it has to rely on Russian suffering and British

frustration to win adherents. Nor are most people likely to be taken in by its guile, since the CP's attitude up to June, 1941, is well remembered. But the answer of the Labour party and the General Council of the TUC should not be confined to prohibitions and warnings. Indeed, if they in their turn can place nothing more positive before their members, it might be as well for them to lay off the warnings. Otherwise, their attitude may be deliberately misconstrued by the CP as anti-Russian, and is liable to be so misinterpreted by their own rank and file.

* * *

Shorter Notes

The revised house charges for meals in restaurants are a step in the right direction. The maximum charge is to be reduced from October 1st to 3s. 6d. for lunch and 6s. for dinner, against the previous 7s. 6d., and meals served in private rooms are to be restricted to three courses. But limitation of the price of meals is open to the same drawback as limitation of the price of any other commodity. It may check profiteering and the ability of the rich to eat more at the expense of the poor, but it also encourages more people to eat out off the ration. The only equitable solution, for meals as for other commodities, is for price control to be combined with rationing.

*

Considerable satisfaction will be felt that the Distinguished Service Order, the Conspicuous Gallantry Medal, and the Distinguished Service Medal have been added to the list of decorations open for award in the Merchant Navy. The first awards of the DSO to officers in the Merchant Navy have been made, and it is significant that they are "for fortitude, seamanship and endurance in taking merchantmen through to Malta," a task of the Merchant Navy in which the risks run are second to none.

*

One at least of the discriminations against women has been removed. It has now been announced that all Service women have the right to be placed on the absent voters' list of their constituency, a right which hitherto has only been granted to male members of the Forces.

AMERICAN SURVEY

The President's Challenge

PRESIDENT ROOSEVELT'S Message to Congress, demanding immediate legislation to authorise him to stabilise the cost of living, with particular reference to farm prices, and greater speed in the formulation of an adequate tax Bill, marks the beginning of a renewed drive on the part of the Administration to deal with the growing threat of inflation. It is also a challenge to Congress to co-operate with the Administration or to forfeit much of its control over the home front. Congress is given one more chance to implement the anti-inflation programme by de-reserving farm prices. But, if adequate legislation is not forthcoming by October 1st, the President promises to act under his wartime emergency power to fix farm prices and stabilise wages. The message, a powerful and persuasive document, not only demands immediate action to control inflation; it appears likely to precipitate a constitutional crisis similar to that over the Supreme Court. *Absit omen.*

The President was emphatic about the need for all-inclusive action to deal simultaneously with every source of inflationary purchasing power. From a political point of view, this is far more likely to succeed than piecemeal attempts to bargain with various groups. But time is growing short. The control of prices which was instituted in May—the only important aspect of the President's anti-inflation programme which has been put into effect—is seriously endangered by the failure to control the growing volume of purchasing power in the hands of the public. The alarm

of the Office of Price Administration is visible in the President's statement that

we cannot hold actual cost of food and clothing down to present levels beyond October 1st.

The cost of all foods has risen about 1½ per cent a month since May, when price ceilings were imposed; and prices of uncontrolled foods, which make up 30-40 per cent of the food budget, have risen 3½ per cent a month in the same period. Between food prices and wage-rates, there exists what has been called a process of complementary provocation. Farmers have been taught to consider their income in terms of parity—that is in relation to industrial purchasing power; and the formula devised by the War Labour Board to govern decisions on wage demands concedes a link between wages and the cost of living.

Both farm income and income from wages and salaries are running at levels about 75 per cent above those of 1939. The wage and salary bill of the United States is now at the rate of \$75,000 millions a year, an increase of 78 per cent over 1939, and is increasing by more than \$1,000 millions a month. The figures of farm income tell the same story. Farm income has risen from \$8,700 millions in 1939 to over \$15,000 millions in 1942, and despite increased costs, net income is expected to increase from \$6,748 millions in 1941 to \$7,756 millions in 1942. On the average, the buying power of farm products has attained the relation to industrial purchasing power that it held in 1910-14, the base year for parity calculations.

A Flexible Policy

The three-point policy that the President laid down for farm prices included the avoidance of inflationary price increases, the stimulation of necessary production and the maintenance of the principle of parity for agriculture. Agricultural ceilings should be permitted at parity or at recent prevailing prices, whichever was the higher. This is hardly a drastic proposal. It probably would mean that most farm prices would be frozen at present levels, which, except for cotton, cottonseed, grain, fruit, and dairy products, are already above 110 per cent of parity; in the case of these commodities fixing the ceiling at parity would permit substantial increases. One of the greatest benefits to be derived from Administration control of farm prices would be the power to direct production through a flexible and discriminating price policy. Existing legislation makes this impossible, by providing that ceilings may not be fixed below 110 per cent of parity, with the consequence that production of staples of which there is a glut is stimulated at the expense of the diversified farming and new products which are essential to the war effort. The wage stabilisation which the President promised to institute as a companion-piece to agricultural price control, although he was careful not to give details, would presumably also be a flexible weapon designed to limit general increases in wage-rates, to stimulate the flow of labour from non-essential to essential occupations, and to protect the standard of living of poorly paid workers.

The futility of prophesying what course the President will take has been strikingly illustrated by the *bouleversement* of correspondents "in the know" who had been freely announcing the imminent appointment of an "Economic Tsar" to govern prices and wages. It still seems likely, however, that wage stabilisation will follow the lines laid down in the "little steel" case. This permitted increases in wage-rates only sufficient to compensate for the rise in the cost of living between January, 1941, and May, 1942, except in the case of obvious sub-standard wages or inequalities. At the time the Board argued that, to be effective, its formula should be made to apply to voluntary wage increases, over which it now has no jurisdiction. These wage and price controls, even if they are instituted immediately, will not be sufficient to preserve present price-ceilings without substantial subsidies.

Nor will limitations on future increases in farm and wage income close the existing "inflationary gap" now estimated at about \$20,000 millions for 1942. For the current fiscal year, ending in June, 1943, it is estimated that Government expenditure will reach \$75,000 millions, of which tax receipts will certainly not supply more than a third. Voluntary savings, on which Mr Morgenthau has placed so much reliance, have been less than satisfactory. The quota for June was set at \$800 millions, but sales only reached \$633 millions and sales in July failed to reach the quota of \$1,000 millions by one-tenth. Compulsion of savings and heavy increases in taxation are obviously urgent if the volume of purchasing power already in existence is to be reduced to manageable proportions. Hearings on the tax Bill, now before the Senate Finance Committee, do not, unfortunately give a great deal of ground for optimism.

The Struggle for Taxes

When the Bill left the House and was sent to the Senate, it contained provisions for only \$6,300 millions additional revenue, rather than the \$8,700 millions which in Mr Morgenthau's opinion is "the very least the American people can afford to provide." The House had scaled down the Treasury's recommendations by \$356 millions in the case of individual income taxes, \$759 millions in corporation taxes, \$316 millions in estate and gift taxes, and \$602 millions in the case of special privileges. Mr Morgenthau has since urged the Senate to increase corporation taxes, and to reinstate the Treasury's recommendations concerning cases of special privilege. These include mandatory joint income tax returns of husbands and wives in "community property" states; the ending of tax exemption on income from State and municipal securities; and the revoking of a 27½ per cent depletion allowance to owners of oil wells and mines. These three recommendations, estimated to produce about \$602 millions additional revenue, have been turned down by the Senate. Last week Mr. Morgenthau tried to persuade the Senate Committee to adopt a graduated tax on spending, part of which would be subject to a post-war rebate; but this has also been turned down, and cabled reports speak of a 5 per cent Victory Tax which has gained the Committee's support. This would be levied on all incomes

above \$624 a year, and would also provide post-war rebates. Information concerning its details is scanty; but the fact that it provides a flat rate for all incomes is likely to incur the opposition of the Administration, which has consistently combated the predilection of Congress towards a sales tax.

Even if President Roosevelt is successful in securing—or assuming—complete control of farm prices and wages, the Congressional control of tax legislation puts serious and continuing obstacles in the way of a co-ordinated anti-inflation programme. It must not be taken for granted, however, that he will succeed in stampeding Congress where persuasion has failed. The farm bloc is strongly entrenched, and will not give in without a struggle. Mr Roosevelt has frequently failed when he has substituted the method of a frontal attack for his usual political technique of infiltration. It is also already evident that Congress feels it is being put on the spot, and the abuse to which it has been subject in the past months, some of it justifiably, but some rather unfairly, has made both Senators and Representatives extremely touchy. Congress might possibly have welcomed Presidential action in the field of price and wage control which would have relieved it of responsibility in an election year, but whether it will acquiesce now, when its goodwill and powers have been challenged, is another matter. Even if the pressure is too great to resist, the defeat will rankle.

Apart from the question of Congressional prestige, which has, unfortunately, been brought into the open, there is also the possibility that Congress may refuse to sanction control of farm prices without legislation freezing wages. There has always been support in both Houses for compulsory wage freezing and suspicion of President Roosevelt's willingness to demand substantial sacrifices from labour. The unions, on the other hand, are determined to avoid any wage freezing which goes further than the War Labour Board's formula; it is reportedly their opposition which caused the President to give up his much-publicised scheme for an "Economic Tsar." The position is that Labour will not agree to any stabilisation without assurance that food prices will be controlled first, and that Congress will be reluctant to grant the President additional powers over prices without guarantees of a strong wage policy. Whether the President's supporters are strong enough to secure for him complete discretion in these matters will be apparent by October 1st. There is no doubt, however, that the country will welcome the President's leadership, and Congress may be sufficiently impressed to swallow its pride.

American Notes

Victory is Not Enough

Breaking a long silence, President Roosevelt last week addressed an international student assembly of delegates from the 29 United Nations. In one of the most moving speeches he has ever made, he pointed out that

The cause of the United Nations is that of youth itself. It is the hope of the new generation—and of generations that are to come—the hope of a new life that can be lived in freedom, in justice, and in decency.

The heavy sacrifices which are being asked of young people to-day, he promised, create a supreme obligation to assure that after the war the provision of jobs, of education, and of opportunities to follow a career should not be left to chance as they were after the last war; but he warned his listeners that victory was not enough, that the new world would come only as the result of bold vision, intelligent planning, and hard work, after years of effort and perseverance. In one passage Mr Roosevelt said

We must be sure that when we have won victory that you will not have to tell your children that you fought in vain—that you were betrayed.

And later,

This time the achievements of our fighting forces will not be thrown away by political cynicism and timidity and incompetence.

Mr Roosevelt was speaking to youth from all the United Nations, but here he evidently addressed himself particularly to the doctrine which in the thirties secured so formidable result of capitalist rivalries in which no principles were at stake. If Mr Roosevelt and men of like mind are able to shape the new world, there will be no similar disillusion-war, but, instead, "steady progress toward the highest goals that men have ever imagined."

Restraint of News

One of the most interesting of recent anti-trust cases is that involving the Associated Press. The Government has petitioned the New York Federal District Court for an order requiring the agency to furnish its service to any newspaper willing to pay for it, and also that the AP be required to divest itself of the stock of Wide World Photos, Inc., which was acquired in 1941. The case originated when the AP refused to sell its service to *The Chicago Sun*, the new Marshall Field newspaper, or to the *Washington Times Herald*, basing its refusal on one of its by-laws which provided that competitors of member newspapers should be excluded from membership and from news distributed by the AP. The Government's case is that these by-laws illegally restrain inter-state commerce in news. The answer of the agency is likely to be that the value of its service would be destroyed if it were available to all newspapers; Mr McLean, president of the AP's board of directors, has argued that the charge is no more than that the agency "seeks to protect its members, who have invested their skill, their work, and their money in its growth." Mr Field, on the other hand, contends that if the suit is successful

it will be one of the most important strokes for the freedom of the Press in the history of the United States.

The merits of the argument have been somewhat obscured in the United States by the fact that the *Sun's* competitor in Chicago is the *Tribune*, leader of a small group of papers which have always been bitterly anti-Administration. This part of the press suggests that the present case is simply the continuation of a vendetta against the *Tribune*. This is unfortunate in view of the intrinsic interest and importance of the issues to be determined.

The Scrap Shortage

An announcement that "unless a miracle happens," a number of steel furnaces will have to shut down because of lack of scrap, has been made by the chairman of the Industrial Salvage Committee. The scrap shortage which has been the main cause of steel mills operating at less than capacity, is not altogether new. Both the President and

Mr Nelson have lent their influence to promote a drive for the collection of scrap, by which it is hoped to collect 3 million tons from industry, and more than 7.5 million tons from private householders. In view of wartime demands, the reasons for the shortage are plain. Consumption is at record levels, while the collection of scrap is increasingly difficult, owing to scarcity of labour and the reluctance of the railways and industry to part with old equipment which is hard, if not impossible to replace. The price of scrap, which stood at \$22 a ton in January, 1941, fell to \$19.17 in April, 1941, and has remained at that level. Sufficient to attract the necessary amounts before the war, it has failed in the last few months to stimulate the collection of scrap equal to war demands. In the words of *Iron Age*, "the psychology of the junkman has been ignored." Government control over scrap collection and distribution is also partly to blame. Responsibility for collection, purchase, and allocation is divided among no less than four authorities, and no action has yet been taken on recommendations for unified control. The difficulty in increasing prices is based on the unwillingness of the industry to see the scrap ceiling raised while its own prices remain frozen. It is hard to see why this should not be surmounted by a Government subsidy to scrap collectors, perhaps along the lines of the premiums now being paid to stimulate metal production. There is no real shortage of scrap that will not yield to a combination of increased prices, better organisation and, perhaps, more vigorous powers to requisition industrial hoards.

Shorter Note

Mr Nelson has appointed a Concentration Committee, under the chairmanship of Mr Joseph Weiner, formerly Deputy Director of the Office of Civilian Supply. Mr Weiner has been an enthusiastic proponent of plans to economise the consumption of raw materials by concentrating civilian production in nucleus factories, but whether he will receive equally enthusiastic co-operation from industry and other branches of WPB is doubtful. It is thought that the first industries to undergo concentration may be farm equipment, porcelain, enamelware, furniture and office machinery, caskets, and cutlery.

THE WORLD OVERSEAS

Oil Reform in Roumania

(By a Correspondent)

ON July 17, 1942, the Roumanian Government passed a new law concerning the exploitation of oil, which has inaugurated a fairly thorough reform of the Roumanian oil industries. Official Roumanian propaganda has, of course, done its best to advertise it as a triumphant act of freeing the country's oil wealth from the grip of foreign capital. German pressure in bringing about the new oil law has, however, been obvious. About half of Roumania's budgetary revenue was until now derived directly or indirectly from the oil industry. The new system of oil taxation will reduce the state revenue from this source by a very considerable amount. The corrupt and greedy Bucharest Government would hardly show so much self-denial had it not been forced to do so by insistent German demands.

The output of the Roumanian oilfields has been declining steadily since 1936, when it reached the peak figure of 8.7 million tons. In 1941, production was already below 5½ million tons. Such a decline could not fail to arouse German anxiety; and though the German press has only too eagerly blamed foreign capital for this decline, it could not help admitting that the irrational Roumanian oil legislation, which was entirely dictated by fiscal considerations, was mainly responsible for the decline.

The new law is said to render the business of oil prospecting and drilling more attractive for private capital than it was under the law of 1937. Hitherto, drilling firms were allowed to exploit only one-third of any newly discovered oilfield. The other two-thirds belonged to the state, and, even on that first third, the exploiting licence expired after two years. The risk for the entrepreneur was high; and

the period of exploitation was, even in the case of successful prospecting, so short that it inevitably meant that oil operations were conducted wastefully. Apart from this, several concessions used to be granted for one oilfield. Entre-

preneurs tended, therefore, to wait for the results of their neighbour's drilling before starting on any serious operations.

Rationalising Production

The new regulations provide for licences covering entire large oilfields instead of small strips of land. Most of the 300 articles of the new law deal with the definition of what is an oilfield. New concessions will be granted only for fields of the size of 10 to 30 thousand hectares, whereas licences covering some hundred yards were not uncommon under the 1937 law. The holders of old, small licences have been compelled to co-operate; they have been given a time limit to work out plans for pooling their output. Entrepreneurs who fail to co-operate may be deprived of their licences, though they will be entitled to an indemnity. All the firms engaged in prospecting on one field will have a proportionate share in the oil output, no matter which of them has actually found the oil. The Roumanian Geological Institute will supervise and direct any prospecting work throughout the country.

A new geographical distribution of oil industries is envisaged. Until now, prospecting was mainly concentrated in the Prahova and Dambovitza districts. A shift to the Southern Carpathians is now planned, to the regions of Oltenie, East and West Muntenie and Moldavia. New drillers will have the right to exploit 100 per cent of the first well and 75 per cent of the second well in every three wells they find. Only the third well will belong to the state, which has to ensure that its oil reserves are worked economically. It is proposed that only one-third of the two million hectares of oilfields should be exploited within the next ten years. Work on twelve big new oilfields has already started.

The change in the system of taxation is intended to favour big firms, and to squeeze out small enterprises with a low output. The progressive oil tax has been abolished, and the lowest tax rate is now 14 per cent of the output instead of the previous 12 per cent. The pipe lines, which were nationalised in 1940, will be returned to private companies, and only those pipe lines which are vital for export business will remain in the hands of the state.

Another interesting point is that the state monopoly for the exploitation of oil gas has been abolished. The monopoly impeded the exploitation of oil layers underneath the gas. Private companies will now be able to obtain licences for gas too; the state has preserved only the right to supervision. Seventy-five per cent of the capital of new oil firms must belong to Roumanians of "pure race." The whole oil output must be refined inside the country.

It seems that on the whole the new law, planned by the ex-Minister of Economy, Marinescu (himself an oil man), has some chance of bringing about an increase in output. The question is how much time it will take for the reform to yield the expected results. German expert estimates are rather cautious; they say that two years are needed before a substantial increase can take place.
