The Parliamentary and Scientific Committee on Coal Utilisation Research, under the chairmanship of Lord Samuel, has produced a comprehensive and far-reaching programme for the scientific development of Britain's coal resources. The present decline in the productivity of the industry, and the falling off of exports over the last 30 years, do not augur a happy future for mining. In 1913, Britain exported 73.4 million tons of coal and imported 487 million gallons of liquid fuel; by 1938 35.9 million tons of coal were exported and 2,640 million gallons of oil were imported. The future of the coal export trade is largely a matter for post-war international agreement; but one remedy which can and should be introduced nationally, is the more efficient organisation of the industry and the efficient utilisation of the product. The Parliamentary Committee states that, at present, only 30 per cent of the potential energy of coal is turned to useful account; 70 per cent is virtually wasted. Far too little attention is paid to research in this country. About £200,000 is spent annually by the British Coal Utilisation Research Association, with, perhaps, an equal amount spent within the industry, while less than 1 per cent of the available scientists are engaged on coal utilisation problems. This compares with at least £1,000,000 a year spent on research by the electrical industry and over £6,000,000 by the American petroleum industry. The Committee considers that fertilisers for agriculture, dyestuffs, chemicals, plastics, synthetic rubber, soaps, lubricants, liquid fuels and high octane spirit for aviation could all be produced from coal, while on the domestic side there could be enormous developments which would lighten the housewife's burden and release many women for employment. It recommends that the national survey of coal should be extended to cover all sources of energy and carbon compounds, and it estimates that a research programme, designed to raise the efficiency of coal utilisation to 45 per cent (instead of the present 30 per cent) in fifteen years' time would cost several million pounds a year, but at the end of fifteen years would result in an annual saving of some £100 million, and, adding the value of expected new industries, might well reach £200 million a year. This estimate more than justifies the Committee's contention that "coal research is an investment which will repay this country handsomely." The Conference on the utilisation of steam, heat and power, which met in London this week, as well as providing a stimulus for war-time economy, may provide the starting-point of a national programme for the more efficient use of coal. It is in new techniques that old industries must find their economic future.

The Progress of Concentration

The President of the Board of Trade, reviewing the progress of concentration of industry at a press conference this week, stated that the process is now virtually completed and that in all about seventy branches of industry have been concentrated. By March, 1943, two years after the scheme was begun by Mr Oliver Lyttelton, excluding the clothing industry where concentration is still proceeding, 5,300 designation certificates had been issued, 2,800 establishments closed, 235,000 workers set free for the Services or for work in other more vital industries—thus directly or indirectly enabling the further release of manpower—and 61 million square feet of factory space had been made available for other forms of production or for storage. The greater part of the total savings effected—about 75 per cent—is accounted for by five industries: cloth, hosiery, boot and shoe, carpets and pottery, and about 80 per cent of the results were achieved between May, 1941, and March, 1942, since when the rate of concentration has been greatly slowed down. The only two industries in which further curtailments can be looked for, and from which considerable numbers of workers can still be released, are clothing and printing. In clothing so far 529 designation certificates have been issued and 269 firms have been closed down. This represents only a small fraction of the total number of firms, between 20,000 and 30,000, in the industry, which presents special difficulties on account of the great diversity in size of its units. Two thousand designated

firms account for 70 per cent of the output and are given 75 per cent of all utility cloth; incidentally, the proportion of utility to non-utility cloth is in the ratio of 80 per cent. The printing industry is comparatively easy to handle, being more manageable in size, and the industry's Joint Industrial Council is facilitating the task. Mr Dalton expressed his satisfaction at the way in which Mr Dalton's arrangements for compensation have operated, for the arrangement on a voluntary mutual basis, but in some cases the most part, through a central compensation fund. The principle adopted during the war has been one of the general pension for loss of business for any reason of no direct enemy action, and, as *The Economist* has rather tentatively argued, the concentration of industry might, consistently achieved even more rapidly if the Government had been prepared to grant compensation to financially hard-hit war casualties.

Training for Engineers

The Institution of Electrical Engineers have issued a valuable report on "Education and Training for Engineers." The engineering industry has been greatly expanded since the war, and if Britain is to maintain its high standards in the war, in competition with countries whose engineering industries have been similarly developed to a wartime footing, it is essential in the national interest to secure the proper recruitment and training of personnel . . . not only for higher professional ranks, but for every grade of worker. The present estimated annual intake of learners in the apprenticeship (based on the Ministry of Labour's 1942 figure, and assuming a 25 per cent increase by 1942) is 21,000; the five-year apprenticeship is in the order of 21,000; the percentage composition of this figure is 50.7 from elementary schools, 20.8 from junior technical schools, 25.3 per cent from secondary schools, and 3.2 from universities. High training facilities have lagged behind requirements, and there are no universally recognised standards of craftsmanship. The Institution's scheme contains a number of sound recommendations for making good the deficiencies. On general lines, it advocates raising the school; the broadening the basis of education, and introducing equal opportunity, and maintaining closer liaison between education, university and employment authorities, and representatives of industry. Among its specific proposals suggests that more care should be exercised in selecting entrants to craft training courses; that all craft apprentices should undergo a probationary period to test their suitability with transfer to other employment if necessary; that craftsman certificate should be introduced; and that responsibility for subsequent practical training should be accepted by the employer. It advocates a great extension of part-time day courses, both general and technical. For university trainees, it recommends an extension of state bursaries and more practical experience in the workshops—the suggestion that university engineering students should spend one year in industry between school and college is particularly attractive. It places great emphasis on post-graduate work, research, and the training of teachers. Although number of questions are left unanswered, such as the relation of the scheme to general post-war reconstruction plan and to likely changes in industrial technique, and the financial basis of the plan, the report is broad and imaginative in conception, and makes a valuable contribution to the vital topic of training for industry.

Unemployment

The returns of persons registered at employment exchanges as unemployed used to be published monthly, and are now appearing at quarterly intervals. The latest figures relate to April 12th, when the total in all categories was 80,091, a decrease of 18,916 since January 18th. Detail figures for both dates are shown in the table on next page. The decreases were spread over all areas, except Wales, where a rise of 1,127 was recorded, and the Midlands, where the rise was 71. The fall in unemployment steady, and it is likely to continue, since the wartime demand for labour is never satisfied. The direction of childless married women into part-time work has been They will be directed into "unessential" work, as well

into actual war work, in order to release more mobile women for industry. The only classes of persons between the ages of 18 and 41 who cannot be directed into work by

REGISTERED UNEMPLOYMENT IN GREAT BRITAIN

the Ministry of Labour are women with children under the age of 14 living with them, and men who are unfit for military service or who have been discharged from the Forces on medical grounds.

Bus Workers' Award

The application for an increase in wartime wages and for improved conditions of service for 200,000 passenger transport workers, employed by the London Passenger Transport Board, and by municipal authorities and bus companies in the provinces, has been rejected by the special Arbitration Tribunal, which has been considering the claim for the past month. The unions concerned were the Transport and General Workers' Union, the National Union of General and Municipal Workers and the National Union of Railwaymen, and the Tribunal was composed of Mr Craig Henderson, K.C. (Chairman), Professor Harold Laski, and Mr Humphrey Edmunds. The unions' claim, which was presented by Mr Harold Clay, was based on the increased wartime strain to which bus workers have been subjected and the greater intensity of their effort, rather than on the cost of living argument. With the need for maximum economy in petrol and tyres, bus services have been greatly curtailed in every area, but the volume of passengers carried has increased. This has resulted in increased loads and higher peak periods—and more peak periods—while the drivers have been employed on older vehicles which are not easy to service. Another grievance has been the cutting down of Sunday services with, consequently, heavier loads, while the regulations increasing the number of standing passengers have added to the strain. The principal demand, applicable to LPTB, municipalities and companies alike, was for the increase of Sunday duty pay; the claim also aimed to bring the provincial companies' conditions more into line with London and the municipal undertakings. The Tribunal rejected the claim on the ground that the case had not been made out and that there had been no substantial alterations in conditions since the war increases were granted a year ago. The unions are bound to accept the award, but it is likely to give rise to considerable dissatisfaction among the men.

Man-power in Coal

The main reasons for the decline in productivity in the coal industry are probably the increasing age composition

of the labour force, the shortage of young men, and the wastage of trained men. It is one of the war's worst defeats that, in spite of the Government's year-old plan, these factors have not been appreciably counter-balanced by the improvements in organisation and technique that are overdue in this antique and atomised industry. Between 1931 and 1941, the average age of miners rose from 34.6 to 37.1 years, while the most important age-group, 21-29, from the point of view of both immediate and future production, dropped from 208,000 to 109,100 during the same period; out of a total personnel of about 700,000, over a fifth are men of 51 years and over. In the four months from September, 1941, to January, 1942, the net loss of trained men was about 9,200. In view of these facts, and with the present deficiency of production and increased demands for coal as the United Nations turn to new offensives, it is more than ever necessary to increase both the intake of young men and the number of those engaged in coal-getting. The Minister of Labour allows certain young men between 18 and 25 to opt between mining and service in the Forces at the time of registration—since last autumn about 2,000 have voluntarily chosen coal-mining—and the Minister of Fuel has powers to direct surface workers underground. Up to March 31st, 1,897 surface workers had gone underground, 1,353 voluntarily, 544 after the issue of directions and 80 refusing to go, after losing their appeals at the Local Appeals Boards. There has been some misunderstanding about the Ministry's policy and some resentment within the industry that young men from other industries should not be given a choice between underground mining and the Forces, but the Ministry has stressed that this direction is in accordance with the policy of placing every available man where his contribution to the war effort will be greatest, and that the transfer of surface workers underground is parallel to the transfer of a man in a reserved occupation to more vital work in an arms factory. Coal production has, and must continue to have, first-class priority. The pit production committees, which may discuss the utilisation of man-power, are being urged to explain the reasons and the need for these measures to the young workers. The Government should at the same time be urged to say why the reorganisation of the industry has proved to be beyond its powers.

Retail Trade

The release of a new block of 20 clothing coupons on March 15th had the effect of raising the average daily value of retail sales above the level of the previous two months, during which it had fallen more than usual. The Bank of England index number of the average value of daily sales (1937 = 100), published in the *Board of Trade Journal* for May 8th, was 106 in March, compared with 96 in February. The apparel sales figure, at 96, was 26 points above that of February. Rises occurred in every department, including household goods, sales of which have been falling steadily for some months. The rise here may be accounted for, to a limited extent, by sales of utility furniture, the production of which is now well under way. Compared with March, 1942, turnover was lower in all categories, except fancy goods and miscellaneous items. The rises were respectively 6.2 per cent and 1.2 per cent, and were probably due to the increase in prices in these goods, which, for the most part, bore purchase tax at 66½ per cent. The largest decrease in turnover in the year was 33.8 per cent, in men's and boys' wear. The total fall in turnover was 5.7 per cent, the non-food total 9.5 per cent, and the fall in the food and perishables total, 2.5 per cent.

COMPANY MEETINGS

NATIONAL BANK OF INDIA,
LIMITED

INCREASED BALANCE SHEET TOTALS

MR. R. LANGFORD JAMES'S STATEMENT

The ordinary general meeting of the shareholders of the National Bank of India, Limited, will be held, on the 25th instant, at 24 Bishopsgate, London, E.C.

The following is the statement by the chairman (Mr R. Langford James), circulated with the report and accounts for the year ended December 31, 1942:—

Again this year the proceedings at our annual general meeting will be limited to formal business.

In September last we suffered a grievous loss by the death of our colleague and general manager, Mr E. H. Lawrence, after a period of service with the bank exceeding 51 years. Those of the shareholders who were acquainted with Mr Lawrence, either personally or by reason of his reputation in the business world—and they must be many—will realise what an asset to our business were his outstanding capability and his universal popularity. The board's appreciation of his services to the bank have been placed on record, of course, but I take this opportunity of expressing again our sorrow at the loss of our friend. To fill his place as general manager we appointed Mr R. L. Hird, who has an intimate knowledge of the bank's affairs and all the attributes called for by the office. It goes without saying that he has our best wishes.

PROVISION FOR TAXATION AND NET
PROFIT BALANCE

Owing to war-time conditions the issue of our report and of the accounts is again delayed and consequently we deemed it expedient to make a final distribution from the profits by means of a second interim dividend, the rate for the year being 14 per cent., the same as on account of 1941. Although we have had to make materially increased provision for taxation the net amount of profit carried to the balance-sheet shows but little change from that of the previous year; actually it is slightly larger. Pension funds receive an allocation of £60,000 and contingency account £50,000, while we have placed £60,000 to premises account.

The totals on each side of the balance-sheet show an increase of £8,800,000 over those of the previous year. On the liabilities side there is an increase by that amount under the heading of current, fixed deposit and other accounts. The greater proportion of this increase is in our deposits in India which reflects the flow of money into the hands of the public there as a result of war expenditure. On the assets side, cash and money at call show an increase of £6,800,000, while British and Indian Government securities are higher by £2,100,000. Bills of exchange, which include Treasury bills, have increased by £3,000,000, the whole of this increase being in Treasury bills. Discounts and loans receivable are lower by £2,800,000, a reduction which has been inevitable under existing conditions. The ratio of the combined items of cash and Government securities to our current accounts, fixed deposits and other accounts is 76 per cent.

EFFECT OF FAR EASTERN WAR

When we met last year the Japanese threat to India was a seemingly imminent danger and maritime trade from that country's eastern seaboard was virtually at a standstill by reason of the activities of the Japanese fleet. Japan decided, however, to strike southward, rather than westward,

with the consequence that so far as India is concerned—but excluding Burma, of course—the war has receded rather than encroached, and the same may, I think, be said for Ceylon. Beyond therefore the natural dislocations arising from war-time conditions, such as local shortages of certain foodstuffs, the limitations imposed by Government regulations and the greatly increased amount of war work, the industries of India and Ceylon are working normally. Without exception I believe, these industries are experiencing a period of prosperity in lesser or greater degree, the outstanding example of the latter being the cotton mill industry in the west of India which appears to be earning profits much in excess of normal.

The Indian constitutional question still presents difficulties which hitherto have appeared insuperable. It is to be hoped that a solution, which should be possible, given good will on all sides, may yet be found.

AN OUTSTANDING FEATURE

An outstanding feature of the past few months in our particular sphere of activity has been the founding of a considerable number of indigenous banks in India, some of which, judged by the amount of capital embarked in them, are likely to become important institutions. From the point of view of internal—as opposed to exchange—banking, there should be much scope for expansion in India, and any sound development in that direction is to be welcomed.

So far as East Africa is concerned, the war has brought generally increased prosperity. Unfortunately the partial failure of the maize crop has been giving cause for some anxiety, this being the staple food of the country.

TRIBUTE TO STAFF

On behalf of the board I extend again our thanks to the staff for their services during the past year. We all know by now the degree of strain engendered by war conditions and, so far as the eastern staff is concerned, we realise fully the additional stress of working in a tropical climate with no present hope of the periodic amelioration afforded by furlough to their home land. It says much, both for them and for the staff in this country, that the standard of those services remains at its usual pitch of excellence and for this we are correspondingly grateful. Although we have released willingly for the fighting services every member of our staff who could be spared, there are indications in the East that further demands may be made upon us, notwithstanding that the increase in ill health among the staff is already causing us concern. In this connection it is to be hoped the essentiality of maintaining banking services, in the interests of the war effort, will be fully recognised by the authorities concerned.

WILLIAM BEARDMORE
AND COMPANY, LIMITED

ANNUAL GENERAL MEETING

The ordinary general meeting of William Beardmore and Company, Limited, was held, on the 13th instant, at the offices of the company in Glasgow.

Sir James Lithgow, Bt., M.C., D.L., chairman of the company, presided.

The secretary (Mr D. M. Cameron, C.A.) read the notice convening the meeting, and the report of the auditors was read by Mr H. MacRobert, C.A.

The chairman proposed the adoption of the report and accounts and the payment of the dividend on the ordinary stock was recommended.

The resolutions were carried unanimously.

The retiring directors (Sir James Lithgow, Bt., and Mr Ralph Freeman, M.Inst.C.E.) were re-elected, and the auditors, Messrs J. Wyllie Guild and Ballantine, reappointed.

A vote of thanks to the chairman concluded the proceedings.

JOHN SUMMERS AND SONS,
LIMITED

YEAR'S RESULTS

The annual general meeting of John Summers and Sons, Limited, was held, on the 7th instant, at the company's offices at Hawarden Bridge Steel Works, Shotton. Mr. Richard F. Summers, chairman, presided.

The proceedings were of a formal nature, covering the adoption of the report and accounts, the re-election of retiring directors and the reappointment of the auditors.

As forecast in the report circulated with the accounts, the chairman did not consider it advisable under present conditions to give any detailed review of the operations of the company, and accordingly did not circulate or deliver any speech to the shareholders. The following are extracts from the report:

The profit for the year and the appropriations recommended by the directors are summarised as follows:

	£	£	£
Balance of profit after providing for depreciation and taxation			458,191
Balance from last account			173,581
			631,772
Provision for war damage insurance premium		31,589	
Transfer to general reserve including £41,800 covering Debenture stock redeemed December 15, 1942		150,000	
Transfer to war contingencies reserve		50,000	
Dividends on Ord. stock—			
“A” stock, 8½% less income-tax	170,000		
“B” stock, 4½% less income-tax	45,000		
		215,000	
			446,581
Balance to be carried forward			185,182

In arriving at the above profit, depreciation of £340,320 has been written off in the accounts of the various companies and full provision has been made for all known liabilities and contingencies. We would like to remind shareholders that, as has been the practice in past years, full provision has been made at the current rate for all taxation—irrespective of when payable—on the profits earned up to December 31, 1942.

The suggested appropriation of £50,000 to a war contingencies reserve has been made to meet any exceptional charges due to the war or to cover any adjustment necessary on a resumption of normal trading conditions.

The directors wish once more to place on record their appreciation of the sustained efforts that have been put forward by all the company's staff and employees

THE UNION BANK OF
SCOTLAND, LIMITED

STRONG LIQUID POSITION

The annual meeting of shareholders of the Union Bank of Scotland, Limited, was held, on the 12th instant, Sir A. Steven Bilsland, Bt., M.C., D.L., chairman of the bank, in the chair.

The chairman in submitting the directors' report mentioned that the balance-sheet total of almost £57,000,000 was higher than last year by over £5,250,000 and constituted a record. This was also true of the deposits which, at £46,618,000, showed an increase of £5,573,000 over 1942. It was interesting to note that the increase of deposits over 1939 was £13,400,000.

Note circulation, which was just under £5,500,000, was also expanding: there was an increase of nearly £1,250,000 in twelve months. Scottish bank notes in circulation at present: amounted to approximately £50,000,000 compared with £25,000,000 prior to the outbreak of war, and this great expansion was largely due to higher wages.

ASSET

The assets side of the balance-sheet presented a condition of still greater liquidity—which had always been a feature—and showed that more money had been invested by the bank in Government war issues. The first two items, which comprised cash, balances with other banks, money lent on the discount market and cheques in course of collection, amounted to nearly £13,200,000, representing over 25 per cent. of their combined liabilities to the public on deposits and note issue. To these liquid items might be added £4,000,000 lent to the Government on six-month Treasury deposit receipts (an increase of £1,500,000) and £1,835,000 of Treasury bills (higher by £1,325,000 than last year). Altogether the total assets in cash or realisable at very short notice represented over £19,000,000, i.e., over 36 per cent. of liabilities. From an earning point of view these assets were not remunerative and for earnings they depended mainly on advances and investments. This year they showed over £23,500,000 invested in British Government securities, an increase of nearly £3,000,000; the dates of maturity were well spread, with a considerable proportion repayable within a few years. Other investments of £3,200,000 showed a reduction of £427,000. There was an ample margin in the bank's favour between the aggregate value of their investments and the total stated in the balance-sheet.

Loans and advances were £9,225,000, a reduction compared with 1942 of £1,900,000, but last year it had been pointed out that the considerable increase in advances then shown contained some items of a special and very temporary nature. An appreciable portion of their advances was due to the financing of Government contracts and they would welcome the day when it was possible to finance ordinary trading requirements to a greater extent.

PROFIT AND ALLOCATIONS

There was no improvement in their earning margin, but, on account of the larger resources available, they were able to show a slight increase in profits, which appeared in the profit and loss account at £306,000.

£50,000 had again been placed to reserve fund, making it £1,950,000 against a paid-up capital of £1,200,000, and although little had been spent on premises during the past year £10,000 had been applied in reduction of this item.

It was recommended that £25,000, as usual, should be placed to pensions and allowances fund and that the same dividend of 18 per cent. should be paid as for many years past. This would leave £151,232 to be carried forward, an increase of £5,000 over the amount brought in.

The report was unanimously adopted, and a dividend at the rate of 18 per cent. per annum declared.

ALLIANCE ASSURANCE
COMPANY, LIMITED

MR R. D. TROTTER'S REVIEW

The annual general court of the members of the Alliance Assurance Company, Limited, will be held at the offices of the company on the 26th instant.

The following is an extract from the review by the chairman, Mr Richard Durant Trotter, which has been circulated with the report and accounts:—

In the life department the net new business completed during the year amounted to £1,401,180, against £1,118,485 for 1941. The claims by death in 1942 amounted to £681,444. The corresponding figures for the two previous years were £573,104 in 1941 and £826,027 in 1940.

At the close of the year the Alliance life and annuity funds amounted to £23,346,453, against £23,141,164 on December 31, 1941.

The amount received in premiums on sinking fund and capital redemption account during the year was £86,137, and after provision for claims, commission and expenses, the fund at the end of the year amounted to £2,124,692.

FIRE AND ACCIDENT DEPARTMENTS

In the fire department, the net premiums, amounting to £2,261,430, show an increase of £132,058 over those of 1941. The claims were heavier than in 1941, and, together with contributions to fire brigades, amounted to £740,381.

The directors have strengthened the additional reserve in the fire department by £100,000. The surplus, after making this increase in the additional reserve and after adjusting the reserve for unexpired risks, is £262,962, which has been carried to profit and loss account.

In the accident department, the premium income has fallen by £81,282, which is more than accounted for by the reduction in premiums received on the motor account. The result of the year, after adjusting the reserves for unexpired risks, was a surplus of £236,848, which has been carried to profit and loss account.

In the marine department, the net premiums were £1,674,204, which is an increase of £612,925 over that for 1941. In this department we continue to enjoy the valuable advice and assistance of our friends, Messrs Chubb and Son, in New York, who, particularly since the entry of America into the war, have been faced with many difficult problems.

The underwriting account for 1940 has now been closed, with a balance of £151,408, which is £8,060 higher than the balance for 1939. £11,029 has been set aside to meet further claims, and, in addition, your directors have considered it advisable to increase the reserve fund for previous years, which has stood for some time at £300,000, to £350,000. The remaining surplus, £90,379, has been carried to profit and loss.

The trustee department continues to make progress, and the funds now being administered total approximately £16,500,000.

INVESTMENTS AND RESERVE

The Stock Exchange securities (all funds) appreciated in value during the year, but the gross rate of interest on the members' fund and the life annuity funds has again slightly declined. The total amount invested during the year in Government War Loans reached approximately £1,140,000, in addition to some £160,000 on behalf of the various pension funds.

If you now refer to the profit and loss account, you will see that we have transferred £100,000 to a reserve, which will bring the reserve up to £2,000,000. We have again transferred the sum of £50,000 to staff pension fund, and increased our contributions to the widows' and orphans' fund to £34,576. We have also considered it prudent to allot £30,727 to reduction in the value of office premises.

CALEDONIAN INSURANCE
COMPANYMR JOHN MAXWELL ERSKINE'S
REVIEW

The one hundred and thirty-eighth annual general meeting of this company was held, on the 13th instant, in Edinburgh.

The chairman, Mr John Maxwell Erskine, D.L., in moving the adoption of the report, said: The net new life assurances granted during 1942 amounted to £886,248, as compared with £957,964 in 1941. We have now practically no field staff, and in all the circumstances the volume of new business may be regarded as not unsatisfactory.

Our mortality experience for the year 1942 was favourable, even taking into account war claims. Surrenders decreased from the already small figure of £41,340 in 1941 to £30,525 in 1942, which, I think you will agree, gives cause for satisfaction in these difficult times.

The expenses for the year 1942, excluding those applicable to annuities, showed a ratio to the net premium income of 15.2 per cent., compared with 14.3 per cent. in 1941, the increase being partly due to the extra expenses of the quinquennial valuation as at December 31, 1941.

The average net rate of interest earned for the year 1942 on the life assurance and annuity fund was £3 3s. 8d. per cent., as compared with £3 7s. 4d. per cent. in 1941.

It has been decided to pay, until further notice, an interim bonus of £1 per cent. per annum on ordinary participating whole life, endowment assurance and double endowment assurance policies becoming claims by death or maturity in 1943, in respect of each year's premium due and paid for the years 1937 to 1940 inclusive.

FIRE DEPARTMENT

The premium income for 1942 was £883,231, as compared with £771,311 in 1941, and the profit was £55,068, as compared with £53,931.

ACCIDENT DEPARTMENT

The premium income for 1942 was £489,591, as compared with £575,817 in 1941, and the profit was £43,871, as compared with £6,208.

MARINE DEPARTMENT

The premium income for 1942 showed a large increase at £621,315 against £351,692 in 1941. Attention is drawn in the annual report to this increase and to simplification in the form of account. You will observe that there was no transfer to profit and loss account in 1942, and that the claims paid on account of that year amounted to the large figure of £439,821. It is not surprising, looking to the worldwide character of the company's connections, that the results in this department have been adversely affected by war-time conditions. The marine fund of £570,257 carried forward at December 31st last is considered adequate.

GENERAL RESERVE FUND

The additional reserves of £500,000 in the fire insurance account, and £250,000 in the accident insurance account, have been transferred to the general reserve fund, which now stands at £1,400,000, as compared with the previous figure of £650,000. This, I think, gives a clearer view of the reserve position of the company.

PROFIT AND LOSS ACCOUNT

If the recommendations of the directors be approved, the balance to be carried forward in this account, after payment of a dividend of 15s. per share and allocation of £20,000 to the staff pension fund, will be £89,197, as compared with £117,150 brought in from the previous year. The balance on this account has been adversely affected by the increased provisions we have had to make for British income-tax and National Defence contribution, and by a substantial loss incurred in the provision of foreign exchange required in the course of our overseas transactions.

THE EMPLOYERS' LIABILITY ASSURANCE CORPORATION, LIMITED

INCREASED PREMIUM INCOME

The sixty-second ordinary general meeting of the Employers' Liability Assurance Corporation, Limited, was held, on the 12th instant, in London, Sir Courtauld Thomson, K.B.E., C.B., the chairman, presiding.

The following is an extract from the chairman's statement circulated with the report and accounts:—

The results of our operations in 1942 may be summarised as follows. Our total premium income was £6,808,664, an increase of £92,221 over 1941. Our underwriting profit of £182,377 (which is arrived at after charging Dominion and foreign taxes) and our gross interest income of £320,018 together amount to £502,395. The aggregate of the taxes, British and Dominion and foreign, paid or provided for in the accounts, is £725,446. We are recommending the payment, on May 28th, of a final dividend of 2s. per share which, with the interim dividend of 1s. 6d. per share paid on October 30th last, makes a total payment per share for the year of 3s. 6d. We then carry forward £562,231, an increase of £38,926 on the year. This carry forward of £562,231 is additional to the general reserve of £2,500,000.

FIRE AND ACCIDENT PREMIUMS

Our fire premiums show an increase over the previous year, and produced a profit of £23,502. It is strange that in these times, when fire brigade services have been so greatly enlarged and are supported by a country-wide system of fire guards, the waste caused by fires, other than those arising from enemy action, should be even greater than in pre-war years. It is estimated that in 1942 the cost of these avoidable fires was over £12,000,000. The monetary loss is serious enough; but the graver aspect is the interruption of production and consequent slowing down of the national war effort.

In the accident and general account the premium income, at £6,367,235, shows a satisfactory increase, and there is a profit of £158,875. This is an improvement over 1941. Under the ever-resourceful management of Mr Stone, which we gratefully appreciate, the United States branch made the largest contribution to profit, as well as to premium income, in the account. The premium income of the branch was well maintained in 1942, but we must be prepared for a reduction in 1943 in consequence of the restrictions on motoring.

The proposals in the Report of Sir William Beveridge will have come under your notice. While we are in sympathy with the fundamental objects of the Report, we feel that these could be attained without revolutionising the system under which the present benefits are administered by the existing insurance organisations. We are naturally desirous of co-operating as fully as possible with the Government in their consideration of those matters with which we are directly concerned.

INCREASED INVESTMENTS

There is an increase of £1,003,968 in our investments, which (excluding properties and our associated companies) amounted at December 31, 1942, to £8,990,351. Their market value exceeded that total. The additional investments consist almost entirely of Government issues, and we are glad to be able to give this support to the cause of the United Nations.

The 1942 results of the Clerical, Medical and General Life Assurance Society and the Merchants' Marine Insurance Company, Limited, indicate the importance of our participation, through these associated offices, in life and marine business.

The report was unanimously adopted.

SUN INSURANCE OFFICE LIMITED

SIR WILLIAM H. GOSCHEN'S REVIEW OF 233rd YEAR'S OPERATIONS

As the business at the annual general meeting on the 25th instant will be confined to the passing of the usual resolutions, the chairman, the Hon. Sir William H. Goschen, K.B.E., has sent to shareholders a statement concerning the year's operations. In this statement he refers with most sincere regret to the death of General the Hon. Sir Herbert A. Lawrence, G.C.B., a member of the board for more than 20 years. Mr D. J. Roberts and Mr C. G. Randolph have been appointed directors.

Mr H. R. Hobson, D.S.O., joint general manager of the office, has retired at his own request after 47 years of service.

THE ACCOUNTS

Premium income in the fire section showed an increase notwithstanding the loss of important connections through enemy occupation of territory in the Far East. Marine income also rose substantially. It had not been possible to maintain entirely the premium income in the accident section, but there had been an advance in the aggregate figure for all sections of £233,000.

The claims experience in the fire account was satisfactory, the improved record at home continuing, whilst in the U.S.A. the adverse experience of the two previous years was not repeated. Fire underwriting profits amounted to £252,177.

Owing to the greatly restricted use of civilian motor vehicles the income from motor business had fallen considerably, but the claims experience showed a marked improvement. The transfer to profit and loss account from accident business was £191,506.

Marine premiums advanced by £346,853 to £1,266,642. Claims at £912,481 increased by £404,745. War risks premiums on U.S.A. shipping and the losses sustained on this section were largely responsible for these increases. After a transfer of £50,000 to profit and loss account the fund remained strong at £1,580,211.

TRANSFER FROM REVENUE ACCOUNTS

The aggregate transfer from the three revenue accounts amounted to £493,683. Net interest earnings at £181,386 were £6,177 higher than in 1941. Provision had been made for British taxation and for War Damage Contribution to the extent of £292,000. £100,000 was contributed to the pension fund and £80,000 carried to general reserve fund, which was thereby maintained at £1,000,000.

THE DIVIDEND

An interim dividend of 1s. 3d. per share was paid last January, and a final dividend of 1s. 6d. per share had been declared. The cost of these two dividends, less income-tax, was £171,875. The book value of the investments increased by £338,466 to £9,456,730.

The chairman felt that, whilst shareholders would regard this record as satisfactory, he should remind them that as the war continued so its destructiveness to much normal commercial enterprise must progress. In the absence of opportunities to replace what the war had destroyed insurance business must be adversely affected.

The chairman, after paying a warm tribute to the work of the management and staff at home and abroad, concluded his statement with a reference to the many men and women now serving with the forces and to those who had fallen or are missing.

J. & P. COATS, LIMITED

THE CHAIRMAN'S STATEMENT

The annual general meeting of J. & P. Coats, Limited, will be held, on the 20th instant, in Glasgow.

The following statement by the chairman, Mr J. O. M. Clark, has been circulated to stockholders in advance with the report and accounts.

I am adhering to the practice which was followed last year by sending to the stockholders a printed statement relating to the accounts of the company to be submitted at the annual general meeting on May 20th. Owing to the paper restrictions which are now in force, it is not possible on this occasion for me to make even a brief survey of the operations of the company and those of its subsidiary and allied companies abroad as I have done in recent years, and I must therefore limit my remarks to some explanations regarding the figures appearing in the balance-sheet and a few other comments.

ACCOUNTS

The balance-sheet shows a few changes to which I shall refer briefly. On the liabilities side, sundry creditors have risen from £10,504,000 to £12,049,000, the rise being mainly accounted for by the following items: an increase in the balance of the excess profits tax account represented by that part of the provision made in past years which has not yet been paid over to the revenue authorities; a larger balance carried in the income tax account than was the case last year; a larger amount outstanding in respect of unpaid cotton purchases; and also increased balances due to third parties in respect of monies borrowed by our selling agents to effect advance payment to us for goods shipped to foreign markets.

Amongst the assets there may be noted an increase in the amount of investments in subsidiary companies from £21,582,000 to £21,822,000. This increase represents a purely internal change, being the conversion to share capital of part of the balance in current account due to us by a foreign subsidiary. The decrease in sundry debtors is accounted for by normal fluctuations. Stock of goods and stores shows a considerable increase, rising from £3,319,000 in 1941 to £5,380,000 in 1942. About half of the increase is accounted for by a large purchase of raw cotton made in Egypt towards the end of the year. It may be explained, however, that in the early days of this year we have, at their request, sold this cotton to the Cotton Control so that our present stock position has been reduced accordingly. The remaining part of the increase is due to the considerably greater quantity of goods on the way to our selling agents, and the increased values. It will be appreciated that, owing to war conditions, deliveries of goods to overseas markets take longer to reach their destination than in normal times.

The profit and loss account shows a balance of £1,706,161, which is after providing £1,130,000 for excess profits tax. The increase in net earnings is explained by an improvement in our standard profits by reason of an increase in the average capital employed in the business. In addition to the provision for excess profits tax, as in past years we have fully covered our income tax liability for the year of account. Consequently, stockholders will appreciate that the tax to be deducted from the final dividend payable on June 30th next will be effective as a credit against next year's liability.

The results will, I hope, be considered satisfactory by the stockholders. The profit figure as shown in the balance-sheet is practically the same as for the year 1941. For the reasons which I gave you last year it could hardly have been otherwise. But what is of more significance is that our sales have, I am pleased to say, been maintained at the high figure of 1941 and are up to the best pre-war years in spite of the fact that

a large part of the European and Eastern countries have contributed little or nothing to the total. Our trading profit remained at about the same level as last year, but our total profits before charging United Kingdom taxes are somewhat reduced. This is due mainly to increased foreign taxation and reduced dividends from associated companies.

TRADING DIFFICULTIES

The demand for our products which are of an essential nature, both for war purposes and for civilian requirements, greatly exceeds our ability to satisfy it, but after meeting the Government-directed orders our agents do their best to make as fair a distribution as possible among our customers. The forecast which I made in the statement to the stockholders last year on the subject of clothes rationing has been fully realised.

FUTURE PROSPECTS

Provided that nothing at present quite unforeseen occurs, our experience during the current twelve months is, as far as I can see, not likely to differ very much from the year 1942, assuming that we can get supplies of suitable cotton to keep our home mills running. The purchase and importation of cotton for this country is now entirely vested in the Control, and since April, 1941, no individual has been permitted to make purchases. We are consequently wholly in the hands of the Control who are well aware of our requirements. So far as our mills abroad are concerned, the question of cotton does not give rise to any anxiety.

Without relaxing in any way our efforts to maintain production, we are giving considerable thought to our world position when hostilities cease. Much new machinery, accessories and stores will doubtless be required to replace any equipment which, either through neglect or excessive use, has become defective. Provision will also require to be made for additional machinery to extend the production of special articles introduced during the last three years.

In many respects these plans must be of a tentative nature until the situation in certain countries becomes more clearly defined, but much can be done meantime to develop a general scheme which may require to be modified only in respect of details.

WORK AT MILLS

Since our last meeting it has been found necessary to introduce a night shift at our home mills and to make certain rearrangements of the work performed by a number of our employees. At one of our factories abroad which is now supplying a much wider area than in peace time, work is being carried on with three shifts.

EMPLOYEES

In expressing our thanks to the staff and employees of the company at the annual meeting last year, I referred to the difficulties under which many of those in our employment were carrying on their work. What I said then still holds good, if not in greater measure today, and we are very appreciative of all they have done and are doing.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes.

In time of war the value of this practice is greatly enhanced because *The Economist* provides valuable information which is not otherwise available to investors, who therefore read it more carefully than ever.

Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, Bottenham House, Lancaster Place, W.C.2.

MAYPOLE DAIRY COMPANY, LIMITED

DIFFICULTIES OF WARTIME TRADING

DIVIDEND OF 4 PER CENT. MAINTAINED

SIR GEORGE SCHUSTER ON THE OUTLOOK

The forty-fifth annual general meeting of the Maypole Dairy Company, Limited, will be held, on the 21st instant, in London.

The following annual review by the chairman (Sir George Schuster, K.C.S.I., K.C.M.G., C.B.E., M.C., M.P.) has been circulated with the report and accounts:—

As the financial results for last year show no marked change and are clearly explained in the accounts and report, this is a good occasion to review the general story of the Maypole Company during the war. Large multiple companies are often represented—in contrast with small traders—as being both immune from war difficulties and devoid of human qualities. It may interest you to know how far from the truth are both these ideas.

WAR DIFFICULTIES

The war has brought our company special difficulties. Maypole shops always specialised in certain lines. Their reputation for high quality in such articles as eggs, butter, margarine, tea, etc., attracted many customers who for their general grocery purchases dealt with other shops of all kinds, including the Co-ops. We organised our own supplies in these special lines. In the case of eggs, for example, we had our own collecting stations in Denmark so that we could get our eggs from the hen to the breakfast table in record time. Then, using our Danish experience, we had established and were steadily increasing our own egg collecting stations in suitable localities in England, thereby rendering good service both to the British farmer and to the British consumer. During the five years prior to the war we more than doubled our sales of eggs, and in 1938 we sold well over 200 millions. The war has changed all this. The Nazis have got our Danish egg stations and the British Government has taken over the control of collection and distribution at our English centres. All we can get now is our quota of eggs in the same way as everybody else, calculated according to the number of our registered customers. The same sort of thing has happened with all our other special lines—butter, margarine, and the rest. We can now merely sell what the Government allots to us in the same way as everybody else.

CHANGES IN SHOPPING HABITS

We can, indeed, still claim that our methods of handling goods and preserving their freshness in our branches offer definite advantages; but the special value of our own organisation has been taken from us. At the same time there have been other forces at work to take our regular customers away from us. Early in the war the practice grew up for general grocery shops to refuse to sell unrationed articles except to people who registered with them for everything else. Then in July, 1942, the Government strongly urged the public in the interests of national economy to register with traders in the immediate vicinity of their homes. This had a further adverse effect on us, since most of our branches are in the main shopping centres, and therefore in some towns quite a long way from our customers' homes. We make no complaint of such Government action, since what they direct in the national interest must be cheerfully accepted in time of war. But these things have meant disadvantages to the Maypole business, the full effect of

which—since some of them only began to operate last July—is not reflected in the 1942 trading results.

I can give a broad idea of the significance of all these factors on our turnover by saying that the volume of sales in our main special lines was in 1942 something less than half of the volume in 1938. Against this drop we have been able to increase our sales in general groceries, while the rise in prices compared with 1938 has helped to keep up the value of our total sales. At the same time, too, the margin of profit under the regulated prices is higher than it was our policy to take in peace time. It is in these ways, combined with careful economy in expenses, that we have been able to maintain a net income sufficient to pay a modest dividend.

HUMAN CONSIDERATIONS

Turning to the human side of the business, it has always been a feature of the Maypole policy to maintain a close spirit of fellowship between the company and its employees, to give them an opportunity through our bonus system to share in improved results, and above all to provide for them good chances of advancement. The war has sadly cut across many of our plans. In the years before the war, for example, we were starting a special scheme for the education of the boys joining our service. We had got great help from local education authorities, especially in London and Leeds, where we made our first start.

CITADEL OF HEALING

Last year at the Christie Hospital 4,864 new patients from all parts of England were examined, 45,223 investigations of patients were carried out and 17 Cancer Diagnostic Clinics maintained at Hospitals over a wide area. Funds are urgently needed for this work and for the extension of research into Cancer, still mankind's great scourge.

CHRISTIE CANCER HOSPITAL
HOLT RADIUM INSTITUTE

Of course all these plans had to come to an end with the war. The war, too, has scattered our "Maypoles" all over the world. Out of our total male staff in the branches before the war of 4,890, only 625 are now with us, the remainder having left mainly to join the Forces or some of them to take up munition work. We are trying to maintain contact with those in the Forces. We give them special financial allowances to supplement their service pay in cases where family obligations make some assistance necessary, and we are now turning our special attention to the problem of how best to look after these men when they come back. We get many encouraging letters from them, showing how they retain their interest and how they are looking forward to getting back again to the company. In the meanwhile the older members of our staff who remain with us have risen in a fine way to cope with the difficulties brought about by war conditions.

A DEMOCRATIC ORGANISATION

We are a very democratic organisation. All our directors except two, and practically the whole of our senior executives, are men who started in the trade right at the bottom and have risen "from the ranks" to their present positions. One of our most valued senior executives, Mr Brooke, who started in the company at 6s. per week, celebrated this year his jubilee of 50 years' service with us. We were very sorry that the occasion could not be marked, as it would have been in peace time, by a large gathering to demonstrate the good will which he himself has done so much to promote.

In the meanwhile the places of the men who have left us have been filled with women and girls. Here again we have had our difficulties, since many of those whom we trained in the early period of the war have been directed away from us into the Services or munition work so that we had to start training all over again. Generally speaking we have nothing but praise for our war-time staff. They have stuck to their jobs and seen us through dangers and difficulties, especially in times of heavy air raids, in a magnificent way.

I hope all these points will interest our shareholders. There are something like 30,000 Maypole shareholders. I wonder if it has ever occurred to them when they shop at a Maypole branch—as I hope they all do—that a word of appreciation to the staff in these difficult times would have a very encouraging effect. I should like to impress on them all that a business like ours is essentially a human business, and that its success largely depends on the spirit of those who represent it behind the counter.

FINANCIAL RESULTS

Turning to the financial results, the net profit available for distribution—allowing for a slightly increased provision for income-tax—is £9,000 less than in 1941. We have again recommended that a dividend at the rate of 4 per cent., less tax, should be paid on the deferred ordinary shares, which will, after making the usual allotment to the company's provident fund, necessitate drawing upon our carry-forward to the extent of £7,722, leaving this at £294,615.

The formal resolution embodying the board's recommendations will be duly submitted at the annual general meeting.

It is a satisfaction to the directors that it has been possible to recommend the maintenance of the ordinary dividend. Although, as I have said, we do not expect during 1943 to maintain last year's level of profits, nevertheless, looking further ahead, we have unshaken confidence in the future of the business. The foundations of our organisation are well laid, the structure is sound, and we look forward to a big response from the public when normal shopping conditions are restored.

SPILLERS LIMITED

CONTROL PROBLEMS

DIFFICULTIES OF SUPPLIES

SIR MALCOLM ROBERTSON AND POST-WAR TRADE

The fifty-sixth annual general meeting of Spillers, Limited, was held at the Great Eastern Hotel, Liverpool Street, London, E.C., on the 14th instant, the chairman of the company, the Right Hon. Sir Malcolm A. Robertson, P.C., G.C.M.G., K.B.E., M.P., presiding.

The secretary, Mr P. Lloyd Tanner, F.C.I.S., read the notice convening the meeting.

The chairman submitted to the meeting his statement, which had been circulated to stockholders with the directors' report, as follows:—

FLOUR MILLING CONTROL AGREEMENT

I am sorry that the hope which I expressed this time last year, that we should not again have to meet without the directors being able to lay accounts before you, has not been fulfilled. This arises from the vast amount of detailed accounting work necessitated by the Flour Milling Control Agreement, which devolves upon a staff depleted by the demands of National Service. Some idea of the work involved will be gained when I tell you that it necessitates the repricing of all inter-departmental transfers of goods back to February 1, 1934, and the segregation from that date of the results of the controlled and non-controlled sections of the company's business. These results have to be computed in accordance with the provisions of the Agreement in order to achieve uniformity between one member of the industry and another and all the workings have to be verified by the auditors and afterwards agreed with the officials of the Ministry of Food. Only after all this has been done can the taxation liability be ascertained. The parties concerned outside the company are also seriously affected by the shortage of skilled staff. Considerable progress has been made and while it is dangerous to make any prophecy, I am hopeful that by the date of the next meeting we shall be able to lay before you a reasonably accurate statement of the results of the first three years' working under the Agreement.

The Agreement itself has now been extended in substantially the same form for a fourth year, i.e., until August 31, 1943. I shall reserve more detailed comment until I am able to make it in light of the actual results, but such information as we have does not lead the directors to alter the broad view which I indicated to you last year that the terms are not generous having regard to all the circumstances.

The technical department has been able satisfactorily to deal with the added complications presented by the adulteration of flour with the admixture of cereals other than wheat, in accordance with Government regulations.

CURTAILMENT OF ANIMAL FOODS

On the animal foods side a further curtailment of trade has resulted from even more restriction in the supplies of raw material. The trade in some products has, for all practical purposes, been extinguished altogether. The proposals for concentration in relation to the animal feeding stuffs industry, to which I referred briefly last year, have now reached a further stage, and a company representative of the industry, on the board of which your company is represented, is being formed to deal with this situation. Certain factories may be closed down, and it is proposed that there will be a levy made on the output of such factories as continue in operation. This will form a pool out of which certain payments will be made to the owners of those

factories which are closed down in order to contribute in some degree towards their standing charges.

Once again the question of the dividend to be recommended (in this case for the year ended January 31, 1943) was one of some perplexity to your board because of the circumstances which I have previously outlined. After reviewing the best estimates possible of earnings, and having regard to the continued strength of the company by reason of the prudent policy followed for many years before the war, your board came to the conclusion that they would be justified in recommending payment of dividends at the same rates as for the previous year. A resolution to carry this recommendation into effect will be submitted at a later stage in the meeting. I reiterate the warning which I previously gave that in these times trading conditions are liable to disruption and dislocation, and the outlook for the future is therefore uncertain.

POST-WAR RECONSTRUCTION PROBLEMS

I have referred in the past to the need for making provision against the rehabilitation of the company's trade when the war is over and the maintenance of its position in a return to a highly competitive market. In these critical days every effort must needs be directed to the carrying out of our first duty of producing and delivering essential foodstuffs to the greatest extent possible and in the most economical manner. But now that the Government is devoting attention to the preliminaries of what is termed "Reconstruction" I venture to suggest that the time has arrived when responsible industry should be consulted in regard to plans for the conduct of the country's commerce in the post-war era in order that knowledge and experience of the realities of such questions may be allowed to play their due part.

In this connection it was most welcome to hear the Prime Minister refer to the essential part to be played by private enterprise and the need to reduce direct taxation when the all-absorbing requirements of wartime expenditure have passed. On the social side it has always been this company's policy to do our best to maintain a reasonable and steady standard of remuneration for our employees and to provide adequate pensions and retiring allowances. It is the duty of well-established industry to promote the best possible conditions for all those engaged in it, and it is my hope that we shall be enabled to continue on these lines in the years to come.

We are proud and pleased to record the honour of knighthood conferred by His Majesty the King on one of our colleagues, Sir Archibald Forbes, for his signal services to his country during the present war.

CONGRATULATIONS TO SECRETARY

I am sure that the stockholders will desire to join with the board in congratulating Mr P. Lloyd Tanner, the company's secretary, on being elected to the high office of President of the Chartered Institute of Secretaries. Mr Lloyd Tanner has been in the company's service for 39 years and has occupied the post of secretary since 1916. As secretary of the company he has earned the admiration of my colleagues and myself, and we are proud that his high qualities should have been so fully recognised by the members of his own profession. We feel they could have made no happier choice.

I should also like to offer congratulations on your behalf to our south-west

area general manager, Mr J. Twomey, who has received the O.B.E. from His Majesty. No honour has been more fully earned, or more thoroughly deserved.

Once more I pay tribute on behalf of the board and the stockholders to the work of the company's staff and work-people. They have coped admirably with the many difficulties presented by abnormal conditions, not least of which is the ever-growing depletion of their numbers.

I should like to convey from you to those of our employees who are in the Services, how much our thoughts are with them in these anxious days, and wish them a safe and welcome return in what we hope is the not too far distant future.

The report was unanimously adopted.

The retiring directors, Sir Malcolm A. Robertson and Mr Arthur Whittaker, were re-elected, and the retiring auditors, Messrs Impey, Cudworth and Co., and Messrs. Deloitte, Plender, Griffiths and Co., were reappointed.

After a vote of thanks to the chairman the meeting stood adjourned.

AUSTIN MOTOR COMPANY, LIMITED

PROPOSED REDEMPTION OF £944,280 5 PER CENT. DEBENTURE STOCK AND ISSUE OF £1,000,000 4½ PER CENT. REDEEMABLE PREFERENCE SHARES

The chairman (Mr E. L. Payton, J.P.) presided at a series of class meetings held, at Longbridge Works, Birmingham, on the 12th instant, under the direction of the Court, also at an extraordinary general meeting, which were convened for the purpose of approving a scheme of arrangement and resolutions altering the company's Articles of Association.

In his opening remarks the chairman commented:—

Ladies and gentlemen, this is the first of a series of three class meetings at which the holders of the company's 7 per cent. preference stock, 6 per cent. B preference stock and 20 per cent. preferred ordinary stock are being asked to approve the scheme of arrangement proposed to be made between the company and the various classes of its stockholders. If the scheme is approved at all the class meetings these will be followed by an extraordinary general meeting of the company at which the necessary resolutions will be proposed for creating the 4½ per cent. redeemable preference shares referred to in the scheme and for altering the Articles of Association of the company to the extent necessary for giving effect to it.

The scheme has been circulated among the stockholders and I do not propose to refer to its provisions in detail, but it may be of interest if I allude to the considerations which influenced the directors in deciding to submit it to the stockholders at this time and in this form.

OBJECT OF THE SCHEME

The object of the scheme is to effect the redemption of the company's debenture debt of which there is £944,280 outstanding secured by a fixed charge on the company's properties and a floating charge on its undertaking and general assets and carrying interest at 5 per cent. Your directors saw various advantages to the company in replacing the debenture stock by a capital liability carrying a lower rate of interest, the issue of which would free the company's property and assets, amounting to about £8,500,000, from the charge attaching to them under the present debenture trust deed and place the company in the best possible position to meet difficulties which may arise during the period of change-over from war-time production to its normal activities. It was decided to make the new preference shares redeemable by means of a sinking fund commencing in 1948 to be provided out of profits,

thus gradually reducing the capital liability standing in front of the existing issues of capital exactly as the debenture debt which it replaces was reducible by the operation of an annual sinking fund. The company's Articles of Association contain provisions for the alteration of the rights attaching to classes of shares issued on special terms by means of resolutions passed at class meetings. Your directors were advised that the same purpose could be achieved by means of a scheme submitted to the stockholders under the Companies Act. This procedure was accordingly adopted, and the meetings now to be held have been convened by the direction of the Court to which the results will be reported. This method affords protection to the stockholders, and the scheme, if approved by you today, will then be submitted to the Court for sanction and to the Treasury for approval of the issue.

PROVISIONAL OFFER ACCEPTED

The board gave careful consideration to the possibility of offering to the debenture holders an opportunity of exchanging their stock for redeemable preference shares of the new issue, and are aware that a number of the company's debenture holders would have wished to convert their holdings into preference shares. It was, however, difficult to forecast the extent to which the debenture holders would have accepted an offer to convert their stock into preference shares and after carefully considering the matter the directors decided that it would be in the best interest of the company to accept the provisional offer received through the company's brokers for placing the whole of the issue of redeemable preference shares upon terms which will give the company £1 net per share and will include an undertaking by the purchasers not to put any of their shares on the market at less than par for six months from the date of allotment.

At the close of the meetings the chairman announced that the scheme and resolutions had been approved by the requisite majorities.

JOHNSON AND PHILLIPS, LIMITED

CONTINUED EXPANSION

The thirty-eighth annual general meeting of Johnson and Phillips, Limited, was held, on the 13th instant, in London.

Mr G. Leslie Wates, J.P. (the chairman) said that the trading profit at £507,797 reflected a continued expansion in the company's operations, and was some £5,000 higher than in the previous year, but the increase was not so great as it had been in the last two or three years of the company's history. He thought that pointed to the fact that, whilst they had not yet reached their maximum output, they were undoubtedly approaching the time when the factory would be producing to the limit of its capacity. In arriving at that figure, they had been compelled to make certain estimates and they had allowed for certain contingencies.

The largest individual deduction from trading profit was again that of taxation. They reserved £310,000. That figure was necessarily an estimate, but he felt satisfied that it would be a safe figure. The dividend recommendations and the allocations to research and to contingencies were the same as they had been during the last two years, and the balance carried forward to next year was within £700 the same as the amount brought in.

The balance-sheet reflected the continued increase in the company's business by showing substantial increases in stock-in-trade and work-in-progress, which were up by £180,000, and in sundry debtors, which were up £125,000. They had borrowed no money or plant from the Government, nor had they received any financial assistance, other than normal bank loans, in relation to the various extensions of buildings, plant

and machinery carried out since the outbreak of war. The whole of those had been financed from their own resources in the ordinary course of their business.

The report was unanimously adopted.

BEIRA RAILWAY COMPANY, LIMITED

INCREASED REVENUE

The forty-second ordinary general meeting of the Beira Railway Company, Limited, was held, on the 12th instant, in London, Mr Arthur E. Hadley, C.B.E. (the chairman), presiding.

The following is an extract from the statement by the chairman circulated with the report and accounts:—

There was an increase in gross revenue of £27,536 as compared with the previous year. Expenditure increased by £9,665, and the net revenue was £17,871 higher. Import traffic showed no improvement, but export traffic was well maintained. The net earnings from the line realised £451,423, an increase of £17,871. Adding balance of interest account and miscellaneous revenue, the total net revenue is £471,468.

The cash position is again very satisfactory, cash, tax, reserve certificates, and investments totalling £942,874, out of a total of £961,615 of current assets. Current liabilities amount to £319,909. The amount of debenture stock outstanding at September 30 last was £1,863,100, £25,750 stock having been redeemed during the year from the sinking fund. Liabilities include provision for taxation, and for rebuilding of properties.

The result of the year's working is a profit of £100,176, which, added to the amount of £42,545 brought forward from the previous year, makes an available surplus of £142,721. It is proposed to pay a dividend of 2s. per share, less tax at 5s. 4d. in the £, absorbing a gross amount of £105,000, and to carry forward the balance of £37,721 to next account.

With respect to the current financial year, we have received, at present, traffic receipts for five months—October, 1942, to February, 1943. Net earnings for this period amounted to £163,772, as compared with £187,077 in the previous year, or a decrease of £23,305.

The report was adopted.

JAMES W. COOK AND COMPANY, LIMITED

The forty-sixth annual general meeting of this company was held, on the 7th instant, in London.

Mr W. J. Clarke (chairman and managing director), who presided, said: The result is within a few hundred pounds the same as last year, and once again this result has been greatly helped by the contribution from our subsidiary undertakings.

Road haulage has continued satisfactorily and has helped our returns, but I must advise you that the Ministry of War Transport has taken over control in the long distance road haulage by acquiring the use of all the fleets of lorries of various concerns all over the country, and some of our subsidiaries have been selected as being desirable for this purpose in the eastern counties which we serve. We shall be left to continue to manage the concerns, and it is to be seen how that will affect us.

It is absolutely impossible to forecast the next year's trading, but it is the firm belief of very many of us that certainly after the war, if not before it is ended, London with its great capacity will come back into its own, and that we can look forward with courage and well-founded hope to the future.

The report and accounts were unanimously adopted, and a final dividend of 7½ per cent., making 10 per cent. for the year, and a bonus of 2½ per cent. were declared.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

THE close of the Tunisian campaign had been largely discounted in the markets, and although a slight impetus was given to the rate of advance in industrial equities, *The Financial News* ordinary index touching a new high at 99.7, the general experience was predominantly one of sagging prices. The *gilt edged* market was dull throughout, both irredeemable and dated stocks declining steadily in the absence of support, and the fall was accentuated in midweek. In the *foreign bond* market, South American loans were firm on reports of current economic conditions. Brazilian and Chilean bonds were outstanding, shortage of stock resulting in gains of a point and more. Absence of buyers, coupled with profit taking, occasioned a general reduction in home raid quotations. The prior charges fell away in sympathy with the Funds, while, among the equities, net losses on the week amount for GW and LMS ordinary to 1½ points, with a 2 point fall for Southern preferred. South American rail stocks rose sharply but failed to maintain their strength, although both debentures and equity issues were slightly higher on balance.

Particular interest in the *industrial* market centred on heavy industrial and motor shares. Ruston and Hornsby rose 2s. and Dorman Long 1s., while among motors, Rover was outstanding with a gain of 2s. In addition, Rolls Royce, Ford and Pressed Steel all advanced. Stores shares were quietly supported, Gussies and Woolworth both improving, but Marks and Spencer weakened on the annual results. Tobacco shares were dull and among breweries insignificant fluctuations were the general rule. Textile shares weakened in mid-week, but losses nowhere exceeded 9d. Dollar stocks spurred at the end of the previous week, and despite a general recession at the reopening, most issues were higher on balance. Brazilian Traction was firm throughout, rising 1½.

In contrast with recent weeks, interest in the *kaffir* market flagged. Movements either way seldom exceeded 1½, while *diamond* issues fluctuated narrowly. Use-

ful gains were scattered throughout the *tea* market, but in mid-week prices eased slightly as support declined. In a quiet oil market, Burmah Oil weakened slightly on the military reports, and Ultramar was irregular on news of the new issue. Other quotations were generally steady.

ACTIVE profit-taking on Wall Street offset the majority of gains occasioned by the encouraging reports from Tunisia. Utility stocks were outstandingly strong, but despite the fairly general rally, most issues failed to recover earlier losses, ranging up to 2 points. Movements in midweek were irregular.

COMMODITY AND INDUSTRY NEWS

Spinning Methods Research.—The surplus assets of the Spindles Board (set up under the Cotton Spinning Industry Act, 1936, and recently wound up), which amount to about £19,000, are to form a Trust Fund to be used for the purpose of experimental research in spinning methods and equipment, and their trial under mill conditions, with the object of improving cotton spinning processes. The first Trustees of the Fund are Sir Frank Platt, Sir Raymond Streat and Mr W. M. Wiggins. The experiments will be carried out under the management of a committee.

Export Licensing.—Under the Export of Goods (Control) (No. 5) Order (S.R. and O., 1943, No. 650), which comes into force on May 24, 1943, control is extended to cover gin; hoots and horns; wooden furniture; travelling and cycle bags; bacterio-

logical products and additional metal goods and chemicals. The Order also extends control to all types of agricultural and horticultural machinery; garment-pressing machinery; industrial steam-raising plant; leather measuring and processing machinery; and fluid injectors and ejectors.

Milk Prices.—The Ministry of Agriculture and Fisheries and the Ministry of Food announce that the prices to be paid to the Milk Marketing Board for milk sold in the year April 1, 1943, to March 31, 1944, will be such as will enable the Milk Marketing Board to pay to producers the same prices as those paid during the corresponding months in the year ended March 31, 1943.

Trading with the Enemy.—The Board of Trade have made the Trading with the

ISSUES TO SHAREHOLDERS ONLY

Ultramar Company.—Issue of 300,554 10s. shares at 42s. 6d. each in the proportion of 14 for each 100 held. Consent of the Treasury has been obtained. Morgan, Grenfell and Co., in association with a group of the principal shareholders, have agreed to guarantee the subscription of the issue for a commission of 9d. per share. The object of the issue is to provide the Venezuelan companies with funds for further development and maintenance of their concessions.

CONVERSIONS AND REPAYMENTS

Realisation and Debenture Corporation of Scotland.—The £200,000 outstanding 5 per cent mortgage debenture stock will be repaid at £105 per cent on November 11, 1943. For this purpose £200,000 ½ per cent debenture stock will be issued at 98 per cent. Holders of the 5 per cent stock registered at May 5th can convert into an equal amount of ½ per cent stock and receive on November 11, 1943, a cheque at the rate of £7 in respect of every £100 of stock converted.

Enemy (Specified Persons) (Amendment) (No. 6) Order (S.R. and O., 1943, No. 642), which came into force on May 10, containing 402 additions to the "Black List" of traders abroad with whom it is unlawful to have dealings of any kind. Persons owing moneys to, or holding or managing the property of, specified persons are under statutory obligation to report particulars to the Custodians of Enemy Property.

Soft Fruits.—The Minister of Food has made the Soft Fruits (Maximum Prices) Order, prescribing maximum prices which have operated from May 10th. The Order applies to strawberries, raspberries, gooseberries, black, red and white currants, cultivated blackberries, wild blackberries and bilberries. No restriction on the picking

(Continued on page 644)

GOVERNMENT RETURNS

For the week ended May 8, 1943, total ordinary revenue was £46,268,000, against ordinary expenditure of £101,157,000, and issues to sinking funds £515,000. Thus, including sinking fund allocations of £978,077, the deficit accrued since April 1st is £374,752,000 against £322,189,000 for the corresponding period a year ago.

alone for ever. From every corner of Europe there goes up the desperate cry of "Hurry! Hurry! For the love of civilisation, hurry!" Nor are all the arguments the negative ones against delay. For the first time, there are positive hopes for early and decisive action. For the first time, the glowing vision of early victory is beginning to come above the horizon. It cannot yet be seen very clearly; it may yet prove to be a mirage; but at least, and at last, the vision is there. There is a possibility of victory in Europe this year, if the United Nations are given skill and luck to add to their new found superiority in weight of metal. With such a glorious argument for haste, and with such certain penalties for delay, it would be a crime and a folly to turn aside now. While the defeat of Japan (as the Prime Minister has pointed out) would not mean the defeat of Germany, the defeat of Germany would infallibly mean the ruin of Japan. And if the greater prize is the nearer attainment, the choice should be clear, however hard its consequences. Whatever can be done against Japan should be and doubtless will be done. In estimating what they can do, each of the United Nations should re-examine its own contribution. Those who would gain most from a concentration of effort in Europe, but who are not yet doing their utmost against Japan, can properly be asked to reconsider their policies. But the main weight of the blow in 1943 must still be directed towards Berlin.

The German nightmare has always been of a war on two fronts. This year, the least that Hitler can count on is war on three fronts, and there may be four or five. The first front is in Russia. Whether it is the Russians or the Germans who open the attack, the next few weeks will show. Whether the tide of war will move east or west is as yet uncertain. But one thing is as clear to Hitler as the crack of doom—he will have to expend in Russia this year more scores of divisions, more thousands of tanks, more millions of men, not one of which he has to spare. Russia is, even on the most favourable of his calculations, a running sore far more exhausting to him than ever Spain was to Napoleon. And, if the calculations of history should not favour him, he has an excellent chance of losing the war outright on the steppes this year.

The second front is in the air over Germany. Hitherto, bombing from the air has not played a decisive part on either side since Warsaw and Rotterdam. Sober observers have doubted whether it could ever be raised to such a pitch as to become a major factor in the grand strategy of the war. It has not yet reached that point; an article on a later page suggests the conclusion that the German will to war is not yet breaking under the hail of bombs. But the scale of the raids, together with what can be learned of their effect, begins to justify the belief that bombing *could* be almost decisive. The heavy bomber force of the RAF is still a long way from its peak, and the weight of the blows it will be able to deliver will increase all through the summer. Apart from the mass raids, there is a growing effectiveness in the special stabs against transport, such as the Mosquitoes are daily delivering, and against key points in the German industrial structure, such as the brilliant exploit against the Möhne and Eder dams. The RAF Bomber Command will be a very formidable weapon indeed in six months' time. And behind the RAF there is the potentially even heavier weapon of the American Air Force. So far, American bombing has been a disappointment. The layman knows nothing of the technical arguments for day and night bombing; but he judges by results, and there cannot be any doubt that Hitler is not being wounded by the American bombers nearly as much as by those of the RAF. This will presumably change. Whatever technical reason has held the Americans back (for of their spirit and ability there can be no doubt) and confined their attentions to the outer rim of German Europe, the time has now come to slip the leash. With American bombs added to British, with every part of Germany receiving the Ruhr treatment, he would be a bold man who would continue to maintain that nothing can be decided by bombing.

The third front is in the Mediterranean; its base is on the Tunisian springboard. The whole world—the Axis world with particular anxiety—is asking Where Next? Very properly, they are being kept guessing. There is not a spot on the southern coastline of German Europe from Port Bou to Dedagach where the blow may not fall. Possibly there are still some clearing-up operations in the Central Mediterranean to be undertaken as the last preliminaries; but it is certain that an Allied invading force will be on the Continent of Europe this summer, and equally certain that it will be the most heavily armed, armoured and equipped force the world has ever seen. This great triangle of retribution is the bid for early victory. With massive blood-letting in Russia, with his industry and transport and his people's endurance strained to the limit, with bombs dropping by day and by night on these stretched nerves, and with an armoured sword thrust directed at his heart—can Hitler stand off all these enemies?

He has still another anxiety. His only significant European ally is failing him. The spotlight, these last few days, has been on Italy, and the most far-reaching rumours are coming out of that unhappy land. It is said that the King has abdicated, that the Duce leads no more, that the Germans are withdrawing their troops, that a plea for peace is only a matter of days. It may be so—or it may not. The Italian people have never had their heart in the war, and there can be little doubt that, if they think they see a way out of it, they will not be held back by love of their allies. But it is not Hitler's way to surrender a valuable position and if, *per mirabile*, it should turn out that he is allowing the Italians to make terms, the United Nations would be well advised to ask themselves where the catch is.

To get Italy out of the war—if this hypothesis can be further pursued without risk of wishful thinking—would be an enormous psychological victory and a very substantial real convenience. But there would be other consequences also. The limiting factor on an Allied offensive anywhere in the Mediterranean area is, and will remain, transport, and every move in that area, military and diplomatic, must be seen against the background of shipping. If the United Nations' strategy calls for an advance on Berlin by way of Rome and Milan, then naturally the military commander will have to take account of the needs of Italy and the Italian people; the administration of his back areas is always a heavy, but a necessary, burden on the general. But if—as geography would suggest—the blow is to be directed either east or west of the Alps, then the wisest course will be to accept the minimum of commitments in the Italian peninsula. There is a danger lest the very praiseworthy desire to have no more Darlan deals should lead the United Nations to refuse to accept even the unconditional surrender of any Italian Government emerging from the present regime and themselves to undertake responsibility for administering and supplying the country. This is a trap. Every administrator sent out is one less fighting man. Every ton of food or coal is one less ton of military supplies. If Italy is needed as a battleground, well and good; but if not, the Allied interest is to turn it as nearly as possible into a No Man's Land. To supervise the re-education of the Italian people will be one of the tasks of the peace settlement; but it is not in the Allied interest, while the war still rages, to lift from the shoulders of the Fascist regime the responsibility for a period which, whether Italy is in the war or not, cannot be other than one of humiliation, frustration and hunger. The precedent of the Allied deal with Darlan must not be followed; but the precedent of Hitler's deal with Pétain shows how a conqueror can best serve his own advantage in the interval before the war is over.

The object of the campaign is Berlin. The proof of Mussolini's abject failure is that he has made his country a pawn in the calculations of both sides. It would be a great mistake, before the war is over, to treat Italy as anything else.

Cheap Money for Ever?

IN his Budget speech, the Chancellor of the Exchequer nailed the flag of cheap money to the mast. "It is the Government's intention," he said, "to maintain its present policy of cheap money after the war for that purpose [reconstruction and development] as well as in the interests of the Exchequer itself." This is emphatic enough to leave very little room for doubt about official intentions. But the City appears to be less sure. For the past few weeks, and especially since the publication of the two international currency plans, with what was thought to be their emphasis on the future rôle of gold, there has been a distinct softness in gilt-edged prices. Doubts about the indefinite continuance of present interest rates are being canvassed, and though there is little questioning either of the willingness or of the powers of the authorities to maintain "cheap money," it is being asked whether this phrase necessarily means interest rates as low as at present.

To any discussion of the prospects of cheap money, three questions are fundamental. Is cheap money desirable? Is it possible? What will its wider consequences be? The first question—that of its desirability—is, in these days, little more than rhetorical. There is very widespread, even if not quite unanimous, agreement that the basic cause of unemployment is the under-investment of its savings by the community, and that cheap money is a very powerful stimulus to investment. Indeed, all that needs to be said here in answer to the first question is to add two footnotes to the statement that cheap money is certainly desirable. The first footnote is that the answer is given with reference to the conditions of twentieth-century Britain, whose major economic problem is to find investments for her savings, and that it may not be equally true of other countries with other problems. The second footnote is that not all of the consequences of cheap money are favourable. If low interest rates are to be perpetuated, both the saving habits of the people and the terms on which financial institutions (especially life assurance offices) can do business will have to be adjusted; to give only one example of the consequences, saving for old age will become more difficult just when it is becoming socially more necessary. These implications should not be forgotten; but they are not sufficient to upset the main conclusion. For present-day Britain there need be few qualms about the desirability of permanently cheap money. There is, of course, some room for dispute about the scope of the policy. To be fully effective, cheap money must percolate to the farthest corners of the economy. But if the rate of interest in the gilt-edged

market and the money market can be held down, three-quarters of the battle will have been won.

Can cheap money be attained? It was secured continuously for seven years before the war, a period when there was, it is true, heavy unemployment, but when the rate of economic progress was at least as fast as in any recorded period of the past. Any contention that cheap money cannot be secured and maintained has to run the gauntlet of establishing that the conditions of the future will be substantially more difficult than those of 1932-39.

It must, of course, be conceded at the outset that, though there may be periods when cheap money will happen by itself, there will be other periods when it will be attainable only with the assistance of financial and economic controls. These controls will need to be of two sorts, foreign and domestic. The chief external measure required will be an exchange control on exports of capital. Such a control, however, is conceded by both the American and the British currency plans, and Lord Keynes told the House of Lords this week that it could be made effective without such obnoxious devices as a postal censorship. Exchange control of capital movements will almost certainly be needed in any case as a protection to the currency, apart from its cheap-money aspects—though the precise nature of the control needed is not the same for the two purposes. A second external consideration is that, if cheap money is to be maintained, there cannot be any adhesion to an international currency system which would impose the necessity of an increase of interest rates in order to correct a disequilibrium in the balance of payments. This is the point that has been causing doubts in the gilt-edged market in recent weeks. But the fears seem to be based on a misapprehension. The American plan, it is true, is not very explicit on this matter; but the British plan mentions the various steps that a deficit country might be called upon to take, and the raising of interest rates is not among them. On the foreign side, then, the maintenance of cheap money would require only such controls—or such absence of commitments—as are already in existence or in general contemplation. It would not require anything in the nature of financial autarky or anything more severe than the exercise of a reasonable oversight on the financial relations between countries.

The need for controls on the domestic use of capital funds would, in most years not arise at all. In most years, almost by definition there is a shortage of investment projects, a tendency for savings to be in excess of the possibilities of using them, and these are not the conditions that are likely to lead to any difficulty in keeping interest

Don't just be careful—take EXTRA care

rates low. The price of money is like other prices in that it tends to rise only when the demand exceeds the supply. There will, however, be times—and if full employment is attained they will be more frequent—when there is a “shortage of money,” and it is these times that provide the crux of the whole argument. Not many people dispute that cheap money both can and should be maintained for, say, five years out of every eight. But there are some who argue that interest rates should be allowed to rise—and perhaps cannot be prevented from rising—in the remaining three years. If interest rates do not tend to rise until investment is tending to exceed savings, and if the same circumstances that cause the rise also cause full employment, is there any harm in permitting it to happen? And may it not be an effective instrument for preventing an excess of investment, with its inflationary effects?

This is an arguable contention, and to deal with it fully would require a lengthy digression into economic theory. It can be agreed that if, when the point of full employment is reached, an inflationary situation is to be prevented from developing, some restraint will have to be placed on the volume of investment, and if dear money does not fill that rôle something must be put in its place. The two great disadvantages of effecting the necessary control by dear money are, first, that it is a heavy-handed method which discourages necessary and beneficial investment equally with the unwelcome excess, and secondly, that every period of dear money leaves behind it a certain legacy of high-interest obligations which obstruct the ensuing period of renewed cheap money. On balance, it would seem desirable to secure the necessary control by the more direct methods of licensing capital issues and, if that is not enough direct licensing of capital expenditure, such as is exercised during the war. The adjustment

of the rate of taxation on company reserves would also be a powerful weapon for the same purpose. It should be freely admitted that the whole case for cheap money stands and falls by the question whether these controls would be effective and tolerable.

This leads directly to the third main question, that of the wider consequences of cheap money. If it leads to inflation, it will be disastrous. If it leads to the maintenance, in time of peace, of controls as extensive and irksome as those of wartime, it will be equally disastrous. Fortunately, there is no reason to anticipate either disaster. It has already been pointed out that there will be no need for any domestic controls in most years. If the object is to maintain an absolute rigidity of interest rates, then some form of control might be needed for about three years out of every eight. But there is no reason to seek complete rigidity. Some elasticity is entirely reasonable. A regime in which the yield on consols fluctuated between, say, 2½ and 3½ per cent, and the Treasury Bill rate between, say, 1 and 3 per cent, could still be accounted one of cheap money. If so, control in any irksome form would, on past precedent, be needed only for very short periods, such as six months at the peak of each cycle. This would not seem to be an excessive price to pay for the benefits of cheap money.

In summary, then, for an economy such as that of Britain promises to be in the next few decades, cheap money is both a desirable and a practicable programme. It will involve some management, some “purposive direction” of the financial markets. But the degree of control will be small, far smaller than may be necessary in some other directions. And the benefits to be expected, both in maintaining employment and in facilitating a steady and rapid growth in the capital equipment of the community, will be very great.

Behind the Lines

THE Nazi press has not taken the loss of Tunisia too tragically. What they say in substance is that last November and December, the German people faced a devastating crisis. The British and Americans had attacked in Africa, the Russians were advancing in the east. The question was whether this would become a gigantic pincer movement, from south and east. By superhuman efforts, the Germans hurled the Russians back across the Donetz and turned the Allied offensive in Africa into a long and costly delaying action which gave the Axis time to put its European citadel in order. Now, they claim, the fortress is impregnable. Its resources are totally mobilised, thousands more workers have entered the war factories, the million men claimed by the General Staff has been released to the army. Recruiting among the peoples of Europe is going on briskly. The six months' delay in Africa has made it possible to build “total” defences along the shores of Europe. If the Allies attempt an invasion—which, the papers point out, they must do if they are not to lose the war—they will be driven back with murderous loss. The Frederickian period of the offensive-defensive has opened. Secure in their fortress, the Axis defenders will watch their enemies bleed and the hostile coalitions disintegrate.

This is the picture painted by the German press. It is almost the exact opposite of the kind of Europe which press—and cinema—have succeeded in creating in the British mind. Occupied territory swarms with spies and terrorists. The German armies of occupation and their *quisling henchmen* walk in hourly terror of sudden death. The new call-up has disintegrated Germany's war economy. Thousands of workers are going slow, indulging in unofficial strikes, throwing spanners into engines and sugar into petrol. Eight million foreign workers in Germany are a vast Fifth Column in the heart of the state. The bombing raids have wrecked the morale of the German people. In the mountains of Savoy and of the Balkans, in the forests of Poland, guerrilla bands are

waging incessant warfare against the Axis rear. Italy is virtually out of the war. Hitler's fortress is a pack of cards. Let the Allies only fill their lungs for a final blast and they can blow the thing down.

Where lies the truth? Obviously somewhere between these two extremes—but the state of Europe is hard to gauge, for the observer is not dealing with a static situation. If on balance it seems that the German view is nearer to reality than the popular picture in Britain, this is true only of the time at which the evaluation is made. By the next day, it may have been falsified by the dynamics of an obviously revolutionary situation.

It must be conceded to the British picture that acts of individual terror have greatly increased. As if to celebrate the anniversary of Heydrich's assassination in the Protectorate, Polish patriots have now settled accounts with his counterpart in Polish occupied territory. Wilhelm Krüger took office a year ago. He was the chief of the Gestapo, the SS, and the SA in occupied Poland; and in this capacity he was directly subordinated to Himmler and exerted more influence even than the Governor-General, Frank, himself. Thus he was the man behind the indescribable horrors of the German terror in Poland—and particularly the mass slaughter of the Jews. The assassination of Krüger testifies to the efficiency of the Polish underground organisation, for the doers of the deed have not been caught; and the fact that the secret organisations announced in advance the names of the Nazi dignitaries who are under sentence of death is an interesting sign of their self-confidence.

At the other end of Europe, in Norway, an extensive hunt for saboteurs in the southern mountain district of Hardangervidda has just ended without any spoils for the hunters. In Holland, Seyss Inquart introduced martial law on May 1st. Among its provisions are the death sentence for strikes, lock-outs, hostile propaganda by written or spoken word. A curfew is in force. The police have orders to shoot at sight on any group of more than

five people collecting in a public place. In Bulgaria, a series of highly placed officials—General Lukov, Sotir Janev, President of the Foreign Affairs Committee of the Sobranje, Dimitrov, a Bulgarian officer attached to the *Luftwaffe*, and most recently, on May 2nd, Colonel Pantev, the former chief of police—have been murdered, all of them for their Axis sympathies. On May 3rd, Sofia was under a two-day state of siege, during which the police and the military garrison combed the silent city, arresting more than a thousand people on the suspicion of terrorism and sabotage. Attacks on the German army—usually with grenades—appear to be the most widespread form of terror in France.

Evidence of economic sabotage is fairly widespread. The Germans have been compelled to introduce a complete system of railway guards in France. Since, however, they have had to call on the French to supply the guards, it is hardly surprising that the sabotage continues. Derailments and collisions are most frequently reported. The Czech workers are another group of inveterate saboteurs. There is news of more executions for sabotage in the Protectorate than in any part of occupied Europe. The Danes have a peculiar penchant for fires. Nearly all the reported sabotage from Denmark takes the form of arson. Behind all the more sensational activities is the permanent, strictly unpatriotic but very effective sabotage of the peasants who refuse to sell their food to the towns in return for devalued currency.

This atmosphere of terror and sabotage is a heavy burden for lonely soldiers and harassed administrators. There have been a number of reported cases of suicide. Nervous breakdowns do not usually get into the headlines, but the strange case of M. Willems, the Rexist mayor of Liège, is worth recording. Shortly after the murder of the Rexist mayor of Charleroi, a horrified official discovered M. Willems sitting stark naked on his desk, pouring ink on his head and proclaiming that he was a geranium. M. Willems was accorded the security of a strait waistcoat. Considering the fate of his fellow mayor, this may have been his object.

Inside Germany the bombing raids are having their effect. The dislocation in Essen, Stettin, Dortmund and Duisburg after the attacks has been reflected in the instructions, appeals and orders issued to the citizens in the daily press—where to get emergency rations, where to go if completely homeless, apologies for unavoidable delays and breakdowns, mobilisation of all citizens for the work of clearing up, evacuation plans, evidence of a very serious housing shortage, appeals for more nurses, the execution of looters. With the bombing go the casualty lists; with them, the silent, oppressed behaviour of the men on leave from the eastern front where war is no longer *frisch und froehlich*.

If morale seems to be weakening in Germany, in Italy it seems almost non-existent. The trouble is Ansaldo's old enemy—apathy. Even now the Italians cannot be made to care. There are no reports of sabotage, no acts of terror. But this is not support for the regime so much as inability to take any action at all. The reorganisation of the Fascist Party under Scorza is a desperate attempt to whip some life into the tired horse, whose one instinct is to lie down. “Italians, learn to hate,” cries Gayda, backing his plea with atrocity tales against American pilots—the machine-gunning of women and babies at Grosseto, the dropping of explosive fountain-pens to maim little children. Even the prospect of invasion does not seem to mean much more to most Italians than a chance of getting out of the war.

All this is reported fact. If it were all, then the British picture of occupied Europe would not be too fanciful. It is not all. Against the sensational individual acts of terror must be set the millions who are working and living quietly and doing as they are told. All over Europe a great majority of the Nazi officials and *quislings* are going about their business unmolested. In spite of strikes here and there and occasionally, as in Holland, a genuine movement of resistance, the mobilisation of foreign workers has been successful. The Germans have

got the men. In particular, every occupied country has been stripped of its skilled technical workers. Even direct recruiting for the armed forces has had some success. To the old anti-Bolshevik legions, Hitler has added a new invention, a bunch of new SS brigades, for recruiting in special districts. These brigades have the status and prestige of the *Waffen SS*, and although some of them—SS *Croatia* for example—are being recruited for home defence, others—the SS *Prinz Eugen* in Danubia, the SS *Galicia* in Ukraine and Galicia (and possibly, since the Polish graves episode, in Poland)—will fight on the eastern front. It is very difficult to say whether Goebbels' use of the Bolshevik bogey has helped in the new recruiting drive, but it has probably had some effect in Poland and in the Baltic fringe, where the Germans have a new *quisling* in General Vlassos.

It is easy to exaggerate the effects of bombing. The chief industrial target has been the Ruhr. But the Ruhr contains less than one-fifth of Germany's industrial capacity and only about one-third of its coal and steel output. The key industries of the war effort are further to the east—the new steel works at Salzgitter, the greatest centre of tank production at Fallersleben, the chemical works at Leuna, Halle and Leipzig, the synthetic oil industry in the Sudetenland, the new industrial developments in Upper Silesia and Southern Poland. It can be argued, too, that concentrated bombing has not the effectiveness it could have, if it were coupled with dispersed bombing, both of places and in time. The weakest link in the German system is not this or that factory or even this or that industrial area, for there is doubling and overlapping everywhere. The weakest points are the administrative machine and the transport which hold the bloated system together. If the RAF could be over key administrative cities for long hours every night, robbing harassed civil servants of their sleep, and if the attacks on railways, bridges, canals and dams could be extended right across the continent, and carried out with the same skill and daring as the sensational RAF raids on the Möhne and Eder dams, then the bombing would rapidly increase the brittleness of the system. Ideally, concentrated and dispersed bombing should go together. Meanwhile, the effects of the short smashing raid can be over-estimated in terms both of material damage and of morale.

Neither the fighting spirit nor the fighting power of the Germans is breaking yet. In some ways, the first felt chance of defeat has stiffened them. There was more apathy when the victories seemed to win themselves. The defences of Europe have really been made formidable during these winter months, when thousands of workers in the Todt Organisation have slaved along the Atlantic and Mediterranean coasts of France building up defences in depth equipped with the heaviest artillery. The Germans claim that Dieppe and St. Nazaire gave them invaluable experience of what was needed. For the last months, the civilian population has been steadily evacuated from the coastal regions of Normandy and Brittany. Bayonne and Bordeaux are also affected. Part of Marseilles has been cleared. Recently the first general evacuation order was issued for the Riviera.

The fortress of Europe is very strong, stronger than many of Hitler's enemies suppose. It cannot be breached except at tremendous cost. There will be no disintegration from within until the blows from without are far more devastating and sustained. Yet the foundations are set on shifting ground. Let Hitler lose another million men in the fighting and this time no mobilisation, however much more “total,” will make good the gap. Let the combined forces of the RAF and the USAAF launch a non-stop, widespread air offensive, and the nerves and will-power of the German people as well as the sinews of the German war effort will give under the strain. Let the Allied invasion strike strongly and swiftly enough to establish effective bridgeheads, and the “individual terror” of recent months will spring to general guerrilla fighting and then to formal war. At every point, vigorous Allied action can be the catalyst of a wholly new situation behind Hitler's lines. But there will be no change without it.

Personal Incomes

PREVIOUS articles in this series have dealt with national income in the aggregate and with the distribution of total national expenditure between consumption, Government activities and provision for capital—that is, they have dealt with the general shape of the national economy as a whole, and with the way in which it has been moulded by war. The White Paper also, however, contains information on the distribution of the total national income among the individuals who compose the community. It is possible to give the distribution of the national income in two separate ways—first, according to the *nature* of individual incomes (*e.g.*, whether they are derived from profits or from wages) and, secondly, according to their *size*.

The first table shows the division between the different kinds of income, both in money terms and in percentages of the total net national income. These figures include income going to companies and other impersonal bodies:

	1938		1942	
	£ mn.	%	£ mn.	%
Rent of land and buildings	381	8½	384	5¼
Profits and interest	1,241	27½	2,183	29½
Salaries (including pay and allowances, in cash and kind, of officers)	1,081	24	1,408	19
Wages (including do. of other ranks)	1,787	40½	3,409	46½
Net national income at factor cost	4,490	100	7,384	100

Wages and the composite item of profits and interest (which, unfortunately, cannot be divided) have increased their share of the total at the expense of rent and salaries. What is of greater interest than this subdivision, however, is the *incomes accruing to persons*. To arrive at this, rent, profits and interest going to corporate bodies must be taken out of the above figures and the so-called “transfer incomes”—that is, incomes such as old age pensions or social insurance benefits, which are not paid out in return for any current contribution to the national output and are therefore not included in the net national income—must be added. This is done in the next table, where the 1942 figures are shown both in 1942 pounds and also in terms of 1938 pounds (*i.e.*, adjusted for the rise in the market price of consumers goods between 1938 and 1942).

PERSONAL INCOMES (£ million)			
	1938	1942	1942 in 1938 pounds
Property income (rent, profits and interest) accruing to persons	1,515	1,811	1,249
Salaries, etc.	1,081	1,408	971
Wages, etc.	1,787	3,409	2,351
Transfer payments	278	268	185
Total	4,661	6,896	4,756

The difference between the first and last columns must not, of course, be interpreted as representing the actual change in the consumption of the different classes. For one thing, direct taxation has to come out of these incomes before they can be spent at all; furthermore, the consumption goods do not exist in sufficient measure. But it does represent changes in what may be called the value-in-terms-of-consumption-goods of the different types of gross incomes. Measured in this way, wages alone have increased by 31.6 per cent. Salaries have fallen by 10.2 per cent, property incomes by 17.6 per cent, and transfer incomes by 33.4 per cent. The last-named fall is entirely due to the virtual cessation of unemployment, but the other three changes, taken together, denote a real change, produced by the war, in the social structure.

The way in which personal incomes are expended is shown, by percentages, below:

	1938	1942
	%	%
Consumption (at factor cost)	77.7	58.3
Taxation (including accruals)	17.4	28.8
Savings	4.9	12.9
	100.0	100.0

Finally, it is possible from the White Paper to give figures for the different sizes of incomes. Unfortunately, these figures are available only for a twelve-month comparison between the financial years 1940-41 and 1941-42. The following table shows, for each income-group in each year, (a) the total number of incomes in that group, (b) the average gross income (*i.e.*, before tax), (c) the average net income (*i.e.*, after income tax and surtax) and (d) the value of the average net income in 1938 pounds*. Since this last column includes the effect of indirect taxation as well as of direct, it is a close measure of the real value-in-consumption of the average income.

Size of gross income	No. of incomes in group	Average gross income	Average net income after tax	Average net income in 1938 pounds
£		£	£	£
250-500	1940-41 3,295 1941-42 4,450	325 335	298 286	241 208
500-1,000	1940-41 770 1941-42 1,050	670 652	535 471	432 343
1,000-2,000	1940-41 250 1941-42 285	1,380 1,400	980 860	791 626
2,000-10,000	1940-41 97 1941-42 97	3,710 3,710	2,030 1,760	1,640 1,280
Over 10,000	1940-41 8 1941-42 8	21,250 21,250	6,000 4,375	4,850 3,180

Unfortunately, it is not possible to give similar figures for the “under £250” group, since it is not known how many incomes are in this group. But, since the total number of incomes enumerated above increased from 4,420,000 to 5,890,000 in a year, it is almost certain that the number of incomes below £250 diminished. But the total amount of income falling to this group actually increased slightly after tax. It is, therefore, highly probable that the average real income in this lowest group was higher even after full allowance for increased taxation and higher prices.

Moreover, the figures of the £250-£500 group are very remarkable. Well over a million persons, on balance, entered this group in the year, most of them presumably from below. Nevertheless, the average gross income rose by £10 and the average net income in 1938 pounds fell by only £33. Furthermore, 280,000 persons crossed the £500 line. These are astonishingly large changes for a single twelvemonth. The impression they leave is that there can have been very few people who started the period with incomes of less than £500 who did not, over the year, increase their real incomes even after the increases of taxation and the rise in prices. In short, the wage-earners were, in the fullest sense, better off in 1941-42 than in 1940-41—except that they could not in fact spend all of their increased incomes. By contrast, the position of the four upper groups was very different. The reduction in a single year in the real value of the average income was 20.6 per cent between £500 and £1,000 (doubtless affected by an inflow at the lower end), 20.8 per

* The rise in market prices of consumption goods above 1938 was 20 per cent in the calendar year 1940, 35 per cent in 1941 and 45 per cent in 1942. For the financial years 1940-41 and 1941-42 ratios of 24 per cent and 37½ per cent respectively have been taken.

cent between £1,000 and £2,000, 22.0 per cent between £2,000 and £10,000, and 34.8 per cent over £10,000. Moreover, these reductions followed on very heavy cuts in the earlier years of the war. Thus the average very rich man with a gross income of over £10,000 enjoyed a net income of about £10,500 in 1938. By 1940-41, rises in taxation and prices had reduced this, valued in 1938 prices, to £4,850, and in 1941-42 there was a further fall to £3,180—that is, to less than a third of the 1938 figure.

These figures confirm what observation has long suggested—namely, that the wage-earners of the country

have not merely increased their share of the national income, but also the absolute real value of their incomes during the war, while virtually all those with incomes over £500 have lost, some of them very heavily. Something of the same sort happened in the last war, and its effects were, in greater or less degree, permanent. It is very likely that the same course of events will take place on this occasion, and that the wage-earner after the war will be both absolutely and relatively better off than before. If so, the two wars will between them have effected a social revolution of major dimensions.

NOTES OF THE WEEK

Peace Terms

A document on the principles of a peace settlement with Germany has been issued by a “Post-War Policy Group” of Conservative Members of both Houses of Parliament under the chairmanship of Sir John Wardlaw-Milne. The suggested terms (which are too long for adequate summary) include the complete and indefinite occupation of Germany; its complete disarmament; the dismantling of the German aviation industry and the closing down of the heavy and chemical industries “to the extent to which they are the basis for the production of munitions”; the punishment of war criminals; the separation of East Prussia and the Rhineland; the transfer of populations; supervision of German radio, printing and education; restitution of looted property; payment of compensation for damage done; payment of occupation costs; and prohibition of loans to Germany. These are severe terms; if carried out in their entirety they would make a peace far harder than Versailles and impose on the victorious nations a burden of supervision and vigilance that would be both severe and long continued. It may be that this will be the right course to follow; on that point minds in this country are not made up. But it is well to be quite clear that this course, if it is followed, will dismiss to the Greek Kalends any possibility of a genuine reconciliation with the German people, now or in the future; that it will impose on the victors, and especially the British people, a very large military establishment and very heavy taxation, and a correspondingly heavy burden of political and economic controls at home. All these, no doubt, the British public, in its present mood, would be ready to undertake if it were convinced of their rightness and necessity. But an even more essential requirement is that the British public, once it enters on this course, should be ready to hold to it without wavering for at least two generations, without any fits of indifference or remorse or blindness or sloth. To impose terms that will outrage every German, and then after five years to let Germany go its own way, is the one sure way to disaster.

This makes it necessary to examine very closely the credentials of the men who put this policy forward. They belong to the Tory party and to its conservative wing. Not a few of them vociferously supported the policy of appeasement, and denounced as warmongers those who warned of what was to come. It would be difficult to find among them any who made themselves notable for advocating leniency to Germany when it was still a democratic country, or who incurred Mr Chamberlain's displeasure by echoing Mr Churchill's voice when it still cried in the wilderness. It was notorious after the last war that the “hard-faced business men” who urged a peace of retribution on Mr Lloyd George were the first to yield to Nazi propaganda and ask pity for the poor German. The prophecy may be ventured that persons with the general preconceptions of the present signatories will, after this war, be the first to call for a cutting of commitments and a reduction of controls—the commitments and the controls without which their present policy could not be carried out. It may be that the British people will bring themselves to assume and to persist in heavy burdens and responsibilities for the maintenance of peace in Europe. But there is every

sign that they would prefer not to be pushed into such a policy by the appeasers. *Non tali auxilio nec defensoribus istis.*

Instrument of Policy

“I have endeavoured to pursue a policy which has paid regard to the general economic position rather than to purely revenue considerations.” This claim by Sir Kingsley Wood in the debate on the second reading of the Finance Bill on Tuesday is a fair description of the system of war economy by which a combination of taxation, savings, rationing and the physical restriction of supplies has been pressed into service for the mobilisation of national resources for war purposes with the minimum of hardship to civilians. The most important speeches in the debate were devoted to a demand that the same broad conception of financial policy should be applied to post-war tasks. Sir George Schuster epitomised this demand when he said that Sir Kingsley Wood had the chance of being

the first Chancellor who had the courage to face the problem of how the complex mechanism of direct taxation could be adapted so as to provide, not only a means for the fair distribution of the national income, but also a guide and incentive for progressive development of British industry.

The plea of Sir George Schuster and Mr Benson—significantly enough a Labour Member—was that existing methods of assessing and taxing industrial profits should be amended in order to stimulate the research, development, re-equipment and replacement in British industry that is essential if the economic position and the standard of life of this country are to be maintained and improved in the post-war period. The Chancellor pointed out that the post-war credit of 20 per cent of the Excess Profits Tax which is intended to be used for the modernising of business after the war is already accumulating at the rate of £40 million a year (though he did not add, as he might have done, that the firms to which it is accruing are very haphazardly selected); and that the Board of Inland Revenue is conducting a detailed investigation into the treatment for tax purposes of profits which are not distributed but used for development and extension. Both Sir George Schuster and Mr Benson claimed, rightly, that the need to use taxation as an instrument of progressive industrial policy will be paramount after the war, when rates of taxation will remain high and “the need will be greater than ever before for British industry to be progressive, adventurous, inventive and flexible.” The caveat entered by Mr Benson is important.

It is not merely enough to protect industry from a high rate of taxation. . . . If undistributed profits are to receive differentiation in their favour, it must be because they are used in the national interest. . . . Unless an increase in depreciation allowances leads to more rapid replacement of obsolete plant, it will merely be a gift to industry without any corresponding advantage to the community.

Sir Kingsley Wood seemed more concerned with the level of post-war taxation than with its effects.

One of our post-war aims must certainly be to keep the total burden of taxation as low and reasonable as is consistent with proper provision for all those national services and projects which have a just claim upon the Exchequer. He scouted the idea that, because taxation is “merely a means of redistributing the national income,” its burden is

therefore made "more congenial" to the individual taxpayer. The advocates of a positive taxation policy, on the other hand, were willing to accept the fact that the standard rate of income-tax will probably not fall below 7s. 6d. in the measurable future. Their concern was rather to see taxation assessed and collected in such a way as to put a premium on enterprise and initiative. Mr Benson proposed that profits genuinely ploughed back into industrial development should be given a differential advantage of as much as two-thirds of the rate of taxation, and that depreciation allowances should be contrived to induce industrial undertakings to scrap old plant as soon as possible. These proposals, which are of course familiar, touch the heart of taxation's role in the peace effort, which can be as effective and comprehensive as in the war effort itself. There are other devices which might be adopted for freeing enterprise while taxing incomes to the top of the nation's need; for instance, the procedure under EPT by which losses are balanced against profits over a period might conceivably be capable of extension to other branches of direct taxation in the cause of encouraging risk-taking. The case for fostering the re-equipment of British industry with all possible speed is unchallengeable, and the time to work out ways and means is before peace breaks out.

Panacea

The second half of last Tuesday's debate in the Commons on the Finance Bill was devoted to a demand, supported by the names of 70 Members, that the Chancellor should tax land values. The demand is not new. The belief that the taxation of land, "which increases in value without any effort on the part of the owner," is capable of providing a solution for all fiscal and social problems, is associated with the name of Henry George. At least one Chancellor, another George, has striven for the prize. But, as Mr Lloyd George found a generation ago, the assessment of any such tax is much more difficult, and its yield is very much smaller, than the "single tax" programme of Henry George. It is fantastic for Mr Stokes, the leader of today's land taxers in the Commons, to suggest that the taxation of land values would bring in an *additional* £500 million every year in revenue. The fact that landowners already pay taxes—direct, indirect and death duties—is apparently overlooked; they have no hoard set aside; all the taxes they pay, whatever their name, must come out of the same pocket. In no degree, of course, should landed income or landed wealth be exempt from the full rigours of taxation, and "unearned increment" should indeed be pounced upon, wherever it arises. But the fact is that the contribution to be made by land taxes has consistently been, and still is, vastly exaggerated. The real aim is to see that no citizen, whatever the source of his income, should be free from the obligation to pay taxes to the hilt according to his ability; to ensure by every device that additional land values do not, in the first instance, accrue to individuals at all from the operations of the community; and to make certain, as the Uihwatt recommendations propose, that the claim of landowners to these increments does not obstruct the planned use of the nation's land in the nation's interest.

Keynes on Bancor

As the other peers who took part were quick to acknowledge, the chief interest of the debate in the House of Lords on the currency plans lay in Lord Keynes's maiden speech. And the chief interest of that speech lay in the points that Lord Keynes selected for emphasis. Some of these were familiar, though all the better for their repetition with authority: the way in which the British scheme would effectively prevent international hoarding; the absence of any intention to re-create any undesirable exchange rigidity; the practical possibility of effecting a synthesis between the British and American plans. Two of Lord Keynes's points, however, related to features of the plan that have been less widely understood. The first of these is that the "principal object" of the British plan is "to provide that money earned by selling goods to one country can be spent on purchasing the products of any other country. In jargon, a system of multilateral clearing. In English, a universal currency valid for trade transactions in all the world." The Schachtian connotations of "clearing" are so familiar that the very opposite intentions of the British plan are worth emphasising. Secondly, Lord

Keynes made it clear that the object of the British proposals is not "to make the United States the milch cow of the world in general and of this country in particular." "The plan," he said, "does not require the United States, or any other country, to put up a single dollar which they themselves choose or prefer to employ in any other way whatever." Both Houses of Parliament have now debated the plan; and both debates have advanced the prospects of eventual agreement.

Unitas and Gold

One passage in the Chancellor of the Exchequer's speech during the Commons debate on the American and British currency plans deserves a wider commentary than it has yet received. Referring to the American plan, Sir Kingsley Wood said:

There is another difference—and this may prove to be a radical one—that the international unit of account, which is called *unitas*, is not an independent world currency, but a unit of gold value; therefore, it is convertible into gold both ways. This means that gold may purchase *unitas*, and that any holder of *unitas* may require gold in place of it at the rate established by the fund.

The Chancellor might well have been at more pains to avoid the obvious misconception to which his words gave rise. The text of the American plan devotes considerable space to describing the composition and working of the proposed Stabilisation Fund. It is to be created by contributions from the member nations of gold, currencies and Government securities. From this Fund member nations are to have the right of acquiring foreign currencies (not gold) when needed to settle their deficit balances. Thus, though the Fund is to be held partly in gold, it is not true that any member may "require gold" from it. Not unnaturally, many people took the Chancellor's reference to *unitas* to be a reference to the Fund, and were puzzled to reconcile his statement with those of the American plan itself. But further research, assisted by enquiry from those in a position to know, reveals that the Fund is one thing, and that *unitas* is another. All the above provisions, and much else besides, are contained in the first three chapters of the American plan. *Unitas* does not make its appearance until chapter IV. Section 1 of that chapter declares that "the accounts of the fund shall be kept and published in terms of *unitas*." But Section 3 provides that "deposits in terms of *unitas* may be accepted by the Fund . . . upon the delivery of gold to the Fund, and shall be transferable and redeemable in gold or in the currency of any member country at the rate established by the Fund. The Fund shall maintain a 100 per cent reserve in gold *against all unitas deposits*." It would thus appear that *unitas* is two things: first, it is a unit of account for a fund which consists of gold, currencies and securities. But, secondly, the words placed in italics in the above extract show that it is also intended to be a sort of international currency, freely convertible into or out of gold, and backed by a 100 per cent gold reserve. The Chancellor's remark referred to, and is true only of, this second meaning. The Fund proposed in the American plan would therefore have a double function. In serving its main purpose of providing means by which countries can meet their deficits—in its "current account" business, so to speak—it operates, in the main, in local currencies, not in *unitas*, which serves only as a unit of account. In its additional functions—its "deposit account" business—*unitas* is an international currency so closely linked with gold as to be almost identical with it.

The Distribution of Food

There was a certain air of complacency about Mr Mabane when he presented the estimates of the Ministry of Food. It can be forgiven him, for by and large the public is pleased with Lord Woolton and his Department. There may be complaints in detail: the supply of meals off the ration in restaurants is one. But to those who can remember the last war, when there were sharp differences in the supplies available between one part of the country and another, when quality was poor and prices were high, the overall standard of the people's diet to-day, near the end of the fourth year of war, is remarkable; and it is worth noting that for this the public thanks, not the Ministry of Agriculture and the farmers, but the Ministry of Food. Even in the case of fish, it was quick to see where the blame for the initial failure of the zoning scheme lay.

Ninety-five per cent of the complaints received by the Ministry, said Mr Mabane, were directed at the trade. The cost of providing a steady flow of necessities at stable prices has been high. The amount spent on subsidies alone, according to Mr Mabane, was £145 million in the year to March 31, 1942. Bread, flour and oatmeal cost £35 million; meat, £23 million; potatoes, £23 million; milk, £11 million; eggs, £13 million; sugar, £16 million; national milk and milk in schools schemes, £17 million; and tea, milk products, bacon and other small items, £12 million. In addition, there is the unknown cost of the Ministry itself, with its huge staff. In wartime, the prevailing scarcities make the public overlook the cost of the machine in its anxiety to secure the food, just as it prefers the paraphernalia of rationing, with registration and restriction, to buying where and what it pleases. But if the Ministry of Food continues after the war—as it is hoped it will, for its peacetime functions could be just as important as its wartime ones—it will not be able to rely on so smooth a passage as it is having at present. The time will come when the public will be able and anxious to call the tune.

Milk

Since there was little to discuss on the major aspects of the distribution policy of the Ministry of Food, most speakers in the debate concentrated on matters of detail—in particular, on the question of milk. There were complaints of the new distribution scheme, that it was squeezing out the small retailer, and that it led to the bulking of tuberculin tested milk with ordinary milk. The Ministry was also asked to introduce the compulsory pasteurisation of milk without delay. But no speaker commented on the significance of Mr Mabane's statement that, if the consumption of milk were "on the same level as before the war, there would be no need to limit the entitlements of anyone throughout the year." Thus the restriction of the ordinary consumer to two pints of milk throughout the winter months is not due to any fall in production. This means that if the wartime increase in consumption by the priority classes is to be maintained after the war, as it should be in the interests of the nation's health, there will have to be a considerable rise in production to allow the non-priority consumer as much milk as he wants, and ought to have, throughout the year, especially if the manufacture of milk is to be restored to its normal level. Is the post-war plan for British farming taking into account this need for a big rise in milk production? And is it aiming to secure it merely by higher prices to farmers? The average price paid to producers, according to a recent parliamentary answer, was 29.91d. per gallon in February this year, compared with 14.87d. in February, 1939. The average retail price has only risen from 27.50d. to 35.63d. in the same period, but at the cost of £11 million a year in subsidies. Moreover, the retail price has long been recognised as far too high for a foodstuff so important as milk, and to bring it down to the level at which it is sold to expectant mothers and children under the national milk scheme would cost many millions more if the present prices paid to farmers and the existing structure of distribution are to be maintained. It is highly important that all milk should be clean and free from infection. But, above all, it should be plentiful and cheap.

The Russian Front

The campaigning season in Russia started some time ago; yet on the fronts the lull continues. A comparison between May, 1942, and May, 1943, shows curious differences. About this time last year, Marshal Timoshenko launched his offensive on Kharkov; and the slogan then was "Victory in 1942." This time the Russians are extremely non-committal. But behind this non-committal attitude there is much more real and solid confidence than there was last year. This is reflected in the quiet but systematic way in which the Russian Air Force has been carrying out large-scale bombing behind the enemy lines, a feature that was completely absent in the preparatory stage of last summer's campaign. Raids have been made on both the close and more distant communications and bases of the enemy; their range has extended from Briansk and Orel to Kiev and Gomel, and to Königsberg and Warsaw. There is still no indication of the intentions of the Soviet High Command—bombing may serve offensive as well as de-

fensive purposes. The reported concentration of troops by both sides, by the Germans in the Bielgorod region and by the Russians around Leningrad and to the south of Moscow, gives no definite clue. Both sides have to replace losses. The Germans have in addition to fill the gap created by the withdrawal of about 10 Italian divisions and the melting away of the Hungarian and Roumanian forces. The "legions" of anti-Bolshevik volunteers from the Baltic countries cannot possibly make good these losses. The hard fighting on the Donetz and on the Kuban has been inconclusive. It seems that the Russians have not yet thrown their main infantry forces into the fighting for the Kuban bridgehead. The maintenance of this bridgehead is a costly undertaking for the Germans; and it may be that for the time being the Russians prefer to exact the full price from them rather than to destroy the bridgehead by an all-out attack.

Plain Speaking at Last

The meeting between General Giraud and General de Gaulle in North Africa has not taken place. The delay is still due superficially to disagreement about the place of meeting. General de Gaulle wishes it to be at Algiers in full publicity, General Giraud suggests a preliminary private meeting at Biskra or Marrakesh. This apparently trivial disagreement in reality goes to the root of the matter dividing the two generals. General Giraud objects to Algiers and General de Gaulle wants Algiers for the same reason—the likelihood of strong de Gaulle manifestations which would enormously strengthen General de Gaulle's position in negotiating a settlement. There is now no doubt about General de Gaulle's own solution for the divided resistance movement. It has been given by the new Council of Resistance set up in France by a Monsieur X, one of General de Gaulle's Commissioners who was sent over to France recently to give the various resistance movements a single mouthpiece. This Council, claiming to speak for the French nation, has issued the following demands: that the meeting between the two Generals must take place at Algiers "*au grand jour*," that

(1) political questions must not be excluded from the conversations; (2) that the people of France will never admit the subordination of General de Gaulle to General Giraud and demands the immediate installation of a provisional government under the presidency of General de Gaulle, General Giraud becoming military chief; (3) General de Gaulle will remain for everybody the only head of the resistance movement, whatever the outcome of the negotiations.

This statement clears the air. Although General de Gaulle has stated subsequently that he will not press for these conditions, there can be little doubt that this—the absorption of General Giraud's administration into the de Gaulle movement under General de Gaulle's political control—represents General de Gaulle's own point of view. Can General Giraud agree to this? Ought he to do so? Obviously not. It is of course true that de Gaulle is synonymous with resistance in France and to a very large extent in North Africa. General de Gaulle has mass support (this fact is discussed at greater length in an article on page 658). Next, it is true that an administration which includes—as does General Giraud's—Peyrouton, Juin and Buisson, cannot claim popular support or esteem. They were all collaborationists. What is inadmissible is the confusion made in Carlton Gardens between Gaullisme as a *mystique* of resistance and Gaullisme as personal power for General de Gaulle. Those—among them many Frenchmen—who talk of "depersonalising" the French Government are not doubting the hold General de Gaulle has on the French masses, but are concerned over the political use to which he may be tempted to put that hold. The immense importance of achieving agreement between the two Generals is not that one may supersede the other, but that both may take their honoured places within a provisional civilian authority which transcends them both.

The British Asylum

Little was expected of the official statement on the results of the Bermuda Conference, and little indeed was forthcoming. What practicable steps to help refugees to escape were decided upon are, for security reasons, to remain secret, and all that is known is the decision to extend the categories of persons in neutral countries to whom visas may be granted to those with children under 16 already here, to parents of members of the Allied

forces, and to persons wishing to join His Majesty's forces. This seems meagre enough. It certainly does little justice to the British people's compassion towards the persecuted and eagerness to help them. In fact, however, more has already been done officially than might be gathered from the results of the Bermuda Conference—far more than certain Zionists, with their insistence on the open door in Palestine, allow for. In a written parliamentary answer on April 7th, Mr Churchill gave details of the numbers who have been given asylum in the British colonies. Jamaica has 558 refugees and 1,500 evacuees from Gibraltar. Cyprus has 4,650 refugees from Greece. In East Africa, the additional population, including Italian prisoners, is 90,964, nearly three times the normal white population; in addition, 21,000 more Polish refugees are in process of being transferred from Persia. Palestine received 38,000 Jewish immigrants between April, 1939, and September 30, 1942—20,000 more than the number of legal immigrants in the same period. Since then, 858 Polish-Jewish children, accompanied by 369 adults, have reached Palestine; 3,300 Jewish immigrants, including 1,000 orphan children and 200 adults from Vichy France, will be admitted under the immigration quota for the last three months of last year; 500 Jewish children will be admitted from Roumania and Hungary, and 4,000 Jewish children and 500 adults from Bulgaria; altogether in the five-year period ending next March, Jewish children, with a proportion of accompanying adults, will be admitted up to a total of 29,000, provided transport is available. In addition, Palestine has provided a temporary refuge during the war for 4,000 people from Central Europe and Greece. India has received 1,000 Polish children and will receive 5,000 more with 5,000 Polish adults; it has also received large numbers of evacuees from the Balkans, Malta and other areas. In Britain itself, the total of refugees who were here at the beginning of the war or who have come since is 150,000, excluding those who have come as members of the Allied forces. Against the millions dying in Europe, England's exertions have not saved many lives, but she has set the example.

Restraint of Strikes

It is time for plain speaking about the sporadic strikes that have recently afflicted the transport and aircraft industries. This war has been outstanding for the political solidarity and industrial peace attained. By contrast with the last war, and with other democratic countries at war, the hours lost by strikes have been remarkably few. But these comparisons afford no excuse for the strikes that have happened and are now growing in number. The trade unions are pledged by law and agreement not to strike without due notice and formal procedure of arbitration. No strike indeed has been authorised in any industry. But "unofficial" strikes have become a habit, still very small in extent, but on the increase. The locomotive men at an outlying London depot recently chose to strike every Sunday. There has been a rash of local strikes in aircraft factories. Most recently, omnibus workers in the North, the Midlands and the Thames Valley stopped work for a time. In part these outbreaks are an index of restlessness after four years of war. Conditions of work and living are not easy. There may be grievances which should be redressed. But there should be no strikes—now less than ever before when the chance of victory is in sight if the right effort is made. Several of these strikes have, in effect, been protests against arbitral awards. Aircraft workers in Coventry have been fined £25 each for striking illegally, and the precedent should be followed elsewhere. The law's penalties are plainly stated and known. But it would not be necessary to invoke them if the authority of the unions themselves were as great as it is claimed to be. One conspicuous reason for the industrial peace that has prevailed so far has been the self-discipline of the unions and the autonomy allowed to them. Only if that discipline can be asserted in detail against irresponsible strikers can that autonomy be retained without the intervention of the courts in the national interests.

The Registration of Youth

There was perhaps a tendency, when it was first announced, to hail the registration of the 16-18-year-olds as a great social reform. The trouble is that people in this country are becoming somewhat too youth-conscious—with the result that they may turn the natural self-consciousness of the adolescent into a wholly unnatural consciousness of

his own and his contemporaries' importance. The publication of a White Paper (Cmd. 6446) on the results of youth registration should help to put the matter in a better perspective. The object of the registration was not the mass redemption of youth, but, in its own words—

to enable local education authorities to make contact with all young people of the ages concerned and to encourage them to find the best way of fitting themselves to do their duty as citizens and of assisting the present national effort.

Forty-two per cent of the 1,442,361 boys and girls between the ages of 16 and 18 who registered were already members of youth organisations or at school, and, since the interviews, it is estimated that from 60-70 per cent of all boys, and about 40 per cent of all girls in this age group, are either at school or associated with some form of leisure-time training and discipline. But the White Paper emphasises that—

it is neither possible nor necessarily desirable that all young people should belong to leisure-time organisations. . . . Many of those interviewed . . . were clearly using their leisure to advantage in a variety of individual hobbies and interests.

Others, it also points out, were already fully occupied. Here, in fact, is the real problem of youth. It is its working time, not its leisure time, that is badly organised, and Part II of the White Paper describes the steps which the Government intends to take to improve the working conditions of young people. These, it must be confessed, are not very encouraging. The restriction of working hours of the 16 and 17-year-olds to 48 a week—with exceptions—and of the 14-15-year-olds to 44 a week; the avoidance of a long journey to work; and the extension of facilities for meals in canteens—all these, though badly needed reforms, are very inadequate. It is true that the Board of Education could hardly be expected to scoop its own forthcoming Bill, but the fact remains that what youth really wants, as the White Paper itself states in summarising the reports of the local education authorities on the registration, is more and better education. The raising of the school-leaving age, and afterwards compulsory attendance at up-to-date day continuation schools for half the working week until the age of 18—it is by means such as these that the work and leisure of youth can best be improved. Youth clubs and the like, desirable though they may be, are merely relief measures. They bear the same relation to schooling as unemployment assistance bears to full employment. The best slogan for youth helpers is Full Education.

Aircraft Labour Controller

The appointment of Sir Charles Bruce-Gardner as Controller of Labour Allocation and Supply at the Ministry of Aircraft Production is not perhaps the choice one would expect Sir Stafford Cripps to make. Sir Charles' personal qualifications are not in question, nor is it disputed that his knowledge of the aircraft industry and his position as chairman of the Ministry's Production Efficiency Committee (which he will continue to occupy) will be of value in securing the most efficient allocation of labour resources to meet production requirements. But the appointment of the Chairman of the Society of British Aircraft Constructors, albeit he relinquishes that post, may be construed in some quarters as a further link in the chain connecting the Ministry with the aircraft "ring"; and for some time a section of opinion has been concerned at the extent of the influence of the "ring." Lord Sempill, in a House of Lords debate on March 25th, spoke about the Society of British Aircraft Constructors

which, while purporting to represent the aircraft industry as a whole, in fact represents the charmed circle of the elect, or what are known as the approved firms. . . . The policy of the Air Ministry, now followed by the Ministry of Aircraft Production . . . has been to give preference from the standpoint of design and manufacture to these approved firms and by so doing to maintain a ring of approved firms.

Nor is identification with the employers' side necessarily the best qualification for a Labour Controller. Sir Charles is very much the representative of industry—he is chairman of the engineering firm of Armstrong Whitworths and of the New Jarrow Steel Company; he has been connected with many branches of heavy industry and with coal-mining, and between 1930 and 1938 he was Industrial Adviser to the Bank of England. But Sir Stafford Cripps has gained many supporters, not least among the unions, for his

intolerance of inefficiency and for his policy of subordinating all considerations to that of efficient production. What is sauce for the goose in this impartial pursuit of efficiency is sauce for the gander. If Sir Stafford can claim that this appointment was necessary to his campaign, there can be no effective complaint. But it remains more essential than ever that the Ministry of Aircraft Production should not seem susceptible to the influence of the so-called aircraft ring.

Home Guard

It is no doubt due to a lack of national self-consciousness that the most remarkable aspect of Home Guard Sunday, which was celebrated a week ago, has gone unnoticed. The Home Guard, three years after its foundation, is not only a vital element in national defence—the body which frees the regular forces for offensive tasks overseas. It is also a unique expression of political unity. There could be no Home Guard in Germany, or for that matter in most other continental countries, without its rapid degeneration into a para-military formation, controlling or threatening to control the state itself. In this country, it is unthinkable that the Home Guard should become an SA or a *Stahlhelm*. It is safe to arm the people. The very suggestion that the Home Guard is an astonishing political achievement would probably cause great surprise to the average Englishman; and this surprise shows the width of the gulf which cuts him off from the political atmosphere of the European continent.

Shorter Notes

In a Note called "Design for Gilds," which appeared in *The Economist* of May 8, 1943 (page 583), a memorandum on post-war trade was criticised as though it were the programme adopted by the leather goods trade as a whole. It should have been made clear that the memorandum was

drawn up by only two members of the National Leather Goods and Saddlery Manufacturers' Association; it was not sponsored by the Association itself.

The following table gives the number of civilian casualties in air-raids since September, 1939:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940.	1,494	1,980	3,474
Sept.-Dec., 1940.....	22,282	28,522	50,804
Total, 1941.....	20,863	21,839	42,702
Total, 1942.....	3,221	4,149	7,370
1943:—			
January.....	328	507	835
February.....	252	347	599
March.....	293	439	732
April.....	172	205	377
Totals to date....	48,905	97,988	106,893

Of those killed in April, 62 were men, 83 were women, 26 were children under 16 and one was unclassified.

A White Paper (Cmd. 6443) shows that on a day in February, when the count was taken, 78.9 per cent of the children attending elementary schools in England and Wales were receiving milk under the milk-in-schools scheme, compared with 79.8 per cent in February, 1942. For secondary schools, the corresponding percentages were 59.8 per cent and 61.0 per cent respectively. Those receiving a mid-day dinner were 20.7 per cent of the elementary school children and 47.0 per cent of the secondary school children against 11.5 per cent and 37.2 per cent respectively in February, 1942. Mr Butler, President of the Board of Education, announced this week that fully equipped kitchens will shortly be available to local education authorities free of charge as part of a plan for a big expansion in the school meals service.

AMERICAN SURVEY

King Coal

MR LEWIS has decided to grant the coalowners—and the Government—a further period of grace. In response to a telegram from Mr Ickes he has extended the duration of the truce until May 31st. There are no signs, however, that he means to take any further steps to end the deadlock, which has become even more formidable in the last few days. Mr Lewis is willing to negotiate with the coalowners—if they will take the initiative; but it appears now that the War Labour Board has instructed the operators to refuse to bargain with the United Mine Workers independently of the Board, and it is precisely the Board's jurisdiction which Mr Lewis is determined to defy. It is evident that Mr Lewis is attempting to manoeuvre the Board into the untenable position of putting a mere technicality before a satisfactory settlement. He would like to obscure the issue of inflationary wage increases and what the Board, in a strongly worded statement, called his defiance of the sovereignty of the United States. There is more than a suggestion, too, of an attempt to play off the War Labour Board against Mr Ickes in the union's insistence that "the jurisdiction and responsibility lie with the agent of the government in charge of the coal mines." This authority to negotiate Mr Ickes has steadfastly denied. The Labour Board has made it clear that although the demand for a \$2 a day increase would violate the President's anti-inflation order, it would consider as legitimate subjects for collective bargaining the guaranteed six-day work week, the vacation allowance of \$50 and "portal-to-portal" pay-

ment which formed part of the original Lewis programme. A combination of these might easily raise the earnings of miners by more than the \$2 increase, but it is only too plain that such small pickings will not satisfy the ambitions of Mr Lewis. He is out to smash the War Labour Board and the stabilisation programme; to discredit the Administration and his old foe, the President; and to demonstrate that he is still the strong man of labour. There are signs that his ambitions go even further, toward a farmer-labour alignment, under Republican auspices.

This urge to power is nothing new in the story of Mr Lewis's past few years. Baulked or only partially successful in half a dozen moves to re-establish his prestige, he has now fallen back on his despotic control of the United Mine Workers. The loyalty to him of some 600,000 miners is very great, and it is reinforced by the startlingly autocratic provisions of the Mine Workers' constitution. These provisions reflect the violent and brutal history of organised labour in the mine fields. Company towns, company-dominated police, complete lack of scruple on the part of the owners demanded an equal authoritarianism in union organisation and the most militant qualities in a labour leader. Both have persisted past their period of greatest usefulness, although it is still true that the miner more than other workers feels that his only safety is in his union. Thus the president of the UMWA has the power to interpret the union constitution; he controls the funds—and those of the UMWA exceed \$6 million; he can suspend

or remove any union officer, and he can even instal provisional officers in any district. It is some explanation of the miners' obedience that last year 20 of the union's 31 districts were under the control of "provisional" officers appointed by Mr Lewis, and that ten Lewis relatives hold union posts connected with the UMWA. This is a patriarchal despotism.

Mr Lewis has the power to determine the date of union Conventions of the Union—the only occasions on which his policies could be overruled or his powers curtailed. In view of the repeated signs of uneasiness and dissatisfaction from the rank and file, it is unlikely that a Convention will be held before the end of war. Protests against the disaffiliation from the CIO and requests for the right to elect their own officers have been disregarded. The anthracite strike early this year was a roundabout expression of disapproval of the policies and dictatorship of Mr Lewis. It is obvious, however, that it is not mere machinery and manipulation which prevent the miners from turning Mr Lewis out or lead them out of—or back into—the mines at the crook of his little finger. The conditions of life in a mining town have led to strong bonds of loyalty to the union, and Mr Lewis himself commands affection and admiration for his qualities of leadership, of intransigence and of daring. As was said of Cleveland, his followers love him for the enemies he has made, and the violence of the attacks on him reinforces his power not only with the miners but with the submerged everywhere in the United States. Nor is it forgotten that he has quadrupled the strength of the union since 1932, and that it was his imagination and drive which created the CIO and broke the steel companies' resistance to organised labour.

The devotion of the miners has been tested, and not found wanting time and again since Mr Lewis's break with the President in 1940. Mr Lewis, it should be remembered, was only a fair-weather New Dealer. He was a Republican before 1932, a conservative labour boss. Whether his falling out with Mr Roosevelt was due to disappointment over not having received some more signal recognition of his support, whether it was due to genuine differences over foreign policy or to an inability to work in harness, he supported Mr Willkie's candidacy in 1940, and rashly promised that if Mr Willkie lost he "would accept the result as being equivalent to a vote of no confidence." Mr Lewis stuck to his promise. He resigned from the presidency of the CIO, for whose origin he and the UMWA funds were largely responsible. This was only a face-saving gesture, however, and probably Mr. Lewis imagined his absence would be only temporary. Since then he has been using every device in his armoury to regain his pre-eminence.

Breach with the CIO

For a time he persisted in efforts to undermine his successor, Mr Murray. These efforts culminated in the abortive and disreputable scheme to arrange a coalition between the CIO and the AFL behind the back of Mr Murray and other progressive labour leaders. This move was promptly scotched, and in the "labour cabinet" subsequently formed to assist President Roosevelt, Mr Lewis and his AFL confederate, "Big Bill" Hutcheson, were ostentatiously omitted. Defeated and discounted within the CIO, it was only a matter of time before Mr Lewis led the Mine Workers out of the federation, with small loss of membership, it is true, but without taking with him the other unions he had hoped to detach.

In isolation Mr Lewis has not been idle. Before his break with the CIO, District 50 of the UMWA had been busily engaged in organising an ill-assorted group of workers ostensibly, if sometimes remotely, connected with coal—those in coal-derivatives such as gas, coke, chemical works, plastics and cosmetics. According to the *New York Times*, District 50 was admitting workers from firms making "corn cures, floor wax, toothpaste, hair-wave preparations, disinfectants, roofing and headache remedies." There was no competition in these trades, and it was estimated that there were about a million potential members awaiting organisation. In 1941 the building trades were invaded—the great preserve of the AFL. The most spectacular move, however, took place just as the UMWA left the CIO and broadened its constitution to admit workers of any description.

This was the attempt to organise dairy farmers, and is of peculiar interest in view of Mr Lewis' recent identification of the interests of the miners with those of the farm bloc. It must be said, however, that the attempt to organise the farm provoked more smoke than fire. After a few initial

successes the hostility of the farm organisations, the rural suspicion of anything to do with unions, and the opposition of the Department of Agriculture seem to have succeeded in choking off any aspirations Mr Lewis and his daughter Kathryn (in charge of District 50) may have had toward securing three million new members and a fresh \$20 millions in revenue.

The tough organisers of the United Mine Workers have been called, with some justice, John Lewis's Commandos. The jurisdictional disputes have been endless, particularly with the CIO, despite Mr Lewis's pious assertion that he had no intention of poaching. Among the trades in dispute have been lumber and furniture, retailing and wholesaling, automobiles and aircraft, as well as the railways. There is little evidence, however, that the very considerable expenditure of money and time has paid any substantial dividends. In fact, the tide seems to have moved the other way. Two-thirds of District 50's membership recently petitioned for a charter from the CIO, and their President, Mr Wagner, also a deserter from Mr Lewis's fold, declared dramatically:

We will not permit this man to build a personal empire of organised gas, coke, and chemical workers to turn over, like a medieval king, to his daughter Kathryn. . . . I predict that . . . daughter Kathryn will find that the Union Daddy gave her as a plaything has gotten up and walked away.

A Third Federation?

A more promising means of building up a rival labour federation may lie, however, in the small independent unions with which the American scene is littered, and in which Mr Lewis has been said to be taking an interest. In part, the existence of these independent unions is due to the size and sectionalism of the country, but their numbers have been greatly augmented by the reform of the company unions which were established by management as an antidote to the organising tide which swept the United States in the early days of the New Deal. In accordance with the provisions of the Wagner Act, these unions have cut their ties to the managements; the most obnoxious features have been eradicated from their constitutions, and they may well be ripe for organisation into a larger body. Unfortunately, their leadership has proved in many cases to be irresponsible, and public opinion has been alienated by a series of industrial disturbances.

To a much greater extent, the same result has followed all Mr Lewis's manoeuvrings and bludgeonings. The failure of the AFL-CIO "peace" move and constant reports of jurisdictional warfare have convinced the public of the irresponsibility of the labour movement as a whole, and of its inability to put its own house in order. Each one of the Lewis campaigns has created more confusion, more division, and more bitterness—muddy waters in which there may be good fishing for one man, but at excessive cost to the war production programme, and to the possibly irreparable damage of the standing of organised labour with the country.

The campaign to transform the UMWA into a third labour federation has been accompanied by an increasing hostility to the Administration, and there is little doubt that any organisation Mr Lewis may create will be a willing hand-aid to the Republican opposition. In his lukewarmness toward the war effort—both in speech and in his feeble co-operation on production problems—Mr Lewis has few sympathisers; but his attacks on the Administration's "bureaucrats," on the inefficiency of the price control mechanism, and on the handling of wage disputes, are grist to the Republican mill, while his defence of the prerogatives and superior wisdom of Congress is equally acceptable.

He has, in particular, been increasingly venomous about the "toadyism" of the AFL and CIO leaders toward the Administration, and the present strike threat is designed, as much as anything, to prove that strong-arm methods still work, and that he is the man to get the wage increases, in defiance of all authority. If he is successful, the prestige of the AFL and CIO must fall, in some degree, even though they attempt to follow suit. There appears to be brewing, however, a greater design than the mere rehabilitation of Mr Lewis as a labour czar. In a speech in April he declared:

The economic position of the farmer and the miner at the outbreak of this war was very similar—far below base parity level. The wage increase in 1941 to the mine workers and the increases which have come thus far to the farm population have been insufficient to put them on a parity with the earning standards of other classes. For this reason the mine workers are in full sympathy with the attempt of the farm population to secure compensating legislation in Congress, represented by the Bankhead and Pace bills, which have recently encountered Administration opposition.

There have been rumours of a working alliance between Mr Lewis and the farm bloc. This appears to confirm it. A combination between two of the most rapacious pressure groups is likely to be fatal to the stabilisation programme. It may affect even more menacingly, however, the 1944 elections, and the post-war set-up. At best, the additional confusion and deterioration of the domestic front cannot but have an unfortunate influence on the quality of American participation in the post-war world. At the worst, Mr Lewis may throw his great personal influence toward the resurgence of an isolationist policy. The volcano that so many observers thought extinct is showing alarming signs of explosive possibilities.

American Notes

The Reciprocal Trade Bill

The importance of Secretary Hull's reciprocal trade programme is, by common consent, more symbolic than actual, and it follows that the action that Congress takes on the renewal Bill is of less importance than the manner of its taking. If so, it is possible to derive a certain encouragement from the way in which the House of Representatives passed the Bill. The final 6 to 1 vote in favour of the Bill as a whole is, of course, less significant than the rejection of the crippling amendments; but these were all rejected by substantial majorities, and the only amendment to be carried was one reducing the period of the renewal from three years to two. This ensures that the subject will come up again in the first months of the next Congress and of the next President; but it is obvious that the whole issue will, in any case, arise again after the elections. Indeed, it is the policy to be pursued after those elections—and more particularly the policy that the Republicans will pursue if they win the elections—that is of major interest. This is where the mild encouragement comes in. No Republicans, it is true, voted against the crippling amendments, but only half the party strength voted for them. That does not provide a sure guide to future policy; but at least it does not leave the matter in the unfortunate state it would have been if the vote of the House had been on such solid party lines as that of its Committee. The Bill now goes to the Senate, whence the policy will be delivered over to the electors.

Crack in the Ceiling

This week has produced what may prove to be the first crack in the wage ceilings established under the President's anti-inflation order. Mr Byrnes, the Director of Economic Stabilisation, has issued a directive slightly broadening the powers of the War Labour Board to grant wage increases. There is restored to the Board its power to adjust wages in order to correct sub-standard living conditions or "to aid in the prosecution of the war or correct gross inequities." Such adjustments, however, must be contained within the existing price structure, and increases which would increase production costs, or increase ceilings must still receive Mr Byrnes' approval before they become effective. In Mr Byrnes' view, this constituted a "reaffirmation" of the "Little Steel" formula. The Executive Board of the CIO has, with some reason, issued a statement declaring that it does not understand the new directive. What both the CIO and the AFL are demanding is that the Labour Board, which has not been unsympathetic to their claims, should be given final authority to determine wage disputes and that Mr Byrnes' restraining hand should be removed. The immediate purpose of the order would appear to be to grant the Board more latitude in its dealings with the coal dispute—should Mr Lewis ever be brought to judgment. But it also looks as though this were a crack through which the other labour bodies might eventually be able to push their demand for a "real wage" formula, which would allow increases to compensate for all changes in the cost of living instead of the limited 15 per cent granted by the "Little Steel" formula. It is noteworthy that the unions, in computing real wages, wish to consider wage rates alone and disregard the effects of overtime on earnings. Possibly by attention to earnings instead of wage rates, the Board might be able to work out a formula which would slow down, if it did not eliminate, inflationary wage increases. It is plain that some fundamental revision in the formula is inevitable. The crack is only a tiny one now, but Samson Lewis seems to have succeeded in bringing down the Temple.

Opening the Closed Shop

The open shop has become so synonymous with industry's anti-union prejudices, and has been such anathema to the Administration, that American commentators are finding a delicious irony in the recent suggestion of the National Labour Relations Board that Mr Kaiser's closed shop be thrown open. The circumstances, it is true, are unusual. The parties to the dispute, which is of long standing, are the AFL and the CIO. The facts, according to the CIO's Mr Murray, are that Mr Kaiser entered into a closed-shop agreement with the AFL before there were any employees in one yard or virtually any at the others. At a recent hearing in Washington, Senator Ball suggested that only 66 employees were involved when the agreement was signed. If this is true—and there seems no reason to doubt it—an unkindly light is thrown on the much-vaunted Kaiser labour policy. The National Labour Relations Board, which exists to guarantee to labour the right to be represented for collective bargaining purposes by a union of its own choice, and should not be confused with the War Labour Board, which handles wage questions, has offered to dismiss the case if the AFL and Mr Kaiser are willing to make the yards "open shops"—a step which would facilitate their organisation by the CIO. The AFL, naturally enough, has refused to do so, and Mr Green has demanded that the NLRB be instructed to keep its hands off inter-union disputes for the duration. The opportunities afforded by NLRB elections to the rank and file to indicate their union preferences are, it appears, occasionally as distressing to their labour bosses as to their employers. Inter-union raiding no doubt causes some confusion, but Mr Green's pious insistence that the war production programme would be best assisted by tolerating contracts such as that signed with Mr Kaiser can hardly be accepted at its face value.

Death and Taxes

The old saying that nothing is as inevitable as death and taxes seems likely to be disproved if the day-to-day farce of the Ruml plan debate continues to postpone consideration of this year's tax Bill. Already Congress is far behind last year's belated schedule. The newest gyrations follow the statement of the President that he could not acquiesce in a Bill which would forgive a year's taxes to wealthy taxpayers while the mass of the people had to pay more. The House thereupon defeated the Senate version of the Ruml plan—the third time the scheme has been voted down. Mr "Muley" Doughton, chairman of the Ways and Means Committee, declared triumphantly "We have killed it. As long as Franklin Roosevelt is President of the United States it will stay dead." The Ruml plan, however, seems to have the proverbial nine lives and it will be surprising if it does not bob up again. Consideration now returns, apparently, to the House compromise, the Forand-Robertson Bill which "forgives" 90 per cent of the taxpayers, by wiping out the normal tax and first bracket of surtax. Why the Treasury and the Administration have chosen to make such a first-class party issue of Mr Ruml's ingenious device is hard to understand. Perhaps the difficulty lies in the word "forgiveness" which misrepresents the facts of the case. Such forgiveness would be purely theoretical to most taxpayers. Only those, whether rich or poor, who happened to have larger incomes in 1942 than in 1943 would be "forgiven" anything, and it should surely not be beyond the powers of the Treasury and Congress to hedge about the scheme with provisions to avoid windfalls and to secure the Treasury its due as wealthy taxpayers die off. Instead a great political issue has been created out of very little, apparently because of the Treasury's refusal to retreat from its first position. The anxiety of Mr Morgenthau to see work begun on the new Tax Bill would be better served by a speedy settlement of what is, after all, only a subsidiary problem.

THE WORLD OVERSEAS

L'idée Gaulliste

(By a Correspondent)

LIKE nature, the political life of a nation abhors a vacuum. *The Economist* described last week how the *Révolution Nationale* has vainly tried to fill the void left in France after the Third Republic. The collapse of French parliamentary democracy has been followed by the failure of Pétain's pseudo-authoritarian regime. The vacuum is now being filled by what may be called the *mystique Gaulliste*. The political outlook of General de Gaulle's movement has not yet crystallised. But it is clear that there is more than a shade of a difference between what Gaullisme means inside France and what it represents abroad. Outside France, General de Gaulle now stands beside General Giraud as one of the leaders of French resistance. In France itself he is, according to all available evidence, regarded by the mass of resisting Frenchmen as the leader of their national renaissance. The *mystique Gaulliste* dominates the underground press of nearly all political shades; and such clandestine organisations as have been active in the daily struggle against the Germans and Vichy seem nearly all to have rallied behind the man who on June 18, 1940, introduced himself to the French people with the words "*Moi, Général de Gaulle, actuellement à Londres*" and called on them to continue the war against Germany.

The fact that from June, 1940, to November, 1942, that is, during the darkest years in French history, General de Gaulle's name was the only symbol of France's will for survival and rebirth, could not fail to leave deep traces on France's political outlook. For the first time since the collapse of the Second Empire, one personality took an exclusive hold of the centre of the political stage within the *pays réel*. The *pays légal* was represented by Pétain. For more than two years, all the great issues of France's present and future were inseparably connected and identified with those two names. The political polarisation of Frenchmen, between those who resisted the invader and those who did not, proceeded around them; and the political evolution of the country during the armistice regime may be described as the evolution of two *mystiques*.

The French Crisis

The reappearance in such strength of personal factors and motives in French political life can be understood only against the broad political background of the crisis of French democracy. Elements of that crisis were apparent in the many social and political disturbances after February, 1934. In spite of all its drawbacks the French democratic system showed enough power of resilience to withstand the shocks of the thirties. It collapsed under the impact of military disaster. The collapse was thorough; and French democracy can recover only gradually from its consequences. On the morrow of the armistice, the traditional party system was smashed to pieces. The old lines of division lost any meaning. All social and political bodies were internally divided and split on the issue of war. The Right provided the leaders for the armistice regime; but it also had its Mandels and Reynauds. The same was true of the Radical Socialists. Inside the Labour movement Jouhaux and Blum stood for the war and for resistance; but Faure and Belin adhered to the *Révolution Nationale*. The old links were broken; and the new ones which gradually united resisting Frenchmen were of a non-political character. Only late in the day—during 1942—did the resisting elements of the old parties try to reorganise themselves according to some of the old political divisions. Even this, they did within the wider framework of the de Gaullist movement, which had in the meantime assumed solid shape.

The characteristic feature of the reconstituted political groupings, as far as one can judge from the French underground press, is the lack of moral and political self-reliance. The feeling that the old parties failed and that each of them had its share in responsibility for the military break-

down is very strong. A "sense of guilt" weighs on all attempts at the revival of the party system. This is an almost ideal background for the *mystique* of a "strong personality." A widespread longing for a Leader almost invariably grows from the people's own political weakness. Napoleon the First built his Empire on the exhaustion of French political energies in the process of the Revolution. Napoleon the Third drew on himself the hopes of the French people after they had been frustrated by the series of futile social collisions between 1848 and 1850. In contrast, Boulanger was a grotesque failure because the French democracy of the 'eighties was far too vigorous and self-reliant to long for a Leader.

The aureole which in the eyes of Frenchmen in France must surround General de Gaulle can hardly be dismissed by references to the much-discussed shortcomings of the leader of Fighting France. To people condemned to the daily miseries and humiliations of Vichy, he necessarily appears as the personification of all the national virtues of France. His political record has not been burdened by the vices of the Third Republic. His military record serves as the pedestal from which he can look down to the incompetence and mediocrity of the older generals. His book, *The Army of the Future*, did in fact forecast the course of the Battle of France five years before the event. True, the military expert may remark that General de Gaulle was not by any means the only, and not the earliest, advocate of modern technical warfare; the pedant may point to his mistake in proclaiming the era of small and purely professional armies. But the mass of Frenchmen consists neither of experts nor of pedants; and to them General de Gaulle is, and will probably remain, the unheeded and unrecognised prophet, the "voice in the wilderness." General Giraud, for all his extraordinary courage, character and patriotic record, does not appeal in the same way. Militarily, he belonged to the "old school" of Pétain and Weygand.

But this is only one element in the *mystique*. The other is the fact that General de Gaulle has secured for his movement the support of many sections of the French nation, while General Giraud has tended to stay within the narrow limits of the conservative, extreme Right milieu with which he has always been associated. General de Gaulle has the almost unconditional support of the resistant wing of the *Croix de Feu*, of the Catholic Trade Unions and of the CGT, of Radicals, Socialists and Communists.

How is it that all those movements, so antipathetic to one another, have recognised his leadership? Resistance is the common denominator. But this is not by itself a sufficient explanation. General de Gaulle's strength lies at least partly in the vagueness of his politics, which lends itself to the most divergent and contradictory interpretations. His supporters of the *Croix de Feu* hold that the political credo of the *Army of the Future* is still valid, a credo that was all against parliamentary democracy and all in favour of an authoritarian royalist regime. The Left keeps in mind General de Gaulle's more recent assurances of loyalty to the Republic and to the Constitution of 1875. Which of the interpretations is right? General de Gaulle's recent utterances allow no definite reply to the question. His assurances of allegiance to the Republic have had attached to them qualifications that his critics regard as subtle clauses of escape. And his condemnation of Pétain's personal dictatorship has not prevented him from himself maintaining a strictly personal control over Fighting France, with many of the somewhat eccentric rites that go with the application of a *Führerprinzip*. One day, the pressure of events and of practical politics on French soil will clear the contradictions. In the meantime, however, in the detached atmosphere of exile—in *partibus infidelium*—contradictions need no unravelling; and the *mystique* is—like every *mystique*—growing with an element of a *malentendu* in it.

A correspondent from Tunis wrote recently that the French there "fell in love with de Gaulle as with an unknown girl." The comparison can be extended to describe the mood prevailing in France itself. To the mass of Frenchmen, General de Gaulle remains the symbol of French resistance. The less emotional student of political affairs looks with some uneasiness to the authoritarian lining of that symbol. In the series of meticulously polite letters exchanged between Carlton Gardens and Algiers, some notes of a strange nationalist egocentricism can hardly be missed. But it would be a fallacy to believe that the growth of the *mystique* could at this stage be prevented or hampered by any artificial devices or by the fostering of any rival myths. The only effective reply to the *mystique* can be provided by the wholesome political prose of a liberated and free France. The *mystique* has grown out of the temporary collapse and sense of inferiority of French democracy. The democratic forces of France must first regain vigour and self-confidence, a task which requires time, opportunity and patience. But, if and when it is accomplished, there will be no room left for any independent *idée Gaulliste*; and General de Gaulle can only retain his well-merited and honoured place in French history if he parts with the highly controversial "ism" that has been affixed to his name.

Eire's New Budget

[FROM OUR DUBLIN CORRESPONDENT]

May 11th.

THE Minister of Finance, in presenting his Budget to the Dail, stated that the influence of the war on the Irish economy has spread in the last year. Nevertheless, in spite of the deplorably heavy shipping losses, the country has succeeded in obtaining visible imports in excess of visible exports to the amount of £17,300,000 since the outbreak of war. The Minister complained of the unreasonable clamour by many sections of the population for increased expenditure of public money at a time when economy is essential. He expressed the view that this demand for Government expenditure was the result of observing the huge expenditure in the belligerent countries which, he explained, are mobilised for total war, and are prepared to endure regimentation, shortages and anti-inflationary measures, however severe. The agitation for further public services reflects, in the Minister's opinion, a certain lack of private and co-operative enterprise. Taxation has reached, he stated, the utmost practicable limit. An increase on the present standard rate of income-tax, which is 7s. 6d. in the £, would fail to yield any additional revenue. This is good news for the direct taxpayer.

Turning to the results of the financial year, which ended on March 31st, the Minister stated that the realised deficit was £2,145,000, compared with an estimated deficit of £4,558,000. This satisfactory result was caused by the expansion of customs duties on tobacco, of excise on beer and spirits, and of income-tax, corporation profits tax, and estate duties. The indirect taxation on beer, spirits and tobacco yielded no less than £13,976,000, which represents 42.7 per cent of the total tax revenue. The great increase in expenditure was almost entirely accounted for by defence, the army costing £8,395,000. Abnormal capital expenditure during the year resulted in a net addition to the public debt of £3,212,000.

The estimate of revenue for the coming year on the basis of existing taxation is £35,195,000, and the non-tax revenue £6,287,000, making a total of £41,482,000. Expenditure is estimated at £46,169,000. Of this, capital expenditure to be met by borrowing amounts to £1,032,000, making the net total expenditure £45,137,000. The Minister justified this high expenditure on the ground that it helps to maintain employment, to relieve poverty, and to increase the social welfare of the people. The sum of £5,000,000 is to be spent on employment schemes, £7,500,000 on social services, £5,312,000 on education and £3,644,000 on subsidies on food and turf to keep down the cost of living. A scheme of family allowances is in preparation, but no provision is made for it in this year's estimates. In bridging the gap between revenue and expenditure, which amounts to £3,655,000, no economies in administration are possible, nor is there any room for increased taxation. There has been no income expansion such as has taken place in the belligerent countries, and shortages of many dutiable commodities are being experienced. A slight change is being made in the corporation profits tax, which will cost the Exchequer £5,000 this year and £30,000 in a full year. Minor changes in entertainments duty will yield an addi-

tional £5,000, and it is proposed to take £100,000 out of the Road Fund. The net deficit will be thereby reduced to £3,555,000, which is to be raised by borrowing. In view of the plethora of funds in the Irish banking system, and of the success of some recent issues by public bodies, there should be no difficulty in floating a loan on very favourable terms.

The Danger of Inflation

The Minister drew attention to the danger that continuous borrowing might have inflationary consequences. Inflation in Eire might result from causes in the outside world over which the Irish Government has little or no control, but it might equally arise from errors in internal policy. The amount raised by borrowing during the war is £12,101,000, which, though not a large sum, shows a steady upward trend. The high direct taxation has the result of transferring income from the saving to the non-saving class. Expenditure on consumption is tending to increase at a time when production is lagging. In spite of the great increase in tillage, the volume of agricultural production has not risen during the war; industrial production has fallen by 20 per cent; and building production by much more. The cost of living index number has risen by 60 per cent, while the agricultural price index number has risen by 75 per cent. The Minister emphasised the necessity for keeping prices and costs in the strictest control. Whatever inflationary symptoms are apparent are not the result of monetary causes. Bank advances have decreased by 10 per cent since the outbreak of war, in spite of a large expansion of bank deposits. The increase in the currency circulation is amply explained by the rise of agricultural prices and the cost of living.

Letter to the Editor

Offers Invited

TO THE EDITOR OF THE ECONOMIST

SIR,—Numerous schemes have been broached for the revival of the export trade after the war, and a common feature of such schemes is the proposal for joint action either by individual industries or by the community at large to facilitate selling abroad at special and attractively low prices. A recent article in *The Times* demonstrated that, from the national point of view, it may well be profitable to sell exports at lower than total cost, or even lower than out-of-pocket cost.

The trouble about such proposals is the selfishness and untrustworthiness of foreigners. They are prone to thwart such schemes by slapping on tariffs, quotas and other restrictions with callous indifference and suddenness.

Pondering over this problem, I have evolved the following solution. I suggest that there should be a League of Voluntary Dumps at home, and I am proud to offer myself as a founding member. Members would be pledged to accept goods and services at, say, 20 per cent below the market price. To show my bona fides in the matter, I hereby formally enter a subscription to the first post-war year issue of *The Economist* at 20 per cent below the then full subscription rate. I also give my full address below so that any producers can engage to supply me after the war on similar terms.

I hope I shall not be overwhelmed with messages of thanks and congratulation, with flattering references to my self-sacrifice. I am now getting to the age when I no longer get satisfaction and pleasure out of paying full top prices, and it is people in my position who can afford to assume the burden of cut rates.

Needless to say, my services are at the disposal of His Majesty's Government for the compilation of a White Paper on this scheme. With the Beveridge, Keynes, and what I may modestly call the Big-hearted George Plan, I think the programme of post-war reconstruction would be complete. Since I understand that the primary effect of a title is to bring about a 25 per cent surcharge on hotel and other bills, I cannot consistently with membership of the League engage to accept recognition through the Honours List. I appreciate, however, that taxation represents the purchase of goods and services supplied by the State, and I am agreeable that the trade facilities of the League should be open to the Government, and to make this clear I am prepared to accept a 20 per cent rebate on all my taxes, and from all trading services such as the Post Office.—I have the honour to be yours faithfully,

GEORGE L. SCHWARTZ.

28 Spencer Drive, N. 2.

Germany at War

Pressure on Banks

THE greater concentration of Germany's economy during 1942 found expression in the reports of the leading banks, whose annual reports have now become available. Semi-official estimates state that the number of joint-stock banks was reduced from 242 in 1942 to 231 at the end of 1942. The number of private banks fell to 503 from 821 in 1938. The total personnel in banking is estimated at 45,000 persons against 63,000 at the end of 1938. During 1942, a considerable number of local branches were closed in the course of a general concentration of the industry; and now the so-called total mobilisation demands a further reduction in local branches.

Official policy is directed towards a "planned" banking industry, in which a small number of leading banks would operate over the whole country, while the variety of mortgage banks, savings banks, and credit co-operatives would be reduced to one bank in each locality and regional district. The leading banks are opposed to this plan—the final closing down of the bourses met with similar resistance. It is clear from the relatively small number of persons employed in the banking industry that a further reduction of branches can hardly yield any appreciable addition to the *Wehrmacht*, or the industrial labour force.

Statistics covering all banks are no longer published; but the reports of the five leading banks indicate the general trend. The principal items in the accounts of the five leading banks—Deutsche Bank, Dresdner Bank, Commerzbank, Reichskredit A.G., and Berliner Handelsgesellschaft—are combined in the following table:—

(In Million Reichsmark)

	1941	1942	Increase or Decrease (—) in %	
	1941	1942	1941	1942
Total Assets	15,927	18,259	22.5	14.7
Bills, Cheques and Treasury Bonds	9,423	11,282	24.6	19.6
Advances	3,065	3,818	13.0	24.6
Investments	2,270	1,729	33.7	—26.0
Deposits	14,923	16,881	27.5	13.2
Taxes	127	161	16.3	19.3
Net Profits	41	52	11.7	26.7

(In Per Cent of Total Assets)

Cash	3.7	3.8
Treasury Bonds	44.3	48.4
Reich Loans	11.2	7.1
Advances	19.2	20.9

The first impression is that the general expansion of the banks has been retarded, although not stopped. Examination, item by item, shows that there have been changes typical of the greater concentration of German economy under effective price control. The increase in deposits is both absolutely and relatively smaller than in 1941. If they are split into current deposits and savings deposits, the increase was 8.3 per cent and 41.5 per cent, respectively. This suggests that the financial liquidity of industry was actually reduced during the year. The small business man, particularly the small shopkeeper, whose activities were contracted progressively during 1942, put his financial surplus into saving accounts. "Iron savings" accounts have been accumulated mainly from the personnel of the banks, been accumulated mainly from the personnel of the banks, party officials and civil servants. This trend is borne out by a continued rise in the deposits in savings banks and credit co-operatives which is estimated at 33 per cent on the average. The restricted activities of small business men, and the greater money surplus of the higher salaried employees and better paid workers, in face of a progressive shortage of unrationed commodities, have shifted the emphasis of financial liquidity from the commercial banks and current deposit accounts to savings accounts.

In contrast to the virtual standstill of deposits, there is

a considerable rise in the banks' advances. The obvious conclusion would be that industry, after the restrictions on advance payments by the *Wehrmacht*, was forced to ask for bank credit. Yet the reports of industrial companies and concerns show that they have rarely needed bank credit. German papers assume that the rise in advances has been mainly caused by a demand for financing the comprehensive storage of foodstuffs as well as for the financing of imports. It seems that official and semi-official marketing and raw material control organisations became debtors on a large scale. The so-called reconstruction of conquered territories also demanded credits. A detailed report published by the Deutsche Bank shows that credits to the armament industries were mainly granted to large companies, which is another indication that small businesses have almost disappeared.

At first sight, the status of the five leading banks at the end of 1942 is thus deceptive, suggesting, as it does, the beginning of a return to normal conditions of financing industrial activity. Actually, there is only a slight change. The greater part of the banks' resources is still absorbed by the state. The share of advances is slightly greater, and the share of Treasury bills, bonds and Reich loans combined is smaller. A striking feature is the reduction of the share of Reich Loans. The Deutsche Bank reduced this item by one-half. But this was compensated by greater holdings of Treasury bonds.

The so-called "silent financing" of the war, that is to say, the fact that no war loans, war bonds in small denominations or war savings stamps, are being issued, increasingly affects the entire banking situation. Small savers have no alternative but to put their savings into banks. This, under conditions of complete rationing, explains the tremendous rise in savings deposits. Total deposits in savings banks alone have been estimated at Rm. 51,000 million at the end of 1942; the increase in 1942 is estimated at Rm. 13,500 million, against an increase of Rm. 9,800 million in 1941. The commercial banks, which before the war competed with savings banks by introducing special savings accounts, are now confronted, because of this policy of "silent finance," with an unwanted increase in savings accounts which carry from 2½ to 3 per cent interest. The cheap money policy and the large holdings of Treasury bonds against relatively small advances are a constant threat to the earning power of the banks.

A typical wartime phenomenon is the fact that the banks, with vastly increased assets and a much greater sphere of influence in almost all European countries, were able to carry on their activities with a considerably reduced staff. The work done by the banks has actually decreased during the war. The Deutsche Bank has computed a ratio between total deposits and the turnover of deposit accounts. This ratio, which indicates with certain reservations the velocity of turnover, remained fairly constant before the war at 1 to 70. It has decreased since the beginning of the war, and in 1942 stood at 1 to 40. In other words, a great number of small transactions have been replaced by a small number of big transactions, resulting in less work.

During 1942, the expansion of German banks into other countries was small compared with 1940 and 1941. The Deutsche Bank and the Dresdner Bank took over the Handelsbank A.G., the Generalbank A.G., and the Internationale Bank in Luxembourg. In Germany itself, a special bank for armament credits was founded. It seems that this was the result of the reorganisation of the armament industry by Minister Speer.

A curious and almost defiant tone was struck in a director's speech at the shareholders' meeting of the Deutsche Bank. He refuted the idea discussed recently that the increase in total assets could be called the formation of capital, and bluntly stated that deposits had lost their normal characteristic as the cash reserves of industrial companies and concerns. At the same time, he enthusiastically declared that the banks were able to supply all the necessary credit to the armament industries on the well-tryed basis of the initiative of the bank managements, and assured his audience that a planned or steered economy will never experience a general lack of credits. He was rather reticent about the demand for abolishing more branches in the interest of "total mobilisation," and said that rationalisation lost its meaning if as a result the economy dependent on the services of the banks would have to spend more time and work in effecting payments, than before the rationalisation.

THE BUSINESS WORLD

Finance and Banking

Big Notes Returning

Although the period of making up for the clearing banks' May statements has already begun, the position in the money market has been such as to withstand any consequent calling in of loans without creating any apparent pressure. The cash position has been helped by the fall in Treasury deposit payments required from the banks this week. The £45 million of fresh money paid in this way was equalled by the nominal maturities, and as pre-encashment of these TDRs appears to have been exceptionally small the net amount lost by the banks through this channel has, this week, proved negligible. Against this, Treasury bill payments have again been £15 million in excess of maturities. Applications for the £90 million of bills on offer last week dropped sharply from £178,975,000 on the previous Friday to £154,660,000. In consequence, the market syndicate obtained the comparatively high allotment of 44 per cent, which means that rather more than £40 million was taken up in Treasury bills by the discount market this week. The banks, freed from the need to make heavy TDR payments, have been much keener buyers of bills than of late, and the market has not experienced undue difficulty in taking up its heavy allotment of bills. At no time, however, has the short loan position shown an over-abundant supply of credit. This week's Bank return shows virtually no change in the level of bankers' deposits, which at £140,689,000 reflect a moderately comfortable credit position. The immobilisation of credit in Government accounts continues at an exceptionally high level, these totalling £18,374,000, which is £2,366,000 down on the week, but still abnormally high in the light of recent experience. The return of notes from circulation again made satisfactory progress last week, a further £4,285,000 coming off the total. Both this and the preceding week's movement are probably due in part to the return of notes of higher denominations previously held as bankers' reserves and temporarily converted into balances with the Bank of England.

Banks and Bills

A change in the clearing banks' bill buying policy, which has been so gradual as to evoke little comment, has taken place over the past 18 months. It is the increasing concentration of bank purchases on bills of comparatively short currency. There was a time when the banks' competition for bills was so keen that the market almost automatically sold the bulk of its Treasury bills to

the banks as soon as the latter were allowed by their agreement to bid for them, that is, a week after they had been taken up by the discount market. The bulk of the business then transacted in the discount market was in what was known as "tepid" bills, that is, "hot" bills after they had been held for one week by the market. There were even breaches of the spirit, if not of the letter, of the inter-bank agreement when some institutions, in order to make sure of their supply of bills from the market, bought "hot" bills a week forward. All that has changed. The Treasury bills now have to be stone cold before the banks show any interest in them. The general experience of the market seems to be that houses now have to run their Treasury bills for four to six weeks before the banks show any interest in them. For example, though early August maturities are at present eligible for purchase by the banks, it is only with difficulty that these institutions can be induced to take up July maturities. It is evident that, since the arrival and development of the Treasury deposit receipt, the banks have come to regard their bill portfolio as a more liquid asset than in the days when it represented the last line of liquidity defence. The growth of TDR's has reduced the banks' demand for bills and in consequence has led to greater fastidiousness in the matter of maturities. Given the inelasticity of the massive and relatively inert mass of TDR's, the banks depend on their bills to a greater extent than before in order to achieve the required day-to-day adjustment of their cash position. Hence the desirability of keeping the average currency of their discounts short, since this will give a larger daily turnover of maturities. Moreover, if ever the banks have to sell bills to official quarters—whether to the Bank of England or public departments—the possession of early maturities will help the operation. As long, therefore, as it is the policy of the Treasury to maintain the major part of the floating debt held in the market and the banking system in the form of TDR's it must be expected that the banks will tend to keep their bill portfolio filled with shorter currencies than those they held when bills were the third and last line of liquid assets.

It should be noted that there is, as yet, little evidence of this change in the banks' bill buying policy leading to an appreciable increase in the volume of bills carried by the market. This is largely due to the fact that there has been increased competition for bills from special Empire sources. The position would change again if the Treasury's call on the banks in respect of TDR payments were to fall off and if the Treasury bill issue were to be correspondingly increased. There is, perhaps, some evidence of a new drift in this direction in the recent increase of the weekly offers of Treasury bills.

THE STANDARD BANK OF SOUTH AFRICA LIMITED

Bankers to the Imperial Government in South Africa and to the Governments of Southern Rhodesia, Northern Rhodesia, Nyasaland and Tanganyika.

Capital Authorised & Subscribed - - £10,000,000
Capital Paid Up - - - - £2,500,000
Reserve Fund - - - - £3,000,000

BANKING BUSINESS OF EVERY DESCRIPTION TRANSACTED AT ALL BRANCHES AND AGENCIES

ROBSON, MORROW and UNDERWOOD wish to engage a first class accountant, Chartered Accountant or equivalent with wide executive experience, who can be trained as an Industrial Consultant. Four figure salary and excellent prospects. Mark envelope "Application." Full particulars to Robson, Morrow and Underwood, Victoria Station House, Victoria Street, London, S.W.1.

Counter Inflation in India

The Government of India has decided to take measures to counter the inflationary forces set in motion by the exceptional Allied expenditure in that country—expenditure which until now has only to a small extent been covered by domestic taxation and borrowing. Most of that expenditure has been offset by sterling payments, and this has meant that, whereas India has been devoting labour and materials out of its current resources to provide the exports and the defence works for which such sterling payments have been received, there has been no corresponding mopping up of the purchasing power thus created. Nor has there been any possibility of converting the huge sums received in sterling into import goods that would have balanced the increase in the circulating medium. The result has been rising prices, hoarding and speculation. The measures with which the Government of India proposes to tackle this situation are a general tightening up of the tax situation and more rigid control on such evidences of inflation as the formation of new companies. In the first place, there are to be exchanges in taxation designed to bring in the equivalent of about £75 million within the next three months. The new ordinance abolishes the present delays in tax assessment and a great deal of the additional revenue will be due to accelerated collection. In the second place, the effective rate of the excess profits tax is to be raised from 80 to 100 per cent by making it compulsory on firms liable to this tax to deposit the 20 per cent as a temporary loan to the Government. There is also to be a tightening up of income tax assessments and, in particular, a closer scrutiny of expenses allowed as deductions from taxable income. The rule that no company may be formed without the permission of the Government is intended to prevent the growth of mushroom companies which have found fertile soil in the present abnormal conditions. These measures are a welcome indication of movement in the right direction, though it would be unduly optimistic to expect them to remedy the ills against which they are directed.

Film Royalty Remittances

The Treasury has announced that the special restrictions on the remittance of film royalties, which have been the subject of agreements with certain American film companies over the past three years, are removed as from October 25th last. Remittances of film royalties will now be subject to the Defence (Finance) Regulations in the same way as other remittances abroad, and applications for effect-

ing such remittances will have to be made in the normal way through the remitter's bankers. From the beginning of the control of sterling exchange, the balances accumulated here by American film companies have constituted a special category of sterling. Varying proportions of these takings have, year by year, been remitted in dollars to the United States, and the balance has remained in blocked sterling accounts. In October last, the accumulated arrears in such accounts were released and converted into dollars, the amount so transferred being \$42 million. The further sterling accumulated in these film royalty accounts since last October will be affected by the new Treasury decision, which has retrospective effect to the date of the last release. It does not, by any means, follow that unconditional freedom has been given for all future conversion of film sterling into dollars. Each application for remittances of such sterling to the United States will have to run the normal scrutiny of the authorities, and only if the royalty is a reasonable one, will the transfer be allowed.

Argentina and Foreign Capital

A decree has been issued by the Minister of Finance of Argentina to control the influx of foreign capital. All purchases of pesos representing capital transactions will have to receive the sanction of the central bank. That sanction will only be given if it can be shown to the satisfaction of the authorities that the capital in question is genuinely seeking long-term investment in Argentina. The main intention of the new control is to prevent the further entry of foreign hot money, of which far too much has flooded into Argentine markets over the past year. The movement began at the time when the United States was considering measures for freezing all European dollar balances. A number of investors who would have been affected by the order anticipated it and transferred their dollars into pesos. The movement has continued and has, of late, been gathering momentum. The neutrality of Argentina, its increasing gold and exchange reserves and the threat of sharply rising prices in the United States have combined to hasten the movement of fugitive dollars into pesos. This influx of foreign capital is more than embarrassing to the Argentine authorities. Their gold and exchange reserves are in any case increasing as a result of their inability to import from the belligerent countries on a scale approaching Argentine exports to those markets. There is no wish to see these reserves expand further as a result of the influx of capital seeking temporary refuge and the possibility of exchange appreciation in this neutral haven.

Investment

Liquidity Preference

The break through at El Alamein halted the boom in industrials. The final expulsion of the Axis from North Africa is said by the market to have started a recession. Its probable extent is a matter of very substantial differences of opinion, but, for the average stockbroker, the outlook seems much more obscure now than it did only a fortnight ago when it looked as though the war were virtually certain to last well into 1944. It is, of course, the function of the market to discount broad developments well in advance. In a sense, the whole problem of successful short term investment is to know how far in advance and, apparently, the time has now come to consider what is likely to happen when the war is won. To keep the actual movement in perspective, it should be remembered that the ordinary share index of *The Financial News*, which rose from 94.1 on January 4th to 99.7 on May 10th, has so far fallen only to 99.2, a minor fluctuation, which at other times would be considered of little or significance. In any case, this index does not pretend to tell the whole story. It is, probably, representative of securities in which the bulk of the business has been concentrated since the fall in turnover in home railways and South African gold and diamond mines, but it is the latter group which had been run up speculatively and is now suffering the heaviest falls. As against this, it does not give any indication of a wave of buying, probably small in total amount, which has raised the price of the French railway stocks and Seine bonds, that carried the guarantee of the French Government, by several points

over the past week. Together with this has gone an improvement in bonds of the Axis powers and of some of the British companies operating in continental Europe, such as Imperial Continental Gas and Trepca Mines.

When all this has been said, the fact remains that the larger operators are certainly out of the market; that the investing public in general is waiting to see what will happen next and that there is a tendency to switch from long dated gilt-edged and equities into shorts, which can be sold at a moment's notice or held without danger of any appreciable capital loss. Whether it is called liquidity preference or under-investment, whether it is done in the hope of jumping into some profitable opening in the not distant future, or because the present level of securities is distrusted, the immediate effect can only be to depress prices. It is not a policy which is likely to appeal to large numbers of people, but it may be a factor of some importance in the immediate future of the market. Meanwhile, the Second Reading of the Finance Bill has produced a renewed assurance from the Treasury that cheap money has come to stay and an article on page 647 discusses the effects of such a policy. The same debate served to stress the consequences to industry of past and present fiscal policy; this matter is discussed in a note on page 651. It is evident that to stress these matters without eliciting a promise of reform is likely to depress industrial equities, but it is hard to believe that reforms will not come, if there is to be an attempt to encourage private enterprise.

Delayed Accounts

Apart from the complete ban on the accounts of public utility concerns, other than purely holding companies, there are a number of companies whose accounts cannot be published—not for security reasons, but because the basis for computing profits is so complex that the necessary work has not yet been done. This at least is the reason advanced by Sir Malcolm Robertson, chairman of Spillers, for disappointing the shareholders once more in the matter of accounts. Under the Flour Milling Control Agreement, it is necessary to reprice all inter-departmental transfers of goods back to February 1, 1934, segregating the controlled from the non-controlled sections of the company's business. The work, having been done by the accountants of the companies concerned, has to be verified by auditors and agreed with the officials of the Ministry of Food. When all this has been accomplished it is possible to set out to determine the tax liability of each company and hence the amount of earnings which they may retain. Looked at from the national standpoint, this seems a rather ridiculous business. It should, surely, have been possible to agree upon a formula which would have led to less complication and waste of manhours which could have been employed in furthering the war effort in some way. From the shareholders' point of view, it will not yield highly satisfactory results, for Sir Malcolm says, once more, that, in view of all the circumstances, the amount retained is not likely to be generous. The agreement has, none the less, been extended for a fourth year to the end of August. Sir Malcolm again expresses the hope that in a year's time it may be possible to present a reasonably accurate statement up to August last, by which time nothing definite will be known of any position more recent than August, 1939. It is little consolation to the proprietors that the current results will have no relation to any normal trading period, for they may, with some justification, fear that flour milling may not return to normal within their lifetime, if the present ideas as to the national production and international control of wheat remain current.

Accountants' Professional Problems

Since the accountants are about to ask that the profession be placed on a statutory basis, it is time that the public paid some attention to their internal organisation. The report of the meeting of the Institute and the speech of Mr Richard A. Witty, president of the Society, afford some further evidence of the attitude of members of the profession serving in industry and in the offices of practising accountants. In the case of the chartered accountants, a resolution was submitted calling for the appointment of a committee representative of all members to consider plans for post-war development. This resolution was lost by what is described as an overwhelming majority, but, since the protests against the existing order occur at every meeting, it is difficult to maintain that the present system of forwarding to the Institute suggestions for improvements is satisfactory. In his address, Mr Witty alludes to a proposal to convene a conference of representative members who are to have opportunities to put their views before the governing body of the society. It is, however, clear that neither body has solved the problem of securing for the large body of what are styled non-practising members the representation in the direction of the profession to which the democratic principle would appear to entitle them. The chartered accountants do not appear to have touched on the subject of education and training. Mr Witty, however, promises a report, following the first fundamental review of the position since 1918, which will show that the society must call for increasing standards of education, training and efficiency. He also holds out more definite hopes of the early appearance of the results of the labours of the research committee which have recently been resumed. Incidentally, he throws a rather different light on the proposals for official licensing disclosed by Mr Palmour, president of the Institute. He describes them as setting up a co-ordinating council, maintaining intact the status and designation of the various bodies, and assuring that none shall be in public practice as accountants *without having received adequate and proper training and experience*. Everything turns on the meaning given to adequate and proper, but the statement does suggest an awareness that the existing criteria of membership are not satisfactory.

Company Notes

Babcock and Wilcox Report

The full accounts for the year to December 31st last of *Babcock and Wilcox*, the leading boiler makers, show that there was considerable difficulty in avoiding a sharp reduction in profits. For the fourth year in succession, there is a decline, but total disclosed income at £741,374 against £777,790 is in fact higher than might have been expected in view of the reduction in the profit margin on Government work. It is clear that costs have been strictly controlled. Lower provisions of rents and war damage counter-act part of the fall in profit, but with tax liability at £370,000 against £365,000, equity earnings are down from £291,292 to £270,264, representing 12.2 against 13.2 per cent as cover for the ordinary payment maintained for the fourth year in succession at 11 per cent including a 1 per cent cash bonus. There is no allocation to write off war losses against £22,935, but the directors point out that certain capital assets abroad have been written down from profits by means of a reduction in the balance-sheet valuation of shares in associated companies which stand at £164,624 against £200,745. As in 1941, there is a transfer of £25,000 against the possibility of a fall in the value of stocks so that the carry forward, after bringing in £453 war losses recovered, is raised from £105,709 to £107,063. The balance-sheet, despite the rise in debtors, suggests that there has been a slight fall in turnover. Stocks and expenditure on orders are together reduced from £2,941,282 to £2,682,942. There is also a fall in creditors including tax provision, coupled with a rise in cash and holdings of Government stocks. The latter stand at £1,438,518 against £1,420,518 and have a market value of £1,531,316. As a result there is a rise in net liquid assets from £3,921,274 to £4,125,551. Net loans to subsidiaries are sharply reduced from £175,317 to £44,638. Total reserves are £25,000 higher at £1,885,965, some £675,000 in excess of fixed assets. The financial position is thus very strong. It is unfortunate that the company does not complete the excellent format of the accounts by provision of a consolidated statement. The £1 ordinary stock at 49s. 6d. ex dividend, yield £4 8s. 11d. per cent.

Colvilles' Results

As in the previous year, final prices for certain materials supplied to *Colvilles* are still unsettled. In consequence, trading profits and the tax liability can again only be estimated. Last year, disclosed profits, struck after war damage insurance and an estimated tax provision, fell £10,436 to £513,323, but, by drawing £130,000 from their reserves, subsidiaries were able to raise the net dividends to the parent by nearly £30,000 to £109,212. The parent has again allocated £250,000 to ordinary depreciation, but the special provision is halved at £50,000. Deferred repairs, however, receive £100,000 against nil. After meeting the preference dividend, a final payment of 5 per cent again raises the ordinary distribution to 8 per cent, out of earnings reduced from £194,634 to £166,035, representing 9.9 against 8.5 per cent respectively. An addition of some £9,250 increases the carry forward to £166,963. The balance-sheet position is

• Interest paid half-yearly
• Income Tax not deducted at source

3% SAVINGS BONDS
1960-70
POST OFFICE & TRUSTEE SAVINGS
BANK ISSUE

Issued by the National Savings Committee

more reassuring. Cash is more than trebled at £1,675,568, partly by replacing a net debt on current account of £211,768 from subsidiaries to the parent, by a net debt to them of £328,311. Debtors are reduced some £224,000 to £2,998,707, and stocks a mere £104,000 to £3,012,587. Tax provision, which the board describes as sufficient, now totals £1,653,462. Creditors, including contingencies and deferred repairs, are little changed at £4,790,548, while the repayment of a further £100,000 reduces the insurance group loan to £800,000. Excluding this debt, net liquid assets are virtually £700,000 up at £1,203,351. Together with £100,000 for deferred repairs, reserves for depreciation and obsolescence now total £2,750,000. The group's position appears strong enough, but it is a pity more information regarding the subsidiaries has not been provided, either in the directors' statement or in consolidated accounts. At 24s. 9d. ex dividend the £1 ordinary stock yields £6 9s. 3d. per cent.

Yorkshire Amalgamated Collieries

The full accounts of *Yorkshire Amalgamated Collieries* for the year to March 31st—the preliminary statement was discussed in *The Economist* of May 8th—show a substantial rise in income from £112,776 to £154,142. There is also an increase in refund of income tax from £581 to £1,601, but true equity earnings are raised only from £77,046 to £118,849, representing 8.2 against 5.3 per cent as cover for the ordinary payment increased from 5 to 6½ per cent. As was to be expected, £25,000 of the surplus, against nil, is transferred to general reserve, raising this fund to £250,000 and the carry forward is increased from £129,496 to £130,202. The directors are reticent as to the cause of the improvement, but it is plain from the consolidated balance sheet that output was higher last year. This statement shows a rise in stocks from £364,568 to £376,444 and in debtors from £525,899 to £580,806. The omnibus total of creditor items, including provision for deferred repairs and taxation, is slightly lower at £957,354 against £964,903, but it is plain that little can be deduced from this movement. There is a rise in net liquid assets from £335,667 to £411,739, while secured debt is reduced from £1,230,050 to £1,193,731. The company's statement shows a reduction of £50,000 in net loans to subsidiaries at £635,000. In the light of the published accounts, there appears to be a fair chance that the recovery is due as much to increased output as to adjustment of EPT liability. The £1 ordinary shares, at 19s. 6d. ex dividend, yield £6 13s. 4d. per cent.

John Lewis Recovery

The accounts of *John Lewis* for the year to January 31st show that the group shared to the full in the recovery in department store earnings which became general last year. Consolidated figures include the earnings of all the interests of the group with the exception of the Suburban and Provincial complex. Trading profits show a remarkable recovery from £298,928 to £403,947. There is a sharp rise in tax provision from £71,500 to £118,000, but depreciation requires rather less at £31,676 against £36,595. Earnings for dividends rose from £57,204 to £107,717, from which the directors have decided to pay eighteen months' arrears on the 7 per cent cumulative preference stock as well as the year's dividend on 5 per cent first preference capital. After charging only one year's service on each class of capital, 9.7 per cent is earned for the equity. The carry forward is raised from £63,906 to £103,325 after crediting £8,577 against £14,234 from reserves no longer required. If trading profits are maintained at approximately the same level in

the current period, the preference arrears, which now amount to only £39,375 net, should be eliminated in a year's time and the ordinary capital again come within sight of a dividend.

The recovery is of course due to all those factors, notably the reduction of expenses and the return of the evacuated population to the larger towns, which affected the concerns whose accounts were published earlier. The directors state that net liquid assets of the group rose by £89,664 to £1,353,574. Net loans of the parent to subsidiaries declined from £1,007,716 to £937,790. No doubt the greater part of the jump in stocks of the group from £1,483,894 to £1,638,250—including only £29,506 against £112,746 outstanding claims under War Risks Insurance—is due to the influence of purchase tax. The same factor was mainly responsible for a jump in money turnover of 16.2 per cent on the year and 8.6 per cent against 1940. Claims for war damage have now been mainly agreed. They stand in the consolidated statement at £237,749 against a suspense item of £272,618. The management indicates that £58,582 of Depreciation Reserve, found upon revaluation of the remaining properties to be excessive, has been used to write off expenditure on improvements and ARP—which a year ago totalled £36,481—and war damage contributions in respect of land and buildings. The group has yet to find the money for rebuilding and re-equipping the Oxford Street and certain provincial premises, but, as far as can be judged at present, there should not be an undue stringency.

Union Corporation Group

After the somewhat discouraging results issued by the mines of the Central Mining-Rand Mines and the "Johnnies" groups, the results of the *Union Corporation* companies come as a relief. It is true that in three out of five cases dividends have been reduced, and that in one only, that of *Grootvlei*, where expansion has been very marked, is there an increase, but three of the mines are young, and the older members, *Geduld* and *East Geduld*, have holdings in *Grootvlei*. The results of the group, analysed in the following table, show that in three cases there was an increase in tonnage milled and in revenue per ton, and, despite the fact that only in one case were costs reduced, there were also three cases of higher working profits. Ore reserves were lower in four out of five cases as the inevitable result of reduced development not paralleled by reduced milling operations. In only two cases, however, was there a fall in grade. The least satisfactory results were attained by *Van Dyk* and by the old-established *Geduld*; the best by the rapidly developing *Grootvlei*. The achievements of *Marievale* and *East Geduld*, which are still below peak production, were satisfactory. It appears from the reports of directors and consulting engineers that shortage of labour and materials became much more acute in the latter half-year, and there is consequently every prospect that the current period will be less profitable. There has obviously been very strict control of stores, which has done something to offset the rise in working costs. The success of *Grootvlei* was in part due to the completion of the second extension to the milling plant, which made possible an increase in tonnage milled to nearly 160,000 a month toward the end of the year. Despite the reduction in development, two connections with the *Palmietkuil* workings have now been completed. In *Geduld*, diamond drilling has been continued, but, as yet, without any great success. The practice of producing munitions from the mining workshops was extended.

UNION CORPORATION GROUP

London and Thames Haven

The 1942 accounts of London and Thames Haven Oil Wharves show a welcome improvement in trading profits from £100,207 to £120,417. Total income, including a non-recurrent item of £20,000, is up from £107,790 to £151,135. The surplus available for distribution is, however, reduced by the directors' decision to adopt the basis of tax provision advocated by the Chartered Accountants. That is, they provide for tax payable on all profits earned, instead of the legal liability as at December 31st only. Thus, tax provision, including in the latest year tax on dividends, is up from £52,466 to £87,500. Depreciation and deferred repairs together receive £5,000 less at £15,000, so that it is possible to pay six, instead of three, months' preference dividends—and nine months' in 1940—bringing arrears up to October, 1941, and to retain £14,355 against nil for the equity. After charging one year's preference dividends, there would be equity earnings of 1.1 per cent. It is possible to raise the carry forward from £108,883 to £146,550 by crediting £18,000 reserve no longer required and £5,312 refund of income-tax. The directors point out that for the second year war damage charges have been deducted from the provision of £20,000 transferred in 1940. So far as the profits statement is concerned, the accounts suggest that that there has been a definite recovery in earning capacity, which explains the payment of a further year's preference dividend in April. It is plain from the balance-sheet that the expansion continues to place a severe strain on liquid resources. There has been a reduction in the secured bank overdraft of more than £100,000 to £416,632, but at the cost of a jump in the excess of current liabilities over liquid assets from £92,511 to £142,682, and a rise in net borrowing from subsidiaries from £3,942 to £9,284. There is also the contingent liability of Frs. 6,736,064 in connection with the partly paid shares of the French subsidiary, *Compagnie Industrielle Maritime*. Cash holdings amount to no more than £485. Thus, the financial position is still far from satisfactory, but the concern appears to be slowly recovering from the setback of 1940, and to be beginning to reap the fruits of the reconstruction of that year. The 4s.

ordinary shares now stand at 8s., which goes some way towards discounting a return to full prosperity.

Anglo American Investments

The item of revenue from all sources, earned by the Anglo American Corporation of South Africa during 1942, shows an increase of almost £100,000 to £1,073,544. Expenses and directors' special remuneration are higher, but tax provision is down from £100,000 to £76,000. This excludes tax on dividends, which has gone up with the raising of the distribution from 25 to 30 per cent, only just covered by earnings, which in 1941 amounted to 25.9 per cent. The company's debts to affiliates and others have increased by some £1,040,000 on the year, while a fall in creditors has been offset by the larger payments and an increase of £106,000 in unclaimed dividends. Loans to affiliates are substantially reduced and the balance-sheet value of shareholdings is lower by £258,000 odd. Funds from all these sources have gone to swell liquid assets, which are more than £1,650,000 up at some £10,203,000, most of the increase being in money on deposit or current account with the company's bankers. The balance sheet shows that shareholdings, taken in at £7,971,200, were valued by the market, or the directors, at £12,178,000. As these include the substantial holding of the group in Anglo American Investment Trust, one of the diamond owning concerns, the current market price may well be very substantially higher. There is no mention of these interests in the report, and most of the benefit from the recovery in profits and quotations will only be reflected in the accounts for the current year. Like the other South African finance companies, Anglo American was under-invested, a fact which may mean either that existing quotations were considered unattractive, or that liquid funds were considered essential to take advantage of more profitable opportunities in the near future. It has to be admitted that the former hypothesis appears the more tenable at the present time, but in the past five months or so the corporation has found money for more than one developing concern, while the shares of many of the companies in which it is interested have improved over that period.

Industry and Trade

Electricity and Gas

The future of the electricity and gas industries formed the subject of an interesting discussion at the Fuel Luncheon Club on Thursday last week. There can be no doubt that electrification has still a long way to go in this country and that even gas is by no means a declining industry. Fundamentally, the problem is one of the utilisation of coal by the most convenient and economical methods. From the national standpoint, there is a great deal to be said for speeding up the displacement of coal, especially for heating purposes in the house, by its cleaner products, electricity and gas. But from the consumers' standpoint, the rate of displacement must depend largely on alternative costs. The need for the electricity and gas industries, in fact, is to concentrate their efforts on securing reductions in costs and further improvements in the services provided to the consumer. This raises important questions of policy about the future organisation of the two industries. Hitherto, and especially during the pre-war decade, competition between gas and electricity, though not always effective, has provided a powerful stimulus to research and progress. Sir David Milne-Watson, chairman of the Gas, Light and Coke Company, drove home this point by asking for equality of opportunity for the competing kinds of fuel and freedom of choice for the consumer. Undoubtedly, direct competition between the two industries for the consumers' favour has been a strong influence for efficiency. But Major Lloyd George, Minister of Fuel and Power, appears to take a different view. He referred to "intensive and sometimes wasteful competition" between electricity and gas, suggested that "the consumer was left to pay," and concluded that some settlement must be reached if consumers' interests are not to be sacrificed. The argument could only be settled by a detailed and fully informed investigation. But one point is fairly clear. If there is to be an elimination of competition between gas and electricity, it cannot be on the basis of their present organisation. The possibility of turning the fuel industries into a public service deserves careful consideration; but so

long as they are operated mainly by private enterprise, competition provides the only sure path to efficiency and continued progress.

Landowners' Views on Agriculture

In a pamphlet on Post-war Rural Reconstruction Problems the Central Landowners' Association has brought together a series of memoranda containing its views on various aspects of post-war agricultural policy. The views are naturally those of a sectional interest and must be treated as such. The CLA includes the majority of owners of the larger agricultural estates in England and Wales, with a considerable number of owner-farmers, as well as many proprietors of small areas of rural land. Its purpose, as set out in the first rule of its constitution, is

to safeguard their legitimate interests (that is, those of owners of agricultural land) and to promote the industry of agriculture, but in each case only so far as is consistent with the interests of the nation, which are above those of any industry or of any individual.

In view of its composition, it is hardly surprising that the CLA champions the maintenance of private enterprise in agriculture on the basis of the existing system. The Association regards as "unnecessary and inadvisable" the acquisition by the state of the development rights of rural areas proposed by the Uthwatt Committee, and it has reached the conclusion that the nationalisation of the land would be a "disastrous policy for the nation." One of the arguments

FIVE THINGS

that RAPIDISM will do for you: it will (1) create will power; (2) perfect your memory; (3) increase your self-confidence; (4) train you to plan and organise; (5) enable you to realise your ambitions.

Write now for free Booklet to THE RAPIDISM INSTITUTE, E29, TUITION HOUSE, London, S.W.19.

adduced against the nationalisation of the land is that this would "throw an intolerable burden on the general taxpayer." It is supported by this extraordinary statement:

The private landowner obtains on the capital invested in land and its fixed equipment, a rate of interest substantially lower than that at which the Government borrows money. It follows that if a large burden on the general taxpayer is to be avoided, agricultural rents under state ownership would have to be doubled at least.

Are the landowners really offering a subsidy to the community and willing to remain content, for purely sentimental reasons, with a rate of interest lower than that which they would obtain from Government securities? How does this square with their demand for a "fair return for capital, labour and enterprise, for guaranteed prices, markets and state subsidies"? While emphasising the need for efficiency in agriculture, the CLA has nothing to say about the size of subsidy that, in their view, would be "consistent with the interests of the nation."

Conciliation Machinery

It is satisfactory that the last-minute hitch in the coal conciliation scheme has now been removed, and that both the employers and the unions, including the Northumberland miners, have accepted Lord Greene's solution. The Northumberland and Cumberland miners had objected that the conciliation scheme did not permit the reference of district matters to the National Board, except by mutual agreement of the two sides and that the district wage agreements "subject to mutually agreed alterations" could not be revised under the new machinery. Lord Greene has proposed a modification of the 1940 agreement so that either party may take a claim for revision of district agreements to an independent authority, provided that a "substantial change of circumstances is proved" and that the district issue is of sufficient national importance to merit reference to the national body. In this way, good will and commonsense have prevailed. The new machinery, if given a fair trial, should make for better relations in the industry and thereby help production, though it is not likely to have any immediate or direct effect on output. It is, therefore, to be hoped that the Minister of Fuel and Power will soon be able to state what steps are being taken to improve the efficiency and achieve the reorganisation of the industry. On the miners' side, the first-fruits of the Tunisian victory have been the decision of the Scottish mine-workers to work an extra day, in order to produce about 50,000 tons of coal.

Coal Fund

The financial allowances granted in the second quarter of this year to colliery undertakings by the new financial arrangements under the Coal Charges Orders of last June and July show substantial increases over those of the March quarter. It will be recalled that by these Orders the collection and distribution of the levies under the War Emergency Scheme and the guaranteed wage provision of the Essential Work Order, amounting to 7d. per ton, was transferred from the Central Council of Coal Owners to the Ministry of Fuel and Power; and that under the authority of these Orders the proceeds both of the 3s. per ton increase in the price of coal in June, 1942, to cover the cost of the Greene wage award and of the 1s. increase on January 1st last were made payable into the same central fund, together with a contingency levy of 6d. per ton. These charges were consolidated into a general levy of 5s. per ton on commercial disposals, yielding at the rate of about £45 millions per annum. This fund is now employed to meet the undertaking of the Government last autumn to provide the industry with a national average credit balance of 1s. 9d. per ton (with appropriate credit balances, based on past performance, for each district), as well as to discharge the costs of the Greene wage, of the output bonus, guaranteed wage payments, assistance to necessitous undertakings, and certain minor charges. Under the original war-period financial arrangements, increased costs were met by differential price advances, but it seems that the Government considers the method of price allowances from a common pool better adapted to meet the requirements of the new profit-earning scheme and the special claims of high-cost colliery districts. The increase in the allowances between the first and second quarters is due partly to certain adjustments which have been made in the trading results in order to cover grants to necessitous undertakings, but

mainly, it is believed, in order to improve the current trading balances in the least remunerative coalfields, where recent joint ascertainment have shown very small credit balances and in one or two cases actual losses. The allowances amount to 1s. 1d. per ton in Scotland (with certain Lanarkshire pits receiving 2s. 7d. per ton); 1s. 3d. in Northumberland; 2s. 6d. in Durham; 2s. 3d. in Yorkshire; 2s. 1d. in Lancs. and Cheshire; and 2s. 8d. in South Wales on bituminous coals, 4s. 2d. on washed and graded smalls, and 7s. 7d. per ton on anthracite. In a large measure these disparities are an expression of the unequal incidence of war conditions on the coal-mining industry. The purpose of the central coal fund, in fact, is analogous in many respects to that of the steel industry's; but the corollary of compensation is insistence on the efficiency of those who claim it.

Industrial Management

Mr Bevin recently remarked in the House of Commons:

I know of no more harassed persons in this war than works managers. A works manager has a terrible responsibility. He has to keep production going and as a rule he has to be a good engineer, a good psychologist and a variety of other things. He is not always blessed with the most intelligent of directors.

The fact is that management, like labour, has been very heavily diluted since the war, and has had to face completely new and often very difficult problems. Sir Stafford Cripps, speaking at the "Oxford" Management Conference on May 16th, paid a tribute to the work which managements have performed, often under superhuman difficulties, such as the constant modifications of programmes to meet operational needs, shortages of materials and machines, the dilution of labour and the inflow of "green" labour. He stressed the importance of personnel management, which by introducing a more human approach could be of inestimable value in facilitating the adjustment of new entrants to factory conditions and reducing labour wastage and unnecessary absenteeism. Sir Stafford also referred to the value of joint production committees and to the contribution which all employed at a factory could make, whether foremen, technicians, shop stewards or trade unionists; but—as he has frequently insisted in the previous speeches—the final responsibility rests with the management, and if things go wrong, it is the management which gets blamed. Other speakers at the Conference spoke on similar lines. Mr Samuel Courtald pleaded for better understanding, and Mr Gordon England for greater ingenuity and flexibility to meet changing circumstances. Dr G. S. Walpole, from his practical experience of joint consultation, spoke of its value in improving output, and urged the establishment of joint consultative machinery at the national as well as at the factory level. Management, he said, should be regarded as "an integral but separate factor in industry, and any attempt to identify management with ownership is illogical and wrong." Increasing attention is being paid to-day to questions affecting management—the basis of recruitment, including promotion from the ranks, education and training for management and management's relations with capital and labour. The "Oxford" Management Conference was useful in focusing attention upon some of these problems, which will become more urgent during the transition from war to peace.

Planning Roads

The need for a bold improvement in Britain's road system, stressed in a recent report by the Institution of Highway Engineers, is as urgent in built-up areas as it is in open country. The decision of the Ministry of War Transport, with the concurrence of the Minister of Town and Country Planning and the Secretary of State for Scotland, to appoint a committee

to consider the design and layout most appropriate to various types of roads in built-up areas, with due regard to safety, the free flow of road traffic, economy, and the requirements of town planning

is therefore to be welcomed. The committee is essentially one of experts; it includes representatives of the Planning Ministers and of the architectural and planning professions. The replanning of roads in built-up areas is, of course, part and parcel of town planning as a whole. The committee

COMPANY MEETINGS

SCOTTISH UNION AND NATIONAL INSURANCE COMPANY

PAST YEAR'S GOOD RESULTS

TOTAL ASSETS EXCEED £18,000,000

MR JAMES L. MOUNSEY'S STATEMENT

Mr James L. Mounsey, W.S., chairman, presided at the one hundred and eighteenth annual general meeting of the shareholders of the Scottish Union and National Insurance Company, held at Edinburgh on May 19, 1943. In moving the adoption of the report and accounts for the year 1942, he stated:—

LIFE DEPARTMENT

In spite of the difficulties created by war conditions it is satisfactory to note that the new life sums assured increased by £161,018, whilst the mortality experience continues to be favourable.

A factor of great importance in the life department is the possibility of increased mortality through causes directly or indirectly due to the war. Up to date the claims by death due to hostilities have been comparatively small. With the prospect of new fronts being opened in the near future, we may be faced with considerably more claims from this cause than has so far been the case. In addition, the extent to which the future rate of mortality will be affected as a result of the physical and mental strain to which combatants and non-combatants alike have been exposed as a result of the war, can only be conjectured.

It must also be remembered that every company has upon its books at the present time a large number of contracts under which the premiums were fixed at a time when it was reasonable to expect that the average rate of interest earned over the period of the contracts would be considerably higher than now appears probable. Fortunately the trend which events might take was recognised some years before the war, and in 1937 the valuation rate of interest used in estimating the liability in the life department was reduced to 2½ per cent. The wisdom of this step is now obvious, and despite the fall in the net interest rate earned, due to cheap money and high taxation, we still have a satisfactory margin over and above the valuation rate of interest. The gross rate of interest earned on the life funds in 1942 was £4 6s. 6d. per cent., and the net rate £3 0s. 5d. per cent.

Our life department fund was valued at the end of 1942. The surplus earned during the five years, including £92,110 brought forward from 1937, amounted to the substantial sum of £1,077,642. Having regard to the difficulties already referred to, this surplus will, I hope, be regarded as satisfactory. The directors decided, after careful consideration, that after providing for the payment of interim bonuses to policyholders whose policies become claims before the next valuation, the surplus should be carried forward. In view of the uncertainties of the future, your directors feel that any other course would be imprudent. It is our intention to review the position so soon as conditions have altered sufficiently for a clearer view of the future to be taken.

FIRE DEPARTMENT

I am glad to be able to report a further improvement in our fire account. Net premiums again show an increase, although only slight, whilst claims paid and outstanding are a little less than in the previous year.

In the U.S.A. and Canada the progress of the war has brought with it inevitable changes. In those countries schemes of war damage insurance have thrown additional

burdens upon the shoulders of insurance companies, but, as in Great Britain, these burdens were cheerfully accepted and the work involved carried through at a minimum of expense to the Governments concerned.

Last year there was further restriction of the areas in the Far East where we carried on business due to their temporary occupation by the Japanese. Fortunately, however, if the shadow still moved forward in the East it has begun to lighten in the West. Algeria and North Africa, where we had useful and developing interests before the war, have already been freed, and although it may be some time before private commerce can be resumed with French North Africa, we are ready at the earliest opportunity to take up the broken threads, and it is my earnest hope, and I am sure it is yours, that before we meet again many additional areas will have been liberated from the Nazi yoke. This applies equally to the marine and accident departments as well as to the fire department.

ACCIDENT DEPARTMENT

In the accident department we show a slight fall in aggregate premium income, which is due to the drop in premium from motor business. Each section of the account, it is satisfactory to report, has earned a profit.

Last year reference was made to the continuing adverse experience in our overseas motor account. This position, I am glad to say, is steadily improving, which is due to the steps we have taken during the past two years.

MARINE DEPARTMENT

Turning to the marine account, which, as you know, is in the care of our associated office, the Maritime Insurance Company, I cannot do better than quote some of the comments of Colonel V. E. Cotton, the chairman of that company, made at their recent annual general meeting.

"The net premium for 1942 showed an increase of almost exactly a quarter of a million pounds over that for the preceding year. This fact has to a large extent affected all the other items in the accounts, for increased premiums necessitate increased reserves. It was therefore natural that the directors should act with caution in making transfers to profit and loss account."

"Another point which calls for comment is that claims paid, even allowing for increased premiums, show an unwelcome growth. This is mainly due to very large settlements on American account in the early part of last year, when claims for war casualties were particularly and unexpectedly heavy. The American market has, however, taken vigorous steps to put its house in order, and I am hopeful that from now onwards our American business will be once again on a satisfactory basis."

"Marine insurance as it was practised before the war was an intricate, delicate and flexible mechanism, world wide in its ramifications and constantly adapting itself to new and changing circumstances. Into this mechanism was thrust the crowbar of war, and if, after the war, it is to be reconstructed so as to function with anything like its former efficiency, it is probable that considerable modifications will be necessary in practices which had grown up over a long period of years. Already we see signs of greater simplification brought about by the needs of economising in labour, so that men

PROFIT AND LOSS

Reverting to our own immediate affairs, in the profit and loss account it will be noticed that interest and dividends, both gross and net, show an increase on the previous year due to an increase in funds. Expenses show only a slight advance. The provision for taxation includes all sums we shall be liable to pay in respect of profits earned in the year which has just closed. The balance carried forward at £295,723 is greater by £81,215 than in 1941.

BALANCE SHEET

The balance sheet which is now submitted shows our total assets at £18,867,206, an increase of £520,155 on the previous year.

The reserve funds of the company, excluding life funds and capital, are £4,122,000, being 160.6 per cent. of the premium income.

During recent months a full examination of our Stock Exchange and other investments has been made following our usual practice of making a detailed investigation every five years. The value of our Stock Exchange securities were in the aggregate substantially in excess of our book values. Whilst the requirements of the Government, to satisfy the needs of the war effort, have severely restricted our investment programme, we have willingly continued to invest our available monies in Government loans, our holdings in which now stand at £4,352,267, an increase of £695,078 during the year. In this our associated company, the "Maritime," has contributed its share.

Regarding our American subsidiary companies, the companies' shareholdings remain at the disposal of His Majesty's Government in accordance with the provisions of the Financial Powers (U.S.A. Securities) Act, 1941. As stated last year, the companies' operations are being carried on under the same conditions as before.

In conclusion, I should like to express our thanks and appreciation to our general manager for his efforts on our behalf. The good results of the past year are due in no small measure to his untiring energy and enthusiasm, and despite all his preoccupation with present worries and difficulties it is greatly to his credit that he still finds time to look ahead, consider and plan for post-war development.

The report and accounts were adopted.

THE LIVERPOOL AND LONDON AND GLOBE INSURANCE COMPANY, LIMITED

In a statement circulated with the 107th annual report of the Liverpool and London and Globe Insurance Company, Limited, the chairman, Mr P. R. England, indicated that total fire, accident and marine premiums, at £10,485,290, showed an increase of £475,943 over 1941. Underwriting profit was £949,528, against £750,784.

New life business, at £1,264,519, was some £67,000 less. New premiums were somewhat higher.

Fire premiums, at £3,705,732, compared with £3,964,216 in 1941. Policyholders were urged, in their own interests, to increase sums insured in line with up-to-date values.

Accident department trading was again satisfactory, premiums, at £5,045,712, comparing with £4,928,422.

Marine premiums, at £1,733,848, showed a substantial increase over the 1941 figure of £1,116,709.

Net interest was £317,251 (against £323,857).

The directors recommended a final dividend of 13s. 6d., making 27s. per share, less tax, for 1942.

THE STANDARD LIFE ASSURANCE COMPANY

CONTRIBUTIONS TO WAR EFFORT

STRINGENT VALUATION OF ASSETS

The one hundred and seventeenth annual general meeting of the Standard Life Assurance Company was held in Edinburgh on the 18th instant, Mr J. C. Campbell in the chair.

The manager and actuary having read the auditors' report, the Chairman said: Gentlemen,—May I take it to be your wish that the directors' report, which is in your hands, should be held as read?

Before reviewing the results of last year I must refer to the company's loss through the resignation from the board for reasons of health of Mr H. A. Jamieson. Mr Jamieson's wise counsel on financial matters during the period of 17 years which he served on the board was greatly appreciated by the directors, and his helpfulness as chairman from 1939 to the date of his retirement—a difficult war period—was most marked. I regret also to report the death of Mr Forbes Angus, who not only served the company as a director in Canada for 31 years but for the last 24 years as chairman of our Canadian board. A man of wide experience, he contributed greatly by his valuable advice to the steady development of the company in the Dominion. It gives me pleasure to take this opportunity of saying how glad we are to have Mr Walter Molson as the new chairman of our Canadian board and also Mr W. H. Clark Kennedy, our manager for Canada, as a member of the Canadian board.

INCREASE IN NEW BUSINESS

Once again I am pleased to be able to submit to you a very satisfactory report. You will notice a substantial increase in new business. The total, after deducting re-assurances and including group life assurances, was £3,001,000, which represents an increase of £996,000 on the figure for the previous year. I should like to lay stress upon the fact that this increased business has been obtained during a year in which the company's outdoor staff in this country has been almost entirely withdrawn from active participation in the new business organisation. At the beginning of last year a few members of our outdoor staff still remained, but we took steps to arrange that in so far as the United Kingdom and Northern Ireland were concerned all these men should be diverted to more essential work. Some of them have joined the Forces, others have taken up alternative work of national importance, whilst the remainder are carrying out essential indoor work at head office and various branches. It is perhaps fitting that I should pay a tribute to the work in the past of our outside men who have built up the connections of the company on such a sound basis that new business continues to come in without seeking. Our field force in countries overseas, where their activities are not so far greatly restricted, deserve no less praise for their success under difficult conditions. A substantial total of deferred annuities, mainly in connection with staff schemes, has also been completed, and a sum of £370,000 has been contributed for the purchase of immediate annuities.

LOW RATE OF EXPENSE

Turning to the revenue account of the life assurance and annuity fund you will note a small reduction in the amount of claims by death in spite of the total including £99,000 directly due to the war. At the same time you will be pleased to see that the premium income which shows a considerable increase over last year now stands at over £2,600,000. It is worth mentioning that of this amount less than

£15,000 has been contributed by way of single premiums. The net interest revenue shows an increase at £1,347,000 and represents a net rate of interest on the life assurance and annuity fund of 4.18.11d. per cent., which, although it again shows a reduction on the previous year, must give satisfaction to members. The expense ratio is still low at 10.4 per cent.

The total assets as shown in the balance-sheet are now £36,976,000, representing an increase of £1,721,000 over last year's total. The directors have again been able to state that in their belief the value of the assets was in excess of the balance-sheet figure. I take this occasion to inform members that, after a very careful and thorough investigation of the value of the various assets of the company had been made, the amount by which this value exceeded the figure in the balance-sheet was found to be considerable.

LARGE CONTRIBUTIONS TO GOVERNMENT LOANS

The policy of contributing largely to British Government loans has been continued and you will see from the balance-sheet that our total holding of British Government securities at November 15th last was £11,623,000—an increase of £2,053,000 during the year. The company's holding in British Government securities has increased by no less a sum than £7,581,000 since the commencement of the war, and of this total £6,495,000 was subscribed to new war loans. These figures speak for themselves, and it should be unnecessary for me to lay stress upon the fact that the company, by encouraging saving through the medium of life assurance policies, is making a very real contribution to the nation's effort. All excess income of the company over outgo in this country, and a considerable proportion of other funds available for investment are being invested in new war loans and in addition substantial contributions have been made by our Canadian branch to the new war loans raised by the Canadian Government.

STAFF AND THE WAR

We are also naturally very proud of the war effort which is being made by the staff. Only one quarter of our pre-war male staff of all ages is still in active service with the company, the remainder being away on service of one type or another. In addition a number of members of our female staff are also on service. The work is being carried on at home by a small nucleus of our regular staff assisted most willingly and loyally by a temporary wartime female staff. All the members of this temporary staff are seeking employment only for the period of the war, so that we are in a position to say not only will we welcome our regular staff back when the war is over but we shall urgently require their help. In the meantime it is no mere formality to say how greatly we appreciate the arduous efforts of those who are carrying on the work of the company under more difficult conditions.

POST WAR PROSPECTS

During the past year much has been said and written of projects for insurances of a national character after the war. Many of these are admirable and represent a desirable co-ordination of and supplement to our existing schemes of social insurance. It is, I feel sure, to be expected that these wider schemes, when they come into force,

will enlighten the public still further regarding the benefits of insurance, and people will wish to make even greater use of the opportunities which companies such as the Standard offer. Our men in the Forces may well feel that when they come back they will be returning to perform a highly useful function and one which will be appreciated by the public in assisting to promote the extension of insurance by the individual for his individual responsibilities. Apart from minimum benefits through national schemes, the Standard, by offering facilities upon the mutual principle, enables members of the public by their own efforts to provide upon a profit-sharing basis for the comfort of old age and for the security of those who are entitled to look to them for protection from want.

I greatly regret to have to report the death since the last annual general meeting of another member of the staff in the Forces, Mr R. P. Tytler. We extend to his wife and relatives our sincere sympathy in their bereavement. Also since our last meeting two other members have been wounded, one being a prisoner of war, and I am sorry to say that we have just heard that another young member of the head office staff is missing as a result of operations in Burma. You will all wish me, I know, to send our greetings and best wishes to our staff in the Forces and to wish them a safe and speedy return.

As will be seen from the report, Mr A. J. Mascall retired from his position as manager and secretary last September after serving the company with distinction at home and overseas for the long period of 52 years. Mr A. R. Davidson was appointed manager and actuary as from the date of Mr Mascall's retirement.

I now move the formal adoption of the report, revenue accounts and balance-sheet submitted.

Dr John Sturrock seconded this motion and the report was unanimously adopted.

EQUITABLE LIFE ASSURANCE SOCIETY

RECORD NEW BUSINESS

The one hundred and eighty-first annual general meeting of the Equitable Life Assurance Society was held, on the 19th instant, in London.

The president, Major Desmond Abel Smith, referred to the retirement of Sir William Elderton from the position of actuary and manager. Since his appointment in 1913 the funds had doubled in amount and annual new business had increased from £250,000 to over £2,000,000.

The principal change in the balance-sheet was the increase in the holding of British Government securities from £1,250,000 to £2,100,000. The market value of Stock Exchange securities exceeded their book value by well over £500,000, and the president was satisfied that there had been an improvement in other investments. High taxation and the growing proportion of the funds invested at a low rate of interest had had an adverse influence on bonus-earning power, but with reasonable caution the society should emerge from the war in a sound condition and again earn satisfactory bonuses for members. At the end of 1943 the bonus position would again be reviewed.

New business for 1942 constituted a record. The figures were greatly influenced by a large staff scheme, but apart from that new sums assured were over £1,100,000. The claims under whole life major profit policies showed the usual remarkable results. War claims at about £70,000 were almost exactly the same as in 1941; the granting of a restricted amount of cover during war-time, whatever the cause of death, had so far been justified.

The report was unanimously adopted.

COMMERCIAL UNION ASSURANCE COMPANY, LIMITED

SATISFACTORY RESULTS

SIR BERTRAM HORNSBY'S STATEMENT

The annual general meeting of the Commercial Union Assurance Company, Limited, will be held, on the 25th instant, at 24, Cornhill, London, E.C.

The following is an extract from the statement of the chairman, Sir Bertram Hornsby, circulated with the report and accounts for the year 1942:—

FIRE DEPARTMENT

The outcome of the company's operations in 1942 has been satisfactory. In the fire department the premium income at £5,945,573 shows an increase of £131,980 over that of 1941. There is a net underwriting profit of 8.9 per cent.; £550,000 is transferred to profit and loss account and the fire fund now amounts to £7,223,818, or 121.5 per cent. of the premium income. In the United Kingdom our premium income shows a substantial increase, but losses were heavier.

LIFE DEPARTMENT

In the life department the process of recovery from the first effects of the war continued satisfactorily. The amount of new sums assured after deduction of re-assurances was £4,442,842, an increase of £635,904; the premium income of £2,090,174 was up by £85,971, and the life fund increased by £794,316 to £30,711,980.

This being the last year of a quinquennial, the assets of the life fund have been carefully reviewed. The surplus amounted to £2,503,894. It was decided that a distribution should be made now of £1,456,406, of which £1,298,120 is used to provide a bonus to policyholders at a rate approximately four-sevenths of that last declared and the balance goes to the stockholders. It has been decided to continue for this year to allow interim bonuses at a somewhat lower rate in the case of those policies becoming claims.

MARINE DEPARTMENT

The net premiums in the marine department amounted to £2,989,153 and claims paid and outstanding to £2,162,015; £150,000 has been transferred to profit and loss account. The substantial increase of £1,512,498 in premium income has followed the entry of the United States of America into the war. The marine fund now stands at £2,628,167, or 87.9 per cent. of the premium income.

ACCIDENT DEPARTMENT

In the accident department the premium income at £7,735,594 shows a reduction, as might have been expected. The amount of the reduction is £606,584, and there emerges a profit of £1,244,890, or 16.1 per cent.

PROFIT AND LOSS ACCOUNT

In the profit and loss account transfers from departmental accounts totalling £1,800,000 exceed last year's figure by £350,000. Taxation paid and provided is the huge figure of £1,915,683. This is £663,099 more than last year, and represents no less than 11.5 per cent. of the combined fire, marine and accident premium income for the year.

The usual appropriations are made to guarantee and pension fund and for writing down freehold premises, and £250,000 is transferred to contingencies and taxation fund, raising that fund to £1,066,365. The balance remaining will meet the cost of the final dividend of 3s. 6d. per £1 stock recommended by the directors and leave £223,340 to be carried forward, an increase of £25,838.

THE EASTERN BANK, LIMITED

DIVIDEND RAISED TO 5 PER CENT.

SIR JAMES LEIGH-WOOD'S STATEMENT

The annual general meeting of The Eastern Bank, Limited, will be held the 9th proximo in London.

The following statement of the chairman, Sir James Leigh-Wood, K.B.E., C.B., C.M.G., has been circulated with the report and accounts for the past year:—

It is with sorrow that I have to record the death of Sir John Caulcutt. This sudden loss following shortly after the resignation of Sir Bertram Hornsby owing to ill health, has deprived the board of the wise counsel of two distinguished bankers. They will be sadly missed by their colleagues on the board.

We have invited Sir Harold Snagge, K.B.E., to join the board, and his name will be submitted for election at the general meeting. I am sure his long experience as a merchant and banker will be of great value to the bank.

Paper restrictions entail further compression in this statement of our affairs, and there is indeed little for me to add to the accounts as presented.

NET PROFIT MAINTAINED.

The net profit of £95,580 6s. 10d. is virtually the same as that shown last year. The total dividend for the year of 5 per cent. compares with 4½ per cent. for 1941, and £45,000 has been appropriated to contingencies and property account as shown in the report. All assets in Singapore have been written off other than cash deposited with bankers or with the Government of the Straits Settlements and an investment in the Government Three per Cent. Loan of 1940.

Current and deposit accounts have continued to increase, being nearly £4,000,000 greater than those shown in last year's balance-sheet. Bills payable are slightly down and the further falling off in acceptances on account of customers by £33,000 reflects the continued restriction in merchants' business.

On the other side, while our cash and bills receivable show little change, our investments in short-term Government securities are greater by £4,846,000.

We regret to note a decline of some £680,000 in our advances to customers, mainly due to abundant money.

With regard to exchange transactions as well as to advances, maritime trade being so much under Government control, all we can hope to do is to maintain our share of the dwindling volume requiring bank finance.

POSITION IN INDIA AND IRAQ

The Government of India has paid off all but a small amount of its public debt held in this country and has accumulated further substantial balances of sterling.

The kingdom of Iraq has also been prosperous and has given notice to redeem the balance of the 4½ per Cent. Loan for £1,000,000 issued in London in 1937.

The effect of expanding note currencies in India and Iraq is reflected in greatly increased prices for foodstuffs, particularly to the embarrassment of our local clerical staff, whom we continue to assist by grants-in-aid.

Since our last report two members of our British staff serving with the Forces have been killed and one taken prisoner of war; all efforts to obtain further news of our Singapore staff have been unsuccessful. We extend our sympathy to the relatives of these men in their sorrow and anxieties.

In conclusion, on behalf of my colleagues and of the shareholders at home and in India, I wish once again to express appreciation of the services rendered by our staff of all grades during a year of increasing difficulty.

INCORPORATED ACCOUNTANTS

CO-ORDINATION NOT MONOPOLY

The annual general meeting of the Society of Incorporated Accountants and Auditors was held, on the 20th instant, at the Incorporated Accountants' Hall, Victoria Embankment, W.C. Mr Richard A. Witty, F.S.A.A., the president, was in the chair.

The chairman, in the course of his address, said that in regard to co-ordination in the accountancy profession, the Councils of the Institute of Chartered Accountants in England and Wales, the three Scottish Societies of Chartered Accountants, the Society of Incorporated Accountants, and the Association of Certified and Corporate Accountants, had appointed special committees who had met together to consider the matter. Progress had been made, but a definite pronouncement as to details was not yet possible. The proposals would be an attempt to embody the following broad principles: (a) the setting up of a co-ordinating council; (b) the maintenance intact of the status and designations of Incorporated Accountants and members of other accountancy bodies; and (c) the assurance that none shall be in public practice as accountants without having received adequate and proper training and experience. He emphasised that there could be nothing in the nature of a monopoly. The ever-increasing responsibility placed upon qualified accountants made it imperative that the profession should have a statutory basis. Incorporated accountants had striven towards the goal of co-ordination for many years and they would specially welcome the opportunity of working in still closer harmony with other branches of the profession.

TAXATION QUESTIONS

The society had accepted with pleasure the invitation of the Institute of Chartered Accountants to join in presenting a memorandum to the Board of Inland Revenue on questions concerning E.P.T. and taxation generally. There was every reason to believe that the Board of Inland Revenue would be prepared to continue discussions with a Taxation Committee representative of the whole profession.

The proper determination of the Government to take the profit out of war, mainly through costing and E.P.T., had inferentially led to some suspicion of the profit motive. The profit motive was an honourable motive. It was the incentive for effort, and effort was the proof of a nation's vitality. Private enterprise implied the profit motive, but that was no reason for maintaining that private enterprise should be regulated, governed, controlled, planned, supervised, concentrated and restricted by statutory rules and orders. He recognised that immediately after the war some degree of control would be necessary in the interests of the nation and of commerce itself, but he hoped this control would be transitional.

POST-WAR PROBLEMS

The Research Committee of the Society had resumed its activities. Its purpose was to consider major questions directly relating to public practice, to make pronouncements from time to time for professional guidance and to issue suitable publications.

Without deflecting the attention of members from the serious preoccupations of the war, the Council had considered the policy of the society to be pursued after the war in relation to its examinations and membership. An advisory committee had prepared a report and he expected that it would reflect the view of the Council that the Society must call for increasing the standards in education, training and efficiency, especially in the unknown conditions of the future. The treatment of a large number of candidates serving with H.M. Forces would have separate consideration by a special committee.

THE DAILY MIRROR NEWSPAPERS, LIMITED

MR JOHN COWLEY'S REVIEW

The twenty-third ordinary general meeting of the Daily Mirror Newspapers, Limited, was held on the 19th instant, at the Memorial Hall, London, E.C.

Following is the statement of the chairman, Mr John Cowley, which was circulated with the report and accounts:

Although again we have had a very good trading year, you will notice that the payment of the final dividend of 5 per cent. on the ordinary stock which we recommend, making a total of 10 per cent. for the year, makes another inroad into our carry forward. This position is caused by the very heavy provision we have had to make for excess profits tax. I have in previous years expressed my views on this burden. Our hopes of receiving a dividend on our large shareholding in Anglo-Canadian Pulp and Paper Mills, Limited, have not been fulfilled. It would be idle to say we are not keenly disappointed, but the many temporary adverse factors, due to war-time conditions, in Canada and the United States which have prompted the directors of that company to decide not to make a dividend declaration are well understood here. I am glad to be able to say that the dividends accruing to the company from our other many and varied investments have been very satisfactory.

PAPER SUPPLIES POSITION SATISFACTORY

The position of paper supplies, after three and a half years of war, may be regarded as satisfactory. We obtain the whole of our newsprint through the auspices of the Newsprint Supply Company, which company, working in collaboration with the Ministry of Supply, has contrived to give every newspaper, national and provincial, a square deal. In looking forward to a continuation of supplies of newsprint with some confidence, I would stress the need of a real nationwide effort to collect wastepaper, which apart from its use in the making of newsprint, is valuable for other purposes in many spheres of war-time industries. Indeed, it behoves everyone to further in every possible way the collection of those waste materials which are so needful to the country at this time.

Newspaper sales are fixed and, as you may be aware from experience, very few, if any, copies are available for chance readers. The old follies of gift schemes, canvassing and free insurance have disappeared into newspaper history. In regard to this, I may add that I trust history will not repeat itself.

INVESTMENTS

The company's investments have not altered greatly during the year, apart from a subscription of £50,000 for Savings Bonds. During the recent "Wings for Victory" week we took up another £50,000 worth, bringing our war-time investment in Government stocks to £225,000. You will notice that the reference on the balance-sheet as to the value of the investments does not include quoted shares. These have had a very considerable recovery, and in the aggregate are now worth a great deal more than the figure at which they stand in our books.

In spite of the many difficulties which beset war-time newspaper production, our editorial staffs continue to produce an attractive and distinctive paper daily.

In addition to editorial staffs, the production of newspapers calls for the labour of many skilled hands engaged in many diverse operations. You may imagine it is not an easy task to reconcile the needs of our industry with the ever-increasing demands for the release of labour for the direct service of the nation. The position creates a problem difficult of solution.

Last year my brief remarks ended with these words: "I record sincere thanks to all members of the staff for their loyal service. During the year many more of our people have left us for National duty. Those who remain gladly carry on to the best advantage, and with goodwill and helpfulness ease the care of management. To those members of the staff who are serving their country in so many diverse ways at home and in many parts of the world I would like to send a message of greeting and thanks. They are bearing our burden, preserving our present, and ensuring our future. We wish them a safe return."

I repeat them, because I believe they express our feelings very simply and honestly.

The report and accounts were unanimously approved, and the auditors, Messrs Deloitte, Plender, Griffiths and Co., were reappointed.

SUNDAY PICTORIAL NEWSPAPERS (1920), LIMITED

MR JOHN COWLEY'S STATEMENT

DIVIDEND INCREASED

The twenty-third ordinary general meeting of Sunday Pictorial Newspapers (1920), Limited, was held on the 19th instant, at the Memorial Hall, London, E.C.

Following is the statement of the chairman, Mr John Cowley, which was circulated with the report and accounts:—

The accounts for the year ended February 28th last show a profit of £222,573 6s. 6d. after providing for taxation, working, office and other expenses, contingencies, etc.

The dividends received from our investments improved, and it has not been thought needful to transfer to the contingencies account so much as we did last year.

In consequence, our showing is considerably better. From the directors' report you will see an appropriation of £20,000 is made for the reserve account, and £5,000 is earmarked as a provision for pensions. In recent years, we have built up our taxation reserve to £100,000. As this amount should suffice to cover any income-tax payment for which we may be liable on January 1st next, we do not propose to add to this reserve.

THE DIVIDEND

An interim dividend of 5 per cent. was paid last November, and the final dividend of 10 per cent. proposed will make a total distribution of 15 per cent. for the year on the ordinary capital against 12½ per cent. Very careful consideration has been given to this matter, and we hope the ordinary stockholders will approve the decision made to recommend the payment of 2½ per cent. more than last year.

I do not think it needful to make detailed references to the changes in our balance-sheet figures. You will notice that the investments total is exactly £50,000 more than a year ago, reflecting a subscription made for Savings Bonds.

During the recent "Wings for Victory" week, we took up another £50,000 3 per cent. Savings Bonds. I may mention that the voluntary work done by our employees in connection with the War Savings groups at our offices and works has been continued with fruitful results.

You will notice a footnote on our balance-sheet: "In the opinion of the directors any depreciation in the value of the unquoted shares is covered by reserves." Last year the footnote covered shares with a Stock Exchange quotation as well, but I am very pleased to inform you that the market price of such shares in our portfolio now exceeds the book value by a comfortable margin.

CONTINUED PROSPERITY OF "SUNDAY PICTORIAL"

Again I am glad to be able to tell you that the *Sunday Pictorial* has prospered. Our sales are as large as the strictly limited quantity of newsprint we are allowed to use will permit. Distribution arrangements are made with great care. Readers will appreciate that with a demand for the *Sunday Pictorial* greatly exceeding the number we are able to supply, unavoidable disappointment must be caused to those unable to obtain a copy.

The advertisement revenue was very satisfactory, and we regret that we have had to disappoint many advertisers who desired to use our columns for their announcements.

As time goes on our labour problems do not grow less, and as more people are called to National duties, a greater burden and responsibility falls on those who are left. It is a pleasure to me to record that they have gladly and willingly responded, and have been unfailing in their loyalty and zeal to serve your company in every possible way. Personally, and on your behalf, I thank them.

The report and accounts were unanimously approved, and the auditors, Messrs Deloitte, Plender, Griffiths and Co., were reappointed.

STEWARTS AND LLOYDS, LIMITED

MR A. C. MACDIARMID'S STATEMENT

The fifty-third ordinary general meeting of Stewarts and Lloyds, Limited, was held, on Tuesday, May 18th, at the registered office of the company in Glasgow. Mr A. C. Macdiarmid, the chairman of the company, presided.

The notice calling the meeting was held as read, and the secretary (Mr L. M. T. Castle) read the auditors' report.

The chairman said:—
A copy of the directors' report was sent to each stockholder, and I presume you will, as usual, agree to hold it as read.

For reasons with which you are now familiar, I am not at liberty to make a speech on the customary lines, but I shall read to you my statement circulated with the report and accounts.

"This statement is being issued with the report and accounts in place of the speech which, under normal circumstances, I should have made at the annual general meeting to be held in Glasgow on the 18th instant. Cards of admission to the meeting, which will be formal, are not being issued. A quorum has been arranged, but any stockholder who wishes to be present will be welcome.

Stockholders will appreciate that it is not possible for me to make the usual review of the company's activities. The accounts submitted show that the company's affairs are in a sound condition.

During the year the company took over the assets and liabilities of a subsidiary company, the Newport and South Wales Tube Company, Limited. The dividend received out of profits retained in former years by a subsidiary company shown separately in the statement of consolidated profits, formed a part of this transaction. The loan from bankers, amounting to £200,000, which appears under the balance sheet heading 'Current Liabilities and Provisions,' was included with the liabilities taken over from this subsidiary company and, by agreement, is not repayable until December 31, 1946. The loan of £1,000,000 which appeared under the same heading in last year's balance sheet was repaid during 1942.

The directors again wish to express their appreciation of the services rendered by the whole body of staff and employees of the company under difficult and trying conditions."

The report and accounts were adopted and the resolutions regarding payment of dividends, the re-election of directors and auditors were duly passed.

AULT AND WIBORG, LIMITED

RECORD PROFIT

The ninth ordinary general meeting of Ault and Wiborg, Limited, was held, on the 14th instant, in London.

Mr Gerald Wellesley (the chairman) said that the profit for the year was the highest yet earned in the company's history and amounted to £80,068. The directors recommended dividends totalling 10 per cent. on the ordinary shares and were carrying forward £21,951, against £17,239 a year ago. During the past year the net assets of the company had increased by £43,605, bringing the total increase since the company's formation eight years and nine months ago to £206,228.

The figures were particularly satisfactory in view of the fact that the country's consumption of ink and rollers, which in normal times provided almost the whole of their output, had continued to decline. Despite that their own production of those goods for the general printing trade, and for the newspapers and periodicals which were so essential to the community in these times, had been well maintained. A very considerable increase had also taken place in their turnover of paints, varnishes and metal decorating products.

During the year under review their efforts to broaden the basis of their business had borne increasing fruit. Production in lines directly applicable to the war effort had expanded steadily and continued to do so. While the attention of the board and staff were largely concentrated on making the best use of the company's plant and equipment, having regard to the present circumstances, sight had not been lost of the substantial developments which

(Continued from page 666)

has been asked to report as rapidly as possible. No doubt it will produce an excellent report. Past experience has shown, especially in so far as London's communications are concerned, that the real difficulties begin when it comes to translate recommendations into practice.

The New Ration Book

Distribution of the new ration book, which will come into use on July 25th, was begun last Monday. The method is simple: consumers are collecting the books from their local food office, in alphabetical order. Announcements are being made locally as each batch is ready. All the consumer ration documents are being issued in one volume; even the clothing book has been bound in. The chief innovation in the food book is the printing of the coupons for the main rationed foods (meat, eggs, fats, cheese, bacon, sugar and preserves) on one page, instead of giving each a page to itself. In this way, all these rations are accommodated on four pages of the book. It will be of great assistance to the housewife, who can see at a glance which of her rations she has bought, and it will save shopkeepers the trouble of turning over pages, although they may grumble at first at the smallness of the space provided for cancelling the coupons. Tea coupons, which have to be cut out, are smaller than the current ones. There are three spares, K, L and M, of the same design as the tea coupons. Points are similar in design and layout to the current ones. Personal points (the present ones are for sweets and chocolate) can be detached page by page. There is no page marked for soap, but there are two panels on the back cover, and a grid on the inside front cover. The book has been simplified in many small details to make it easier to deal with at the shop counter. One criticism can be made: although the coupons are numbered for each week of the ration year, there is no key to the date of the numbers. Leaving out the dates may be a precaution in case it becomes necessary to change the date on which the new book comes into use. The Board of Trade advises the detaching of the clothing book on receipt of the complete book, since it will not be valid until September 1st. It, too, is an improvement on the current book. It is the same size as the food book, and consists of three pages in bright pink covers. The first two pages contain 36 cloth-

had taken place in their primary industries. All their factories and also those of their subsidiaries were actively employed, and the various lines they were manufacturing covered a very wide range. The report was adopted.

PARNALL AIRCRAFT, LIMITED

CONTINUED EXPANSION

The adjourned seventh ordinary general meeting of Parnall Aircraft, Limited, was held, on the 13th instant, in London, W., Sir Ernest Simon, M.I.C.E., M.I.Mech.E. (the chairman), presiding.

The following are extracts from the statement by the chairman which was circulated with the report and accounts: The balance sheet has been prepared on conservative lines and the board hope it may be possible at the end of the next financial year to present consolidated accounts embodying all subsidiaries.

Reference has been made previously to the incidence of excess profits tax, on the net earnings of the company. Such taxation is penal in its severity, and it is to be hoped the Government will recognise this inequitable position and modify the present legislative anomalies.

Addressing the shareholders at the meeting, the chairman said: I very much regret the inordinate delay in presenting these accounts, but it has been due to facts beyond our control, but steps have now been taken to avoid that happening again, and I hope the next annual meeting will be held at some reasonable date before the end of this year.

Regarding the accounts, the most striking point, I think, is the fact that the current

assets have increased by £1,000,000, and this reflects the very substantial increase in the turnover of the company and the services which the company has rendered to the national war effort. The profit for the year at £96,883 is almost exactly the same as in the previous year. We have had to allow for income tax the sum of £70,000, against £56,000 last year, which leaves £27,000 available, of which £18,750 is required to pay 5 per cent on the shares. The report was unanimously adopted.

BRITISH MATCH CORPORATION LIMITED

The sixteenth ordinary general meeting of British Match Corporation Limited, was held, on the 19th instant, in London. Sir Clarence E. Bartholomew, O.B.E. (chairman and managing director of the company) presided.

The chairman submitted the report of directors, which states:

The net revenue for the year ended April 30, 1943, amounted to £336,777, to which has to be added the balance brought forward, £94,524, and after allowing for the dividends already paid, which absorbed £92,297, there is a balance of £339,004 available for distribution.

The directors recommend placing to dividend equalisation reserve £50,000, the payment of dividend on the preference stock for the half-year to April 30, 1943, and a final dividend on the ordinary stock of 5½ per cent., making a total of 8 per cent. for the year, leaving £104,874 to be carried forward.

Subsidiary and associated companies, at home and overseas, have continued to operate satisfactorily in spite of difficult conditions.

The report was unanimously adopted.

ing coupons, four of which are divided into quarters. The third page consists of four "token" coupons, which provide an instrument of flexibility, since any value can be assigned to them, and 14 other coupons, the purpose of which has not been disclosed. The ration book is a neat, compact, simple and well-designed document.

Industrial Diamonds

At the annual meeting of the Anglo-American Investment Trust two weeks ago, Sir Ernest Oppenheimer revealed that, in 1942, the syndicate sold stones valued at £10,500,000, of which £4,250,000, or roughly 40 per cent, were accounted for by industrial diamonds. Total sales, the highest since 1929, showed an increase of £3,000,000 on the year, and were about £500,000 higher than the trade had expected. Sir Ernest gave the first authoritative statement of the sales of industrial diamonds since the outbreak of war. Despite the fact that it was generally known that the war had raised demand for industrial diamonds to unprecedented levels, the figure given exceeded all expectations. Before the war the share of industrials in the total diamond turnover used to be less than one-quarter in value, although it approached two-thirds in quantity. Owing to the fact that prices for industrial stones have been stabilised at pre-war levels, while gem stones have seen a sharp and continuous advance, it was not believed that the share in sales values had materially risen during the war. From Sir Ernest's figure, it can be estimated that last year the share of industrial stones in the quantitative diamond turnover must have been well over 90 per cent. The limit has by no means been reached. The *Wall Street Journal* recently estimated that the United States would use 5½ million carats of industrial diamonds this year, one million carats more than last year's figure, which was already four and a-half times as large as the highest pre-war consumption figure. The steep increase in consumption is not only due to wider demand for well-established uses; in addition, the range of diamond tools is being rapidly multiplied. The United Nations, despite their control over virtually the entire world supply, had recently to take measures to extend and regulate the flow of industrial stones, which include the diversion of certain types of cheaper gem stones into the market for industrial diamonds.

* Two-hour session only.

Farm Machinery.—The Farm Machinery (Control of Manufacture and Supply) Order and the Farm Machinery (Prescribed Types) Order (S.R. and O., 1943, Nos. 693 and 694) have been made by the Minister of Agriculture. Under the first Order the Government can regulate output, fix prices and impose conditions of sale. Manufacturers and retailers (except those selling spare parts) must be licensed after July 31st. The second Order prescribes the types of machinery of which retail sale becomes subject to regulation under the main Order. Dealers may only sell to farmers against certificates granted by the county war agricultural executive committees.

Capital Issues

Laying the Ghost

IN formally dissolving the Comintern, the Soviet Government has laid an unhappy and unprofitable ghost. From the first moment of its inception, the Communist Third International rested on such false assumptions that as an instrument of policy it was not only a nuisance to Russia's neighbours but an inconvenience to Russia itself.

In the first chaotic years after the last war the Comintern worked in the expectation of immediate world revolution—the liquidation of the bourgeoisie and the setting up of the dictatorship of the proletariat. This hope was defeated, not only by the resistance of the Right, but by two fundamental fallacies in the Communist diagnoses. The first was their belief that class solidarity was a stronger force than nationalism. The second was their hope that the various European labour movements would become revolutionary. Both beliefs were proved completely wrong. By ignoring reality, the Comintern prepared the way for its own futility in the years that followed.

After 1921, the Russians were thrown back on their own revolution. They had to come to terms with an out-

side world in which the revolutions they had tried to back had failed, and which was now openly hostile to their ideology. It was inevitable that from these facts they should draw the further conclusion that the "capitalist Powers" were hostile to the continued existence of socialist Russia, and would sooner or later join together to crush out the first successful experiment in Communism. Here they projected their own revolutionary and ideological point of view into a non-revolutionary and non-ideological situation. The nations of Europe, the British Commonwealth and the United States were occupied with their own national problems. Their one desire was to avoid war. The earlier attempt at a war of intervention had failed and a new anti-Bolshevist crusade was unthinkable. The Russians were falling victim to a bogey, the bogey of capitalist encirclement. This was the first great false assumption of the post-revolutionary period.

The Comintern's activities naturally reflected the fears of the Russian Government. The national Communist parties had the rôle of protecting the measure of world revolution already achieved, in other words, of working for Russia. As the Soviet state itself developed in a more

and more markedly nationalist direction, the local Communist parties tended to become the instruments of the foreign policy of another national state. Each of them worked on the assumption that its own native country was only waiting for an opportunity to stab Russia in the back. The weaker and more disintegrated its own country was, the safer Russia would be. Communist activities were, therefore, anti-nationalist and anti-patriotic at a time when nationalism was the deepest emotional force in any country. Thus they became unwitting agents in the growth of exasperated fascist nationalism.

The Communists' misreading of the fundamentally pacific attitude of the outside world, particularly of the Anglo-Saxon Powers, and their under-estimate of nationalism, might have done less harm if their mistaken strategy had not helped to wreck the European Left. They combined their work for the Russian Government with the preaching of extremism: of a rigidly doctrinaire type. They poured scorn on the methods of progressive constitutional action preferred by the European trade unions and the parties on the Left. Indeed, they regarded the non-revolutionary workers as worse traitors than the Right. Their most virulent attacks were directed against Social Democrats and Labour men. They succeeded in splitting the Left in most countries into a constitutional and an anti-constitutional wing. When anti-constitutional groups arose on the Right in reaction to their activities, the Communists in the crucial years before Hitler's advent to power even at times supported the National Socialists against the "social fascists," as they called the constitutional parties of the Left.

The Popular Front represented a change in the tactics, but not in the fundamental outlook, of the Comintern. It was still primarily the agent of a foreign government, and deep suspicion—of the capitalist governments and of the non-revolutionary labour movements—continued to dominate the activities of the local Communist parties. For example, the Communist party in France after the 1936 elections refused office in a Popular Front government, preferring to snipe at M. Blum from the side lines and exasperate the bourgeois elements in the coalition. Their activities in France and Spain gave the dictators just the material they needed for plugging the theme of the Bolshevik bogey—it should not be forgotten that the alliance uniting Germany, Italy and Japan was called, for the democracies' benefit, the Anti-Comintern Pact. Nor was Russia well served. The local parties, blinded by their prejudices, reported back to the Soviet Government that the policy of appeasement was not dislike for war, coupled with military unpreparedness, but a Machiavellian plot to get the Nazis to fight Russia. The change of British policy in March, 1939, was dismissed as irrelevant. Thus the war developed in an atmosphere of "revolutionary defeatism" which within a year had brought upon Russia the disaster of the fall of France and the loss, for three crucial years, of the possibility of a Second Front in the West.

All these errors and mistaken strategies go back to a misreading of the policy of the Great Powers and of the position of the constitutional Left. The formal dissolution of the Comintern is a realistic and generous recognition that the old strategy was wrong. It is without doubt one of the greatest political events of the inter-war and war years. It can mean the liquidation of old misunderstandings. If it is welcomed generously by Russia's allies and followed up courageously by both sides, it can be the first step in a campaign to eliminate the suspicions and distrust which have hung like a dank pall over Russia's relations with the outside world. It can restore a belief in and desire for constitutional political activity all over the civilised world.

Since the Comintern originally reflected Russia's suspicions of its neighbours, to put an end once and for all to those suspicions is the only way of ensuring that the ghost is laid. The fact of fighting together has brought the Allies to the first step—the Comintern's formal dissolution. Co-operation and agreement must go much further

yet. In the war, the first need is a greater Anglo-American military contribution to the defeat of the Axis. Within the limits imposed by shipping, more supplies must also be got to Russia—the plea made by the Russian delegation at Hot Springs that more food should be sent immediately is a reminder of the crisis facing the Russian people. The really testing time will be, however, the post-war years when the overwhelming purpose of defeating Hitler will no longer act as the cement of the Grand Alliance. If broad agreement can be reached in advance, mutual suspicion and distrust will be stilled. Then there is some hope that the pursuit of common policies during the period of re-occupation, armistice and reconstruction will not be liable to disturbance every time some tactical difficulty arises. Otherwise the Powers may find themselves jockeyed into opposed policies by sheer pressure of events, and actions taken on the spur of the moment may then be interpreted as part of deep laid and hostile schemes.

Europe has lived too long with the Bolshevik bogey, and Russia with the fear of capitalist encirclement, for one formal act of exorcism to banish completely these "warlocks that peep and that mutter." There must be a period of psychological convalescence, and it can take place only in an atmosphere of constructive collaboration. It is not difficult to see where the danger points of future misunderstanding lie. They must be faced frankly now. For example, with which groups of people in Europe will the Allies deal? Will all resisting groups now make common cause? How and by what forces is Germany to be occupied? Ought the German State to be dismembered—or to be federalised? What forms of international supervision are necessary over German heavy industry? Are regional groupings desirable in Europe, particularly in Eastern Europe? Every unsettled problem is a potential entry point for fresh suspicion. It is no use hoping that the questions will settle themselves. Mr Davies is in Moscow. The Anglo-Soviet Treaty is a year old. The Comintern has been dissolved. This is a conjuncture which must be seized. The long-expected meeting between the leaders of the Great Powers should take place, and a start be made in securing a common policy for peace.

In the strictly national field, too, the dissolution of the Comintern can be the starting point of new and more prosperous political experiments. Now that the link between local Communist parties and the Russian Government has been formally broken, it is possible to consider their case on its own merits. Does the existence of a Communist Party in any country contribute to the strengthening of the forces of progress? Does it increase the power and unity of the working classes? Does it promote national solidarity and international understanding? Only a very bold man would affirm these vital propositions without any question. A narrow and doctrinaire ideology, an accepted policy of exasperating disputes and encouraging political and industrial misunderstandings, a complete disregard of consistency, a scorn for intellectual honesty, a penchant for heresy hunting and bogey raising, subservience to extra-national interests, and above all a standing excuse for political violence on the Right—this is the record of local communist parties in times of peace.

If, in spite of the Comintern's decease, the national Communist parties continue to behave as they always have behaved, then it is difficult to recommend the Right to abandon its previous dislike of them, and even more difficult to expect the constitutional Labour parties to cease regarding them as trouble-makers who should be kept at a distance. So far as concerns the domestic politics of Great Britain, for example, the dissolution of the Comintern would then have been an empty formality.

It may be, however, that this particular leopard can change his spots, and that the Communist Party of Great Britain is now prepared to occupy in British politics very much the same position as was filled for so many years by the ILP. If so, and if it will abide by the tolerant rules of the game, it will be very welcome. It is reasonable to hope that this will be the course of the future. But it is equally reasonable to wait and see.

Servants of the People

THE Civil Servant in wartime occupies an important and peculiar position. Besides running the war, he is the public scapegoat. All the vexation of wartime toil and constraint is vented against his works or lack of works. He cannot answer back, either to the charge that, automatically, he takes too much upon himself or to the accusation that, frightened of the consequences, he will not take any responsibility at all; and the criticism by which he is beset arises in part from the extraordinary demands made by war upon the technique of administration, and in part from defects in the machinery and personnel of Parliamentary government.

The attack on the Civil Service takes two forms. First, there is the familiar protest that the departments exercise what are in fact legislative and even judicial powers, without any effective check either by the courts or by Parliament. Secondly, there is the equally familiar complaint that, in the exercise of their powers, civil servants are neither efficient nor informed. The first criticism is the one voiced with much vigour by the late Lord Hewart some years ago when he inveighed against the New Despotism. It has been expressed again this week in a private Members' motion in the House of Commons requiring that "Parliament should vigilantly maintain its ancient right and duty of examining legislation, whether delegated or otherwise." The functions of government have spread so widely and into such complex fields in modern times that it is not possible for Acts of Parliament to make detailed provision for all the contingencies and circumstances in which the executive powers they confer will require to be applied. It is therefore a practice of long standing for departments to be given general authority to make Orders which shall have the force of law as if they had been part of the original Act. Inevitably, this practice has grown in wartime with the assumption by the state of powers of direction and control over the greater part of the nation's activities. Without this procedure, government under modern conditions, and, above all, in conditions of total war, would be impossible. It may be regrettable, but it is a fact that the modern state cannot be governed in detail by Act of Parliament.

It is all the more necessary, therefore, that the representatives of the people and the guardians of the law should be in a position to scrutinise executive acts, so that the intentions of Parliament in conferring these powers shall not be exceeded and so that injustice shall not be done. Formally, the necessary machinery exists. Orders must necessarily take effect promptly, but they are laid before Parliament for challenge. The courts, if appealed to, can pass judgment on whether particular Orders are *ultra vires*. The submission of the critics, however, is that these safeguards are ineffective. Far too many

Orders are made for Parliament possibly to scrutinise each one; nor is the House of Commons competent as a body to decide all the technical and legal issues involved. Similarly, the courts can say nothing about the way in which powers are applied or about the sufficiency of the reasons for their application in individual cases.

The demand is therefore for some special machinery to reinstate the legislature's control over executive acts. It is important that the real issue should be understood. In the last resort, Parliament must accept the Orders made with the authority of the Government which it supports in power. Its only alternative is to turn out the Government. The most that can be expected from any new device for more vigilant scrutiny is that Parliament might thus be placed in a better position to suggest amendments and revisions—as indeed has been done several times in the case of wartime Orders. There can be no question of reversing the development in methods of government which has produced the system of departmental Orders. The Government must have power to act appropriate to its many and varied tasks. It is reasonable, however, to seek ways and means of breathing new life into Parliament's "ancient right and duty" of vigilance. Two proposals have been made: one that there should be a standing committee of the House to examine all Orders and to report on those which seem to raise issues that the Commons should pass judgment upon; another is that there should be a series of Parliamentary committees attached to particular departments or groups of departments with the duty of examining the Orders put out by the departments under their purview. Almost certainly, however, the scrutiny of Orders is too specialised a task for miscellaneous bodies of Members to undertake. On broader grounds, there is a good case for the setting up, after the war, of standing committees of the Commons to concern themselves especially with the particular problems of broad groups of Ministries—foreign affairs, home affairs, social questions, trade and industrial matters, financial problems, and so on. The wartime Select Committee on National Expenditure has shown how usefully the time, knowledge and ability of Members can be employed. But the function of scrutinising Orders comes into rather a different category, and the kind of Parliamentary committee suitable for this purpose would probably be a small body of lawyers and experts, with professional assistance. It is not certain this innovation could be introduced effectively in wartime; but the attempt should be made. And it is quite certain that, in the revision of parliamentary procedure that will be needed after the war to make the Commons more positive and effective in their contribution to the tasks of modern government, the institution both of expert committees

to carry out expert functions and of larger and more general committees to survey the facts upon which policy must be based will be necessary.

Thus, this first criticism of Civil Service administration resolves itself, on analysis, into a demand for more modern and more efficient methods of procedure in Parliament itself—and, indeed, for more able Members. The same is very largely true, in the last resort, of the second criticism, that of the competence of Civil Servants. Six months ago, the Select Committee on National Expenditure made a number of proposals for raising the efficiency of the Civil Service in modern conditions. The Government has rejected each one of the Committee's specific proposals, but has promised, first, that in every department, the work concerned with organisation and methods will be given a new importance; and, secondly, that at the Treasury the status of the official in whole-time charge of organisation and methods will be raised. Mr I. J. Pitman, a Director of the Bank of England, has been appointed to be Director of Organisation and Methods at the Treasury, an encouraging step towards a greater recognition of the need for methods of departmental administration suited to the demands of modern government and modelled upon the best practice of modern management.

These questions of technical method, however, do not go to the heart of the matter. The Civil Service is generally blamed, not for its technique, but for its tendency to "run to paper," and for its habit of burking responsibility by "passing the buck." It is, however, a hasty conclusion to suppose that these shortcomings are mainly due to the calibre and mentality of Civil Servants themselves. In part, they are an inevitable function of the size of the machine. More important, Civil Servants are only instruments. The quality of their work is largely determined by the quality of their parliamentary chiefs. Ministers, by and large, secure the service they deserve from their Civil Servants. If they have a policy, and the determination to carry it through, their Civil Servants will act with confidence and decision. It is the Ministers who are solely responsible for policy—and their officials are always aware of the criticisms that may be made in Parliament.

A much more cogent criticism is that the members of the present Service are not experienced or competent in the matters of industry, trade and finance, which are increasingly the concern of governmental direction. This is, of course, true. There is a gap in the ranks, which has had to be filled in wartime by the appointment of temporary officials with training or experience in these fields. It is certain that after the war

the need for officials skilled in economic matters will be no less than it is now; and the problem is to devise more permanent ways of filling the gap. Many Civil Servants acquire from their administrative contacts wide knowledge of the economic and social questions with which they have to deal. But none is directly trained or experienced in these special skills. A short time ago, the Home Secretary stated the need for an Economic Civil Service, for men with competence in the theory and practice of business life to meet the representatives of industry, trade and finance on equal terms. The nucleus of such a body already exists in the temporary Civil Servants who have been brought in to give economic and business weight to the wartime Civil Service. It is essential that the ambit of peacetime recruitment should be extended to include men of these qualifications, that it should be possible to bring in, at the appropriate stage and at the appropriate salary, men from the professional and business world outside.

The root of the trouble is that the Civil Service has become too rigid in its conditions of recruitment, promotion and pay. The area of choice for almost all key positions in this country, in politics, in administration and in business itself, is too restricted. The nation tends to be inadequately represented in Parliament and in the men who make up its Government for precisely the same reasons as it is inadequately served in the Civil Service. What is needed more than anything else is much greater equality of opportunity and experience, and a much greater freedom of movement, in the careers of talented men. The problem of the Civil Service is, at bottom, a problem of the peculiar traditional democracy that this country has evolved. It is first of all a problem of education and a problem of politics. Only in detail, and by reflection, is it a problem of administration. The Civil Service is probably as good as it can be in present social, political and educational conditions. Nevertheless, its improvement is imperative if democracy in the British style is to meet and beat the boasted efficiency of autocratic systems. The only means of achieving this is to staff the departments at every point from the widest possible field of training and experience; and to place at their head politicians of ability and character. The first charge upon Parliament—and the parties—is to produce such men. Government by Order will continue and spread after the war. There will be more work for Civil Servants, and correspondingly more responsibility for Ministers and Members of Parliament. The task is to enlist the best citizens, to both Westminster and Whitehall, and by the best organisation of their procedure, methods of work and joint endeavours to give the people the best service.

Canadian Aid

THE royal assent was last week signified to the Canadian Mutual Aid Act. As is proper with financial arrangements in wartime, the chief effects of the Act will be technical; it will not affect the underlying reality, which is to be found in the ever-growing stream of men, munitions and materials leaving the ports of Canada for the battlefields. But the new Act nevertheless provides the opportunity for a summary review of the history of Canadian aid. The enormous quantities in which the economic activities of the United States are measured have served somewhat to obscure the achievements of its neighbour, and in Great Britain, the chief beneficiary, there is to this day an inadequate appreciation of the efforts that have been made. It is to the credit of the Canadian Government and people that they have never trumpeted their virtues. The greater is the obligation to acknowledge what they have done.

Canadian aid began with the declaration of war in September, 1939, and has continued on an increasing scale ever since. The financial counterpart to this aid has had three phases, and is now to have a fourth. In the first phase, from the end of August, 1939, to March 31,

1941, the United Kingdom made an effort to pay for its requirements—not, indeed, wholly out of its current earnings of Canadian dollars, but by re-sale of its holdings of Canadian debt. In this period, British needs of Canadian dollars, over and above those earned by exports, were \$795 million, of which \$337 million was met by the sale of British assets (mainly Dominion securities), \$250 million by the sale of gold, and \$208 million by payment in sterling in London.

The second phase covers the financial year 1941-42. The growing scale of the war and the keener realisation of the extent to which victory depended upon the outpourings of the North American arsenal led to increased Canadian deliveries, and consequently to increased British requirements of dollars. In spite of increased repatriation of Canadian securities, the Canadian balances in London were raised to \$700 million. The first phase had been one in which almost three-quarters of the British requirements of dollars were met by the handing over of gold and securities. The second phase was one in which the formalities of payment were still being performed, but by far the larger part of this payment consisted merely of sterling credits in London.

To continue the financing of mutual assistance by the piling up of bank balances was satisfactory neither to the debtor nor to the creditor. Moreover, the institution of the Lend-Lease system in the United States in March, 1941, made it undesirable to retain even the formal appearance of "war debts." With the beginning of the financial year on April 1, 1942, the position was regularised, marking the third phase. The accumulated Canadian balance in London of \$700 million was converted into an interest-free loan, and to meet British requirements in the new financial year, 1942-43, a free gift of \$1,000 million to the British Exchequer was made.

Once again, however, the physical scale of Canadian assistance outran the financial provision for it. Mr Ilsley, the Canadian Minister of Finance, told the story of 1942-43 in a recent speech in the House of Commons. The total British requirements of Canadian dollars in the year amounted to \$1,890 million, of which imports from the sterling area and other current earnings produced \$740 million, leaving a deficiency of \$1,150 million. The gift, large though it was, thus fell short of the requirement. Moreover, the Mutual Aid Act has not become law until nearly the end of May, so that there have been continuing requirements for some seven weeks after the end of the financial year for which no provision has been made. This gap has been closed in two ways: first, by the sale to Canada of certain British balances in the United States (another indication that these balances are now more comfortable than they were); and secondly by the sale for \$200 million of certain British interests in Canadian war plants.

The fourth phase now beginning approximates the Canadian system to the American Lend-Lease and British Reciprocal Aid provisions. Henceforward, war materials will be provided by the Canadian Government for its Allies without any financial counterpart. (Not all of the supplies that Canada provides will come under the Act, but only the excess that the recipients cannot pay for—this is, of course, substantially similar to the position in the United States.) Goods can be transferred under the Act "on such terms and conditions as the Government may deem appropriate" and a Board has been appointed to be responsible for the administration of the Act. The Budget includes a sum of \$1,000 million for Mutual Aid in the present financial year.

For a variety of reasons this billion dollars of Mutual Aid cannot be directly compared with last year's billion dollars of free gift. For one thing, nearly two months of the financial year have gone. Secondly, the Mutual Aid provisions apply to all the United Nations. Some Canadian supplies will go to Russia, and some to the other Dominions. In this latter case, however, there is an offset. Hitherto, the United Kingdom has assumed the financial responsibility *vis-à-vis* Canada for the whole of the sterling area, and the "British requirements" of Canadian dollars quoted above have been the requirements of the whole sterling area. If deliveries to the other Dominions are now to come out of the \$1,000 million, that leaves less for the United Kingdom, but the UK's needs are correspondingly reduced. Thirdly, Canada has, from April 1st, assumed financial responsibility for the full cost of RCAF squadrons in the United Kingdom and certain ancillary units serving outside Canada. This will relieve the British Government's sterling expenditure, and will put it in possession of an additional amount of Canadian dollars, estimated by Mr Ilsley as \$341 million. Fourthly, the Canadian Government is taking over at cost price all remaining British equity interests in munition factories in Canada. Since the total assistance to be provided under the three heads of Mutual Aid, RCAF and this last item was put by Sir Kingsley Wood on Tuesday at "over \$1,800 million," the purchase price for these British interests must be at least \$460 million. The figure to compare with previous years—for example, with the \$1,150 million of 1942-43—is the proportion of this \$1,800 million that will go to sterling area countries. No figures are available to serve as the basis of an estimate

of what that proportion might be, but it is almost certainly very large. The total of Canadian assistance to the sterling area in the two years 1942-43 and 1943-44 will probably be about \$3,000 million.

These are gigantic figures in their own right. Compared with Canada's resources they are still more impressive. Three methods of comparison suggest themselves for converting financial figures into a measure of real effort. The first is with the Canadian national income, which is no longer estimated, but cannot be much greater this year than \$8,000 million. If so, Canada is proposing to hand over to other countries this year goods to the value of more than one-fifth of her national income.

The second comparison is with the United Kingdom. By a fortunate chance, there is an easy rule of thumb for converting Canadian financial figures into their British equivalents, by simply changing the dollar sign into a pound sign, since the ratio of population between the two countries is almost exactly the same as the rate of exchange between their currencies. A figure of \$1,800 million for Canada implies a burden equivalent to what £1,800 millions would be to the United Kingdom. The total estimated Vote-of-Credit expenditure in the current year in this country is £4,900 million. If something like two-fifths of the total war expenditure of the British Government were for goods and services to be handed over to other countries, that would convey an approximate measure of what Canada is proposing to do. It is probable that the total British burden—at home and abroad—is still larger than the Canadian. Indeed, this is almost certainly so, for Mr Ilsley has defined the impact on the civilian population as no more than "some moderate decline from the peak of wartime consumption, and some increase in the inconveniences of shopping and travelling." But what may be called the war-effort-for-export is much larger in Canada than in Great Britain.

Lastly, there is the comparison with the United States. The ratio of population is 13 to 1, and the rate of exchange between the two dollars is 10 to 11. This means that \$118 US represents a burden to the larger country equivalent to that of \$10 Canadian to the smaller. The Canadian figure of \$1,800 million would, therefore, be the equivalent of about \$21,240 millions in the United States. The actual American expenditure on Lend-Lease in its first two years was \$9,632 million, though the rate is, of course, rising.

It is right that due honour should be paid to the realities of steel and muscle behind these monetary figures. If Canada is prevented by the smallness of her population from taking rank with the Great Powers, she has in the last three years made a place for herself in a category all her own. Relative to her resources, her effort is second to none. In absolute terms, the distance that separates Canada from the Great Powers is less than that between her own achievements and that of any other of the smaller United Nations.

Women Engineers

THE dilution of labour in Britain has reached a fairly advanced stage and has, on the whole, proceeded smoothly, with the co-operation of employers and trade unions. No information is available about the proportion of women to men engaged in the whole of war industry, but in aircraft production women constitute about 40 per cent of the total labour force, in Royal Ordnance Factories (including shell-filling) over 60 per cent, and in the industries covered by the Iron and Steel Control roughly 17½ per cent. At this stage of the war, little can be expected in the way of fresh intake of labour, either male or female, and the really pressing task of the moment is to improve the productivity of the existing labour force and so to enable the further release of men for the fighting forces.

The conference of women shop stewards of the Amalgamated Engineering Union last week was important, not only from the point of view of trade unionism—the union which had hitherto resisted the admission of women has recruited 64,000 in less than five months—but in pointing the way to achieving this objective. The proposals put forward by the 26 delegates were eminently practical and indicate some of the measures that need to be taken if the fullest mobilisation and most efficient utilisation of woman-power are to be secured.

The first of these lies in the improvement of health and welfare arrangements in the factories. Both Mr. Bevin and Sir Stafford Cripps attach great importance to personnel management, but it is clear from the descriptions given by some of the delegates that provision at many factories for even elementary cloakroom and washing facilities is still inadequate and that far more attention should be paid to welfare. More nurseries, time off for shopping, better canteens, improved transport and billeting arrangements: demands for these have frequently been made, but their importance in reducing labour wastage and voluntary absenteeism, especially among married women, cannot be too strongly emphasised. Involuntary absenteeism can best be diminished by extending health provision within the factories, increasing the number of works doctors and nurses, setting up joint works health committees, and above all by avoiding excessive hours of labour. It is becoming almost a truism that excessive hours defeat their own purpose; evidence was given at the conference of girls suffering from strain and fatigue after a long day's work, without enough rest pauses, on welding and heavy jobs. The wisdom of the resolution calling for a maximum of 54 hours a week for women and young persons—exceptions to be restricted to short periods and arranged in consultation with the unions—will not be disputed.

As important as welfare and hours, but, perhaps, more controversial, is the question of women's wages. (The present position is dealt with in more detail on p. 699.) The union is claiming a minimum wage rate for adult women in engineering not less than that of the adult male labourer and asking for the negotiation of wage rates for semi-skilled grades equally applicable to men and women. The existing disparity between men's and women's wages in engineering is not only anomalous; it is impeding production. The stories of munition girls bringing home fantastic sums each week are clearly exaggerated, and in fact women, employed on what is unquestionably semi-skilled work, are often paid far less than they could command if they were men. The "rate for the job" has been widely accepted in principle. In engineering, an agreement reached between the Employers' Federation and the AEU in May, 1940, provides that where a woman is doing a man's job, "without supervision or assistance," she shall receive the man's rate after 32 weeks. But, in practice, relatively few women seem to have qualified for the full rate and widespread evasion of the relaxation agreement was alleged at the women's conference. One difficulty is the definition of "supervision" (a delegate said that it was enough for the

foreman to walk about and occasionally say "Hullo"); and another is the determination of the rate for processes which have been newly introduced and for jobs which have been broken up into component parts.

It is difficult to distinguish exactly what parts are played in this wages issue by mere prejudice or tradition and by more genuine factors. The only reason for denying a woman the same wage as a man is if insistence on equality would lead to a preference for men, all prejudice apart. That there are such cases, even in the peculiar conditions of wartime, is, perhaps, shown by the slow progress being made in the "up-grading" of women—though even there sheer conservatism also exercises its influence. The capacity of women, given suitable training, to do men's jobs, except the very heaviest, has been abundantly proven since the war, but not enough attention has been paid to up-grading or training, either by employers or unions, as the AEU's third production enquiry showed. The 26 Government Training Centres and the Technical Colleges provide a sound initial training, but the bulk of training has to be given in the factories. In March, 1942, the Select Committee on National Expenditure found reluctance on the part of many firms to provide training facilities for men or women, and there is no evidence of any spectacular improvement since that date. Some firms, it is true, have excellent schemes, already in existence before the war. Thus, at one aircraft factory, where systematic training is given, many women have now replaced men as skilled operators and machine-setters. At a Royal Ordnance gun factory, there is an excellent training school, where entrants learn the rudiments of factory procedure and discipline, safety, and simple machine operating. A firm manufacturing aircraft accessories is experimenting with a synchophone (a gramophone plus pictorial diagrams) which illustrates in a vivid way not only the types of machines, but the relation to the war effort of jobs which may seem trivial and dull. Such schemes are excellent and firms which operate them should be encouraged to train for others.

There is some difference of opinion about Government Training Centres. Their trainees become machine-minded and acclimatised before they enter industry proper; on the other hand they may not be trained along the lines most suitable for the employers, many of whom prefer to train their own labour. But this disadvantage is reduced where arrangements are made for special or "biased" training to fit particular employers' requirements. Training "on the job" has undeniable advantages, but it is too often haphazard and unsystematic; instruction and promotion depend largely on the interest shown by the individual foreman or chargehand and there is need for training of instructors, as well as operatives. The ideal is probably a combination of pre-training in a centre or in the factory's own training school, and training "on the job," with adequate opportunities for promotion and "refresher" courses. One of the functions of the Labour Supply Inspectors of the Ministry of Labour is to encourage employers to train the maximum possible number of women and to see that women's skill is properly utilised, but in practice there are too few of them and they have no direct powers of compulsion.

Training is the key to the increase of productivity, and it is clear that many employers still have to be convinced that training is an economic proposition. The trouble is, perhaps, that some of them are thinking along pre-war, or rather post-war, lines, when large numbers of men will be returning to industry and many women will leave. But, as the AEU women emphasised, their purpose in demanding higher wages, the "rate for the job" and better working conditions is to preserve the standards of the union's male members. Their determination that women should never be used as "cheap labour" will be supported by all who believe in elementary economic justice.

NOTES OF THE WEEK

A British Food Plan

So far as can be judged from the available reports, the plan presented to the International Food Conference at Hot Springs by the British delegation is on the right lines. It at least lays emphasis on the need for expansion rather than restriction of supplies of food in a world that is still hungry. The plan envisages two transitional periods—the first when the dominant problem will be the relief of hunger and the chief need the provision of energy foods; the second when there will be enough food to satisfy hunger but not enough to assure a balanced diet. The proposals envisage international co-operation to "encourage the maximum production of commodities most needed and to secure equitable distribution of commodities in short supply." This is said to require "an international production programme and machinery for the co-ordinated purchase, allocation and transport of such commodities." Subsidies in aid of consumption are praised; quotas on production or exports (but not on imports) are denounced. It is also suggested that in order to create orderly marketing conditions at prices that shall be stable and fair to both parties, there shall be "an internationally held balancing, or buffer, stock which could be increased when production for the time being outruns consumption and would demand to be drawn upon when it falls short." This set of proposals, which appears to be very much in line with the principles suggested in an article in *The Economist* of May 8th, has had a very favourable reception in the American press. This, of course, is all to the good; but a little caution is perhaps to be recommended. Generalities about the need for improving nutrition and expanding supplies are common form; the preamble to the Draft Wheat Convention of last year had these fine phrases aplenty, though the practical effect of the ensuing provisions would be almost the exact contrary. "Prices that are fair to both parties" may be a verbal smokescreen, or a device for dodging the issue. Pools to hold stocks off the market "when production for the time being outruns consumption" are familiar, but it is difficult to remember an example, since the days of Joseph, when a pool has been allowed to sell its stocks or when the producers have been willing to admit that supply fell short of consumption. The ultimate test is quite simple: is there to be any restriction of production and supply? It would be as well to wait and see whether the British detailed proposals meet this test, and, if they do, what the reaction of other delegations will be. The latest news is of an agreement to create a continuing commission to discharge duties which are only vaguely defined. There is, however, a welcome verbal insistence on expansion.

The Pensions Debate

The unofficial Labour amendment to the second reading of the Pensions and Determination of Needs Bill was defeated by 232 votes to 61. On the last occasion when pensions were debated—July 29, 1942—the Opposition vote was almost the same, 63; it was then the biggest recorded against Mr. Churchill's Government, but the debates on the Catering Bill and the Beveridge Report have put mere sixties in the shade. Nevertheless, the Opposition is significant. As Mr. Shinwell said in last week's debate:—

If there is one subject upon which members on this side and elsewhere feel with the most passionate intensity the implications of the situation, it is the plight of the old age pensioners.

And since in the course of the next twenty years they will number, on present trends, over eight million—one in six of the population—this "passionate intensity" is likely to gather strength as the years go on. Actually, the Labour opposition to the new Bill was somewhat divided. The mover and seconder of the amendment were in favour of an increase in the basic rate; Mr. Shinwell himself advocated instead an increase in the scale of supplementary pensions. There is certainly a strong case for increasing the basic rate, which has been 10s. a week for non-contributory pensions since 1920 and for contributory pensions since 1926, by at least the extent of the wartime increase in the official

cost of living index. Every other form of social service payment—whether contributory or not—has been increased since 1939, and there seems no equitable reason why pensions alone should remain constant. This, it is true, would only improve the position of pensioners who do not apply for supplementary pensions, and many of these are not in need as they have other means or are in work. Those receiving supplementary pensions, which are based on need and therefore bear some relation to the cost of living, would presumably have their supplementaries docked by the same amount as the rise in the basic rate. But to increase supplementary pensions alone, which was done last July, would not help those widows who, in spite of the new Bill, will still be ineligible for them or people who refrain from applying for them because of the barrier of the needs test. Up to the end of last year, the Government refused to face the pensions problem squarely because it was "waiting for the Beveridge Report." Since it has rejected the pensions part of the Beveridge plan, it has now no option but to produce a comprehensive one of its own.

Price Stabilisation

During the debate on the Supplementary Vote of Credit in the House of Commons on Tuesday, Mr. Barnes (Labour Member for East Ham) congratulated the Chancellor of the Exchequer on the success of his policy of stabilising food prices by subsidy, but pointed out that price control had been less successful in goods other than food, and that the "utility" principle should be extended. Sir Kingsley Wood, in reply, stated that the Government's stabilisation policy had been largely concentrated on the most essential goods, that is, those entering into the calcula-

tion of the cost of living index. When the experiment of stabilisation was begun, the Government concentrated on food. Since then the policy has been extended to many other essential goods, and clothing prices have actually been lowered by the introduction of the utility scheme. The cost of living index rose by only 28 per cent between 1938 and 1941, and has remained almost unchanged since then. True, the market prices of all goods and services purchased by the public advanced by 45 per cent between 1938 and 1942. The fact is that, quite rightly, the Government has refrained from stabilising all prices. A distinction must be drawn between essentials and luxuries, including "conventional necessities," such as entertainment, beer, spirits and tobacco. So far as the first category of goods and services is concerned, the Government has undoubtedly been successful in preventing a major rise in prices; there are, of course, exceptions, such as certain household goods and rents not covered by the Rent Restriction Act. To stabilise the prices of luxuries and "conventional necessities" would have been not merely unnecessary, but quite unjustifiable. Indeed, part of the rise in their prices is due to deliberate policy. The Government's policy of increasing the taxes on luxuries is the counterpart of its decision to hold down the prices of essentials.

Air Transport

The announcement that a chairman and two new members have been appointed to the British Overseas Airways Corporation may go some way to satisfy the impatience of the critics of the Government's air transport policy—or rather lack of policy. Viscount Knollys, Governor of Bermuda, has considerable administrative and business experience; Miss Pauline Gower is Commandant of the women in Air Transport Auxiliary, and Air-Commodore Critchley has a reputation for "toughness," business capacity, and energy. The need for strengthening the Board has frequently been expressed and the public will wish the new team well. But there are a number of major issues which the new appointments will not help to settle. In the first place, the demand for the removal of control over civil aviation from the Air Ministry has been growing and, though the present moment may not be opportune for a change, such a transfer of authority must sooner or later take place. Secondly, as revealed by the recent White Paper, the late chairman and his fellow-directors resigned because they felt that the Corporation was in an anomalous position vis-à-vis the Air Ministry, and Mr Clive Pearson asked for an elucidation of the Ministry's intentions. Was the Corporation to remain the sole British instrument for overseas air transport, and was it to regard itself as a branch of the Air Ministry, or as an independent policy-forming body under the Act? This question was repeated by Lord Rothermere and other peers in the recent Lords' Debate, but no answer was given. Lord Sherwood had "nothing to add." The American solution, where wartime aviation is controlled by the Transport Command, works well—but possibly only because, in fact, the Command is dominated by the civil aviation agencies. Transcending the issue of national control is the international question. Vague assurances have been given that the Government is alive to the importance of civil aviation, but there are still no signs of a decision. The ideal solution would be the complete internationalisation of air transport services. This may well be Utopian. Probably some form of the solution by which national routes are reserved for national airlines, while international routes are free on equal terms to the aircraft of all nations, is most likely to be accepted by the nations most concerned. At any rate, it is essential that some measure of international understanding should be reached at an early date on such matters as standards, safety and the "freedom of the skies."

Most fires are caused by
CAREFUL PEOPLE

DON'T JUST BE CAREFUL—
TAKE EXTRA CARE

Fears and Hopes

Outside Parliament, where in questions and debate, Members of both Houses have been assiduously and persistently prodding the Government, the demand for a declaration of aviation policy is growing. But a strong current of defeatism runs through all the statements and memoranda which have recently been issued. Mr Wakefield at the Conservative Conference said that Britain was at least five years behind the United States; Captain Lamplugh's independent committee believes that British air lines will be compelled to use American machines for some time after the war; and the Joint Air Transport Committee of the British and London Chambers of Commerce and the Federation of British Industries thinks that the present disparity between British and American production may lead to a "calamitous situation." In so far as this pressure succeeds in galvanising the Government into activity, it is to be welcomed. It is true that, primarily for reasons of military strategy, America—which has, in any case, the considerable prior advantage of a continental "home market"—to employ its aircraft factories and to train its personnel—has concentrated on the production of transport planes, and has acquired operational experience and control of routes which may ensure its supremacy in the immediate post-war years. But there is no reason to be unduly pessimistic; given good will and international understanding and by the adoption of vigorous measures nationally—including, if necessary, subsidies during the initial period—British production capacity and operational skill, and the possession of imperial bases, may well largely restore the balance. Certainly, there is no justification for delay and neglect, and nothing should be allowed to impede the fullest development of air transport both as a weapon of war and a future instrument of peace.

Freedom to Migrate

In the House of Lords on Tuesday, Lord Barnby pleaded for the removal of obstacles to the migration of persons from this country to the Dominions. In particular, he suggested that, unless special provision is made, the existence of a comprehensive scheme of social security will act as a deterrent to migration, because individuals will not willingly forgo the benefits they will be entitled to here. Lord Barnby's concern is probably needless. There is a strong case, on both political and economic grounds, for the utmost freedom of movement between all countries. There is no good reason for stops to either emigration or immigration. The racial, political and other discriminations which at present impede movement should have no place in a free world. Economically, they have no justification, on the broadest view of national and international welfare; and it is certain that, if restrictions on migration are maintained and extended after the war, a potent cause of the next world conflict will be preserved. Nevertheless, the old idea that the solution of the social and economic problems of this country is for its citizens to go abroad is now outdated. Britain is threatened in the measurable future, not with over-population, but with a shortage of numbers, youth and strength. It would be an ill-conceived palliative for emigration to be encouraged after the war to solve problems of poverty and unemployment, which have rather to be solved by a conscious programme to make the fullest and most productive use of all the nation's resources. Indeed, the world formula should be full employment in each country with free migration. Britain's task is to provide full employment; and Lord Barnby's plea for the lifting of bans on migration should be addressed abroad, to the Dominions themselves and the United States.

Polish-Czech Difficulties

It has been known for some time past that the negotiations between the Czechs and the Poles for a future federation had come to a standstill. At first, no official reasons for the deadlock were published and it is unfortunate that the Czech Foreign Minister, Dr Ripka, should have felt called upon to give a somewhat tendentious account of the breakdown at the precise moment when the Polish Government is already involved in misunderstandings with the Russians. The chief aim of both the Czechs and the Poles, as constituent parts of the United Nations, must be to mend the breaches in the fabric of the alliance and, in Count Raczynski's words, to avoid "polemics when both countries are in need of constructive views for

the future." The reason given by Dr Ripka for the breakdown were, briefly, that a friendly understanding with Russia was the precondition of agreement; that Poland's attitude towards Hungary was equivocal; and that the Poles maintained their right to retain Teschen which had been so disreputably filched from Czechoslovakia in 1938. Count Raczynski has taken up these points. When the negotiations began in November, 1940, Poland was at war with Russia; and Count Raczynski claims that a "gentleman's agreement" covered the question of relations with Russia, as well as the similar problem of Hungary and Czechoslovakia's other Central European neighbours. The Poles were not to be drawn into a conflict over Central Europe and the Czechs were not to be drawn in over Russia. This "gentleman's agreement," Count Raczynski states, also covered the problem of Teschen, which apparently simply means that it was agreed to consider this point last. Here it must be said, emphatically, that it would undoubtedly have been wiser, more just and more generous of the Poles to renounce outright territory gained so discredibly. But the real problem goes deeper; it is the question of federations in Europe, particularly in Eastern Europe. The Soviet Government dislikes them. Russian memories of the *cordon sanitaire* are too strong. The Czechs, determined to maintain the closest relations with Russia, have, therefore, dropped the negotiations for federation with the Poles. On the other hand, Mr Churchill has spoken of the need for federations and the Poles, declaring that a Polish-Czech federation "never could, and never in future will, have an anti-Soviet bias," are anxious to continue the negotiations. There is thus a difference of approach between the Great Powers mirrored in differences and friction between the smaller states. The whole question of European federations should plainly be frankly discussed between London, Washington and Moscow.

Paying for Illness

The announcement of the formation by the Nuffield Trustees of the Central Provident Association, to help individuals and families to meet certain medical costs, raises important questions of principle. In theory, the scheme is admirable; it enables the members of the association to spread the cost of illness involving hospital, specialist or consultant treatment instead of having to pay it all at the time of the illness. But there are also very grave dangers, which are not so apparent as the advantages and therefore may be overlooked. Assumption B of the Beveridge Plan was the establishment of a comprehensive health and rehabilitation service for all members of the community, and the Government has accepted it. This means that irrespective of their means

every man, woman and child who wants it can obtain, easily and readily, the whole range of medical advice and attention, through the general practitioner, the consultant, the hospital and every related branch of professional up-to-date methods—the words are Sir John Anderson's. The aim is unexceptionable. The difficulty is that, quite apart from the problem of securing agreement between the medical profession, the Government and the public and among the different members of the profession, there is likely to be a real shortage of certain services, particularly the specialist services and hospital accommodation. Any scheme, therefore, which allows superior purchasing power—whether spread over a period of years or not—to pre-empt the resources of the health services has this great drawback that it may obstruct the provision of a comprehensive service to those with equal or greater needs but no means. It is obvious, for instance, that a large part of the nursing and domestic staff employed in expensive nursing homes to look after wealthy hypochondriacs would be doing a far greater service to the community in the wards of hospitals, which again and again have to refuse cases of real need because of the shortage of staff. It is true that members of the new Provident Association are only likely to use the resources of specialists and hospitals when they really need them, but the fact that they are paying patients should not be allowed to give them priority. Nor, too, should paying patients, even after a comprehensive health service for all has been set up, be allowed extra privileges at the expense of that service. In recent years, the existence of pay beds in hospitals, which carry such privileges with them, has tended to obstruct much needed reforms in the way of privacy and visitors for the general wards. That persons should not have the new health services forced on them is sensible—and declared Government policy—but it is essential that all those concerned in run-

ning the services should not have a vested interest in keeping them at a minimum standard.

First Discussions

The best way of ensuring that priorities in the treatment of illness are not determined by superior purchasing power is, of course, to establish a fully comprehensive health service, available to all irrespective of their means, as quickly as possible—to make, that is, the national service so attractive and adequate that private arrangements will wither away. Since, however, this can only be achieved over a period of years, the best way of laying the foundations would probably be through improving national health insurance. If the panel system were extended to the dependants of the insured, it would mean that some 90 per cent of the population would have the right to a free general practitioner service. But the insured and their families should have the right to a free hospital and specialist and consultant service as well, and this right should be laid down in the national health insurance legislation. Generally speaking, a doctor treats a sick panel patient as carefully as he treats a sick paying patient—it is in the attention he gives to chronics and hypochondriacs that a distinction between the two classes may appear—and there is no reason why the same should not be true of the hospital and specialist service under new NHI legislation. Unfortunately, the Ministry of Health, in its feelers for a comprehensive health service, seems to be starting at the wrong end of the stick. Instead of meeting these obvious deficiencies in NHI, which are recognised by all members of the medical profession, it began its discussions with the representative committee of doctors by laying down proposals for the employment of doctors as mainly whole-time salaried officers by a local authority—a new type of local authority, it is true, but the complete veil on the Government's views for the reform of local government is not calculated to persuade doctors that the new type will be any better than the old. The Ministry also proposed that general practice should be based on health centres. The idea of health centres has indeed attracted the public, and it is probably sound—the British Medical Association itself has reported in favour of them. But, as the representative committee pointed out, to recast the whole of general practice on the basis of a local authority health centre, before one has been built or tried out, is surely premature. Final judgment on the Ministry's proposal must await the publication of the promised White Paper. It is reassuring to know that it is thinking progressively, and the representative committee turned the proposal down a bit too flatly. But it would be wiser, when the discussions are resumed, to start on a more realistic basis.

Ration Books

The chief complaint against the method adopted for the issue of the new ration book and the new identity card is the distance many people have to travel to collect them. Even in London boroughs there are such complaints, but the plight of the rural dweller is worse. It is not uncommon for a journey of more than ten miles to be necessary, often with a poor transport service, and frequently to a place not usually visited. For security reasons, only larger food offices are being used. Great inconvenience, loss of time, expense (often a heavy burden), and pressure on transport are involved in the method adopted. The Ministry of Food has admitted that the system was perforce the result of a choice between evils. Steps will have to be taken, and have been promised, to get the new ration books to people who

AMERICAN SURVEY

Negroes in War Work

(From a Correspondent in Chicago)

April 26, 1943.

WHEN Chicago and the Middle West began to gear themselves as part of the "arsenal of democracy" negro workers were seeking jobs in vain. The progress made since then in utilising skilled negroes has meant a revolution in the policies of many important industrial firms. The number of commercial and industrial firms in Chicago that employ skilled and semi-skilled negroes has increased within the last two years by 400 per cent. Hardly a day goes by that an additional firm does not employ negroes for the first time. The significance of this trend, in terms of war manpower, is evident from the fact that Chicago has the second largest urban negro population in the United States (277,731). In other words, Chicago contains more negroes than are found in the former slave state of Kentucky.

Yet only 10 per cent of the firms that received defence contracts in this metropolitan area in 1940 had been employing negroes on the production line. In 1941, a broad sampling of industrial and commercial firms made by the Chicago Urban League (an organisation for inter-racial co-operation) indicated that 15 per cent employed negroes in skilled or semi-skilled capacities; now the percentage is 64.

To achieve this progress has required a process of education; and the brunt of this process falls officially on the War Manpower Commission. Though Chicago at this writing is classed as an area in danger of critical manpower deficiency, reluctance to employ qualified negroes is no longer expected to play a major part in that problem. To be sure, the Illinois Board of Unemployment Compensation reports that about 6 per cent of men claimants, and about 16 per cent of women claimants are negroes, whereas negroes form 8.2 per cent of the population, irrespective of age. (A figure of 6,027 negroes among 10,121 indigent persons receiving outright relief, and classed as physically capable of some sort of work was reported by the Chicago Welfare Administration in February, but all these persons are of marginal employability.) The WMC counts on the utilisation of all available negro women and men.

The regional director of the WMC, William H. Spencer, on leave as Dean of the Business School of the University of Chicago, in urging the integration of negroes in industry has a psychological point in his favour. He was born and educated in Alabama, where Jefferson Davis was inaugurated as President of the Confederacy. More than once, when representatives of management or of labour have opposed public emphasis on non-discrimination, he has said: "It is strange that a man from Alabama must plead this cause in the state of Abraham Lincoln."

Past Performance

Several reasons might be given to explain why anyone must do so. Southern observers sometimes say that Northerners' interest in negro rights has been more theoretical than practical; that they fought to end slavery, but have not always been as flexible and intelligent as they might have been when numbers of freed men confronted them in their own communities and labour markets.

One factor, in any case, which retarded the employment of negroes here was local inexperience with negroes as skilled industrial workers. One employer in 1940 spoke for many when he said: "We have never employed negroes; we have just never given the matter any thought." Several large enterprises, on the other hand, reported long experience with negroes and reported them dependable workers, good mechanics; these firms were the exceptions. The South knew somewhat more, naturally, about the negro industrial worker. In Charleston, South Carolina, 1,579 free male negroes were distributed in 1859 among 700 occupations; they included blacksmiths, tailors, millwrights and 122 carpenters. The iron grilles of New Orleans attest negro skill in French colonial times. After the Civil War negroes

were accepted in the South in certain industries. But by far the greater number of American negroes have been employed in agriculture and domestic or personal service. Northern employers, from what they had heard of Southern experience, feared negroes would be irregular in reporting on the job. They also apprehended difficulty in integrating them with white (often foreign-born) personnel under Northern social conditions in the absence of segregated facilities.

The first large influx of negro workers to Chicago came during the first World War. Most of them were unskilled. Some later improved their proficiency and status, but hosts of them were displaced in the depression. When the necessity arose for meeting the needs of war, many employers doubted if there were negroes with the requisite skills. It surprised employers to learn, for example, that of 52 moulders in a single classification (squeeze machine), registered with the State Employment Service, 18 were negroes. Registrations for many other positions showed a similar ratio. There were instances, in the early stage of production for the war effort, of negroes who completed training courses at the head of their class, yet were passed over by employment managers while their white fellow-trainees were accepted in industry.

Adjustment in Industry

Though for reasons of present policy the FEPC (now part of the WMC) has held no public hearings for some months, the work of education in employment practices goes on in other forms. For example, one of the first official acts of the regional director of WMC was to select one of his former students of business administration, Mr Austin Scott, as negro representative in the minorities division of the regional staff. Mr Scott is tactfully seeking to promote both the utilisation of negroes and their harmonious integration in working personnel. The WMC regional office seeks to impress on other governmental agencies that they must lead the way. A Federal agency transferred here from Washington, bringing Southern personnel, was induced to abandon its segregation of white and negro employees, since "there is no need of perpetuating in the new environment the patterns of another region." The WMC regional office itself has found an effective harmonising agent in a good old English custom; the girls of the clerical staff serve tea each afternoon, and white and negro workers partake together.

But the adjustment in industry hasn't been all tea and crumpets. Italian-born members of a local union of the United Auto Workers, CIO, began to picket their own plant, where skilled negro workers were being introduced. They ignored a telegram from the head office of the union. On an appeal from the WMC, Paul Russo, district representative of the UAW, went to the picket lines in person and pointed out to them in racy Italian that discrimination is a bad precedent, especially when set by a group that might easily fall victim to the same practice. He got them off that picket line in a hurry. From many other plants, supervisory officials, who anticipated squalls, report instead smooth sailing. Moreover, from Illinois, Indiana and Wisconsin, reports to the regional WMC office indicate no greater occurrence of absenteeism among negro workers than among others—and that the record of workers in this area is generally good.

Almost daily an additional employer hires negroes for the first time. The Chicago Urban League has a list of some 300 that have changed their policy in this way. The League also has, or rather had, a long list of qualified negro workers. Virtually all of these have been hired. And the League's industrial secretary, Mr H. D. Gould, commenting on the changed attitude of both employers and labour unions, observes: "Two years ago their minds were closed—now they are open."

American Notes

Fourth Term Talk Line-up

It is mildly astonishing to find the United States, which a few years ago seemed so indissolubly wedded to the two-term tradition, already hotly discussing the pros and cons of a fourth term for President Roosevelt. On the one hand are such people as Senators Neely and Mead and Congressman Sabath, who are openly stating that a fourth term for the President is essential and inevitable. On the other is the Republicans' "anti-fourth term drive." For the Administration, hints of a fourth-term candidacy serve to strengthen the President's hand, as an outgoing President inevitably loses much of his control over Congress, which knows that he is not much longer to be reckoned with in terms of patronage and prestige. Already defections of the Southern Democrats have been scotched by the suggestions of his supporters that President Roosevelt is not out of the running. Indeed, a recent Gallup poll showed an overwhelming majority of Democratic voters for President Roosevelt—79 per cent against 8 per cent for Mr Wallace, the nearest contender. It is, in fact, difficult to think of any candidate but Mr Roosevelt who could bind together the conservative South, and enough of the labour and farmer vote to secure another Democratic victory. It is possible that even Mr Roosevelt will not be able to repeat this achievement a fourth time. The present array of candidates on the Republican side, however, with the exception of Mr Willkie, do not suggest that a Republican victory would be due to the stature of its leader. A recent Gallup poll shows Governor Dewey well ahead in the estimation of Republican voters, with 38 per cent of the poll; Mr Willkie next with 28 per cent; General MacArthur with 17 per cent; and Governor Bricker and Stassen trailing far behind. Of the lot, Mr Willkie constitutes the biggest threat to the President, but whether the Republican party would swallow its pride and his approximation to the President's foreign policies is still in doubt. The call for a candidate to "save the party from Willkie, the country from Roosevelt, and the world from Wallace," is still unanswered.

Wages and Prices

The War Labour Board's decision in the coal dispute is to refuse the 10 a day increase demanded, but to urge the coalowners to grant practically everything else on the Lewis agenda—portal-to-portal payment, the increased vacation allowance, and other small adjustments. Both sides have been directed to report the results of their negotiations to the Board within 15 days. What is surprising is a report that Mr Lewis is ready to accept the ruling, despite the fact that the labour members of the Board dissented. Meanwhile, his example has not been lost on the other unions. In Akron, nearly 50,000 rubber workers are on strike against the Board's recent wage increase, which they consider inadequate. The Chrysler works were idle last week at a result of an inter-union difference over incentive payments. Behind this labour upheaval lies the steady increase in the cost of living. Miss Perkins, the Secretary of Labour, reported last week that living costs of city workers rose 1.5 per cent in the month ended March 15th. The largest increase was in food prices, which rose 2.8 per cent. The prices of fresh fruit and vegetables increased 13 per cent, under the impact of canned goods rationing. These advances took place before the President's Hold-the-Line order. But although the increase since then has slowed down, it continues. And the Office of Price Administration is running into heavy weather in its attempt to roll back prices. In these circumstances, it is hopeless to expect a cheerful acquiescence in wage stabilisation. The position of the War Labour Board is rapidly becoming impossible.

The Plot Unfolds

Mr John L. Lewis is not, after all, going to establish a rival Federation of Labour. His request last week for readmission to the AFL makes it clear that he now hopes to further his ambitions by capturing one of the established organisations. It is believed that his application will be granted. The return of the Mine Workers would make the AFL considerably larger in numbers than the CIO; and the financial resources of the miners are substantially

greater than those of any other union. The greatest interest attaches, of course, to the bargain to be struck between Mr Lewis and the AFL. It seems plain, however, that he would not have considered re-entry into the Federation he disrupted less than a decade ago without some assurance as to his union's autonomy and his own position in the Federation. The rumour in Washington this week is that he is determined to smash the CIO, and that when the miners go back into the AFL they will take with them a number of the more conservative unions now attached to the CIO, leaving the left-wing out on a lamb. The CIO difficulties at Chrysler are an omen of the struggle to come. Though it could hardly endure, this would be one kind of labour unity—at a disastrous price. It is the same plot that was foiled a little over a year ago. But its chances are better to-day. The failure to arrest the rise in the cost of living aroused dissatisfaction throughout the labour movement with the Green-Murray policy of co-operation with the Administration. Mr Lewis, on the other hand, has demonstrated his ability and determination to force the pace. The anti-labour bent of Congress, and the possibility that the Administration may not be able to restrain it, add to the temptation of rallying behind a strong and unscrupulous leader. The immediate effect on the stabilisation programme of delivering the labour movement over to Mr Lewis would be devastating. The power of the President over the home front would be gravely shaken. Even more perturbing is the implication for 1944 when Mr Lewis may control the votes of a large section of labour.

Lean but Healthy

Last February Mr. Joseph Weiner, Director of Civilian Supply in the WPB, submitted estimates of the goods and services which would constitute a "bedrock" standard of wartime American living. These estimates varied from 71.8 per cent of 1941 consumption for food, 65 per cent for wines and beer and 72.5 per cent for tobacco, to 2.5 per cent for phonographs and radios, and none at all for jewellery, tombstones and passenger cars. The overall figure was about 68 per cent of 1941 standards. The American way of life is probably still comfortably remote from bedrock, but there is some evidence that this is due, not to excesses of present production, but to the existence of stocks of goods. Nearly two-thirds of current production is for war purposes, and severe shortages are beginning to be felt particularly in "hard goods" like hammers, dustbins, and safety pins. Increasing anxiety over the possible effect on civilian morale of a general shortage of civilian goods has led to the proposal, by Senator Maloney, for a Civilian Supply Administration, divorced from the WPB and responsible directly to Mr Byrnes. After testifying against the Bill, Mr Nelson has attempted to counter it by creating a new post in WPB, that of vice-chairman in charge of civilian supply, and appointing to it Mr Arthur Dare Whiteside, of Dun and Bradstreet. Mr Weiner apparently is too greatly identified with a policy of leanness to satisfy the critics. In the early days of the war his office, of which Mr Leon Henderson was then head, was more concerned with lopping off unnecessary fat than with presenting a case for civilian essentials. While there is a strong case for vigilant and energetic supervision of the supply of civilian goods, it is to be hoped that attention will be focussed on reducing unnecessary demands, and, when that has been done to the utmost, on increasing supplies by rationalisation and standardisation of production—of which so far there has been little sign—rather than merely on pressing for the diversion of material and manpower resources from war production.

Shorter Note

The Senate Finance Committee, which is now considering the extension of the Reciprocal Trade Agreements Act, has voted 11 to 10 in favour of an amendment which would give Congress the power to revoke any trade agreement six months after the end of the war. This limitation on his authority has been vigorously opposed by Mr Hull. Two Democrats joined with the Republicans on the Committee and with Senator La Follette, Progressive, in passing the amendment. There are, however, Republicans in the Senate who are expected to oppose the amendment, although they are not represented on the Committee.

THE WORLD OVERSEAS

Overproduction in Canada

(From Our Ottawa Correspondent)

April 11th

THE systematic completion of the inventory stocks of offensive weapons for the Allied armies is producing a series of problems in industrial adjustment which are felt particularly keenly in Canada. The curtailment of lines of war production in which overproduction has been reached, resulting in pockets of unemployment, has caused perplexity and anxiety which, at this stage, is mingled with frustration over the fact that Canadian forces have so far participated only in limited phases of land warfare.

In the long months from June, 1940, until the end of 1941, when war capacity of unprecedented proportions for Canada was being organised, there was no comparable mobilisation of industrial resources in the United States. In the early part of that period, there was no strict comparison between the production objectives of the United Kingdom, which were concerned in large part with the devices of defence, and those of Canada, which were organised from the first for the manufacture of offensive weapons. For a period, which in retrospect now shows clearly to have fallen within 1941, Canada was the leading producer of many types of weapons of offence. That was the period of Canada's gift of \$1,000 million worth of war supplies and services to the United Kingdom.

But now the offensives, for which long preparations have been made, appear near at hand. This fact seems *a priori* evidence that the production required has been fulfilled, and the economic scene presenting itself in Canada at present bears this out. In war production, Canadian industry has been an integral source of British weapons. In the common use of raw material sources and in the development of production processes, it has moved steadily into integration with American war industry. In broad outline, Canada has occupied middle ground. Gradually, through 1942, the broad single purpose of Canadian, British and American war capacity had been fulfilled. United Kingdom industry moved into its peak output of weapons of offence, as Mr. Lyttelton indicated in a recent statement that the output of war stores late in 1942 reached a rate double the average of 1941. United States industry, utilising the experience gained in British, Canadian and other orders, geared up quickly a vast arsenal dedicated overwhelmingly to offensive weapons. In January, Mr. Stettinius reported that the US war industry had outstripped that of every Allied country. Finally, on April 2nd, Mr. Lyttelton said:

The striking forces of the United Nations in 1943 are, under any computation, greatly in excess of our ability to transport them.

This was testimony, not only to the critical nature of the Battle of the Atlantic, but also to the vast productive power that had been mobilised within the English-speaking countries.

In the past six months, Canadian war industry has been operating at what must be considered peak capacity, even though it is still expanding in certain lines. A rough estimate places its proportion to American capacity at 15 per cent. It should have been no surprise that conditions of overproduction would begin to appear, or that they should appear first in the Canadian scene, where the prime task of equipping Canadian forces has been exceeded several times over. But, in Canada, the main line of public thinking about home-front problems has been concentrated for so long upon a seemingly endless vista of expanding production, of conquest of one bottleneck after another, that a sharp psychological adjustment is required now. This need is reflected in current debates in Parliament. Evidence of curtailment of certain lines of war production is becoming abundant. The evidence of a vast backlog of produced weapons and materials is plain.

"We have reached the point," Mr. Howe told Parlia-

ment, "where the requirements for certain types of munitions have been filled." Categories revealed publicly have included 4.5 shells, Valentine tanks and six-pounder guns. Reasons for over-production lie in part in excess capacity and partly in technological factors. The Minister of Labour, Mr. Mitchell, said:

If we cannot produce tanks or if tanks are not needed, then ships and more ships are needed. There is no reason in the world, with the exception, of course, of indifferent planning, why we should not be engaged in producing ships if other work is not available.

A clear distinction is emerging, as far as over-production is concerned, between the production of weapons, which in Canada has been sufficient to date to equip three armies or more of the size of the Canadian Army overseas, and the production of materials, which has supported large sections both of British and American production. In the production of coal, lumber, certain minerals and some other materials, Canadian industry still labours under critical pressure. The same is true of Canadian agriculture in the production of food.

Problems of Planning

These circumstances present the Canadian Government with problems in planning that are just coming into sharp focus. One of the best informed Ottawa correspondents, Mr. Grant Dexter, wrote in the *Winnipeg Free Press* recently:

No one who surveys this country to-day would affirm that we have achieved total war. In the balance between striking power, output of munitions, foodstuffs and essential raw materials our war effort shows a creditable degree of planning and organisation. But in one vital field—manpower—there has been a partial failure.

This analysis led to the discovery that a startling proportion of Canadian manpower was still engaged in non-essential activities.

That point has assumed significance in the face of actual curtailment of weapon production, still confined to a few lines, but likely to grow. It will lead logically, as the public grasps it, to demands for more drastic transfers of manpower to either essential production or to military service. It will accentuate the problem of industrial readjustment being forced by changing demands of war as they are felt in Canada. Capacity to produce weapons must be maintained on a basis capable of being called into immediate functioning, as curtailments are made. Canadian industry is still the second line of British industry, and must remain on an effective shadow basis even though stocks are filled. Remaining critical production must be given prompt priority, and into this category some essential civilian services, such as transportation, now fall. So does ship-building, lumbering and food production. But the prospect exists that Canada will shortly need new war production tasks to which the national will can be orientated.

The Comintern's Record

[BY A CORRESPONDENT]

THE idea of a Third International was first conceived by Lenin in 1915, during his exile in Switzerland. The founder of Bolshevism then believed that the Socialist International would never be able to recover from its collapse in 1914; and the new International was to take its place as the directing centre of the international labour movement. At the preparatory conferences of Left Wing Socialists at Kiel and Zimmerwald in 1916, Lenin and his supporters found themselves in a small minority. Apart from the Bolsheviks, no

European Labour group, not even the most radical Marxists, stood for the creation of a Third International. The idea gained some more ground only as a result of the Russian Revolution. Even then only tiny sects from the European countries attended the first Congress of the Comintern at Moscow in February, 1919. The new body, which aspired to lead the world's working classes to "the last and final battle," was in essence a body of political generals without an army. Its only strength—a very real one—was the moral authority which the successful Russian revolution commanded in Left circles all over the world.

The Lure of Moscow

The position changed during 1919 and 1920. In the atmosphere of economic and political chaos which followed the armistice, a great *bouleversement* took place in many of the European Socialist parties. Moscow became a place of pilgrimage; and in the period between the first and the second Congress of the Comintern, even moderate Socialists like Serrati in Italy, Hilferding in Germany, and many others, were carried away by the "rush to Moscow." They tried to find a common language between European Socialism and the Russian Revolution. But Moscow had its own conceptions of policy tactics and organisation, which it tried to transplant into the European movements. Lenin and Zinoviev drafted the famous "21 points" on which the admission of Socialist parties to the new International was made conditional. The main conditions were the abandonment of parliamentary democracy, the acceptance of the Soviet method of proletarian dictatorship, and the transformation of the Socialist parties into strictly centralised and disciplined Communist parties.

The second Congress of the Comintern coincided with the Red Army's march on Warsaw, in the summer of 1920. The Congress could now claim to direct large sections of European Labour. The fiery speeches of its leaders were animated by the hope that the European revolution was only a matter of months, if not of weeks. The Russian Revolution was considered as a mere prologue to the establishment of a world-wide Soviet Republic. The second Congress worked out a detailed programme for revolutionary movements in colonial countries. Asia and Europe were to unite in one gigantic struggle against Capitalism and Imperialism.

The third Congress of the Comintern took place in 1921, during the ebb of Communism, when the illusion of a world revolution was fading. Now it was Moscow that looked for a *rapprochement* with the other sections of European Labour. The tactics of the "united front"—forerunner of the Popular Front—were devised. But the fundamental split between Communists and Socialists made the "United Front" fruitless; and the fourth Congress of the Comintern in 1922 could only register failure. During all that time, the preponderance of Russian influence in the Comintern very largely conditioned the outlook of its national branches. But, on the other hand, the Comintern was still a reality in Russia itself. Russian policy was still subordinating the national point of view to the concept of an international proletarian revolution.

The fifth Congress of the Comintern in 1924 put an end to this phase. The Congress virtually endorsed the programme of "Socialism in one country" and assigned to the Comintern the modest role of an "auxiliary frontier guard" for Soviet Russia. The peculiar feature of this frontier guard was that its activities were to take place far beyond the Soviet frontiers. The Comintern was no longer a threat to the established order; but it was a by no means negligible nuisance in international politics, and in the internal affairs of many continental countries. In Germany, for instance, the Communists played a disastrous role in facilitating and speeding-up the victory of National Socialism.

The sixth Congress of the Comintern took place in 1928. It proclaimed the struggle against Liberals, Democrats and Socialists as more urgent and important a duty for Communists than the struggle against the rising tide of National Socialism. This policy remained in force from 1928 to 1935, that is, during the critical period of the coming of Hitler to power. It was in those years that the German Communists went hand in hand with the Nazis in their fight against the Weimar Republic. Together they launched the famous *Rote Volksentscheid*, and together they propagated the slogans of "social and national liberation for Germany" claiming the reincorporation into Germany of all those territories which were claimed by the Nazis, too. The Communists were bound to be outpaced in this nationalist race by their Nazi rivals; and this chapter in the history of the Comintern will for ever appear an extraordinary instance

of political blindness and stupidity. The "frontier guard" was guarding Soviet Russia's frontiers very badly indeed. Compared with its failures, Dimitroff's courageous conduct in the famous Leipzig trial was hardly sufficient to restore the prestige of German Communism.

The list of subsequent failures is long. In 1935 the seventh Congress of the Comintern inaugurated the policy of the Popular Front; and the centre of gravity of its activities shifted to France. The *Front Populaire* was handicapped from the beginning by the fact that one of its strongest parties acted not in the interests of progress and democracy in France, but in the interests of a foreign Power. The policy of the French Communists reflected every change of weather in the diplomatic chancelleries of Moscow and Paris, and it was a constant factor of instability inside the movement. Similarly, the coalition of the Loyalists in the Spanish civil war was sapped from inside by the encroachments of the Spanish section of the Comintern, which used the trump card of Russian deliveries of munitions for its own disruptive purposes. Thus, at every stage, the Communist contribution to the defeat of the European democracies was very substantial; and in the first phase of this war it was crowned by the defeatist attitude of the Comintern between 1939 and 1941. Communist defeatism could do little harm in the English-speaking countries, where the local sections of the Comintern have never been more than tiny sects; but in France Communist influence was a potent factor in the collapse of 1940. There, the defeatism emanating from above, from Big Business and from the military command, was supplemented and strengthened by the defeatist trend from below.

The record of the Comintern has thus been one sad sequence of failures. First, it failed in its ambitious bid for a world revolution. Then it failed as the auxiliary instrument of Soviet foreign policy. In the course of time, the once menacing spectre of revolution was reduced to a clumsy bogey; and now—with the self-disbandment of the Comintern—the bogey, too, has been laid. Nobody, apart perhaps from Dr. Goebbels—will shed a tear over the grave of the Comintern.

Venezuela's Oil

[BY A CORRESPONDENT]

May 11th.

THERE are few overseas countries whose international trade and, as a direct consequence, their internal economic position, has suffered so much from the war as that of Venezuela. This republic, consisting of 20 states, one Federal District and two "Territories," with a total area of 393,976 square miles and a population of under 3,500,000, is completely dependent on oil. Mineral oil and its derivatives have in recent years been responsible for over nine-tenths of the country's export trade, and through this had provided the bulk of the Government's revenue. Of the remaining tenth, coffee and cocoa normally accounted for over half, and of this three-quarters used to be shipped to Europe until the outbreak of war. Venezuela's oil position was exceedingly promising until, on February 16, 1942, Axis submarines attacked and damaged the large oil refineries of Aruba, where the greater part of the Venezuelan oil is refined. This damage, together with intensified U-boat warfare in the Caribbean area, and the tanker shortage, seriously reduced the demand for Venezuelan oil. The Venezuelan Government, as a result, was faced with the need to adjust its sources of revenue. Last July, the Venezuelan Congress passed the first income-tax law—a very mild one—in the country's history (which came into effect from January 1st this year), and, last November, the Government for the

first time for very many years had to issue a short-term loan in the form of 4½ per cent Treasury notes.

The latter loan coincided with President Medina's speech at Maracaibo, in which he raised for the first time the question of his country's obtaining a larger share in its oil wealth. It was only natural, therefore, that this speech and the subsequent revision of the country's Hydrocarbons Act were almost generally linked up with the current Venezuelan financial and economic difficulties. Press reports published in the United States and this country at the turn of last year appeared to indicate that President Medina's speech had come like a bolt from the blue. Some of them referred to Venezuela's demand for a revision of the oil law in a way which caused a temporary depression of Venezuelan oil share quotations. The official text of the new *Ley de Hidrocarburos* has now arrived in this country. Its details, together with the accounts of the preparations of the law, show that the Venezuelan oil case has been very inadequately reported.

The new law, which was ratified by the Venezuelan Congress on March 13, 1943, contains six major changes compared with the oil code of 1936. First, the royalties, which in Venezuela are virtually a production tax, were raised from between 7½ and 15 per cent (averaging about 11 per cent) to 16½ per cent. Secondly, the surface taxes were increased on a sliding scale to make concessionaires who fail to develop their concessions pay higher taxes. Thirdly, the new law removed the oil companies' privilege of exemption from import duties on their stores and equipment, although the Government retained the right to allow duty-free imports of equipment for new construction. Fourthly, it unified the duration of oil concessions to a period of 40 years, whereas hitherto the duration of concessions had been fixed by individual arrangements. The existing concessions are not directly affected by the new law, but old concessionaires are entitled to convert their concessions into new ones of 40 years' duration on the basis of the new Act. After the expiry of any such 40 years' concession, the holders will have preference in their renewal. Fifthly, the new law granted oil companies the right, which they did not possess until then, to explore public lands outside their concessions. Lastly, the 1943 law made the existing oil pipe-lines common carriers. In other words, the pipe-line owners are under an obligation to transport oil produced by other concessionaires without discrimination, provided that their installations have the necessary capacity.

These changes cannot be regarded as revolutionary. They are by no means one-sided, and do not indicate that the present economic and financial difficulties of the Venezuelan Government have in any way been used as the basis of undue pressure on the oil companies. In fact, all major changes contained in the new law had been laid down by the Ministerio de Fomento in a memorandum on the country's oil policy, which was published in March, 1941, that is, when the country's oil production was approaching its highest level, and when all signs pointed towards an increase in Government revenues, not a contraction. While the present financial difficulties have undoubtedly accelerated the translation of these plans into practice, the new law is essentially a long-term move of decisive importance.

Despite its big expansion in the past two decades, Venezuela's oil industry is still very young, and most of the existing concessions originated in the early pioneer period of the industry. In other words, the oil companies were intentionally favoured in order that their interest in large-scale development should be attracted. To-day, Venezuela is not only the world's third largest, and potentially even the second largest oil-producing country, but for some years before the recent curtailment of shipments, it was also the world's largest oil-exporting country. The basic conditions of Venezuela's oil industry, therefore, have changed decisively in recent years, and the new law does not do much more than take notice of these changes. Generally speaking, it claims for the first time the right of the Venezuelan nation, as the owner of its oil resources, to a more adequate participation in its oil wealth.

Moreover, the provisions of the new law show very clearly that the Venezuelan Government does not wish to eliminate the foreign oil groups, which today dominate the oil industry. The new law is not restrictive but expansive, and the Venezuelan Government is obviously anxious that future expansion is secured by the fullest co-operation between the Government and the foreign oil companies. As a matter of fact, when President Medina last November "inspired by a spirit of reason and equity," claimed an increased share for the nation in its oil wealth, the negotia-

tions between Dr Gustavo Maurique Pacanius, Venezuela's Attorney-General, and the foreign oil companies on the question of their future co-operation had been in progress for some months. These negotiations resulted in arrangements which, in some parts, go beyond the provisions of the new law. In particular, it has become known that the oil companies have given an undertaking that they will actively pursue an extension of Venezuela's oil refining industry, so that within five years after the war the country's refineries will have a daily throughput of 192,000 barrels, compared with the present facilities of only 72,000 barrels. The increased refining operations will automatically expand the country's industrial basis, but the co-operation between the Venezuelan Government and its oil concessionaires does not end here. Some of the foreign oil companies have for some time past acquired mortgage-bonds issued by the Venezuelan Farming and Livestock Bank, and the Venezuelan operating companies of the Standard Oil Company of New Jersey (Creole Petroleum Corporation) and Lago Petroleum Corporation have decided to make a study of the industrial possibilities in Venezuela with a view to investing new capital in enterprises distinct from petroleum. It is obvious, therefore, that the new co-operation between Venezuela and its oil producers achieved by the new Hydrocarbons Act is an important milestone in the country's economic history.

FUEL EFFICIENCY COMMITTEE OF THE CIPHER TRADE ASSOCIATION (Appointed at the request of the Ministry of Fuel and Power)

The Managing Director.
Messrs Symbol Ltd.

Dear Sir,

Fuel Economy in Process Work

We have now made our analysis of the questionnaire on fuel economy circulated to members of the Association in January. The results show that there is considerable scope for improvement in the industry since different firms' fuel consumption vary between 7 and 21 tons per unit of production.

Your own firm's consumption per unit of production is 17 tons, somewhat higher than the average for the whole Association. From your detailed answers to the questionnaire, we conclude that you could make substantial economies by:-

- (i) reducing peak demands for steam by starting the different boiling processes at staggered intervals;
- (ii) using exhaust steam for the central heating of the offices and cutting out the separate boiler;
- (iii) ensuring that the steam supplies to the vats are reduced as soon as boiling point is reached.

We understand that your power house is already being overhauled as a result of the recommendations of the Ministry of Fuel's engineers. This will not only reduce your fuel bill still further, but enable your firm to contribute substantially to the War Effort.

Yours faithfully,

M. Robinson
Secretary.

NOTE: The Ministry of Fuel has reminded all industrial consumers of fuel that they must not change from one fuel to another, or install new fuel burning plant, without having first ascertained that the fuel will be available. Such changes are rarely permitted, except in the case of oil burning plant to use creosote/pitch. If your firm has been asked by the Petroleum Board to convert its plant, you should act at once. Details of the Ministry's instructions can be obtained from the Public Relations Branch, Ministry of Fuel, Dean Stanley Street, S.W.1.

For correct disposal of used Lubricating Oil contact your oil supplier or L.O.P. (Lubricating Oil Pool).

THE BUSINESS WORLD

Department Store Outlook

ALTHOUGH 1942 was a year of progressive curtailment of supplies and of great extension of Government fixing of margins, the profits of many stores, and of some of the London department stores in particular, have shown a very marked recovery. Under a regime when almost all concerns return profits after EPT, the difference between specifically London concerns and others may well be less than, at first sight, appears. But there can be no doubt that the return of population is a factor of more importance in London than elsewhere.

The White Paper on National Income and Expenditure shows a rise between 1941 and 1942 of almost 6.5 per cent in personal expenditure on consumption at market prices, but the corresponding rise in household goods and clothing, excluding food, drink and tobacco, was only 1.7. The retail trade statistics give an increase of only 1.9 per cent for the twelvemonth to February 1, 1943, while there was actually a fall of 0.1 per cent in non-food sales. The corresponding figures for London Central and West End were, however, rises of 14.9 in total and 17.1 in non-food. This, however, falls far short of making good the declines on the two preceding years, during which there was a net expansion in total sales for the whole country. Nor, in some cases, is it enough to explain why the general results in London should be the best since pre-war days. Barkers, in particular, appear to have achieved a record profit.

Company chairmen are on the whole reticent as to the causes, but there are some fairly clear indications that the factor which played a decisive part in the result was a reduction in what may be conveniently summarised as the services rendered element in this side of retailing. The accounts cannot be said to be informative on this point. Harrods show the cost of printing, advertising, stationery and stamps and an item "transport expense." On these, they saved £101,000 between 1939-40 and 1941-42 and a further £62,000 last year. It is certain that this by no means exhausts the saving under the general head of services. The chairman of Whiteley says that reduction in advertising, savings on light, wrapping paper, a reduced delivery service and an increase in cash payments more than counteracted the rise in the wage bill. The rise in wages, which is a common factor to all the accounts stating this item, is presumably due here, as in many other cases, to the fact that payments have to be related to age rather than to skill, and that the age composition of staffs is, of course, rising rapidly. The charge of Harrods for salaries, wages and staff pension funds rose by some £88,000 on the year. It seems evident that circumstances which permitted a firm to achieve the savings without suffering the rise in staff costs—due solely to abnormal shortage of labour—would make possible some reduction in selling

prices. In 1939-40, the transport and the miscellaneous postage and advertising items of Harrods amounted to almost 18 per cent of the gross trading profit. The total "service" expenditure must have been very much higher than this. Unfortunately, the other companies concerned restrict their "profit and loss account" almost entirely to financial charges.

It is impossible to check the retail trade figures of the Board of Trade against the purchases of the White Paper, since one cannot say what "weight" ought to be given to the item drink and tobacco in the former, and because, for obvious reasons, issues in kind to the Forces are lumped together with other goods in the latter. It is doubtful whether under war conditions, the Board of Trade figures are fully representative of turnover, and it is admitted that those for stocks are less so than the sales figures. For what they are worth, they show an increase in stock, by value, last year, and at the end of January non-food stocks were 57 per cent higher than four years earlier.

The figures of the White Paper suggest a rise in prices of a selection of goods and services, covering some 90 per cent of total consumption, of 45 per cent between 1938 and 1942 and about half that percentage between 1940 and 1942. The rise in non-food prices alone would be very substantially higher, but it does not appear, on the basis of these figures, that as yet there has been a very serious fall in retail stocks, taken as a whole. Doubtless those of articles on which the profit margin is greatest may have suffered the heaviest decline.

Taken by and large, the immediate outlook for shops of all sorts, other than those mainly concerned with food, is none too brilliant, from the standpoint of physical quantities. But there appears to be virtually no limit to the prices that will be paid for a large number of commodities in short supply. There can be little doubt that this state of affairs will continue, in some lines at least, for years rather than months after the conclusion of hostilities. So long as the shortage remains general, there will be little need for concerns to indulge in acute competition by offering to reinstate services now restricted. The figures, so far as they are available, suggest no very striking relapse in the immediate future and a period of almost unexampled prosperity during the re-stocking process. This belief is reflected in the very low yields obtainable on shares of the leading concerns, a representative selection of which is given below:—

	Ten-Year Averages for Equity		Latest Year for Equity		Price May 26, 1943	Yield
	Earned	Paid	Earned	Paid

None the less, it is not easy to evaluate the prospects of any given type of store for any period beyond the post-war re-stocking movement. In pre-war days, despite a very strong tendency to shop in the centre rather than in the suburbs, and for provincial towns to buy from the store in a few large centres, either by personal visit or through the growing mail order business, the London department

stores were far from being uniformly successful, if disclosed earnings are the criterion. Most of them secured higher profits until NDC began to make inroads into gross earnings, but the rise was not comparable with that secured by some of the chain store companies and by other concerns outside London.

In the absence of turnover figures, it is not possible to say whether this was due mainly to exceptionally high costs in this type of business or to the fact that the department stores were receiving a decreased percentage of the total business done. Almost certainly, both factors played a part. Three main trends were at work: the redistribution of income in favour of the comparatively poor, by means, mainly, of taxation; the competition in services; and the growth in the travel habit among a considerable proportion of the community. It is, perhaps, a fairly safe guess that of these the first was more important than the last two together. The chain store, which attracted the now-not-so poor—as well as the now-not-so-rich—gave the former better service than they had been accustomed to in the second-hand market, or the small local shop. Insofar as it catered for the requirements of those demanding low quality goods and only a modicum of service, the department store also benefited from the redistribution of incomes, but, at the top of the range, it had a fairly hard struggle to increase its turnover sufficiently to replace the profit on some of the lines which it was continuously losing to the chain store, and perhaps to the local shop, whose service consisted in being on the spot.

The war has speeded up the process of income redistribution and it has reduced both mobility and ability to offer services. It is just possible that some concerns may find it possible permanently to restrict services which are not essential to carrying out the main job, but there is a good deal of evidence to suggest that appearance, amenities and services will make an even greater appeal to the classes rising to the income levels which use the department store than they have done to those who have grown up with them. It seems probable that the three pre-war trends will be accentuated after the re-stocking period. It is, however, likely that the section of the population which will experience the greatest improvement in income status will be the lowest and that they will still remain below the level for which the large department store, principally, caters. From such a development, the chain store might well be the greatest beneficiary, although the local shop would secure a considerable share in the greater purchasing power.

The war has brought two new developments which may have some permanent effect on the situation: utility goods

and a greater respect for durability, resulting from the rationing of clothing and some household linens and soft furnishings. Apart from control of selling prices and freedom from purchase tax, utility goods are, presumably, cheaper than others insofar as variety has been sacrificed to mass production. This principle may be carried a good deal further before the war is over, but the fields to which the principle has so far been applied are, mainly, those into which private taste enters largely and which are, therefore, least suited to any process of standardisation. It is to be hoped that, insofar as utility goods are of guaranteed standard, this departure will be continued and extended after the war. Insofar as utility is synonymous with lack of variety, it will probably not survive the period of scarcity. Anything which makes for standardisation is likely to be relatively disadvantageous to the department store.

The second development, the tendency to look for quality and durability rather than meretricious attractions, may well persist after the period of rationing. If there is to be an increase in goods which carry the guarantee of the Government, or of a consumers' council, the new attitude of mind would, presumably, result in a larger demand for such goods. Outside their range, the more critical attitude would seem very definitely to favour the department store—or at least a department store which had mended its ways. Further, a rise in the standard of living—and it may be hoped of education in living—would also be a factor making for a more critical attitude. It would be a mistake to suggest that the goods sold by departmental stores are superior to those obtainable elsewhere. The point is that nowhere else is it possible to obtain so quickly a view of what there is available. If the redistribution of incomes and the lessons of clothes rationing mean that those in the lower income brackets are in future to study goods with a view to getting the best value for money rather than the cheapest available, that is probably a large bull point for the department store, or at least for the very large shop. At the same time, it can hardly fail to be the case that the same process will benefit the efficient chain store. Almost certainly, both will continue to make progress at the expense of the small local shop, but that is not to say that the last will not continue to hold a substantial part of the total turnover, even outside the commodities which can, strictly speaking, be brought within the food category. In general, it seems there will be reduced opportunities—although still considerable ones—for the supply of goods at very large margins of profit to the comparatively well-to-do. This will put some small shops and certain departments of some of the stores in the position of having to remodel their policy extensively.

Finance and Banking

Special Assistance

The money market has during the past week been in need of a fair volume of assistance from the customary official quarters. The most apparent factor making for stringency of credit has been the calling of loans and a refusal to buy bills by clearing banks, which have been making up for the May statements this week. The discount market, for its part, had to take up another substantial allotment of Treasury bills, having again obtained 44 per cent of its applications for the £90 million of bills on offer at last week's tender. The shortage of credit experienced over the past week is, however, somewhat surprising in view of the fact that the banks were net recipients on TDR account. Their payments were £15 million less than nominal maturities, and though there has been some pre-encashments, the banks nevertheless stood to gain a substantial amount from this source. The credit position had eased considerably by Wednesday afternoon, and the Bank return shows bankers' balances at the relatively high level of £174,067,000, showing an increase of £33,378,000 on the week. That this figure should appear in a week during which there has been evidence of stringency is a measure of the immobilisation of credit which is caused by the banks' monthly making-up. The expansion in bank cash has been mainly caused by a reduction of £15,172,000 in public deposits and in an increase of £17,295,000 in Government securities. The latter movement probably reflects some of the special assistance given to the market during the course of the week.

That assistance has been provided by means of direct purchases of bills by the official agent from discount market firms and from the banks.

Open Market Technique

The elasticity of the banking authorities' open market technique was well illustrated on Saturday of last week when an exceptional spasm of credit stringency had to be remedied in a matter of minutes before the mid-day guillotine fell on all banking operations. The causes of the sudden development of credit shortage were many: the belated effect of the banks' TDR payments, the exceptional allotment of Treasury bills which the discount market had had to take up during the week and, finally, one of those fortuitous disparities between the day's payments and receipts of the Exchequer which the authorities must

always be prepared to iron out. The hint of more difficult conditions in the short loan market had already appeared on Friday of last week, and by mid-morning on Saturday it was evident that a substantial deficiency in the market's resources would have to be filled by the customary official quarters. Saturday, with its exceptionally short working day and its equally short number of available staffs, is, however, a difficult day for the deployment of the customary open market technique—involving as it does a special bill purchasing operation between the agents of the Bank of England and each of the market houses in need of immediate assistance. The method chosen on this occasion was for the agent of the Bank to take a large parcel of bills from one of the clearing banks and to leave it to that institution to give help where it was needed in the market. That assistance was given by way of loans—a simpler procedure than that of bill purchases—and, owing to the larger number of telephone wires available to the clearing bank in question, it could be diffused over the parched area with the requisite rapidity. This use of a clearing bank for the purpose of giving open market assistance to the market by the authorities is not unprecedented, though it is many months since it was resorted to. Its occasional use when the circumstances call for it shows how well the authorities have diversified their open market technique since the war. This occurrence, incidentally, illustrates a point made in *The Economist* last week when discussing the tendency of banks to buy shorter dated bills from the discount market. In so far as the banks are made the indirect instrument of open market policy and are therefore called upon to sell bills to the authorities, they will find it more convenient to run a portfolio of comparatively short bills, since the authorities always insist on such maturities for their open market purchases.

Bombay Bullion Slump

The ever-fickle bullion market in Bombay has since May 17th staged a slump of impressive proportions. On that day, both silver and gold reached their record quotations, silver touching Rs138 3a per 100 tolas and gold Rs95 10a per tola. By Thursday of this week, the prices had come tumbling down to Rs119 12a and Rs76 2a respectively. The peak prices were reached when the threat of a Japanese invasion of India appeared to be recurring, and when the inflationary situation in India was seemingly being left to its own devices. Since then the news from the Arakan front has improved, and the Government of India has launched its anti-inflationary campaign. It is the latter factor which

has particularly impressed Indian speculators, and their sales, coming on what has always been a very narrow market, have caused considerable damage to prices. It will be seen that the fall has been proportionately greater in gold than silver. This is because the genuine up-country offtake of silver for hoarding and other purposes is a persistent factor in the market and goes on irrespective of the oscillations in the fever chart of speculative sentiment. It is, moreover, felt in responsible Indian quarters that there is more promise of permanence about the present premium in the rupee price of silver over the dollar and sterling parities than there can be about the corresponding premium on gold.

Silver for Industry

The Chancellor of the Exchequer announced in the House of Commons this week that the price at which US Lend-Lease silver is to be made available to industry would be fixed by the Treasury. He added that this would merely prolong an existing arrangement, implying that the method of marketing the Lend-Lease silver would be exactly the same as that followed hitherto for effecting official sales of silver in the London market. The Chancellor was also asked whether the price at which the silver would be made available to industry had received the approval of the US administration. He answered that the question of obtaining such approval had not arisen. Although the date of the supposed exhaustion of British silver stocks is approaching fast, there has as yet been no evidence of American silver bars being handled in the market. They should make their appearance in the near future. The market still regards an upward adjustment of the London price to the American parity as improbable. Almost daily, official sales of silver are taking place at the price of 23½d. per standard ounce, and, though the daily turnover is small, the total handled over substantial periods is large enough to suggest that the arrival of 5 million ounces, of which only one-third will be available for industrial requirements, can only fill the needs of the market for a very short period—a matter of weeks rather than months. Experiments are being conducted by industry with a view to improving the recovery of silver from used products. The scope for such recovery is greatest in the photographic film industry, which is by far the largest single industrial consumer of the metal. The processes hitherto developed are, however, extremely expensive in relation to the market price of the metal. The discovery of a satisfactory method of treating film scrap would considerably relieve the shortage of silver in this country.

since the recent peak, is appreciably heavier than that in equities. This suggests that the factors affecting gilt-edged are special and not of general application. Apart from the Funds, the real interest of the investor continues to be concentrated upon speculative issues, such as diamond shares and what are called invasion stocks, that is securities which might be expected to benefit most directly from an early liberation of occupied territory.

Great Boulder Progress

It is at last possible to report some progress towards the solution of the Great Boulder dispute which has been in progress, in one form or another, since pre-war days. It may be recalled that the directors had placed the company in voluntary liquidation, as a preliminary to transferring its domicile to Australia, with a view to avoiding double taxation. This measure was blocked by the authorities, and it was then sought to put the original board back in office. This measure was resisted by a number of independent shareholders and the company has remained in liquidation, the liquidator striving to achieve some settlement of the differences. As reported in *The Economist* of March 27th, the Court granted an adjournment of a petition that the liquidator should summon a general meeting of the shareholders to appoint a new committee. In the meanwhile, those concerned were to attempt once more to obtain

a board which would be acceptable to all parties, or at least, as reported, to the majority of shareholders. This, it seems, has now been achieved, and there was some expectation that the new board would be ready to take office this week, all but one of the old board having resigned. No names are so far available, either of the new members or of the director who wishes to retain his position. As previously pointed out, the crux of the matter is that the old board exercised control of the company by virtue of its shareholdings. Nothing has transpired to suggest a change in that position, and it is evident that the new board will have to be a strong one to ensure confidence among the independent proprietors.

Stable Profits

Scarcely a change of any moment is evident in the latest industrial profits figures. These relate to accounts published in the first quarter of this year, together with the usual analyses by accounting periods, and returns on capital, on page 708 of this issue. Readers will also find an explanation of the figures on that page, and a fuller description in *The Economist* of May 23, 1942. Gross profits for the quarter (Table I) amounted to £81.6 million, compared with £81.7 million for the same 465 companies in the preceding year, and £85.5 million three years earlier, when they were roughly on a peacetime basis. Reserve allocations still tend to increase and gross equity dividends to decline, but these movements are significant rather than substantial. So far, only incomplete results are available for profits earned in the year 1942 (Table II); about two-thirds of the eventual total of companies show an increase in gross profits of 1½ per cent from £197.3 million to £200.6 million, but the final figures may show little change. Variations in the distribution of these stable profits (Table V) are equally unremarkable. Ordinary capital received 13.3 per cent gross, compared with 13.4 per cent in the first quarter of 1942, though this dividend absorbed a rather smaller share of the profits—60.3 per cent against 63.8 per cent. Heavy industrial groups show increased gross profits and increased reported net profits (Table VI). Probably this is mainly due to a less stringent provision for taxation and not to any basic change in earning conditions. This table shows for the first time the plight of the rubber industry "in the red"; 44 companies which earned £534,000 gross in the previous year showed a loss of £9,000 in the first quarter of this year. The figures of Tables II and III have been revised by the inclusion of figures for a number of small concerns and by the exclusion of those public utility companies for which no further accounts are to be presented during the war.

Company Notes

Dunlop Rubber

The preliminary statement of Dunlop Rubber for 1942—the first to reflect the influence of the Malayan losses—shows a drop in net profits from £3,186,269 to £2,433,307. Despite the increase of £50,000 to £700,000 in transfer to reserve for next year's tax provision, the drop in total tax provision exceeds that in net profits. After meeting preference payments, there is, in consequence, a small rise in equity earnings from £424,149 to £451,602, but these figures may not be comparable. Thus, it is still possible to repeat the 8 per cent ordinary dividend—less tax at some 9s. 7d.—and the transfer of £100,000 to contingencies, while raising the carry forward from £622,839 to £627,586. In a sense, the

latest results have shown the precautionary reduction of ordinary distributions from the 10 per cent paid in 1940 to have been unnecessary. The reduction in net income following the loss of Japanese-occupied territory has been less than might have been supposed, and the 10 per cent dividend could have been covered more generously than in the previous year. Yet, in view of the reconstruction liabilities which the concern will eventually have to face and the possibility of competition from synthetic and Latin American sources of supply, there can be no doubt of the wisdom of the management's decision to transfer the £100,000 surplus to contingencies. The reason for the relative stability of net earnings is, of course, in part the EPT cushion. The effect of the taxation of the group as a whole will, presumably, be disclosed in the full accounts. The £1 ordinary stock, at 34s. 3d., yields some £4 15s. 6d. per cent.

J. Lyons' Earnings

After the somewhat pessimistic statement in which Mr Salmon last year discussed the immediate future of J. Lyons, it is encouraging that, for the second year in succession net profits have risen; this time from £866,500 to £905,305 for year to March 31st. Ordinary and "A" ordinary stockholders receive 20 per cent for the fourth succeeding year out of earnings of £414,952 against £406,147, covered, it is possible to estimate, by profits of 24.7 against 23.8 per cent. After meeting proportional profit-sharing dividends, there is £43,697 for transfer to reserves, or for addition to the carry forward. In the latter case, the carry forward would be raised to £399,579. The recovery in earnings, which apparently exceeded the expectations of the directors, who forecast a disastrous cut in transport facilities, is most probably due to a further curtailment of service. During the past year, the installation of the cafeteria system has become general, and the initial cost of the physical alterations must have been many times covered. The shortage of supplies has been accentuated, but low cost ingredients have been substituted for high cost ones, without a corresponding reduction in retail prices. Within the altered range of the possible, quality has been maintained. The £1 ordinary stock, at 113s. 9d. ex dividend, yields £3 10s. 4d. per cent, a level which suggests that the market expects a steady recovery.

Kaffir Results

The results of the Anglo American group of gold mines, like those of the Union Corporation group, contain a number of bright features which partially offset the depressing influence of war conditions. Inevitably, as the following table shows, the majority of concerns have reduced their dividends. The group, however, contains two new mines, *East Daggafontein*, and *Western Reefs* which commenced commercial operations only at the end of June, 1941. In both these cases, there are increases in dividends based on higher output and diminishing costs. *Western Reefs* is, moreover, the only mine in the group to realise a rise in ore reserves, although one other, *Daggafontein*, also discloses an increase in payability. For the rest, the effect of the shortage of labour and materials has been to curtail milling operations and to reduce revenue per ton. The fact that the impact on working profits is relatively slight is due to very strict control of costs. These have been reduced in all cases except those of *Springs*, where there is a rise of the order of 1d., and *Brakpan*, where they have been held approximately constant. In the case of *Western Reefs*, the December costs figure amounted to 21s. 7½d. against 22s. 11d. for the year. The directors state that this mine has agreed to loan to *Springs* and *West*

Springs two hoists to assist the sinking of the new joint ore shaft. Despite the war, development on a limited scale is being continued on all mines and the position of the group as a whole remains satisfactory.

Textile Results

Results for the year to March 31st last of *Fine Cotton Spinners* and of "*Slubbers*"—the leading dyeing and bleaching concern—both show a rise in profits. The preliminary statement of the former discloses a rise in the net figure from £635,228 to £658,179, but there is in addition £100,000 written back from EPT not now required. This serves to meet tax liability of double the £50,000 provided in the previous year. Depreciation receives £120,000 as before, and there is a transfer of £30,000 against nil for deferred repairs. Except that £150,000 against £50,000 is provided for redemption of 5 per cent Funding Certificates, other charges are mainly constant. Thus, the surplus for equity is reduced from £175,676 to £105,509. Since there is no transfer for replacement of stock, against £80,000, the directors are able to raise the ordinary payment, resumed in 1941-42, after agreement of the refunding scheme, from 3 to 3½ per cent. The carry forward is increased from £194,025 to £199,222.

A much smaller rise in profits, from £205,857 to £206,156, has been realised by *British Cotton and Wool Dyers*. There has, however, been some fall in appropriations, including a cut in the combined provision for depreciation and deferred repairs from £124,354 to £116,753. Assuming that, as in the previous year, £3,000 is charged for directors' fees after the date of the balance-sheet, the 5 per cent ordinary dividend is covered by a rate of 7.9 against 7.1 per cent. Allowing for this payment for directors, there is an increase in the carry forward from £50,412 to £51,441 after repeating the £10,000 transfer to war contingencies. The balance-sheet suggests that the slight rise in profits is due to an increase in turnover, and this may well prove to be the explanation of the more marked improvement realised by *Fine Cotton Spinners*. In that case, however, the previous year's accounts showed an ominous running down of stocks.

Industry and Trade

Council of Agriculture on Food Production

On Wednesday the Council of Agriculture for England published a memorandum on the "Principles and Objectives of Long-term Agricultural Policy" prepared by its Standing Committee. The Committee includes representatives of landowners, tenant farmers and workers from different parts of England and Wales, and its views deserve careful examination. It has defined the objects of agricultural policy in these terms:—

The aims of agricultural policy which should satisfy the agricultural community and at the same time gain the full support of the rest of the nation, will be those of fitting the various types of British agriculture into the industrial and economic life of the whole community, including (1) the restoration and improvement of the productive capacity of farms and their equipment, and the maintenance of soil fertility; (2) the stimulation of the output of the products which are especially necessary for the health of the nation and which we are best fitted to produce; (3) the raising of the standard of life of the rural population; and (4) the attraction of an increase in that population by improving the amenities of rural life.

While admitting that by no means all the food required by this country can be produced at home, it expresses the view that production policy should be devoted to the expansion and increased efficiency of the livestock and livestock products and the horticultural industries, on the grounds that these are the main sources of farming income and of the better

DUTTON ONE-WEEK SHORTHAND is learnt in twelve 2-hour postal lessons. Send 3d. in stamps for first lesson to E.C., 92, Gt. Russell Street, London, W.C.1.

The latest statement of "*Slubbers*" shows a slight reduction in this item from £212,612 to £210,961, while net liquid assets are up from £392,704 to £453,964. The "*Slubbers*" 5s. ordinary shares, at 5s. 4½d. ex dividend, offer the sound yield of £4 13s. per cent; the £1 ordinary stock of *Fine Spinners* at 16s. 9d. yields £4 11s. 7d. per cent.

Oil Revenues

According to the accounts of Anglo-Ecuadorian Oil-fields for the year ended June 30th last, net operating income, after all tax, declined from £230,580 to £216,461, despite the inclusion in the latest year's total of £28,500 recoverable on past Ecuadorian taxation. A rise of nearly £11,000 to £26,888 in investment income brings the total revenue of £245,359 virtually up to the 1940-41 figure of £246,705. Depreciation is reduced from £138,436 to £101,200, but £100,000 against nil is placed to post-war development reserve, to meet, as the chairman, Mr H. C. R. Williamson, explains, the heavy programme of drilling that will then have to be undertaken. On the basis of the year's accounts, the ordinary dividend, unchanged at 5 per cent, is paid almost entirely out of tax recovery and draft on the carry forward, reduced by nearly £5,000 to £109,962. General reserve receives nothing this year, against £20,000. Changes in the balance sheet are insignificant, apart from a rise of approximately 50 per cent in oil stocks to £156,588. A slight fall in investments to £769,904, and a decline of £14,099 to £47,381 in cash, are more than offset by a reduction of over £50,000 to £273,108 in creditors. This sum includes tax provision and suspense items, the London account of £207,847 largely representing the reserves for Ecuadorian and British taxation, of which the latter includes the 1944 liability. The position of the company is strong, net current assets increasing over the year by some £50,000 to £1,003,718. It appears that it has been impossible to replace the loss of markets, which occasioned the fall of one-third in net trading profit for 1940-41. Post-war prospects, however, are favourable, and the company should benefit if the drilling programme can be effected without undue delay. The £1 ordinary stock, quoted at 24s. 3d. ex dividend, yields £4 2s. 6d. per cent, which compares with a return of some £6 2s. 9d. per cent on the 13s. 4d. ordinary shares of VOC, which has just announced the maintenance of the 16½ per cent distribution for the fifth successive year.

nutrition of the people. In order to secure an expansion in output the Committee proposes "such a system of guaranteed prices for the foodstuffs we are to produce as will give the efficient producer a reasonably remunerative return." It rejects tariffs as being "ineffective, or at least uncertain," as well as import quotas, which are "but a relatively indirect, and sometimes an ineffective, means of attaining a stable and satisfactory price level." It suggests that imports should be regulated and marketed through the agency of commodity commissions, which would be entrusted with determining the volume of imports. In other words, the British farmer is to have a guaranteed market for his products at guaranteed prices and deficiencies in supplies are to be made up by imports. The consumer would pay a "pooled price," to be calculated by averaging the price of the imported supply and the "somewhat higher price" of the home-produced supply. The administration of the commodity commissions might be brought under a single control under which "the financial pools for the various products might be unified into a general agricultural pool for the maintenance, with any Exchequer subsidies that might be required, of the home producers' guaranteed price level." The Committee does not say what share of consumption should be reserved for farmers in this country, but its reference to the desirability of a bigger rural population and of an expansion in output suggests that it would like to see an increase. True, the consumer is not left entirely out of the scheme of things; the Committee concedes that its control should be vested "in a body or bodies representing the general public and not an exclusive section or sections of the agricultural industry." But the consumer must have some estimate of the probable cost of the plan before he can be asked to give its his support.

Rural Land Utilisation

Last September Dr Dudley Stamp, perhaps the chief architect of the Scott Report, was appointed to be the Chief Advisor of the Ministry of Agriculture and Fisheries on the utilisation of rural land. In addition to the Chief Advisor, rural land utilisation officers have been appointed for the various regions of England and Wales. In fact, an elaborate organisation has been built up by the Ministry "to provide information and advice on matters affecting agriculture and the utilisation of the land and to co-operate closely on all questions of town and country planning." Such an organisation, of course, can render valuable services. Everything depends on the nature of the advice tendered to the Minister; if this were to be based on certain of the economic principles set out in the Scott Report, the resulting new order might well be open to objection. At a conference of the rural land utilisation officers last Friday, Mr R. S. Hudson, Minister of Agriculture, pointed out that, on balance, 750,000 acres of good farm land had been "indiscriminately" absorbed for industrial and residential development between 1934 and 1941; that this had hampered food production in war; and that there was now a wider recognition of the importance of safeguarding the position of agriculture in relation to land. Did Mr Hudson mean to imply that agriculture should in future have a prior and absolute claim in the utilisation of rural land, regardless of considerations of the relative economic advantages to the community of rival claims?

Women's Engineering Wages

One of the most-discussed topics at the Amalgamated Engineering Union's Women's Conference (described in an article on page 682) was that of women's wages. The present position is that under an agreement reached in December, 1942, between the Engineering and Allied Employers' National Federation on the one hand, and the Transport and General Workers' Union and the National Union of General and Municipal Workers (which, until the AEU admitted women in January, 1943, were the sole unions catering for women engineers) on the other hand, a rate of 50s. for a 47-hour week was laid down for adult plain-time workers, representing an increase of 7s. over the previous minimum. This rate is made up of 25s. basic rate, 22s. national bonus and 3s. time-workers' bonus; the rates for women from 14 to 20 are proportionately lower. The second part of the agreement dealt with the grading of women and proposed four categories of work: (1) for simple forms of machine-operating, assembly, viewing and work recognised before the war as women's work, 47s.; (2) for machine-operating or setter-operating and work regarded as semi-skilled and requiring training, 54s.; (3) for skilled jobs taken over completely from the men, but requiring additional supervision or assistance, 63s.; (4) for skilled jobs, taken over from the men without additional supervision or assistance, the appropriate skilled man's district rate and national bonus. In each grade the rate is for a 47-hour week, and qualifying periods between each grade are suggested. This part of the agreement is conditional upon its acceptance by the unions who were parties to the Extended Employment of Women (Relaxation) Agreement of May, 1940, which was on a somewhat different basis. It laid down that women workers employed on work previously performed by men should serve a probationary period of eight weeks at the women's rates; for a further twelve weeks they should receive an increase equal to one-third of the difference between the national women's and men's basic rate and national bonus; at the end of twenty weeks and for a further twelve weeks, a basic rate and bonus equal to 75 per cent of that of the men replaced; and at the end of the 32 weeks, women who carry out men's work without additional supervision or assistance would receive the full men's basic rate and bonus; for those who required supervision or assistance the rate would be "negotiable and arranged according to the nature of the work and ability displayed." The whole question of wages, the definition of work "commonly performed by women," and the basis of grading, is a very complicated one, and negotiations are still proceeding between the various unions.

Future of Cotton Industry

In accordance with a suggestion from the President of the Board of Trade, the Cotton Board has set up a com-

mittee of enquiry into the post-war problems of the cotton industry. Besides members of the Cotton Board, the committee includes representatives of the various sections of the industry. The industry now has a strong and representative committee to explore its postwar problems. These will be manifold and their solution may well require a substantial break with past practice and policy. But the chief task will be to render the industry as efficient as possible, that is to enable it to produce the right kind of goods at prices at which they will find ready markets. Everything else should be subsidiary to this task.

Overtime in the Cotton Trade

During the past two or three weeks, writes a correspondent, a large trade has been done in Manchester in cotton yarn and piece goods, the requirements of the Government Departments, the "utility" trade and export allocations being such that demand has overtaken supply. As the output of coarse yarns is not equal to the needs of cloth manufacturers, Sir Frank Platt, the Cotton Controller, has arranged for a number of mills to work overtime to the extent of four hours per week. About fifty mills in the Rochdale, Newhey, Royton and Shaw districts have been selected for the scheme. It is pointed out that this area has always been engaged in the production of coarse yarns, and overtime will substantially increase the weight of yarn produced. Some 15,000 operatives will be affected; the factories will work 52 hours per week instead of 48 hours. It is understood that the Controller has consulted the employers and the trade unions and they have agreed to give full support to the proposal. The yarns mentioned are urgently wanted for Government cloths. Sir Frank Platt has put forward a new slogan: "To beat the Hun, yarn must be spun." If the action now taken does not mitigate the shortage of supplies, overtime may have to be extended to other mills.

Conciliation in Coal Mining

The full text of the award (briefly summarised in last week's *Economist*) of the Greene Board of Investigation on the issue raised by the Northumberland miners concerning the restrictive effect of the War Wage Additions Agreement of 1940 on national and district freedom of action under the new National Conciliation Scheme, deals with one or two particularly interesting features of the system of collective bargaining. The governing principle of the award is the desirability of reserving to either party to an industrial agreement the right to apply for a review of some or all of its provisions in the light of altered circumstances. Usually this contingency is met by limiting the lifetime of agreements, but in the coal mining industry such a safeguard has been provided even under agreements limited to three years. The position, however, as regards the 1940 national agreement was exceptional in that it was long and indeterminate; it could not be terminated except by six months' notice after the cessation of hostilities. In such circumstances collective bargaining, in the opinion of the Board, should in the interests of fairness and industrial peace, be regarded as open to review at the instance of either party able to establish a substantial change of circumstances. The immediately practical question then was: Could such a substantial change of circumstances be established in this particular dispute? The Board held that it could, and on this finding it has brought the 1940 agreement within the scope and purpose of the new National Conciliation Scheme. The four principal altered circumstances to which it draws attention in its award are the following: (1) Under the new national arrangements the principle has been accepted that settlements upon national questions are subject to review upon proof of a substantial change of circumstances since the date of such settlements; (2) the Government's White Paper policy favouring the treatment of questions of wages and conditions in the mining industry on a national basis and by a properly constituted national body; (3) the acceptance by the coal owners of the Greene wage award of last June, in spite of the fact that they had protested to the Greene Board at the time that both these demands were inconsistent with the provisions of the 1940 agree-

COMPANY MEETINGS

ROYAL INSURANCE
COMPANY, LIMITED

PROGRESS IN ALL DEPARTMENTS

MR P. R. ENGLAND'S SURVEY

In a statement circulated with the ninety-eighth annual report of the Royal Insurance Company, Limited, the chairman, Mr P. R. England, indicates that fire premiums, at £6,368,000, were higher than for 1941, due in part to increased values. Home losses, though heavy, were better than in the previous year. Underwriting profit of £548,000, or 8.6 per cent., was shown. Premiums in the United States again rose with the growth of industrial activity and increased commodity values, and with both loss and expense ratios lower a satisfactory underwriting balance was disclosed. In Canada premiums were lower, losses moderate, and a profit resulted. Australasian operations had been satisfactory. In the general foreign field the accounts reflected in full the effect of enemy occupation of Far Eastern territories. Elsewhere the overseas business showed healthy vitality and trading results had been satisfactory.

Accident and General premium income at £6,871,000 showed further expansion, a moderate reduction at home, mainly motor, being offset by increases overseas. A profit of £876,000, or 12.7 per cent., resulted.

ROAD ACCIDENTS

The continued slaughter on the roads called for insistent protest. A new feature was the marked rise in child fatalities, which in 1942 were 27 per cent. higher than in 1939, despite a reduction of 16 per cent. in the total fatalities. Children's deaths in road accidents in this country during the last three years totalled nearly 4,000, or over 75 per cent. of children's deaths through air raids. The whole question should be taken in hand by the authorities in no uncertain way. Radical changes in road policy might be called for; but the need for the individual, whether driver, cyclist or pedestrian, to exercise a greater measure of care and consideration for other road users remained as urgent as ever.

THE BEVERIDGE REPORT

The chairman emphasised that insurance companies were not ranged in opposition against the Beveridge Scheme. The underlying aim—the abolition of want—must obviously command universal sympathy, but when there were alternative methods of administration available which involved no abandonment of the social aims, Parliament had surely not only a right but a democratic duty to examine them.

So far as workmen's compensation was concerned, the terms of benefit were laid down by Statute and the function of the companies was to administer those terms whatever they be. Any beneficial adjustment which might be introduced would be welcomed. Moreover, the margin for working costs was strictly limited under agreement with the Home Office. The chairman claimed that insurance companies had built up a machine for administering benefits which was unexcelled in its smooth and practical efficiency, and that, in the interest of workman no less than of employer, it should not lightly be scrapped.

Net new life business, at £2,665,000, was about £500,000 less than in 1941. The total was still over one-half of the pre-war figure, despite the fact that the company had now no staff canvassing life business. Death claims, at £795,000, included war claims of £48,000, and were £107,000 less than in 1941.

Marine business had been attended by many difficulties during the past year. The area in which business could be transacted had been restricted, but problems had multiplied. Premium income had greatly increased, owing to higher rates and values, and had reached a record figure of £3,967,000. In 1942, however, war losses falling upon the company's American business were particularly heavy, so that the amount carried forward to meet second-

year claims was proportionately smaller than usual. This account, therefore, might well close with a debit balance, a factor to be borne in mind when considering the very good result of the 1941 account.

PROFIT AND LOSS ACCOUNT

The directors recommended that an amount of £500,000 be transferred from the balance of profit and loss account to the reserve fund, thereby increasing the latter to £2,000,000. After provision for the final dividend of 3s. 3d. per share, a balance of £2,444,000 is proposed to be carried forward, an increase of £137,000.

Total underwriting profit was £1,762,000, against £1,191,000 in the preceding year.

BALANCE SHEET

Market values of the company's investments showed an enhanced margin over book values. It was a continuing story of higher capital values and lower interest returns. The claims of Government issues dominated all new investment, and the company's existing portfolio was subject to the constant erosive effect of requisitioning and conversion schemes. The "Royal" and its associated companies now held over £12,000,000 of British Government war securities and they subscribed further large amounts to the war issues of the United States, India and the Dominions. Apart from increased holdings in British and other Government bonds, there had been no material change in the broad classification of the company's assets.

In a multitude of ways, collectively and through the services of individual officials, the company continued to assist the Government in those many matters where, by virtue of its country-wide organisation and technical equipment, it was specially able to help.

The company's staff had been both reduced and diluted. Only 53 per cent. of its pre-war male personnel now remained, and over 800 of the home staff, male and female, were now in the Forces or in National Service.

Post-war problems might seem remote, but the need for a full development of international trade was axiomatic, and there could be no commercial activity more international in character than insurance. Of the business of the British companies, other than life, more than half came from overseas, and was built up on confidence. Provided nothing was done to impair that confidence, the companies could maintain, both now and after the war, a contribution to the country's welfare comparable with any of the nation's major exporting industries.

BRITISH ENKA, LIMITED

The eighteenth ordinary general meeting of British Enka, Limited, was held on the 24th instant in London.

Mr A. D. Carmichael presided, and in the course of his statement said:—The working profit for the year 1942 is £139,373. This is £16,935 higher than for the year 1941. In view of the reduced production, dislocations following the heavy withdrawals of labour, rise in costs of wages and raw materials, the result is not unsatisfactory.

The net profit for the year is £66,080.

We have been able to maintain a good standard of quality, and to give satisfaction to our customers in quality if not in quantity. We are scheduled under the Essential Work Order, and the whole of our production is now directed by the Board of Trade, and is for war purposes, for utility clothing, or for export. Rayon producers have negligible stocks of yarn compared with normal times, and in the home trade it appears similarly that our main clients are also very short of yarn. The demand is very keen. In the export market we are restricted by Government control because of war conditions. The total of annual exports from all rayon producers from this country, whilst comparing favourably with pre-war, is less than that made alone by our parent firm from Holland in pre-war days.

The reports and accounts were adopted.

NORWICH UNION LIFE
INSURANCE SOCIETY

SUBSTANTIAL NEW BUSINESS

The one hundred and thirty-fifth annual general meeting of this Society was held, on the 25th instant, at Norwich.

Mr Ernest Hicks (the president) said that during 1942 they increased their holdings of British Government securities by over £1,750,000 in addition to purchasing on behalf of members some £250,000 of Savings Bonds under their special Savings Bonds Schemes. He was pleased to see recently that the Government gratefully recognised that offices, by these special schemes, were making a direct contribution to the national financial effort. They had also been able to pass over to His Majesty's Government a further £200,000 worth of these overseas currencies needed to finance our heavy purchases from abroad.

Their field staffs had been reduced almost to zero, and it was therefore a great tribute to the Society's good name and reputation that they were able to record a new business figure of over £7,400,000, an increase of £750,000 on the figure for 1941.

Total claims for the year were £1,356,536, and these included the large sum of £213,000 due to war deaths at home and abroad. In addition the Society had paid out £2,000,000 under matured policies.

They were able to show a net rate of interest of £3 8s. 6d. per cent. on the total funds, a small, but very welcome, increase of 9d. per cent. on the 1941 figure.

The funds at the end of 1942 stood at approximately £55 millions and showed an increase of £1,669,585. Last year the market value of their securities was much above the figures shown in the balance sheet, and there had been a further very considerable increase in value during the year of account.

The report was unanimously adopted.

NORWICH UNION FIRE
INSURANCE SOCIETY

INCREASED PREMIUM INCOME

The annual general meeting of this Society was held, on the 24th instant, at Norwich.

Mr Ernest Hicks (the chairman) said that in the fire account there was a satisfactory increase of £122,050 in premium income, and a gratifying profit of £204,261 was available for transfer to the profit and loss account.

The accident account disclosed a decrease in premium income of £96,338, principally due to the very considerable curtailment of motor business, but the underwriting provided a very substantial profit of £244,658.

The marine premium income had increased during the year by £605,132, showing a total of £1,312,970. Unfortunately, 1942 had been a very heavy drain on the companies, particularly in America, where the losses were exceedingly severe immediately following the Japanese attack upon that country. The 1940 account now closed showed a profit which the board had decided should be left in the fund, which now amounted to £1,072,817, sufficient in their view to meet future liabilities.

A summary of all departments was as follows: The total premium income was now £5,089,787, an increase of £630,844, and the total amount available for transfer to the profit and loss account was £448,919. In addition to the trading profit, the profit and loss account was credited with £116,199 for net interest, leaving, with the amount brought forward, a sum of £900,319 at their disposal. The balance carried forward was £330,498, as against £335,195 last year.

The total assets of the Society were now £8,151,839, £547,754 more than the previous year.

The report was unanimously adopted.

IMPERIAL CHEMICAL INDUSTRIES,
LIMITED

FACTORIES AT FULL PRESSURE

LORD MCGOWAN ON POST-WAR TRADING

The sixteenth ordinary general meeting of Imperial Chemical Industries, Limited, was held, on the 27th instant, in London.

The Rt. Hon. Lord McGowan, K.B.E., D.C.L., LL.D., the chairman, presiding.

The following is an extract from the chairman's statement circulated with the report and accounts:—

The intensification of the war during 1942 raised to still higher levels the pressure of demand for the products of our factories. They have worked to full capacity throughout the year. Our plants generally are being run at the highest possible pressures, working many more hours a day in some cases than normal and giving output well beyond usual rated capacities.

Considerable quantities of exports have been safely carried through all perils to their destination. We again pay tribute to the courage of the merchant sailors, and the high degree of protection afforded by the British and American forces on the sea and in the air.

Our main manufacturing subsidiary or associated companies in the British Empire—Imperial Chemical Industries of Australia and New Zealand, Limited, Canadian Industries, Limited, and African Explosives and Industries, Limited—have continued their successful careers. War conditions in those countries daily become more like those in our own. The story of the efforts of these companies in manufacturing goods essential for the prosecution of the war will be a proud record when it can be fully told.

RESEARCH AND DEVELOPMENT

We have played our part in scientific developments during the war, and are ready to adapt our novelties to the many uses that will come with victory and peace. If I were free I could tell you of some remarkable chemical discoveries available to the United Nations that have been made by British scientists—in which, indeed your company's personnel have played no small part—but the products of these inventions have in almost all cases been used by the services, for medical purposes, in agriculture, and in other fields, to help to defeat our enemies and succour our allies.

We are convinced that British industry must be prepared to invest much more generously than in pre-war days in research and development. For years past we have spent considerable sums, but we are at the present time considering a marked post-war expansion of the company's scientific staff, its laboratory accommodation, the necessary experimental engineering shops and all other branches of this work.

PHARMACEUTICAL PRODUCTS

We have a substantial interest already in the plastics industry and some notable achievements to our credit in the production of new and highly complex plastics with a promising future. Beyond that we have in our large and able research organisation covering a vast field of chemical activity the surest background for further development in this expanding branch of production.

It is now nearly seven years since we decided as an initial step to commence research on pharmaceutical products with a view to later manufacture. We had in our dyestuffs enterprise the essential basis for entry into this highly specialised field, and in our powerful research establishments in organic chemistry the necessary instrument of progress.

During the years immediately preceding the war we were pursuing the objective of discovering new substances, but on the outbreak of war a fresh situation arose in that there were many important drugs which had hitherto been available solely

from Germany, and our energies were turned towards mitigating this difficulty.

Our entry into manufacture has therefore been accelerated until we have now felt it desirable to co-ordinate our activities by the formation of a separate company, by name Imperial Chemical (Pharmaceuticals), Limited. We have had the satisfaction of providing the Government with a number of essential pharmaceutical products.

LARGER TOTAL INCOME

The total gross income shown in the consolidated income statement is £22,182,000, compared with £19,956,000 for 1941. The net consolidated income for the year has risen from £6,243,000 to £6,873,000, an increase of £630,000. The estimated total National Defence Contribution and Excess Profits Tax, both British and overseas, chargeable on our home and overseas companies exceeds £7,200,000.

The surplus of combined assets over combined liabilities and share capital rose from £15,916,000 to £16,622,000 during the year. The general reserve remains unchanged at £12,000,000; the war contingency reserve has risen by £250,000 to £2,750,000; the war personnel reserve is £100,000 and the central obsolescence and depreciation fund has risen by £1,350,000 to £8,240,000.

The post-war future is clouded with uncertainty for everyone. Of only one thing can we all be sure—that for some years conditions for trade and industry will be subject to varying measures of State control.

In drawing the line between public and private enterprise I would emphasise the truth that whatever measure of international co-operation may be achieved in the future, no instrument of progress and prosperity has yet been found to equal private enterprise in originality, celerity, or accomplishment. Industry, therefore, has to look to its own organisation in order that by discussion and consultation its views may be effectively presented in the press of argument out of which future detailed policies will emerge. We are already active in this field.

IMPORTANCE OF EFFICIENCY

Our manufacturing and commercial institutions run beyond these islands, reaching out into the Dominions, India, and the Colonies, and many foreign countries. International trade is of vital importance to us, and we shall welcome every step to facilitate its freedom and extension. Above all, we are convinced that our own international trading position, in whatever condition of rivalry or organisation the trade will in future be carried on, must rest upon a high efficiency of production springing out of persistent research for new methods and new products, accompanied by the initiative and speed of action which private enterprise alone can provide.

It will therefore be our purpose to preserve your long-term interest by the maintenance of efficiency and contentment among our people, by the rising standard of education and knowledge in all our ranks, by the prosecution of our research in an ever widening field, by our boldness in the development of the new services and products which are emerging from the industrial chemist's brain and by the wise conservation of your company's financial resources, all governed—not by any selfish interest dictated solely by the profit motive—but by our policy of service to the innumerable people who, directly or indirectly, are our customers at home and abroad.

ASSOCIATED GAS AND
WATER UNDERTAKINGS,
LIMITEDADVANTAGES OF CO-ORDINATED
CONTROL

The tenth ordinary general meeting of Associated Gas and Water Undertakings, Limited, was held, on the 26th instant, at 2, Chart Lane, Reigate, Surrey.

The chairman, Mr W. H. Bennett, M.Inst.GasE., said: Additional ordinary capital to the extent of £300,812 has been issued for the acquisition of a majority interest in the Bognor and District Gas and Electricity Company. Investments have increased by £325,851 in consequence of that acquisition and the purchase of further holdings in other of our subsidiaries.

Revenue receipts at £172,714 show an increase of £6,345. Expenditure has risen by £7,855. Net profit amounts to £60,310, which is sufficient to pay dividends of 5 per cent. on the ordinary stock and 5½ per cent. on the newly created deferred capital and to increase the sum carried forward by £4,349.

DEVELOPMENT OF UTILITIES CONTROLLED

Before the outbreak of hostilities it was my practice at our annual meetings to deal not only with the figures shown in our own accounts, but to review the activities of our subsidiaries. It is regrettable that this is not permissible during the war, but I believe that, when normal conditions again prevail and the position can be reviewed, stockholders will be more than satisfied with the results achieved by our 29 associated companies.

In the development of this company we have always had in mind the acquisition of a majority interest in contiguous undertakings, so as to facilitate (where economic and practicable) the closing down of smaller units and the maintenance of the gas supply by inter-connection with larger works, coupled with co-ordination of management and technical and commercial supervision. Whilst hostilities have necessarily placed our schemes in abeyance, definite progress has been made during the war, and we are now chiefly operating in two compact areas in Southern England.

It is interesting to observe that this policy and practice (which we have pursued for the past nine years and intend to extend to the utmost when victory is secured) now appears to be the accepted basis for the post-war planning of the gas industry by the Government and the industry itself. The development of this ideal will be facilitated by the closer co-operation between holding companies which is being brought about by the Association of Gas Corporations, of which your company is a founder member. The Association is actively engaged in preparing its post-war reconstruction proposals as affecting the 250 gas undertakings which its 11 members control, representing an embarked capital of £25 millions and the supply of 41,000 million cubic feet of gas per annum to 1,400,000 consumers.

FREEDOM OF OPPORTUNITY AND CHOICE

We face the immediate future with confidence, despite the fact that our primary objective of increasing the output of our undertakings cannot be fully attained owing to the imperative need for fuel conservation, to secure which we are, as you would expect, co-operating with the Ministry of Fuel and Power in its fuel economy plans. The recent establishment of this Ministry has been widely welcomed by the fuel industries as a means of securing the best possible service to the public. We ask only that each industry shall be accorded equal freedom of opportunity and that consumers shall have equal freedom of choice amongst the fuels available for use.

The report and accounts were unanimously adopted.

THE RIO TINTO COMPANY, LIMITED

THREAT TO LONDON MINING MARKET

The seventieth ordinary general meeting of the Rio Tinto Company, Limited, was held, on the 21st inst., in London.

The Rt. Hon. the Lord Geddes, G.C.M.G., K.C.B., chairman of the company, in the course of his speech, said: I think I may say that considering all things, the accounts disclose a position better than might have been anticipated. With no market whatever on the Continent outside Spain, we have been able to maintain our installations in reasonable efficiency, pay our taxes, meet our debenture interest and redemption liabilities, earn our preference dividend and add some £7,000 to our carry-forward, but this was only possible because we had in our peseta balances, built up by our extremely conservative practice in years gone by, funds from which there is now brought into revenue the amount of £194,660.

London has for many years been a great centre for the organisation and finance of mining enterprise. I believe the prosperity, even the continued existence, of the mining market in London to be gravely threatened from the political side by ignorant but loquacious agitation which, were it to succeed, would deal a very severe blow to the prosperity of this nation and to the wage earners in many of our manufacturing industries.

A HAZARDOUS ENTERPRISE

Mining is at all times, and even under the most favourable conditions, a hazardous enterprise, and the overall return is surprisingly small.

Under English taxation practice no depreciation allowance is conceded for a great part of the main development work, notwithstanding the fact that, when the mine is worked out—and the life of a mine is often short and always unpredictable—the whole of the money spent upon it has been dissipated. The mining industry is exceptional in that the principal capital asset—namely, the ore—must necessarily be wholly consumed in the process of production.

There has been slowly built up in England over the past 100 years or so a very efficient, very complex, organisation, financial, technical, industrial, and commercial, which is spoken of as the London Mining Market. It is engaged in mining exploration in overseas countries, and in financing, developing and managing mining enterprises.

REGISTRATIONS ABROAD

The position of the United Kingdom as a centre of overseas mining enterprise has been of recent years increasingly challenged, and the mainspring of that challenge lies in the much more favourable taxation position of mines registered in other countries compared with those registered in the United Kingdom. In North America for many years past, in South Africa more recently, the exceptional position of the mining industry in respect of the wasting nature of its capital assets has been recognised.

Unless the handicaps under which mines registered in this country now labour are removed, new mining ventures will seek registration abroad. Many have already done so. With the loss of United Kingdom registration will go not only much of the invisible export represented by dividends and remittances, but a large part also of the visible trade in the form of mining machinery and accessories.

Without some provision to secure fair play for mining companies with headquarters here, the London Mining Market will vanish, and if it vanishes much of our national power to defend the peace that is to be will disappear, for metals are the basis of strength in peace as in war.

The report was adopted.

RAND MINES LIMITED

(Incorporated in the Union of South Africa)

A SATISFACTORY POSITION

MR JOHN MARTIN'S ADDRESS

Mr John Martin, the chairman, presided at the annual meeting of Rand Mines, Limited, on the 21st instant, in Johannesburg.

In moving the adoption of the report and accounts, the chairman said that it would be agreed that the position disclosed was satisfactory. Profit earned had been £874,468, a decrease of £90,893, compared with the figure for 1941. That profit had been derived exclusively from dividends, interest and sundry revenue. There had been a decrease of £118,066 in the investment reserve account, which stood at £3,318,907. The balance of the appropriation account had been increased by £69,717, to £1,445,625, that sum being represented by cash and cash assets after allowing for all liabilities except those of a contingent nature. Ample cash resources were available to meet all contingent and option liabilities to subscribe for shares in and to finance certain undertakings.

Investments in shares and debentures had been brought into account at book value of £3,838,803, which was a decrease of £116,480 compared with the total at the end of 1941. Investments for which share market quotations were available appeared in the books at, or under, cost, but in no case above market price at December 31, 1942. Unquoted securities had been entered in accordance with the conservative valuation placed upon them by the board, and in no instance at valuation exceeding cost. The market value of the gold mining interests of the company at the end of the year had represented 75.049 per cent. of the market value of all investments, and of these gold mining investments 91.208 per cent. had been dividend-producing.

MINING OPERATIONS

The gold mining industry had experienced in 1942 one of the most difficult years in its history. Nevertheless, operations had been maintained on a satisfactory basis and the results achieved reflected clearly the inherent stability and excellent organisation of the industry. The output of gold by mines of the Witwatersrand area, together with miscellaneous production, had been 13,761,035 ounces fine, a decrease of 278,877 ounces compared with 1941. As a result of a drop in the tonnage milled and in the average gold yield, working profit earned had fallen by £2,189,897, to £43,655,146.

The price received for gold and the rate at which normal income-tax had been payable by the gold-producing companies remained unchanged throughout the year. As from January 1, 1942, however, the special contribution which was based on taxable income before deduction of redemption allowance and any tax loss brought forward from a previous year had been increased from 16 per cent. to 20 per cent. Since January 1st of the present year that contribution had been further increased to 22½ per cent. During 1941 a tax of 5 per cent. on dividends payable to shareholders non-resident in the Union had been introduced, and since the close of the company's financial year that tax had been increased to 7½ per cent. Taxation of gold mines in the Transvaal, including the share of profits paid to the Government by leased mines, had amounted to approximately 27.7 million pounds in respect of 1942.

STAFF WAR WORK

The manufacture of munitions in mine workshops for the Department of War Sup-

plies had been continued throughout the year.

In July the Prime Minister appealed for recruits for the Army to take the place of soldiers captured at Tobruk, and in response to that appeal the gold mining industry had released an additional 1,200 of its employees for full-time military service, bringing the total number of employees so serving at December 31, 1942, to 7,405. At the same date 6,060 employees of the industry had been engaged on part-time military service, the bulk of whom were members of the Mines Engineering Brigade, which had been re-organised and turned into the Armoured Car Brigade Group.

Good relations had been maintained between employers and employees, and there had been ample evidence of that spirit of co-operation which had played so large a part in enabling the industry to deal successfully with many war-time problems with which it was confronted.

During the latter part of the year there had been a serious shortage of native labour which had added considerably to the difficulties of most mines. There had since been some easing of the position, but various factors were operating at the present time against the maintenance of an adequate supply.

Large numbers of natives had enlisted for military service, many more had gone to Transkei and Ciskei to work in dock areas and on defence works and in wartime industries. In order to assist the military authorities to recruit natives, recruiting for the gold mining industry had been suspended during the year in Nyasaland, Southern Rhodesia, Basutoland, Bechuanaland and Swaziland, and it was only recently that recruiting had been recommenced in certain of these territories.

SUPPLY DIFFICULTIES

Increasing difficulties had also been experienced in obtaining adequate supplies of essential materials from overseas. Since the beginning of the war systematic efforts had been made to effect economies in the use of essential materials and to conserve stocks. The plan for pooling stocks among gold mines introduced in 1941 was in 1942 carried further by the introduction of an agreement whereby stocks, purchases, allocation, distribution and rationing of supplies were controlled by a mine stores department of the Transvaal Chamber of Mines.

Owing to the shortage of paper the report of the proceedings at the meeting would not be circulated to shareholders, but copies could be obtained on application to the office in Johannesburg or to the London secretaries of the company, Messrs A. Moir and Co.

Among emergency measures adopted during the year had been the creation of a war damage pool, in terms of which gold mining companies which were members of the Transvaal Chamber of Mines had agreed to pool within certain limits the cost of replacing property and plant damaged in circumstances attributable to the war.

WITWATERSRAND RESULTS

Ore milled by the Witwatersrand mines of the Central Mining-Rand Mines Group during 1942 had been 20,432,200 tons, a decrease of 636,300 tons compared with the previous year. The average yield of gold per ton milled had fallen by 0.069 dwt., to 3.621 dwt., a decrease of 1.87 per cent. There had been a fall of £743,967 in the

total working profit, which had amounted to £10,344,861.

The total amount distributed as dividends had been £4,317,097, or £392,616 less than in 1941. The amount provided for payment of direct taxation to the Government had decreased by £29,393, to £5,731,531.

Development accomplished during the year had totalled 328,728 ft., a decrease of 350,800 ft. That large drop in development footage had been due to the decision by the industry as a whole to reduce that type of work to the lowest level consonant with the maintenance of a sound ore reserve position and in order to achieve the maximum economies possible in the use of essential stores and materials.

At Blyvooruitzicht mine, milling of development rock had commenced in February and during the year a total of 99,200 tons had been treated, the yield being 6.371 dwt. per ton. Working costs had been 53s. 2.4d. per ton milled, and net working profit for eleven months had been £1,816. Development had totalled 22,171 ft., and 12,415 ft. had been sampled on the reef, which had averaged 62.4 dwt. per ton over a stoping width of 11.6 in., equal to 724 inch-pennyweights.

At Geldenhuis Deep Mine the payable ore contained in the eastern section had been exhausted during the year and mining operations at No 2 shaft had been discontinued in November. In the western area conditions had become increasingly difficult owing to numerous and severe earth tremors which had frequently interrupted operations and resulted in serious caving and falls of hanging. That extensive damage had restricted the areas available for mining and rendered inaccessible a large portion of ore reserve which was widely scattered throughout that section. Remaining resources were very limited, and it was clear that the life of the mine must now be brief.

HEALTH OF STAFF

The average number of Europeans employed by twelve Witwatersrand mines of the group had been 14,471, including those on active service. The average number of non-European employees had been 110,048, a decrease of 4,226 compared with 1941. At the end of last month the average number of non-Europeans employed at these twelve mines had decreased to 95,978.

The health record of the native employees had continued to be good. The mortality rate from disease had fallen from 3.10 per thousand to 3.05 per thousand, while deaths from mining accidents had decreased by 0.20 to a new low record of 1.47 per thousand. Compared with 1941 shifts lost per native per annum due to disease and accidents had risen from 5.21 to 5.36.

The present valuation of outstanding phthisis liability of mines of the group was £6,408,119, an increase of £59,289 compared with 1941. The twelve mines affected had provided with accrued interest up to the end of 1942 a total of £3,727,644 towards meeting that liability.

Many employees of Rand Mines, Limited, and of the companies within the Central Mining-Rand Mines group are absent on military service. Our thoughts and good wishes are with them. It is with deep regret and with sincere sympathy for their relatives that I have to record the fact that since the beginning of the war 86 have lost their lives, 15 have been reported missing and 215 are prisoners of war.

I wish to acknowledge the valuable work performed by the Transvaal Chamber of Mines and its subsidiary bodies. I should also like to thank the head office staff of the company and the managers and staffs of the mines of the group for their loyal and able services. At the same time I want to express warm appreciation of the excellent work performed in difficult circumstances by Messrs A. Moir and Co., London Secretaries of Rand Mines, Limited.

The report and accounts were adopted.

CROWN MINES LIMITED

(Incorporated in the Union of South Africa)

MR JOHN MARTIN'S ADDRESS

Mr John Martin, the chairman, presided at the annual meeting of Crown Mines, Limited, held, on the 20th instant, in Johannesburg.

After reviewing the operations, the chairman said the total profit had been £3,229,678. Dividends had absorbed £1,225,981, provision for taxation had amounted to £1,898,421, capital expenditure had accounted for £52,795, and further provision made in respect of miners' phthisis outstanding liability had been £71,054.

Expenditure on capital account had been chiefly for air-cooling plant at number 17 shaft pumping plant, at number 14 B shaft, and alterations and additions to "C" reduction plant. All capital work on "C" reduction plant had now been completed, and there had been a consequent improvement in residue values. At number 17 shaft work was still proceeding on the air-cooling plant, portions of which had only recently been delivered from overseas.

During the year the gold-mining industry had made every effort to conserve essential stores and materials to the fullest extent. In order to achieve that object and in conformity with the general policy followed by the industry, development on the mine had been curtailed, the total amounting to only 34,426 ft., compared with 116,060 ft. in 1941. The bulk of the work had been confined to the Main Reef Leader, where disclosures had remained satisfactory, the total payable ore disclosed amounting to 1,322,700 tons, of an average value of 5.9 dwt. per ton. The available ore reserve had been re-estimated as at December 31, 1942, to be 17,191,300 tons, of an average value of 4.8 dwt. over a stoping width of 44.2 inches.

Compared with the position a year previously there had been a decrease in the available ore reserve of 2,327,200 tons, width being 0.1 in. lower, while the value had remained unchanged. In spite of a reduction in the tonnage of ore the reserve position remained satisfactory.

The price received for gold and the rate at which normal income tax had been payable by the company had remained unchanged throughout the year. There had been, however, an increase in the special contribution, which was based on taxable income before the deduction of the redemption allowance and any tax loss brought forward from a previous year. As from January 1, 1942, the percentage payable had been raised from 16 to 20, while as from the beginning of the current year there had been a further increase to 22½ per cent. In 1941 a tax of 5 per cent. on dividends payable to shareholders non-resident in the Union had been introduced, and since the close of the financial year it had been increased to 7½ per cent.

LABOUR AND SUPPLIES DIFFICULTIES

During the latter part of the year serious shortage of native labour had restricted operations at the mine to a considerable extent. Since the close of the financial year there had been some easing of the position, but the many calls made upon native labour supply for defence purposes must be expected to have a continued adverse effect on the volume of labour available for service on the mines.

Difficulties had also been experienced throughout the year in obtaining adequate supplies of essential materials. In order to ensure that mining supplies were used to the best advantage, an agreement had been entered into, in common with other companies in industry, whereby stocks, purchases, allocation, distribution and rationing of such supplies were controlled by a mine stores department of the Transvaal Chamber of Mines.

Owing to the shortage of paper the report of the proceedings at the meeting would not be circulated to shareholders. Copies could, however, be obtained on application to the head office in Johannesburg or to the London office.

At the end of the year there had been 441 employees on full time duty in the armed forces. Munitions production had been well maintained in mine workshops.

The report and accounts were adopted.

CITY DEEP LIMITED

(Incorporated in the Union of South Africa)

DR HANS PIROW'S STATEMENT

Dr Hans Pirow, the chairman, presided at the annual meeting of City Deep, Limited, held, on the 20th inst., in Johannesburg.

After reviewing operations for 1942, the chairman said the total profit had been £822,774. Dividends had absorbed £408,750 and provision for taxation had amounted to £435,448. Further provision in respect of miners' phthisis outstanding liability had been £24,169.

Net expenditure on capital account for the year had been £91,731, of which £35,350 had been charged to appropriation account, being the amount in excess of working capital of £56,381 in hand at the beginning of the year. The bulk of that expenditure had been in connection with air-cooling plant at number 4 shaft, which was now in operation. That plant, which was situated on the surface at number 4 shaft was passing into the mine approximately 280,000 cubic feet of air per minute and considerable benefits had already been obtained in the workings served by the shaft.

In conformity with the general policy of the gold-mining industry to conserve essential stores and materials to the fullest possible extent, development had been carried out on a much reduced scale, the total amounting to 23,455 ft., which was a decrease of 39,819 ft. compared with the previous year's figure.

Payable ore proved had totalled 510,300 tons of an average value of 5 dwt. per ton. Of that, 480,700 tons had been in the Main Reef Leader and had been valued at 5.2 dwt. per ton, while the remaining 29,600 tons had been in the South Reef and had been valued at 3.3 dwt. per ton.

Available ore reserve as re-estimated at December 31, 1942, had been 3,693,000 tons, of an average value of 5.3 dwt. over a stoping width of 43.5 in. Available ore reserve showed a decrease of 420,900 tons compared with the previous year's figure, the value and width being greater by 0.1 dwt. and 0.2 of an inch respectively.

PRICE RECEIVED FOR GOLD

The price received for gold and the rate at which normal income-tax had been payable by the company had remained unchanged throughout the year. There had been, however, an increase in the special contribution which was based on taxable income before deduction of redemption allowance, and any tax loss brought forward from a previous year. As from January 1, 1942, the amount payable had been raised from 16 per cent. to 20 per cent., while as from the beginning of the current year there had been a further increase to 22½ per cent. In 1941 a tax of 5 per cent. on dividends on non-resident shareholders had been introduced, and since the close of the company's financial year it had been increased to 7½ per cent.

During the latter part of the year operations at the mine had been hampered by a serious shortage of native labour. Difficulties had also been experienced throughout the year in obtaining adequate supplies

of essential materials, and every effort had been made to effect economies and conserve existing stocks. In that connection and in order to ensure that mining supplies were used to the best advantage, an agreement had been entered into by the company in common with other companies in the industry whereby stocks, purchases, allocation, distribution and rationing of such supplies were controlled by a Mine Stores Department of the Transvaal Chamber of Mines under the direction of the Executive Committee of the Chamber.

In order to conserve paper stocks, the report of the proceedings at the meeting would not be circulated to shareholders. Copies of the report could be obtained, however, on application to the head office in Johannesburg or to the London office.

A large number of the company's European employees was absent on military service. In addition, the mine had continued to carry out its share of munitions production.

The report and accounts were adopted.

THE INDUSTRIAL AND GENERAL TRUST LIMITED

DIVIDEND AGAIN 12 PER CENT.

The fifty-fifth ordinary general meeting of The Industrial and General Trust, Limited, was held, on the 24th instant, in London.

Mr. W. Sandford Poole (the chairman) said that last year he had stated that the outbreak of hostilities in the Far East would undoubtedly adversely affect their revenue. The accounts submitted showed a reduction of £26,759 in the gross income of the past year. Apart from the adverse effects of the war in the Pacific, the normal revenue of the year had been more than maintained. The revenue, after providing for taxation, was £265,264 as compared with £275,637 in 1941-2. The preference dividend was covered over 4½ times and they were able to maintain the ordinary dividend at 12 per cent. as in the past

five years and to increase the amount carried forward by £26,542. With the immediate and post-war outlook so uncertain, the substantial carry-forward of £184,746 was a useful revenue reserve.

The result of a valuation showed that the £8,025,000 at which the investments stood in the balance sheet was represented with a satisfactory margin. In other words, not only their capital but their reserve of £1,850,000 and their carry-forward were, on the basis of the valuation, intact, with a margin.

Dealing with South American interests, he said it was to be hoped that the Brazilian Government would move much further towards meeting the terms upon which the various loans had been subscribed, chiefly in this country and the United States. With regard to the Argentine, Britain was, in fact, now fighting her battles without her help. It seemed to him that the British public had reason to expect much more benevolent treatment from a country for which the British had done so much when she was growing up.

The report was unanimously adopted.

(Continued from page 699)

ment; and (4) the recommendation of the Forster Committee on the Recruitment of Juveniles that national minimum wage rates should be fixed for juvenile workers, and that the scale should be determined under the machinery of the National Conciliation Scheme. In the light of these circumstances, the Board of Investigation has modified the 1940 agreement to make it possible for the National Conciliation Board during the currency of that agreement to entertain requests by either side for dealing with any element in the wage structure of the industry on a national basis. It is pointed out, however, that questions raised by either party about the interpretation of the 1940 agreement in its modified form shall be dealt with as follows: (a) A question which relates exclusively to those provisions which are concerned with district wage arrangements shall be dealt with by the District Referee but subject to the provisions governing the transfer of district questions to the National Board; and (b) all other questions shall be dealt with by the National Tribunal.

Air Ministry Works

It is a pity that the time-lag between the publication of the Comptroller and Auditor-General's report on the Appropriation Accounts, and the expenditure which is the subject of his examination, prevents comment in the press or in Parliament at the time. As it is, the damage has been done, and the chief value of the report lies in its indication of the need for constant vigilance over the Service departments' expenditure. The most serious criticism arising from the Report on the 1941 Air Services Appropriation Account is that of excessive expenditure incurred in connection with the provision of landing facilities at a requisitioned airfield. As a result of modifications in the original scheme, owing to changing operational requirements and the use of heavy bombers, and of the labour and transport difficulties due to the nature and location of the site, the work of extending the existing runways, for which the sum of £60,000 was sanctioned by the Treasury in August, 1940, finally worked out at a cost of £832,000, nearly fourteen times the original estimate. The great part of the construction was executed on a target cost basis, which emphasises the disadvantages of this method of contract. It is therefore satisfactory to learn from the report that the fixed price contract has largely superseded the target cost system in the Air Ministry's major works. The bulk of the Ministry's construction programme is presumably completed by now, but additional works in the way of extensions and adaptations, especially to meet the needs of the United States Army Air Corps, will still be necessary.

Pork in Quantity

Butchers have had an inordinate amount of pork, especially in London, during the last month. About 40 per

cent of London supplies have been pork, and there have been many complaints. The other meat is quickly bought, and customers then have no choice. They complain that they cannot eat it, that they are tired of it, and, above all, since it is more expensive than beef or mutton, that they get less meat on their ration. The reason for the appearance of pork is that it is surplus at this season in the United States, and large quantities have reached this country. Had it been possible to distribute it more evenly over the country (some districts have had none of it) it would have been less noticeable, and the complaints fewer. Since the price of pork is relatively high, less shipping space is needed to honour the ration. All complaints about the meat ration boil down to transport. Some areas only get home-killed meat, and consequently less weight. Others get only imported meat, and the complaint is that they have to be content with meat of poorer quality. The basis of the content with meat of poorer quality. The basis of the complaint probably not altogether avoidable, since internal transport has to be conserved. In this case, the pork would have been gladly accepted had the reason for its bountifulness been given.

Bismuth Control

The United States War Production Board has introduced an allocation system for bismuth, a move which suggests that stricter control measures may also be pending in this country. In normal times the bulk of the world's bismuth goes into medicines, pigments for the ceramics industry and some low-melting alloys. To-day, there is only just enough bismuth available to meet essential war needs. Bismuth has some special properties which make it indispensable for certain uses in armament production. These properties include, besides the low-melting point, the tendency to expand on cooling and the diamagnetic character of bismuth. Bismuth is, in fact, the most diamagnetic substance known and is repelled by a magnet. To-day it is largely employed as solder for munitions, for making patterns in aircraft manufacture, for centring machine-tool bearings, as nozzles for automatic sprinklers and as contact point in electric fire alarms. Molten bismuth alloy is frequently employed for testing vital tubing in aeroplanes, tanks and ships. When poured into tubing the alloy squeezes through any possible holes and on cooling it splits open weak seams in the tubing owing to its expansion. As the great bulk of the bismuth is recovered as by-product in the smelting of lead, copper and other non-ferrous as well as precious metals, exact production figures are not available. In 1940, world production was estimated by the US Bureau of Mines at about 3,000,000 lbs., but it may be somewhat larger now. The United States, Mexico, Peru and Canada are producing the bulk of world supplies, but some bismuth is also produced in Europe, including Spain, Yugoslavia, Belgium, Germany and France. European production, however, covers only a minor part of the European demand, which before the war used to absorb about one-half of world supplies.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

DESPITE the further contraction in turnover, which according to the bargains received has reached virtually the lowest level this year, the undertone in the markets remains quietly firm. The outstanding development of the week has been the rally in the Funds. Both short and long dated issues have participated in the advance which has in general eliminated the recent falls, although the volume of business in the gilt edged market does not seem to have experienced any corresponding improvement. In the foreign bond market, Chilean loans failed to hold an earlier advance on the renewal of the copper contract with the United States. Similarly, Japanese issues reacted slightly after a minor improvement. Absence of support for the prior charges in the home rail market led to a general easing of prices. In particular, the GW 4 per cent debenture fell 1½ points. Junior issues were fairly steady, after a minor recession at the reopening. A slightly easier tendency among Argentine issues in the foreign rail market was accentuated in midweek by the proposal of BA Western to extend the moratorium on interest payments. Senior charges lost up to 3 points, with correspondingly smaller falls for equity stocks.

Small mixed movements predominated in the industrial market. Changes among brewery shares, apart from a rise of 1s. for Taylor Walker, were downward. Tobacco shares, however, were steady. Heavy industrial shares failed to attract attention, and small declines were plentiful. Exceptionally, Carlton Main fell 3s. on the year's lower profit and dividend. Motor and aircraft issues were dull, with occasional losses seldom exceeding 6d. Shipping shares were idle. Minor improvements were scattered throughout the textile section, although Fine Spinners ordin-

ary weakened on the years' results. The preliminary statement of Dunlop occasioned a fall of 1s. for that stock, and in a dull dollar group, Brazilian Traction lost ½ point.

Some investment demand in the kaffir market for the June dividend paying issues relieved the general quietness. Interest in diamond shares was mainly confined to De Beers, the deferred rising 1½ points. Rubber issues were idle, and occasional movements ranging from 6d. to 1s. in the tea market displayed no definite trend. Leading issues in the oil market were firm. Both Anglo-Ecuadorian and VOC improved on the maintenance of the year's dividends. Ultramar, however, weakened on the development report.

New York

LABOUR disputes and the tax controversy continued to exert persistent restrictive pressure on trading throughout last week on Wall Street. Sporadic buying occasioned by the satisfactory war news failed to stem the downward tendency of quotations until midweek, when a sharp rally raised industrial and rail leaders to peak levels for the past two years.

COMMODITY AND INDUSTRY NEWS

Fire Wastage.—Speaking to aircraft workers recently, the Minister of Aircraft Production dealt with the waste caused by fires which could be avoided. The outbreak of fires in this country amounts to about 1,000 a day, and the majority are caused by carelessness. If only one in a million cigarette ends resulted in a fire, there would be 200 a day from this cause. Loss by fire exceeds the money value, monthly, of 400 Spitfires, or 100 twin-engine bombers, three destroyers, or 20 corvettes, as well as the loss of actual material and time.

Directorate of Woodworking.—By arrangement with the Ministry of Production and the Departments concerned, and in order to co-ordinate demands for woodworking and to utilise to the best advantage the facilities of the industry, it has been decided to establish a Directorate of Woodworking under the Director-General of Equipment and Stores in the Ministry of Supply. The Directorate, of which the director is Mr R. H. Hall, and the deputy director Mr H. Freeman, will make arrangements for the allocation of capacity for the fabrication of all woodworking requirements for all Government departments, except those for the specialised

needs of certain Ministries, such as for aircraft components and ships' fittings. The primary object of the Directorate will be to ensure the most economical use of labour, plant and premises, and the director will be assisted by an advisory trade panel.

Scottish and Swedish Co-operation.—The sales of the Scottish Co-operative Wholesale Society for the past year were £34,539,715, an increase of £2,364,071, which, excluding purchase tax, represents 7.6 per cent. The output of the Society's own productive works was £10,995,233, an increase of 12 per cent. The surplus totalled £1,122,629. The Society, jointly with the Co-operative Wholesale Society of Sweden, is controlling the British Luma Co-operative Electric Lamp Society, Ltd., of Glasgow. This has a capital of £139,200, and last year made a deficit of £2,311 on a production of £51,045 on sales through co-operative societies in Britain.

Cotton for Senegal.—Facilities for the supply of cotton fabrics from this country to Senegal have now been arranged. Supplies will come from firms who normally export to the French and British West African markets, and for the time being will be strictly confined to stocks. Goods will be consigned to Senegal through the

THE ECONOMIST PROFIT FIGURES.

The defects of company accounts and the complications of income-tax make it impossible to present statistics of profits in a simple, standardised form. The following definitions may assist the reader:—

(a) **Gross and Net Profits.**—Gross profits are profits before payment of standard income-tax (but after such other taxes as EPT and NDC). Net profits are profits after tax. In many cases, figures of gross profits can be calculated only by adding back what appear to be the appropriate amounts of tax to the net figures published.

(b) **Accounting Period and Reporting Period.**—Company reports are published some time after the end of the period in which the profits were earned. The figures can be grouped by the quarter in which they are published (i.e., by the reporting period) or by the quarter in which the company's financial year ends (i.e., by the accounting period).

(c) **Old Basis and New Basis.**—On the old basis the net profit consisted of preference and ordinary dividends as published, whether gross or net, plus actual allocations to free reserves. Total profit was the largest figure of the profit and loss account, excluding capital profits and transfers from reserves. The figure was struck before depreciation if that was disclosed. On the new basis no net profit figure is provided. It can be obtained by deducting from the gross the appropriate rate of tax. The gross profit is the gross total of interest and dividends plus additions to free reserves and other savings, both grossed up at the stated rate of tax.

GENERAL.—The Joint Ore Shaft was sunk to a total depth of 272 feet below the collar, was timbered to a depth of 265 feet and have been completed. Delivery of the winders, ordered overseas, is not anticipated during the War period and arrangements Development Company, Limited, and West Springs, Limited, on the one hand and Western Reefs Exploration and Development Company, Limited, on the other hand, whereby the latter Company will loan one of its large hoists and an auxiliary hoist. These hoists are in course of erection at the Joint Ore Shaft and it is considered that sinking operations will be resumed during the second half of this year.

CAPITAL EXPENDITURE for 1943 estimated at £80,000, most of which will be incurred in connection with the Joint Ore Shaft.

WESTERN REEFS EXPLORATION & DEVELOPMENT CO., LTD.

(Incorporated in the Union of South Africa.)

CAPITAL: Authorised £1,500,000. Issued £1,375,000 in 5,500,000 Shares of 5s. each, fully paid.

Tons Milled	Yield (per ton 4.71 dwts.)	213,793 ozs.
EXPENDITURE AND REVENUE ACCOUNT.

61,452	51.5	39.82	10.98

GENERAL.—As previously announced in June, 1942, the Company accepted an offer by the Anglo American Corporation of South Africa, Ltd., to subscribe for 200,000 5s. Shares at 35s. per Share; the proceeds of this issue enabled the Company to liquidate the balance of its loan debt to the Anglo American Corporation. This issue effected an increase in the issued capital from £1,325,000 to £1,375,000.

The Company has loaned, under necessary safeguarding conditions, to Springs Mines, Ltd., and West Springs, Ltd., one of its 4 large hoists and an auxiliary hoist. The release of these will have no effect on the normal working of the Mine as the remaining hoisting capacity is more than adequate to meet maximum requirements for the next few years.

CAPITAL EXPENDITURE for 1943 estimated at £12,000.

WEST SPRINGS, LIMITED.

(Incorporated in the Union of South Africa.)

CAPITAL: Authorised and issued £1,935,000 in Shares of £1 each, fully paid.

Tons milled	Yield (per ton 4.29 dwts.)	213,473 ozs.
EXPENDITURE AND REVENUE ACCOUNT.

Civil Aviation

AS this week's unusually animated debate in the House of Commons demonstrated, the topic of post-war civil aviation has come to the centre of the political stage. There are a number of interesting side-issues—such as whether civil aviation should continue to be the responsibility of the Air Ministry, or whether the Government should have one or more "chosen instruments" of its policy—on which Members had a great deal to say. But the urgent aspect of the matter is the impact of civil aviation on international politics. If it can arouse feeling between parties, it can also arouse feeling between nations. The original fault for the feeling of rivalry that has arisen possibly lies with the American aviation companies, whose publicity, with its talk of post-war "domination," has been calculated to excite the most alarmist reactions in other countries. But the challenge has been taken up all too eagerly in this country, and there has been considerable talk, reflected in the Parliamentary debate, of attempting to achieve Empire "solidarity" in opposition to American claims. This would be very foolish. The attitude of the American authorities—as distinct from Congressional and other orators—has been extremely moderate and reasonable, and nothing would be more likely to estrange their sympathies than caucus tactics on the part of the British

countries. However reasonable it may seem in London, any suggestion that the British Commonwealth should act as a unit, but still have six or more votes in any international gathering, will meet with resistance in Washington. There is every reason in favour of the fullest prior consultation between the various British Governments; there is every reason against prior commitment.

What, however, is to be the policy that is to be presented either to the Dominions or to the United Nations as a whole? It appeared to be the universal assumption of the House of Commons that British civil aviation would require some form of protection if it was to exist at all. For a very short period after the war, the position of British civil aviation will admittedly be difficult. But in the longer period, after the immediate difficulties of the transition have been surmounted, is there any real reason to believe that British civil aviation will not be able to survive in competition?

Some materials for the answer to this question were provided in the highly interesting lecture on "Post-War Transport Aircraft" delivered to the Royal Aeronautical Society last week by Dr Edward P. Warner, Vice-Chairman of the United States Civil Aeronautics Board. Dr Warner gave an analysis of the total costs of American

Total Advances upon House Property to Policy-holders exceed

TWENTY-FOUR MILLIONS

J. G. SLEIGH, Managing Director.

civil air lines in the spring of 1942. The figures relate to domestic operation, but there is no reason to suppose that they would be very substantially different in an overseas context. These costs, as percentages of the total, can be roughly summarised as follows:—

Fuel and Oil	12.4
Labour and personnel	32.3
Aircraft and equipment (aircraft depreciated over five years)	8.9
Maintenance of aircraft and equipment (other than labour)	7.4
Operations expense (other than labour)	17.8
General overhead (other than wages and salaries)	16.2
Unallocated	5.0
	100.0

These figures do not lend any support to the belief that British costs must necessarily be higher. There is no reason why, on international routes, British operators should have to pay more for their petrol and oil than any others. On labour and personnel costs, which amount to a third of the total, British lines should have a distinct advantage over the Americans. As for aircraft and equipment (which, together with maintenance costs other than labour, amount to only 16.3 per cent of the total) the argument is sometimes heard that American operators on international routes, being based on a much larger domestic aviation industry than any other country, will have the advantage of the economies of mass production. But the argument does not stand up to examination. The total number of aircraft owned by all American civil aviation companies before the war was not much more than a week's present output of the American aircraft factories. Both in America and in Great Britain, the economies of aircraft construction are entirely dependent upon the size of the military air forces; the requirements of civil aviation are a very small drop in the bucket. In wartime, British factories turn out aircraft that are as good as, and very much cheaper than, those of the United States. So far as it is possible to foresee the future, military orders will be enough to support a British aircraft industry, not indeed of its present size, but large enough to reap most of the advantages to be secured from quantity production.

There consequently seems to be no reason to believe that British civil aviation will require protection against the Americans or anybody else. If this fact can be established and the present incipient inferiority complex banished, there should be no insuperable obstacle to an agreement, satisfactory to all, on the international law and practice of aviation. Undoubtedly the form of organisation that would represent theoretical perfection would be the internationalisation of all "trunk" lines, and

perhaps of all international flying. It was encouraging to discover that Mr Attlee does not rule out all possibility of such a solution, and so long as it has a chance of acceptance, it is entirely in British interests—and in those of mankind at large—to urge it. But, apart from the administrative difficulties, there is the possibility—amounting unfortunately to a probability—that the idea of international administration will not meet with favour in the United States. Without abandoning the pressure for it, the British Government should clearly have an alternative in mind. The opposite proposal is that for exclusive, or almost exclusive, "zones of influence," which has achieved favour in some quarters. It appears to be an attempt to secure for British civil aviation the benefits of protection combined with those of a wide geographical sphere of activity. Like most attempts to secure the best of both worlds, it is likely to be defeated by the opposing objections of both sets of partisans, those of national exclusiveness and those of free competition.

The proposal that appears to be emerging from responsible American discussion is that of the so-called "freedom of the air." Each nation, would be free to reserve to itself its own purely internal traffic, on the analogy of "coastwise shipping," but international traffic (i.e., traffic between ports of one nationality and those of another) would be free to all, and aircraft of all nations would be admitted, in search of this traffic, to the airports of all nations. British aircraft, for example, would be free to fly across the United States on their way to Australia; they would not be free to carry passengers between New York and San Francisco, or San Francisco and Hawaii. Before the full purport of this proposal can be grasped, one needs to know what the British unit would be. The dependent Colonies would no doubt be included with the United Kingdom. But would the Dominions? American opinion would no doubt resist any such suggestion; and so might the public opinion of at least one of the Dominions. It would probably be wiser to merge this question in the wider one of multilateral agreements in general. There would need to be some provision by which countries could enter into working arrangements with each other—for example, the British, Dutch and French lines operating between Western Europe, the Far East and Australia—and such reciprocal agreements as the United Kingdom and the Dominions desired to make would easily come under this heading. Any special arrangement for the internationalisation of European aviation would clearly be of the same general nature.

As a second-best to complete internationalisation, the principle of the freedom of the air, properly defined, holds no terrors for Great Britain. On the contrary, it would be a disaster if in aviation, which should be a world-unifying force, British policy should advocate that parcelling-out of spheres of influence which, in shipping, it has always rightly resisted.

Pacific Stalemate?

THE question has been raised in America whether or not the Japanese stand to gain by a waiting war. Those who adhere to the Switch-the-War-Over-to-Japan school of thought have at least this point in their favour, that, by all appearances, the Japanese are hoping to be given time to consolidate their position. A certain amount has been heard of the "Frederickian" phase in the European war—the organisation of a self-sufficient supply and defence position so strong that the coalition ranged against it will break down under the pressure of discouragement and of its own inherent contradictions. But this picture is probably truer of this stage of the Japanese war effort than of the more threatened and unstable Axis position in Europe. The lull in military operations is making it possible for Japan to develop a long-term plan of exploitation for the new empire in the

south. Looked at from the Tokyo angle, there seem to be unmistakable signs of friction and difficulty between the policies of the various enemy Powers. It would not be altogether fanciful to argue—from Tokyo—that each year of stalemate will strengthen Japan and weaken its enemies.

This possibility must be examined with complete honesty. If the Japanese are right, the Allies are faced with a very uncomfortable position and one which is calculated to create much bad feeling and misunderstandings among the four Great Powers. The strength of the Japanese case lies first of all in the completeness with which Japan's economic needs can now be satisfied. Apart from wool and just possibly copper, the Co-Prosperity Sphere lacks no important raw materials. There are large surpluses of sugar and rice and rubber. Pro-

longed exploitation of this area, whose full resources are only beginning to be tapped, could make the Japanese Empire the richest in the world.

Its defence position is on the whole satisfactory. By holding the enemy everywhere on the periphery—beyond the hills in Burma, beyond the barrier reefs of the China Sea, beyond the Amur river to the north, beyond the mountains in China—the Japanese have ensured that the first stages of every counter attack by land will be discouraging and difficult. Only in Russia's Maritime Provinces are there forces in a position to do immediate damage to Japan's industrial heart, and here a careful neutrality backed by a very strong concentration of Japanese troops gives some security—however temporary. Hostile airfields and an effective air supply organisation in China depend upon the reopening of the Burma Road. In a word, the Japanese have managed to give themselves a great deal of elbow room and have pushed their military outposts forward into regions which offer the enemy a very limited field of manoeuvre. Whether they meant to go further—as last year's forays into the Indian Ocean, the air attack on Ceylon and the bitter fighting in the Solomons suggest—is a question which probably turned on and was settled by Germany's 1942 offensives. There might indeed have been an attempted meeting in Aden if Hitler's Caucasian and Egyptian dreams had materialised. Today the question of a further Japanese advance is academic.

To a good economic and defensive position the Japanese hope to add divisions and disintegrations among their enemies. They are probably soberly satisfied with the difficulties facing General Chiang Kai-shek. There has been a steady worsening of the economic position in Free China since the cutting off of all outside supplies. Inflation is out of hand in some provinces and famine is reported in others. In recent weeks the Japanese army has been systematically attacking the rice-growing areas on the fringe of Free and Occupied China; their depredations must aggravate the extreme food shortage. They have also attempted a new thrust in the direction of Chungking. The Chinese armies can carry on with guerilla fighting and small attacks on limited objectives, but all the heavy equipment needed for a modernised army is lacking; and unless the Chinese receive more tangible proof of Allied aid and interest, there is the danger that many of them will, in despair, drift over to the puppet government at Nanking. One of the factors in the Japanese strategy of stalemate is moral discouragement at Chungking. The sense of elation and encouragement felt in Free China on the entry of Britain and America into the Japanese war has made the sense of subsequent disappointment over ever greater isolation all the more keen. As for the other Great Powers, the Japanese hope for a real clash of policy between America and Britain on the question of Pacific strategy. They hope too to see resentment rise, particularly in America, at Russia's neutrality in the Far East.

There is, however, another side of the picture which the American apologists of an all-out Pacific war this year leave out of account—and which the Japanese no doubt wish they could leave out of account. The fundamental economic difficulty of the Co-Prosperity Sphere is, now as ever, shipping. The experts give at least 15 million tons as the requirement for a successful exploitation of Japan's new empire. At the beginning of the war the Japanese may have had about 7 million tons, and it is estimated that over 2 million tons were sunk in 1942. Foreign experts put Japan's replacement capacity at about 600,000 tons a year, but this may have been increased by a variety of methods reported from the Co-Prosperity Sphere—the salvaging of wrecks in the harbours of Malaya and Java, the registration and mobilisation of all shipyard workers in the Philippines and Java, the building of wooden junks in the Netherland Indies. Even so, the shortage of shipping is already so great that there is a rice glut in Burma, a sugar glut in Java, and severe shortages elsewhere. At the turn of the year, the Japanese Press admitted that 12 million tons of goods were piled up in Japan awaiting shipment.

Nothing the Japanese can do can mend this deficiency for many years to come. On the contrary, it is likely to grow more acute as the steady toll of sinkings continues. Indeed, the Japanese Government has recognised this fact by launching out on a policy of decentralisation. It is now announced that industries will be built up on the fringe—in Malaya, Siam, Indo-China, the Netherlands Indies—so that the costly business of shipping raw materials to Japan and manufactures back can be avoided. This policy is connected with the new "sweetness and light" drive to persuade the other co-prosperous peoples to take an active part in the programme of industrialisation. Immediately on Japanese occupation, all local concerns were made to carry on under military control, delivering quotas fixed in the main by the army officials. Now great play is being made of establishing "genuine" Siamese, Indo-Chinese and Chinese managements. Newly-launched ventures are native-controlled—native interests owning, say, 51 per cent of the stock, the Japanese 49 per cent, the chairman a native, and the vice-president a Japanese, "with discretionary powers." These far more cumbersome methods show how strong among the conquered peoples has been the reaction against direct Japanese control. The success of the policy cannot yet be judged, but hitherto the Japanese have not been very convincing purveyors of reconciliation.

The amount the Japanese can do by way of developing an autarkic empire in the South Seas must not of course be underestimated, but it is perfectly obvious that a policy of decentralised industrialisation, hampered by an inadequate and often unwilling labour force and quite inadequate shipping resources, cannot perform miracles of self-sufficiency under five years at the very least; and even in five years, Russia, the exemplar of speedy industrialisation, had only completed one plan.

The military difficulties of the long-term policy are even greater. China's military resilience is remarkable. Even if Free China cannot strike a decisive blow against Japan, neither can Japan invade and occupy Chungking. The most recent attempt has ended, as usual, in frustration. Indeed one of Japan's chief problems is that it is impossible for the Japanese Army and Navy to win their war by a decisive blow anywhere. Even to occupy India and Australia would not end the war. A "decisive blow" northwards would involve the Japanese in endless fighting in the deplorable climatic conditions of Siberia. And so long as the Asiatic land mass remains as a potential base for the United Nations, Japan itself remains a possible and vulnerable target. Besides, the whole theory of the long-term Pacific war presupposes another stalemate—a stalemate in Europe. The real fallacy behind Japan's strategy—and the arguments of the American Pacific firsters—is that a knock-out blow is possible in Europe, and that the power which such a blow would set free will be turned immediately and relentlessly against Japan.

It is impossible to avoid the conclusion that Japan cannot, in anything under a five or ten year period of immunity, so build up its defensive position that it is virtually invulnerable. Nevertheless, there is no point in the Allies neglecting any feasible plan that will make things more difficult for Japan in the meantime. To build up a functioning economy on the fringe, the Japanese need peace and quiet. Every Allied bomb dropped on new harbours, installations, restored oil wells, new factories, is so much delay to Co-Prosperity. To hold their sprawling empire together, the Japanese must keep their sea lanes open. The toll taken by the Allied navies and air forces will go on. Free China is still the best and nearest base for the destruction of the Japanese mainland. Here and now its morale should be improved by bigger deliveries of material. It is to be hoped that this will be one of the outcomes of the Washington Conference. And the recapture of Burma should be the first priority in the Allies' Far Eastern campaign when the fighting there begins again in earnest. Such measures—bombing, sinking, reinforcing—will deprive the Japanese of their period of even relative peace and quiet, whereas their whole strategy of stalemate, if it is to be successful, demands uninterrupted ease for a good ten years to come.

The American Economy

THE domestic affairs of the United States remain in a condition of tension. Crisis, even its dilute modern meaning, is too strong a description; but there are certain tendencies, apparently gaining in strength, which leave the onlooker with some apprehension. These feelings, it should be said at the outset, and with all emphasis, do not relate, at least directly, to the American military effort. The strength of the armed forces of the republic is growing daily; the munitions programmes appear to have emerged from the difficulties of the winter and to be advancing rapidly. The time when the United States will have armed forces in larger numbers than those of any other belligerent, and with superior equipment, is only a few months off. The deployment is far advanced; the plans are matured and agreed with the other Allies; and the political adjuncts to offensive warfare, which had been so imperfectly considered at the time of the landing in North Africa, have now been thoroughly re-thought. The cutting edge of the American war effort is being lengthened and sharpened according to plan.

It is on the domestic front that the picture is less rosy. Both on the economic side of civilian life in the United States and in the political theatre, there are disturbing signs of disorganisation and impolicy, where there should be order and plan. The main issue on the economic side can be graphically presented in a very few summary figures. In the first quarter of the present year (the latest period for which figures are available in London) the total of "income payments"—that is, broadly, the stream of income passing into the pockets and the bank balances of individuals—was very nearly \$4,000 million a month more than it had been in the same months two years before. Against this, the taxation receipts of the Government were only about \$1,500 million a month greater; moreover, not all of this increase came from individuals. In other words, the individual citizens of the United States have, in the aggregate, about \$3,000 million more income, after taxation, every month than they had two years ago. Slightly more than \$1,000 million a month is being mopped up in war savings bonds, leaving the enormous amount of about \$2,000 million a month, or \$24,000 million a year—considerably more than the whole pre-war British national income—as a net addition to potential purchasing power. For every \$3 the average American had left in his pocket (after paying his taxes and his war savings) in the early months of 1941, an extremely prosperous year, he has about \$4 left now.

These figures are very approximate, but they pose the issue clearly. Only the fanatic would maintain that it is possible, in the conditions of total war, to absorb, by taxes and war savings together, 100 per cent of the extra income that is generated by the frenzied activity of war. In the United Kingdom, for example, over a similar two-year period, from 1940 to 1942, only something like 55 per cent of the increase in personal incomes has been mopped up by increases in taxation and by the so-called "small" savings; but the unabsorbed balance is of the order of only £48 million, or \$192 million, a month. The United States, with rather less than three times the population, has something like ten times the uncorralled income.

The issue of inflation has been discussed in America almost *ad nauseam*. But it is possible that the public has been left with the impression that inflation is a species of economic malady which can be cured if the right patent medicine is administered in Washington. The problem is discussed in terms of wage formulas (which Mr John L. Lewis is in the act of breaking), of price "ceilings" (which are cracking) and of the economic rights and political wrongs of a policy of subsidies—when, in fact, it is a problem of incomes. The plain truth is that no legislative or administrative mechanisms can dam up inflation, if so great a head of liquid purchasing power is allowed to press upon the dam. It has not been put to

the American people with sufficient clarity that arguments over the different methods of price-control, wage-control and rationing are pointless until the flood has been abated. The rates of taxation have been increased, and they will doubtless be increased again in this year's Tax Bill. Pay-as-you-go may also assist the revenue to catch up with the flood of income. But nothing that is now contemplated will be enough to reduce the problem to manageable dimensions.

The difficulty of controlling incomes is very great, and there are many people in the United States who are disposed in consequence to argue that a certain measure of inflation is preferable to the alternative of far-reaching and ever more intensive control. Better freedom and inflation, they say, than order and bureaucratic tyranny; let us devote our energies to fighting the war rather than to filling up forms. Unfortunately, however—and this is the point to which insufficient attention has been paid in America—"freedom and inflation" is not a formula for getting on with the war. The tremendous volume of civilian purchasing power is not exerting pressure on prices alone; it is beginning to compete with war production. The level of civilian consumption, averaged over all fields, has been reduced below the peak of 1941, but it is still higher than in any previous year. It has been supported hitherto by drafts on the very large stocks of consumption goods that had been accumulated by the spring of 1942; production for the civilian market has been cut back—severely in the field of metals—in order to permit the rise of munitions output. Now, however, the stocks are running out. If, in face of the flood of money, the supply of goods for consumption is now to fall to the level of current production, all the difficulties mentioned above will be vastly accentuated. Not without reason, this prospect is regarded with great alarm. Even in food, where rationing should be administratively easiest, there is a serious proposal from the industry to abandon completely the attempt by the Office of Price Administration to impose any restraints. And in Congress there is a move to set up an independent Office of Civilian Supply, whose duty would not be, as might be thought, to assist in the orderly but severe contraction of all unnecessary supplies, but to make certain that a larger share in the total of available resources was reserved for the civilian market. These are not examples of wrong-headedness; but they are examples of the lengths to which reasonable men are driven when incomes are insufficiently corseted.

It is apparently to deal with this problem of production that the Office of War Mobilisation, with Justice Byrnes at its head, has been set up. The OWM has been greeted as a "War Cabinet"—that is, as a body competent, under the President, to decide any of the economic problems of wartime administration. But a close reading of the announcement suggests narrower functions. The President defined Mr Byrnes' task as "to unify more closely the work of war agencies concerned with the production, procurement, transportation and distribution of military and civilian supplies, materials and products," and such matters as price control, rationing, food supply, wages and manpower do not come within the province of the new agency. In short, OWM is not very much more than the latest of the many attempts the President has made to "co-ordinate" war production. Moreover, even if the new agency were, in any sense, a "War Cabinet," a further doubt would be legitimate. What would appear to be necessary in Washington are not administrative devices but policies. On some of the more important issues, policy is within the competence of the President; but he cannot afford to forget the attitude of Congress, which has shown a disposition to overrule his administrative acts. And on the most important issue of all, taxation, policy belongs to Congress alone.

So the argument comes back, as all arguments in every country do, to politics. Americans, when challenged on the point, are apt to declare that a political truce would be impossible under their constitutional arrangements. It is difficult for the outsider to understand why this should be so, if the will to a truce were present, and it must be said that contemplation of the present state of American politics leads to the conclusion that it is the will, rather than the means, that is absent. American politics have been bitter for a decade past, and they are no less bitter today. The Administration is on the defensive; it has almost, if not quite, lost control of Congress; and the basic reason why Mr Roosevelt cannot be bold in policy is that it would almost certainly, since boldness implies severity, injure his political position. Eyes are fixed on next year's election, Mr Roosevelt's no less than anyone else's. His very proper object is to avoid a change in the Commander-in-Chief in the middle of the war—or at least such a change as would risk a reversal of policies and an administrative overturn. Unfortunately, it seems to be the case that the only candidate who both stands a chance of winning and also would follow the Roosevelt policies is Mr Roosevelt himself. He is thus

forced by inexorable pressures into a position where he is the defenceless object of charges of personal ambition. A fourth-term candidature would unleash a catalogue of abuse beside which the performance of 1940 would be insignificant. This might not hinder Mr Roosevelt's chances with the electorate. But it would immeasurably embitter the atmosphere of Washington and turn his opponents in Congress, of both parties, even more severely against him. The absence of anything in the nature of a coalition compels the President to do, for the protection of his policies, what will inevitably deepen the fissure and make a political truce still less possible.

From this dilemma, policy cannot help but be the sufferer. The world has known ever since 1919 that the constitutional system of the United States seriously reduces the influence that the country can exert in peacetime international policies. What is happening at present looks uncomfortably like a demonstration that the same cause makes it difficult for the United States to deploy in war as high a proportion of its resources as other belligerents. It is fortunate for America and the world that those resources are so gigantic that, even with such handicaps, they can tip the scales with overwhelming weight.

NOTES OF THE WEEK

The Rule of Law

It is not an offence for the Union of Post Office Workers to seek an affiliation, as it has done, to the Trades Union Congress. Nor will it be an offence for the Trades Union Congress to accept this request, as it seems disposed to do. But it will be an offence for the individual members of the UPW, as civil servants, to belong to a union thus affiliated. This is the effect of Section 5 of the Trades Disputes Act, which was passed in 1927 after the General Strike, with the object of preventing the political use of sympathetic strikes in order to coerce the Government. There can be no two opinions about the policy which the UPW and, apparently, the TUC have decided to pursue. Their deliberate defiance of the law is not mitigated by the fact that the consequences will fall, not upon them as societies, but upon individual Post Office workers who, if affiliation is completed, will be disqualified from the Civil Service establishment and deprived of their pension rights. Nor is their lawlessness lessened by the possibility, upon which perhaps they are reckoning, that the Government may not in the event be inclined to act so drastically towards individual civil servants, at a time when industrial peace and political calm are so plainly in the national interest. It is a grave pass that the affairs of the nation have reached when a body of the

weight and influence of the TUC embarks deliberately upon a career of lawlessness. It affords an evil precedent. Ever since 1927, the Trades Disputes Act has been regarded by the Labour movement as a vindictive and punitive measure. When Labour joined the Government, an attempt was made to secure its amendment by agreement with the Conservative party, but the consultations that took place for this purpose in 1941 broke down; and the Prime Minister asked the TUC not to press the point, because of the evident danger of "serious political controversy" at a "critical stage of the war." Now, it seems, the TUC has decided to resort to direct action, and to take advantage of the fact that the war is still at a critical stage, in order to obtain its way. Significantly, the attack has been directed at the weakest spot in the programme of 1927—the position of civil servants. There seems no reason, either in justice or in expediency, why civil servants should not be permitted to affiliate with outside labour organisations, provided that there are at the same time safeguards to prevent this connection from being put to political uses; and this safeguard exists in the prohibition of sympathetic or general strikes. But to say that the Act of 1927 appears worthy of amendment is not to say that either the UPW or the TUC is justified in flouting its provisions. So long as the British trade unions are pledged, as in distinction from other revolutionary labour organisations they are

Fire Damage caused by 1,000 fires a day hampers War Effort.

Half the fires in the country are caused by matches and cigarette ends.

MOST FIRES ARE CAUSED BY "CAREFUL" PEOPLE.

DON'T JUST BE CAREFUL—TAKE EXTRA CARE

pledged, to secure their aims by constitutional means, it is their duty, as it is their right, to seek the alteration of distasteful laws by the methods of argument and persuasion upon which the parliamentary process is built. It is not for them to take the law into their own hands. If they begin in this vein, with what seems some formal justification, others will not be lacking to follow without any justification at all. Law-abidingness is the cement of the British political system. And the right course of action at this stage would seem to be, first, for the UPW and TUC to withdraw their challenge; secondly, for the Prime Minister to show that, as he said a few weeks ago, he is prepared to "consider the matter further"; and, thirdly, for the Conservative party to show that, despite appearances, it is not controlled entirely by Bourbons.

* * *

Farm Prices

There is almost unanimous agreement among the many bodies and individuals that have lately made pronouncements upon agriculture that the pivot of policy must be guaranteed prices. This is a highest common factor of great significance, running as it does through the expressed views of all shades of political and technical opinion—from the farming interest proper to, it should be said, *The Economist*, which has consistently supported a policy of price guarantee for agriculture for several years. Plainly this policy should be the point of departure for the agricultural programme which the Government was not yet ready to produce when Lord Perry raised the question in the House of Lords on Thursday last week. The degree of unanimity on this particular method of procedure does not, of course, mean that there is similar agreement about the scale of British agriculture that is desirable or economic. Broadly, opinion on this issue can be divided into two categories: those who believe, like *The Economist*, that the objective of farming is to supply food; and those who believe that its object is to employ farmers—in the farmers' own interests and because of the social, as distinct from economic, consideration that the preservation of agricultural pursuits in this country as "a way of life" is, so it is said, of fundamental importance. This discrepancy of view does not necessarily emerge at this first stage of the discussion, when a policy of guaranteed prices is being given general approval by all parties. It inevitably does emerge when it becomes necessary to put figures to the prices to be guaranteed and to work out the methods of regulation by which the guarantees are to be enforced. The prices guaranteed must make it possible for efficient farmers to remain in production through good years and bad; but if food, whatever its origin, is to be given its proper priority over farmers, the prices fixed should be no more than those which would obtain on the average and over a period in a relatively free market. Any other policy must inevitably mean the restriction of the total supply of food available to and purchasable by consumers. The amount of food that can be purchased and consumed by the people of this country depends upon two factors: the price at which foreign food can be obtained, and the price at which domestic produce is sold. It is an international as well as a national question; the upshot of the Hot Springs conference will help to shape Mr Hudson's policy here at home. The crucial question, by whatever means the cost of subsidising the home price is to be raised, is the price at which the Government proposes to admit the supplies of relatively cheap food from overseas, upon whose amplitude the British standard of living will largely depend in the future as in the past. If the intention is to do no more than save efficient home producers—the emphasis must be placed upon efficiency—from the sudden sharp fluctuations to which the agricultural markets are inherently subject, then the programme achieved has a chance of being desirable, economic and in the national interest—as well as in the interests of smooth and ample world trading.

* * *

The World's Food

At Hot Springs, there appears to be no doubt, judged by an unofficial summary of the recommendations of Section Three of the United Nations Conference on Food and Agriculture, that the purpose of agriculture is to supply food for consumers to eat. It is explicitly recognised that the expansion of production is only the first step; the widest possible distribution and consumption are the real goals. This is a truism which only needs stating because it is so persistently disguised by interested, mystical or nationalistic arguments. A buffer pool, for instance, such

as has been suggested by the British delegation to Hot Springs, is not justified if all it does is to enable producers to get rid of all they can produce at a remunerative price; it is only justified if it also enables consumers to buy all the food that can be produced at a price they can pay. The latest draft recommendations point out that the chief obstacles in the past to the diffusion of consumption have been barriers to international trade, restrictive economic policies, and the absence of industrial development in hungry but impoverished areas. All these, it is argued, have been symptoms of a world in which collective security and international economic collaboration have been notably absent. The first prerequisite, therefore, is a guarantee of international peace; and the second the pursuit of policies of economic expansion, full employment, industrial development, ample investment, orderly exchange and freer trade. The Conference's latest recommendations insist in particular on the prevention of excessive short-term fluctuations in food prices; on the effective representation of consumers in all international commodity arrangements; on "meeting consumption needs from the most efficient sources of production at prices fair to both producers and consumers"; and on the taking of steps, international as well as national, to provide all people, whatever their income, with a sufficient diet in both quantity and nutritional value, by social security programmes and subsidising the consumption of special classes of consumers. The lessons of wartime rationing and distribution according to priority needs are clearly in mind in this last proposal to abolish under-nutrition and malnutrition. They will be especially in mind during the transition from war to peace when there may not be a sufficient supply of essential foods or of the means to produce and transport them to meet all basic requirements, and orderly allocation according to need will be imperative. No one can tell yet how successfully the recommendations of the Hot Springs Conference can be translated into national and international policy without being wrecked on the old rocks of sectional self-interest. But the simple truth that food is meant to eat is a sound beginning.

* * *

The Generals—

On Sunday, May 30th, General de Gaulle, accompanied by M. André Philip and M. René Massigli, made his long delayed journey to Algiers, and the final negotiations for the reunion of combatant France began in earnest. Since then, there has been a further series of setbacks and misunderstandings. The agreement on principle achieved before General de Gaulle left London, largely as a result of the untiring mediation of General Catroux, has yet to be substantiated by agreement on the personnel and powers of the new Central Executive Committee. The trend of discussions can be gathered from the fact that M. Peyrouton has resigned his appointment as Governor-General of Algeria—which is said to have been announced in two letters addressed to the two Presidents of the Executive Committee, General Giraud and General de Gaulle—and the retention of the Army command by General Giraud is now uncertain. These two issues, obviously involve joint military and civilian authority, obviously involve important questions of principle; but it is to be feared that a certain number of purely personal considerations are still holding up the final merger. On the face of it there appears to be no ground for the objection in Free French quarters to the inclusion of General Jacques Georges, on the Central Executive. General Georges is not only a soldier who fought with distinction in the Battle of France; he is also a loyal servant of the Third Republic. Both he and M. Jean Monnet appear to be excellent choices. It is greatly to be hoped that the nomination of the remainder of the Committee will be achieved with a minimum of friction. No party except the enemy draws any benefit from the prolongation of the Algiers talks. Some surrenders will have to be made on both sides, and these are best made promptly and with a good grace. For an atmosphere of indecision places a great strain on the good discipline of the Algerian populace, and delay must breed a highly damaging partisan enthusiasm.

* * *

—And the Admirals

Unhappily, dissension between the French generals has had its repercussions on the attitude of certain French admirals. Admiral Godfroy at Alexandria and Admiral Robert at Martinique have for some time adopted the view

that French sovereignty continued to reside at Vichy until such time as the resistance movements abroad could put up an effective united counter-claim. Admiral Godfroy, who appears to be something of a realist, foresaw the likely merger of the movements led by General de Gaulle and General Giraud some weeks ago, and made known his fleet's decision to join the Allied cause on the day that the Tunisian campaign ended. Admiral Robert, who has recently made a further statement to the press, continues to maintain that he will take no action which leads him into rebellion against the "French Government"—by implication Vichy—and he continues to stress the disunity of the resistance movements. It is not even clear that a formal merger at Algiers, and the designation of that town as the capital, not only of *France d'Outre Mer* but of Metropolitan France translated, would eliminate his scruples. Meanwhile, the unfortunate inhabitants of Martinique continue to run short of food and the situation remains extremely unsatisfactory. Admiral Godfroy's decision renders Admiral Robert's position even less tenable than before—if that were possible. To-day the fact that in the middle of the Caribbean, fighting ships and essential tonnage should be withheld from the common cause for the *beaux yeux* of a Vichyite makes no sense at all.

* * *

The Donkey and the Haystacks

Once upon a time the attention of philosophers was much engaged by the riddle of the donkey which was equidistant from two equally palatable haystacks of equal size. The question was why the animal should choose one rather than the other of the haystacks for its next meal; and there was a persistent suggestion that, unable to make up its mind between two identical alternatives, the unhappy creature would starve to death. According to Lord Selborne, who spoke for the Government in last week's debate on agricultural policy in the House of Lords, His Majesty's Government is in a similar plight with regard to reconstruction. Ministers, it seems, cannot make up their mind between, not two, but many projects of equal attraction. Peter is weighed against Paul, housing against social security, hospitals against education, civil aviation—somewhat oddly—against all other claimants on the nation's post-war resources. It is, of course, true, in general, that as the Minister of Economic Warfare sagely said, "You cannot draft policy for one great department of national economy without reference to issues of basic importance in other great departments of national economy." This is what, above all, has been learned by hard experience in wartime. But it is an argument, not for procrastination, but for the setting of priorities. Policy for peace cannot be extemporised any more than policy for war can. There will be no *entr'acte* between the fighting and the future. The problems of demobilisation and resettlement, of remobilisation and re-equipment, will arise at once whether the Government has made decisions on these matters or not; and the absence of decisions will simply amount to the utmost impolicy when that moment comes. Mr Churchill is undoubtedly right when he insists that winning the war must come first; and "the leading members of the Government" who, Lord Selborne declares, "have no time for consideration of policy," deserve all sympathy. But facts remain. No one suggests that making policy for peace is easy, any more than making policy for war, which got off to the worst of starts, has proved easy. But the responsibility cannot be set aside. It seems from Lord Selborne's gloomy gloss that the Prime Minister's broadcast slogan, "No promises but every preparation" means "No decisions by Ministers, but heaps of preparatory work by civil servants and experts." If this is so, immediate post-war policy—for some policy will be required, whether decisions have been made or not, and the absence of decisions is itself policy of a kind—will be worse than even the most sober have feared. Mr Morrison, in the same vein of apologia for the fact that the Cabinet is allergic to reconstruction, recently said that the soldiers must not come back with the promise of a paradise that they will not get. True; but they must come back with the promise of a sanely and decently run community that they will get.

Town and Country Planning

The Minister of Town and Country Planning's first press conference was a friendly affair, but it did not throw any new light on the Government's intentions about post-

war planning. It was good to hear Mr Morrison stress the importance of consulting ordinary people in the drawing up of plans and of taking their needs as a starting-point for reconstruction. Planning from the top alone would not be compatible with a democratic society, and such studies as Mass Observation's "People's Homes" are of value in finding out about the kind of homes and neighbourhoods people want to live in, as well as in stimulating public interest in the general problem. There is a danger that such admirable precepts may become mere platitudes, and Mr Morrison's appeal to local planning committees to seek the opinion of local inhabitants will, it is hoped, be listened to. The Minister described local authorities as "the spear-head of the planning movement," and said that councils in blitzed areas were now engaged in drawing up plans, in co-operation with adjoining authorities. This is a proper preliminary, since the local unit must form the basis of a national plan, but there is no sense in local planning in a vacuum. Until the Government's policy on certain broad issues is defined, much time and effort may be wasted. In the first place, local plans must be fitted into a national frame-work, and there has still been no firm indication of the Government's intentions with regard to the basic recommendations of the Barlow, Scott and Uthwatt reports. Secondly, in the absence of a Treasury decision on the financing of rebuilding projects, local authorities may very well be driven to press for developments which will raise the rateable value of their areas, though they may not be socially the most desirable. The Bill which Mr Morrison has promised to extend local powers of purchase will help; but it will only be a beginning of the solution of this crucial financial problem. Thirdly, it is doubtful whether the local authorities, as at present constituted, have the necessary man-power, either in number or competence, to cope with the task of formulating and executing plans. Finally, the Government has yet to define its attitude towards the whole question of local government reform—what is to be the size of the administrative unit, and what are to be its powers? Mr Morrison, in the House of Commons debate on May 11th, hinted that it might be necessary, at a later stage, to "consider afresh the authorities" who are to exercise the powers. Such a review not only might be necessary, but obviously is necessary, and at an early date.

Mediterranean Air Offensive

The relentless bombing of Italy continues. Allied bombers have attacked the mainland as far north as Leghorn and harbours and airfields throughout the south are being pounded. The outposts—Pantellaria and Sicily—are suffering almost ceaseless visitations. Sardinia, too, has been raided. The immediate purpose of this air offensive is, of course, to clear the Mediterranean. From Axis sources are coming circumstantial reports of big convoys in Gibraltar, and it is essential to any speedy military developments anywhere in the Mediterranean that the Allies should

have an uninterrupted field of manoeuvre from Gibraltar to Alexandria. A secondary purpose of the bombing is naturally to cause alarm and despondency among the Italians. The scale of the evacuation from the bombed cities is evidence of its devastating effect. Yet neutral observers in Italy suggest that the Italian people are accepting the new calamity in the spirit of fatalism and indifference with which they have followed the fortunes of war hitherto. One German correspondent has even complained that they still seem to feel that the war is a long way off. The fatalism springs primarily from their conviction that there is nothing they can do about it. In the feverish months of 1939 and early 1940, they still hoped that the King-Emperor might finally make a stand, abdicate, refuse to declare war, dismiss Mussolini. There seems to be no hope of that now. The Crown Prince is a figure-head. The political horizon is dominated by the Duce. He has little real popularity, but he is all there is. The Fascist Party has probably been strengthened by the reorganisation of recent months. Mussolini's old guard, the "fascists of the first hour," have been promoted at the expense of younger men. Men with fighting experience are receiving precedence over non-combatants, many of whom are being sent off to the Army. The changes can only have made the Duce's political monopoly more complete.

The Satellites

Italy's dilemma is repeated in all the satellite states which form a protective shield along Germany's southern flank. They are in the front line. They expect to take the first bloody shock of invasion, and they must take it in a cause which they shrewdly expect to be already lost. It is not surprising that the puppet Governments are all attempting to hedge. In Hungary, M. Kallay, the Prime Minister, in a speech last Sunday declared his country's devotion to democratic forms of government, and said roundly that Hungary could not bear sacrifices out of proportion to its strength. This speech came on top of the return to Hungary of the Second Army for demobilisation and the Hungarian Government's opposition to Germany's proposal to make use of Hungarian territory for purposes of transit. Two months ago M. Kallay was in Rome, and it is generally assumed that the possibilities of retreat were discussed. In Roumania, King Michael and Marshal Antonescu are reported to be at loggerheads over the question of fresh troops for Russia. There is even talk of the King forming an all-party Government to include politicians of the pre-dictatorship period such as Bratianu and Maniu. In Bulgaria, German pressure on King Boris's comparatively moderate Filov Ministry has produced no concrete military support—only the expulsion of the Jews from Sofia, almost certainly as a preliminary stage in the terrible journey to Poland. It is hard to speak of established Governments in Croatia, Serbia and Greece. In the Yugoslav territories fierce fighting continues almost without interruption. Even Axis commentators admit that the Pavelic Government has no more than nominal authority. The peninsula from Hungary and Roumania southwards is either militarily occupied or still fighting. There is little doubt that Italy could swing all the satellites out of the war if there were anywhere to swing to—or from. The Governments are all too deeply compromised to deal with the Allies themselves. Yet in no country is there any alternative Government which could come to power without the aid of an invading army. In all of them fear of Russia and ignorance of the Allies' plans for Europe still act as strong inhibiting factors. In the last war the existence of parliamentary oppositions made collapse and surrender a possibility. To-day one of the penalties of the "monolithic state" is that no alternative to bloodshed can emerge save by way of bloodshed.

More Trouble in Tangier

The latest disturbances in Tangier have an air of calculated provocation. In the course of the last few days, the Spanish authorities and police have rounded up some hundreds of local Jews and Arabs, believed to be on the point of volunteering for service with the Allies in French Morocco, and deported them to concentration camps in Spanish Morocco; they have also picketed the offices of the local British newspaper, the *Tangier Gazette*, in an attempt to prevent its publication. In the circumstances of to-day, this truculent behaviour requires more explanation than

did the failure to control the riots in the spring of 1942. To-day, all North Africa, apart from Tangier and Spanish Morocco, is under Allied control. Recent pronouncements of General Franco have suggested that he realises that times have changed. Spanish provocation cannot still appear to be a paying proposition. Indeed, the inept belligerence of the Spanish administration in Tangier has already aroused reawakened interest in the status of the whole zone. The assurance which was given to the Spanish Government on November 8, 1942, at the time of the Allied landings in North Africa, included a guarantee that the *modus vivendi* established with regard to Tangier in February, 1941, would be respected. This provisional agreement was framed to protect the personal rights of British subjects in the conditions resulting from the Spanish occupation of the International Zone in 1940. It has always been maintained by the British authorities that there was no *de jure* recognition of Spanish rule. Since February, 1941, the terms of the provisional agreement have been repeatedly violated by the Spanish authorities. On several occasions there have been attacks upon British property and, in January last, General Orgaz, High Commissioner of Spanish Morocco, announced the incorporation of Tangier in his territory. On this occasion, the British Government again pointed out that it reserved all rights. It is curious that in these delicate circumstances the Spanish authorities should continue to cut away the ground under their feet. The Allied guarantee of November 8, 1942, agreed to observe the provisional arrangement of February, 1941. This arrangement has not, however, been observed by the Spaniards, and it is hardly surprising if British opinion is increasingly disatisfied with the existing state of affairs. The fact that there is abundant evidence that Spanish provocation has throughout, and more than ever on the latest occasion, been German inspired, makes it doubly important to end this nuisance. No doubt the aim of German intrigue in Tangier is still a clumsy attempt to create ill-feeling between Great Britain and Spain. The strongest argument for ending the Spanish administration is its inability to resist German pressure.

Twice Delegated

The Government has not accepted the proposal of a group of Members, which was debated in the Commons on Wednesday last week, that a Standing Committee should be set up to examine delegated legislation and to report upon it to the House where necessary. The Home Secretary, upon it to the House where necessary, claimed that this formal procedure could not be introduced without the Government in fact handing back a part of the emergency powers which it has been granted by Parliament to conduct total war. According to this argument, which the Home Secretary drew out to very considerable length, it is a question in wartime not simply of delegated legislation, but of legislation doubly delegated. Over a substantial field the House of Commons has transferred full legislative powers to the Government. Not only are Statutes filled in and interpreted by Orders as in peacetime; they are actually replaced, in effect, by Defence Regulations, under which in turn Orders are made. The genealogy of the process was described by Major Petherick, the mover of the motion. The parents are the Emergency Powers Acts, the children the Defence Regulations, the grandchildren the Orders; the great grandchildren are "directions and instructions made under the Order, which is made under the Regulation, which is made under the Act of Parliament." If Mr Morrison's claim is accepted that this procedure of proliferation, which has transferred the responsibility of law-making from Westminster to Whitehall, is necessary for the prosecution of the war, he is probably also right in saying that the institution of a Parliamentary Committee to scrutinise draft Orders would either be ineffective or impeding. It is plain that there are great dangers in this transfer of power and responsibility, however inevitable it may be in the circumstances of war; but Parliament has given these powers, and only by taking them away, that is, by removing its support from the Government, can it reverse the trend. This, obviously, it is not prepared to do. There are other means, however, of keeping watch and ward. Last week's debate is a case in point. It extracted from the Home Secretary, on behalf of the Government, a number of valuable promises: that steps of importance, in principle or effect, shall normally be taken by Regulations, which can be annulled, and not by Orders, which cannot be annulled; that Regulations and Orders will, where possible, be drawn up in

plainer language and accompanied by explanatory notes; that the practice of drafting Regulations and Orders by reference shall be largely abandoned so that each is intelligible in itself; and, more generally, that Parliamentary time will be given for debating Orders which a substantial number of Members wish to discuss.

Parliament cannot control from day to day the executive creature which it has vested with full powers; but it can check and restrain it by suasion. This has already been proved by the achievements of an informal group of Members who have made it their business to examine the intelligibility and merits of Orders as they appear; and there is always the weapon of Questions, Parliament's most potent instrument. On the other side, success in the extraordinary process of wartime government depends upon the self-discipline of departments themselves. Mr Pickthorn, in much the best speech of last week's debate, stated strongly the danger of "Ministers taking larger powers than they really need"—"where you only want 2½d. worth of legislation, taking 100 quids' worth to be on the safe side." Only if these powers are used with due reserve and restraint can the climate of understanding and co-operation be preserved that has so far enabled Parliament and Executive to work together in their distorted wartime relationship. The case for greater Parliamentary control over delegated legislation in peacetime is very strong. In wartime this is probably not possible, though Mr Morrison was perhaps more eloquent than he was convincing; but, at any rate, there is need for the firmest assurances of good conduct from Ministers, proved by their practice and if possible, as suggested by Mr Pickthorn, embodied in a Statute, "so that they do not repose entirely on the vigilance of private Members."

Church Bells

Three years after it was imposed, the ban on the ringing of church bells has been lifted. On June 19, 1940, the Control of Noise (Defence) Order prohibited the sounding of any church bell, except in accordance with military instructions to indicate that members of an enemy force "are landing or attempting to land, or have landed from the air." After the first few months, the possibility of being summoned by church bells to repel invasion was not taken seriously, and as long ago as March, 1941, the Government announced that there would be no general ringing of the bells if an invasion occurred; they would only be heard in places where parachute troops had been seen to drop. In fact, the proposed use of the bells was symptomatic of the general state of unpreparedness of 1940. As preparations against invasion were completed, the ringing of church bells as a warning became, in Mr Churchill's words, redundant. This being so, one may ask why the ban was not lifted long ago. In particular, why did it have to be lifted in two stages? The Control of Noise (Defence) No. 2 Order, made just before Easter, prohibited the sounding of any church bell except for the purpose of summoning people to worship on a Sunday, Christmas Day or Good Friday—but not Ascension Day. It took more than a month, apparently, for the Government to realise that if the bells were not wanted to sound an invasion warning at church-going times on Sundays—and Christmas Day and Good Friday—they were not wanted at all, and from the end of last week they may be rung for any purpose at any time. Bow Bells have also been restored as an interval signal by the BBC. The episode is insignificant; but it is a warning that regulations may sometimes be continued after they have become unnecessary, and that the official mind evidently finds it harder to relax restrictions than to impose them.

Assumption B

The discussions between the medical profession and the Minister of Health on a comprehensive health service have reached the open, and on Tuesday they were debated in the House of Lords. Lord Derwent's motion was badly worded, for it ran

... In view of the fact that the medical provisions of the Beveridge Plan ... concerning the future status of doctors and the medical treatment of the population in general do not appear to be designed to further the best interests of British medicine or of the population. ...

Actually there were no medical provisions in the Beveridge Report at all. It assumed a comprehensive health and rehabilitation service, but expressly declared that the problem of organisation was outside its scope. What it did, however, say was that it was in the interests of the proposed Ministry of Social Security that a health service should be found which

will diminish disease by prevention and cure and will ensure the careful certification needed to control payment of benefit at the rates proposed in this Report.

It is viewed in the light of this sentence that the Minister of Health's proposals are regarded by the representative committee of the medical profession with suspicion. The deputy-secretary of the British Medical Association stated recently that, in his view, the Government had decided that, before a social security plan could be adopted, it would be necessary to control the doctors, upon whose certificates a great deal of the money going out of the social security fund would depend. This suspicion was also voiced by Lord Dawson of Penn in the House of Lords debate. The question of certification is indeed a tricky one. Since the Beveridge benefits would give a sick person a subsistence income—which the really sick person should undoubtedly have—there is a grave danger that they would be exploited, whether consciously or unconsciously. Possibly the best safeguard would lie in the rehabilitation service, which formed part of Assumption B, and in some means of periodically reviewing cases of non-organic illness. There should certainly be no question of making doctors agents of the social security fund, and it is a pity that Lord Snell, replying for the Government in Tuesday's debate, did not dispel this bogey. In fact, his speech was disappointing. He said that the Government was not proceeding in haste or without consideration. But he gave no indication that any consideration at all is being given to reform and reorganisation at the centre where different aspects of the health services are dealt with by different Departments. Nor did he say anything to dispel the other bogey—that the Government intends doctors to be employed by local authorities, without giving any indication of what the new local authorities will be like.

The Coal Outlook

There has been a further drop in coal production. Output in the four weeks ended May 15th was only 3,624,600 tons, compared with 4,005,200 tons in the previous four-weekly period. Although the incidence of the Easter holiday in part accounts for the decline, the present figure is lower than that for any previous month in which a holiday period occurred, and is, indeed, the lowest reached in the last two years. (Detailed statistics are given on page 740.) The outlook is far from encouraging, and it is surely time that the Minister of Fuel told Parliament what progress has been made with the promised reorganisation of the industry, with the scheme for concentration on the most productive pits and the increased use of machinery. The Eighth Report of the Select Committee on National Expenditure suggests that little progress has been made in this direction. It seems that transport and housing problems, together with the reluctance of miners to move, have acted as a deterrent to concentration, while the deliveries of special coal-cutting and conveying machinery have been slow. The Select Committee

pins its hopes on achieving such a reduction in the rate of voluntary absenteeism as will compensate for the inevitable labour wastage in the industry, and recommends a more speedy procedure for dealing with absentees. The rate of wastage is normally 20,000 or more men a year, and measures so far taken to arrest it have not proved effective; "the country faces the certainty that by the end of this year the number of men engaged in the industry will be smaller than at the present time." The Committee is very properly satisfied with the response of the public to the voluntary restriction scheme; but it is doubtful whether, given a hard winter, voluntary restriction of consumption could again produce adequate economies. It is difficult to agree with the Committee's view that the main solution of the coal problem lies in increased measures against absenteeism. That there is avoidable and inexcusable absenteeism, especially among the younger men, is certain. The need for firm action against offenders has been emphasised by the miners' leaders themselves. But an appreciable part of absenteeism, due to sickness and accidents, is involuntary, and the problem is too complicated for it to be boiled down to a lowest common denominator—absenteeism. The drive for coal production necessitates measures for increasing productivity, for preventing labour wastage, for maximising economies in industrial and domestic consumption, as well as for reducing absenteeism. Mr Churchill's message to the miners, that the coming offensives will call for increased coal production, should be heeded no less by all the other parties concerned in the business of getting and using coal.

Shorter Notes

At the end of last week, in a broadcast talk, Lord Woolton announced certain "concessions" to make the collection of ration books easier. He admitted that distribution was over-centralised—a slight understatement of a system that *inter alia* sent people by foot over the Kirkstone Pass and back—and gave full authority for the opening of sub-offices, travelling offices, and block distribution with the aid of the

Women's Voluntary Service. Where there is more than one initial letter in a household, all the ration books may now be collected together, when the hour of the last letter comes.

From June 1st, a strict and far-reaching censorship has been imposed by the Portuguese Government on all outward correspondence and other communications—press, public and private. Among other restrictions, no criticism may be made of Portuguese neutrality or of the Government's attitude towards the belligerents.

In a parliamentary answer this week, Mr Attlee gave the numbers of casualties among the armed forces of the British Empire in the first three years of war:

	Killed†	Missing	Wounded	Prisoners of War	Total
United Kingdom*	75,477	75,405	50,163	76,801	275,844
Canada	3,142	2,058	1,557	3,865	10,422
Australia	6,192	24,193	15,700	7,874	53,959
New Zealand	3,219	2,860	7,178	6,088	19,345
South Africa	1,439	13,350	3,229	4,597	22,615
India†	3,286	86,289	9,168	5,236	101,979
Colonies	1,334	22,566	1,499	5,430	30,829
Total British Empire	92,089	228,719	88,294	107,891	514,993

* Including overseas personnel serving in those forces.
† Including casualties to the Hongkong and Singapore Royal Artillery.
‡ Including died of wounds and injuries.

The figures are of casualties up to September 2, 1942. In roughly the same period, up to the end of August, the number of civilian casualties in air-raids on the United Kingdom was 102,934—killed 47,291, and injured 55,643. In the first three years of the last war, British Empire casualties were about 1,741,000, of whom 387,500 were killed and 1,177,500 were wounded.

AMERICAN SURVEY

Inflation and Speculation

(From a Financial Correspondent)

Chicago, May 3, 1943.

IN the spring of 1942, an advance began in the New York stock market that carried the averages of industrial, rail and utility groupings upwards by as much as 50 per cent in a single year. Trading volume doubled and tripled, and quadrupled. Speculation in securities became so general that newspapers which maintained investment advisory services even reported inquiries from private soldiers in the Army camps, whose previous experience in risk of capital had never gone beyond betting on horse races.

Two fundamental factors contributed to this remarkably vigorous rise of stock prices. First, there was the inflation brought about by wartime economy. Second, there was the limited supply of capital issues. Public savings were the highest of all time. Opportunities for the placement of venture capital were almost nil. The banks reported steady and severe declines in their small loan accounts, which meant that the people who used to borrow money for comparatively trivial purposes no longer did so. National unemployment had declined from something around 10 millions to close to the irreducible minimum of around 1,000,000 in a very few years.

The resultant pressure had economic results comparable to the meteorological calamities that follow great changes in air pressures. The level of market prices could not do otherwise than go up, even though corporation earnings declined under the great burden of wartime taxes, and dividends fell off with them. Supply and demand and the volume and

velocity of money in circulation made what had happened inevitable.

The presence of "little people" in the stock market was demonstrated by the activity in low-priced issues—stocks selling at less than \$5 a share. The daily totals of these issues ran to thousands of shares, and increased steadily. Brokerage firms reported that most of the customers who bought such securities paid cash and carried them away to store in bank vaults. These people bought under the impression they were making sound investments, even though their investigation into the quality of their holdings had been sketchy, to say the least. Their habits of buying had been formed by buying "baby" war bonds, which they also stowed carefully, and with complete confidence. Paper, to them, was honest paper, even though the common shares of railroads in the process of reorganisation, or a utility issue that might be wiped out under the procedures of the Securities and Exchange Commission, might ultimately be worth no more than the expensive engraving on the certificate.

This was a different generation from the disillusioned speculators of 1929. And the longer the advance continued, the more difficult was the problem of convincing them of their danger, as well as the danger to the nation's economic structure, however apparent this might seem to a trained economist. Practically all these people had substantial "paper profits"—100 per cent was not unusual. They cared little about corporate earnings or dividends so long as

the stock quotation tables showed they had doubled their money by what they considered to be their own native shrewdness.

Stemming the Tide

The dangers of the situation have been recognised, however, by the United States Treasury Department, the Securities and Exchange Commission, and the officials of the nation's stock exchanges. There are political possibilities, the outcome of which it would be difficult to predict. The economic consequences may result in the closing of the exchanges.

This is not to suggest that all low-priced stocks have no intrinsic value. The courts have decided, however, that some of them are worth little or nothing. In March, for instance, the United States Supreme Court ruled to uphold a previous ruling of the Interstate Commerce Commission on the reorganisation plans of the Milwaukee Road and Western Pacific Railroad. The ICC had decided that the stockholders of these railroads would be left out of reorganisation plans. This method, it was assumed, would apply to other reorganisations of railroads, and there was a rush to sell stocks that had had sensational advances. The prices of common stocks of railroads in reorganisation tumbled more than 50 per cent, and bewildered people who had purchased them in hopes of making their fortunes grumbled loud enough to be heard in New York and Washington.

A few days later the governors of the New York Exchange decided that all transactions in stocks selling at less than \$5 a share must be for cash. Practically the only effect of this was psychological, since most of the trading had been for cash, anyhow; and the stock market advance had carried on so far that there were almost no shares left for sale for less than \$5. The concern of officials and interests associated with the stock exchanges has been expressed again and again. Emil Schram, president of the New York Stock Exchange, in several speeches and announcements for the press told his alarm at the heavy activity in low-priced stocks listed on the exchange. He said that buyers should not be led astray by the fact that many stocks were selling at low prices, but should be guided by factual information on earnings and other financial details. The exchange's largest member, which maintains offices in nearly 100 cities throughout the nation, also grasped the situation, and tried to do something about it. The partnership advertised in 100 newspapers, offering to supply annual reports of corporations to non-registered stockholders as well as to others who contemplated buying securities, in order that they might study all phases of a company before purchasing its stock.

There can be no question as to the sincerity of these admonishments and advice, but it will be appreciated that many of the people who are speculating now for the first time in their lives, on earnings gained at operating a turret lathe or a punch press, would not know one item from another on an income account. They only know that it is nice to see stocks go up, if they happen to own them. They will feel cheated if they go down, or if they find they own a hundred shares of a utility holding company that has become worthless in the "death sentence" proceedings of the National Securities Act. They will not lose money without complaining, never having considered that possibility in speculation. True, their uncles, aunts and parents lost money in 1929. Conditions these days, however, were supposed to have changed. The Securities and Exchange Commission was supposed to have made everything safe for a man with a bit of coin to risk. That is as much as they know. And they will certainly write to their Congressmen to ask how it happened that one day they were rich, and the next had nothing.

Spring Sales

In February, one New York Stock Exchange firm began to keep some of its offices open nights in order to care for the investment needs of war workers unable to get away from their jobs during the day. During the same month it was disclosed that two members of the staff of the SEC had drawn up a tentative memorandum discussing steps that might be taken to prevent an undesirable boom in stocks. Ganson Purcell, chairman of the commission, explained that the memorandum was confidential, not intended for publication, and had never been discussed at any meeting of the Commission. He said members of his staff regularly made various studies as a matter of routine, "a great deal of which is done in order to form the basis

Splitting the mighty atom

It is recognised now that coal is a means to an end—or rather to many ends. Not merely something to burn for its heat, but a source of numerous valuable substances that will be the basis of Britain's post-war prosperity.

The carbonising industries point the way to this modern treatment of coal. The process of gas-making splits up the coal into many different parts and extracts every ounce of value from it. Every 100 tons of coal used in the gas works produce 7,500 therms of gas, 50 tons of coke, 1,000 gallons of tar, 250 gallons of benzole, 2,500 lbs. of sulphate of ammonia and 300 lbs. of toluene. And the Gas Industry carbonises over 18 million tons of coal annually.

These valuable by-products of gas-making in turn yield over 2,000 chemical substances of tremendous value. Among them are explosives; drugs such as M & B 693, novocaine, acriflavine and aspirin; sulphuric acid for electric batteries; food flavourings; baking powder and saccharine; camouflage paints; agricultural fertilisers; aviation spirit; and the chemicals from which plastics are made for use in a hundred and one ways from the ubiquitous ashtray to the essential fittings of our fighter aeroplanes.

The Gas Industry in war, as in peace, plays an important part in the national economy.

BRITISH COMMERCIAL GAS ASSOCIATION · LONDON · S.W.1

for final definitive action whenever that may seem necessary."

Early in April the stock market, after an almost uninterrupted twelve-month rise, crashed under the heaviest selling since the Nazis overwhelmed France in May, 1940. In a series of anti-inflation moves, the national administration speared the stock market balloon in several places. Then President Roosevelt issued a surprise proclamation freezing wages and prices, which was intended to shut off the mechanism that generated gas for the balloon. Towards the end of the month the nation's full force of securities salesmen concentrated their efforts on pushing the \$13,000 million Second Victory Loan. It was a "market basket" loan, with types of securities to attract every type of investor, big or little. Undoubtedly, substantial funds, which had been going into the stock market, were diverted, because trading slowed down, but activity persisted in the bracket of lowest-priced stocks.

These were the two most effective measures that had been tried, in a year of advancing stock prices, to curb careless public speculation. The effective emergency powers of the Securities and Exchange Commission had not yet been exercised. The Victory Loan had been a complete success, so far as the participation and co-operation of the nation's banks was concerned. Even so, there remained a tremendous flood of money in the hands of the public.

American Notes

The Growing Crisis

The miners' "strike against the Government," which President Roosevelt was confident would never take place, has begun. Despite desperate last minute efforts by Mr Ickes, and the offer of a temporary compromise by Mr Lewis, no further progress has, at the time of going to press, been made towards a settlement and, in accordance with their policy of "no contract, no work," the miners left the mines on Tuesday morning. The issue now at stake is the number of minutes consumed in getting the miners to and from the coal face, in accordance with the War Labour Board's suggestion that to pay for this period would be a legitimate method of increasing the miners' pay, although a direct wage increase would not be tolerated. It is of particular interest that, although both Mr Ickes and Miss Perkins, the Secretary of Labour, have blamed Mr Lewis for not extending the truce, they have also denounced some of the coalowners for deliberately setting their faces against any reasonable compromise. It is indeed only too likely that the coalowners may not be averse to a situation which embarrasses the Administration and in their view may lead Mr Lewis to cut his own throat. News from other sectors of the labour front, while less spectacular, is not altogether reassuring. There has been a rash of smaller strikes, and there are indications that some union leaders may be losing their control of the rank-and-file. The rubber strike is over, under a direct Presidential order, but as the *Washington Post* points out, before the strikers returned, they had received an assurance from the War Labour Board that the decision which precipitated the walk-out would be reconsidered. The Board saved its face to the extent of insisting that production be resumed before it reviewed the case, but the incident is not likely to increase its authority. The railway workers have succeeded in obtaining a recommendation for a general wage increase of 8 cents an hour for more than a million non-operating employees from an emergency board appointed from the National Railway Labour Panel. Meanwhile a Gallup poll has measured the obvious and growing public distaste for war-time strikes, finding that 81 per cent of those questioned believe that strikes in war industries should be forbidden by law, with only 13 per cent defending labour's right to strike. The figures vary only slightly for strikes in companies taken over by the Government, and it is noteworthy that union members questioned were 67 per cent in favour of making it a crime for anyone to urge a strike in Government controlled industries. The exigencies of the coal situation combined with the state of public opinion make the passage of an anti-strike law almost certain, but whether coal can be mined any better by Congressional decree than by bayonets remains to be seen.

The Nationalist Line

Those who were naïve enough to suppose that the combined influence of Mr Churchill, Marshal Stalin and

Warner Bros. would suffice to allay American suspicions of Russia have been disillusioned this week. Cardinal O'Connell has expressed the continuing distrust of the hierarchy and Senator Burton K. Wheeler has uttered the most defiant whoop of isolationism heard since Pearl Harbour. Senator Wheeler's Chicago speech gives a useful indication of the line that his fellow-Isolationists—they prefer now to be called Nationalists—are likely to take. Announcing that he had learned from "reliable sources" that Russia's post-war demands will be a large share of Poland, the Baltic States, a substantial part of the Balkans, political and economic influence in Norway, Sweden and Finland, and control of the Bosphorus, Senator Wheeler declared:

What happens to Poland may determine whether the peace conference is to ensure the welfare of the world or merely to present a scheme of disorder and intrigue—an ignoble contest for power at the expense of principles.

Until Russia renounces her Imperialist demands and makes clear her position in the Pacific, the United States would do best, the Senator argued, to concentrate upon finishing off Japan, particularly as he thought it unlikely that after the defeat of Hitler Britain would be in a position to send substantial aid to American forces in the Orient. From his distrust of America's Allies in war there flowed naturally the demand that monetary stabilisation—on any pattern—be abandoned in favour of establishing the dollar in the position formerly held by the pound, and that the United States, while co-operating in economic matters, should refuse to be a party to "military or other entangling alliances." Here is a return to the classic formula of isolation from 1919 onwards. In its most effective form the argument is, basically, not selfish, but puritan. The soul of America must be preserved from the contagion of European rapacity and greed. In 1919 it was the political immorality of France and the imperialism of Britain that alienated the isolationist conscience. This time it is to be Russia that wears the horns. The demand for a "Pacific First" war may, as Mr Lippman says, be obsolete. But it has tenacious roots and, combined with the use of Russia as bogey-man, provides a plausible issue for an able man suffering from frustrated ambitions. Mr Wheeler counts as a Democrat, and there is no possibility of his converting his party. But the Republican Party is still flirting, as a party, with Isolationism, and a new "post-war advisory council" of the party ostentatiously omits those Republican Senators who have declared for collaboration. Mr Willkie loses no opportunity of challenging this tendency, and, as he has pointed out, the decision will lie with the Convention of next year.

Committee Tactics

The Bill to abolish the poll tax as a prerequisite for voting in Federal elections is once more before Congress. This tax on voting in seven Southern states effectively disfranchises a substantial number both of negroes and whites, as has been proved by the increase in the electorate in other states where the tax has been eliminated. It will be remembered that the Bill passed the House last year, but that no vote was ever taken in the Senate owing to a filibuster by Southern Senators. It is part of the procedure of both the House and the Senate that Bills are referred to one of a number of standing committees according to subject matter. These committees have, in general, the power of life or death over Bills, for they can only be considered if favourably reported by the committee. For this reason there is a good deal of manoeuvring in the referring of Bills to committees. Anti-labour Bills, for example, may be so worded that they will be sent to a kindly disposed military or naval affairs committee, rather than to a labour committee whose members are hostile to labour restrictions. In the case of the anti-poll-tax Bill, it was referred to the House Judiciary Committee, which was known to be opposed. There is in the House, however, provision that a majority of the Representatives may, by petition, rescue a Bill from the committee shelf, and this is what has happened in the case of the poll-tax Bill. It has now been passed by 265 to 110. Its success in the Senate is less likely although a repetition of last year's tactics is improbable. The present session has a year and a half to go and it would be a brave man who would attempt to occupy the attention of the Senate for 18 months. It is more likely to be held up permanently in a Senate committee, for the Senate, which clings to more of its ancient privileges than the House, has no provision for forcing a committee to produce a Bill to which it is opposed. The Bill

is not only a gesture; it is of real political importance, for it threatens the safety of the Conservative Democratic strongholds in the South. Some of the Southern states are, because of the poll tax, almost pocket boroughs. In the 1940 election, for example, only 22 per cent of the adult citizen population voted in Virginia and only 19 per cent in Alabama, compared with 75 per cent in New York, 73 per cent in California and 82 per cent in Illinois.

Three-Fourths Rum

The pay-as-you-earn debate is over, with a moral victory for the Rum plan. The compromise worked out between the House and Senate provides for the complete cancellation of a year's taxes—either 1942 or 1943 liabilities, whichever is less—when they are below \$50; and the cancellation of 75 per cent of larger tax liabilities. The payment of the remaining 25 per cent will be spread over the next two years. There are additional provisions to prevent windfalls to wealthy taxpayers. A 20 per cent withholding levy, to be applied both against victory tax and income-tax assessments, is included in the Bill, and probably will go into effect in July. It is estimated that the moving forward of the taxable year will increase the Treasury's revenue by well over \$2,400 millions during the coming two years, an estimate which may come as a shock to taxpayers who have assumed that "tax forgiveness" meant some real abatement. As Mr Morgenthau has pointed out, however, these increased revenues are but a small part of the additional \$16,000 millions the Treasury is seeking this year. Congress may not be willing to meet this figure, but the unpalatable job of raising tax-rates for its constituents and bringing in new taxes—probably a sales tax—must now be faced.

Lend-Lease Summary

The latest Lend-Lease Report—covering operations up to April 30 of this year—was sent to Congress against a happier background of promises fulfilled in North Africa. As the President pointed out in his letter of transmittal, Lend-Lease weapons equipped the French armies in Africa, and Lend-Lease supplies of food and medicine enlisted the peoples of the freed areas as effective forces against the

Axis. Of the \$1,000 millions of Lend-Lease supplies for Africa and the Middle East, over \$32 millions represented clothing, food, and other necessities for the civilian population behind the lines in North Africa. Over the whole life of Lend-Lease, aid has amounted to slightly more than \$11,000 millions, approximately 12 per cent of the total US war spending. Britain still stands as the foremost recipient, with \$3,116 millions of supplies, and Soviet Russia second, with \$1,882 millions. It is noted, however, that munitions exported to Russia have exceeded those sent to Britain by the difference between \$1,042 millions and \$880 millions. In the over-all programme of aid, munitions have accounted for 46 per cent of the total, industrial materials and equipment for 22 per cent, agricultural products for 15 per cent, and shipping and other services for 17 per cent. Food, however, is a growing proportion of Lend-Lease. Over one million tons of food were shipped to Russia up to April 30th, but more than half of this was sent in the last six months, and 40 per cent of all shipments to Russia in March consisted of food. Mr Stettinius, the Lend-Lease Administrator, testifying last week before the Senate Appropriations sub-committee, stated that 60 per cent of Britain's Lend-Lease supplies were in the form of food, and that 10 per cent of America's meat supplies would be shipped overseas under Lend-Lease this year. To those concerned about the level of civilian rations in the United States there is no doubt that food shipments are the Achilles heel of Lend-Lease.

Shorter Notes

The Senate has, by a vote of 59 to 23, passed the Bill to extend for two years the President's powers to conclude reciprocal trade agreements. All amendments were defeated.

Renegotiation of contracts by the War Department has saved the country an estimated \$1,866 million, according to the Chairman of the War Department Price Adjustment Board. Of this total, nearly \$700 million represents recovery of excessive profits already paid, and the rest price reductions on future deliveries. These readjustments were made on contracts totalling approximately \$18,500 million.

THE WORLD OVERSEAS

Ceylon's Constitution

THE neighbouring and larger problem of India has tended to overshadow Ceylon's struggle for self-government. Yet the declaration made by the British Government last week was merely the latest chapter in a long story of an attempt to give the colony, if not Dominion status, at least "full responsible government under the Crown in all matters of internal, civil administration."

As in India, the attempt has been frustrated over and over again by communal difficulties. Before the last war, the dominant community was the European. As in other parts of the colonial empire to-day, the demand for self-government came from them, and the Ceylon Government, like the present Governments of Northern Rhodesia or Kenya, was forced into the position of trustee for the native communities. But another community was also becoming politically vocal. The Ceylon National Association began to demand a new constitution based on a mainly elected legislative council with financial control, half of whose members would be given places on the executive council.

But, in spite of its name, the Ceylon National Association was not speaking for the Ceylonese. It chiefly represented the Sinhalese, and the low-country Sinhalese at that, because the million and a quarter Sinhalese of Kandy regarded themselves as separate from the two million others. In addition, there were half-a-million Ceylon Tamils, 312,000 Mohammedans, and 700,000 Indian Tamils, besides the burghers of Dutch descent and the 10,000 odd Europeans. Thus, the Government had to act as trustee for these smaller communities; in particular, it had to uphold the interests of the peasants in an island which for more than two thousand

years prior to the establishment of British Crown Colony rule in 1800 had been subject to an absolute monarchy, accompanied by unpaid forced labour by the peasants.

This is the background against which the last twenty years of constitutional progress in Ceylon should be viewed. The constitution granted in 1920 specifically provided for the communal problem by establishing a legislative council of 14 nominated official members and 23 elected members, of whom 8 were elected by communities. The aim behind this constitution was to ensure that the smallest community should not be subjected to the will of the strongest. Inevitably, the strongest—the Sinhalese—protested, and a new constitution, granted in 1922, attempted to reconcile the interests of minorities with an advance in self-government.

Power Without Responsibility

Investigating the working of this constitution six years later, the Donoughmore Commission found that it had failed. There was a big majority of elected members in the Legislative Council, but they had no responsibility for government. This was vested in the minority of official members. The position thus arose by which, in the words of the Commission, "those who have the controlling votes . . . do not bear the responsibility for their decision, those who have to bear the responsibility are without the controlling votes." Nor had the attempt to educate the unofficial members in the duties of government by a system of committees been at all successful. Of select committees there were plenty—55 for an assembly of 49 members—and of

criticism and interference with the business of government there was far too much. But of co-operation between the legislative and the executive, of training of the former in the responsibilities of administration, there was none at all.

It surprised us in visiting the various institutions in Ceylon which are engaged on medical, agricultural and social service work, that although these had on more than one occasion provoked the strictures of unofficial members of the Legislative Council, we saw no evidence in the Visitors' Books of any widespread tendency upon their part to inspect or look over such institutions; and further inquiry assured us that such, in fact, was not their practice.

To its great credit, the Donoughmore Commission attempted to solve the constitutional deadlock by going forward, not back, and its proposals were accepted by the British Government. The divorce of power from responsibility, the Commission proposed, should be remedied by the fusion of the legislative and executive councils in a single State Council. There was to be a Board of Ministers—ten in all—to be responsible for the various departments of government, of whom seven were to be elected members of the Council. These seven were to be chairmen of the committees into which the State Council was to divide for executive purposes.

Universal Suffrage

The problem of communalism, it recommended, should be dealt with no less drastically. Communal representation, as introduced by the earlier constitution, had intensified communalism instead of appeasing it. The Commission accordingly recommended that it should be abolished and boldly proposed instead the grant of more or less universal suffrage. There were to be no property or literary qualifications—except for Tamil immigrants—and the electorate was in consequence increased from about 200,000 male voters to about 2,000,000, of whom some 650,000 were women. In 1938, seven years after the new constitution was granted, the number of registered electors was 2,486,412, of whom 1,370,657 were males and 1,115,755 were females; this was 43 per cent of the total population, a proportion far and away higher than in any other part of the colonial empire.

The Donoughmore Commission nevertheless frankly recognised that by itself the extension of the franchise on a national basis would not obliterate communalism. It hoped rather that the combination of universal suffrage and a large measure of responsibility in national administration would eventually encourage wider loyalties and sympathies. But in the meantime it still regarded communalism as an obstacle to the grant of full self-government, and it accordingly recommended that the Governor should have special powers to protect the rights of the smaller communities. It was in this respect that the Sinhalese immediately found fault with the new constitution. They complained that the Governor's powers of declaring Bills to have the force of law, even though they had not been passed by the State Council, and of prohibiting legislation, were not being used only in the cases of paramount importance envisaged by the Donoughmore Commission. Nor did the amended Order in Council of 1937 help matters, for it laid down that the special powers could be used to carry out "the essentials of good government." Another point at issue was the limited control over finance exercised by the State Council; under the previous constitution the Legislative Council has had complete power of the purse—though without the responsibility for spending.

In the last five years, therefore, there has been considerable pressure in favour of a revision of the constitution. Moreover, it appears that the Governor in this period, Sir Andrew Caldecott, has approved of some of the proposals for reform put forward by the Ceylon National Congress. In a despatch to the Secretary of State published at the end of 1938, he suggested the abolition of the executive committees of the State Council and of the Board of Ministers and the introduction of a normal Cabinet system. He also stated that, in spite of the Donoughmore Commission's hopes and aims, communalism had increased to some extent; but he urged that the territorial basis of representation should be retained, at the same time proposing that members of minority communities should be given better opportunities to gain seats, possibly by the revision of the electoral areas.

War broke out before any decision was taken on this despatch, which was supported by the State Council—with the addition of a proposal that there should be some curtailment of the Governor's powers. Since then there have

been demands by the Ceylon National Congress for full Dominion status, and also, in October, 1941, a statement by the British Government that, before proceeding further with the reform of the constitution, it would desire a further examination of the position by a commission or conference, which would be undertaken as soon as possible after the war. To this the Ceylon National Congress replied that it was not seeking reform, but a statement that Ceylon would be granted full Dominion status immediately peace was declared.

Last week's declaration by the British Government did not promise that. What it did was to give the Board of Ministers a clear expression of the Government's intentions regarding constitutional reform. In matters of defence and external relations, the Governor will be given powers to carry out the directions of the British Government. The classes of reserved Bills—requiring the independent assent of the Governor—will be "largely reduced"; but they will include, besides those relating to the rights and property of British subjects not resident in Ceylon and to currency, those which evoke serious opposition by any racial or religious community, and which, in the Governor's opinion, are likely to involve oppression or unfairness to any community. Within these stipulations the British Government will examine by commission or conference any constitutional proposals formulated by the Ministers, provided that they have been approved by three-quarters of the members of the State Council.

It is not likely that this declaration will be greeted with enthusiasm by the Ceylon National Congress. But, in view of the existing conditions, how could the British Government make any other? Ceylon is still not a nation, and the very most its politically conscious inhabitants can expect to achieve in the near future is self-government of the sort obtained by Southern Rhodesia. The declaration shows that the British Government is indeed anxious that this should be achieved. But anything more would almost certainly be doomed to failure. The history of Ceylon's constitution seems, it is true, to have been marked by failure already. Even the promising and interesting Donoughmore experiment has not had the success hoped for. But unlike Newfoundland, unlike Malta and unlike Cyprus, Ceylon has never had a constitutional setback. From each apparent failure the next step has always been forward. No better proof that the promise of self-government to a British colony is a very real thing can perhaps be found than in the story of Ceylon's slow, halting but unmistakable constitutional progress in the last twenty years.

BENEFACTORS OF MANKIND

KELVIN (1824-1907)

Thermo-dynamics and electricity comprise the two main branches of the work of this great man, and he made mathematics the handmaid of both. It was written of him "He must measure—he must weigh—in order that he might go on to calculate."

Accuracy

THE laying of the Atlantic Cable will always be associated popularly with the name of Kelvin. This was the most spectacular, but by no means the most important of his achievements. His vast powers of mind were brought to bear upon diverse scientific problems such as telegraphy, navigation, electric lamps and electrolytic processes, and he evolved the theory of electric oscillations, the basis of wireless telegraphy. To these problems he applied systems of accurate measurement combined with profound vision, and his discoveries have had a lasting influence upon electricity. Upon the principles of Kelvin our own development has been largely based and our standard of accuracy achieved.

Germany at War

Food Changes

ON May 31st, the weekly meat ration for all categories of consumers in Germany was reduced by 100 grammes (3.5 oz.). This is a very heavy reduction. The normal consumer, as distinct from the special categories of workers who receive larger rations, will now get as little meat as in 1918. It would be wrong, however, to assume that the food situation in general is yet as bad as in the last year of the last war. Until April, 1942, food rations in Germany hardly changed. But the monthly variations, according to the seasons, indicated a gradual shift to foodstuffs of greater bulk and lower quality. During the last 12 months, the deterioration has been marked. There is now a more pronounced shortage of animal as well as vegetable proteins and fats. Apart from potatoes, which provide the bulk of the diet, the rations of the three most important foodstuffs have been as follows for normal consumers:—

	WEEKLY RATIONS				
	Aug./ Sept., 1939	Oct., 1939, to March, 1942	April, Oct., 1942	Nov., May, 1943	May 31, 1943
Bread, in lb.	5½	5	4½	5	5½
Meat, in oz.	17.6	14.1	10.6	12.3	8.8
Fats, in oz.	9.5	9.5	7.3	7.3	7.7

The latest reduction in the meat ration has been accompanied by a very small increase in bread and fats; and, during the summer months, the so-called *Naehmittel* rations, mainly barley, offal, potato flour and rice, will be substantially increased. At the same time, millet will be available which is now recommended to housewives as "the basic food of our Germanic ancestors." The table shows that the meat ration is now only 64 per cent, and the fat ration 87 per cent, of the quantities supplied during the period from October, 1939, to March, 1942. The bread ration is very slightly bigger. Since the beginning of the war potato consumption has almost doubled, and the consumption of vegetables is estimated to have increased by roughly 65 per cent. The Nazi authorities are therefore right when they claim that the supply of foodstuffs measured, deceptively, in terms of calories has not decreased. But if the actual composition of the present German diet is analysed it becomes clear that the nutritional value of the total ration for the normal consumer has now been reduced to the consumption of the lower income classes at the beginning of the war.

Compared with 1917-18, there are, however, remarkable differences. First of all, it can safely be assumed that the *Wehrmacht* is still adequately fed. The modern knowledge of vitamins, new methods of drying vegetables, research in the food requirements of soldiers, and the fact that the *Wehrmacht* has a privileged position in the hierarchy of the totalitarian state mean that soldiers will remain to the last moment the best-fed part of the population. Civilians are divided into categories according to age and the importance of their work in the war economy. Prisoners of war and the so-called "East workers" receive totally inadequate rations. Among the workers, rations differ according to the nature of their work and the length of their working hours. Here, too, rations for heavy and heaviest workers are far better than in 1918.

There is virtually no single item that is not rationed or obtainable in restaurants and canteens without coupons. Vegetables and fruit are a baffling problem. No points system is workable in these instances, and the simple prohibition of direct selling by the producer to the consumer is not foolproof. Very heavy penalties have recently been inflicted on producers selling directly to consumers, and a great effort is being made to requisition the entire crop this season. But it seems that the necessary manufacturing capacity—jam factories, refrigerator plants and canning factories—is not sufficient to make full use of that part of the crops that exceeds direct market requirements. The preserving of vegetables and fruit by individuals appears to have reached a limit because of the lack of jars and other materials, and the conscription of housewives for war work.

Total rationing in Germany has become wasteful mainly because of bureaucratic rigidity, the lack of storage capacity, and transport difficulties. The redistribution of the population, because of the concentration of war industries in new areas, the evacuation of children, and the general instability

of war conditions, demand correspondingly greater flexibility in the distribution of foodstuffs. The rigidly fixed zones of food supply have to be changed frequently with consequent local shortages or surpluses. The food processing industries, which before the war depended mainly on imported raw materials, have been completely changed. Out of 185 margarine factories, only 49 have been left, which, moreover, cease production during the summer months. Imported whale oil and oilseeds have been replaced by lard, tallow and new oilseeds, as, for example, sunflower oil, which were hardly used before the war. Changes in manufacturing processes and even in machinery have been necessary. An interesting example of the shifting emphasis in Germany's agricultural industry is the increase in the manufacture of butter from 450,000 tons before the war to more than 700,000 tons in 1942. Yet the total output of milk seems to have declined. Milk formerly supplied to towns or used by the peasants is now almost all delivered to dairies. No fresh milk is supplied to normal consumers. The increase in butter production has made it possible to maintain the meagre fat rations, but the subsequent lack of skimmed milk has contributed to the rapid decline in the number of pigs.

On the face of it, Germany has kept the bread ration remarkably stable. But there has been a profound change even here. Bread is an important source of protein, and the change-over from wheat to more rye, and then to the inclusion of barley, has diminished the supply of protein, which is highest in wheat. The baking industry has had to alter its practice in accordance with the changing mixture and the higher extraction of the flour. Large bakers have been favoured, and many small bakers have not been able to cope with the difficult problem of adapting themselves. Bread and potatoes before the war provided roughly 45 per cent of the total intake of calories. This percentage may now have risen to nearly 70 per cent. A highly industrialised population cannot for long exist on such a diet, which is characteristic of a predominantly agricultural population. Naturally, the argument that it is more economical to eat cereals directly instead of converting them into meat and fats through the stomach of pigs, cattle, poultry and sheep has been a mainstay of Germany's agricultural propaganda before the war. Since 1941 the problem has taken on another aspect. Cereals and potatoes formerly used for fattening pigs have had to be diverted to human consumption, and the deficiency in feeding stuffs because of the blockade has become so pronounced that the number of pigs had to be drastically reduced during 1942. The immediate result was a temporary increase in meat supplies. This is the real reason why the meat ration was partly restored last October. At the same time, it was hoped that greater supplies of feeding stuffs could be imported from occupied Russian provinces. These hopes have been disappointed. The surplus of meat from the heavy slaughter of pigs has been consumed; and the meat ration has now had to be reduced to the level of 1918 for a reasonable supply of cereals and potatoes to be maintained during the new agricultural season. In March, 1918, the number of pigs in Germany had fallen to 22.5 per cent of the number in 1914. It may be assumed that during this war there has been a reduction to at least 50 or even 40 per cent. In 1917-18, the great lack of feeding stuffs subsequently forced peasants to slaughter not only cattle, but also dairy herds. At present there are many signs that the slaughter of cattle is growing from the same reason. The only difference compared with 1917-18 is that the slaughter is organised, and that the temporary increase in meat supplies is carefully husbanded.

There is no relief from the inexorable deterioration of Germany's food situation. The greater part of the occupied countries can no longer supply any appreciable quantities of foodstuffs beyond the provisioning of the armies of occupation. The lack of feeding stuffs has become universal on the whole continent. Only a bumper crop in cereals and potatoes would enable Germany to stop the decline of the livestock population. It may be possible to maintain the present rations for another year, with a number of countries already reduced to a near starvation level. No serious defects resulting from the wartime diet have been reported so far from Germany. For generations a considerable part of the population existed on a diet not very different from the rations that are now available. It can, however, safely be said that a further reduction will certainly lower the standard of efficiency, already gravely impaired by the dilution with foreign workers and women.

Russia at War

Agriculture and Food

THE sowing in Russia has been concluded, and food prospects will largely depend on its results. This has probably been the most difficult agricultural campaign for the past two decades; and, unfortunately, no optimistic view can be taken of its results. For a number of reasons, which reflect the cumulative effect of the war on Russian agriculture, this year's crops are almost certain to be substantially below the average. The sown area is smaller than ever, even if the Ukraine and the other German-occupied territories are left out of account; the inevitable deterioration in agricultural technique has become more accentuated; and some very important grain-producing areas are confronted this year with the danger of a drought.

The Commissariat of Agriculture fixed the acreage for this year's sowing at a limit "exceeding by 16 million acres the area harvested in 1942." The emphasis here is on the word "harvested," as last year vast areas in the Northern Caucasus and on the Don steppes were sown but not harvested. The battles of 1942 raged over an area of some 55-60 million acres of cultivated soil. Only a fraction of the farming area in the South has been rehabilitated during the few months since its recapture by the Russians. A sober realisation of the position was reflected in the statement made by M. Krutikov, chairman of the Soviet delegation to the Allied Food Conference:—

The restoration of agricultural production in the regions which have suffered from German occupation will demand considerable time, great effort and funds.

The Drought Danger

In the other regions, the position varies very much all the way from Siberia to the Volga. The grain centres on the middle and lower Volga and in Kazakhstan are very vulnerable to drought. The average rainfall there is only about 15-16 inches per annum; and the country is exposed to scorching winds from the Asiatic deserts. The early spring this year has resulted in a smaller rainfall than usual. The Soviet press has warned the farmers to prepare in time for the contingency of drought. Loosening of the soil and very deep ploughing have been strongly recommended; and the press has recorded complaints from farmers who have been handicapped in doing this by insufficiency of implements. The farms on the Volga are now the only producers of grain surpluses in European Russia. Drought there would mean that the whole of Russia would become largely dependent on Siberia for its bread supplies. The significance of such a possibility can be properly understood only if account is taken of the transport difficulties which would become even more aggravated than they are by such long hauls of grain. The northern parts of European Russia and the Transcaucasus usually have a grain deficit amounting to about 50-60 per cent of their consumption; the normal deficit for central Russia used to be 15 per cent of its minimum needs. All those gaps used to be filled by the surpluses of the northern Caucasus and the Volga. A drought might make the food position in those provinces extremely critical. Another important circumstance is that, to the east of the Volga, spring wheat and spring rye—the sorts of grain which are most vulnerable to drought—still form the bulk of the crops, in spite of many successful attempts to switch over to winter cereals.

The various ways in which the deterioration in agricultural technique has affected the position have frequently been discussed in *The Economist*. All that can be added now is that the state of affairs in the machine tractor stations does not seem to have improved. The measures adopted early in the year to effect a reorganisation in the machine and tractor services have achieved only partial success. Mobile repair shops have not been set up everywhere; and the lack of spare parts, as well as the shortage of skilled drivers and engineers, have caused more frequent and longer breakdowns during field work.

The position in regard to cattle has been fluctuating. During the first months of 1942, there were great losses, resulting from lack of care for evacuated cattle and the slaughter of young animals. A series of decrees prohibiting slaughter had its effect; and during the summer of 1942 conditions improved. During last winter complaints again became more frequent. Lack of buildings and shortages of fuel apparently brought about some further deteriora-

tion. *Pravda* wrote recently of "infertility among the breeding herds and mortality among young cattle in many farms." Still, the "overall" results are said to be satisfactory. From January 1, 1942, to January 1st this year the number of large-horned cattle, sheep and goats on collective farms is reported to have increased by 11 per cent. It has not been stated, however, whether or to what extent this was due to the evacuation of cattle from the west. A deterioration in the age composition of the cattle has been admitted as well as a slight decrease in the total number of hogs. No figures have naturally enough been published about horses; but it is clear that a very massive depletion of the stock has been unavoidable.

The cereal position is decisive for the general food situation. Normally, 70-75 per cent of the calories in the diet of the Russian people were provided by cereals. Since the war the average civilian diet has almost entirely consisted of bread and potatoes. For the Russian people the change has hardly been a drastic one; and as long as bread and potatoes can sustain the customary standard the position can still be regarded as tolerable. The crucial question is whether the third wartime harvest may not reduce the bread and potato diet below the minimum.

It is nearly impossible to give a general picture of the Soviet rationing system. Formally, there is a system of differential rationing with three different categories of rations. As a rule, however, the Soviet citizen depends not so much on the nominal ration as on the supplies that are available at any particular moment and on the produce of the kitchen garden. Food supplies have been extremely decentralised. Conditions vary from factory to factory in proportion to the efficiency of the factory's farm and its supply department or canteen. The private allotments of workers and employees cover an area of one and a quarter millions of acres. The rush to work on private allotments and factory farms became so great that it threatened to interfere with the normal work in the industrial establishments, and the Trade Union Council had to point out that workers were not allowed to grow food during normal working hours.

The Army in Russia, like the Army in Germany, is by far the best fed section of the population. In the first world war Army supplies were the object of boundless speculation and profiteering. The soldier was as a rule worse off than the civilian; and this was one of the chief factors in the Russian breakdown in 1917. The present position is incomparably better in this respect. Even so, Army rations behind the front lines have been cut several times—only in the fighting lines have the original rations been more or less maintained.

Supplies from Overseas

It was significant that the Soviet delegate to the Allied Food Conference, in his plea for food for Russia, specifically mentioned the needs of the Army. It seems that the bulk of Lend-Lease food supplied is being allocated directly to the fighting Forces. Changes in the composition of Lend-Lease deliveries to Russia show that food has gradually come to occupy the same category of priority as weapons and munitions. At first, food items made up only a small proportion of the deliveries. They grew in bulk towards the end of last year. Up to the beginning of this year, nearly half of the total food deliveries from the United States were meat and domestic fats. More recently grain is reported to have figured prominently, and further increases are envisaged. Part of the grain supplies will undoubtedly be diverted to feed the civilian population in the borderlands in the north and in the south. These happen to be the deficit areas; and the distribution of imported foodstuffs there will not involve any special strain on the railways.

It is worth while stressing the fact that the first official and public Soviet statement on post-war economic policy has been made in connection with the food position. At the Hot Springs conference, M. Krutikov stated that:

the Soviet Union will need long-term credit to accomplish the programme for importing food and other essential agricultural products.

This statement can very likely be regarded as indicative of the essential trend of Russia's trade policy after the war. In a sense, this is the first public renunciation of autarky in favour of economic co-operation, and the food position has been a major factor working in this direction.

THE BUSINESS WORLD

Heavy Industry Shares

RECENT activity in the shares of companies operating in the heavy steel and engineering industries is a logical development of Stock Exchange trends since Dunkirk. Ever since the brief period in May and June, 1940, when psychological rather than investment factors governed the markets, investors have been prepared to take quite considerable chances with shares having a "post-war recovery" appeal and has steadily refused to buy industrial equities whose status seemed assured "for the duration" only. Positively, this tendency has been exemplified by the relatively high prices (in relation to current dividends) achieved and maintained by shares of certain London stores, public utility enterprises generally, companies in consumers' goods industries, and even rubber plantation concerns after the first shock of Japan's conquests—in most instances, that is to say, where current earning power has been impaired or destroyed by enemy action or wartime Government regulation, but prospects of post-war rehabilitation are reasonably good. Negatively, the same tendency has revealed itself in the investor's marked distrust of the shares of aircraft companies and other concerns whose rapid expansion, indispensable to the war effort, has been regarded as a measure of their post-war transitional problem, and in the conspicuously high yields obtainable on marginal home railway stocks whose dividends are virtually Government-guaranteed—but only for the life of the wartime rental agreement. Ordinary share prices as a whole have approximately doubled since the fall following the collapse of France. *The Actuaries' Investment Index* of industrial ordinary share values has risen from 38.9 at the end of June, 1940, to 75.1 at the end of April, and the average yield on the constituent securities has dropped from 9.01 per cent to 4.38 per cent. For the greater part of the time, however, "recovery" shares have been in the van of the rise, and the others have caught up more slowly, as the fall in yields generally has impelled investors to search the markets' highways and byways for income during a period of low interest rates in a closed capital market.

Investment criteria, however, are always relative, and investors, inevitably, have been disposed to assess the post-war prospects of "war effort" companies more highly and their peacetime transitional difficulties more leniently, at a time when the yield on ordinary shares as a whole has been little more than 1 per cent above the gilt-edged yield (or a half of 1 per cent after income tax) than in earlier days, when the margin was anything up to 5 per cent. No section of the market has benefited more from this involuntary reorientation of ideas than that which includes the shares of companies using iron and steel for the manufacture of munitions, ships and machinery. Earlier, these were indubitably like the dog with a bad name. Investors could not forget the association between the stimulus to plant expansion given to many of these companies during the last war and the drastic capital reconstruction schemes of the 1920's. Nor were investors apt to under-emphasise the difficulties the heavy industries were likely to encounter in re-establishing their export trade after the war. More recently, however, the tone of market comment has changed significantly. Stress has been laid increasingly on the more favourable features in the heavy industrial picture—the generally favourable EPT standards of the companies concerned their assured wartime position in the matter of labour and raw material supplies, and the advantages which their strong financial position is likely to give them in coping with post-war difficulties when the time came. Over the past year the rise in the price of, for example, the iron and steel shares in the *Actuaries' Index* has been appreciably more rapid than that of equities in general.

Perhaps the greatest influence in this change of emphasis, however, has been the fact that heavy industrial dividends have shown considerably more elasticity during the war than was generally expected. Recently, they have been tending to rise at a time when the generality of dividends appear to be stabilised for the duration. Possibly, the market under-estimated the effect of the tying up of EPT standards with "capital employed in the business" in a group of

industries which is going all out to meet Government demands. Certainly, the latest earnings and dividend figures of most heavy industrial concerns are considerably above the average of the last ten years, and not very far from the highest achieved during the pre-war boom. The following table, which includes a representative selection of companies covering many of the most important branches of the trade, is instructive:—

"HEAVY" INDUSTRIAL COMPANIES: TEN YEAR RECORD

Company		Percentage on Ordinary Capital				Present Price (and Yield %)
		Highest	Lowest	Average	Latest	
Allied Ironfounders	{ Earned Paid	19.8 12.5	Nil Nil	11.1 8.4	19.8 12.5	47/6 5.26
Cammell Laird	{ Earned Paid	28.7 10.0	Nil Nil	15.2 6.7	28.4 10.0	9/- 5.56
Dorman, Long	{ Earned Paid	23.3 10.0	Nil Nil	10.0 5.1	14.7 8.0	27/6 5.52
Guest, Keen & Nettleton	{ Earned Paid	11.6† 7.5†	Nil Nil	6.4† 4.1†	7.6† 5.0†	33/- 3.03†
Stewarts & Lloyds	{ Earned Paid	27.6 12.5	6.2 2.5	18.2 9.5	21.2 12.5	50/6 4.95
United Steel Cos.	{ Earned Paid	11.8 10.5	2.0 Nil	8.9 7.1	9.0 8.0	26/7½ 6.01
Vickers	{ Earned Paid	22.0 10.06	4.1 4.0	16.8 8.8	21.1 10.0	19/6 5.15

† Free of Tax. (a) 15.1% and 10% before tax, respectively. (b) Cash dividends; for 1935, a capital bonus of 50% accompanied a cash dividend of 8%.

The conclusions suggested by this sample of results are, first, that earning and dividend-paying power has suffered no serious setback since its somewhat spectacular recovery from the depression of the early 1930's, and, secondly, that present dividend policy is usually highly conservative. Post-war refunds of EPT should, with these companies, be over, rather than under, the average. But, without prejudice to future help from this quarter, directors are maintaining a deliberate policy of ploughing back current earnings on a large scale. The bearing of this on post-war problems is obvious. Even if a sizeable part of "reserved" profits is, in fact, being used to finance the capital requirements of increased wartime output, the industry is, to that extent, avoiding the laying-up of post-war rods in pickle. The fundamental weakness of many heavy industrial concerns in 1918 was that their wartime expansion had been largely financed by bank loans, which had later to be funded in a period of excessively high interest rates.

Indeed, without under-estimating the transitional difficulties which many of these companies will have to meet in due course, it can be said with fair confidence that these will be far less subjective, and far more objective, this time than last. They will arise, not so much from structural weaknesses in the industry itself as from the problems of its post-war environment. So far as factors within the companies' own control come into the equation, deductions drawn from the last war may be definitely misleading. Then, there was a 50 per cent increase in steel-making output and capacity. Now, though the figures are confidential, it is known that the wartime increase has been not in production as a whole, but in certain special steels. And here a good deal of the plant expansion has been on account of the Government, and not of the industry at all. The war came at a favourable psychological moment for the heavy industries, when managements had had sufficient time to pile up fairly formidable resources, but not to forget the hard lessons enforced by long years of adversity.

At present market prices, the yields on most of the leading industrial equities range between 5 and 6 per cent—the figure for the "iron and steel" companies in the *Actuaries' Index* is 5.5 per cent, against a mean for all industries of under 4.4 per cent. The difference represents a moderate—but only a moderate—discounting of the environmental difficulties the industry is likely to meet after the war.

Obviously, it should be well placed in the initial reconstruction period, when world demand for steel products may exceed its production capacity, and most branches of the industry are likely to stand high in the priority list under a modified system of Government controls. For the reasons already stated, the sword-to-ploughshare metamorphosis is unlikely to produce the stresses and strains within the industry that it did last time. After that, almost everything depends on the sort of structure which world statesmen evolve after victory. If the post-war economy, over the five continents, is half as expansive as the United Nations spokesmen now assert, there will be a continuing demand for steel and its products, of which this country must the more strenuously endeavour to secure its due share because of its indispensability in the rebuilding of our export trade position.

But this result will not follow by itself. Undoubtedly, the technical efficiency of the heavy industries has increased under the stimulus of war. There have been operating economies, advances in mass production methods and equipment, and a great deal of successful research into the manufacture and utilisation of new products, particularly new alloys. These developments should permit a substantial lowering of costs. But other steel-producing and steel-fabricating countries have had similar advances, and purely technical efficiency can be thrown away if it is not accom-

panied by the economic efficiency that is bred by the determination to sell the largest possible quantities at the lowest possible prices. It is on this score that there is chief room for apprehension about the future of the British heavy industries. If their policy is to be that of seeking protection for high costs of production, then it cannot be remunerative in the long run to investors. No form of international division of the market (apart altogether from the public interest in the matter) can for long protect the high-cost producer from the competition in third markets of more efficient countries, for the simple reason that these more efficient countries will not for long be content to be balked of markets which they could fully occupy. And as for domestic protection, high prices in the heavy industries would be more potent than any other single factor (save, perhaps, dear food) in preventing that rapid expansion of the British national economy which must be, in the long run, their main reliance.

Those who buy heavy industrial shares at present prices are, in effect, declaring their confidence that the post-war policies of those industries will be those of cost reduction and maximum economic efficiency. It is not a prognostication for which there is very much visible evidence, and until he is satisfied on this point the prudent investor will regard the shares of companies in these industries as attractive only for the short period of the immediate post-armistice years.

Finance and Banking

Unseasonal Tightness of Credit

Though the return of large notes did not last week prevent a slight rise in the note circulation, the net withdrawals of £1,464,000 were only one-third those in the corresponding week of 1942. The note efflux has been a negligible factor in the credit situation. Bankers' deposits have come down with a run from £174.1 million to £140.3 million, this movement having its chief counterpart in a decline of £20.2 million in Government securities, and an addition of £14.0 million to public deposits. This immobilisation of credit confirms what was already apparent, that the Government's floating debt borrowing has been pitched rather high having regard to the heavy inflow of subscriptions to Government loans. Thus, the week's Treasury bill offer and TDR call show a combined excess of £5 million over nominal maturities, and a considerably greater excess over effective maturities. The latest figures of "large" and "small" savings, on the other hand, show a combined total of £65 million, compared with a current deficit of only £48 million. It is hardly surprising that even the payment of the War Loan dividend failed to produce the return to abundant credit usual in the early days of June. The demand for money was accentuated by the market syndicates high Treasury bill quota of 46 per cent, the third large allotment in succession. Over the past six weeks the outstanding tender issue has been increased by £90 million, this being one reason for the decline of £60 million in Treasury deposits receipts shown by the May debt return. Though this increase in tender bills was expected to lead to a rapid restoration of the bank's depleted bill portfolios, clearing bank demand has, in fact, been on a restricted scale (owing to Wings for Victory weeks), and the market has in consequence had to finance a large share of the additional bills.

UDT and the Discount Market

Consolidation of the discount market into larger units is carried yet another step forward by this week's announcement that the United Dominions Trust has taken a substantial interest in Messrs Ryder, Parker and Company, whose name is now changed to Ryders Discount Company, Ltd. Originally established in 1903, the discount market business was registered in June, 1934, as a private unlimited company, which is understood to have had resources of some £250,000. Ryders Discount Company is a private limited company with a capital of £750,000 in £1 shares, fully paid. It would thus appear that the investment of the United Dominions Trust in the company amounts to

£500,000. Whereas discount market consolidation hitherto has proceeded mainly through amalgamations and absorptions, the present operation represents a fresh infusion of capital into the discount market on a very substantial scale. At first sight, it may seem rather striking that a hire-purchase concern, which in normal times is a user of short-term capital, should be acquiring an interest in a concern whose purpose is to arrange short-term finance. The hire-purchase concern does not, however, place its own acceptances in the market, but is seen only as a drawer under acceptance credits granted by merchant banks. The market for such paper is obviously not affected in any way by the present deal, and it is understood that the placing of UDT bills will not even be canalised through the discount company, whose management, incidentally, remains unchanged. The participation of United Dominions Trust must, in fact, be regarded simply as an investment like any other. The trust clearly takes a confident view of the future of the market. Judged by experience after the last war, the post-war years should certainly bring abundant opportunity for operations in short-term bonds, whatever view may be taken of the functional importance of the bill market in the financial machinery. At the present time, fresh avenues for the employment of the Trust's capital must clearly be very welcome in view of the shrinkage in hire-purchase business generally, reflected in a decline in bills receivable from £6,521,000 in June, 1939, to no more than £1,071,000 in June last.

Bombay Bans Forward Bullion Deals

The recent prohibition by the Bombay bullion market of forward dealings in silver for the June settlement has now been reinforced by an official "Defence of India" rule, providing that no person shall enter into any form of forward contract or option in bullion at all. Though the ban on forward dealings is clearly intended to restrain the rise in bullion prices, its immediate effect has been precisely the opposite. From the recent peak of Rs.138 3a on May 17th, spot silver had reacted to Rs.119 8a on May 28th, while over the same period the price of gold dropped from Rs95

ROBSON, MORROW and UNDERWOOD wish to engage a first class accountant, Chartered Accountant or equivalent with wide executive experience, who can be trained as an Industrial Consultant. Four figure salary and excellent prospects. Mark envelope "Application." Full particulars to Robson, Morrow and Underwood, Victoria Station House, Victoria Street, London, S.W.1.

10a to Rs.77. There has since been a recovery to Rs.127 and Rs.87 for silver and gold respectively. The suspension of forward dealings would be likely at first to accentuate the tightness of the spot position in two ways: by causing covering of forward commitments, and by removing the incentive to "lend" metal to the market by a spot sale covered by a forward purchase. On May 17th, for example, silver for the May 26th settlement was quoted at a discount of Rs.2 under spot, offering a profit to holders of some 60 per cent per annum. The fact that all dealings are now for cash payment, on the other hand, should have a damping effect on speculation, though this will be lessened by the generally inflationary situation in India. For the really long view, of course, when imports of the metal will again be possible, operators have to bear in mind that the US Treasury's buying price for foreign metal remains unchanged at 35c, whereas current prices in India are far above parity with the New York market price of 43c.

Financing Expenditure

The following table summarises the Exchequer returns to date (May 29th) and shows the respective shares of revenue and borrowing in meeting expenditure:—

£000			
Total ordinary expenditure...	933,394	Total ordinary revenue.....	372,051
New Sinking Funds.....	1,278	Loans raised:—	
Loans repaid:—		3% Def. Bonds (net).....	27,706
Bank of England Adv.....	6,500	3% Savings Bonds 1960-70	103,265
Public Dept. Adv.....	49,170	2½% Nat. War Bds. 1949-51	9
Miscellaneous issues.....	2,535	2½% Nat. War Bds. 1951-53	149,210
Increase in balances.....	279	3% Terminable Annuity ..	120,000

		Treasury Bills	112,331
		Treasury Deposits	14,500
	£993,156		£993,156

The items shown as net are given after allowing for repayments and receipts.

Receipts from Bills and Cheques

A question put in the House of Commons has again elicited from the Chancellor of the Exchequer the information on stamp duties from bills of exchange and cheques which, prior to the partial statistical black-out, could be obtained year by year from the annual reports of the Commissioners of Inland Revenue. The relevant data for each of the past five financial years is as follows:

NET RECEIPTS FROM STAMP DUTY (in £000's)			
	Cheques	Bills of Exchange and Promissory Notes	Bankers' Bills and Notes
1938-39	3,914	518	98
1939-40	3,910	417	103
1940-41	3,242	214	120
1941-42	4,193	149	141
1942-43	3,325	114	182

The exceptional fluctuations in receipts from stamps on cheques require special explanation. The slump in 1940-41 was due to the destruction of large quantities of cheques in the air raids of that year. The subsequent recovery reflects the reconstitution of the banks' depleted stocks. To get a proper perspective of the changes in the amounts of cheques used over the past five years, it will probably be best to take a moving two-yearly average of the figures for 1940 to 1943. The slump in the volume of bills of exchange drawn in this country is well illustrated by the above table. Assuming the average currency of bills drawn to be three months, and taking the duty on bills at 1s. per cent, the volume of commercial paper outstanding can be calculated to have fallen from £259 million in 1938-39 to £74,500,000 in 1941-42 and to £57 million in the year ended last March. This drop fully corroborates the experience of the discount market, where the commercial bill has become a very rare bird. The steady increase in receipts from bankers' bills and notes reflects the expansion in the Scottish banks' note issue, which is by far the most important contributor to this item of stamp duty receipts.

Investment

Moderate Movements

Although there was a steady decline in the equity index of *The Financial News* between May 12th and 28th, there was a net improvement against April 30th of 0.5 points to 99 per cent of the value on July 1, 1935. A year ago the rise, although described as modest, was more than five times as great. A large part of it was due, however, to the first two "thousand bomber" raids. This year, raids of much greater importance occur two or three times a week without causing any visible deviation in the course of the index. On the first business day of the month, the equity index rose above the fixed interest line, apparently for the first time since early February, 1938. At that time, the level was some six points lower, but, on this occasion, the two figures were within 1.3 per cent of their base. As will be seen from the accompanying chart, the two curves have been running roughly parallel

FIXED INTEREST AND EQUITY SECURITY MOVEMENTS (July 1, 1935=100)

Financial News indices of 20 fixed-interest securities (converted to new base) and 30 ordinary shares

for about a fortnight. The equity index is designed to be hypersensitive. But, on this occasion, the net movement is no greater than that shown by the much more comprehensive *Actuaries' Investment Index*. Between the last Tuesday of May and four weeks earlier, this rose by 0.6 points, or about 0.8 per cent, to a new high for recent years of 75.7. For the most part, the movements on the month confirm the impression that prices in general have been very little changed, but among industrial equities there have been rises of over 5½ per cent in coal shares, of nearly 4 per cent in gas stocks, and of an equal amount in oil shares. Elsewhere, a further recovery of 3.6 points to 104.1 puts insurance shares back to the level of mid-December last. In the whole equity list, there are four falls, the largest being well under 1 per cent in cotton shares.

Industrial Prior Charges Weak

It is evident that the process of levelling down yields is still going on among equities. The yields on coal and predominantly war industrials, including railways, are still well above average, but, whereas a year ago the range between the highest and lowest yields was one and a half times the yield index for the whole group, it is now scarcely greater than the much reduced figure of the index. The established improvement in equities has continued for another month, if at a much reduced rate, but in fixed interest stocks the recent trend has been reversed. This happened for home corporations two months ago and for 2½ per cent Consols during April. Now, there is a definite fall in all industrial preferences and in distributive and miscellaneous industrial debentures. Only investment trust senior stocks continue to rise. Incidentally, the trustee securities in this index show a net fall on the month, but that position might have been reversed if the closing days had been included in the calculation. The figures of this index are based on end December, 1928. If they are con-

verted to June 25, 1935, the nearest date to the base of *The Financial News* index, the showing for industrials is 97.7 for equities, 101.8 for preference shares and 99.2 for debentures, with a corresponding figure of only 94.6 for 2½ per cent Consols. The sample of companies has been adjusted more than once during the period, but the results suggest that, broadly speaking, the picture presented by the

ACTUARIES' INVESTMENT INDEX

Group and Number of Securities	Price Indices (Dec. 31, 1928=100)				Average Yields		
	May 26, 1942	Jan. 26, 1943	April 27, 1943	May 25, 1943	May 26, 1942	April 27, 1943	May 25, 1943
2½% Consols	147.2	146.5	144.7	143.6	3.03	3.08	3.11

Indust. Debs. Total (43) ..	117.9	121.2	121.9	121.3	4.03	3.89	3.91
Ind. Pref. Total (101)	105.0	107.7	112.7	112.0	4.44	4.30	4.33
Insurance Cos. (10)	101.4	102.6	100.5	104.1	4.00	4.13	3.99
Aircraft Mfg. (5)	49.8	70.5	70.6	70.7	10.81	7.54	7.54
Coal (8)	78.7	95.8	96.5	101.7	6.47	5.72	5.61
Gas (8)	71.0	89.3	91.7	95.2	3.26	3.17	3.15
Oil (4)	48.3	74.4	72.6	75.5	5.20	3.29	3.16
Total Productive (90)	61.9	76.2	76.3	77.3	5.22	4.53	4.49
Home Rails (4)	44.8	75.5	78.8	79.9	7.61	5.48	5.43
Total Miscellaneous (40) ..	69.1	81.0	82.2	82.1	4.92	4.24	4.24
Industrials— (All Classes) (159)	60.4	74.7	75.1	75.7	5.05	4.38	4.36

more sensitive index is accurate. It need hardly be said that, while the total index shows little change against 1935, individual changes are in some cases very great. Gas, motors, shops and stores and electric supply are the principal sufferers among industrials, while there is a 13 per cent fall in insurance shares. Home rails, shipping and electrical equipment have gained most.

Outlook for Diamonds

The statements of Sir Ernest Oppenheimer at the annual meetings of *De Beers* and of the *Consolidated Diamond Mines of South Africa* last week, accompanied by the announcement of interim dividends for the current year at highly satisfactory rates, have caused a further boomlet in the shares. There is more justification for this movement than the mere wartime prospects of the companies. Sir Ernest made it clear that the comment in *The Economist* of May 1st on the rôle of industrial diamonds was a considerable understatement of the facts. Plans are in hand for the reopening of the Premier Mine, whose output is mainly industrial, after the war, where a new washing plant will be constructed out of funds at the disposal of that company. There is also to be a new treatment plant at Jagersfontein, while *De Beers* anticipate that they will be relieved of the necessity of closing down production in times of trade depression by the level of the demand for industrial stones. It is, of course, a crucial matter that the price of these stones should be "right" from the standpoint of the companies, but, as is pointed out in a note on page 736, they have secured a complete monopoly of African output. Another factor of substantial importance is that the Diamond Corporation in which *De Beers* and *Consolidated* hold the whole equity, has paid off £10 million of debt within a decade. It would seem that, if operations are to be continued in times of trade depression, stocks may be re-accumulated and fresh borrowing may be necessary. But it is very possible that the annual charge for interest and sinking fund will be well below the £500,000 stated to have been the provision in recent years. Meanwhile, past accumulations are being liquidated and every repayment of debt adds to the distributable profits.

There can be very little doubt that, if Sir Ernest's expectations are fulfilled, the great development in the demand for industrial diamonds will introduce a stabilising element into the fortunes of the producers, which has been conspicuously absent for many years past. There does not exist, however, any means of assessing what the demand for gem

stones may be. The prudent investor will, therefore, regard the present bout of prosperity as being, to some extent, subject to the same conditions as have determined the length of similar bursts in the past. As to the immediate future, sales this year are already well up to the total for 1942. Interim dividends have been renewed at the rate of 30 per cent for De Beers, against a total for last year of 40 per cent and at 20 per cent for Consolidated, compared with 15 per cent for the whole year. In making these announcements, it was emphasised that each half-year must stand on its own feet and that the only provision made towards the second half of 1943 was to see that the preference dividends were covered. At the same time, it appears from a reading of the two addresses that the payments for the year may well, in both cases, be more than double those for 1942.

Short Brothers Payment

In reply to a question on Tuesday, the Chancellor of the Exchequer announced that the prices to be paid for the requisitioned shares of Short Brothers would be 29s. 3d. for each ordinary and "A" ordinary share and 22s. 3d. for each preference share of the company. These are the averages of the buying and selling prices quoted in the Official List on the day fixed by the order, March 17th last, the date on which the Controller was put in and five days before the announcement of the vesting. They are also within very little of the prices ruling on that day. Thus, it would appear that the price "as between a willing buyer and a willing seller" is deemed to be the market price, which is at least some relief to the harassed investor. The "A" ordinary shares, held largely by the family, carry four times as many votes as the ordinary, giving complete control. Apart from this, they rank *pari passu* with the ordinary, and the decision to pay the same price for both means that there is no recognition of the fact that voting rights may have a value. That is not a matter affecting the investing public, which will be relieved that the price fixed is based on the only valuation which seems justifiable and that the delay has not been greater. Payment is to be effected as soon as possible. The statement, like those which have preceded it, has not removed the anxiety caused to investors by this incursion of the state into a field where it is felt that private enterprise must for long be the only form of development which will enable the industry to keep abreast of world developments. There is still no statement of policy for post-war or any indication that the shares of this company are to be re-sold.

Local Authority Mortgages

As from the beginning of this month, a further measure of relief has been granted to all local authorities and public boards in the matter of re-borrowing on mortgage. Eleven months ago, permission was given to renew, or replace, mortgages bearing interest over 3 and up to 3½ per cent, optionally redeemable within the coming eighteen months. That right was granted subject to a general direction that the period of renewal should not be less than seven years. Now, all limits to the rate at present paid on the mortgages are abolished, but limitations on the conditions of borrowing are increased. There is a list of exceptions to the seven-year rule, of which the chief are that repayment may be made by instalments; and that, where there are specific regulations governing the loan which conflict with the requirement, the latter may be disregarded. In addition, there is a requirement that extension of the life of a loan, subject to short notice on either side, shall be discontinued. This is a matter of very considerable importance. It has for long been a weakness of this type of finance that substantial sums could be called at any time. Incidentally, the expectation that money could thus be lent at short call at the full rate governing the original operation was not without influence in bringing down that rate. The latest available figures of borrowing by corporations and public bodies refer to March 31, 1940. At that time, the total debt was some £1,715 million, of which £935½ million was in mortgages of one sort and another and some £637½ million in stock. The former cannot be completely allocated to different types of mortgage, but some £280 million was in Public Works Loan Board mortgages, £206½ million in mortgages repayable by instalment, and the bulk of the remainder was borrowed on ordinary mortgages. Of these, £267½ million ran for over five years.

Company Notes

Dunlop Rubber and Taxation

The full accounts of Dunlop Rubber (the preliminary statement was discussed in *The Economist* of May 29th) provide some interesting details of the group's tax position. Estimated EPT, despite the reduction of trading profits from £3,722,434 to £3,067,366, totals £827,368. A further £260,587 is set aside for the 1942-43 income-tax liability, which together with a net increase of £50,000 to £700,000 in the reserve for next year's charge brings the parent company's total tax allocation to £1,787,955 against £2,574,620. Of particular interest is the statement that the total EPT provision up to December 31st last amounted to £5,922,794 in the group's accounts, of which £4,293,793

† Dunlop Rubber Company's proportions.

was provided by the parent company. The 20 per cent post-war credits are estimated at £983,683 and £692,695 respectively, both figures subject to income-tax. As shown in the table above, the parent company has had to meet the Plantation company's preference dividend under the guarantee, but the fall of £786,665 in tax exceeds by some £33,000 the drop in profits. In consequence, the ordinary dividend, unchanged at 8 per cent, is covered by earnings equivalent to 10.4 against 10.2 per cent. The transfer to contingencies is repeated, and the carry forward raised almost £5,000 to £627,586. The very large amount provided in EPT is a virtual guarantee of distributable profits at about the current level so long as the tax is in operation.

Supplies Assured

The paper restriction has not prevented Dunlop from providing highly informative and well-presented legal and consolidated balance-sheets. Current assets in the consolidated statement have declined slightly to £21,829,740, but net liquid assets are over £1,118,000 higher at £14,767,515. Certain moneys and supplies from enemy occupied subsidiaries which arrived during the past year have been set off against the figure for investments in enemy and enemy occupied territories, leaving a net fall of £436,000 to £4,138,030. Against this, all reserves, including surplus profit, total £7,902,660. Among current assets, the free of interest loan to the Government of £2,024,886 has been replaced by a holding of tax reserve certificates of £2,135,925, an item which is not only more remunerative, but may play some small part in improving the company's EPT standard. A reduction of some £1,124,000 in debtors explains the expansion in cash to £3,342,346 and in Government securities from £268,923 to £865,720. It does not appear that shortage of raw materials has greatly hampered the group, although the loss of the highly remunerative civilian demand has been severely felt. In addition, the

chairman, Sir George Beharrell, anticipates adequate supplies of synthetic material from the United States. In this connection, certain plant adjustments may have to be undertaken, but as a user rather than producer of rubber the outcome of the synthetic versus the crude product problem need not cause the company very great concern. The £1 ordinary stock at 34s. 9d. ex dividend offers the relatively high yield of £4 12s. per cent.

Marks and Spencer Accounts

The full accounts of Marks and Spencer for the year to March 31st last show a drop in total profits of £217,863 to £2,020,970. As was suggested in a note on the preliminary statement in *The Economist* of May 15th, this decline is greater than the setback to net profits. Moreover, there is no statement that gross profits have been struck after provision for war damage, as in the two previous years. The tax provision in the latest year, of £863,000 against £895,486, is shown after deduction of estimated refund of EPT—presumably overprovided in 1940-41. Thus, the earned rate of 47.5 (against 56.3) per cent is probably a slight over-estimate. The chairman, Mr Simon Marks, explaining the reduction in the balance-sheet item of creditors from £978,802 to £571,110, points out that purchase tax no longer applies to the majority of goods sold by the group. In these circumstances, the small rise in stocks from £1,279,389 to £1,300,073 is more satisfactory than the figures suggest. There is a rise in net liquid assets from £1,735,361 to £2,507,529, represented in part by the contraction in creditors and in part by a rise in cash items, the result of a decline in net loans to subsidiaries from £478,551 to £91,035. This contraction Mr Marks attributes to the reduction in the scale of activity of the export company. The decline in total profits is no doubt due mainly to the limitation of supplies and to rationing. But the group appears to have found some scope for the maintenance of its specialised methods. As a result, the 35 per cent dividend is still generously covered, and the liquid and reserve positions—total reserves and surplus amount to £3,881,391—are very strong. The 5s. "A" ordinary shares, at 50s. 6d. ex dividend, yield £3 9s. 4d. per cent.

Court Line Dividend

The full accounts of Court Line for 1942 show a small rise in profits on voyages from £81,666 to £93,202. Total profits, at £147,882 against £102,306, are swollen by the inclusion of recoveries from earlier years, amounting to £40,551 in 1942 and £7,093 in 1941. The directors have repeated the 1941 depreciation provision of £40,000 and transferred the same amount to tax reserve against nil. There is also an allocation of £10,000 against nil for staff pensions. The recoveries ought to be distributed over a period of years, but if they are attributed to 1942 equity earnings are down from £61,148 to £56,724, representing 21.6 against 23.3 per cent. The management has decided to pay a 3 per cent interest bonus in addition to the 15 per cent dividend distributed in each of the three previous years from the interest on accumulated liquid resources. After meeting this payment, the carry forward is raised by £9,475 to £161,096. The directors point out that there have been fleet losses during the past year, and this is evident from the jump in the balance-sheet total of fleet replacement account from £594,608 to £1,365,295 and the similar rise in debtors from £348,579 to £1,045,069. Moreover, there is a rise in Government tonnage replacement account from £50,000 to £114,663. The company has obtained possession of two ships, costing a total of £305,750. Ownership will not pass to the Court Line until after the war, nor will payment be made until then, and it is the interest on the sum eventually required to make payment that the management has decided to use for distribution as an interest bonus. It may be questioned whether, in view of the replacement demands on liquid funds which shipping concerns will have to meet after the war, it would not have been wiser to conserve all available resources. Sir Philip Haldin himself has in the past frequently emphasised the inadequacy for post-war needs of the liquid funds of the companies in which he is interested. It is surprising to find that he now advo-

cates the dissipation of sums which might have been re-invested. The accounts of the company, on the whole, convey an encouraging impression that loss at sea has not prejudiced current earning capacity. The 6s. 8d. ordinary shares, at 21s. 6d., yield £5 14s. 3d. per cent.

Philip Hill Investment

The accounts of Philip Hill Investment Trust for the year to March 31st last show a substantial rise in income from £211,774 to £379,926. The business was split on February 12, 1942. Up to that date the old company earned £149,151, while in the closing six weeks of 1941-42 the Trust earned £57,568 and received £5,000 from a subsidiary. Last year the Trust earned £189,830 and the other half of the business, Philip Hill and Partners, paid a dividend of £185,000. Tax provision is up from £108,003 to £187,164, so that, after meeting preference dividends, there is £158,063 against £69,073, representing 29.8 against 13.0 per cent for the equity. The directors have wisely refrained from raising the 10 per cent payment and the whole surplus goes to increase the carry forward from £86,608 to £191,546. The improvement is apparently due mainly to the recovery in finance business in which Philip Hill and Partners shared. This recovery is a good omen for post-war conditions, but there may well be a further setback to receipts from this source before there is any return to normal. The balance-sheet shows a reduction in holdings of quoted and unquoted securities from £3,350,994 to £2,815,587. At the same time, there is a rise in cash holdings from £23,714 to £421,752 and in net loans to a subsidiary from £89,842 to £350,225. In the previous year quoted securities were written down to market value. On this basis they stood at March 31, 1943, more than £1,120,000 above the balance-sheet valuation of £2,615,872, while the total of general reserve and surplus amounts to £1,391,546. The 5s. ordinary shares at 13s. yield £3 17s. 8d. per cent, a level which certainly discounts substantially higher payments in the future.

Anglo American Investment Trust

The important diamond finance concern, Anglo American Investment Trust, reports a rise in income from £324,606 to £456,886 for the year to December last. Despite this increase, there is a reduction in tax provision from £23,000 to £16,000 and general expenses are also lower. Thus, equity earnings jumped from £232,750 to £375,342, narrowly covering the dividend, which is doubled at 15 per cent. The surplus raises the carry forward from £135,667 to £136,009. The latest dividend is the highest distributed since 1937, when the ordinary capital received 20 per cent. The increase is, of course, due to the 1942 recovery in earnings of De Beers and other diamond mining concerns in which Anglo American is interested. This revival in profits and the recent Stock Exchange boom in diamonds to which it has given rise is reflected in the balance sheet by an excess of market and directors' valuation of investments over balance-sheet valuation at cost of £1,105,020 against £522,852. These investments now have a market valuation of £4,334,643 against £3,379,530, the balance-sheet valuation having risen by some £373,000 by investment of cash reserves and new deposits. Debenture holdings of the Diamond Corporation are reduced from £1,703,200 to £817,000. The company holds £700,000 of the proceeds for redemption of its own debentures on June 30th next. The drop in net liquid assets from £376,289 to £88,386 is mainly a reflection of the repayment of loans at call by Anglo American Corporation. The sum outstanding now amounts to £222,060 against £476,333. The £1 shares, which have risen substantially in recent weeks, stand at 66s., at which price they yield £4 13s. per cent.

YOUNG ECONOMISTS interested in new investigations are invited to communicate with The Science (Research) Society. Write The Secretary, S.R.S., The Cottage, St. Mary's Abbey, Mill Hill, N.W.7.

Industry and Trade

The Diamond Monopoly

The diamond-producing industry is one of the tightest monopolies in existence, designed to protect producers—and, incidentally, owners—of gem diamonds from the effects of sudden changes in demand and supply. There is complete control over African production and stocks, and sales are handled by a central agency, the Diamond Trading Company. Prices are maintained at an artificial level. As Sir Ernest Oppenheimer, chairman of De Beers Consolidated Mines, pointed out at the annual meeting of shareholders on May 28th, the basic aim of the new producers' agreement which came into force at the beginning of the year is the same as that of the original agreement—that is, to assure "sales through one channel" and "the limitation of supply to demand," presumably at a profit to the producers. A producers' monopoly in as unessential a commodity as gems, while obnoxious in principle, is innocuous in practice. But the industry also produces a vital industrial raw material—an essential abrasive. The demand for so-called industrial diamonds has grown rapidly since the beginning of the war, and last year their sales represented nearly 40 per cent by value of the total turnover of the Diamond Trading Company. Hence the monopoly takes on an entirely new aspect, which was recognised in the new producers' agreement in so far as gem stones and industrial stones are now regarded as two different commodities. Sir Ernest Oppenheimer admitted that the "principles of the trade" applicable to gems are unsuitable to industrial stones. But he appears to envisage the continuance of a producers' monopoly for this vital industrial raw material. True, the price of industrial diamonds has been held at pre-war levels, a decision which Sir Ernest cites as "a contribution by the trade to the war effort." But the value of this "contribution" can only be measured by costs of production, which may have fallen with the rapid increase in turnover. As reported in *The Times*, Sir Ernest went on to say:

I believe that this policy of providing supplies at pre-war prices should be adhered to after the war so as to ensure the continued consumption of industrial diamonds in industry and encourage even an increased demand. . . . It is also pleasing to know that in future the sale of industrial diamonds produced by the De Beers mines will provide your company with a steady source of revenue which, whilst insufficient to cover the entire cost of production, will, nevertheless, considerably reduce the risk of our being compelled to suspend mining operations in Kimberley in times of trade depression.

So long as the supply of industrial diamonds is organised as a producers' monopoly, it may be difficult for it to resist the temptation of subsidising the gem trade out of the pockets of the industrial consumer.

"Slaughter" Tapping

When the Japanese deprived the United Nations of the greater part of their sources of natural rubber—the occupied territories contributed nine-tenths of the world's total output before the war—steps were taken to produce synthetic rubber on a large scale in the United States. But the necessary preparations could not be made at short notice, and it will be some time before synthetic rubber will be available in large quantities. Fortunately, the United Nations—especially America—possessed substantial stocks at the end of 1941. Moreover, arrangements were made to increase output from the sources of natural rubber still available, even if this meant the ultimate destruction of plants. Ceylon is the most important of the remaining sources of supply—its output was 102,000 tons in 1941. Naturally, plantation owners could hardly have been expected to practise intensive "slaughter" tapping without special compensation. Of two possible forms of compensation—higher prices and payment of costs of replanting—the Government has rightly chosen the latter. According to a letter sent to the Ceylon Association by the Colonial Office, compensation is to be paid at the rate of up to £45 per acre, but not for more than one-fifth of a proprietor's total acreage. Proprietors claiming compensation must adopt, for two years or until the exhaustion of the areas, double two tapping (that is two opposite half spiral cuts once every two days instead of the normal practice of one half spiral cut every two days) for one-fifth of their planted acreage and double three tapping (two opposite half spiral cuts every three days) for the rest.

Utilisation of Coal

In an address before the Institute of Export, on May 27th, Mr W. Wakefield Adam outlined a programme designed to eliminate the use of coal in its crude form. He gave interesting data, but some of them should be regarded as speculation rather than as precise estimates. In 1938, the output of coal was 227 million tons; 187 million tons (including exports) were used in the raw state, and only 40 millions in processed form. He pointed out that the net value of processed coal is about 2½ times that of raw coal, and that, with a pithead price of £1 per ton, the value of the derivatives destroyed in 1938 was about £280 million. In addition, the use of all coal in processed form would eliminate smoke and soot, and an annual expenditure on repairs to buildings of some £50 millions. Mr Adam, therefore, estimates that, on the basis of 1938 prices, the annual saving realised by the processing of all coal would be of the order of £330 millions. In his view, the processing of all coal, including exports, would provide "widespread employment," "excellent opportunities for safe financial investments," and "the extension of a wide range of industries to provide the home and export markets with the processed and sometimes semi-processed derivatives of coal." As a statement of ultimate aims, Mr Adam's programme serves a useful purpose. In spite of recent progress, far too great a proportion of coal is still used in the raw state, and of this the greater part is wasted. But the processing of all coal is not merely a technical problem; it also has an economic aspect in the sense that the consumer can hardly be forced to pay a higher price for the processed than for the raw product. In the absence of a subsidy for processed products, the rate at which coal can be converted into electricity, gas and other derivatives must depend on comparative costs. To this extent the problem is one for the technician.

Clothes Ration Anniversary

Clothes rationing was two years old last Tuesday, and the Board of Trade has given some statistics of coupon spending. During the first rationing year the proportions of coupons spent by men and women on different items of clothing were as follows:—

MEN		WOMEN	
Shirts and underwear	26	Underwear	19
Boots and shoes	17	Boots and shoes	15
Socks	15	Stockings	18
Suits, jackets and trousers	22	Dresses, coats, jackets and skirts	23
Other items	20	Other items	25

From these figures it can be seen that the popular view that women spend a disproportionate number of coupons on stockings is unjustified. They do not appear to have spent more on dresses than men on suits. In the second year, however, men spent a smaller proportion (17 per cent) of the ration on suits, jackets and trousers. The other items remain substantially unchanged, as do those for women, except that more outerwear and less underwear have been bought. No doubt "make do and mend" is more possible for the latter than the former. The average expenditure of coupons per head by men during the first year was 68, and by women 70. The basic ration was 66, but supplementary coupons were granted to certain classes of persons. During the second year, up to the end of March, men spent 46½ and women 50. The disparity is widening. On an average, three coupons per person were carried over from the first year to be spent in the second year of rationing, and two of these had been spent, in addition to the current allowance by the end of last March. Booms in spending have not unnaturally occurred at the beginning of coupon releases. In June, 1942, for example, about one-seventh of the ration for 15 months was spent. Another false impression has been dispelled by the release of these statistics—that parents have to use their coupons to clothe their children. On balance, the coupon expenditure for children aged 4 to 13 was below the adult rate and their entitlement, although those aged 14-16 needed all their coupons.

Industrial Health Conference

With commendable promptness, which reflects the importance which the Minister attaches to the subject, the Ministry of Labour has issued, through the Stationery Office, the verbatim report of the conference on industrial health. (Continued on page 739)

COMPANY MEETINGS

ATLAS ASSURANCE COMPANY LIMITED

ANOTHER SUCCESSFUL YEAR

MR G. F. HOTBLACK'S REVIEW

The annual general Court of Proprietors of the Atlas Assurance Company Limited, was held, on the 28th ultimo, at 92, Cheap-side, London, E.C.

Mr G. F. Hotblack (the chairman), in the course of his speech, said: It is a particular pleasure to us to be able to place before you accounts which I am sure would, even in peace-time, be a source of gratification to you and will thus, I think, be additionally welcome when regard is had to the many complications and difficulties which beset us in war-time.

FIRE ACCOUNT

The fire department premium income at £1,999,525 is higher by £49,071 than in 1941 and the profit emerging is £262,578, representing a ratio of 13.1 per cent., as against £145,124 and a ratio of 7.4 per cent. in the previous year. The increased income is the outcome of rising values and increased industrial productivity, and, as to the profit earned, all I think I need say is that we may count ourselves very fortunate, bearing in mind that the general loss record in the home field has been heavy.

ACCIDENT ACCOUNT

As regards the accident account, here I am able to present to you results which I think are remarkable. Although, largely due to a further fall in motor business consequent upon petrol restrictions, our premium income of £600,898 is lower by £50,713 than in the previous year, the profit earned is £114,784, as compared with £56,656 in 1941.

MARINE ACCOUNT

In the marine department the increase in premium income from £452,901 in 1941 to £601,003 in 1942 is a natural reflection of the times in which we live, and, while the incidence of loss on account of the year 1942 has been heavier than that to which we have been accustomed in the past, it has not been by any means of such a character as to suggest that our underwriting policy has not been properly attuned to the circumstances; indeed, I think we can reasonably anticipate that when the liabilities assumed last year have run off we shall find that our underwriting has been productive of a profit.

You will see, however, that no transfer is made to the credit of profit and loss account and the position is that your directors feel that, in view of our increased commitments and of the somewhat unpredictable future generally, it would be wise to maintain the marine insurance fund in as strong a position as possible. You will observe that the fund at the close of the year was £596,064, as compared with £522,755 at the end of 1941.

LIFE ACCOUNT

In the life department the new business, although far below our 1938 figure, was considerably larger than in the previous year, being £2,663,416, compared with £1,944,173 in 1941. The consideration for annuities, at £231,953, was £30,746 less than that received in 1941. The premium income, at £1,154,598, has increased by only the nominal amount of £1,108. Mortality among our lives assured has again been light, although the death claims, amounting to £319,615, include claims due to the war under 61 policies for £51,343. Including these, war claims, the strain of our claims was only 88 per cent. of that expected.

Our life assurance and annuity fund increased during the year by £606,191. During the year this increase, together with other substantial sums, has been invested in British Government securities, of which the life department now holds £3,687,370.

Our life department has been pleased and proud to contribute to the war need by investing all available money in Government war securities, but it will be realised that interest is the life blood of life insurance, and that the money which has been invested in Government securities arises mainly from premiums on policies issued prior to the war. These policies were issued on terms which call for the investment of the premiums, as they fall due each year until the policy matures, in securities giving a yield fixed by reference to the financial outlook at the date the policy was issued.

The combination of large investments in British War Loans and the high rate of income-tax renders it exceedingly difficult for life insurance companies to do what they desire to do—namely, to support the Government loans to the maximum extent, and at the same time perform their duty to their policyholders.

LIFE INSURANCE COMPANIES AND TAXATION

We congratulate the Government on the success of their policy of cheap money; we regard it as an essential feature of war finance. I would, however, ask that the special needs of life insurance companies, who support the Government policy by investing all available money in Government securities, earning a net yield thereon of only about 2 per cent., should be considered in connection with their liability to taxation, and that the income of these Government securities, so far as they exceed, say, 5 per cent. of the life fund, should be freed of income-tax. If this concession cannot be granted, then I feel that the standard rate of income-tax for life funds, which was fixed in 1940 at 7s. 6d., since when the net rate of interest has fallen, should be reconsidered and reduced.

At the end of the year the market values of our securities exceeded the book values by £935,000. This substantial appreciation constitutes a useful cushion against future depreciation. Mainly as a result of our further large investment in Government securities our net rate of interest for 1942 was £3 8s. 11d. per cent.

Once again it has been regarded as necessary to use the whole of the surplus to strengthen the reserves, £75,000 having been added to the annuity reserve and an additional unhypothecated reserve having been made by increasing the carry-forward from £6,033 to £177,152.

PROFIT AND LOSS ACCOUNT

Turning to the profit and loss account, it will be seen that the net interest receipts amount to £89,779, this figure being £5,740 in excess of earnings in 1941. The profits transferred from the underwriting accounts amount to £377,362. Charges include the sum of £135,000 reserved on account of the income-tax payable in respect of 1943, the sum of £49,883 transferred to the accident account in respect of investment guarantee transactions, expenses not charged elsewhere and the contribution to the "Essex and Suffolk" staff provident fund. The balance, including the carry-forward from 1941, available for disposal amounts to £533,725. Of this amount the dividend at 10s. 6d. per share, subject to tax, absorbs £125,400, and, £25,000 having been transferred to the staff pension fund, the balance carried forward is £383,325 as compared with £427,084 brought forward from 1941. That concludes my comments on our figures; figures which, in all modesty, I think we can claim to be a good example of the stability of that stout and age-tested pillar in the economic structure—British insurance.

The report and accounts were unanimously adopted.

ALLIED NEWSPAPERS, LIMITED

LORD KEMSLEY'S REVIEW COMPANY'S NEW NAME

The nineteenth ordinary general meeting of Allied Newspapers, Limited, was held on Monday, May 31st, at Kemsley House, London, W.C.1.

Lord Kemsley (the chairman), in the course of his speech, said:

The trading profits show an increase of £56,703, but against this there is an increase in the provision for taxation and contingencies of £55,000. Your directors have again recommended placing £100,000 to reserve. This transfer is equivalent to an appropriation of profits amounting to £200,000 before deducting income-tax at the present rate of 10s. in the £1. We were pleased to be able for the first time for some years to resume the payment of an interim ordinary dividend, and hope to make this a regular practice. After making the transfer to reserve and providing for a total dividend of 8 per cent. for the year on the ordinary stock, the carry-forward shows an increase of £15,087.

Turning to the balance-sheet, the sundry trade creditors, etc., are slightly reduced.

The fall in amounts owing by subsidiary companies is due to the repayment of some of the loans by these companies. The decrease in stock in trade is in consequence of the reduction in our stocks of newspaper.

The increased investment in British Government securities and tax reserve certificates together with the cash balance presents a strong liquid position.

PRIVATE ENTERPRISE

During the last few months the economic system known as private enterprise has been subjected to incessant and prejudiced attack. The criticisms have mostly come from those possessing little practical knowledge of business and who are accordingly ignorant of how private enterprise has benefited the community in the past and is benefiting it in the present.

I say in the present because it is only by means of our wonderful industrial apparatus, the offspring of private enterprise, that we have been able to achieve our immense output of every variety of weapon.

It is a striking and conclusive fact that Britain and America, which are severally producing a greater volume of armaments and munitions than any other country in the world, both practise the principles of private enterprise in their economic life.

The totalitarian countries—where, by definition, the State is paramount—can furnish nothing like equal results either in magnitude of production or in the widely spread welfare of the individual.

CHANGE OF NAME

Before I end I must remind you that you are going to be asked to vote on a resolution to change the official title of this company. I think you will agree that the present name is so vague as to lead to confusion. We share the word "Allied" with some 30 entries in the London Telephone Directory. We need something more definite, more easily distinguished and remembered. I am glad to note that a financial organ of weight describes this proposal as "wise and practical." I am confident that you will express similar approval.

On the proposal of the chairman, seconded by the Hon. Lionel Berry (deputy chairman), the directors' report and accounts were adopted.

The retiring directors and the auditors (Messrs Price, Waterhouse and Co.) were re-elected.

A special resolution changing the name of the company to Kemsley Newspapers, Limited, was proposed by Mr. W. M. Teasdale, seconded by Sir William Crawford, K.B.E., and unanimously adopted.

A vote of thanks to the chairman, board and staff, proposed by Mr M. S. Myers and seconded by Mr Hugh Edwards, was carried unanimously, and the meeting concluded with the chairman's reply.

GEORGE WIMPEY AND COMPANY, LIMITED

OUTSTANDING CONTRIBUTION TO THE WAR EFFORT

UNJUSTIFIED ATTACKS—COMPANY COMPLETELY VINDICATED

The twenty-fourth ordinary general meeting of George Wimpey and Company, Limited, was held, on the 3rd instant, at Incorporated Accountants' Hall, Victoria Embankment, London, W.C., Mr G. W. Mitchell (chairman and managing director) presiding.

The chairman said: Ladies and Gentlemen,—The directors' reports and accounts have been in your hands for some time and I presume that, as usual, you will take them as read. (Agreed.)

They cover the third complete year during which we were wholly employed on war work. On each occasion when I have addressed you since the outbreak of war I have emphasised that the supreme and over-riding aim and policy of the directors of your company has been to exert every effort in making its maximum contribution to the successful termination of this war. In the very busy year under review I am confident that your company has more than maintained its reputation for speed and efficiency in the completion of a number of large building and civil engineering projects.

ATTACKS UPON THE COMPANY

Last year some concern was shown by shareholders present at our annual meeting about the attacks that were being made in the House of Commons in respect of our war contracts in Scotland, and questions were put to me as to what action we were taking in the matter. I pointed out that these attacks were made under Parliamentary privilege. Later it became apparent that our staff throughout the country was becoming confused and restive under attacks which it knew to be wholly without foundation and, as the attacks persisted, we wrote to the Prime Minister requesting that the Government would make the fullest inquiry and publish the result of their investigations.

A most exhaustive inquiry was, therefore, held by Mr J. L. Clyde, K.C., with the assistance of Mr David Anderson, M.I.C.E., and the findings of the Commissioner were eventually published in the form of a White Paper (a document of 26 pages) described as the "Clyde Report." To all interested in the good name and reputation of Wimpeys I would recommend the purchase of a copy of this report, which is obtainable from His Majesty's Stationery Office.

EXTRACTS FROM CLYDE REPORT

I do not desire to take up your time referring to an episode from which your company has emerged so clearly vindicated and will content myself with reading two extracts from the Commissioner's report:—

"By the beginning of the war they (i.e. Wimpeys) had established an organization which was able to meet, as it happened, just the very type of demand which the war conditions created—the need for a fully equipped and organised business which could undertake sole responsibility for a large job and drive it through to completion in the shortest possible time. Although the firm secured a large number of contracts, even at the peak of their activity they had not more work than they could effectively undertake."

"The considerable share of the total contracts placed by the Government Departments during the war with Messrs Wimpey and Co. is essentially attributable to their own proved merit."

PRESS COMMENTS

As you are probably aware, the result of this inquiry was widely commented on in all the London and Provincial Press, and I

will just refer to an extract from *The Economist* of October 10th last:—

"It, as is suggested by Mr Clyde, the success of the firm is due to its efficiency. Government Departments can hardly be criticised for using its services."

And one from *The Accountant* of October 10th last:—

"It is unfortunate that at a time when efficiency and speed in production were never more necessary and are by no means to be found everywhere a firm which apparently achieved both should be attacked for that very achievement."

Shareholders will be gratified by such a complete vindication of their company and its outstanding contribution to the national effort.

The efforts we have made to increase our efficiency and speed up our production have been greatly assisted by the work of a small group of our highly expert engineers working in the Planning and Progress Department, where the exact sequence of operations and the time, plant, and manpower to be allotted to each operation is planned in advance and the progress of each contract subsequently closely watched.

WELFARE DEPARTMENT

I would like to refer to the work of our Welfare Department, which looks after camp amenities and canteens on the various contract sites. Each major contract also has a Production and Welfare Joint Committee, half of the members being elected by the men and half being members of our job staff. These committees hold weekly meetings to discuss the various aspects of their contract and valuable suggestions for increasing efficiency and speeding up production are brought forward. A news sheet consisting of contributions, criticisms, and suggestions—some grave, some gay, prose, verse, and cartoon—sent in by workmen and staff is produced monthly and posted in canteens and other prominent places on all jobs. The news it gives of outstanding progress and competitive gang outputs on various jobs serves to maintain the men's interest in their share of the war effort and in the work of these committees.

The company's Staff Pension Fund has accumulated a fund of £110,000.

The very complete records of the past work history, experience and special aptitudes of every member of our staff which are kept by the Establishment Office have enabled us, by a review of the whole of the staff and precise selection on merit, to fill the many gaps occasioned by the demands of the fighting services. Staff joining the Forces know that we retain a complete record of their services and experience.

COMPANY FULLY ENGAGED

Your company is still very fully engaged in urgent works of national importance despite the tendency for the volume of work to recede. As to the future we remain entirely at the service of the Government in the war effort, and we are sure that wherever the staff of Wimpeys are required, whether it be here or abroad, under the flag of the firm or in khaki, they will give a good account of themselves.

The directors' report and the accounts were adopted and resolutions were passed transferring £50,000 to general reserve, confirming the payment of the preference dividends for the year 1942, and declaring a dividend of 20 per cent. on the ordinary shares.

Mr H. Wheeler was re-elected a director of the company; and the auditors (Messrs Saker & Davis) were re-appointed.

Magnus Goddellow (Chairman) at
the Annual General Meeting of
The Ever Ready Company (Great
Britain) Limited, on June 3rd,
1943.*

INCREASED COSTS COVERED.

Owing to our long term planning and preparations, we achieved substantial increases in our production during the year under review.

The demands for our batteries during the Autumn were so heavy that at times we were unable to supply fully the civilian requirements. We have again increased our establishments, plant and stocks, and with these added facilities, we anticipate a further increase in production.

The profit on the larger turnover, together with the increase in the prices of wireless batteries imposed on the 1st April, 1942, has enabled us to cover all additional costs of production.

STRONG FINANCIAL POSITION.

We are proposing to pay to the Stockholders the same dividend and bonus as for the past three years, we have paid higher wages to our workpeople and large contributions to H.M. Government towards the "sinews of war." Under peace conditions our experience and facilities will enable us to continue fully our services to the public.

The Accounts before you show that our liquid financial strength has improved, net current assets having risen from £862,000 to roughly £1,000,000.

Our Managers, staff and workpeople have served the Company well and continue to work with the greatest loyalty and goodwill, and I am sure you would wish me, as I do, to express our appreciative thanks to them for their efforts.

CAMP BIRD, LIMITED

MR F. W. BAKER'S REVIEW

The forty-first ordinary general meeting of Camp Bird, Limited (of 49, Moorgate, E.C.), was held, on the 3rd instant, at River Plate House, London.

Mr F. W. Baker (the chairman), in the course of his speech, said: Income for the year was £27,818, and after the usual charges there remains a balance of £14,551, which has been credited to reserve account, now standing at £226,273. The depreciation on quoted investments is reduced by the satisfactory figure of £168,143 to £308,747 and was further reduced on May 10, 1943, to £185,407.

We have this year felt ourselves in a position to place an estimated value of about £200,000, or approximately 2s. per share, on our unquoted investments, advances, etc., totalling £327,783. As the net value per share of the remaining assets was at December 31, 1942, 6s. 2d. per share, we arrive at an estimated total value of 8s. 2d. At May 10, 1943, the corresponding figure was 9s. 5d. per share.

Under the present difficult conditions, which limit the activity of a company of

this nature, it is at least satisfactory to know that definite improvement in the company's position has taken place. Moreover, the elimination of the debenture issue removes the annual interest and other charges in connection therewith.

The report was unanimously adopted.

OZALID COMPANY, LIMITED

STATEMENT BY MR C. A. G. HEWSQN

The annual general meeting of the Ozalid Company, Limited, was held in London on the 31st ultimo. The following is an extract of the statement of Mr C. A. G. Hewson, F.S.A.A., the chairman:

It is with gratification that your directors recommend a final dividend of 15 per cent., less income-tax, on the "A" and "B" ordinary shares, making 25 per cent. for the year, after provision for the dividend on the preference share capital.

The company is engaged in manufacturing a dry developed sensitised paper known as "Ozalid," used for plan reproduction and photo-printing, and also deals

in and manufactures sensitised opaque and tracing cloths. The company serves the leading aircraft companies, armament concerns, engineers and shipbuilders, and also the building trade. I might mention that for forty years or more additional copies of master drawings were made by means of the blue printing process, which gives white lines on a blue background. In recent years the diazotype process, of which this company were the pioneers, has been perfected and widely adopted. This process furnishes black lines on a white ground.

The technical direction of the company is under the control of Mr H. D. Murray, M.A., F.I.C., and I should like to pay tribute to the services he has rendered.

In passing you may wish me to touch upon our future prospects. By reason of the anticipated post-war reconstruction programme, it is considered that we shall be fully occupied in the period following the declaration of peace. The company's success is also dependent upon the maintenance of a high standard in the technical section of the business, and your directors are taking active steps to ensure continuation of the position in this direction.

The report and accounts were adopted.

(Continued from page 736)

health held in London on April 9th-11th. This document should be carefully studied, not only by those directly responsible for factory welfare, but by all employers and trade unionists. The Chief Inspector of Factories, at a press conference held in connection with the report, said that the most significant development in recent years had been the great interest which the workers themselves are now taking in their own welfare and working conditions, and emphasised the value of joint works health and safety committees in stimulating this interest and the desirability of extending their number. There is to-day a wide realisation of the importance of preventive measures, and factory canteens have played a considerable part in maintaining the standards of health during wartime. The figures given by the Chief Inspector show an encouraging improvement over last year:

NUMBER OF CANTEENS

	December, 1941	December, 1942
In factories employing more than 250 workers:—		
Subject to the Canteen Order . . .	2,814	4,026
Not subject to the Order	351	314
In factories employing less than 250 workers	2,530	4,141
Dock canteens	110	160
Canteens on building sites	787	868
Total	6,592	9,509

There is reason for satisfaction at the nation's industrial health record, but there is no room for complacency. There are many black spots that have to be eradicated, and many measures that should be taken now. Though the number of fatal accidents decreased during 1942, the further increase in non-fatal accidents points to the need for constant vigilance, especially in dealing with untrained labour. The Factory Inspectorate probably needs enlarging—401 inspectors to cover between 200,000 and 300,000 establishments seems pitifully few, and many of them have to undertake additional duties in connection with fire prevention, industrial clothing and other wartime circumstances. At the Conference, a personnel officer from the railways drew attention to the shocking conditions that prevailed at a certain goods yard and to the inadequacy of the sanitary provision for women workers. The trouble is that the railways, except for their manufacturing, repair and maintenance shops, do not come under the Factory Acts, and there seems to be a strong case for extending the powers of the Factory Inspectorate to cover rail transport, or, at any rate, for establishing adequate machinery for investigation and inspection.

Transport Workers' Wages

A number of wage claims affecting transport workers are now pending. The Railway Executive Committee has rejected the collective claim for a 10s. increase put forward by the three railway workers' unions in March. The terms

of the REC's counter-offer have not been made public, but it is understood that an increase of less than half the unions' demand was proposed. Consultations are now going on between the executives of the three unions, and the REC's offer is likely to be very unpopular among the men, who were already impatient at its delay in replying to their claim. If the offer is rejected, the unions will probably resort to arbitration again. Last year, after the Railway Executive had offered less than the increase which the workers claimed, the Railway Staffs National Tribunal on December 11th awarded a 5s. increase to conciliation grades and salaried staffs and a 1s. increase to locomotive men, since these had already received an increase of 4s. The National Union of Railwaymen and the Railway Clerks' Association accepted the award, but the Associated Society of Locomotive Engineers and Firemen refused, although they had pledged themselves in advance to abide by the Tribunal's decision, and the strike threat was only averted when it was decided to present a new claim in conjunction with the two other unions. In the meantime, the rejection, by the special Tribunal, of the 'bus workers' application for improved wages and working conditions has been discussed by delegate conferences of the Transport and General Workers' Union in London and the provinces. The 'bus workers' claim was based not upon any rise in the cost of living since their war wage increases were granted a year ago, but on the added strain to which driver and conductors have been subjected as a result of curtailment of services, "spread-overs" and generally increased difficulties. A new claim will shortly be presented. The canal workers, too, have formulated wage claims, which are now under discussion.

* * *

Points Changes and Soft Fruit

A number of changes were made in the points value of certain foods from the beginning of the current four-weekly ration period which began on May 30th. The smallest sized (1 lb. and 12 oz.) packs of canned luncheon meat, pork loaf and ham loaf have been reduced in points value and the larger ones increased. The points value of green split peas is halved. There is no change in the value of points coupons, and the total remains at 20 for each ration book. Home-canned plums, damsons and rhubarb were removed from the ration to clear stocks, on the ground that they might not keep beyond the end of June. It is a pity that the disposal of these stocks was not achieved earlier, perhaps by lowering the points value. Retailers will be compensated for loss of coupons. A large part of the new soft fruit crop will go to jam manufacturers, and it seems likely that little will be left to be eaten fresh or for private jam-making and bottling. The Minister of Food has made directions restricting the transport of soft fruit. The United Kingdom has been divided into four areas within which the fruit may be moved by rail. By road, transport is limited to distances not more than 40 miles, but the fruit may cross the boundaries of areas to a depth of ten miles.

RECORDS and STATISTICS

STOCK EXCHANGES
London

Note: all dealings are for cash only

PENDING war developments, activity in the markets has been light and in the absence of adequate support quotations have tended to ease. Quiet conditions prevailed throughout in the *gilt edged* market, although some demand was apparent for short dated issues at the close of the previous week. Long dated and irredeemable stocks were, in contrast, distinctly heavy. Old Consols and 3½ per cent. War Loan and Conversion all losing ¼th. Interest in the *foreign bond* market was negligible. Brazilian loans weakened early this week, but in general most prices remained steady. According to the number of bargains marked, turnover was well maintained in the *home rail* market. Equity stocks were sold steadily, GW and LMS in particular falling 1 and 1½ points respectively. The preference issues were dull, but after their recent decline, the prior charges displayed a rather steadier tendency. Argentine rail issues in the *foreign rail* market were still under the influence of the depressing BA Western statement rather than the Central Argentine payment, both equity and junior issues suffering small declines.

Industrial issues failed to attract any particular attention, and with few exceptions prices throughout the market tended to slightly lower levels. Losses for brewery and tobacco shares were relatively insignificant, but heavy industrial shares and several motor and aircraft issues were especially heavy. Babcock and Wilcox and Allied Iron lost 1s. 3d. and 9d. respectively, among numerous other smaller falls, while Raleigh Holdings and Rolls-Royce both

lost ½. Exceptionally, shipping issues were firm, although actual improvements were slight. In contrast textile issues fell back. English Sewing Cotton losing 1s., while Courtaulds and British Celanese each fell 6d. Dollar stocks were dull this week, International Holdings in particular declining ½. Elsewhere Cable and Wireless ordinary eased slightly, while Dunlop Rubber after an earlier fall, recovered sharply on the chairman's statement.

The *kaffir* market was completely overshadowed by the activity in the *diamond* market. Sir Ernest Oppenheimer's statement on the industry occasioned a widespread demand for shares, De Beers rising ½ and Consolidated Diamonds 3s. 3d., although profit taking later reduced these gains. Anglo-American Investment also attracted buyers, the price rising 2s. 3d. The *rubber* market was idle, but a long list of minor losses were recorded in the *tea* market. Quotations in the *oil* market receded on lack of support. The maintenance of the Shell distribution failed to check the decline, leading issues falling by as much as ½ on the week.

COMMODITY AND INDUSTRY NEWS

Soft Fruit Prices.—The maximum prices of soft fruit per lb., varying according to area, operate on different dates. They are as follows: Cherries, 1s. 6d. to 1s. 9½d. (June 7th); gooseberries, 6d. to 6½d. (May 24th); strawberries, 2s. 6d. to 2s. 10d. (May 31st to June 6th).

Home-Grown Linseed.—A price of £27 10s. per ton net weight, sacks included, delivered to mill, will be paid by the Ministry of Food for all home-grown linseed of good quality from the 1943 or previous crops. The arrangements for sale in operation this season are to be continued in the coming year. Growers may retain their own linseed for sowing or for feeding to their livestock, but any surplus must be delivered to the nearest seed crushing mill, with the exception of linseed for sowing. The price of linseed sold for sowing or for resale for such use will not be controlled.

Coal Output.—The official figures for the output of saleable coal for the past nine months, with corresponding figures for the previous year, are given in the accompanying table. They do not include production from opencast workings (outcrops), which in the four weeks ending May 15th was 70,500 tons per week. The second table shows what percentages of the standard tonnage were achieved by each district. Those with over 100 per cent qualify for bonuses, and approximately 55,000 miners will receive a bonus.

Wholesale Fish Trade Workers.—It has been decided to withdraw one in eight of the total workers engaged in the wholesale fish trade, including administrative, supervisory and clerical staff. The proportion of workers to be withdrawn will vary in different markets and ports and in different firms. Arrangements are being made where practicable for local committees of the trade and trade unions to be set up, to advise about persons to be withdrawn. Representations that withdrawal will involve exceptional hardship to the workers or to their employers may be made.

Closed Mills.—The Board of Trade has approved the following percentage increases in the maintenance payable to small mills owned by firms who do not own any run-

New York

TRADING on Wall Street during the past week has been moderately active, with peace issues favoured against war stocks. Occasional profit-taking, however, and some lightening of commitments before the holiday generally eliminated scattered gains. The recommencement of the coal strike created some dullness among heavy industrial stocks, but other quotations were generally steady.

A Hopeful Conference

IT looks as though an important blow for sanity in world economics has been struck at Hot Springs, Virginia. When the United Nations Conference on Food and Agriculture met a month ago, there was no evident reason to suppose that the unhappy precedents of earlier conferences on these subjects, and in particular the precedent of last year's unfortunate Wheat Conference, would be forsaken. It seemed only prudent to apprehend that yet another assembly mainly representing the interests of producers would formulate yet another programme, however well disguised, to keep up prices and restrict supplies. But this, apparently, has not happened. Judged by their recommendations (which are summarised on page 751) the delegates to Hot Springs devoted most of their time and expert knowledge to the over-riding problem which the interests of the world's inhabitants required them to solve—the problem of providing more and better food for 2,000 million people to eat. To this end almost all their proposals for the expansion of production, the improvement of nutrition and the enhancement of consumption are specifically directed; and to this extent President Roosevelt's description of their work as "epoch-making" is no doubt justified.

It is, however, much too soon to rejoice. The Conference was representative of nearly 40 nations but responsible for the policy of none. When the President claims that its delegates have unanimously agreed that the world's problems of food supply "can and must—and will—be solved" he overstates their powers. Such a conference can only propose. The responsibility now rests upon Presidents and Prime Ministers, Cabinets, Congresses, Parliaments, political parties and, above all, public opinion to see that good deeds follow fair words. The consumer is a sceptic by experience. Words and phrases, he knows, are at the disposal of politicians, and can have a whole dictionary of meanings. He has often heard of projects to put "a chicken in every pot", and every time stayed hungry. He has learned by repeated trial that the planning of production to meet the needs of consumption usually means the curtailment of both; that the fixing of prices "fair to both producers and consumers"—a constant theme in the Hot Springs recommendations, and in itself unexceptionable—almost always results, by an odd coincidence, in a price appreciably higher than he can afford to pay; and that "the full employment of the world's resources for the benefit of

all" is generally interpreted in practice as the complete protection of each country's farmers, whatever their comparative efficiency or the suitability of their crops, to the detriment of everybody. He has a simple faith in cheapness and plenty and is heartened by the declaration from Hot Springs that the trade barriers and restrictive economic policies, which he knows to be the chief impediments to four square meals a day, should—and can—be removed.

It would be churlish, and indeed defeatist, to allow a proper sense of the political difficulties and national obstacles which have still to be surmounted to diminish the praise that is due to the Hot Springs Conference for the able and encouraging picture it has drawn of the practical possibilities open to common sense and co-operation. The problem has been tackled from its two ends: the need to increase the selling power of farmers by enabling them to produce food more efficiently, and so to sell more of it at lower prices; and the need to increase the buying power of consumers by enabling them to produce other goods more efficiently, and so to buy more food in exchange. The root of the trouble in the past, when overproduction in agricultural communities has been accompanied by undernourishment and even starvation in almost every country, has been the unbalance between actual needs and effective demand; and it is only by an all-round increase in productivity—and not by any juggling with monetary counters—that the terms of trade can be established between agriculture and industry which will enable supply and demand to be equated at the highest possible level of food supply. The focusing of the Conference's proposals upon expansion and efficiency, in both the agricultural and industrial fields, however manifold the interpretations that may still be put by politicians upon its recommendations and qualifying phrases, is, nevertheless, a contribution to economic wisdom.

Expansion and efficiency are the first two Hot Springs principles. The third is ease of exchange. The establishment of optimum terms of world trading between farm production and manufacture implies the utmost possible freedom of international exchange. The picture drawn at Hot Springs is very clear. The prior charge upon each country will be to provide the foods of high nutritional value, such as milk, other dairy produce, vegetables and fruit, which are mostly perishable and best produced as near as possible to centres of consumption; the want and need for these protective foods, which are most of all lacking in wartime, is almost unlimited in nearly every country. Beyond this basic domestic priority, "consumption needs must be met from the most efficient sources of production" in whatever areas, at home or abroad, those sources may be found; and, with specific safeguards for the conservation of the soil and its fertility, "the inherent natural and economic advantages of any area should determine the system of farming adopted and the commodities produced." Essentially, this programme for feeding the world is a manifesto for freer trade and the international division of labour. At the one end, it implies the maximum output of the right foodstuffs in the right places. At the other end, it implies ready entry for foreign foodstuffs in the quantities required and at a price that consumers can pay; and it implies, no less, the development of industries, and therefore of purchasing power, in backward areas by the unimpeded international investment of surplus savings. It is a programme of full employment in each country and the eager exchange of goods, services and capital between the nations. It is not a policy of "cut-throat competition," or "disorderly *laissez faire*." A *sine qua non* of success is a guarantee to efficient producers of stable prices which, while not surpassing the average of prices over a period in an unguided market, will prevent the collapses which have been the bane of producers in the past; the purpose of the British plan for a buffer pool, like that of the Keynes proposal for an international clearing union, is to facilitate policies of economic expansion, nationally and internationally. The protection of pro-

ducers and the restriction of supply by high tariffs or quantitative restrictions on imports is *ipso facto* an offence; the protection of consumers and the maintenance of demand by social security measures or subsidies to special classes is, on the other hand, a virtue.

What are the chances of translating precept into practice and achieving this state of expansion, efficiency and mutually beneficent exchange? The political obstacles, national and sectional, are of long standing. The right principles of production and trade were not invented at Hot Springs; they have always been right, and the chief factor preventing the nations of the world from eating as adequately as possible, within the limits set by the current technique of production, transport and storage, has always been the desire of all the nations to eat at each other's expense. The present and the immediate future are especially difficult times to make new sense out of these old nonsenses. Of necessity, war economy is uneconomic. Because of wartime barriers to trade and wartime shortages of transport, manpower, fertilisers and machinery, the wrong foodstuffs (by economic standards) have to be grown in the wrong places (again by economic standards) to be eaten on the spot at a relatively high cost in both real and monetary terms. Conditions of siege, blockade and devastation put an end, very largely, to the international division of labour. By a policy of *saute qui peut* in almost every belligerent country, all seeking self-sufficiency at all costs, the output of energy foods, such as cereals, is pushed up, while the protective foods go lacking. World agriculture is hopelessly unbalanced and distorted—and a vested interest in uneconomic farming is created in each separate nation. Moreover, as the delegates to the Conference have recognised, this state of affairs will not end when the fighting ends. "War economy" will continue for an unspecified period of months or years during the emergency and relief stage, when the overriding need will be to succour the starving until their agriculture and their trade can be restored. The emphasis will still tend to be on quantity, regardless of quality, efficiency or cost; and the task of reversing the engine at the end of this period, to establish the brave new diet envisaged at Hot Springs, will be correspondingly difficult. The farming forced on nations by wartime shortages and the severance of communications is poles apart from the programme of abundance that co-operation and common sense could devise in a peaceful world; but it is too close to the narrow nationalistic aspirations of politicians and producers, as they have been demonstrated in the past, for the prospects of an easy change-over to be contemplated with any optimism.

This is the issue upon which the Governments of the world must fasten if the nations are to be fed amply and well in the future. It is not enough to pay lip-service to the good work and counsel of this conference. Its vision of an efficient and fruitful world agriculture based upon the expansion of world production according to a functional division of tasks must also be accepted in specific terms. The Permanent International Organisation, proposed by the Conference, on the lines of the International Labour Organisation, is indispensable to collate world data and to concert joint action among the nations. But crucial decisions of policy are no less urgently and immediately required in every country—above all a self-denying ordinance not to seek by any means to perpetuate beyond the period of *saute qui peut* the present artificial distribution of output which, in quantity, would restrict supplies and, in quality, make impossible the provision of a balanced as well as a sufficient diet to all the peoples. Such a decision is especially required in Britain, whose buying power is a key to both world stability and its own welfare. A continuation of the present programme of all-out food production in this country may conceivably fit the abnormal requirements of a world torn by war and its aftermath. As the foundation of a long-term policy, it would be the negation of world and, especially, British interests—and an outright denial of the principles that seem to have emerged from the Conference at Hot Springs.

Reunion in Algiers

FOR nearly fifty years, between 1871 and 1918, among the statues on the Place de la Concorde representing France's cities, two were veiled, a reminder of the servitude of Strasbourg and Metz. So, too, for the last three years the tragic figure of a betrayed and occupied France has stood among its allies on the front of freedom. Today the unveiling has begun. The tragic *absum* of June, 1940, has been rescinded. From the union of the forces of General Giraud and General de Gaulle, the sovereignty of France has re-emerged in a central authority, the Committee of National Liberation, which represents all Frenchmen save the few whom General Giraud does "not call Frenchmen, that handful of traitors who have played the game of the enemy fully and deliberately."

The tragedy of France—the profoundest tragedy in all this tragic war—did not lie in defeat and occupation. It lay in the shattering disruption of French unity. The passions and prejudices, the *frondes* of a century, blew the outer crust off French society, and beneath, the world seemed to see a society which was a society no longer, one in which no single loyalty was strong enough to bind men together against sectional passions and personal hates. General de Gaulle's great stand prevented the total submergence of the French cause, yet one of the most painful facts with which, in the last three years, the friends of France have had to come to terms, was the continuance of disunity even among men who possessed—and recognised—a common cause in fighting Hitler. Frenchmen of good will were divided inside the Fighting French movement. Frenchmen of good will remained outside it. Frenchmen of good will joined it only to leave it—or be dismissed. And all too often the atmosphere was one of unrestrained political partisanship and virulent personal animosity. Was it surprising that in this atmosphere some people began to doubt the possibility of a reborn France? It seemed to them that they were witnessing a profound and horrifying mystery, the physical dissolution of a nation which, in losing the unity and loyalty of its people, had in a very real sense lost its life.

Since November last the warmest friends of France have feared that the crystallisation of two separate French movements behind two Generals simply expressed the intractable disunity of France. They believed in the physical deliverance and restoration of France, but would this prove a resurrection or the exhumation of a corpse? This has been the fundamental preoccupation of all those who have followed, sometimes in hope, at times in despair, the long negotiations between the two Generals—the delays, the disputes, the manoeuvres, the deadlocks. Again and again, the chances of unity seemed to be, as a Fighting French newspaper put it, "*au point mort*." On the

side of General Giraud stood the obstacles of a conservative and traditional outlook, which underrated Republican sentiment, of loyalty to men who had compromised themselves through collaboration, of a Darlanesque legacy of other officials, indispensable technically, but politically anathema. On the side of General de Gaulle was the rather natural resentment of the labourer of the first hour, the "personalism" of the de Gaulle *mystique* and of many of de Gaulle's supporters, a consciousness of power based on the mass character of Fighting French support inside the resistance movement and to a lesser extent in North Africa itself. As the negotiations dragged on, there seemed no end to the points first of principle, then of procedure, and finally even of prestige, which slowed down the discussion and threatened to frustrate its goal. The hesitations on both sides showed, with Freudian accuracy, how great was the continuing conscious—and unconscious—will to separation. Even after the Generals had met at Algiers—it took nearly three weeks to agree on the place—the first deadlock in the negotiations was followed by the affair of M. Peyrouton's resignation, which threw an equally disagreeable light on the attitude of General de Gaulle and the activities of the ex-Governor.

Yet unity has been achieved. The Committee of National Liberation represents a genuine fusion, not only of the two movements, but of many points of view and of a very wide range of talents and capabilities. The names and their significance are discussed in a Note on page 753. Here it is only necessary to point out that the two Generals are joint presidents, and that their chief civilian supporters, MM. Massigli and Philip on de Gaulle's side, M. Monnet on Giraud's, are to work on the Committee in company with a number of men, drawn indiscriminately from Carlton Gardens, Washington and Algiers, who are primarily technicians. The new authority is pledged to republican and democratic methods. It has broken with Vichy and its legislation in every shape and form. It is an impersonal body representing not this or that leader, but France. Yet it is not a *de jure* government, not even a provisional government, since full authority must wait on national liberation. It is, however, the *de facto* authority governing all Frenchmen and French possessions. Thus, in spite of the difficulties and divisions which persisted up to the last moment, the new Committee represents very much the type of authority for which the French and their allies, though often without much confidence, were hoping.

The deepest meaning behind this consummation is that, after all, the moral unity of France is still intact. There is still something vital and compelling, bigger than

this or that Frenchman or this and that group, which has, often slowly and with difficulty, but surely all the same, driven the malcontents to silence their calumnies, the leaders to sink their differences, the divergent factions to close their ranks. That thing is the idea of France *une et indivisible*. All through these months, in a word here, a speech there, this or that article in a French newspaper, this or that message from the underground movements, the force has been growing and taking shape. That indefatigable negotiator, General Catroux, could have done nothing without it. Mr Roosevelt in the White House, Mr Churchill and Mr Eden on the spot could have done nothing without it. Willy nilly, the Generals could do nothing about it. In 1940, the desire for unity was stunned. The voices calling for resistance in the name of unity met with no response, in 1943, the desire, the passionate, anonymous, irresistible desire for unity has hushed the voices of disunity and faction. This is the greatest single fact about the reunion in Algiers.

The liberation of France by force of arms is certain. France's new armies, fighting beside the Allies of France, would have achieved it, even had there been no unity. (In parenthesis, it was surely both unpractical and ungenerous of General de Gaulle to declare at the Fighting French rally on June 5th that France does not wish to be liberated by anyone except Frenchmen, not even by its friends.) The existence of the Committee of National Liberation can be a guarantee that the physical liberation of France will not be a prelude to civil war, followed all too possibly by another period of enslavement. It is absolutely essential that the unity which has been achieved should be preserved, and it must be remembered that it is only a minimum unity, achieved with very great difficulty. The irresistible desire for unity, canalised now by the years of German oppression, may lose its force and its directness once the period of servitude is at an end. Then will come the testing time for the soul of France.

Unity itself does not guarantee the re-creation of France, although it is its indispensable condition. There are a thousand questions of political, social and economic reconstruction which will have to be decided before it can be said that France has recovered its full stature. But much that is to happen will be decided now. On the work of the National Committee depends the

French people's hope of a peaceful, stable decade in which to heal their wounds and begin the reconstruction of their shattered economy. Neither side can claim a monopoly of political wisdom, economic progress and social justice. If they can act in concert, achieve loyalty and frankness in their relationships and, though without committing the French people in advance, reach agreement on some of the broad principles of reconstruction, then their work will survive the actual task of re-invasion and will be in truth a work of national liberation—the liberation of the hopes and energies and capacities of France.

Since this task of reconciliation is the new Committee's gravest responsibility, it was disturbing to see a resurgence of the spirit of division within a day of the formation of the new authority. On June 5th General de Gaulle presided at a rally of the Fighting French movement in Algiers. It was there decided that the "Combat" group, the Communists and the Committee of Socialist Action, should continue to act as the political instrument of Fighting France and to work for national renovation and the "Fourth Republic." This move can only mean that General de Gaulle has accepted the rôle of leader in a party which is not based fundamentally on resistance—otherwise why should it have a separate existence apart from the resistance movement in general? It is based on the fact of de Gaulle's leadership and is thus primarily a personalist party, of allegiance rather than principle. It perpetuates the polarisation of French opinion round persons which General de Gaulle so justly condemned in Pétain. It is radically alien to sound French practice and, with its Fourth Republic, ominously reminiscent of Second Empires and Third Reichs. It is, of course, possible to over-estimate the significance of this move. Even so, the timing was unfortunate. Work for the Committee of National Liberation, unity, loyalty—these are the essentials of the French situation. As Mr Churchill said in the Commons:

The gravest responsibility lies upon these men, and opportunities shine brightly before them. They have only to act together in good faith and loyalty to one another, and to set aside sectional or personal interests, and to keep all their hatreds for the enemy—they have only to do this to help to regain for France her inheritance, and in doing so become themselves the inheritors of the gratitude of the future generations of Frenchmen.

The Empty Cradle

THE debate initiated by Lord De La Warr in the House of Lords this week on the prospect of a decline in population undoubtedly served a useful purpose. It served to demonstrate the very general agreement of views on the subject, and how completely those views diverge from the neo-Malthusianism that was fashionable only a decade or two ago. It served also to elicit the promise of another statistical White Paper. This is better than nothing at all; but it is very little, for the facts—statistical niceties apart—are already familiar. It is the formation of a community attitude that is now necessary, the task is, as Lord Samuel said, "through the Government in general and in the press and all the agencies that influence public opinion, to impress upon the nation that this is a most grave matter, and that the whole health and safety of the country is ultimately involved."

There is, however, one statistical point that is worth making. The argument that a rapid fall in the population of the country was impending first caught the public ear about eight years ago, and many of the calculations then used were based upon the experience of the year 1933. It happens that 1933 was a year of unusually low births and there has been some recovery since then. This fact has led a number of people to imagine that the fears of 1933 can be removed and that the problem is on the way to solving itself. It is worth while, therefore, to establish that the position, though not quite as bad as the 1933

figures would suggest, is still bad enough to justify a great deal of alarm. The following table shows the numbers of marriages and of live births in England and Wales for different periods during the past half-century:—

	Marriages	Births
1890-02*	225,563	894,017
1900-02*	259,543	932,459
1910-12*	275,499	883,612
1920-22*	333,453	862,240
1930-32*	311,380	631,621
1933	318,191	580,413
1936	354,644	605,292
1938	361,768	621,204
1939	439,694	619,352
1940	470,549	607,029
1941	387,510	587,228
1942	368,252	655,075

* Average of three years.

The year 1933 was at the bottom of a slump, and as trade revived and incomes rose there was, quite naturally, an increase both in marriages and in births. But while by the end of the 1930's marriages were more numerous than ever before, the number of births did not even recover to the average of 1930-32, still less to that of earlier periods. The "net reproduction rate" for England and Wales in 1933 was calculated (on the imperfect data which were all that then existed) to be 0.738—i.e., each generation could be expected to be just less than three-quarters as numerous as the one before—and it was this figure that caused the original alarm. By 1938, on the

basis of the facts elicited by the Population (Statistics) Act, the net reproduction rate was discovered to be 0.805. The rate of decline per generation was thus not a quarter but a fifth—but it was still a rate of decline rapid enough to justify alarm.

Since the outbreak of the war, there has been some increase in the number of births, especially in 1942. But the explanation is not far to seek. There has been a very considerable increase in marriages. But there has been no such proportionate increase in the number of women of marriageable age; what has been happening is an ante-dating of marriages—what the demographers call "depleting the accumulated stock of spinsters." Similarly, the increase in births means that a certain number of babies have been born earlier than they would otherwise have been. Mr Bevin, with the exemption from industrial conscription that he confers on mothers, has encouraged earlier births, while Lord Woolton, with his insistence on seeing a birth certificate before issuing a ration book, has stimulated prompter registration. But the future of the population depends not on how soon women have their first babies, but on how many they have in all, and it would be rash to conclude from the evidence of a few war years that the size of the average family has begun to increase, or even that the secular decline has been stopped. The position at the outbreak of war was that the average family fell short by about 20 per cent of what is needed to prevent a decline in population—a decline which, once it starts, would be continuous. The increase in births that has occurred since 1938 is not nearly enough to close this gap. Moreover, there is no reason to reject the common-sense assumption that the rise has been due to the abnormal conditions of war, and that, after the war, it will be compensated, after a further temporary increase when families are reunited, by an equivalent fall.

The problem therefore remains. The first beginnings of an economic approach to it can be found in the great recent growth in popularity of the principle of family allowances. The economic burden of parenthood is by no means the whole of the reason for the decline in the birth-rate; but it is a large part. For the first time in human history, children now lower the standard of living and reduce the social security both of their parents and of themselves. Parents who, knowing this, prefer to give a good start in life to a few children, rather than a poor start to many, are not selfish, but merely prudent. There cannot be much doubt that this revolution in the economic significance of children has played a large part in creating the *desire* to limit families, which, together with the *ability* to do so provided by knowledge of contraceptive methods, has produced the great fall in the size of the average family over the past hundred years.

Some economic relief to the large family must, therefore, find a place in any policy designed to fill the cradles. But it is not the only approach; it is only the first of three separate and distinct lines of action. In addition to a redistribution of income in favour of the *kinderreich*, the "children-rich," there needs to be a parallel readjustment of all the manifold pressures that human institutions, of a social and conventional as well as economic kind, exert upon the individual. And neither of these two lines of attack will be successful unless there is at the same time a revival of faith and confidence in the present merits and future prospects of modern society.

What is more, each of these three lines will have to be pursued with far more vigour than is yet realised. Family allowances of five, eight or ten shillings a week would prevent the presence of children from resulting in actual destitution. But if married couples limit their families to avoid being dragged down to the poverty line, it is not likely to be an effective argument to tell them that they will not be allowed to fall below it. The amount of money a father and mother need to induce them to give birth to a child—if this is what the decision turns upon—is the amount of money that, given their station in life, they would actually spend on the child. Family allowances are not likely to affect the birth-rate substantially until they

cease to be small flat sums and become fairly large percentages of the parents' income.

Equally large measures will be needed in the institutional field. For example, if the country is to take the population question seriously, a pretty complete recasting of the English educational system will be required. So long as expenditure on education remains a necessary for maintaining, and a method of increasing, social status, so long will there be a premium on small families. The design of houses, the whole relationship between building costs and rents, the encouragement of home ownership—these are other matters that will require drastic re-examination if a determined effort is made to stop the decline—it would be more realistic to say *when* the determined effort is made, for the community will certainly not be indifferent to its own extinction. Women are not going to be denied the fruits of their emancipation—so if jobs and careers are not to drive out motherhood they will have to be so adjusted as to find a place for it. The State will have to solve the servant—or domestic assistance—problem. The vista of the institutional changes that will be necessary is endless.

Nor is the third avenue of approach any less wide. Not only for this purpose—but for this purpose most essentially—the task is nothing less than the repair of shattered confidence in the reason and object of society. There is no warrant for agreeing with the collectivist enthusiasts that only a Communist state can create the necessary faith in the direction of society; there have been many periods in the past when boundless confidence in the future reposed on the fiercest individualism. Nor is a return to formal religion the only path to trust in Providence. But whatever the precise route, the goal is the re-creation of an Elizabethan spirit that dares to explore new worlds with trusting faith and a high heart. Not until parents once again feel that the life they confer on their children is a boon and not a burden, a licence to adventure and not a sentence to adversity, will the race deserve, or be able, to survive.

Those Raw Materials

A survey of the technical aspect of the problem of raw materials

BY

C. A. WARD, A.M.I.E.E.

"Engineering"

comments on the book as follows

"It is definitely 'general' in character . . . As a background for a more detailed study of the economic and industrial questions involved, which is all that the author claims for it, the book is excellent."

The Wolf and the Fold

WHEN Sennacherib, King of Assyria, was organising his blitz against Jerusalem he decided to start operations with a war of nerves*. His opponent, and intended victim, was Hezekiah, King of Judah—an upright, respectable person, of virtuous if somewhat narrow ideals, and with a congenital inclination towards a policy of appeasement. Hezekiah, not unnaturally, had never heard of Danegeld and its consequences, and his first reaction to the nerve blitz was to present Sennacherib with “all the silver that was found in the house of the Lord and in the treasure of the King’s house.” He cut off the gold from the doors of the temple and from the overlaid pillars and gave it to the King of Assyria, hoping, and believing, that a gift sent under the impulse of fear would be taken as proof of good will and secure for his fellow countrymen peace throughout their generation.

He discovered within a few months how badly he had misread the character of his antagonist, who hurried on his preparations for the assault and massed infantry and chariots at strategic points for the final attack on the city. But the blow did not fall at once, for Sennacherib had his own theories about the best use to make of armies, and believed that a ruler who was sufficiently strong could achieve bloodless victories as satisfactory as those of the old-fashioned kind, and much more economically. Already he had overrun the neighbouring country of Samaria with the loss of a handful of men, and now he proposed, by the judicious mingling of propaganda, threats and cajolery, to march into Jerusalem without sacrificing a chariot or a javelin-thrower. He had in his service a gentleman of the name of Rab-shakeh, who controlled his Ministry of Propaganda; and, as soon as the invading army was comfortably placed to deliver (if need be) the knock-out blow, Rab-shakeh was sent forward to the walls of Jerusalem “to the conduit of the upper pool which is in the high-way of the fuller’s field,” and in a loud voice delivered his master’s message to the emissaries of Hezekiah, who were standing on the wall of the city.

He began by calling the attention of the inhabitants to the fate which had overwhelmed their neighbours, and to the isolationism of their hoped-for allies. “What confidence is this,” he said, “wherein thou trustest? On whom dost thou trust? Thou trustest upon the staff of this bruised reed, even upon Egypt, on which if a man lean it will go into his hand and pierce it.” What had happened, he asked, to Samaria, which had had the temerity to oppose him? And what was the good of this ideology of Hezekiah’s by which he appeared to put such store:

If ye say . . . We trust in the Lord our God . . . hath any of the gods of the nations delivered at all his land out of the hand of the King of Assyria? Where are the gods of Hamath, and of Arpad? Where are the gods of Sepharvaim, Hena and Ivah? Have they delivered Samaria out of mine hand? Who are they among all the gods of the countries, that have delivered their country out of mine hand, that the Lord should deliver Jerusalem out of mine hand?

It was a formidable recital, and the trail of destruction which had overtaken one by one these rival ideologies might well make it appear that in war at least the Assyrian scheme of life and belief and administration gave the country an irresistible advantage over all other schools of thought. And, as the screaming voice of Rab-shakeh developed his menacing argument, there was undoubtedly great danger that the nerves of his audience would give way; for the envoys of Hezekiah, looking nervously over their shoulders at the townsfolk who stood behind them at the wall, did their best to protect the common people from the flood of propaganda that the Assyrian was pouring out at them. They could not commandeer any wireless sets, but in an agitated voice they made a request

to Rab-shakeh that he should behave himself in a more considerate manner and keep the populace out of the discussion.

Speak, I pray thee, said Hezekiah’s representative, to thy servants in the Syrian language, for we understand it: and talk not with us in the Jews’ language in the ears of the people that are on the wall.

But the reply of the Assyrian Minister of Propaganda to this very reasonable suggestion was unmistakable. It was too indelicately worded, not to say obscene, for the columns of *The Economist*; but it is reported verbatim in the Second Book of Kings, and its purport in less physical though less striking language was “I shall say what I damn well like.”

Having secured the ear of the populace and frightened them half out of their wits, the Assyrian Minister proceeded to a description of the New Order which Sennacherib had planned, and the enviable life of security and plenty that the people of Jerusalem might lead if only they would be good and come quietly and behave like sensible folk:

Thus saith the King of Assyria, cried Rab-shakeh, Make an agreement with me by a present, and then eat ye every man of his own vine and every one of his fig tree. Until I come and take you away to a land like your own land, a land of corn and wine, a land of bread and vineyards, a land of oil olive and of honey, that ye may live, and not die: and hearken not unto Hezekiah, when he persuadeth you.

At this point in the discussion it would have looked to any neutral observer as though everything was finished. All the cards were in Sennacherib’s hands—numbers, weapons, military skill, and an overpowering weight of propaganda. Surely the thing was in the bag.

But now a remarkable thing happened. There emerged from the semi-privacy in which he had been living in Jerusalem a man of the name of Isaiah, a man of great determination, unbending courage, bold judgment, and endowed with a gift of speech and a power of oratory that were to communicate his own high qualities to the humdrum government of Jerusalem and all the inhabitants of the city. He told them that they must win and they would win; that they were not to fear the words of the servants of the King of Assyria; that the Lord would cause him to fall by the sword in his own land; that he should not come into the city nor shoot an arrow there nor cast a bank against it; but by the way he came by the same should he return. “I will put my hook in thy nose and my bridle in thy lips and I will turn thee back by the way by which thou camest.” So did he encourage his fellow countrymen to go forward with sober confidence.

That appearance and the speech of Isaiah’s were the turning point in the campaign. The Assyrian challenge had been met and Rab-shakeh returned to Assyrian GHQ for further instructions. He found there that his leader’s intuitions had changed; that Sennacherib had selected a new point of attack and started a war against Libnah, his plans for an assault on Jerusalem being for the time suspended. The stream of propaganda still flowed, but the worst of Jerusalem’s danger was behind her, and in due course either in the neighbourhood of the city or in the treacherous climate of Libnah Sennacherib’s legions were stricken by plague, so that he lost nearly two hundred thousand men and “when they arose early in the morning, behold they were all dead corpses.”

So ended the great blitz and the result was rightly attributed—under Providence—to the courage, the enthusiasm of a few, and to the eloquence of one man who had known how to lead. It would be nice to find out what happened to Rab-shakeh and the Ministry of Propaganda which he had conducted with such ability. We may surmise perhaps that from his office in Nineveh

he passed the word down the Euphrates that it was Hezekiah who had devised the blitz method of warfare; that it was at best a dirty business; and that this low trick of massing large numbers of chariots and bowmen

and javelin throwers to intimidate civilian populations was not the kind of good, clean war which a nation of high culture like the Assyrians could either approve or respect.

Hot Springs: A Summary

THE United Nations Conference on Food and Agriculture at Hot Springs ended last week in an atmosphere of mutual goodwill. Its objective was “to ensure an abundant supply of the right kinds of food for all mankind”; and, as President Roosevelt told the delegates, it “demonstrated beyond question that free peoples all over the world can agree upon a common course of action and upon common machinery for action.”

The Conference was organised in four sections, each being divided into a number of committees, responsible for examining particular aspects of the general problem.

Nutrition Standards

The first section on *Consumption Levels and Requirements* dealt with the causes and character of malnutrition in each country and sought to formulate national and international goals for increased consumption. (a) Its report stresses the relationship between malnutrition and poverty—a relationship strikingly illustrated by the fact that the death rate from tuberculosis among poorly-fed peoples is from 150-250 per 100,000, compared with 30-40 among better-fed peoples. (b) The picture is one of “world-wide underconsumption, malnutrition and its attendant evils”; three-quarters of the 1,150 million inhabitants of Asia are living below decent health standards; malnutrition exists among the lower income groups of the United States and Europe; and there are widespread deficiencies in tropical Africa, the West Indies and other colonial territories. (c) The war has aggravated an already serious position. (d) The Conference was not able to formulate a uniform set of dietary standards for general application, but it lays down certain broad principles. Such standards as those evolved by the League of Nations Technical Commission on Nutrition are universally applicable—there are no essential differences in the nutrient requirements of Eastern and Western peoples—and advances in nutritional science permit the establishment of minimum dietary requirements in terms of calory, protein, mineral and vitamin content. (e) The maintenance of health in wartime Britain shows what can be achieved through a scientific nutrition policy and the planned distribution of basic foodstuffs. (f) The Conference recommends that governments should provide systematic education in food values, develop community services, school meals, factory canteens, and make special provision for pregnant women, nursing mothers, infants and adolescents.

Agricultural Production

The second section examined the *Expansion of Production and Adaptation to Consumption Needs*. It distinguishes between the short and long-term objectives. (a) As a first step there should be an immediate increase, wherever possible, in the acreage of crops for direct human consumption, even at the expense of postponing the replenishment of livestock herds. (b) For as long as shortages continue, the governments, individually or collectively, should aim at coordinating national production policies and the means of transport and distribution, and should take measures to prevent speculation and price fluctuations. (c) Those countries which, because they have been free from the impact of war, have been producing more than their normal output should maintain and, if possible, expand production, and should develop the manufacture of farm machinery and fertilisers.

(d) The period of transition will involve considerable adjustments in policies. Countries which have excess capacity and those which have deficient capacity will both have progressively to adjust their allocation of resources, in order to conform to the long-term plan. (e) The long-term programme of each nation should be to increase the efficiency of production through better farming methods, measures for soil conservation, the encouragement of research, the exploitation of undeveloped areas through land clearance, drainage and irrigation projects; and to introduce changes designed to foster the production at home of protective and relatively perishable foodstuffs (vegetables, milk, eggs and fruit). (f) Nations should not attempt artificially to produce nutritionally desirable foods which can easily be obtained

elsewhere. (g) The Conference recommends greater facilities for obtaining technical assistance and the extension of credit, at low rates of interest, to help the small farmer. (h) It invites the nations to prepare periodic statistical reports, which would be submitted to a permanent International Food Organisation; to study the possibilities of extending producer and consumer cooperatives; and to undertake surveys of their systems of land tenure and their land and water resources, with a view to determining where production can be increased and rendered more efficient, what areas could be developed and what services in the way of engineering, drainage, etc., would be needed. (i) In order to facilitate occupational adjustments, the Conference recommends that countries with large populations in relation to their agriculture should develop suitable industries for processing and preserving their own produce, and should be assisted to export processed articles rather than raw materials, and to import machinery and tools. Where feasible, intra-national and international migration should be encouraged, and assisted by the provision of occupational training schemes, special labour bureaux and economic and social facilities for settlements. (j) The International Organisation would play an important part in facilitating migration, as well as in coordinating the work of improving agricultural efficiency and promoting research in the various countries.

Improvement of Distribution

The recommendations of section 3, on *The Facilitation and Improvement of Distribution*, are less definite in character, since they depend on international agreement in the wider field of reconstruction. (a) The Conference recognises that the key to the long-term problem lies in full employment, with generally increased purchasing power and improved standards of living. (b) It emphasises the need for maintaining a balance between agriculture and industry, and denounces international trade barriers and restrictions. (c) Expanded production without improved distribution is valueless, and in the immediate post-war period it will be necessary to ensure the most economic distribution of available supplies, and to avoid price fluctuations and unrestrained competition. (d) Though provision of food for national needs is primarily the responsibility of each nation, under-nutrition after the war will necessitate international action on a large scale. (e) International commodity arrangements will be necessary, and these should allow effective representation of consumers, the maintenance of adequate reserves and the orderly disposal of surpluses. (In this connection, the British delegation favoured the creation of an international buffer stock, which would guarantee ample supplies for consumers and markets for producers, but the details of how such a buffer stock would be operated appear to have been left for later consideration.)

(f) The Conference advocates international standardisation in methods of processing, preserving, storing, packing and transport, with international minimum standards for drugs and fertilisers and measures for protecting the consumer from unfair trade practices. (g) It recommends that full use should be made of such wartime developments as dehydration, and in general that there should be greater cooperation in securing marketing economies.

International Machinery

The work of the final section concerns the *Permanent International Machinery* through which the Conference recommendations may be carried out. (a) Until such time as a Permanent Food Organisation can be established, an Interim Commission is to function in Washington, meeting not later than July 15th. (b) This Commission will be charged with the promotion and coordination of research, and with the collection and dissemination of information. It will submit to the individual Governments recommendations for action along the lines agreed by the Conference. (c) It will examine such questions as the development of agricultural resources, commodity arrangements, consumer cooperatives, land tenure and other subjects considered at the Conference. It will thus perform in the field of food and agriculture many of the same functions as the ILO fulfils in the sphere of labour.

* See the *Second Book of Kings*, chapters xviii and xix, in which the incident is told.

NOTES OF THE WEEK

Design for Victory

The investment of Pantellaria and Lampedusa, in itself, gives no clue to the Allies' next intentions. In one aspect, these islands are impediments to be removed from the Mediterranean passage; in another, they are stepping-stones to Europe. In which light they are now to be regarded is not yet revealed. It is symptomatic of the transformation that has taken place in the balance of power that Mr Churchill's speeches are now scanned and sifted, by friend and foe alike, with even more avidity for information about the future course of events than were Hitler's speeches between 1938 and 1941. There is little doubt that the eloquent discretion of the Prime Minister's report to Parliament on Tuesday left the scanners and sifters, very properly, dissatisfied. Two points in particular were in the minds of a number of listeners and readers at home. Some people have lately seen signs, so they thought, of a change in the strategical intentions of the Allies. Is the attempt being made, they ask, to win the war in Europe primarily by bombing? Have the directors of Allied strategy, they wonder anxiously, watered down the policy of "Hitler first," under pressure for action now in the Far East? Statements by Mr Churchill in the United States has given rise to both these speculations. In his speech to Congress, he said that the experiment of winning the war by bombing was "well worth trying"; and he told a press conference that the wars against Germany and Japan would be pursued "concurrently," and not "consecutively." On Tuesday, Mr Churchill neither confirmed nor removed these doubts. Air bombardment, he stated, would be "the first cause" of the enemy's ruin, and he gave it as the aim of Allied effort to achieve "the complete destruction of our foes by bombing from the air, in addition to other means." He told how the heightening of the bombing offensive, decided upon by him last summer as Minister of Defence, had involved "sacrifices everywhere"; and he spoke of the fruitful use of long-range air power against enemy submarines. Of the war in the East, he said very little. The giving of "more speedy and effective aid" to China, and of "a stronger measure of security" to Australia and New Zealand, he declared, is "constantly in mind." To the layman, one thing seems certain: a decision to rely chiefly on bombing in Europe, and to concentrate forces in the Pacific before Hitler is beaten, would be contrary both to the high opportunity of victory that now confronts Allied arms and to Mr Churchill's own principles of attack by every means against the most dangerous enemy. To have the initiative, Mr Churchill said, is "a heavy and exacting responsibility," as well as an immense advantage. The time that has been gained by victories in Russia and Africa will equally be lost whether it is not used or is dissipated in failure. The Prime Minister specifically said that "amphibious operations of peculiar complexity and hazard on a large scale are approaching"; and on balance there seems no reason to suppose that the combined assault upon Europe by all arms for which the whole world is now waiting will be delayed too long. The coming struggle in Russia—"the greatest battles impending"—has yet to start, and a main purpose of the Allies in Europe this year must be to synchronise the blows they give and receive with the fortunes of the Russians, who are "bearing the heaviest burden, and paying the highest price in blood and life." It still seems likely, therefore, that when the curtain goes up, the drama will unfold on land and at sea, as well as in the air, and "that wicked man" will be the central figure. That is the Churchillian manner—and the right design for victory.

Bombs v. Torpedoes

In the course of his speech in the House of Commons, Mr Churchill pictured the war, in one aspect, as a contest between British bombers and German submarines. The first priority in this country must be the U-boat war, because upon shipping all else depends—and because the Germans are basing their few remaining hopes upon the sinking of Allied ships. At the moment, the vast under-water offensive is being more than held. May was the best month both for Allied losses and U-boat casualties since December, 1941. The method of attack in packs means that the U-boats can be, and are being, brought to battle. "We may have set-

backs"—but it seems unlikely that, at the worst, the U-boats can do more than impede and slow down the Allied advance. Meanwhile, in the air, the enemy is being worn down remorselessly. The process of wearing down is necessarily slower than very many people suppose; and the need for aircraft to perform, on a larger scale in a bigger battle, the strategical and technical tasks that were carried out so effectively in Tunisia means that the margin of resources available for long-range air bombardment is not large enough to permit the continuous blasting that would probably be required if the great experiment of victory by bombing alone were to be made. It means, too, that the same organisation of co-operation and combined command that was evolved *ad hoc* in North Africa will be needed in the wider sphere of combat. At present Allied air power is plainly all-purpose. The bombing of Italian islands, bases and towns is as directly an aid to naval and military operations as it is an offensive against output and morale; and the moment Allied troops land on the outworks of German Europe, with the way cleared and the landing covered by air mastery, the same will be true of the bombing of Germany and its western fiefs.

A Palace Revolution

The situation in Buenos Aires, after the military *coup d'état* which began last Friday, is still far from stable. Nor has the provisional Government, headed by General Pedro Ramirez, a former Minister of War in the Castillo Government, issued a statement of policy. The Government was, however, formally sworn in on June 7th, and its legality has been recognised by the Supreme Court. The personnel of the Cabinet is wholly military and Conservative; and the vice-president, as in the short-lived Cabinet formed by General Arturo Rawson, the leader of the *coup d'état* of June 4th, is Rear-Admiral Saba Sueyro. Ex-President Castillo is said to be at liberty in Buenos Aires; after a brief attempt to rally the country behind him from a mine-sweeper in the River Plate, he acquiesced in the *fait accompli*. His former Cabinet, some members of which retreated to the Argentine embassy at Montevideo, have been permitted to remain at large. It seems likely that the withdrawal of General Rawson from the political limelight, after one crowded day of office, in which he dissolved Congress and suppressed the Communist newspaper *La Hora*, was due to personal difficulties rather than to any divergence of policy between him and his successor. The dropping of the only two civilians in the Rawson Cabinet, both of whom are accused of pro-Nazi sympathies, scarcely illuminates the ideological confusion which surrounds the leaders of this revolution. It is plain from the tone of Axis propaganda that Berlin knows as little as London or Washington of what the new Argentine Government really stands for. The immediate cause of the revolt is believed to have been the knowledge that President Castillo had virtually secured the election of his nominee, Patron Costas, as his successor at the forthcoming presidential elections, and that an important section of Argentine opinion resented the prospect of automatic, and indefinitely continued, government by the Castillo clique.

Government by Military Junta

The background of this truly Latin American change of Government is complicated. President Castillo's rule—his maintenance of a state of emergency, his avoidance of free elections and his rigid censorship—was authoritarian without being strong. It was widely criticised and generally unpopular; but there is no ground at all for supposing that he has been displaced by democrats. His democratic and Radical critics who might possibly command a majority at a free election apparently remain in the wilderness. The Argentine press on June 5th, it is true, contained a number of articles pressing for a return to the exercise of democratic rights and condemning the prevalent corruption. The Uruguayan press, however, has continued to point out that in the absence of evidence to the contrary, a military government appears to have replaced a civilian dictatorship.

The military, no doubt, had purposes to serve in domestic politics, but it seems likely that the immediate occasion for the revolt lay in the international situation. Not that the *coup* is necessarily to be interpreted—as was done in the first flush both in Washington and London—as a pro-Allied move heralding a diplomatic rupture with the Axis. This may still be the case, but so far General Ramirez has committed himself only to a policy of continuity in foreign relations, coupled with a reiteration of Argentine neutrality and independence. But what chiefly alarmed the Argentine soldiers and sailors was the fact that Brazil, Chile and Uruguay are all having their military and naval establishments expanded by Lend-Lease facilities, while Argentina, which likes to think of herself as the leader of South America, is losing ground. The United Nations—and particularly the United States—will, of course, require some more substantial proofs of sincerity than a mere change of personnel. No doubt it remains as true as ever that Argentina contains a large number of genuine democrats who fervently support the cause of the United Nations. Since the death of General Justo, the most distinguished supporter of the Allied cause—he offered his personal services to belligerent Brazil—this section of opinion has lacked leadership. It does not appear to have found it in the new Government.

The French National Committee

The Committee of National Liberation was established on June 3rd by virtue of an Ordinance signed by General Giraud and General de Gaulle. The Committee will conduct France's united war effort; it will exercise authority in all unoccupied French territories; it will have diplomatic representation; it will continue to exercise its functions until the total—or even partial—liberation of France makes it possible to set up a provisional Government in France according to the laws of the Republic. The impersonality and collective responsibility of the new Committee are assured. Under the alternating Presidency of General Giraud and General de Gaulle, there are twelve members: M. André Philip—Minister of the Interior and of French Resistance; M. René Massigli—Foreign Minister; M. Jean Monnet—Minister for Armament and Supplies; General Catroux—Moslem Affairs; M. René Plevin—Colonies; M. Henri Bonnet—Information; M. Adrien Tixier—Labour; M. Maurice Couve de Murville—Finance; General Georges—Minister Without Portfolio; M. Diethelm—Production and Trade; Dr. Jules Abadie—Justice, Education and Health; M. René Mayer—Communications and Merchant Navy. This list is remarkable by the number of men in it who are not, strictly speaking, politicians. M. Monnet is a financial expert with League of Nations experience before the war; he was Chairman of the Anglo-French Co-ordinating Committee before the collapse of France and afterwards worked in Washington on the British Supply Council. M. de Murville was second in command at the French Treasury. M. René Mayer was the Director of French Railways. M. Adrien Tixier was Under-Secretary of the ILO. The technical qualifications of these men are more important than their previous attachment either to General Giraud or General de Gaulle. The same is probably true of M. Massigli, who was a career diplomatist until 1942. M. Bonnet's appointment is remarkable since, a "neutral" figure with a long League of Nations experience, he represents a compromise between the two Generals. He replaces M. Labarthe, General Giraud's Minister of Information; General de Gaulle's candidate was M. Soustiel. The appointment of M. Philip as Minister of the Interior and of Resistance raises the interesting question whether the new Committee will have full authority over the underground movement in France or whether some attempt will be made to keep it under the more personal direction of General de Gaulle. The field of civil administration is now fairly well settled, but there have been no decisions yet on the final form of French military organisation. The first decrees of the new Committee established a War Committee which was to be small and include the heads of the departments most directly concerned. It has not yet been set up, partly no doubt because none of the Service appointments has yet been made. There is no Commissioner either for the Army, the Navy or the Air Force. The military problem also includes the delicate question of General Giraud's position. For the time being he combines the Presidency of the National Committee with the post of Commander-in-Chief. This is not in accordance with French practice. Everything will depend now on the good will which the Committee members bring to their work and the degree

to which the Committee can avoid the legacy of the Third Republic—which still haunted Vichy—that of a changing and unstable, and therefore irresponsible, Cabinet.

Parliament

There was a touching scene, almost one of reconciliation, when Mr Aneurin Bevan associated himself with Mr Greenwood's tribute to the Prime Minister on behalf of the Labour Party. The particular passage in Mr Churchill's speech which evoked Mr Bevan's generous response deserves quotation in full:

Let me record the fact that this House, a democratic institution based upon universal suffrage, which has preserved its function and authority intact and undiminished during the war, and has shown it can change and sustain government with equal consistency of purpose, has proved itself the foundation and instrument for the waging of successful war and for the safety of the state never surpassed in modern or ancient times.

There have been times when the Prime Minister, pressed by crowded and anxious events, has been somewhat short and even harsh with his parliamentary critics. Some of those critics, and not least Mr Bevan, beset by the same anxieties as Mr Churchill, with none of his vast responsibility or store of information, have carried their duty of vigilant interrogation and personal scepticism somewhat beyond the limits of democratic helpfulness. On balance, however, neither the Prime Minister nor any of the relatively few Members of courage and energy among the Commons, upon whom his unparalleled wartime authority has rested, has forgotten that a central question in this struggle has been the ability of free men to oppose disciplined force to aggressive tyranny by free and representative means. First and last, Mr Churchill is a man of Parliament; his status as a world leader and his renown as the direct spokesman of British determination, has not abated his recognition that he is what he is because of the peculiar British system of representative and responsible government. It is this fact, perhaps more than any other, that has enabled the parliamentary method to prove, for a second time in a generation, that in a fight to the finish it can guide even

easy-going folk, wishing to lead a free life with active politics and other opportunities of innocent diversion and of national self-improvement

to a successful issue against a nation cradled in war and the discipline of military ways. The present House of Com-

mons is not a conspicuously able or representative body. Like the leaders whom Mr Churchill replaced in 1940, it was the product of a depression in British political life. Yet the tradition of parliamentary vigilance and responsible authority is so strong that this assembly has earned the high tribute which Mr Churchill has paid it—which is at the least a happy augury for the ability of this country to avoid the political pitfalls which will inevitably open up when the tension of total war is relaxed.

Enterprise

The speech made by the Financial Secretary to the Treasury, Mr Ralph Ascheton, to the Engineering Industries Association was probably intended to be, and has certainly been taken as, a reply to Mr Herbert Morrison's recent speeches on the post-war relations between state and industry. Mr Ascheton spoke, he said, as a Progressive Conservative. His purpose was not to deny that there is a very large sphere for advance by the method of guidance and direction by the state. Nor did he wish to assert that all was well with the present condition of private enterprise; he specifically advocated "strict control" of monopolies and price rings—a most welcome advance for a Conservative member of the Government. Mr Ascheton's chief purpose was to assert that private enterprise would have a vital role to play in the future of economic organisation. It would continue to exist, not merely as a temporary concession until the state could get around to abolishing it completely, but permanently and deliberately, within its proper sphere, because it had merits of its own that are essential to a free society. He came to the defence both of the profit motive and of the institution of private property. The former, with its "ruthless test of efficiency," and the latter, through the widespread guarantee of individual freedom it would provide if it were more widely diffused than at present, both form necessary elements of a balanced society. It was the proper role of the state to "supervise, advise and restrain" private industry—there could be no going back to *laissez faire*. But even as an ultimate ideal, the complete "absorption" of private enterprise by the state was to be rejected, and though controls of the wartime intensity could not be removed immediately the war is over, they should be retained only as temporary expedients.

All this is very true and needed saying. There is no real disagreement between Mr Morrison and Mr Ascheton. Mr Morrison has himself emphasised the case that can be made for private enterprise and Mr Ascheton would not deny the case for public enterprise. What they are both condemning—and very rightly—is unenterprise, Mr Morrison being more concerned with private unenterprise and Mr Ascheton with public unenterprise. In fact, the country is now very close indeed to realising that there is nothing more substantial than shades of emphasis between the views of responsible leaders in both parties on the proper relationship between the state and industry. The more is the pity that misguided partisans—the latest example is the *Daily Herald* in its comment on Mr Ascheton's speech—try to whip up differences where there are none, to impute motives that do not exist and to excite hostility where there should be unity in further progress. Democratic society will have enough difficulty in struggling with its real conflicts, without dead arguments being resurrected or unreal controversies created.

Labour and Beveridge

After the storm which the controversial questions of Communist affiliation and the electoral truce will undoubtedly arouse at the Labour party's conference next week, its discussions on the Beveridge Report may conceivably seem like sailing in calm seas. But there is one rock, even here, on which good temper may split and founder. This is the fact that Labour members of the Cabinet have not only supported, but also approved, the decisions of the Government on the Beveridge Report, while the majority both of Labour M.P.s and party members have done neither. The Executive Committee has tabled a resolution welcoming the social security plan as "an important advance towards a democratic social policy," while recognising room for amendments and improvements, and calling for immediate legislation. The interest of the Labour movement as a whole can be gauged from the fact that over 40 resolutions relating to the report have been submitted. No precise indication

of the official Labour attitude to the detailed proposals of the plan had been given until the Executive's report to the Conference set out the National Council of Labour's decisions on the individual recommendations, in comparison with the Government's declarations. The proposal for a Ministry of Social Security is accepted, subject to the establishment of representative advisory committees to avoid bureaucratic administration, and to the assimilation of the Ministry of Pensions in the new organisation. So is the proposal for the supersession of approved societies. The Executive suggests a higher rate of benefit for industrial disability—30s. against the Beveridge 24s.—and a reduction in the period of transition for old age pensioners from 20 to 10 years. The proposal for an Industrial Assurance Board, rejected by the Government, is accepted, and stress put on the need for a maximum charge for funerals. The proposal for making unemployment benefit conditional upon attendance at a training centre, which touches most closely the craft principles of the trade unions, is accepted, subject to a right of appeal against arbitrary decisions. On the face of it, this seems to be much the most significant decision the Executive has made; but the fact that it is accepted subject to further consideration in the light of the Tomlinson Report for the rehabilitation of the disabled suggests that this decision may be much narrower in its import than appears at first sight. The question is whether the trade unions will continue to insist on the reinstatement of unemployed workers in their old or similar occupations at their old rates of pay regardless of the changing structure of industry. Mobility of labour will be a vital requirement of prosperity and full employment after the war—and it is likely that the answer of the trade unions to this fundamental question has still not been given. The discussions of the Beveridge plan may have a bearing on the election to the Treasury. Mr Greenwood is closely identified with the original appointment of the Beveridge Committee, and with the Labour party's revolt in the House of Commons last February, while Mr Morrison had the task of explaining to the House why the Government could not accept certain recommendations. In the meantime, it is interesting to hear that Sir James Grigg has at last allowed a summary, though not Sir William Beveridge's own, to be distributed by ABCA. The soldiers of a democracy will now be able, with official approval, to read about what they are fighting for.

In Darkest Scotland

This week's debate in the House of Commons on housing and health in Scotland tended to concentrate on housing. It is not surprising that Members should have stressed the acute shortage of housing because it has a very direct influence on Scottish health. There are possibly individual English towns which have an equally bad record, if not worse, but if the statistics for the whole of the two countries are compared, it seems that the black spots of Scotland are a little bit darker than England's. The maternal mortality rate is about 2 per thousand higher. The infant mortality rate, though declining, is considerably higher; the record low figure of 68.5 per thousand live births in 1939, almost achieved again last year, compares with 50 for England and Wales in 1939, and the rate rose to 78 per thousand in 1940. Tuberculosis, an environmental disease, has increased both north and south of the Border since the war began, but whereas in England and Wales the percentage increase in deaths in 1941 compared with 1938-39 was 12.1, in Scotland it was 20. Moreover, although last year the number of TB deaths in England and Wales fell from over 28,000 to 25,500, in Scotland the number, according to one Member, is likely to have been stationary, and according to another Member will have shown a slight increase. In the light of these statistics, the stories painted by the Scottish Members of the housing conditions in Glasgow and Clydeside are given an added urgency. Nor is the problem entirely one of Scottish slums. Part of the overcrowding in the cities is due to the depopulation of the Highlands, which in its turn is partly due to the lack of amenities in Highland homes. Thus the remedy must be more far-reaching than a mere housing programme for Glasgow and Clydeside, which would only temporarily remove the worst symptoms. It is a case of recasting on a national scale the Scottish economy as a whole.

The VADs

The War Office's acceptance of the report of the Committee on Voluntary Aid Detachments (Cmd. 6448) ends a controversy that began over a year ago. In May, 1942, the

Army Council proposed that the VADs should be merged in the ATS, partly because it considered that the best use of man and woman power would thereby be made, and partly for the sake of individual VADs, for whom there is no prospect of advancement to officer status—in fact, the only promotion obtainable is from a Grade II nursing member to Grade I. A further reason for the merger was that an anomaly was created where VAD members were serving alongside the ATS. The VADs were not subject to military discipline, and, in the case of Grade I nursing members, but not dispensers, cooks and typists, had certain privileges such as first-class travel and board and washing allowance, and accommodation scale, as for the QAIMNS. The British Red Cross Society and the Order of St. John protested against these proposals on the grounds that there would be no saving of manpower because many of the VADs would prefer to resign and take up other war work rather than be transferred to the ATS, and also that the wearing of ATS uniform would be objectionable to nursing VADs, who held that a nurse's uniform commands special respect in hospital wards and off duty. The Committee was thereupon appointed to examine the problem. Its first recommendation is that the status and range of duties of VAD nursing members should be the same as that which would apply to the ATS nursing orderlies who are being recruited to replace RAMC nursing orderlies; this means that the privileges referred to will lapse. VADs, like members of the ATS, should be subject to military law, and, to avoid dual control, the office of commandant should be abolished and VAD welfare left to the officers commanding units, and to the QAIMNS officers. There would be no officer ranks in the VAD, but selected members should be eligible for direct commission in the ATS. Others should be eligible for promotion up to the rank of warrant officer to assist hospital matrons in supervising domestic matters affecting the VADs. If these recommendations are carried out, the Committee considers that there is no case for merging VADs with the ATS. The former should be allowed to keep their own identity and their own uniform—though there is a specific recommendation that the expensive uniforms so often favoured by certain VADs should be avoided.

Whistling in the Dark

The demonstration held at the Berlin *Sportpalast* on Saturday last, June 5th, throws some light on the state of German opinion. The chief speakers were Professor Speer, who a year ago was put in charge of the rationalisation of the German armament industry, and Dr. Goebbels, who has recently emerged into new prominence as official public substitute during Hitler's prolonged disappearing act, and as chief propagandist in the "total mobilisation" drive of recent months. In the course of Speer's long speech some figures were given about German armament production in 1943. In May, 1943, the total output of munitions was six times greater than the monthly output in 1941. The manufacture of guns was up by 400 per cent. Significantly the production of light and medium tanks was only 20 per cent of 1941. The output of heavy tanks and assault guns had increased between February and May, 1943, by 250 per cent. These figures are impressive, and, although there is no possibility of checking them, some of them may even be true. But Speer shrewdly chose the average monthly output of 1941 as a basis of comparison; in other words, the period during which Hitler ordered the stoppage of the production of certain kinds of munitions and weapons on the grounds that the stocks were enormous and the war nearly won. The year 1941 was a peak year in Germany's overall production, but during 1942 the actual production of munitions and weapons was greater, because heavier restrictions were put on civilian output. The figures given by Speer would have looked very different had he chosen 1942 as a basis. His speech may have served its chief purpose—to encourage the German people with a picture of their own strength. But it betrays their uneasiness over the comparison between the German and the Allied war effort. They suspect that the Allies, especially the Americans, are outproducing them. Hence the idea of "total mobilisation," primarily a political manoeuvre designed to make the Germans believe that in their overstressed war economy there was still a big slack to take in; hence Speer's figures to convince them that the slack has been taken in to good effect. The most interesting point of the Rally was, however, the background against which Speer's production pep talk was set. There was no question of "on to victory." On the contrary, the tone throughout was grim and glum, the theme that of no

surrender, and holding out against all odds. This probably explains Dr. Goebbels' dismal failure in his attempt to repeat his revivalist performance of last February. His tirades against the Jews and the bombing attacks fell flat. He had little else to say. The Doctor is finding that a military dictatorship, fed on glory, cannot pull a recipe for morale out of its tin helmet when the day comes for defensive warfare.

Re-educating Germany

Both in America and Britain, there is a persistent myth that the re-education of the German people is a mechanical job which can be perfectly well managed provided a sufficient number of serious-minded democrats—Allies as well as German emigrants—are trained for the job. Mr Wallace and Mr R. A. Butler have done well in recent weeks to remind the world that the re-education of Germany will be done by Germans. Both stressed two stages in the process of re-education. The first is total military defeat. The realisation that blood and glory ends in defeat and disgrace is in itself a very powerful lesson, and judging by the recent purges in the German universities—purges which have included professors as distinguished as Kurt Huber, of Munich—it is possible that the lesson of defeat is already being learned. The next stage is to encourage those people in Germany who believe, in Mr Wallace's words, in a "peaceful, worthwhile purpose in life." He believes that they exist. The Allies' delicate task is to temper stern justice for war criminals with generosity and understanding for the young men and women on whose collaboration the future of Europe must to a great extent depend. In other words, it is as bad to snub the democrats as to appease the militarists. There is, however, a third step in the process of re-education which Mr. Wallace perhaps had in mind when he turned from discussing the re-education of Germany to talk of the political immaturity of the American people in 1918:

As a nation we decided we were not ready to take on adult responsibilities. We were not ready even to graduate from high school, and some of us wanted to go back to the eighth grade.

It is no use expecting the German people to rediscover the way of peace, democracy and responsible international action if the peace-loving Powers merely pursue retribution, as they did last time.

Licensing

Plans for post-war organisation still flow from trades which wish to see something like a guild system after the war, with restriction of entry. Everything that draws attention to this movement does a public service, whatever the intentions of the inquirers or publicists. The Association of Rotary International in Great Britain and Ireland has made a survey of projects through its constituent clubs; and it emerges quite clearly that, in the retail trade, for instance, there is a general wish among the associations to see both the number of shops and of traders restricted. There would be, it seems, a National Council, made up of representatives of employers and work people with a leaven of independent members. Each separate trade or group of traders would have its own committee. Each trader would be compelled to belong to the organisation of his group. There can be no doubt that trade organisations of this kind might well perform very valuable technical and professional functions. But it would only be possible to view their spread, on a compulsory basis and with the sanction of the state, with anything like equanimity, if, at the same time, it were made impossible for such bodies to engage in the practices that condemn them out of hand from the national standpoint, whatever their other virtues and uses. These practices are well known: the fixing of minimum prices and of maximum quotas of sales or output; and the restriction of entry—in short the supersession of competition by quasi-monopoly to the harm of the consumer. Unfortunately, it seems that restriction of entry and of competition is fundamental to almost all these plans. Even among the associations that agree on this principle of restriction, however, there is some disagreement. They cannot decide how to deal with "mixed businesses," with the sale of perfumery or soap, for instance, by a pharmacist, when there is a grocer next door. This sort of problem is very much exercising the ironmongers' associations—furniture shops which sell gardening tools and paint, drapers who sell hardware and so on. The aim is to prevent traders

from selling what they will, just as it is to prevent buyers from purchasing what they want where they choose. Fortunately, it is much more difficult to do than to aspire to.

Shorter Notes

The leader of the Ceylon State Council stated this week that the Board of Ministers considered that the British Government's declaration on constitutional reform in Ceylon (discussed in an article in *The Economist* last week, page 725) marked a definite advance. He added that they did not like the qualifications in the statement but, believing that they were unnecessary and would decay from disuse, they were proceeding to frame a constitution in accordance with the Government's offer.

Amends have been made to the Jews and Arabs arrested in Tangier for suspected pro-ally sympathies. A "pardon" has been issued by General Uriarte, the Spanish Governor of Tangier, and their release was initiated toward the end of last week.

At a press conference last week, Sir Wilson Jameson, Chief Medical Officer of the Ministry of Health, stated that by the end of last year about 3½ million children in England and Wales had been protected against diphtheria under the free scheme organised by the local authorities. Others had been immunised by private doctors or had been protected before 1941 when the national campaign was started. At least 50 per cent of the children aged 1-15 are immunised, but efforts will be made to raise the percentage to 75, for until that figure is reached, there will still be diphtheria epidemics in various parts of the country. The value of immunisation is shown by the fact that the number of deaths last year was 1,000 fewer and the number of notifications 13,000 fewer than the average for the previous ten years.

AMERICAN SURVEY

Agricultural Conversion

(By a Correspondent in Iowa)

Des Moines, April 30th

THE conversion of American agriculture to serve war needs is still far less complete than the conversion of industry, and will not be made complete in 1943. Partly, this is because there are so many more individuals making the basic decisions: there are over 6 million farms in the continental United States, with the operator and his family providing three-fourths of the total farm labour force for the lot. Partly it is because of the dangerous jockeying for position by the political spokesmen for agriculture and for labour, and by different interest groups within agriculture itself. Partly it is because the huge federal Department of Agriculture and the farm groups that have benefited from its activities find it hard to make the drastic shifts in attitude and measures necessary to switch from crop reduction and price raising to crop expansion and price limiting, though this switch was inherent in the whole "parity" concept and was consciously formulated from the start by such farm spokesmen as the Vice-President, Mr Henry A. Wallace.

One of the frictions most puzzling to outsiders and most dangerous to full production arises out of the notorious fact that roughly half the farmers in the United States produce nearly all the marketable surplus of food. So when the war brought a need to expand food production instead of to contract it, two schools of thought developed: one emphasising the desirability of getting the productive half

to produce yet more; the other emphasising the desirability of getting the largely untapped half into production for the market.

The latter school was championed inside the federal Department of Agriculture by the Farm Security Administration (FSA), which since 1937 has been engaged in a wide variety of endeavours to help low-income farm families toward self-support at better living standards; also by certain economists in the department's planning branch, the Bureau of Agricultural Economics, and, briefly, last winter by Mr H. W. Parisius while he was Director of Food Production. Outside the Department this policy was championed by the left wing of New Dealers generally and by the National Farmers' Union, the one of the three chief private farm organisations which has been closest to President Roosevelt on domestic policies in recent years.

This school promised a 20 per cent increase in farm production at a time when conservatives were fearful that there might instead be a decrease: 1942 had unusually favourable weather, the larger commercial farms were at, or near, capacity in that year, farm labour was being drawn off to the armed forces and war industries, and farm machinery production had been ordered to be cut to 23 per cent of 1940 and a cumbersome system of rationing applied to existing stocks of farm machinery.

Even so, Mr Parisius thought an expansion could be achieved, mainly by a gigantic extension of the highly

individualised "case work" methods developed by the FSA.

A whole train of obstacles—political, administrative and economic—stood in the way of this ambitious proposal. The political ones hit first. The severest critics of the FSA were among the substantial commercial farmers and plantation operators and their spokesmen in the Department of Agriculture and the farm organisations. Many of these thought the FSA "clients" were "worthless," the FSA staff "dreamers" or worse, and the whole scheme a costly subsidisation of undeserving and inefficient competitors and actual or potential farm labour. The FSA had vulnerable spots in its record, especially in its early years.

The American Farm Bureau Federation, headed for years by Mr Ed O'Neal, an Alabama cotton planter, and having its chief strength among the more prosperous commercial farmers of the corn (maize) and cotton belts, played a leading part in the fight as a national lobbying organisation, though not all of its state branches felt the same way. Economically, the arguments against the plan were that (1) any increase in the poorer farmers' food production would go largely to increase their admittedly inadequate diet, and (2) that with labour and machinery the chief limiting factors in production, it was more efficient to apply as much as possible to the richer lands of the commercial farmers and under their more skilful management. Even the FSA and the Farmers' Union recognised the force of this, and part of their plan was to train thousands of volunteer farmers and farm youths from the poorer lands—Appalachian hill country and cut-over Great Lakes districts—for year-round labour on the richer dairy and livestock farms of the corn and dairy belts, and to mobilise other thousands for seasonal labour on the specialised fruit and vegetable crops.

Beginnings were made on both these projects during the winter, along with plans to import farm labourers from Mexico, the Bahama Islands and Jamaica. The draft of farm workers into the armed services has twice been relaxed, until now all "essential" agricultural workers are deferred. Other sources being explored are former farm workers in non-agricultural jobs, conscientious objectors, prisoners, women and youths. The order issued by the War Production Board in November, holding down manufacture of farm machinery to 23 per cent of the 1940 production, was raised in February to 40 per cent, too late for all but late harvests in 1943. But stocks were released and more spare parts made available, and fortunately the great corn and wheat belts were already highly mechanised before the war.

Here, at least, Marxist prophecies of a proletarianised agriculture have not worked out. There is less dependence now on hired labour in grains than there was in the early days of farm machinery. Social customs restraining farm women and youths from doing certain types of farm work have been strongest in the grain, livestock and dairy belts, though modern machinery makes much more of it physically feasible and the taboo has been breaking down. This fact alone gives these areas an invaluable reserve labour supply for the emergency.

The small rubber-tyred tractor with powerful running lights and the still newer small crop harvester join these to make it possible for a corn belt family to run a family-sized farm by themselves with top modern efficiency. Trucks and "interior markets" have given them alternatives to the railroads and big city markets they once denounced as monopolistic middlemen. The telephone, the radio, often electric light and power, the automobile and the all-weather road have enriched their lives. These are the farmers whose crops pile up great surpluses. This year, in spite of labour and machinery troubles, they reported intentions to plant more corn, more oats, more soybeans, more potatoes, more flaxseed, more peas and beans. With the huge existing supply of wheat in storage and field and the many small farmers with livestock experience but not enough animals to keep them fully employed, there are sizable possibilities for expansion in hogs, dairy cattle, poultry, etc., given ample loans and some guidance.

Unfortunately, it is the larger farms with more hired labour and already in full production which tend to dominate most of the farm organisations and the farm bloc in Congress. Especially is this true in the South, where so many of the low-income farmers live, and where in seven states payment of a poll tax is a prerequisite to voting. There, even more than in the corn belt, is deep suspicion of outsiders from Washington who come in and lend money to these local poor folks and teach them expensive tastes. This suspicion acts as a drag on the full conversion of agriculture.

American Notes

Reciprocal Trade

The passage by the Senate of the Bill renewing the President's power to conclude reciprocal trade agreements was briefly noted in *The Economist* last week. The size of the majority on the final vote—59 to 23—and the fact that all amendments were rejected have been widely taken as a demonstration that Congress's bite is often less harmful than its bark. It is, indeed, an encouraging result; but it would be a mistake to read too much into it. For one thing, some of the wrecking amendments were rejected by majorities of as little as 44 to 33, which is less than the two-thirds majority necessary for the ratification of treaties. For another, though 7 Republicans voted for the Bill, they were matched by 7 Democrats who voted against it. And if there were any temptation to read into the vote a decisive indication of "internationalism," it can be deflated by the reflection of one American newspaper that Congress was, after all, only confirming its attitude of nine years ago.

Security for All

A Bill embodying most of the proposals of the National Resources Planning Board's report on social security has now been put before Congress by Senator Wagner. It proposes, on the one hand, to widen and strengthen the existing system of social insurance, and on the other to establish a more complete system of public assistance. On the question of insurance, coverage is to be extended to millions now outside the law; sickness and disability insurance is introduced, filling the greatest gap in the present law; and, perhaps most important, it is proposed to establish a unified contributory programme, based on a single 6 per cent contribution from employers and employees, and providing a uniform set of benefits throughout the country, in the place of the logically indefensible confusion of state and federal insurance schemes now in effect. From reports, it appears that Senator Wagner has suggested a level of benefits substantially higher than those now paid, particularly in the case of old-age insurance. Of particular interest are the provisions covering demobilised soldiers, who would be eligible for unemployment benefits ranging from \$12 to \$30 a week, according to the number of their dependants, and continuing from six months to a year if necessary. Strengthened Federal employment offices, under the auspices of the Social Security Board, would assist war veterans to find places in industry. Public assistance, now administered by the states on a system of equal Federal contributions, would receive additional funds under an arrangement whereby the Federal government would pay 75 per cent of the costs in the poorer states. The Wagner-Murray Bill embodies most of the social security reforms generally agreed upon by the experts, with the notable omission of the principle of the "right to work" put forward by the NRPB's report. In the reaction against anything smacking of New Dealism, however, it is doubtful whether the expansion of social security legislation stands much chance of passage through Congress. On this point the Republicans appear certain to take a firm and reactionary stand, and to preserve social security as a live issue for 1944. If the Wagner Bill has any hopes of speedy action, it is due to the skilful appeal to the soldiers' interest. The shadow of veterans yet to come already lies across the future of American politics.

Fetters for Labour

Mr John L. Lewis's compliance with the President's order that the miners return to work by June 7th has been interpreted, in the first flush, as his final defeat; but more than that, it is widely taken as proof of the need for even greater firmness in dealing with war-time strikes. It has not gone unnoticed that Mr Lewis's surrender followed with great promptness upon the passage in the House of Representatives, by a large majority, of the Smith Bill, which, among other restrictions, would have made it possible to send him to jail for his part in the renewal of the coal strike. Mr Lewis has a unique capacity for provoking Congress. The present Bill is a freshened-up version of the same Bill passed by the House in November, 1941, after an earlier coal stoppage. At that time, the efforts of the Administration and organised labour buried it in a Senate committee. Unlike the Connally Bill, which has passed the Senate, the

House Bill would apply in many respects to disputes in all war plants, not only to those which have been taken over by the Government. Among its most hotly opposed provisions are those requiring labour unions to register with the National Labour Relations Board, and file statements of their finances; prohibiting political contributions by labour unions; and requiring a secret ballot and a 30-day "cooling-off" period before the calling of a strike in a war plant. Two provisions are directed point-blank at Mr Lewis, and have led Mr Elmer Davis to christen it the "Lewis Anti-Strike Bill." One gives the War Labour Board the right to subpoena witnesses, a result of Mr Lewis's refusal to attend the Board's meetings; and the other imposes a fine of \$1,200, or a year in gaol, on any one instigating a strike in a Government-seized plant. Administration witnesses and spokesmen have vigorously opposed the more drastic provisions of the Bill, and good behaviour on Mr. Lewis's part might lead to their elimination, in conferences between the Senate and House representatives. But surrender has not sweetened Mr Lewis's disposition. Even in ordering the miners back to work, he took the opportunity of denouncing the War Labour Board for its order suspending collective bargaining during the walk-out. Moreover, it would be premature to assume that the affair is ended. Negotiations with the soft coal owners appear to be breaking down, with Mr Lewis declaring the conference a "farfetched proceeding," and an insult to the miners and the nation. The very fact that the return of the miners to the pits has been characterised by the union as an extension of the truce to June 20th only is explicit encouragement to Congress to retain in its Bill the most drastic provisions to deal with another strike.

are not forthcoming; and the prejudice which stands in the way runs right down into the working classes and the unions which represent them. That this prejudice hampers the successful prosecution of the war was the burden of a recent White House announcement which laid it down as the duty of all employers—public and private—and all labour organisations, to eliminate discrimination. And Dr. Frank Graham, announcing the Labour Board's decision, pointed out that in addition to the question of democratic sincerity, "the negro is necessary for the winning of the war." The increasing strain on manpower as the war progresses will provide better jobs for negroes. Surrendering to necessity does not, however, mean that there will not be tension. The Packard strike was an indication of the strength of feeling in the north. In the south, with its ancient tradition of negro inferiority, and its frankly avowed fears, the situation is even more delicate. Since war began, several southern states have been swept by alarmist rumours of proposed negro uprisings, rumours which, when tracked down, had no foundation in fact, but were apparently the spontaneously generated result of endemic fears. It should also be said that sections of the negro press have pursued a more violent policy than discretion might have indicated. The opportunities provided by the war for the advancement of the negro's position will be of lasting value only if the pace is not forced.

Shorter Notes

The Senate has passed the compromise "Pay-as-you-go" income tax bill. It now goes to the President, who is confidently expected to sign it.

The latest Gallup poll tested the popular attitude to the question of a fourth term for President Roosevelt. Voters were asked whether they would approve of a fourth term in three differing circumstances, with the following results:—

- (a) If the war is over. For a fourth term, 31 per cent; against, 69 per cent.
- (b) If the war is still going on. For, 56 per cent; against, 44 per cent.
- (c) If the war is not entirely over, but looks as though it might be soon over. For, 51 per cent; against, 49 per cent.

The Negro's Wage

"Equal pay for equal work" is a principle that now applies to negroes as well as to women in war work. The War Labour Board, in a test case affecting a small number of workers at a Texas oil refinery, has ruled that the classification of wages according to the colour of the worker be abolished. The difficulty of making such a decision a reality was almost simultaneously brought out by a strike at the Packard plant in Detroit, which was occasioned by the up-grading of three negro workers, who graduated to the assembly line from some more menial occupation. Although the decision of the Board breaks new ground, it will hardly satisfy the coloured man if opportunities for equal work

THE WORLD OVERSEAS

The End of Aberhartism

(From Our Ottawa Correspondent)

May 26th

IN his death—at Vancouver on May 23rd—Premier William Aberhart rated obituary notices that ran, in some instances, to several columns of Canadian newspapers. In his eight years of public life, he had been headline news, and not only in Canada, though on a decreasing scale lately.

CANADA

The remarkable development of Canada presents opportunity for post-war trade extension. Explore now. Canada's oldest bank welcomes enquiries.

Main London Office:

BANK OF MONTREAL

47 Threadneedle St., E.C.2

Assets exceed - \$1,000,000,000

Incorporated in Canada in 1817 with Limited Liability

When elected in 1935, Aberhart led a group of 56 out of 63 members in the Alberta legislature. His pledge to provide \$25 a month out of state resources for each adult in the province aroused fanatical enthusiasm in some districts and attracted migrants from other provinces. Foreign-born residents rushed to take out naturalisation papers to qualify for Social Credit dividends.

A man of attractive personality, who mixed religion with politics and aroused intense antagonisms as well as loyalties, Aberhart was the product of acute economic depression. As the social conditions which had created currents of discontent underwent change, the Aberhart Government mellowed and became, as the record shows, a passably honest and efficient provincial administration. Aberhartism as a doctrine of monetary reform and social revolution was steadily watered down as the shadow of economic ruin passed away. The end of the serious drought in the rich farm lands of Alberta, the rise of new prosperity based on the war demand for farm products, and the special Alberta boom, occasioned by Canadian and American defence developments in north-west Canada, restored a new faith in progress. None of these things was due to Aberhart. They came in spite of him. But they marked the turn of the cycle, and Aberhartism had run its course. Aberhart him-

self, before he died, was busily seeking to extend his political power. He was learning French, against the prospect of campaigning in Quebec. But his political movement was steadily losing ground. His small group in the Federal Parliament exerted scarcely any influence on national policy.

A retired British major, C. H. Douglas, the originator of Social Credit doctrine, played a curious part. Aberhart scarcely quoted Douglas, and probably preferred popularised versions of his clouded doctrine. The previous Government had Douglas under contract as an adviser, but he freed himself from the contract shortly after Aberhart took office. "In fifteen months," Douglas had said, "I believe that Alberta will be a blessed land." But finally Aberhart declared: "If Douglas does not come, why I'll do the job myself." "For the first time in modern history," Douglas had said, "a Government has been elected against the wishes of those financial powers which, for the most part, control all governments." Aberhart believed this, too, and acted in the faith. His chief obsessions were "the money barons" and the press.

On the negative side, Aberhart's inspiration was emphatic enough. He was against debt and poverty. He believed in the universal depravity of the human race. He experimented with a number of measures relating to monetary reform. His Government issued stamp scrip along lines suggested by Silvio Gesell. These "prosperity certificates" failed. At a net loss of \$350,000 a year, his Government has operated a system of Treasury branch banks, of which cheques circulate in Alberta. This scheme is probably an infringement of Federal banking law, but, possibly on the ground that it is better to allow the experiment to proceed rather than to stop it, there has been no interference with it.

As in monetary reform, the chief barrier to the cancellation and reduction of private debts has been the Canadian constitution. There is a field, restricted to approving debt settlements made by agreement and to providing administrative machinery for assisting such agreements, in which the provinces may operate in debt adjustment. But the arbitrary scaling down of debt contracts is beyond their jurisdiction, except in the power of moratorium. Altogether, the Aberhart Government sponsored twenty legislative measures that were disallowed by Ottawa or ruled unconstitutional in the courts. In a total bonded indebtedness of \$127,953,000, the province of Alberta has more than \$25 million worth of its bonds in default, through the refusal of the Aberhart Government to meet maturities. This was a case, not of inability, but of unwillingness, to pay. Since July 1, 1936, the province has offered to cash interest coupons only at half the contract rates.

The Spellbinder

The political career of Aberhart cannot be understood without some knowledge of his power as a spellbinder. He regularly conducted Sunday services, under the auspices of the Prophetic Bible Institute, which he founded while still a school teacher in Calgary. He would praise the virtues of Christian life and curse his critics in the same sermon. His campaigns for office were conducted in a spirit of vituperation unequalled in recent Canadian history. Those who criticised him were "terrorists and false propagandists." His sincerity was not in question when he declared that he could "create credit by a stroke of the pen," when he promised to pay dividends in "fountain-pen money." He was merely intellectually incoherent.

The stock in trade of most reformers of Aberhart's type is that the will of the people should prevail. Aberhart rather identified himself with the will of God. His most characteristic pose was, in the pulpit, as an interpreter of Scripture, a task aided by canned sermon material obtained from an American fundamentalist organisation. A man who denounced economists, Aberhart claimed omniscience on a scale to which no reputable economist ever pretended. There was a dark side to his career, and it appears in the perspective which a few years have provided for the troubled 1930's. Aberhart was in the line of reaction against liberal reason in politics. He attempted to shackle the press and to deprive bank employees of their civil right. His declared creed contained this:—

We believe in the creation of man in holiness, by direct act of God, and not by an evolutionary process; in the historicity and terrible reality of the fall of man and the resulting total and universal depravity of human nature.

Whether Aberhart had said that the average mentality of the people of Alberta was thirteen years of age was once a subject of controversy. In a sermon on July 26, 1936, he said: "The mass of the people to-day have never been

taught to think or reason." He acted on the supposition.

Many progressive-minded people regard Aberhartism as a reaction to progress. Aberhart's career served the purpose, however, of producing a long public discussion on money and banking and, as well, it illuminated many precise aspects of the relations between the Dominion and the provinces. He helped to delay the Federal Government's programme of reform in Dominion-provincial relations, and his death removed from public life the last of the three provincial premiers who blocked the Dominion-provincial conference of January, 1941. His emphatic affirmation that a better social order is within reach drew many deep undercurrents of social discontent into his following in the years that will be remembered in Alberta as the hard times. For that reason, he will be remembered by many as a legendary figure, full of righteousness, indignation and violent language, on the side of the angels.

Bolivia at War

[FROM A CORRESPONDENT IN LA PAZ]

May 1st

ON April 5th, the day Mr Henry Wallace arrived in La Paz, the public was surprised by the announcement that the Supreme Defence Council had recommended President Peñaranda to decree a "state of war" (as distinct from a "declaration of war"). On April 7th this recommendation was accepted.

Bolivia's action was probably motivated by several factors—some international, some domestic. At least two of its neighbours, Peru and Chile, seemed to suspect that Bolivia's underlying intention was to outsmart them and to secure advantages by obtaining as a belligerent the right to participate at the peace conference and to push energetically its demand for an outlet to the sea. The La Paz evening paper, *La Noche*, has waged a campaign to this effect since the beginning of the year. Suspicion of Bolivia's intentions was voiced by Sr Alberto Ulloa, ex-Foreign Minister of Peru, in an article published by *La Prensa* in Lima:

We are aware that the only gun-shot which Bolivia will probably fire in the Second World War will be towards the sea and at a very definite target at that. This was how Chile took it. This is how we take it too. . . .

And although Anze-Matienzo, the Bolivian Ambassador in Lima, immediately and categorically denied that "several war plans were being worked out and that one of them was directed against Peru," the discussion was typical of opinions held by certain quarters in Chile and Peru.

Another motive attributed to the Bolivian Government was that it wished to bring pressure on the US Government by the declaration of a state of war and persuade it to grant higher prices for Bolivia's strategic minerals, particularly tin and tungsten, and perhaps secure long-term contracts which would prevent a collapse in the Bolivian economy at the end of the war.

So far as domestic implications are concerned, Bolivian politics are very much dominated by next year's presidential election. The present coalition of the traditional parties resembles the headquarters of an army, with a lot of generals but no soldiers to command. Its popularity declined even more after the recent tragic events in Catavi

THE EMPIRE PRESS - NORWICH

(described in *The Economist* of March 27, 1943, page 395). The state of siege decreed on the outbreak of the strike in the Patiño tin mines expired on March 15th, and there was no justification for prolonging it. The repression of the PIR (the political party of the Bolivian working class) had not yielded the desired results—on the contrary, it had made martyrs of them. The Bolivian press has even talked about a left wing presidential set-up—a Socialist as President and a member of the PIR as Vice-President.

The traditional parties then set out to state the somewhat artificial issue between "civilismo" and "militarismo," which meant attempts to put an end to the list of military Presidents—the sequence since 1936 has been General Toro, Lieutenant-Colonel Busch, General Quintanilla and General Peñaranda. This move was intended to secure popular support. *El Diario*, the mouthpiece of the Liberal party, on a trivial pretext, violently attacked the army. This immediately caused a Cabinet crisis, but a solution was repeatedly adjourned, because of Mr Wallace's pending visit. At last, however, it could not be put off any longer, and it was found in the declaration of a state of war. This placated the military, giving them more power; established a certain, though uneasy, equilibrium between the governing civil parties and the army; and finally gave guarantees to the big mining operators that under "complete mobilisation" every miner will be compelled to work six days a week. It was soon officially announced that there would be no military mobilisation, only industrial, in order to increase the production of strategic materials which will remain Bolivia's main contribution to the war effort of the United Nations.

It certainly did not add to the popularity of the measures adopted that public opinion was wholly unprepared and saw no concrete reason for Bolivia's entry into the war. It was feared that, with the help of the emergency powers thus obtained, the present coalition would perpetuate itself; that the presidential election would be held under martial law; and that from now on any demand for an increase in wages or an improvement in living conditions could be considered a "seditious act." The movement of National Revolution charged the Government with having deprived the people of any control over public affairs. The PIR demanded freedom of association for labour and that the administration should be cleared of "fifth columnists"—but gave its support to the declaration on condition that the state of war should not be used by the Government to suspend public liberties and perpetuate low wages.

A Merchant Navy for Eire

[FROM OUR DUBLIN CORRESPONDENT]

May 24th

It has frequently been remarked that the Irish are not a seafaring people. In spite of the fact that no part of the country is more than sixty miles distant from its long coastline of two thousand miles, the fishing industry and the mercantile marine have never developed to the extent that might have been expected. In the eighteenth century, Irish shipping was discouraged by the Navigation Laws. In the nineteenth century, although Irish imports and exports were mainly conveyed by British ships, a number of flourishing Irish shipping companies were established. Many of these companies amalgamated with British companies in recent times, and went out of existence. Since the Treaty, Irish shipping has not been regarded as a protected industry, and the number of Irish ships was reduced still more in the years before the war. When the war broke out, want of

Trusteeships and Executorships Accepted.

shipping was acutely felt. Belligerent shipping was fully occupied for war purposes, and neutral ships became difficult and very expensive to charter. An attempt has been made to build up a mercantile marine and a small naval force in the last three years. Needless to say, the price paid for ships acquired during this period was abnormally high, but the expenditure was necessary if essential supplies were to be maintained. More than one Irish ship has perished at sea with regrettable loss of life.

With the object of awakening interest in mercantile affairs there has been established the Maritime Institute of Ireland. This body has organised a National Maritime Week, the principal feature of which was an exhibition in the Dublin Mansion House. Opening it, Mr de Valera stated that it had been at all times the policy of his Government to establish a mercantile marine. He revealed that, shortly after his coming into office in 1932, attempts had been made to do so, but that many unexpected and insuperable difficulties had been encountered. The war had provided an opportunity for taking measures which could not have been undertaken in peacetime, and the experience gained during the emergency would not be forgotten when normal conditions were restored. The provision of a reasonable supply of Irish-owned ships is an entirely laudable object of national policy, although, of course, complete self-sufficiency in this respect, as in others, is unattainable. An island so dependent as Ireland is on external trade for its very existence should be able to rely, at least partly, on its own resources for the transport of essential imports and exports. Even those whose bent is in general in favour of free trade will be prepared to make an exception in the matter of marine transport. If any excuse be needed for this apparent inconsistency, the great authority of Adam Smith may be invoked.

If the exhibition achieved no other useful purpose it at least aroused considerable interest in Dublin. It should be shown in some of the leading seaport towns, where nautical schools should also be established. The success of the seafaring industry would be assisted by the further development of the fisheries. During the last war, the Irish fisheries enjoyed a period of great prosperity, but they collapsed in the post-war slump. Since the Treaty, the Sea Fisheries' Association has been founded, and the country now possesses a good fleet of well-equipped fishing boats. Although fish is expensive, it is not very scarce. If it were not for the Irish fishing boats, it would be quite unobtainable. It is to be hoped that future years will see the development of the fishing industry, and of a mercantile marine that will belie the statement that "in Ireland the sea is something to be looked at and not used."

Changes in Arab Economy

[FROM OUR JERUSALEM CORRESPONDENT]

March 31st

THE native sector of Palestine's economy is usually regarded as static, contrary to the novel, dynamic economy built up by Jewish immigrants. This assumption is, however, a fallacy, originating in the general appearance of backwardness presented by Arab social life, and in the lack of reliable figures about the changes occurring therein. In fact, the Arab economy, too, is at present in a state of rapid growth and transition. During the last decade, the Arab population of Palestine has increased by almost a third and has reached about 1,100,000, still making almost 70 per cent of the country's total population (against about 90 per cent twenty years ago). At the same time, its standard of living, previously higher than in the adjacent countries, has further improved; agriculture has been both expanded and intensified; the number of Arab workshops and factories, though still very small, is on the increase; and recently there has been a marked progress even in Arab banking. The old feudal structure of the native society is rapidly giving way to new social forms, and it is this rise of new social forces, more than the reaction against foreign predominance, which finds its expression in the local national movement.

On the other hand, it should be borne in mind that this development has been very much fostered by external factors, chiefly by Jewish immigration. The growth of the urban population, from 250,000 in 1922 to almost 400,000 in 1931 and to about 750,000 at present, has provided a ready and ever expanding market for the produce of the fellahin and for Arab hired labour. The bulk of the new townfolk, however, are Jews, while among the Arabs the percentage of urban population is still only about 30 per

cent, and has scarcely risen since the British occupation. The best explanation for this phenomenon may be found in the following figures, showing a continuous rise in the income derived by the Palestine agricultural community, of which Arabs constitute an overwhelming majority.

INDEX NUMBERS OF VOLUME OF CROPS

(Weighted by Standard Prices)

(Average annual crop during 1926-1936=100)

Year	Cereals, Legumes and Oil Crops	Vegetables	Fruits (Other than Citrus)	General Index
1931	78	98	171	95
1932	47	158	125	56
1933	45	158	79	55
1934	93	237	138	107
1935	115	440	310	163
1936	79	456	326	156
1937	140	791	387	210
1938	85	713	397	166
1939	106	846	384	185
1940	154	1,306	430	250

To a small extent, this increase is a result of Jewish agricultural colonisation. But, on the other hand, the index does not take into account the considerable development of native animal farming, nor the expansion of Arab citrus plantations and the areas under tobacco and fodder crops. Moreover, the large-scale residential construction, the public works connected with it, the increased volume of commerce and transport, and, to a lesser extent, the establishment of new manufacturing plants, all of them have created additional sources of income. To these should be added the sums which the Jews have been pouring into the country in exchange for the lands they need for settlement. Since 1920, these sums have totalled about £Pro million.

The continuous influx of capital has enabled the Arabs to get rid of a great part of their indebtedness, and furthermore to invest large sums in earning assets, mainly in agricultural holdings and in urban properties. They were also anxious to adopt the new methods of farming introduced by the Jews. To quote one example—tractors were introduced into Palestine by Jewish settlers about 15 years ago, and up to the disturbances Arab farms and plantations also had been ploughed up by Jews. They were also instrumental in breaking large tracks of virgin land in the south. But by now this job is done almost entirely by the Arabs themselves, who own about 10 per cent of all the tractors in the country. So Jewish immigration has not only created a new external demand for land in Palestine and enhanced its price; at the same time it has enabled Arab farmers and capitalists to extract increased revenue from landed property, and supplied them also with means for expanding their holdings.

It looked as if the prolonged pre-war disturbances would greatly reduce the impetus of this development, and thereby create a situation favourable to a political truce. But, during the years of war, the influx of money has set in again, and the accumulation of excessive purchasing power has been most pronounced in primitive agriculture, which is least affected by the rise in the prices of raw materials, imported implements, and so on. In 1942, the net income of the Arab agricultural community was perhaps twice its pre-war volume, and the loss of citrus exports is more than offset by the increased Government expenditure on public works. The monthly pay-roll of persons employed by Government departments (most of whom are Arabs) has risen to over £P750,000, about four times as much as in 1938; and Arab industry too is benefiting from the bigger demand. Moreover, because of the curtailment of Jewish immigration, large numbers of Arab labourers have been absorbed in Jewish citrus groves. It would, however, be wrong to infer from this that the Arab-Jewish antagonism is fading away. The increased inflationary pressure is accompanied, not only by a scramble for goods and by a rush in the real estate market, but also by a marked advance of capitalistic forces within the Arab society and by a new stiffening of national relations. It is significant that the first representative Arab assembly since the outbreak of war was followed by a series of conventions of Arab chambers of commerce and business circles. The chief concern of these assemblies was economic matters, and the most important of the resolutions passed were those in favour of establishing a national investment company; against the proposed new taxes, especially the estate duty; and demanding the re-establishment of the Arab National Committee dissolved since the disturbances.

Chairman's Copy

Progress Report for a Meeting

of the Directors

on

Co-operation by the Company in the Battle for Fuel

1. **Boiler Plant.** Following the survey by the Ministry of Fuel's engineers, instruments have been repaired, leaky brickwork made good, damper controls adjusted and made accessible.

Foreman and boiler staff are attending the Ministry's local lectures.

2. **Process Work.** On advice of Trade Association Fuel Efficiency Committee:

- (a) boiling processes are started at staggered intervals;
- (b) steam supplies to vats are reduced as soon as boiling point is reached.

Production has not been affected.

3. **Heating of Workshops.** Thermostatic control is to be installed. Meanwhile temperature of shops has been restricted to minimum required by Factory Acts. Welfare Officer reports even temperature is generally appreciated.

Door-shutting campaign for exclusion of draughts is already showing results.

4. **Fuel Consumption Records.** Weekly fuel consumption records are now posted in each shop as basis for inter-staff economy competition. Steam raising already shows 10% fuel saving and process side 12% Used Lub. oil is now reclaimed and re-used and consumption of new oil is down by 10%.

5. **Further Action.** Keep in close touch with the Ministry of Fuel and the Fuel Efficiency Committee of Trade Association.

A Staff Fuel Efficiency Committee is suggested to:-

- (a) survey continuously all fuel-using operations;
- (b) follow up fuel-watchers' reports;
- (c) carry out Lub. oil economies suggested by suppliers.

(Signed) S. MacTavish
Chief Engineer

Issued by the Ministry of Fuel and Power

THE BUSINESS WORLD

Finance and Banking

Immobilised Credit

The money market continues to be driven by the authorities on a fairly tight rein. For about three weeks there has been no superabundance of credit such as the market grew accustomed to during the earlier months of the year. This week there has been no repetition of the special assistance which was required in the latter part of May, but the needs of the market have been barely satisfied by the available amount of credit; and there have been no cheap balances from non-clearing bank lenders offered at under 1 per cent. It is still too early to say that there has been a change in the official policy of maintaining an ample margin of surplus cash with the banks; but it is clear from the evidence of recent Bank returns that a much larger volume of credit is being kept immobilised in public deposits than has been the case for some time past. This week again, though these deposits have fallen by £2,813,000, they remain at the comparatively high level of £14,456,000. Bankers' deposits have received the full benefit of this slight fall in Government balances and are £3,332,000 higher at £143,627,000. This last figure must, however, be considered low by recent standards, and is fully in keeping with the conditions of near-stringency experienced in the money market during the week. The evidence of the Bank returns is not conclusive proof of a change of policy, since the position tends to change widely from day to day, while the weekly return is an instantaneous photograph of the situation at one particular moment of the week. But the persistence with which recent Bank returns have shown

public deposits above the normal level cannot be altogether ignored. The exceptional receipts from subscriptions to Government loans during the Wings for Victory campaign is one probable explanation of the phenomenon. The Treasury may have persistently underestimated these receipts when arranging its floating debt operations. This week floating debt changes have had little net effect on the credit situation. Payments for Treasury bills have been £15 million in excess of maturities, but Treasury deposit payments at £50 million were £30 million below nominal maturities, and, it is estimated, some £15 million below true maturities.

Peso Exchange Moves

The rigid and somewhat artificial structure of official Argentine exchange rates has remained entirely unaffected by the political convulsions in that country. The free market rate, however, has tended to move adversely to Argentina, and the US dollar, which for some months past had been falling in that market, has been week, recovered appreciably. This movement has been reflected in the rate for payments into the Argentine special sterling account for remittances to Argentina in settlement of peso debts. The rate had been 15.96 to the £ since May 20th, but was revised to 15.99 at the beginning of this week, falling back to 15.96 again on Wednesday. This rate is quoted by the Bank of England after receiving advice from Buenos Aires and applies to the comparatively small business for the acquisition of pesos required to meet peso debts in Argentina. Remittances for ships' disbursements are, perhaps, the most typical of these operations. The greater part of the current commercial payments to Argentina is made in sterling and canalised through the special account maintained for the Argentine authorities in London. The rate for remittances to Argentina through the special account is now fixed so as to give the Argentine authorities the full benefit of the open market peso-dollar rate. Up to the middle of last month, the rate for making such remittances was 16.95½ pesos to the £, and the remitter was thus for a time insulated from the appreciation of the peso in the open market. That protection has now disappeared, and the rate for effecting such remittances to Argentina closely follows the open market trend. The rate for reverse operations, that is, for financial remittances from Argentina to the sterling area, remains 17 pesos to the £. This rate is largely inoperative, because remitters have the alternative of buying US dollars in the open market and converting these dollars into sterling at the official rate. Since the appreciation of the peso in the open market, which got under way towards the end of last year, this alternative method of remitting funds to the sterling area has been cheaper than the official rate and has consequently been used. It is only natural that the Argentine authorities should have made a corresponding adjustment in the rate for inward remittances.

Argentina's Gold Clause

This considerable adjustment in the rate at which sterling paid into the special account is convertible into pesos for remittances to Argentina must increase still further the exceptional exchange profits of the Banco Central. It is true that under existing conditions such operations merely involve a more rapid accumulation of temporarily blocked sterling held in the Argentine special account in London. But it appears that this sterling is guaranteed by the British Government under a gold clause. This fact was not announced at the time of the conclusion of the payments agreement between Argentina and the United Kingdom, but it is categorically stated in the annual report of the Banco Central for 1942. This document, commenting on the problem of blocked pounds, states that the equivalent of 295 million pesos had been accumulated by Argentina in

blocked sterling up to the end of the year. Of this total, 33 million pesos was held for account of the commercial banks. This accumulation of sterling would have been even greater had it not been for the repatriation of public and private sterling debt which the Banco Central estimates to have totalled 123 million pesos. The gold guarantee given to sterling held here on Argentine account means that pesos must, in effect, be reckoned among the hardest of hard currencies with which the British authorities have to deal.

Smaller Credit Expansion

The banking figures for 1943 to date show a remarkable slowing down in the rate of credit expansion. The total of clearing bank deposits for May was £63 million lower than it was at the end of 1942. There is normally some deflation of credit over the first months of the calendar year, owing largely to the concentration of revenue payments in that period and to the consequent repayment of floating debt. But since the beginning of the war this seasonal factor has been largely neutralised by the persistent deficit at which the national finances have been running even during the periods of heavy revenue collection. It is true that over the first five months of 1942 bank deposits dropped by £198 million, but this movement must be read in con-

junction with the accompanying increase of £231 million in the amount of tax reserve certificates outstanding. This year the fall in bank deposits can only be attributed to increased holdings of tax reserve certificates to the extent of £10 million. The principal factor in the slowing down of credit expansion in the early months of this year is to be found in the Wings for Victory campaign, which has been rather more concentrated in the matter of time than the preceding efforts of this character. Another factor has been the extension of lend-lease and free deliveries from the United States and Canada respectively. These do not affect the credit position at all, whereas expansion took place when cash payments were made and when Canada accumulated

sterling in respect of the payments due to her. The clearing banks' own participation in Wings for Victory weeks is again evident in the May returns which show a further increase of £13,590,000 in investments. The same factor is also reflected in the drop of £40 million in TDR's, which is accounted for by heavy pre-encashments to finance the banks' and their customers' subscriptions to Government issues. Against this movement, bills have risen by £25,654,000, showing that the banks are beginning the process of building up their exceptionally depleted bill portfolios from the larger offerings now made at the weekly tenders. An increase of £15,687,000 in short loans is a partial measure of the much increased holdings of bills in the discount market.

Vertical Combination in Lombard Street

The advent of the United Dominions Trust as the principal shareholder in one of the discount houses continues to provide the main subject of discussion in the money market. There is no disposition to criticise a specific operation which must have received the blessing of the Bank of England, whose concern for the well-being of the discount market is proverbial. But the general principle at stake—that of vertical combination in financial operations of this kind—is perhaps questionable. Even assuming that the UDT will not go out of its way to canalise its bills to the discount firm in which it is now so greatly interested, that firm can hardly help handling a certain amount of its parent company's business. To that extent, the creator and discounter of the bills in question will be interrelated, with some inevitable deterioration in the quality of the paper concerned. It only needs a further capital transaction by which one of the clearing banks would take a participation in the UDT-Ryder group for the vertical combination to be completed, and to bring within one fold the drawer, the discounter and the ultimate buyer of these bills. The question is of somewhat academic interest now, because the amount of hire purchase paper making its way to the market is negligible. The position is also safeguarded by a special agreement which guarantees the complete independence of the existing management of Ryders Discount Company. But managements are mortal, and this agreement is similarly conditioned. The temptation for hire purchase finance houses to use the facilities of the discount market to the fullest possible extent is evident from the disparity between the terms quoted at each end of a hire purchase transaction. The cost of financing hire purchase paper in the market would be rather less than 3½ per cent to-day, namely, 2 per cent acceptance commission to the acceptance house and slightly more than 1 per cent as the discount on the resulting bills. As against this, a recent Government order stipulates that 20 per cent on the balance after the initial payment must be the maximum cost of a hire purchase sale to the public. There is a substantial margin between these two figures. The technical adjustments to the recent increase in the capital of Ryders Discount Company are being completed. The firm has increased its facilities with its bankers, and its quota as a member of the discount market syndicate for Treasury bill tenders is presumably being adjusted to its new capital.

Investment

Industrial Replacements

The letter from Sir Kingsley Wood to Sir Arnold Gridley on the matter of the EPT refund seems to fall far short of meeting the desires of the industrialist. It makes it clear—if that was still in doubt—that the conditions to be imposed by Parliament apply only to the distribution of the refund. It must be used for replacement of capital, and not directly to increase the receipts of shareholders. It is difficult to see that much more can be done at present. Industry would like to see the obligation acknowledged in actual legislation, leaving only the appointed day of payment to be named, but even that would not bind a Government which did not wish to make the refund. There can be no doubt that one of the objects, which ought to have priority at an early date, is the re-equipment of industry with up-to-date plant. There can equally be no doubt that legislation ought to be such as to encourage, if not to enforce, much more rapid replacement than was common before the war. Over a considerable field, EPT refunds can scarcely help toward the solution of the problem, for although the plant of these

concerns may not be worn out, it will tend to be obsolete. It is known that the Board of Trade is engaged in taking an inventory of the post-war capacity of some trades, and of the supplies of materials and amount of factory space and machinery required to reach full pre-war production. It does not appear, however, that any arrangement is being made so far for the replacement of old plant by new. It is possible to read into the questionnaire the idea that existing concentrations are to be maintained. Whether this is with a view to securing the largest possible output with the minimum of capital replacement, leaving the adjustment to better things to a later date, is not clear. If this is the intention, it may be worth pointing out that the analogy with the decision at Hot Springs does not hold. It is probable that people must have food in quantity, rather than quality, and irrespective of cost, if they are not to pass beyond the hope of salvation. With replacement of stocks, it would be more true to say that every sacrifice, in the immediate post-war period, made to secure improved capital equipment, will, before long, pay for itself in better, cheaper and more plentiful production.

Aircraft Prospects

It is perhaps not very surprising that aircraft shares have been little affected by Sir Stafford Cripps' statement that the post-war aircraft industry could not be maintained at more than one-tenth of its present size. The proportion seems small, but the figure, whatever it is, will be determined by the size of the RAF, since the demand for civil aircraft must be comparatively moderate. According to a statement of Lord Brabazon, the present dimensions of the industry are 60 times pre-war, so that Sir Stafford's figure still allows for a five-fold expansion. That is, however, little consolation to shareholders in individual companies, for there is no means at present of judging the relative efficiency of those firms whose sole business is the production of frames, or engines, or both. Still less can one judge of the relative performance of companies which have taken on aircraft construction since the war broke out. Equally, it is impossible to trace the expansion of the industry out of its own funds, which may have occurred over the past few years. The accounts bear eloquent witness to expansion in turnover in swollen figures of stock-in-trade, but it is seldom the case that fixed assets show any great change. In fact, the figures of the accounts can form no basis for assessing future possibilities. As in the past, the safest guide is the reputation of the company, but it is impossible to place a quantitative value on that. As in other industries, the lot of any individual firm will be determined largely by the organisation of the industry after the war.

It was not until re-armament was well advanced that any orders for design were placed outside the approved circle of full members of the Society of British Aircraft Constructors. Sir Stafford stated that post-war industry would be carried on by the most efficient firms. If this means that all firms which choose to remain in the industry will be allowed contracts on the basis of efficiency, it is a great step forward. But if it means that the Government will choose a few large firms—presumably the most efficient at that moment—with which to place future orders, it will be retrograde. Virtually, the whole demand for aircraft will come from the Government. Export demand is not likely to be large, and only local services and private planes are not covered by Government ownership or control. Further, does Parliament intend to retain under its own control part of the industry, as in the case of the ordnance factories? Evidently, there is a sufficiency of uncertainties to make the investor pause before putting his money into any but one or two of the most firmly established concerns.

Argentine Railways

The immediate effect of the Argentine revolution, or rather of the statements that it was a pro-Ally move, was a very sharp rise in most Argentine investments and particularly in railway equities. At the time of writing, there is no certainty as to what the short run outcome of the revolution will be. If it should prove that whatever Government finally obtains control is more democratic and more sympathetic to the United Nations than the old, that will presumably have some influence on the attitude toward British capital in the Republic. The main determinant will, however, be economic and, in particular, the conditions of trade between this country and Argentina. In the immediate future, the outlook for Argentine external trade is none too bright. The annual report of the Central Bank shows that the fall in total imports was not particularly severe in 1942, while the physical volume of Argentina's industrial production increased at an accelerated rate. This year, there is in progress a more drastic reduction of imports of commodities which are regarded as indispensable to industrial production. The total of these is estimated at 519,100 tons, against 693,100 last year and 1,487,700 tons for the average of 1938-40. Rather over one-quarter consists of metals, machinery and fine chemicals; a further 115,900 tons is made up of newsprint and wood paste for paper and rayon manufacture, while soda and calcium compounds account

ROBSON, MORROW and UNDERWOOD wish to engage a first class accountant, Chartered Accountant or equivalent with wide executive experience, who can be trained as an Industrial Consultant. Four figure salary and excellent prospects. Mark envelope "Application." Full particulars to Robson, Morrow and Underwood, Victoria Station House, Victoria Street, London, S.W.1.

for a further 80,000 tons. Nearly three-fifths of the total is to come from the USA; the British contribution is not mentioned. Despite all efforts to develop home production and substitutes, and despite the possession of substantial stocks, a fall in the standard of living is inevitable if the war continues for any length of time. Transport of substitutes is probably one of the reasons for increased gross railway traffics, but their use, and in particular the shortage of fuel, is likely to reduce net takings. The very favourable balance of payments, assisted by capital receipts of 235 million pesos, has led to a further accumulation during 1942 of foreign currency holdings of 503 millions, after repatriating 135 millions of public and private debt. The report makes it clear that the principal limitation upon the amount of repatriation was the difficulty of raising the peso equivalent by loans and taxation. A recommendation is made for overcoming this difficulty. This and a number of other statements suggest very strongly that the policy of the bank, and presumably that of the financial authorities as a whole, is to reduce by every means possible reliance upon foreign capital and imports of all but capital goods, both now and after the war.

Imperial Cold Storage Issue

For the second time within eight months the Imperial Cold Storage and Supply Company, registered in South Africa, is making a substantial issue of ordinary capital, mainly to holders of that class. Unlike the offer of October last, that now proposed is not to finance expansion, but to provide the bulk of the funds for the repayment of £971,800 5 per cent debentures at 102½. For this purpose, there are to be created and issued a further 650,000 ordinary shares of £1 offered at 27s. 6d. Of these, 450,000 go to existing holders at the rate of two new for every five old. As the price of the shares in the market is some 35s., this represents a bonus by way of rights of about 2s. 6d. per old share. The remainder go to the Anglo-American Corporation, and the Industrial Development Corporation, both of South Africa, in consideration of which they will underwrite the whole issue free of payment. A similar arrangement was made in October last, when an equivalent proportion was allotted firm, but the price was then only 22s. 6d. After the previous increase in capital, the dividend was raised from 10 to 12½ per cent. Presumably, in raising new ordinary shares, on what appears to be rather onerous terms, in order to repay a debenture on a basis of rather under 5 per cent, the board has in mind the very lean period experienced by the company prior to 1936, when for several years losses or very small profits were made. Incidentally, it is interesting to note the increasing extent to which finance houses, primarily associated with gold mining, are providing the backing for new ventures and the refinancing of old ones, not only throughout Africa, but in other developing areas. In this case, each of the underwriters is receiving a seat on the board of the company.

Cable and Wireless Payment

Those who have been running up the price of Cable and Wireless (Holding) ordinary, in the expectation of an increased dividend, have been disappointed. The payments of both operating and holding companies are unchanged at the established rate of 4 per cent, but it is worth observing that the rate of tax deduction is to be only 8s. 11d. against 9s. 10d. last year. The rise on the year in the price of the equity stock was some 24 points to 84, of which almost half has occurred in the past two months. The inner ring of the market—jobbers and brokers particularly interested in the stock—have always emphasised the point that a rise in the rate of dividend was extremely problematical. Apart from the crucial question of EPT, on which no statement has so far been made, the revenue must have been adversely affected by the loss of the Eastern business, while receipts from the investment trust side of the business are not likely to have advanced appreciably. The Marconi dividend is also unchanged on the year. It seems highly probable that the distribution is being "stabilised" at 4 per cent, at least for the duration of emergency conditions. At a cum-dividend price of 80, the yield is £5 14s. per cent, subject to tax at the full standard rate of 10s. in the pound. In a world in which the free flow of international trade in the hands of private enterprise were assured, the dividend would appear to be virtually guaranteed. The fact that the yield is well above the industrial average is some indication of the doubts as to the post-war international set-up.

Company Notes

Ford Motor Improvement

The 1942 accounts of Ford Motor show total profits after EPT which required £1,365,703 in the previous year. There is, however, a satisfactory increase in trading profits from £2,044,783 to £2,267,121, and it is plain that the gross figure was correspondingly higher. Income-tax liability is up from £711,091 to £749,900, but there is again no transfer from profits for war damage, so that, although other charges are somewhat higher, there is an increase in equity earnings from 7.8 to 10.5 per cent. The trend of profits over the past three years is analysed in the following table:—

	Years ended December 31.		
	1940	1941	1942
Total profits*	2,785,594	3,410,863	*2,267,290
Depreciation	851,559	793,443	798,654
Fees, pensions and ARP	213,856	190,172	245,168
Income tax	735,000	711,091	749,900
EPT and NDC	920,000	1,365,703	...
War damage	102,500	...	...
Ordinary shares:—			
Earned	Dr. 37,321	350,451	473,568
Paid (net)	270,000	270,000	270,000
Earned %	Nil	7.8	10.5
Paid %	6	6	6

Contingencies 100,000 100,000 100,000
Carry forward† 961,716 1,050,841 1,191,010

* Shown after EPT in 1942.
† After bringing in from past profits £325,000 in 1940, £108,671 in 1941 and £36,601 in 1942.

NOTE.—The figures are in each case those shown in the report for the year, not the later adjusted figures which show minor changes only.

The directors are applying a dividend stabilisation policy so that there is no rise in the ordinary distribution above the customary 6 per cent. It is possible to increase the carry forward from £1,050,841 to £1,191,010 after repeating the £100,000 to contingencies by bringing in £36,601 surplus on guarantee premiums held in suspense. The rise in net profits, despite the fact that the company is well within the EPT level, is presumably due to an expansion in the capital employed. It is, of course, common knowledge that there has been a marked rise in physical turnover and in output of tractors and other agricultural machinery on which the group is mainly employed. The chief feature of the balance-sheet is the increase in liquidity. The directors point out that this is a matter of policy reflecting estimated post-war replacement needs. Net liquid assets are up from £5,341,231 to £6,345,138. There has been a switch from cash holdings to investments in Government securities, including tax reserve certificates, which have jumped from £208,547 to £4,358,125. Stocks are also substantially higher at £4,742,680 against £3,816,993. The increases in debtors and creditors reflect the rise in turnover as does the rise in net loans to subsidiaries and associates from £28,106 to £115,069. The position is entirely satisfactory, and the market price of 32s. 6d. ex dividend for the £1 ordinary stock, yielding £3 13s. 10d. per cent, discounts a further recovery.

Electric Cable Results

The preliminary statements of two of the leading electric cable manufacturers, *Callender's Cable* and *W. T. Henley's Telegraph*, contain a broad hint that total profits of both concerns have substantially increased. In the case of *Callender's Cable*, no profit figures are supplied for 1942, but the directors, unexpectedly, announce the distribution of a 5 per cent cash bonus in addition to the customary 15 per cent dividend. Only twice in the past decade, in 1936 and 1937, has a 20 per cent payment been distributed. In those years, equity earnings reached records for the decade of 39.9 and 40.5 per cent. In 1941, however, equity earnings declined for the third year in succession to 30.8 per cent. The directors then pointed out that the set-back was due to higher costs and that there had actually been an increase in turnover. It must be hoped that turnover has continued to increase and that costs have fallen to a level justifying the distribution of the bonus. The preliminary statement of *W. T. Henley's Telegraph* for the same period shows only a small rise in net profits from £326,379 to £331,379, a level still below that of the three years 1937-39. Equity earnings of £322,379 against £317,379,

represent a rate of 29.6 against 28.8 per cent. There is no increase in the ordinary dividend, maintained at 20 per cent for the sixth year in succession, and £62,379 remains for transfer to reserves or addition to the carry forward. In the circumstances, it is highly probable that war contingencies will receive £50,000 as in the two previous years. It is not surprising that these two concerns, in line with the rest of the electrical equipment industry, have realised higher distributable earnings. The industry appears to be financing expansion out of its own resources, with benefit to EPT standards and earnings. The £1 ordinary stock of *Callender's Cable* rose 13s. 6d. to 95s., at which it yields £4 5s. 7d.; the 5s. *Henley's* ordinary at 25s. yields £4 1s. 3d.

BET Accounts

The first full accounts of British Electric Traction to be issued since the divorce from the Thomas Tilling interests show a modest decline in gross income for the year to March 31st last from £767,588 to £760,293. Since the prolonged negotiations with the Inland Revenue authorities have resulted in a decision that the company is not, now or retrospectively, liable for EPT, tax provision amounts to only £51,553 against £105,750. With other charges virtually stable, there is a surplus for equity of £406,273 against £364,271, and the 45 per cent ordinary payment is covered by earnings of 57.7 against 47.1 per cent. Thus, there is £50,434 against £8,434 to add to undivided profits which, after inclusion of £170,000, formerly provided for EPT but not now required, are raised to £2,204,247. The effect of the reconstruction on the company's assets has been slightly to raise the balance sheet valuation of total investments from £6,805,447 to £6,844,170. Of these, a rather higher proportion is held in the form of investments in subsidiaries, while outside investments, at cost or under, are reduced from £3,794,382 to £2,666,707. It is unfortunate that no market valuation of these holdings is provided. For the rest, the only significant change is the drop in creditors and tax provision from £213,908 to £41,050, for which the reabsorption of the EPT transfer is mainly responsible. The financial position is strong. The influence of the separation of interests from the Tilling group cannot yet be estimated, since in the latest accounts it is overshadowed by the effect of the EPT decision. The £100 deferred stock, at £1,085, yields £4 2s. 11d. per cent.

"Shell" Dividend

The preliminary statement of "Shell" Transport and Trading for 1942 shows a small decline in net profits from £2,314,028 to £2,306,908. After meeting preference payments, there is £1,506,908 against £1,514,028 for the equity, representing some 5.2 per cent free of tax as before. The directors have again repeated the 5 per cent tax free ordinary dividend distributed each year since 1939, so that there appears to be £59,626 against £66,746 for addition to the carry forward—in which case it will amount to £646,166. There has been no evidence of an important change in the supplies available to the group in 1942, and it was not to be expected that there would be more than a minor fluctuation in net income. Demand for the products of the group have continued to expand, but no substantial rise in profits can be expected, while oil wells and installations are in the hands of the enemy and normal trade

demand is strictly controlled. The progress of development in the Americas, and in particular in Colombia, will be watched with interest. The £1 ordinary at 66s. 3d. ex dividend yields no more than £1 10s. 2d. per cent tax free. This low level implies a belief that reconquest will come soon, and confidence that, whatever may be the fate of oil refining in this country, the worldwide interests of the group will ensure its post-war prosperity.

Siemens Expansion

No true comparison is possible between the figures of total earnings after tax, other than tax on dividends, disclosed by the accounts of Siemens Brothers for 1942 at £460,168 and the total of £477,669 earned in 1941, since the former figure is struck after the transfer of an undisclosed sum to stock reserve. Depreciation requires £95,858 against £89,578, but a reduction by some £34,000 to £108,502 in special wartime expenses raises the distributable profit by some £11,000 to £252,140. After meeting the preference payment, which requires £55,000 gross, the earnings cover for the ordinary dividend, unchanged for the eighth successive year at 7½ per cent, is slightly higher at £197,140 against £186,019, equal to 8.6 against 7.7 per cent.

Industry and Trade

Post-War Building

On Wednesday, last week, Lord Portal, Minister of Works, amplified in the House of Lords the scheme for the training of building labour after the war, outlined in a White Paper (Cmd. 6428), and discussed in *The Economist* on March 6th and March 13th. It was stated in the White Paper that, on the basis of the facts then available, a post-war construction programme designed for ten to twelve years would require the industry's labour force to be built up to about 1,250,000 men; no details were given of the nature of the programme or of its relation to the total sources of capital investment. Lord Portal's statement gave the impression that the estimate of the size of the labour force was somewhat tentative at the time of publication last February. On the basis of the target figure this, in the Minister's words, is how the problem was approached:

If we have 1,250,000 men who are to be allocated to the building trade after the war, it is imperative for us to see that there is work for them to do. During the last three months, we have obtained from nine Government departments their programmes, and we have put the work on a twelve-year basis. We are already able, from the first survey which we have made, to say that we have balanced the figures of men employed with the programme over the first twelve years, so that now all we have to do is to go on breaking that programme down. We can already see that work is available for the first twelve years, as suggested in the White Paper.

In other words, the Ministry has named a measure of cloth, and is now fitting its coat accordingly, without knowing whether there will be enough cloth left for other coats. This is not to disparage the Ministry's empirical approach to the problem of post-war building. Any plan of this kind must necessarily have a tentative beginning; but it can only be given more definite shape in the context of other plans for capital expenditure. Lord Portal drew attention to one serious problem, namely, the enormous rise in building costs since the beginning of the war, amounting to no less than 105 per cent. He emphasised that costs will have to be brought down after the war, since "high costs of building will kill building." He saw the solution in working at greater speed with different methods, and, by the appointment of a Controller of Experimental Building Development, he has already taken steps to secure an improvement in the efficiency of the building industry.

50-Year Plan for Forestry

As in the last war Great Britain's forests have again proved to be a valuable reserve of timber whose utilisation is one of the most important means of saving shipping space. In the years before the war only 4 per cent of the timber consumed was home-grown; since 1939 home-grown material has been extensively substituted for imported timber, though no statistics are available to show the extent of substitution and of the depletion of forests this policy has involved. The need for building up an adequate reserve

The surplus of some £13,000 raises the carry forward to £413,010. The balance-sheet throws a little more light on the past year's activities. A net bank overdraft of £267,253 has been replaced by a cash holding of £118,869 and £100,000 in tax reserve certificates. Stocks are some £225,000 greater at £2,144,624, despite the writing down out of profits, a reflection, in part, of higher prices. The decrease in debtors by over £320,000 to £1,120,166 is explained by the chairman, Lord Queenborough, as the result of the settlement of certain large outstanding payments. Trade creditors are reduced some £62,000 to £402,851, and in consequence net liquid assets, excluding trade and other investments of £626,110, have risen by virtually £460,000 to £2,475,393. The parent's net liability to the subsidiaries on current account has been practically quadrupled at £305,062. A pointer to the present rate of output in the company, and in the industry as a whole, is the chairman's statement that the plant has been written down by more than the sum set aside for depreciation in the profit and loss account, a further indication of the little value attaching to that statement. There is an addition to war contingencies reserve of £140,000, bringing the fund up to £830,000, including £50,000, formerly held for ARP reserve. The £1 ordinary stock, quoted at 29s. 6d. ex-dividend, offers the useful yield of £5 1s. 9d. per cent.

of standing timber was recognised after the last war, and in 1919 a forest authority, the Forestry Commission, was set up. But the activities of the Commission have been limited by the financial resources available to it, though it has been able to acquire 714,000 acres of plantable land, of which 434,000 acres were under woodland by the end of 1939. The progress of private forestry has been disappointing. The inadequacy of the prewar preparations has prompted the Forestry Commission in its report on Postwar Forest Policy (Cmd. 6447) to urge for "speedy and large-scale action" after the war. Conditions, in its view, are suitable for the rapid growth of timber, and sufficient land is available. The report suggests a forest acreage of 5 million acres—2 millions from existing woodlands and 3 millions by the afforestation of bare ground—to be attained during a period of 50 years. The net outlay for a "desirable programme" of planting 1,100,000 acres in the first decade is estimated at £41.2 million, compared with a net outlay of £13.8 million on a corresponding prewar basis. Forestry, no doubt, was neglected before the war and the report of the Commission would seem to deserve careful examination in conjunction with other postwar plans.

Another Salvage Drive

The inauguration of a salvage drive in London last Saturday, with stirring marches played by the Welsh Guards and the Customary display at Trafalgar Square, once more emphasised the need for conserving every ounce of useful material during this critical year of the war. Lord Portal gave some interesting examples of the important contribution made by the collection of scrap and waste to the supply of raw materials. Thus, waste paper now provides no less than 60 per cent of the materials used in the manufacture of paper. Since the outbreak of war 3,000,000 tons have been collected—enough to fill 370 ships of 5,000 tons each. Again, iron and steel scrap is being collected at the rate of 110,000 tons a week, or 5,720,000 tons a year. But salvage of paper, metals, rubber, textiles, bones and the rest is only one aspect in the conservation of scarce materials. The other is the need for utilising them as effectively as possible, for substituting the scarce for the less scarce materials if they can be made to serve the purpose, for making a given quantity of, say, copper, go further. Much has, in fact, been done to eke out scarce materials by substitution and by changes in specifications. But even the smallest economy which is still possible should not be neglected.

Fuel Efficiency Campaign

A great deal has been heard in praise of domestic consumers who have voluntarily restricted their fuel consumption; it is satisfactory to learn that good results have also been achieved by industrial users, whose quantitative

contribution to the nation's economies is considerably more important. The Ministry of Fuel's Fuel Efficiency Committee, under the chairmanship of Dr. E. C. Grumell, has now been in existence for eighteen months, and, though the total savings cannot be measured, the Committee's information is that substantial economies, greater than were originally expected, have been realised. The success of the fuel-saving campaign depends on getting industrial managements to realise the urgent need for economy, on securing the co-operation of factory operatives and boilerhouse staff, and on mobilising the industry's technical experts. The efficiency conference held in London last month is being followed by similar conferences in provincial centres, and last winter's courses of instruction for boilerhouse operatives, with lectures and films, which were attended by about 10,000 people, are to be continued this year. In spite of the shortage of engineers trained in fuel technology, 650 technicians have volunteered to serve on the Ministry's regional panels. Last winter they visited over 11,000 factories consuming nearly 29 million tons of coal a year, and estimated that the savings made amounted to between 8 and 12 per cent on the average. One firm, manufacturing motors and aircraft, reported a saving in one factory of 4,282 tons in twelve months and in another of 988 tons. The Committee considers that the greatest scope for further economies now lies in saving on the process side, and organisations are being set up to give expert advice on the utilisation of steam and on furnace design. It is difficult to

tell how much these savings are the result of the correction of past extravagances or of the introduction of more efficient methods of generation and consumption, but there is no doubt that the drive for more efficient utilisation of fuel in industry is important, not only for its immediate bearing on the coal situation, but for the future of the industry. The present over-all efficiency of conversion is of the order of 30 per cent, and the Parliamentary Scientific Committee estimated in its recent report on fuel utilisation that this proportion could be greatly increased.

Women in Shipbuilding

Shipbuilding has traditionally been regarded as a man's occupation, and before the war practically the whole of the industry's labour force consisted of men, women's employment being limited to cleaning and clerical work. Tradition has died harder in shipbuilding than in newer industries, such as aircraft production, and the need for accelerating the rate of dilution at this critical stage of the war is emphasised in a letter which has been sent to all concerned in the industry by the Minister of Labour and the First Lord of the Admiralty. "Shipbuilding is one of the most vital forms of production for the successful prosecution of the war," they write. "It is essential that more and more women should be employed on all forms of work of which they are capable." To encourage employers to take on more

THE CUNARD STEAM SHIP COMPANY LIMITED

FIVE PER CENT. CUMULATIVE PREFERENCE STOCK.
SIX PER CENT. SECOND CUMULATIVE PREFERENCE STOCK.

NOTICE IS HEREBY GIVEN that the Transfer Registers in respect of the above stocks will be closed from 16th to 22nd June, 1943, both dates inclusive, for the purpose of preparing Warrants in respect of Dividends for the half-year ending 30th June, 1943, to be paid on 1st July, 1943.

By Order of the Board,

H. J. FLEWITT, Secretary.

Offices: Cunard Building, Liverpool. 10th June, 1943.

AVELING-BARFORD LIMITED

At a Meeting of the Board of Directors held on Tuesday, 8th June, 1943, the following Resolutions were passed:—

It was resolved that dividend be paid on the 1st July, 1943, on the 175,000 Cumulative Preference Shares of £1 each at the rate of 5½ per cent. per annum for the six months from the 1st January, 1943, to the 30th June, 1943.

It was resolved that the Preference Share Transfer books of the Company be closed from the 17th June to the 30th June, 1943, inclusive.

By Order of the Board,

E. ODDS, Secretary.

Grantham, 8th June, 1943.

women, the Ministry of Labour has issued an illustrated booklet, "Women in Shipbuilding," showing jobs where women have replaced men and the type of work for which they are suited. Except for a few highly skilled occupations, needing years of training, women can be employed at any work that is within their physical strength. In some yards, they are engaged not only in the fitting and mechanics departments, but in the electrical shop, drawing office, blacksmiths' and boiler shops, in the foundry, and on carpentry, riveting, plating and welding. They are best at welding, electric wiring and painting. It is an interesting psychological point that, though they do very well on all-women gangs, they are not happy in mixed gangs, where the men sometimes tend to use them as assistants or labourers. The pamphlet properly emphasises the importance of welfare and training, and brings out many of the same points that were made in an article on women in engineering in *The Economist* of May 29th. Government training centres organise special courses for shipbuilding, but in this industry, more perhaps than in any other, adequate "training on the job," as well as pre-training, is essential. Several interesting examples are quoted in the pamphlet. In one firm making tank-landing craft in Scotland, two-thirds of the labour force are women. A north-western yard proposes to take on 165 unskilled women to meet its new labour requirements and to upgrade the women it now employs to more responsible positions. Unfortunately, no figure is available for the proportion of females to males in the industry as a whole. But the existing evidence suggests that it is far too small, and it is to be hoped that the Ministry of Labour's pamphlet will have the desired effect in stimulating the recruitment of women.

Trade Disputes

There was a slight increase in the number of trade disputes between 1941 and 1942, from 1,251 affecting 360,000 workpeople to 1,303 involving 456,000 workers, but a more marked rise in the number of working days lost. More workers were affected indirectly last year than in 1941, and there was an increased number of strikes in coal-mining and engineering. The former accounted for two-fifths of all the stoppages and more than half the working days lost; while engineering, shipbuilding and other metal industries between them accounted for nearly two-fifths of the total number of stoppages and for about a third of the number of days lost. The Tyneside strike last October resulted in the loss of an aggregate number of working days of 135,000, while 120,000 working days were lost in a stoppage in Belfast over the dismissal of two shop stewards. Wage questions accounted for 62.3 per cent of all the disputes. Over half of the total were settled by direct negotiation, 36.1 per cent by the men returning to work on the employers' terms without negotiation and only 1.8 per cent by arbitration. The accompanying table gives the course of trade disputes over the last seven years, as compared with the period 1913-1919.

Year	Number of Working Days Lost	Year	Number of Working Days Lost
1913	9,800,000	1936	1,830,000
1914	9,880,000	1937	3,410,000
1915	2,950,000	1938	1,330,000
1916	2,450,000	1939	1,360,000
1917	5,650,000	1940	940,000
1918	5,880,000	1941	1,080,000
1919	34,970,000	1942	1,530,000

The main reasons for the relatively few disputes during the present war are probably the success in stabilising the cost of living, the high level of earnings in industry as a whole, and improved industrial relations. The first six months of 1943, however, indicate a certain growth of industrial unrest, taking the form of sporadic strikes, such as those among engineers and bus workers in connection with wages.

Industrial Diamonds

At the annual meeting of De Beers Consolidated Mines on May 28th, Sir Ernest Oppenheimer pointed out that after the war the industrial diamond, whose use, especially as an abrasive, has been greatly extended during the war, will be looked upon as a normal part of the equipment of any modern engineering, industrial or mining enterprise. Last year he suggested that in future crushing board, the lowest and at the same time by far the largest class of industrial diamonds, should no longer be measured in carats (five

carats are roughly equivalent to one gramme), but in kilogrammes. This proposal has found the support of all producers and has now been approved by the British and United States Governments. In future, therefore, there will be two sets of diamond production figures, one for gem diamonds and the better grades of industrials, measured in carats, and the other for crushing board measured in kilogrammes. There are indications that the present classifications of industrial diamonds may also be revised. The United States War Production Board, supported by the War Metallurgy Committee of the US National Academy of Sciences, has begun a scientific investigation to ensure the most effective possible use of industrial diamonds in war industries and to consider how their useful life may be prolonged. Announcing this investigation, Dr C. K. Leith, Chief of the WPB Metals and Minerals Branch, pointed out that "results to date show that current classification of industrial diamonds may not always accurately reflect the usefulness of a given stone, at least as far as wheel dressing is concerned, and that selected stones from categories now classed as inferior may be used as acceptable substitute material for some important purposes." In view of the extensive demand for diamonds for war purposes, some classes of stones are no longer readily available; it has therefore become necessary to bring the present standards of classification more into line with current needs.

Typewriters

Since May 13th, when the Supply of Typewriters (Restriction) Order (S.R. & O., 1943, No. 676) came into force, the sale or hire of typewriters (except second-hand portable machines weighing less than 22 lb.) has been controlled. Licences issued by the Board of Trade's Directorate of Office Machinery are required for the acquisition or disposal of all typewriters, and none may be broken up without permission. Dealers may obtain a general permit to acquire machines, but anyone wishing to dispose of a typewriter to such a dealer must also obtain a licence, and the dealer must have a licence for individual sales. In view of the relative shortage of typewriters these control measures are logical. There have been no imports of typewriters for nearly three years; normally imports accounted for nearly 60 per cent of typewriter sales. In addition, home production has been considerably reduced, and nearly eight out of every ten new typewriters have been acquired for Government use. The demand of the Civil Service and factories has increased since the war, and every unit of the Services needs typewriters. To ease the shortage, both of typewriters and typists, much work that would otherwise have been done on machines is done by hand. Prices of new and second-hand typewriters have been controlled by the Price of Goods Act, 1939, and the Goods and Services (Price Control) Act, 1941. In many homes, and even in some firms, there are typewriters which are not being used to capacity. These form a stock which could be drawn upon if they were needed for more essential use.

Clothing Sales

The level of spending on apparel during April was considerably higher than for some time. According to the index numbers of the average value of daily sales (1937=100) published in the *Board of Trade Journal* for June 5th, sales were 32 per cent higher than in March, and 27 per cent above the average for the twelve months ending in March. Sales generally go up and down according to the coupon periods. That is to say they are high when a new block of coupons becomes valid, and tail off until the next issue. Seasonal factors, although they do not influence sales as strongly as they did in peacetime, nonetheless play their part. A certain amount of buying "for Easter" is apparent in the figures for April. More is being spent per coupon than a year ago, in spite of the large quantities of utility clothing now on the market. The amount spent per coupon was ten per cent higher last April than in April, 1942, which suggests buying for "quality" rather than price. The clothing component of the Ministry of Labour's cost of living index dropped by nearly 13 per cent between May, 1942, and May, 1943, but only cheaper clothing is included in it. As stocks of higher priced clothing are now small, and those of utility clothing reach saturation point (90 per cent of clothing stocks should eventually be utility) the amount spent per coupon should decline.

COMPANY MEETINGS

GUARDIAN ASSURANCE COMPANY, LIMITED

COLONEL LIONEL H. HANBURY'S REVIEW

The annual general meeting of the Guardian Assurance Company, Limited, was held, on the 7th instant, in London, Colonel Lionel H. Hanbury, C.M.G., the chairman, presiding.

The following is an extract from the chairman's statement circulated with the report and accounts:

LIFE DEPARTMENT

The increase of over £767,000, as compared with the previous year, in the net new sums assured is due to our participation with two other companies in several staff assurance schemes. Owing to deaths caused by enemy action there was a small loss of £2,000 from mortality as measured by the A. 1924-29 Mortality Tables.

The net rate of interest on the life fund, including the investment reserve fund of £222,500, but excluding the amount invested in reversions, was £3 4s. 8d. per cent. On the recommendation of the actuary it has been decided to pay interim bonuses in respect of policies becoming claims by death or maturity during 1943 at the same rates as those payable in the previous year.

FIRE DEPARTMENT

The reduction in our overseas business, due principally to enemy occupation of territories in the Far East, has been more than offset by the gain in home business, and the total revenue increased in the year by £30,000. The loss ratio for the year was 43.4 per cent. of the premiums, and the commission and expenses of management together equalled 45.7 per cent. After providing the reserve for unexpired risks, calculated on our usual basis of 50 per cent. of the premiums, the amount transferred to profit and loss is £91,514, equal to 9.3 per cent. of the premium income.

ACCIDENT AND GENERAL

The fall in premium income of some £46,000 is due to the further restriction in the use of motor vehicles and to rebates of premium in connection with employers' liability business. The loss ratio for the year was 42.6 per cent., and the ratio of commission and expenses to premium income 44.8 per cent. By reason of the reduction in revenue during the year there has been a release of reserves for unexpired risks of £20,785, and the sum of £106,742 has been transferred to profit and loss account, equal to 15½ per cent. of the premium income.

MARINE BUSINESS

Marine business has been adversely affected by the entry of Japan into the war. Whilst the premium income shows a substantial increase of £200,000 the first year's settlements have been on a much heavier scale than usual owing to losses on American business in the earlier part of the year. The 1941 account, which was closed at the end of 1942, proved to be very satisfactory, but in view of the heavy taxation we are only transferring £5,000 to profit and loss.

PROFIT AND LOSS ACCOUNT

After providing for the final dividend of 6s. per share (making 11s. for the year) proposed to be paid, the balance of profit to be carried forward in profit and loss is £190,000, compared with £143,000 at the end of the previous year.

At December 31st last there was an appreciation in Stock Exchange securities in the life and general accounts over the values at which they appear in the balance-sheet of nearly £1,000,000, and in addition there is an investment reserve fund in the life account of £222,500.

The report and accounts were adopted.

F. FRANCIS AND SONS, LIMITED

INCREASED NET PROFIT

The forty-second ordinary general meeting of F. Francis and Sons, Limited, was held, on the 4th instant, in London.

Mr John Ismay (chairman of the company), who presided, said: The net profit for 1942 at £67,100 shows an increase of approximately £3,300, but of this increase we have had to reserve an additional £2,000 for taxation. However, I am pleased to say that, subject to the approval of this meeting, after payment of a final dividend of 10 per cent., making 14 per cent. for 1942, we have been able to increase the carry forward from £21,702 to £24,177.

Your board considers adequate provision has been made at all times for taxation and depreciation, and all liabilities in respect of War Damage Contribution and War Risks Insurance have been provided for before arriving at the net profit figure.

You will observe from the consolidated statement that the balance of current assets over current liabilities is increased by £7,260 to £119,983. Although not affecting the accounts for the period under review, I would like to refer briefly to the issue of 50,000 5½ per cent. cumulative preference shares which were recently offered to shareholders, and to say that the response received resulted in a heavy over-subscription, which was very gratifying. The money, as explained in the circular at the time of the issue, was required to finance the purchase of additional plant and machinery and to defray the cost of essential alterations to factory premises and reorganisation generally, and I feel certain the employment of this additional capital will prove most advantageous.

The report and accounts were unanimously adopted, and the proceedings terminated with a vote of thanks to the chairman, directors and staff.

ODHAMS PRESS LIMITED

INCREASED NET PROFITS

The twenty-third annual general meeting of Odhams Press Limited was held, on the 10th instant, in London.

The Rt. Hon. Lord Southwood of Fernhurst (chairman and managing director) said that the net profits for the year under review amounted to £698,428, an increase of approximately £86,983 over the previous year. He was sure that shareholders would consider that satisfactory. (Hear, hear.) The general reserve now stood at £680,000. It was proposed to transfer to it out of profits of the year under review a further £60,000, which would bring it up to £740,000, approximately sufficient to cover the whole of the book values of copyrights and leases of advertising sites. The directors recommended a dividend on the ordinary shares of 12½ per cent.

All the newspapers and publications owned or controlled by the company had maintained their popularity. Indeed, owing to the paper restrictions it had not been possible to make the supplies meet the demands of the public. For a similar reason they had also had severely to ration advertising space and the company was greatly indebted to their advertising clients for having accepted those restrictions in the friendliest spirit, realising that they had done their utmost to meet their wishes.

There had, of course, during the past year been many difficulties to overcome. He was glad to be able to say that the purchase of newsprint on a co-operative basis through the Newsprint Supply Company had worked extremely satisfactorily. In addition to the difficulties of supplies, they had also had to deal with the continued heavy demands by the Government for man-power. As to the future, he would not dare to make any forecast, but he was glad to say that so far this year the company's trading was being well maintained.

The report was unanimously adopted.

LEGAL & GENERAL ASSURANCE SOCIETY LIMITED

Established 1836

EXTRACT FROM REPORT AND ACCOUNTS FOR THE YEAR 1942

"At the Annual General Meeting held on 8th June, the Chairman, Mr. Ernest E. Bird, gave the following details from the Report,"

	1942	1941
New Life Policies Issued	12,996	12,097
Net New Life Sums Assured	£11,311,583	£10,133,159
New Deferred Annuities Effected	£741,612 per annum	£694,873 per annum
Consideration for Immediate Annuities	£525,363	£401,519
Net Life Premium Income	£6,060,875	£5,487,374
Life Expense Ratio	9.70%	11.11%
Total Net Fire and Accident Premiums	£631,073	£601,640
Total Amount paid in British Taxation	£369,070	£264,300

ASSETS EXCEED £62,000,000

CHIEF ADMINISTRATION, ALDWYCH HOUSE, LONDON, W.C.2
General Manager: Vernon E. Boys

DUNLOP RUBBER COMPANY, LIMITED

DIVIDEND MAINTAINED ON REDUCED PROFITS

SIR J. GEORGE BEHARRELL'S STATEMENT

The forty-fourth annual general meeting of the Dunlop Rubber Company, Limited, was held, on the 9th instant, in London.

Sir J. George Beharrell, D.S.O., presided. The following is an extract from the chairman's statement circulated with the report and accounts:—

Last year I told you that the amount of business which we would be able to do would depend on the amount of rubber available and that it seemed as though we must be prepared for a substantial reduction in sales. I am glad to be able to tell you now that the volume of our business has not been affected to the extent then anticipated, although both in this country and overseas it has been subjected to drastic readjustments to meet the situation. In this country we have had to close down in whole or in part some branches of our business which used to return a good profit, but other branches have expanded and we have been able to undertake some quite new types of manufacture of vital importance to the war effort.

EXPORT POSITION

A scheme was devised for the control of exports, in the form of market quotas, based on essential requirements and their satisfaction, where possible, from the nearest manufacturing source of supply. This action has necessarily excluded the British exporter from certain market areas and, in our case, has naturally brought about a sharp fall in turnover of exports from this country. Nevertheless, in spite of this, I am pleased to say that profits earned on the reduced turnover compare favourably with previous years.

The manufacturing companies in India and South Africa have continued to be fully occupied and have played a great part in meeting entirely new demands. Despite many new problems arising out of war conditions, both companies have shown a substantial return, and their combined sales and profits again show a record.

The volume of business of the American and Canadian manufacturing companies fell substantially during the year, but satisfactory profits were earned in each case.

The Irish company naturally suffered from a shortage of raw materials and the severe restriction on the use of petrol, but I am glad to say a fair profit was earned, and the factory looks like being reasonably employed during 1943.

THE ACCOUNTS

The net profit for the year amounted to £2,433,000, compared with £3,186,000 last year. The decline in profits is due to a curtailment of business owing to regulations and also to the lower margin of profit on the greatly increased proportion of business for the Allied Governments. The provision for United Kingdom excess profits tax this year is estimated at £827,000, which brings the total provision made in the parent company for United Kingdom excess profits tax, up to December 31, 1942, to £4,294,000, and for the Dunlop group of companies to £5,923,000.

The board has again allocated to contingencies reserve the sum of £100,000. After making these appropriations and providing for the preference dividends, a dividend on the ordinary stock of 8 per cent. is recommended, and, if approved, will be paid on July 1, 1943.

The aggregate profits of the parent company and all subsidiaries for 1942 amount to £4,472,000, against £5,185,000 last year. The provisions by the subsidiaries for income-tax and excess profits tax, both British and foreign, are £1,534,000, bring-

ing the total provision of the group as a whole for 1942 to £3,322,000.

The consolidated statement of assets and liabilities is submitted on the modified lines adopted last year. This year, however, the position has improved, since there is an increase to £1,129,000 in the surplus funds of the subsidiaries and associated companies in enemy and enemy-occupied territories deposited in England and the U.S.A. After deducting these surplus funds the net investment is £4,138,000—a decrease of £436,000 on last year. On the other hand, aggregate surplus and reserves have increased by £581,000, to a total of £7,903,000. While we still cannot move funds freely from one country to another, the increase in immediate liquid resources of the group as a whole is very satisfactory, the total amount in securities, tax certificates and bank balances being £6,427,000, compared with £5,249,000 last year.

IMPORTANCE OF ECONOMY

Turning now to the general position of the industry, the need for strictest economy in the usage of rubber is apparent, and your board will continue to co-operate with the Government in all measures to this end. Assistance has been given to other manufacturers in order to increase the supply of products which are urgently required. In these and other ways the company's technical resources have been of great value to the nation.

So far as supplies of materials are concerned, your company has received its fair share, and I am sure that its staff has made the best use, both in production and distribution, of what has been allotted to it.

We have benefited greatly in these difficult times by the excellent relations which prevail between our employees and the management. In December, 1942, the joint factory council at Fort Dunlop, which was the first of all the joint councils in our factories, celebrated its twenty-first birthday. These councils continue to form an important link between management and operatives—especially in matters of a domestic or local character—and enable many problems arising from war conditions to be dealt with satisfactorily.

LABOUR AND WAR REQUIREMENTS

In the early part of 1942 the rubber situation made it necessary to release a proportion of the labour force and to transfer many of the retained employees to other work in the factories. The conditions leading to this were fully appreciated by the workers' representatives, and many difficult adjustments were greatly facilitated by the assistance which they gave. Both then and since, all employed in the factories have worked under a terrific strain and the administrative staffs, with numbers greatly depleted by the demands of National Service, have had to bear heavy additional burdens, including the large volume of paper work which systems of control and other war conditions inevitably entail. All these burdens have been shouldered cheerfully and loyally.

THE OUTLOOK: REASONED OPTIMISM

I cannot close this statement without a reference to the more hopeful world outlook which presents itself this year. The current year should see us nearer to the temporary solution of the rubber problem through the increase of supplies of the synthetic material from America. I feel, therefore, that, although there must be no premature optimism and no relaxation of effort, we can all look forward to the future with confidence.

The report and accounts were adopted.

ASSOCIATED NEWSPAPERS, LIMITED

LORD ROTHERMERE'S SPEECH

The thirty-eighth annual ordinary general meeting of Associated Newspapers, Limited (proprietors of the *Daily Mail*, the *London Evening News*, and the *Sunday Dispatch*), was held, on the 9th instant, in the Memorial Hall, Farringdon Street, London, E.C.

The Viscount Rothermere, the chairman, presided.

The following is the statement by the chairman, which was circulated with the report and accounts, and was taken as read:—

SUBSTANTIAL PROFIT

In the accounts for the past year we are very pleased to be able to record the very substantial profit of £567,124, and the balance-sheet shows that the financial position of your company is very strong indeed, despite the many difficulties with which our industry is contending.

You will see that we have increased the company's holdings of War Loan to £1,050,000, and we have also tax reserve certificates amounting to £400,000 as a provision for tax liabilities. In addition, a further sum of £50,000 has been transferred to reserve for contingencies in the appropriation account. Full reserves for investment, newsprint, taxation, and other contingencies having been made, the directors recommend with confidence the final dividend on the deferred shares of 12½ per cent., making a total for the year of 17½ per cent.

The net sales of the *Daily Mail*, *Evening News*, and *Sunday Dispatch* have been maintained at the maximum possible with the amount of newsprint available. In fact, it becomes increasingly difficult to ration the available copies of our newspapers fairly among our readers.

PRESTIGE OF THE "DAILY MAIL"

The prestige of the *Daily Mail* in advertising circles stands as high as ever.

The allocation of advertisement space continues to receive the closest attention, and after Government requirements have been met first considerations are for our regular pre-war advertisers.

The reduced amount of advertising space in our small-size newspapers has been carefully rationed and a general reduction made in the sizes of advertisements, which enables us to accommodate the largest possible number of individual advertisers per issue.

It is gratifying to note that we have, as usual, had the wholehearted co-operation of advertisers and their agents.

As is only to be expected, the *Evening News*, with the largest sale of any evening newspaper in the world, provided similar problems connected with advertisement space.

The *Sunday Dispatch* also provides solid grounds for satisfaction. Its appeal to the public and its importance as an advertising medium are greater today than ever.

Demands for space for Government purposes are particularly heavy in the *Sunday Dispatch*, and in some issues has represented as much as 40 per cent. of the total space available.

ANGLO-NEWFOUNDLAND DEVELOPMENT COMPANY

It is my custom to make some reference to the Anglo-Newfoundland Development Company, whose report and accounts will be issued shortly. The Anglo-Newfoundland Development Company is largely dependent upon the vital question of shipping, and it is unnecessary for me to enlarge upon the difficulties facing the

company, which, up to the outbreak of war, had sold practically its entire output of newsprint in this country for the production of our newspapers. The severe rationing of newsprint supplies to the newspapers over here—now less than 20 per cent. of pre-war—has also made it necessary for the Newfoundland mills to seek markets elsewhere. Whilst the Anglo Company is fully equipped in every way to stand a lean period, it would appear that it must continue to face a difficult time pending the return to normal conditions.

NEWSPRINT SUPPLIES

During the year our main problem has once again been our supplies of newsprint. However, with the excellent arrangements made by the Newsprint Supply Company and the helpful co-operation of Government departments, who have shown a full understanding of the necessity of maintaining a free and widely distributed press, we have come through the year with only a small further reduction in consumption, although our stocks are lower than was the case a year ago. I am hopeful, however, that we shall be able to continue on our present basis and that the next alteration in our consumption of newsprint will be an increase, bringing increased sales and bigger newspapers.

In the tremendous events that are before us, following the complete and magnificent victory of the Allied Forces in North Africa, our newspapers will continue to play their part in the certain knowledge that final victory will be ours.

We have now 1,348 members of our staffs serving with the Forces, and it is with keen satisfaction that we have found it possible to continue our scheme of salary allowances, which I know, from the many letters received, has helped in making their position and that of their families so much easier.

To my colleagues on the board—all working directors—my grateful thanks, and also to the staff and all those associated with us in the ramifications of our business.

The report and accounts were adopted, the retiring directors were re-elected, and the auditors, Messrs Lever Honeymann and Company, were reappointed.

The proceedings terminated with a vote of thanks to the chairman and directors.

MARKS AND SPENCER, LIMITED

DIVIDEND OF 35 PER CENT.

MR SIMON MARKS'S STATEMENT

The seventeenth ordinary general meeting of Marks and Spencer, Limited, was held, on the 10th instant, at Michael House, 82 Baker Street, London, W.

Mr Simon Marks, D.Sc. (chairman and managing director), presided.

The following is the chairman's statement which was circulated with the report and accounts:—

Our accounts are presented in a revised form. The assets and the liabilities have been grouped under main headings, and the figures have been taken to the nearest pound. The necessary adjustments of the previous year's figures have been made for the purposes of comparison.

ALLOCATION OF PROFITS

The net profit for the year is £1,457,467, compared with £1,583,088 last year. The provision for taxation at £863,000 compares with £895,486 last year. The dividends are now shown after deduction of tax. The balance remaining this year, plus £571,940 brought forward from last year, makes a total available for distribution of £1,166,407, against £1,034,132 last year.

The profits have been arrived at after making the usual provisions for depreciation, and a reserve for deferred repairs, and after writing off all capital expenditure in connection with A.R.P. works.

The directors proposed a final dividend of 20 per cent., making 35 per cent. for the year, which will leave an increased carry-forward of £704,015.

RESERVES AND SURPLUS

The reserves and surplus have all been brought together and total £3,881,391.

CURRENT LIABILITIES

The fall in creditors and accrued charges to £571,110 is accounted for mainly by a reduction of the amount due for purchase tax, which no longer applies to the greater part of our merchandise. The deferred repairs reserve is a provision for repairs at the stores which will have to be carried out as soon as opportunity offers.

ASSETS

The only notable change is the reduction in advances to subsidiary companies from £478,551 to £91,035. This reduction is due in the main to the decreased scale of business carried on by the Marks and Spencer Export Corporation, owing to the restrictions of exports.

GENERAL SURVEY

The scope of retail distribution is governed by the number of coupons and points available to the public. The limitation of supplies and of spending power represented by coupons and points has caused a contraction of retail business. The activities of your company have accordingly been affected, and this process may be expected to affect them still more in the current year.

Within the framework of the production of utility garments, the specifications for which are laid down by the Board of Trade, there is a certain amount of freedom for the exercise of initiative. We are, therefore, still able to maintain our policy of offering the public the best values obtainable.

We are grateful to our manufacturing friends and suppliers for their continued co-operation under difficult conditions.

STAFF

Over 1,500 of our men have joined H.M. Forces. It is with deep regret that I have to report that 37 of them have been killed, 25 are reported missing and 37 are prisoners of war. To the families of the bereaved we extend our condolences in their sad loss; we sympathise with the families of those who are missing, in their anxieties.

We have continued our scheme of supplementary allowances, and have dealt individually and sympathetically with the families of those who have become casualties. We correspond with all our men who are prisoners of war, and we do our best to meet their requests for cigarettes, books and games by sending them regular parcels.

Of our pre-war staff of 20,000 only 3,000 are still with us, the majority having left to take up other work of national importance in the war effort. Our present full-time labour force numbers some 9,500. I would ask you to join the board in expressing thanks to them for their loyalty and service to the company.

The report and accounts were unanimously adopted.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

THE past week brought virtually no change from the conditions prevailing in the markets for some time. Turnover suffered a further slight contraction, but prices were generally steady. Very little selling in the gilt-edged market of both short and long-dated stocks was, in the absence of support, sufficient to depress prices. Old Consols falling ¼ and 3½ per cent. Conversion ½, among other declines ranging from ¼ to ½. The foreign bond market was devoid of any particular interest, although prices were maintained. Home rail issues fluctuated narrowly without greatly affecting quotations on balance. Exceptionally, LMS ordinary rose ½ point, while the 4 per cent LMS preference stock improved. The feature of the foreign rail market was the sharp marking-up of Argentine rail stocks on that country's change of government. Initial gains ranged from 2 to 3 points for junior and senior stocks, but profit-taking later reduced these gains, generally by half.

Main activity in the industrial market attached to those shares with current interest. Thus, Callenders Cable rose 14s. 6d. on the announcement of the bonus payment, and De la Rue a full £1 on the dividend. In contrast, Cable & Wireless ordinary fell 5 points on disappointment at the absence of any increase in the year's distribution. Brewery shares fluctuated narrowly, but tobacco shares attracted support, Imps and Bats both advancing ½ among other gains. Motor shares were rather erratic, Morris Motors and Thornycroft rising 1s. 6d. and 1s. 3d. respectively, while Rolls-Royce fell 1s. 3d. among other minor losses. Of the heavy industrial issues, Staveley was outstanding with a rise of 1s. 1½d., but losses were numerous. Tube Investments in particular losing 9d. Textile shares lost most of their earlier gains as the week advanced, and net changes were insignificant. Dollar stocks were dull throughout, but, elsewhere, James Finlay rose 1s. 6d.

*

Pending the June dividend announcements, the *kaffir* market was quiet. Some demand for Far Western Rand issues was

evident, but gains were generally insignificant. *Diamond* shares suffered from profit-taking after their recent strong advance, De Beers deferred losing ½. Turnover in the rubber market sufficed to maintain prices, but, after some improvement at the reopening, when Jorehaut rose 1s. 3d., tea shares became irregular in midweek. Apart from a gain of ½ for Burmah, the oil market was devoid of interest. Anglo-Iranian was sold in midweek, losing ½, but Shell remained unchanged on balance.

New York

A TENDENCY to await the next phase of the war prevented the development of any decided trend on Wall Street during the past week. Occasional selective buying of leading issues was rather overshadowed by selling of rail, industrial and aircraft stocks. Actual price changes, however, seldom exceeded 2 points on balance.

COMMODITY AND INDUSTRY NEWS

Retail Trade.—The Retail Trade Report for April (published in the *Board of Trade Journal* for June 5th) shows a slight rise in the average daily value of sales compared with a year ago. The percentage changes in all departments can be seen in the accompanying table. A drop in the household goods index was again recorded. Sales of "other merchandise"—fancy goods—were bigger owing to higher prices. The rise in turnover in the clothing departments is discussed in a note on page 768. Total sales were about 7½ per cent. above those of March.

Flour Zoning.—The Ministry of Food announces that the postponed zoning scheme affecting the transport of self-raising flour packed in containers of 28 lb. or less will be brought into operation on Sunday, June 13th, by an amendment of the Flour Order, 1943. The scheme will prevent the movement of self-raising flour from zones in which production is insufficient to satisfy the demand, and will regulate imports into those zones from the most suitable zones with surplus production.

British Wool Clip.—Under the Control of Wool (No. 20, Order (S.R. & O., 1943, No. 788), which came into force on June 5, 1943, the British wool clip is requisitioned by the Minister of Supply. This follows the procedure adopted last year. The Order prohibits disposal, except to the Minister, and provides for the furnishing of returns of such wool and the issue of directions concerning removal, transport, keeping, storage, disposal or delivery of it. The Ministry has issued a schedule of prices which the Wool Controller has been authorised to pay for the wool, which are substantially the same as those paid for last year's wool. The Order does not apply to wool clipped in the Orkney Islands, the Shetland Islands and the Outer Hebrides, or to wool removed by fell-mongers from skins in any part of the United Kingdom.

Essential Oils Control.—More than 70 varieties of essential oils will be controlled by the Ministry of Food from July 1st. Control will cover importation, allocation and prices. The soap trade will be restricted to the use of eleven varieties instead of the 35 or so it uses at present. Prices may be reduced by as much as 80 per cent. under the new schedule. For example, peppermint oil will be less than 40s. a lb., while the current price is about 120s. Two varieties of lemon oil have been selling at 60s. and 35s. respectively; the controlled prices are likely to be about 20s. and 6s.

Tar Shortage Areas.—The Tar Controller, Ministry of Fuel and Power, has issued a direction to tar distillers in the Eastern and London divisions of the Ministry of War Transport and in the county of Berkshire (Southern Division)

COMMODITY AND INDUSTRY NEWS

that these are "shortage" areas. Tar distillers in these areas (unless their stocks exceed amounts specified to them by the Tar Controller) will supply tar, and tarmacadam manufacturers will supply tarmacadam only for Air Ministry requirements or on the authority of a permit issued by the Ministry of War Transport's Divisional Road Engineers. Anyone in the shortage areas needing tar or tarmacadam for other than Air Ministry requirements may apply to the appropriate Divisional Road Engineer for a permit.

GOVERNMENT RETURNS

For the week ended June 5, 1943, total ordinary revenue was £30,280,000, against ordinary expenditure of £37,579,000, and issues to sinking funds of £295,000. Thus, including sinking fund allocations of £1,573,077, the deficit accrued since April 1st is £670,215,000 against £552,791,000 for the corresponding period a year ago.

Road Accidents

"The continuing slaughter on the roads calls for insistent protest.

"A new feature is the marked rise in child fatalities which in 1942 were 27 per cent. higher than in 1939 despite an overall reduction of 16 per cent. in the total fatalities for the same period. Children's deaths in road accidents in this country during the last three years total nearly 4,000 or over 75 per cent. of children's deaths through Air Raids.

"The whole question should surely be taken in hand by the authorities in no uncertain way. Radical changes in road policy may be called for; but the need for the individual, whether driver, cyclist or pedestrian, to exercise a greater measure of care and consideration for other road users remains as urgent as ever."

An extract from the Statement issued by the Chairman, Mr. P. R. England, in connection with the 98th Annual Report and Accounts of the Royal Insurance Company, Limited.

Labour and The Coalition

UNLIKE the Conservative Party, which met in conference this year for the first time since 1937, the Labour Party is guided from year to year by the decisions of its annual conference, and its policy is determined in a democratic way by the votes of its membership. Three years ago the Bournemouth conference sent its leaders into the Government; this year, the conference instructed them to stay in the Government, but not a moment longer than was necessary in order to win the war, and above all, not to think of perpetuating the coalition that was entered into for a specific objective.

The overwhelming vote confirming the electoral truce was surprising. It was far larger than the majority on a similar motion last year, although it might have been thought that the Catering Bill and the opposition of certain Conservative members to the Government's exercise of war-time powers would have fortified the critics of the truce. The decision is a triumph for the policy of commonsense and patriotism over more impetuous and impatient counsels. National unity has not been a bed of roses for the professional politicians, and the difficulties of maintaining it increase as the end of the war comes in sight. The right wing of the Conservative party has become more openly provocative and a nostalgia for

the *status quo ante bellum* is beginning to be expressed in certain quarters. But it would be foolish and wasteful for the Labour Party to embark on a policy of contesting by-elections. And it would be suicidal for the Labour Ministers to withdraw from the Government—which would be the only logical conclusion of such a policy. The Labour Ministers, as they, perhaps too assiduously, reminded the conference, have had the most "awkward" jobs in the Government. There was comparatively little criticism of the way in which they have discharged their duties, but there was evidence of a good deal of feeling that the Labour leaders have been too timid in office, too content to play second fiddle and too ready to compromise, whether on domestic or foreign matters—their acquiescence in the Darlan régime in North Africa and in the Government's India policy were both mentioned. If all that the Labour representatives in the Government need is an assurance that they will be supported by the Party's rank and file in any measures they may take to further the prosecution of the war and to plan for improvements in the standards of living after the war, they received it fully this week. The discussion on the Beveridge report amply illustrates this point. The Executive Committee's resolution did not go far enough for many delegates, who

moved an amendment, which received substantial support in the conference, accusing the Government of "timidity, evasion and delay," congratulating the Parliamentary Labour Party on its stand, and urging it to continue to bring pressure to bear.

Though the proposal for ending the electoral truce was thus decisively rejected, there was evidence that considerable misgivings are felt lest some Labour leaders might be tempted, if not exactly to "do another 1931," at any rate to carry over the coalition into the period of peace. Mr Attlee's pledge that as soon as hostilities with Germany came to an end or there was any question of a general election, the conference would be recalled to consider the continuance or ending of Labour's participation in the Government, should go far to remove the fears and doubts on this point. If any Ministers were intending to remain in the Government they would have to persuade the conference that this was the right course, which, to judge from the feeling at this conference, would be no easy matter. Labour has thus given an emphatic No in response to Mr Churchill's appeal for the continuation of the coalition to carry out a four-year plan. Tribute was paid to the Prime Minister's magnificent leadership in the war, but there was general agreement that he should not be the nation's leader in time of peace. On the surface, a case can be made out for the continuance of all-party Government. War and peace are indivisible, in the sense that plans must be laid now for the transition to peace. Labour is co-operating in war administration and in the preparation of post-war plans; it might therefore be argued that it should continue in partnership until such time as the joint plans can reach fruition. But the analogy between war and peace—even the first years of transition—is fundamentally unsound. In peace, there is no general agreement on immediate policy, or on the methods of attaining more distant goals, even if the goals themselves are agreed, as is not always true. If there were fundamental differences of view within a coalition Cabinet, the only policy that could emerge would be one of dilute compromise. And if there were no disagreements, the formal unity of politics would be a false reflection of the country. The sooner that British politics can return to the open competition of parties for the favour of the electorate, the better both for the parties and the country. The essential unity of the national outlook is better achieved by an alteration of policies than by an agreement to do nothing that might offend anybody. A contested election after the war would probably not give a Labour majority, but it is the only way to a future Labour Government.

But this ignores the vital question: Is Labour fit to govern? It could be answered, with truth, that Labour could not govern worse or display greater bankruptcy in home or in foreign affairs than the Conservatives during the Baldwin-Chamberlain era. But this is not enough. Mr Herbert Morrison, at Leeds in April, said that Labour "must be ready for the tasks of Government," and at the conference he outlined some of the tasks ahead, not the least of which will be the battle for the continuance of controls. The Labour programme has long been known and accepted by Labour conferences, and its recent pronouncements on the social services, health, housing, education and local government reform are sensible, progressive and constructive documents, which will command wide support. What people want to know now is, how does Labour propose to carry out its programme? This year's conference shows that the rank and file of the Labour movement are tired of the reiteration of phrases and catchwords, and of promises of "jam tomorrow." They want a clear-cut lead, and assurances that the party's programme can become practical politics, and will be translated into practice at the earliest opportunity. The ballot for the party officials showed the trend of opinion in the constituencies—Mr Laski and Mr Shinwell, who topped the poll, have been active prodders inside the party. The defeat of Mr Herbert Morrison in the election for the Treasurership is probably due in the main to the personal popularity of his rival, Mr Greenwood, and to the respective rôles each played during the House of Commons debate on the Beveridge

report. Although Mr Morrison is no longer a member of the Executive, it may be assumed that he will continue to exercise a very great influence on its counsels. Indeed, it would be ludicrous if he did not.

The Labour Party has suffered too long from an opposition complex, and has too long been retired behind its Maginot line in Smith Square. "In office, but not in power," was the experience of two Labour Governments—and the excuse for many inactions—and the defeats of 1931 are still deep in men's minds. As Mr Attlee himself remarked, the British never know when they are defeated, and British Socialists never know when they have won. More self-confidence and initiative will be needed if the Labour Party is to become a governing party. The party, largely owing to difficulties of wartime organisation and the abandonment of local electoral activities, has sunk to a low level; its individual membership has declined progressively since its peak of 1937, and is today lower than at any time since 1928. The plea of the Communist party that it would provide the necessary galvanising influence was decisively rejected, though by a smaller majority than was the ending of the electoral truce. The argument that Communist affiliation would bring greater strength to the movement, and that the dissolution of the Comintern had demolished the chief argument against their admission, though sincerely put by Mr Will Lawther, the miners' leader, was overruled by the deep mistrust of Communist tactics and of the record of the British Communist Party.

The present moment is Labour's testing time, and also its opportunity. Labour's aims and policy, its programme for social reform, greater equality of opportunity and extension of public ownership, have a wide appeal. The successes of Common Wealth can be attributed in part to lack of competitors in the electoral field, but more particularly because it preaches—in simple language—the same doctrines as the Labour Party. If, after the war, Labour is to have an equal chance with the Conservatives of getting a majority, it will have to attract a great body of liberal (with a little "l") opinion, and become the nation's great progressive party. More than this, it will have to attract the great floating mass of the non-political electorate, upon whose votes its accession to power would depend. The blight upon British politics ever since 1918 has been that this central mass of the electorate has always, with the rarest and most partial exceptions, thrown its weight to the right. Until it begins to alternate, until there is a pendulum to swing, there will be no life. And it will not be attracted to Labour, even at alternate elections, until Labour starts to attract it. To do this, Labour will not need to water down any of its actual policies (as distinct from some of the abstract nouns it uses), but it must give evidence of constructive and bold leadership. It should put an end to heresy hunting, with its black circulars, expulsions and disciplinary action against those who co-operate with outsiders. It should make it easier for young men and young women with brains and ability—even if they have not the means—to enter Parliament. At present the tendency is for parliamentary seats to be reserved for trade union officials and for candidates who are regarded as "safe" from the Transport House point of view. The millions of young men and women who have borne the brunt of the war and who will vote for the first time at the next general election will certainly not cast their votes for elderly candidates or for those who play for safety first. Nor can Labour expect to lead the nation if it does not permit leadership within its own ranks, if it rejects its great men because it suspects their greatness, or if it imposes too many obligations of servitude on those it elects to office. Men are led and governed by men, not by nominees.

This Whitsun conference has shown signs that the Labour movement has begun to realise what it is that has held it back for all these years, just out of reach of what has seemed to be its obvious reward. The transformation is beginning. Like all psychological transitions, it is difficult and intangible. If it is successful, not only the Labour movement, but the community as a whole, will feel the benefit.

The Peaceful Ocean

OVER a year has passed since the fall of Singapore, the bombing of Ceylon and the brief irruption of the Japanese Navy into the Indian Ocean. In spite of the gloomy prophecies made at the time of Japan's sweeping advance through the South Seas, the Indian Ocean is the only great stretch of water in the world that is still substantially untroubled. India has not been threatened from the sea; nor, save for the brief internecine fighting in Madagascar, have the east coasts of Africa been disturbed. The Japanese are in occupation of a large segment of the rim—but they remain on the rim. The comparative immunity of so large and so strategically vital a part of the earth's surface is a fact worth comment. The Indian Ocean has been an area of peace for the last hundred years, and today, in the middle of the Second World War in history, it is still, in the main, at peace.

The reason is, of course, the Pax Britannica. The Indian Ocean is, above all others, the zone where the possession of overwhelming sea power and control of all the bases by one peacefully intentioned nation has given a stability and a security other regions have not known. There is no other reason why the Indian Ocean and its shores have been spared the ordeals of the Atlantic, the Pacific, or the Mediterranean. If it is thought desirable to go on maintaining so large a portion of the earth in peace, the problem is to ensure the continuance of the unified system of military security which British suzerainty has provided hitherto, and to secure its continuance in a form tolerable to the peoples concerned.

The force of Eastern nationalism is not spent. It will be far stronger after this war. Burma and India will secure some form of independence. Ceylon has in the last week accepted a number of constitutional reforms which take it on another stage towards dominion status. The restored regime in Malaya, whatever its precise form, will certainly leave more scope for local independence than the old. To the West, the Arab nationalist movement must sooner or later develop in Aden and the Hadramaut. There are aspirations to independence in East Africa, and if the great problem of racial tolerance can be solved, they will be granted. South Africa has for a generation been fully sovereign.

A general movement towards independence all round

the Indian Ocean would be in keeping with the democratic ideal of self-determination. But, by itself, it would contribute very little to the other ideal of freedom from fear. Young nationalist states are not usually either strong in themselves or naturally given to strategic co-operation. Thailand is a warning of their incapacity to resist aggression. And the bleating of the lamb excites the tiger. An area weak in political and military strength, yet rich in resources, a centre of world commerce, criss-crossed with vital air and sea communications, is a standing temptation to the ambitions of more powerful nations on the periphery. It would be rather naïve to suppose that because the present aggressors will have been beaten, the temptations that led them on will not entice them again, or entice others.

This will be the dilemma before British policy in the Indian Ocean after the war. The aspirations towards independence cannot be crushed or disregarded. At the same time, only some strong general security system can maintain the area as a zone of peace. Moreover, by one strong pair of hands, the Indian Ocean can be very economically defended. Its strategic outline is simple. Strong forces maintained at only seven points—at the Cape, at Suez or Aden, at Baghdad, on the North-West Frontier, at Mandalay, at Singapore and in the Timor Sea—can command all the entrances either to the ocean or to its littoral; there are no other ways in. The forces needed are, in the main, naval and air forces; the chief rôle of land forces is to ensure the security of the naval and air bases. (The ease with which Singapore was taken from the land was an exposure of the imperfect way in which the broad strategic policy was executed, not a disproof of the policy itself.) In short, the integral defence of the Indian Ocean is the sort of task that only a world-power can undertake; a number of independent national units, operating separately or even in co-ordination, could hardly achieve it, even if they could refrain from attacking each other, or from suspecting each other of designs of attack. And it is exactly the sort of task to which British arms are suited. Yet if the strategic facts point so conclusively to unity, the political facts point no less conclusively to diversity. Unless the countries of the Indian Ocean can attain, or at least aspire to, independent nationhood, they will be dis-

To every man and woman smoker

Will you help to reduce the appalling loss of vital material caused by fire damage?

THOUSANDS of tons of foodstuffs completely destroyed, a clothing factory in flames, destroying hundreds of thousands of garments—fires like these are costing the nation £12,500,000 a year! More important than the money are the labour, the raw material and the shipping space which must be diverted from the war effort to replace the loss.

And the facts are, undeniably, that most fires start from some little act of carelessness by a normally careful person. A match thrown away still smouldering,

a cigarette end left burning, an electric iron left switched on—simple acts of carelessness like these are slowing up production, as well as making tragic inroads into the nation's reserve of materials. Will you help to stop it?

Be more than careful with lighted matches and cigarette ends—be sure! Stub your cigarette ends till they're right out and never throw away a match or spill unless you know it's out. Your help, everybody's help is needed, to reduce the loss to the war effort by fire.

Most fires are caused by careful people

3 SAFETY FIRST
RULES FOR SMOKERS

1. You know a match is out when you can do this.

2. Stub your cigarette end right out.

3. Look twice, when you're in any doubt.

contented—and the unity of their discontent would pose a problem far beyond Britain's power to solve. But if independent nationhood were to mean a collapse of the present strategic unity, the Indian Ocean peoples would gain independence only to lose it—and probably for ever—in somebody else's New Order or Co-Prosperity.

British practice has, however, evolved a number of working models for meeting this difficulty. It is not certain that when their time comes, either Malaya, Burma, Ceylon or even India will opt for complete independence outside the Commonwealth. They may all prefer to retain Dominion status and to co-operate in a joint defence system as Australia and New Zealand have tacitly done in the Pacific area. The Singapore base was not in any formal sense a joint Imperial effort. But it was heartily welcomed and explicitly blessed by the Antipodean Dominions. Yet Dominion status of itself, at least as understood in its present form, is not a complete guarantee of co-operation. The Treaty Ports in Eire are an obvious example of the way in which the right to remain neutral can be used to prejudice the right of other nations to survive. Dominion status in the Indian Ocean requires an agreement on the joint use of bases essential to general security.

It is possible that the nations bordering the Indian Ocean may wish to go further than the achievement of Dominion status and break their political connection with the British Commonwealth. Here again, there are models in British policy for combining political independence and strategic co-operation. In Iraq, the abandonment of the British mandate in 1922 and the establishment of full Iraqi sovereignty carried with them free agreement on the maintenance in Iraq of British air bases. Egypt is another example of the combination of national sovereignty with the joint use of bases. In both cases, the fact that Great Britain had retained these facilities enabled both Iraq and

Egypt to develop their independence without involving themselves in costly warfare or hardly less costly armaments.

If peace is to be maintained in the Indian Ocean, solutions on the lines of the Imperial base of Singapore or the treaty relations with Iraq and Egypt must serve as a model. It may be objected that this arrangement cuts across United Nations solidarity. There is no reason why it should. The existence of the British military agreement with Egypt made it possible for American troops to use Egypt as a base. Similarly, had the Pacific war gone better, presumably American battle-ships would have operated from Singapore. Bases maintained by Britain for safeguarding the peace of the Indian Ocean could be used by other peace-loving nations. Great Britain's part would be primarily that of accepting the continuous responsibility—and liability—of keeping the bases in first class military order and of shouldering the often arduous task of maintaining cordial diplomatic relations with the national states—Dominions or otherwise—in whose territory the bases were situated.

Such a working arrangement would not be a cloaked form of resurgent imperialism. Its attraction is that it can work within a framework of national sovereignty and of international co-operation. Other nations will have a similar responsibility in other areas—America in the Pacific, for example. In the Indian Ocean it is Britain that could bring to the work the greatest measure of experience and the most considerable record of success. In all the policies that growing nationalism and economic development in the Indian Ocean will make necessary over the coming decades, this great beneficent fact of strategic integrity should never be lost from view. The British rôle is that of trustee, and of trustee only. But it should not be surrendered until there is some other trustee in sight whose strength is as great and pacific intentions are as honest.

Post-War Export Policy

IT is entirely right and proper that the methods and possibilities of British post-war exports should receive an increasing volume of public discussion. This is a healthy reflection of the growing realisation of the magnitude of the problem that will face the British community when the war is over. The facts from which the discussion starts are common property. The balance of payments of the United Kingdom on the average of 1936-37-38 can be very briefly set out in the following table (the figures are in £ millions, rounded to the nearest £10 millions):—

Imports.....	930	Exports.....	540
Govt. payments.....	10	Investment income ..	200
		Shipping earnings ..	110
		Commissions, etc.	40
		Other receipts.....	10
			900
		Deficit	40
			940

The war will have made substantial inroads on some of the items on the right-hand side. Investment income may have been reduced to half the £200 millions shown for the pre-war years. Shipping earnings will be much reduced until the Merchant Navy can be re-built and re-capture

its former position. Income from commissions, etc., may have been impaired (though not in so serious a proportion as the two former items). Moreover, there is the possibility of an adverse movement of the terms of trade—that is to say, of a greater rise in the prices of imports than of British exports. Even the essential minimum of imports may cost much more than £930 millions a year. As a convenient target for policy, there is general agreement on an increase of 50 per cent in the pre-war physical volume of British exports.

So much is common ground—as is the realisation that a great effort will be needed. Unfortunately, the trend of much of the public discussion is disappointing in the extreme. British industry is, in these days, far gone in the protectionist mentality. There is no point in reciting once again the origins of this state of affairs; but the results are frightening. It seems to be taken almost for granted nowadays that a British manufacturer cannot—and should not—be expected to hold any market in fair competition. At home, the dominant policy is to erect barbed wire and “Trespassers will be Prosecuted” notices round every market. Abroad, the British exporter seems to have an equal fear of the American competitor with his high wages and of the Asiatic with his low wages. Most of the dis-

cussion of post-war export policy, therefore, resolves itself into a rather pathetic search for the inherently impossible—that is, for ways and means of protecting export markets.

Two articles which have recently appeared in the *Times* have illustrated the more ludicrous aspects of these general tendencies. One of these was signed by Colonel Walter Elliot, whose thesis was that modern technical developments made international trade entirely unnecessary; autarky was the natural system of the twentieth century. This is utterly wrong-headed. It may be true that scientific invention is making it technically possible for a country to make at home all its essential requirements—provided that it pays no attention at all to any considerations of real or money cost. But scientific invention is simultaneously extending the advantages to be derived from international interchange. The more producers there are and the greater diversity of methods, the greater are the potential benefits of the division of labour. Just as the individual in a nation gains from the growth in the productive competence of the community, so will the nations in the world commonwealth. A rich industrialised nation may spend a smaller proportion of its total income on imports than a poor primary producer; but it is a vastly better market. It may someday be physically possible for the British people to make at home all that they need. But, Colonel Elliot's whimsy apart, the common-sense of the position is what it has always been; there are many things that the British people must import if they are to live at all; and if they are to live well, they must not debar themselves from buying goods from where they are cheapest or best.

The other *Times* article was more sophisticated. It argued that there is no such thing as an exact “cost of production” for any particular quantity of goods, that the producer need not apportion his overheads proportionately and that it may be the soundest practice to sell goods at a price that does little more than cover the out-of-pocket expenses of production; provided the sale yields anything at all towards overheads, it is better than no sale at all. This is true, though not new. Any heavily-capitalised industry can increase its total returns if it can sell at different prices in different markets. But when an accounting truism is widened out into a policy of dumping in export markets, something more needs to be said. What reason is there to suppose that, if one nation begins to sell its goods, as a deliberate policy, at less than their full share of the total costs of production, other nations will not follow suit? And if this policy—which most people will persist in calling dumping—is to become general, the advantage is clearly with the country whose exports form a small part of its total production. If the United States were to sell exports at their prime cost, the contribution to the overheads of American industry would hardly be missed. But it is hardly so with Great Britain. Export business, though it has fallen in importance, is not yet so insignificant a part of British industrial activity that it could be thus subsidised without a heavy strain being felt throughout the economy. Moreover, as Mr G. L. Schwartz argued in a letter to the Editor of *The Economist* four weeks ago, if there are to be sales below total cost, why should it always be the foreigner who benefits? Is not this a case where charity begins at home?

The truth, the very plain and obvious truth, is that there are no means by which export markets can be protected. Such devices as are possible are of very temporary efficacy. Thus it is always possible for a great importing country to drive bilateral bargains whereby its suppliers are compelled, in default of other outlets for their produce, to buy its goods at very high prices. This was the method of the Nazis before the war; it is the method for which some sections of British opinion have hankered. But, unless the margin of price is very small, this device will work only until the parties of the second part, who suffer under it, can readjust their economies and escape. International cartels are another device for assuring a market to the high-cost producer; but the assurance lasts only until the renewal of the agreement, when the producer who could extend his sales in open competition will be just as insis-

tent on a larger share as the best-armed brigand at a robbers' share-out. Nor is currency depreciation a permanent remedy. The pound must not, of course, once more be over-valued. But a deliberate under-valuation would lead both to imitation by other currencies and, also, through higher food and material prices, to increased costs at home.

There is only one way in which British exports can be expanded and the expansion maintained, and that is by producing a better article at a lower cost than other countries. It is difficult to imagine why it should be supposed that Great Britain, which invented this sort of business and has practised it with more success than anyone else, should now consider herself so inevitably inferior. The native and historical advantages remain. Is it the economies of mass production that are lacking? The world's second largest national income is in this island, and there are very few industries where the economic unit of production is larger than the British internal market can support. Is it the cost of materials that is excessive? It is cheaper to bring materials from the ends of the earth to England by water than from the Rocky Mountains to the Atlantic seaboard by rail. Is it skill of workmanship that is absent? The achievements of the war—and especially those of the aircraft industry—prove that the British workman—when properly led, properly organised and properly equipped, can turn out in an hour's work a higher quantity of better products than anyone else on earth.

The trouble is that he is not always properly led, organised or equipped. An article by Dr Leon Rostas in the current issue of *The Economic Journal* draws some highly interesting comparisons from the returns of the pre-war censuses of production in Germany, Great Britain and the United States. In physical output per head, averaged over all factory industries, if the British pre-war achievement be reckoned as 100, the German was between 101 and 107, and the American between 229 and 238. The British workman expects a standard of living, not equal to the German but considerably superior. How can he maintain it if his output is no higher? The same question is posed by a comparison between the three countries of the share that wages form of total costs of production. In Great Britain in 1935 the figure was 44.3 per cent. In Germany in 1936 it was 32.0 per cent. In the United States in 1935 the figure was 39.4 per cent. Germany gets low costs by paying low wages. America gets low costs in spite of high wages by very heavy mechanisation. Britain does neither, and has high costs. This may be an over-simplification, but it is not a falsification, of the picture.

If, therefore, British costs are high, they are not inevitably high, but high only in the environment of the present structure and equipment of British industry. If, in the struggle to pay for imports, wages and living standards in the export industries are not to be dragged down to the Continental level, then efficiency must be raised to the American level. That is the task before the country in the years after the war.

There are two sorts of efficiency, technical and economic, and it is both in conjunction that are decisive. Technical efficiency is a matter of machines and methods. It is not entirely the fault of British industry that it has fallen behind in these respects—taxation policy has played a part—but that it has fallen behind is hardly open to doubt. There has been a great deal of re-equipping during the war, and a shattering of outworn traditions that may be even more valuable. But there is a very great deal still to do in keeping up with the Industrial Revolution. This is not a matter for the state alone or for industry alone. Both share the responsibility for the present state of affairs; contributions will be needed from both if it is to be put right; and both will suffer if it is not. In the interests of the level of wages, the aim should be to double, for a few years at least, the secular rate of increase in the productivity of an hour of labour. The utmost degree of labour-saving is the only way to save Labour.

But technical efficiency will be useless without economic efficiency. It is not enough to have a few show plants

where costs are low if they are not allowed to sell at their low costs. It is absurd to build plants for mass production and then to throttle them down to a fraction of their capacity, so that traditional methods may have a comfortable old age. There is no purpose in having in England the world's cheapest producers if it is the world's dearest producers, also in England, who call the tune. This is a familiar theme in these columns and it need not be pursued further on this occasion, except to remark that insistence on the most ruthless economic efficiency does not necessarily imply insistence on *laissez faire* or on "cut-throat competition." On the contrary, especially in the context of exports, there is a great deal

to be said for various forms of collective organisation, of which the wartime Export Groups might form the embryo. Trade Associations have the most useful functions to perform in organising the co-operative endeavour to reduce costs of production—always provided that the reduced costs are allowed to find their full and immediate reflection in reduced selling prices both at home and abroad. It is not only the neo-Luddites but the cartellites who have to be defeated before full efficiency can be achieved. British export trade has, by common consent, a gigantic task in front of it. It labours, admittedly, under grave difficulties. But the fault is not in its stars, and the remedy is its own.

Eire Votes

EIRE will go to the polls on June 22nd to elect the eleventh Dail. This will be the first election since the war, and the third election that has been held since Mr De Valera became head of the Government. Since the nominations were handed in at the beginning of the month, a vigorous election campaign has been in progress. Party leaders and ministers have been touring the constituencies, and the Irish papers have reported little else but the cut and thrust of democratic debate. Yet for all the atmosphere of party clash, this election has an unreal air. There appears to be less fundamental disagreement on policy than ever before in the short but chequered history of Eire, and the tendency of the two leading parties, *Fianna Fail* led by Mr De Valera, and *Fine Gael* led by Mr Cosgrave, to conduct the discussion in terms of Lewis Carroll adds to the atmosphere of unreality. The *Irish Times*, for Mr Cosgrave, taunts the Government with excerpts from "Alice in Wonderland," while the *Irish Press*, for Mr De Valera, replies with telling quotations from "Through the Looking Glass." The quotations are certainly apt in the sense that they correctly assess the coming elections as a paradoxical event held in an attractive backwards-looking wonderland where cause and effect seem to have parted company. The censorship has been relaxed for the period of the elections, but much of the atmosphere of unreality is a hang-over from the freezing of public controversy. For three and a half years, there has been no discussion in print of the great issues of the day. It is hardly surprising if an election held in these circumstances tends to revolve round superficial and irrelevant issues, and if it fails to raise the fundamental problems of Irish democracy.

Mr De Valera's party, *Fianna Fail*, has been in office since 1932. In the forthcoming contest, there are 355 nominated candidates. Of the three main parties, *Fianna Fail* is putting up 105 candidates, *Fine Gael* 87, and Labour 72. In addition, there are 47 *Clann na Talmhan* (farmers' party) candidates, 36 Independents, 5 adherents of *Coras na Poblachta* (a group which takes its stand on a programme of currency reform and of more intensive stimulation of the Irish language), and 3 supporters of the implicitly totalitarian *Ailtirí na h-Aiseiríge*. The eleventh Dail, like its predecessors, is likely to be composed of representatives of the three main parties, with a few notable Independents. It would be surprising if the existing division of the parties were very radically altered. There is an expectation that, after successes in the municipal elections last spring, Labour will find increased support in Dublin, and perhaps in Cork. But few Labour enthusiasts suggest that the existing representation of 9 will be much more than doubled.

The issue on which the election is being fought is, rather surprisingly, that of whether or not Eire should be governed by a coalition. The plea for a National Government was first put forward a few weeks ago by the *Irish Times*. It has been adopted by *Fine Gael*, and Mr Cosgrave has announced that if he is entrusted with the task of forming a Government he will invite the co-operation of *Fianna Fail* and Labour, and will form a Government of all the talents. The attitude of Labour

remains somewhat equivocal, but Mr De Valera has roundly denounced the coalition move as cumbersome and unpractical. He is calling on the electorate to return a "truly national" Government by giving *Fianna Fail* an overwhelming majority, and he asserts that if he fails to attain a clear majority he and his party will go into opposition. So it appears that Mr Cosgrave, even if successful at the polls, would hardly be able to form a National Government without the assistance of defections from the ranks of *Fianna Fail*.

The coalition controversy is a very significant pointer to the current state of Irish domestic politics. It reflects the paucity of ideas and lack of vigour which colour the whole of Irish political life. Mr De Valera's Government can plausibly be accused of pursuing an unimaginative policy; but the lack of any practical alternative policy—other than the piecemeal Labour programme supported only by a fraction of the urban population—is an even graver commentary on the existing bankruptcy of statesmanship. The two main parties, *Fianna Fail* and *Fine Gael*, as the *Irish Times* pointed out in its plea for a coalition, derived from two wings of the old Sinn Féin party which split some twenty years ago on their attitude to the Anglo-Irish Treaty. In the past ten years, all outstanding questions between Britain and Eire have been settled, with the sole exception of "partition," and on the partition issue the parties are alike, both in having the ultimate aim of re-uniting Ireland and also in having no immediate plan for realising their aim. Thus there is, the *Irish Times* claims, no live difference between the two parties. In the past, there has been a very important difference on economic policy. Mr Cosgrave developed an economy based on stock breeding and the British market. Mr De Valera, partly as a result of the economic war, turned to grain crops, halfway autarky and the encouragement of secondary industries. For the present, the war and the blockade make Mr De Valera's policy inevitable, so that on this score, too, the immediate difference of principle boils down to very little.

To lift the election a little out of the sphere of personalities and past history, the coalition issue was a necessity. Although there patently is all too little difference between the immediate policies of *Fianna Fail* and *Fine Gael*, that would not by itself justify the conclusion that a coalition is the solution. Somewhat amusingly, the success of the British experiment is constantly quoted by its *Fine Gael* advocates—who perhaps see no other hope of shortly returning to office—but Mr De Valera, whose belief in democratic practices is deep, if not wide, is surely right when he claims that democracy is essentially majority government and minority opposition. A National Government is a *pis aller*, useful only in time of extreme emergency, such as does not now exist for Eire, and totally unsuited to a people as little given to compromise as the Irish. Mr De Valera has a policy. It is based on neutrality, on nationalism, on liberty within certain rather stringent limits (which do not prevent him from internment the IRA), and on self-sufficiency as a virtue as well as a necessity. He believes in the neutral, Catholic, hairshirt

Republic, and he has a right to claim that he should be replaced only when an opposing policy commands the support of a majority of the Irish nation.

On any of these elements of the De Valera policy, the search for an opposition of sizeable proportions is completely vain. To the British observer, the most "through the looking-glass" aspect of the election is undoubtedly the attitude of the various parties to the neutrality issue. Save for Mr James Dillon, an Independent with a *Fine Gael* past, no voice is raised against neutrality—and even Mr Dillon would not permit Irish troops to leave Eire. Indeed, the opposition parties tend to outdo the Government spokesmen in acclaiming a policy which they believe to have the heartfelt support of the Irish people, and which they fear is generally attributed to the astuteness of Mr De Valera. They claim that they would have been just as clever as Mr De Valera has been; and neither he nor they show the slightest recognition of the manifest fact that the maintenance of Irish neutrality has not been due to anything that has, or has not, been done in Eire, but to the indifference of one belligerent and the forbearance of the other. In any case, there is no disagreement on the neutrality issue, which is by now past history, and the main concern of Mr De Valera's opponents is to prevent him from walking away with all the credit. Mr Dillon's is also the only voice to disturb the monotony of agreement on the question of partition, with a proposal for the creation of a United Ireland within the Commonwealth. His solution for the economic problem is a frank recognition that Irish prosperity is dependent on the purchases of the British market and a proposal to reintegrate Eire in a system of world trade at the earliest possible opportunity. This is a true opposition policy; but not one likely to conquer Irish opinion, which sees in it a drift back to the British Empire and a preference for economic prosperity over political independence. The policy of the totalitarian *Ailtirí na h-Aiseiríge* is again completely in opposition, but it is happily a negligible quantity. The opposition of Labour is based upon a far

more embittered nationalism than that of Mr De Valera, and on a somewhat irresponsible willingness to offer all things to all groups: higher wages to turf cutters and lower priced turf in the towns; lower taxes, but improved social services—again Lewis Carroll, but this time Sylvie and Bruno.

In fact, so long as the war lasts, and so long as the neutrality issue is, as it certainly is now, dead or dormant, no Irish government can do more than mark time, seek to maintain employment, and husband the increasingly scanty supplies of almost all sorts of goods. *Fine Gael* does not pretend to offer a different answer from Mr De Valera's to the problems raised by the war—hence the coalition suggestion. The answers provided by Labour, by Mr Dillon, and by the other groups, will almost certainly fail to carry the day. In these circumstances, it may be that the future of living parliamentary democracy in Eire would best be served by Mr De Valera's return to office with a working majority, so that he can freely reject offers of coalition support. When the war is over, Eire will need a Government capable of carrying the country out of political isolationism and economic retrogression, a Government of constructive, young and competent minds; and it will need a powerful opposition able to suggest a workable alternative scheme of development. Today, in a world of great events, Eire is sidetracked in contemplation of a tragic past. The closed chapter of the struggle for national independence is still re-read at every election, with the result that the next chapter is never begun. The leading political figures remain the revolutionaries of two decades ago—brought down to earth by the responsibilities of office, and tired by the insoluble problems posed by the back-wash of another war. If Irish democracy is not to peter out, there must be a shift of interest and of emphasis from the past to the future. To have been "out in '16 and '22" must become a less important password to popular favour than to have coherent plans for national development in '47 or '55. And policy will be born of divergence, not of compromise.

NOTES OF THE WEEK

UNRRA

The United States Government, after lengthy negotiations with all its Allies, has produced a comprehensive plan for administering relief in the wake of the armies of liberation. The major Powers have already approved it, and, under the name of the United Nations Relief and Rehabilitation Administration, it will presumably be the framework within which the relief system will work. It is based on a Council representing all the United Nations, to which neutral states with goods to supply will be invited. This Council will meet about twice a year, and determine general lines of policy. At the next level are a group of committees—some regional, for Europe, for the Far East; one functional, the Committee on Supplies, which will represent the countries supplying the materials for relief. It is probable that Canada will preside over this latter Committee. At the next stage, exercising considerably more executive authority, is the Central Committee on which the four Great Powers, Great Britain, the United States, the USSR and China, will sit *ex officio*, and which will be attended by the Chairman of the Committee on Supplies and by any country whose relief position is under discussion. Finally, presiding over the Central Committee, is the Director-General, who will carry the executive authority of the whole Administration. It is possible that Mr Lehman, the Chairman of the American Relief Organisation, will become Director-General. The existing Inter-Allied Relief Committee will probably be transformed into the European committee, with its seat in London. This is the framework. It is interesting to note how closely it follows the pattern set by the machinery of the League of Nations. The General Council corresponds to the Assembly, the Central Committee to the Council, the Committee on Supplies to the various commissions. The only real innovations in organisation are the subsidiary regional committees. The test of the scheme will lie, however, not in its elaboration or comprehensiveness. It will lie in the speed and efficiency with which its officers secure

the passage of supplies from the producers overseas to the stricken peoples of Europe and Asia. Here the example of the last war should serve as a warning. In the Allied Maritime Transport Council and the Food Council there existed in 1918 a piece of tested machinery which could have been rapidly switched from its war tasks to the reconstruction job of supplying the peoples. It was not allowed to function until after Mr Hoover had wasted three months trying to set up an entirely new and separate organisation. To-day the various Combined Boards—Food, Shipping, Production, Raw Materials—in Washington have even more experience of international administration than the inter-Allied bodies of the last war, and are already handling problems identical with those that will face UNRRA—the determination of requirements, the allocation of supplies, the matching of deliveries with shipping availabilities, etc. It would be disastrous to ignore this machinery. Fortunately, there is no reason to suppose that the same mistake will be made a second time. It should also be possible to make use of such a regional organisation as the Middle East Supply Centre. The use of the Boards would not modify United Nations control of the Relief organisation, for their part in the machinery of relief would be to advise and execute, not to decide. But if the existing machinery is not used, it is all too likely that the delays and confusions of the last war will be repeated.

* * *

Air Power

Lay discussion of the next stage in the war is being much confused by debates about whether or not air bombardment is capable of gaining victory single-handed. Some commentators have even gone so far as to suggest that the surrender of Pantellaria a week ago proves that bombing alone can reduce the enemy's continental fortress. In fact, of course, the capture of this tiny island was as much a vindication of the sea power that blockaded and shelled it,

and of the land power whose triumph in Tunisia laid it bare, as of the air power that beat its buildings into ruins and broke the morale of its low-grade defenders. This is not the first time in military history that a besieged garrison has given in before the assault, and it affords no general precedent for the Continental problem of invading Europe. The *Times* correspondent on the spot is worth quoting:

Our capture of Pantellaria was in its immediate results a resounding success. . . . It is no detraction from that . . . to point out that the operation proves very little. . . . The fact is that we shall never again meet anything so easy, and that if we had failed in this we should have had to reconsider our whole combined operations policy.

Nor is the very great damage done in the Ruhr region (which is commented on in a Note below) and elsewhere by heavy bombers a guarantee in itself of German defeat. The task ahead is not to send the various arms, land, sea and air, singly into the attack, in order to discover, competitively, which can be most effective, but rather to throw in all three together in a single attacking force, each exerting the maximum of its strength at the chosen point in the grand manner of combined operations for which geography, industrial capacity, experience and leadership have peculiarly fitted the Allied forces.

Combined Operations

The view of many observers, held almost throughout the war, that the pattern of victory requires, not only the central planning and ordering of strategy and production, but also the common training and command of all arms in actual operations, has been borne out by the course of events. By a brilliant improvisation, after many setbacks, a way to make effective joint use in battle of the Allied air and land forces was devised and applied in North Africa, with the commanders of the two arms working together throughout the battle at a common headquarters. The air resources at their disposal were divided into two parts, one responsible for the direct tactical support of the armies in the field and the other for the logistical task of rendering the enemy's logistical problems insoluble by the bombing of ports, bases, dumps and communications. This division of function has now been introduced into the RAF at home, with the setting up of what is called the Tactical Air Force, under the command of Air Vice-Marshal D'Albiac. This is no hasty change on the eve of battle. It is two and a half years since the Army Co-operation Command was set up to try out "all forms of land and air co-operation." This Command, now that the period of experiment and training has ended, has been merged into the TAF. The new force will be "located" in Fighter Command to ensure that in its work as an essential part of the Army in the field, "the closest possible integration with the main fighter force" will be ensured. Already, the process of integration has been tested in large-scale operations, not only in the real arena of North Africa, but also some three months ago in the biggest combined exercises ever held in this country. The emphasis is, and must be, upon "integration" rather than "co-operation"—common training, common command, common action. Nor should the allocation of the Tactical Air Force, equipped with "all the types of squadrons which have proved most suitable for the direct support of armies in the field," to this specialised task, conceal the need for what can be called the Strategic Air Force—that is, in the main, Bomber Command, with its vast and growing striking power—to play an equally direct part, when the time comes, in the process of invasion. The "location" of the TAF in Fighter Command must not mean either that it is to be merely a fifth wheel to the Air Force coach, or that Bomber Command is to ride aloof and apart. The remarkable work of devastation done by Bomber Command in bombing the enemy's backward areas, production centres, communications, bases and ports almost throughout the continent of Europe is indispensable to victory; but its contribution in the same vein nearer the field of battle when the sea and land advance on Europe starts can be a decisive factor. The latest change in organisation is a tremendous step forward; but the test is still the extent to which every weapon in all three elements will actually be available, and under a single direction, when the moment for the final series of knock-out blows arrives.

Bombing the Ruhr

The Ruhr and Rhine area of industrial Germany is being heavily and consistently bombed. The confusion that has arisen in the minds of many people about the effects of this massive bombing upon the enemy's power to produce the goods of war is due, in part at least, to the British authorities' frequent habit of relating the output of this

smitten region to the total output of pre-war Germany, without including the industrial potential of the countries conquered, annexed and occupied during the war, and without allowing for the appreciable wartime changes that have taken place in the distribution of German industry. Statistically, the percentages put out officially to the press and over the wireless are, of course, quite accurate—as a statement of the relation that the Ruhr-Rhine industries had to German industry some time before the war (though not of the relation they bear to-day to the area that was Germany then). But if they are intended to demonstrate in roughly quantitative terms the damage that Bomber Command is doing to the industrial capacity now available to the Germans—as they seem to be—they are a very considerable overstatement and one which if it were officially credited as fact, would base certain crucial strategic decisions on a serious false premise. The relative importance of the Ruhr-Rhine area to Germany has declined for two main reasons. First, even before the war new industries were being located in central Germany; secondly, since 1938, the industrial capacity of Austria, Poland, Czechoslovakia, Holland, Luxembourg, Belgium and France, all of them coal and steel producing countries, has been added. In 1938, the Ruhr-Rhine area produced roughly 60 per cent of the coal output of Germany and Austria together, against 72 per cent of the output of Germany alone in 1927-29 (lignite is included at its coal-equivalent). The area's share in the total steel output in 1938 was also about 60 per cent, against 80 per cent in 1927-29. During the war there has been a considerable expansion in the output of lignite, mainly in central Germany. The coal of Poland, Czechoslovakia and Holland, which is produced in areas that are geographically contiguous with the German coal districts, has also increased, while output in the Ruhr-Rhine has probably remained stationary, for technical reasons. These changes, it may reasonably be assumed, may have reduced the share of the Ruhr-Rhine area in the total coal output available to Germany to less than half, perhaps to some 40 per cent. If, say, 80 per cent of the pre-war coal output of Belgium and France is also included in the total, the share of the Ruhr-Rhine area is reduced to some 36 per cent, that is, to not much more than one-third.

In steel production the situation is similar. The new Salzgitter iron and steel capacity in Germany came into production during 1941. If allowance is made in addition for an increase in steel output in Poland and Czechoslovakia, and if Luxembourg's output is added, the share of the Ruhr-Rhine area may have fallen during 1941-42 to roughly 40 per cent. If, lastly, only a half of pre-war output in Belgium and France is added to the total available to Germany, the share of the Ruhr-Rhine area is reduced to approximately 36 per cent, again to just over a third. These estimates are naturally very speculative—as all such estimates, official or unofficial, must be. They are based on pre-war figures and on general indications given in the business reports of German concerns. But they do suggest, even allowing for a wide margin of error, that even if the Ruhr-Rhine area were totally put out of action by bombing, Germany would be left with a total available coal output of roughly 250 million tons a year, including brown coal; and that steel output might still be about 20 to 22 million tons.

Direct Action?

The campaign among civil servants to break the ban on their affiliation to the Trades Union Congress continues. The Union of Post Office Workers, which numbers 157,000 members, recently voted for affiliation, in spite of the prohibition imposed by the Trade Disputes Act of 1927, and Sir Walter Citrine publicly signified the willingness of the TUC to accept the union's petition for membership. This set the ball rolling. The Civil Service Clerical Association, with 140,000 members, has decided to organise a national campaign against the Trade Disputes Act and to ballot on the advisability of applying for affiliation, Act or no Act. The organised servants of local and municipal authorities have also moved. The National Association of Local Government Officers, with 120,000 members, has taken a ballot, which shows a majority in favour of seeking affiliation. Neither the NALGO nor the CSCA, however, is yet disposed to pursue the direct line taken by the UPW. The campaign set on foot by the CSCA is, on the contrary, an attempt to secure the lifting of the ban by proper political means, that is, by the persuasion of public opinion and the

consequent amendment of the Act; and the NALGO has referred the question of direct action back to its branches. Obviously there is need, first, for agreement between the TUC and the Labour Party, which is represented in the Government, on the right course of action for the Civil Service unions to take; and, secondly, for the reopening of discussions on the Act between the political parties which make up the present coalition. There is little doubt what the right course of action is. It has been stated this week at the Labour party conference, on behalf of the Executive. While deploring the provisions of the Trade Disputes Act and the intransigence of the Conservative party, this pronouncement made it plain that, in the Executive's view, the only legitimate means of obtaining redress, if an agreement cannot be made with the other parties, is by an appeal to public opinion and the electorate—"in exactly the same way as the legislative reversal of the Taff Vale decision was obtained in 1906." The apparent bias of the TUC, or at any rate of its chief spokesman, towards an immediate flouting of the law was not supported; and delegates to the conference were urged "to refrain from any form of intervention, even by discussion," which was stern and unexpected advice. There was even talk as a result of a split between the industrial and political sides of the labour movement—which, apart perhaps from a clash of personalities, seems hardly likely in view of the weight of the trade unions in the party. At any rate, the Executive's careful counsel was both timely and judicious. It is unreasonable that civil servants should be prevented from being affiliated to the TUC; it would be criminal and foolish for the unions to defy the law; it would be reasonable and wise for the Act as it stands to be amended—with its safeguards preserved to prevent civil servants from being drawn, by their industrial connections, into political activities. The danger of the present situation is that, by resorting to direct action in place of political persuasion and discussion, the unions may fatally prejudice their good case for securing an amendment by agreed and constitutional means.

Delays in Algiers

Those who hoped that the setting up of the French Committee of National Liberation would enable Frenchmen to turn their energies from problems of divided allegiance to the job of winning the war have been disappointed by the first week's record at Algiers, for it is precisely the work of mobilising French resources for victory that has rushed the Committee head on into another deadlock. For days now the Generals, the Commissioners, their Allied friends and advisers have been trying to find a way round the divergence of views which has immediately become manifest over the question of Army reorganisation. The problem is one of control: who is to rejuvenate the French Army? The crisis opened with General de Gaulle's forcible raising—at the first Committee meeting—of the problem of the Commander-in-Chief's status and of its relation to the proposed War Council. Since then, at least five different solutions of the dilemma have been suggested, but each has broken on the fear—first of one General, then of the other—that their own position and their own views would not be sufficiently safeguarded. At the time of going to press, no solution has been reached, and although the question is to go before a meeting of the full Committee, it is not certain that either side will abide by a majority vote. The trouble is that much deeper issues are involved than purely military efficiency. The army of re-invasion will inevitably have great political influence. In its cadres are undoubtedly men who compromised with Vichy. Yet many of these men, from the standpoint of technical knowledge, are essential to the new French Army. The de Gaullists are apparently pressing for a much more drastic purge of political suspects than General Giraud thinks the Army can stand. Here, of course, is the entry point for suspicion. The de Gaullists suspect General Giraud of using the technical argument to protect "traitors," the supporters of Giraud suspect the de Gaullists of wanting a political purge. The moderates, now a well-defined group consisting of General Catroux and MM. Monnet and Massigli, are working tirelessly to reach a compromise.

Interim Development

Lord Simon's apology for the Town and Country Planning (Interim Development) Bill during the second reading debate in the House of Lords on Thursday last week, was as disingenuous as it was skilful. The Lord

Chancellor made two claims: first, that the Bill substitutes "the conception of a central authority and direction for the exercise of local government functions"; and, secondly, that at a stroke the Bill will bring under planning resolutions the quarter of the land of England and Wales that is still not covered by local resolutions under the Act of 1932. It is difficult to see, however, in what real sense the Minister of Town and Country Planning will, simply on the passing of this Bill, take the place of local authorities—who must surely remain the planning agents in any case—in the actual making of plans. What the Bill appears to do, is not to substitute one authority for another but to add a new authority, the authority of the Minister, which is still so vaguely defined that, in effect, the local authorities will remain the planners. It is true that when land has been brought under a planning resolution, "interim development," that is, building, can be controlled or forbidden until an operative plan has been made; and that the new Minister will be, as Lord Simon pointed out,

in a position in which he will influence and provoke and it may be in proper cases originate along regular national lines the policy which we are now considering.

But there are no national lines; there is no policy to which "interim development" can be referred. And the Minister's position, until there is a policy, will not differ in essentials from the position of the Minister of Health under the Act of 1932, when his function was almost solely to approve disparate local projects. The passing of this Bill will not alter in the least the fact that it is still the local authorities who are being asked to prepare plans for local areas without any guidance on the kind of planning that is likely to be in the national interest or on the Government's ultimate intentions in regard to the control of urban growth and industrial location. There is still a vacuum at the top; there is the simulacrum of a central planning authority in the Ministry of Planning, but not even the basic principles of a positive central plan. While this is so, planning will continue to be largely ineffective because the local planning authorities will lack both the common context of a national policy for land-use and the powers and resources to carry their plans through. While some three-quarters of the land in England and Wales is already covered by planning resolutions, only 5 per cent is covered by operative planning schemes, partly because of the absence of a national policy, and, more immediately, because of the inability of individual authorities to compensate owners for the disturbance of property values. The further Bill that has been promised to extend the power of local authorities to acquire land will be a step forward. But, inevitably, unless the local authorities are given a Government brief on the control of land-use and the compensation of land-owners with a specific promise of the powers and resources necessary to apply its principles to all building in their areas, in the "interim" as well as in the ultimate stage of operative planning, they will plan in the future as they have done in the past—whether they want to or not. That is to say, they will not plan at all, but will direct their efforts, willy-nilly, to the speediest restoration of local rateable values.

Thrift

Before Parliament adjourned for the Whitsun recess, the Pensions and Determination of Needs Bill passed its third reading in the House of Commons. An amendment allows widows under 60, who now become eligible for supplementary pensions if they have children under 16, to continue to be eligible for them even after the youngest child has reached that age. But most of the discussion at the Committee stage centred on the treatment of capital assets. The new Bill raises from £300 to £400 the maximum sum owned by the applicant which is to be regarded as not available for his needs. One Member pressed for this maximum to be raised to £1,000, but when it was taken to a division the amendment secured only 8 votes. That it should have been moved shows how, after three years of existence, supplementary pensions are already coming to be regarded as payments as of right like contributory pensions. But the main argument brought forward in favour of it was that under the present system thrift by the working class is discouraged. Where it is a case of unemployment assistance, there are certainly strong reasons for taking as lenient a view as possible of the possession of savings. Generally speaking, a person saves for his, or her, old age, and if his savings have to be depleted during a long period of unemployment, it will merely mean that he will have to apply to the state for assistance at the age of 65 because it was not granted to him, in full at least, when he was unemployed at 40. But since savings are for old age, when that period is reached surely they should be used. It is indefensible that a person should keep a sum of £1,000 intact, to leave to his family when he dies, and live on the taxpayer. This surely is an abuse of thrift. It is also an abuse that people should skimp themselves and their families when they are young in order to save. Mr Kirkwood mentioned people who have put money aside instead of buying boots for their children. The answer is that they ought not to have done it. No one should cripple himself and his family by saving what he cannot afford.

Farm Cottages To-morrow

Early in February the Ministry of Health published details of a scheme for the construction of 3,000 agricultural cottages to relieve the housing shortage in certain rural districts. Work was to start in April in order to ensure its completion by harvest time. Construction and management were to be the responsibility of the rural district councils, who were to select sites in collaboration with the county war agricultural committees. Designs had been produced by the Ministry's Central Housing Advisory Committee, with and without a parlour. The project aroused much interest and controversy in Parliament and the press. Some said that the programme was much too small to make any impression upon the housing shortage—a figure of 300,000 houses was mentioned—and others criticised the designs, methods of construction and cost. In the excitement it was quite forgotten that 3,000 houses were urgently needed by harvest time. Work does not appear to have even begun. On June 10th Mr Ernest Brown, Minister of Health, informed the House of Commons that tenders for 220 houses had been submitted to him, and that those for 54 houses had already been approved. Questioned about the delay, Mr Brown said it was due to the high tenders, which had necessitated a review of the situation. Of the 54 tenders approved, the lowest was £747 and the highest £937, exclusive of the cost of land, roads, sewers and architects' fees, amounting to £100 in the first case and £51 in the second. These prices are very high indeed; the rise in building costs since the beginning of the war, Lord Portal stated on June 2nd, has been 105 per cent. The rents envisaged for the farm cottages are 8s. 6d. a week for a non-parlour house and 10s. a week for a parlour house. If these prices are the best that can be got, no further time should be lost. The 3,000 cottages are urgently needed; and any more ambitious programme is ruled out at this stage owing to the shortage of labour and materials, especially timber. Perhaps a proportion of the cottages may be ready by the spring.

Neutrality or Collaboration?

Great Britain, the United States, Germany and Italy have all recognised the new regime in Argentina. Meanwhile the Ramirez government has done nothing to modify

Argentina's previous policy of neutrality. Unofficial hints have been thrown out that this may be only a temporary phase and that definite action will be taken to break off relations with the Axis "when public opinion is ready for it." But public opinion in Argentina, in so far as it is vocal, is well ahead of the Government; it was ready long ago. The propaganda work carried on by the *Accion Democratica*—before the Castillo regime put a stop to all such activity—has had very considerable influence, and no Argentine government need fear popular disapproval of a policy of full collaboration with the United Nations. The real difficulty lies with the government itself. It is military in character—one of the exceptions, the civilian Minister for Finance, Señor Santamarina, is thought to be a friend of the United States—and it is above all in military circles that pro-German propaganda has been most successful and distrust of American hegemony most keenly felt. If the generals and the admirals did not feel so strongly their need for American lend-lease equipment to keep on approximately the same level of military preparedness as their neighbours, they would certainly prefer a policy of neutrality. Their professional outlook is in collision with their sense of national pride. In these circumstances they will need time to climb back along the limb of Argentine isolation. Meanwhile, the overthrow of President Castillo in Argentina has caused an eddy of unrest in Chile. The Chilean President was due to leave for Washington. Apparently a plot was discovered, implicating the Minister of the Interior, Sr Morales, to declare war on Germany during the absence of Sr Rios in the United States. As a result, the President has postponed his journey and dismissed Sr Morales.

Distribution of Milk

The Government's policy for milk distribution was strongly criticised last Friday by Sir Thomas Baxter, chairman of the Milk Marketing Board. The introduction of a functional method of payment for services whereby separate remuneration was paid to depot proprietors, wholesalers, self-wholesalers and retailers was, he said, leading to a long chain of distribution charges, and encouraging supplies to pass through many separate hands. For example, because of the reduced financial incentive to buy supplies direct from farmers, many retailers were now using the services of a wholesaler for the first time, thus making an additional link in distribution for which the Ministry of Food paid a wholesale margin of twopence a gallon. Mr Sidney Foster, general manager of the Board, pointed out that the Ministry's policy was responsible for a level of distribution costs which, during the past six months, was the highest in the history of milk selling—which, if true, means that the level must indeed be mountainous—and this in spite of the real saving effected by economies in transport and the elimination of the consumer's choice of milkman. The introduction of the self-wholesaling allowance to big distributors, a consequence of the adoption of the functional method of payment, was again criticised by Sir Thomas Baxter. This gives the large dairy companies and some co-operative societies up to 14d. a gallon more than their smaller competitors. The Government's case for this extra emolument is that these big distributors perform the function of wholesalers as well as that of retailers. Sir Thomas contends, on the other hand, that the additional margin is not granted for any additional service. This is an issue which can surely be cleared up very simply—by a statement of the facts. More generally, however, the critics seem to be disingenuous. When they talk about costs, they mean money costs, and they make no allowance in their comparisons for the fall in the value of money or the rise in the price of labour. Even so, the matter is too important to be allowed to rest. Milk distribution was extravagant enough, in all conscience, in the old days of the Milk Marketing Board itself. What seems to be wanted is an expert, authoritative and impartial body of inquiry to find out what the truth of the matter really is.

New Trends in Russia

The first anniversary of the Soviet-American Agreement was celebrated with great enthusiasm in Moscow last week. The exchange of messages between M. Kalinin and President Roosevelt was accompanied by extensive press comments which drew popular attention not only to the effectiveness of the Grand Alliance during the war, but also

to its prospects after the war. This demonstration of "Allied-mindedness" in Moscow has come as a climax to a marked and general growth of confidence since the conclusion of the African campaign. This attitude is in very happy contrast to the mood which prevailed throughout the second half of last year. The feeling that Russia alone, like Atlas, bears the whole burden of the globe has been considerably dispelled. Events in North Africa and in the air over Germany have spoken for themselves; and the present long lull on the eastern front has revealed to the Russian public the extent to which the wars in the west and in the east have merged into one. There remains the question how deep and definite is this change-over from long-standing isolationism? The dissolution of the Comintern has probably had fewer visible repercussions in Russia than abroad. The belief that revolutions in other countries would free Russia from its isolation faded long before this war. What was lacking until recently was any positive proof that friendly and stable co-operation with capitalist nations would be possible. This proof has now been provided in the most tangible manner. The Russian pilot flies an American or British machine; the Russian soldiers wear British-made shoes; the Red Army driver knocks about in a foreign lorry delivered under Lend-Lease; the worker at the lathe reads the inscription "Made in Britain" or "Made in the U.S.A." on the new and excellent machine tool which he has just been given to handle. The masses learn very eagerly from their daily experience. And this prosaic daily experience is beginning to suggest to them new possibilities of international friendship and cooperation. True, there are still important difficulties inherent in the Soviet political system. Reasons of domestic policy have not permitted the Government and the press so far to explain to the Soviet people the working of a foreign democracy. But if military events and post-war economic cooperation combine to strengthen the new mood and the new trend of thought, the Russian people may perhaps learn not only to appreciate the efficiency of British and American machines, but also to understand the outlook of the men who made them.

Soviet "Millionaires"?

For several months past the Soviet press has carried lists of acknowledgment for donations contributed by individual collective farmers to the various defence and Red Army funds. Sometimes these donations have amounted to several hundred thousand roubles; and a recent donation by a Kirghiz farmer amounted to more than one million roubles. The generous donor was honoured by a personal letter of thanks from Marshal Stalin. The size of the donations raises, of course, the question of the size of private incomes in Russia. It looks as if the "immoral kulak"—liquidated thirteen years ago—has been miraculously resurrected. Yet there is nothing really miraculous in this economic process. Ever since 1934 some sort of private farming and some private trade in agricultural products have existed in Russia within the framework of the collective agricultural system. The scale of this private trade has been difficult to assess since official statistics ignored it. Similarly, the published Russian statistics give no figures about the different income groups in Russia, probably because there is no wish to destroy the official notion of Russia as a classless society. *The Economist* has, on several occasions, pointed out that wartime decentralisation of food supplies in Russia is likely to favour the development of private trade in agricultural products, and the list of donations published by the Soviet press seems to bear out this assumption. The donors have been, almost exclusively peasants, and they can in the main have derived such large savings only from private trade. Even so, the size of the sums is somewhat surprising. Probably these figures point to a very advanced stage of inflation in private trade in the countryside. It is also significant that the possession of large private savings is being explicitly encouraged. Marshal Stalin's letters to the donors have more than a hint of the old "*Enrichissez vous!*"

The Oldest Colony

This year will see the tenth anniversary of the Newfoundland Act, which suspended the Dominion's constitution and provided for its administration by a commission of government of six, under the supervision of the British Government. It was stated that this regime was to be only

temporary until Newfoundland should be self-supporting again, and now that ten years of commission government are nearly up, it is not surprising that in this country as well as in the Dominion itself the question is being asked how long the regime is to continue. In Parliament last week Mr Attlee was not very encouraging. A "good-will" commission of three Members of Parliament is to visit the island, but it will make no report and it is difficult to see what useful purpose it can serve. The reasons that led to the suspension of self-government in 1933 are still there, though superficially Newfoundland has regained prosperity. There was a budget surplus of \$7 million in 1942, since the war, revenue has multiplied some four- or five-fold; the debt service is now being met regularly. The fact remains that ten years of commission government have not remedied the fundamental economic defects. The present prosperity is almost entirely due to the construction of military bases, and to a wartime boom in the fishing industry, because of the cessation of Scandinavian supplies. But the military projects are nearly completed, and the island's economy will then revert to a cod basis, which is all the more unsubstantial in that the industry is organised on antiquated lines. Ten years ago the people of Newfoundland voluntarily renounced self-government in favour of good government—but they did not get it, and it is hardly surprising that they are now regretting their renunciation. Yet there does not appear to be any strong united movement for a return to self-government, though there is undoubtedly a vague wish for it among many sections of the people. The trouble is that political abnegation has resulted in political apathy. All things considered, there seems a strong case, first, for a long-term policy of reconstruction and then for associating Newfoundlanders both in formulating it and in carrying it out. But there is also a lesson to be drawn from the Newfoundland experiment. It is that though British institutions may sometimes break down or be inappropriate, it is no solution merely to put the clock back. After the war, British colonies are going to need large subsidies out of the Imperial Exchequer if the British colonial empire is to be justified. But financial dependence should not be allowed to stand in the way of progress towards self-government.

AMERICAN SURVEY

The Machine Tool Situation

(From a Correspondent in Cleveland, Ohio)

May 21st

A PROCESSION of war industries has been rounding over their peaks for almost a year, beginning with the builders of munition plants, then reaching the builders of steel works, and now including some of the builders of machine tools. The big era of construction is definitely over. A War Production Board statement last week to the effect that the United States is at last "tooled to beat the Axis" was more dramatic than inclusively accurate, inasmuch as the machine-tool industry still has on its books orders exceeding \$500 million, worth. But unmistakably spotty outlooks appeared in the industry three or four months ago.

The makers of these master tools of industry used to regard a production of \$150 million worth a good year. In 1939, thanks to British orders, they turned out \$200 million worth; in 1940, with the beginning of the American defence programme, \$442 million; in 1941, \$785 million; and last year, \$1,360 million. This year they will probably slide off to a point between \$1,100 and \$1,200 million.

The industry is heavily concentrated in a few centres—its old homes in Connecticut and Massachusetts and the newer plants in Cleveland and Cincinnati, with outliers in Vermont, Illinois and a few other places. A number of the companies have connections of long standing in Coventry and Birmingham. The plants are mostly small or middle-sized, as American establishments go, and they are seldom publicly financed; but with the rush of war demand they were persuaded or coerced into doubling, tripling or quadrupling their forces and erecting new works which a few of them have not yet fully utilised. Now they are beginning to take on subcontracts from other manufacturers of war material to piece out the machine-tool business. Within the last few weeks, a number of them have been taking such fill-in jobs as parts for Diesel engines, cutting of gears and making governors for ships' turbines and fabricating marine valves.

The product of the industry consists of the elementary and mostly unspecialised tools of the metal-working factories. The fact that its peak has been reached is conclusive evidence of the maturity of the American war economy. The first tools to round over the hump were engine lathes, several types of boring mills and deep-hole drilling machines for gun-boring. Demand is still very large for cylindrical grinders, used for airplane parts; big hobbing machines for cutting the teeth in marine turbines, and multiple-spindle bar machines used for making any number of items. On the side of the argument for continued high activity are several additional projects which are coming along, a few inventions which approach the tooling stage, and the changes brought about by the fluidity of war in the design of weapons. The Soviet Government is also seeking to place several hundred million dollars' worth of new orders; and the word that the British machine-tool industry has not slackened its operations and that the British trade is still trying to buy quantities of machinery in this country leads many American firms to think they will be busy on approximately the present scale for the remainder of the war.

Enormously expanded though the industry is, the amount of work still required by the aircraft and shipbuilding industries and a few others is expected to keep most of its 300 plants running at their present pace for the rest of the year. The managers are still perplexed by the extreme shortage of skilled workmen. They contend weekly with the draft boards in their effort to keep essential hands at least long enough to train women to take their places.

Machine toolers in general welcomed the announcement that their major task is done, even though it requires them to make adjustments sooner than some of them had expected. They have had posed to them a part of their post-war task before the war is over. The industry has been concerned

over the rate at which it was turning out tools capable of lasting years beyond the end of the war—as they did in 1917 and 1918, with a longer depression ensuing in that trade than in most others. This time they have almost doubled America's tool equipment from where it stood in 1938, and some of them have mourned the possibility of being out of business for ten years. Renegotiation of contracts is leaving them with profits insufficient to carry them that long; even, many of them complain, with less than enough to enable them to get into new lines of business.

Views of their post-war prospects range among the tool builders from the dubious to the pessimistic. No one is cheerful, but some of them, like Mr Tell Berna, manager of the National Tool Builders' Association, look for heavy exports and the rise of new industries. Existing machines, moreover, are being worn out at a very rapid rate. Three shifts of workers depreciate them much more than three times as rapidly as one shift would, particularly as most of the workers are still relatively new to their jobs, many of them women who have never before worked in factories.

American Notes

Food Prospects

The June crop report has come as a shock to those who assumed that it would be an easy matter for the United States to shoulder the major burden of feeding the world. Floods covering nearly 4,000,000 acres in Oklahoma, Kansas, Arkansas, Missouri, Illinois and Indiana, drought conditions in the Dakotas and New Mexico, and heavy rains elsewhere, make the outlook less promising than it has been for the past three years. The wheat crop, estimated at 730 million bushels, will be the smallest since 1936; production of truck (market-gardening) crops is running 13 per cent below last year. On the credit side is the larger production of livestock, which, according to Mr Davis, the Food Administrator, may bring total food production near to that of 1942, given average weather, hard work on the farms, and adequate supplies of labour and equipment for harvesting. Mr Davis's mild optimism is not shared by his critics, foremost among whom is Mr Hoover, whose gloomy prophecies now appear to have some justification. Mr Hoover's demand for a single over-all Food Administrator, and the recall of industrial workers to the farm, has now been taken up in Congress. The ex-President would also like to see brought back into production much of the 47 million acres retired from cultivation by the restrictive policies of the '30's, when food was a drug on the market. President Roosevelt, however, has remained cool to Congressional stirrings and proposals from the same quarter of further shake-ups in the Department of Agriculture. He reiterated last week his belief that subsidies would do the job of encouraging production and at the same time keeping the cost of living stable. Already subsidies to "roll back" the price of butter, coffee and meat by 10 per cent are on the way. Over a one-year period they are expected to cost just under \$1,000 million and will be financed by the RFC, which at present has both the funds and the power to do so. How long it will retain these powers in the face of Congressional hostility, is problematical. The implacable opposition of the farm bloc, which is campaigning for higher prices, has been reinforced by those who see possibilities of political advantage in the administration of subsidy payments. And while the battle rages on Capitol Hill, the distributive trades are prudently emptying their larders of butter, meat and coffee in anticipation of lower prices next month. This artificial shortage, combined with the proba-

bility of a disappointing harvest, will now produce a price spiral "like a Kansas cyclone" unless authoritative action is forthcoming; and it will further embitter those unions which, unlike Mr Lewis, have put their faith in a strong policy of price control and rationing.

To Strike or Not To Strike

As yet there is no sure sign of a settlement of the coal dispute before the renewed truce expires on June 20. Consequently speculation is focused on the anti-strike Bill now lying on Mr Roosevelt's desk awaiting signature, veto, or the *laissez faire* attitude which would make it law in ten days without his signature. There are reports that Mr Lewis, facing the threat of imprisonment that the bill carries, may be willing to climb down to the extent of accepting a War Labour Board decision in the matter of portal-to-portal payment which, with other concessions, might net the miners nearly \$1.50 a day more. The breach which he had made in the coalowners' front has apparently come to nothing, and the owners have withdrawn from negotiations and appealed to the WLB for direction. It is also suggested that Mr Lewis may calculate that submission now might later be used to "show up" the WLB and the Administration for what he would describe as an anti-labour bias. Presumably he could so manoeuvre the miners, although there is growing resentment in the pits owing to Mr Ickes' forcible-feeble policy of imposing a \$5 fine on each striking miner, in accordance with their old contract, and then, when it appeared that the issue was too dangerous, speedily announcing that it could be eliminated by local negotiation. Whether the President will sign the anti-strike Bill is unknown, although some quarters are confident that he will. If he accepts it, the most likely course would be to allow it to become law without his signature, although even this could not fail to alienate much of his labour support. There appears to be no question that the bill is badly drawn and truly anti-labour, but the pressure of public opinion, and particularly that of men in the Services, is manifestly very great, and next year's elections must be remembered. As it stands, the bill includes the provisions noted last week concerning secret ballots, the 30-day "cooling-off period" before strikes are called in war industries, and a choice of heavy fine or imprisonment for anyone inciting strikes in government-seized plants. It also outlaws clauses in labour contracts by which workers can be compelled, as a condition of employment, to maintain their membership in the union—a sort of halfway-house to the closed shop. The impassioned opposition of the AFL and the CIO is based on the firm, and probably correct, belief that such drastic limitations on collective bargaining would invite a full-dress revival of managements' anti-union activities and prejudices. It should not be forgotten that for nearly two years after the passage of the National Labour Relations Act, which protects collective bargaining and prohibits discrimination against union members, employers, particularly in the heavy industries, openly defied the law. Compliance was not general until 1937, and the good old days are mourned and not forgotten.

Bulled Through

The first phase of the synthetic rubber programme has been successfully accomplished. Speaking at the opening of the Union Carbon and Carbide Company's new butadiene-from-alcohol plant at Institute, West Virginia, Mr Jeffers, the Rubber Administrator, confidently prophesied that production of synthetic rubber in 1943 would lie between 250,000 and 275,000 long tons. With the year's expected imports of crude at 54,000 tons, and an initial inventory of 443,000 tons, Mr Jeffers felt safe in saying that at last military needs and essential civil requirements, totalling 609,000 long tons for 1943, were assured, although he was quick to add that the point had not been reached at which restrictions on civilian use could be abandoned. So far this year, 25,000 long tons of synthetic rubber have been produced in the United States. Next year, Mr Jeffers estimated that production in the 40 plants being constructed would be at a yearly rated capacity of 850,000 long tons, greatly in excess of any previous imports of crude rubber. Of the plant needed to produce the 850,000 tons of rubber to which the programme has now been cut back, 30 per cent are already completed and the rest will be in production before the end of the year. Although the first plants to come into operation are those that derive butadiene from alcohol,

by the end of the year, according to *Time*, only 30 per cent of the materials for butadiene will come from corn. This is due to the higher cost of corn over oil as the basic ingredient. If Mr Jeffers is not disappointed in his predictions, he will have cause to congratulate himself. It has been agreed all along—and Mr Jeffers has been insistent in pointing out—that there were infinite possibilities of failure in compressing into a few months technological experiments which in peace-time would have been spread over years. If the synthetic programme lives up to expectations, it will also cast an undeserved shade over the remarkable efforts of the Rubber Development Corporation to turn South America—and particularly Brazil—into a reliable source of small amounts of crude rubber. Because of the conditions under which wild rubber is gathered—the trees grow about two to an acre of forest—these have involved the virtual underpinning of the whole Amazon economy, with the United States assuring supplies of petrol, air communication, sea transport of food, and anti-malarial medicines. Early in April, South American production in 1943 was estimated at between 35,000 and 40,000 tons, and that for 1944 at about 70,000. After allowance for the internal consumption of the countries, the total amounts available are not large, but in view of the need for crude rubber to mix with synthetic for certain types of tyres, and the chanciness of the synthetic programme, crude South American rubber at a total approximate cost of 65 to 70 cents a pound was considered useful insurance.

Zoot Suits

The zoot suit, for all its eccentric specifications of coats below the knee, six-foot key chains, foot-wide shoulders and peg-top trousers, is not altogether a comic subject. About 500 men and boys are in jail and 150 in hospital in Los Angeles as a result of clashes between the uniform of the United States and that of the gandy-dancer, and Los Angeles has been put out of bounds for service men. Nor are the disorders purely an expression of lawless and jitter-mad youth, although the immediate excuse has been attacks by so-called "pachuco gangs" on service men and their women friends. These gangs, of which Los Angeles is said to have 40 or 50, are largely made up of Mexican youths, and they are not of recent origin. One of the familiar sights in Los Angeles has been these boys, racing about in cut-down jalopies (i.e., old stripped motor-cars), dressed up in fancy suits, broad-brimmed hats, with their long hair combed into a top-knot. War conditions have made their activities less harmless. Last summer a public hearing was held by a grand jury investigating a murder attributed to the pachuco gangs. Unlike the local sheriff's office, which arrested 300 Mexican youths and attributed the murder to their "criminal biological tendencies" (Los Angeles has a Mexican population of over 200,000), distinguished witnesses called by the grand jury testified that the manifestations were due primarily to persistent discrimination, in the schools and the community, against second-generation Mexicans, who retaliated by forming their own gangs. The zoot suit is a symptom, not only of irresponsibility and recklessness, or of American eccentricities, but of a partial failure of the melting-pot.

Shorter Notes

One of Mr Byrnes' first steps as Director of the Office of War Mobilisation is an attempt at an arrangement with Congress whereby each House maintains a single committee to cover matters relating to the War. The demands which the many existing overlapping committees make upon the limited time of Service officers and members of the Administration have become intolerably heavy, and some rationalisation of Congress's committee organisation is urgent.

Coming changes in manpower distribution have been indicated by Mr McNutt in recent testimony before the House of Representatives Appropriations Committee. The Armed Forces, which will number 9,200,000 by July 1st, will take an additional 1,700,000 men during the last six months of the year, making their total strength just under 11 millions. Munitions industries, now employing 10 millions, must be increased by another 1,300,000 in the next twelve months. In order to meet these demands, 2,500,000 workers will be shifted from civilian industries, and another 1,200,000 will be drawn from those not normally in the labour force, raising the latter to the unprecedented total of over 64,000,000.

THE WORLD OVERSEAS

Seed Beneath the Snow?

(By a Correspondent)

THE third anniversary of Italy's entry into the war was not a happy one for the Duce and his people. Scarcely less hard pressed than France in 1940, Italian resistance, and with it the fascist regime, awaits the *coup de grâce*. And when the Allies have made surrender possible, there is no doubt that the Italian people will be glad to cut their losses; to acquiesce in a change of government and to scrap the tawdry glamour of the dictatorship. To attempt to forecast the exact form of the government of to-morrow, before the final campaign has been fought, would be an error of taste as well as of judgment. Sufficient categorical inexactitude on this subject has already been offered to the world. The whole gamut of Italian conservative traditionalism has already been inconclusively canvassed. There is little doubt that, when the time is ripe, Italy will not lack its defeat Premier or its group of realists ready to support the leader who is to conclude a "soldier's peace." The erection of a temporary government scarcely presents a political problem. There is no need, and indeed no opportunity, to discover and reward an underground opposition. But the composition of a defeat Cabinet, always, of course, provided that it is not fascist, is not a matter of the very first importance, since there is a strong probability that it will not endure.

The real problem of political reconstruction comes later. It will take time for the Italian nation to shake off the deadening influence of twenty years of fascism and also to recover from the shock of defeat. The function of the first provisional government, and possibly of the authorities controlling an Allied occupation, will be to speed this rehabilitation; to hold the scales and to foster the return of the elementary political rights of freedom of speech and association without which no democratic rebirth is possible. To do this, there must be intensive study of the damage that two decades of fascism have done to the mental and moral make-up of the Italian people. In recent years, Allied criticism of fascism, perhaps in an attempt to appeal to the intelligent self-interest of the Italians, has tended to fasten on its practical military and economic incapacity. There have been many excellent expositions of the method by which Mussolini, through an outstanding error of judgment, has sold to Germany his country's political freedom and has allowed Italy to be exploited economically in the manner of any other satellite. All this is true, but it fails to point to the greatest damage that fascism has inflicted on the heirs to the Roman tradition, the loss of character, of backbone and of self-respect. Before any national revival can produce a constructive and popular alternative to the fascist government—anything more respected than a government which owes its *raison d'être* to surrender to a foreign Power—there must be an end of the psychological blight which fascism has induced.

In his latest book* the great Italian Socialist, Ignazio Silone, has provided a penetrating and convincing picture of the mental climate which fascism will leave behind it. The book has an optimistic title: *The Seed Beneath the Snow*. But the seed which Silone describes is individual, scattered and negligible in the conditions of to-day and even possibly in those of to-morrow. The content of the book is not optimistic. It provides a picture of cynicism, corruption and social decay. It suggests that virtually the whole of present-day Italy has allowed itself to be compromised by the terror of a police state; that the exceptions are much rarer than has generally been believed. The account of Italian psychology which Silone provides agrees in the main with the evidence afforded by observers of other totalitarian states. There is perhaps rather more cynicism, a greater tendency to discount all political activity, of what-

ever complexion, than may be found in Germany. The Italian dictatorship has bred less fanaticism and less unquestioning faith than has been distilled from blood and earth north of the Alps. The result may be a quicker collapse, but an equally delayed return to political health.

A Lesson in Caution

Silone's novels are, of course, not evidence. They are written in exile, and are based on the experiences of the author as an active member of the underground movement some ten years ago, and on hearsay. They offer no more than an opinion about the psychological condition of present-day Italy; nevertheless, they are the work of an author who throughout the last twenty years has lived closer to the Italian people, even in exile, than the majority of political refugees. They certainly deserve the very careful consideration of the Allied world at the moment when the end of fascism is in sight. The lesson of Silone's books, and particularly of his latest novel, is a lesson on caution. They emphasise, as do no other accounts of fascist Italy, the deadening effect of enforced conformity, of ubiquitous suspicion and hollow applause. Yet, most marked, and perhaps most far-reaching, Silone considers to be the decay of personal friendships. Believing that under Mussolini's regime friendships—a good neighbour policy—have become luxuries entailing too often an intolerable tension between emotion and security, Silone suggests that human relationships have become almost completely formalised. His latest novel, which, apart from its urgent political implications, is an excellent story very well told, abounds in examples of this tension: between mother and son on account of a grandson hunted by the police for anti-fascist activities; between the Government official and the colleague who has displaced him by intrigue; between the displaced official and his former satellites; between old friends of every sort who cannot trust each other's reactions to the order of the day. Against this depressing background, Silone depicts a rebirth of hope issuing from the comradesly affection of a Socialist agitator in hiding and a few peasants. This reawakening of human values is "the seed." From a sophisticated standpoint, the hope that this seed will bear fruit appears slender indeed. The striking implication is that Silone, from his vantage point in a democratic country, sees no other hope—that the reclamation of Italy, in the view of at least one competent observer, is to be expected not from any political *credo*, but in the first place solely from the revival of a living humanity.

The Seed Beneath the Snow definitely rebuts the suggestion that any social group or class or any institution, not excepting the Roman Catholic Church, has remained immune from the taint of fascism. But it is significant that Silone takes his vital and sympathetic characters almost wholly from two often overlapping groups: from the peasantry and from those inspired by a living Christianity.

We find among peasants and workmen, Pietro maintained, the last remains of pride, dignity and common sense, the last reserves that our race may hope to draw on,

And again,

It may be a heresy on my part, Maestro Eutimio, but I have always taken Christianity to be a defiance of the world and all its vanities. . . .

Yet the whole emphasis of the book is on the rarity of independence of mind. The contention is that, under a dictatorship, mutual confidence can exist in only two forms: as the fellowship of the very poor who have virtually nothing to lose, and as the fellowship of the other worldly who snap their fingers at temporal values. But most peasants still have something to lose.

His friends and acquaintances of other days, peasants who

had attained a certain manly conscience and dignity in the former league movement, men whom he had come to know at league assemblies and congresses, were now dead or dispersed. . . . The few survivors were almost unrecognisable, bent under the weight of heavy cares, stultified from long misery, hardship, persecution and loneliness, oppressed by vague fears, fallen back into their traditional apathy, inaccessible to Pietro's simple message of friendliness. . . .

And most of the pious, in Italy as elsewhere, are security-minded.

Submission, whatever may be the intentions and the spiritual qualities of those who accept it, leads to enslavement and degradation. To take refuge in a life of hermit's contemplation, on the other hand, means simply to break off and wash one's hands of everything, operations which are not only cowardly but which are not within everyone's reach. And so the only honourable way open to Christians in this country is frank rebellion against money and the state, against their idols and their fetishes, with no thought for the consequences, which cannot be the subject of any illusions.

So that a scheme for the regeneration of Italy which pins its hopes on backing "the Church" or "the peasantry," as such, is reading too much into Silone's book and is probably doomed to disappointment.

In terms of political science, Silone's thesis amounts to a plea that, before Allied propaganda talks to the Italians of the joyful return of liberty and equality, it should emphasise the value of fraternity. The French at the great crisis of their history found this an essential category in the rebuilding of the state; and it would be possible to argue that a betrayal of the qualities which it implies, far more than their loss of faith in the virtues of liberty and equality, was responsible for the catastrophic loss of nerve in June, 1940. There can be no doubt that whether or not Silone's novel provides a completely accurate account of the state of mind of present-day Italy, there must be a lapse of time in an atmosphere freed from police terror before the average Italian will feel able to speak his mind on political questions. The aim of an interim government, from whatever quarters it is drawn, and the aim and responsibility of Allied officials in Italy should be to secure the sort of conditions in which the seed can take root and flourish. When the Battle of Italy is won, the Allies must foster the return of political activity and of freedom of discussion. They must not squander their efforts in attempting the hot-house development of competing political nuclei which may, or may not, eventually win the confidence and assume the government of the Italian people.

Chetniks and Partisans

(BY A CORRESPONDENT)

THE feud between General Mikhailovitch's Chetniks and the Yugoslav partisans has been the most baffling of Balkan problems during this war. Both movements have made their contribution to the unique armed resistance in Yugoslavia which the Germans and the Italians have so far vainly attempted to suppress. Between them they have, in a sense, turned Yugoslavia into an Allied fortress inside the *Festung Europa*. Both groups have pinned down a considerable number of Axis divisions in Serbia, Croatia, and the coastal provinces in the south. But, undoubtedly, the internecine struggle between the two movements has reduced the effectiveness of their common resistance, and has caused a great deal of valuable energy to be wasted in futility and frustration.

The dividing factors have been manifold and complex. Fundamentally, the split seems to reflect the old antagonism between Croat and Serb, though this line of division has by no means been clear cut; Croats fight under General Mikhailovitch's orders and Serb peasants frequently join the partisans. Nevertheless, General Mikhailovitch's detachments have been predominantly Serbian and Orthodox, and those of the partisans predominantly Croatian and Catholic. (On both sides Moslem Bosnians and Catholic Slovenians add a further complication to the picture.) The peculiarities of the two movements are, to a large extent, due to the different political conditions which prevailed in Serbia and Croatia during the first phase of the Axis invasion. The Serbs were the first and the main victims. Belgrade lost its dominant position. Neditch—the Serbian Hacha—could not even hope to obtain the meretricious rewards that his Czech counterpart obtained. The Serbs could have no illusions, and this favoured the immediate resumption of national resistance. Geography allowed the

resistance to assume an armed character. At the centre of the movement of resistance stood the Serbian officer, whose outlook, most often, was pan-Serbian and reactionary. But he possessed one important advantage; he was steeped in the tradition of guerilla warfare, and at the same time able to analyse his tasks in rational military terms.

Croatia and the Invaders

In Croatia, events took an altogether different course. Croatian nationalism was in the throes of a grave internal crisis. Years ago, Matchek's Peasant party was its main exponent. The old programme, dating back to the period of Raditch's leadership, combined democracy with Croat nationalism. But in the years immediately before the war most of the Croat nationalists pinned their hopes on Rome and Berlin; and Croat nationalism was gradually transformed from a democratic into a pro-Fascist movement. In 1941, Zagreb greeted the Germans almost enthusiastically. The illusion of independence lured large sections of the Croatian middle classes and intelligentsia. The Peasant party disintegrated. One part of it joined Pavelitch's Ustashi—the Storm Troopers of Croatia. Some of its politicians joined the Yugoslav Government in exile. Matchek himself, with his mind divided between nationalism and democracy, withdrew from political activity. The honeymoon of Croatian "independence" was marked by an outburst of revenge on the Serbs, who fell victims to the most cruel massacres.

Only gradually did the Croats' illusion of independence fade; and only gradually did their resistance to the Axis develop. Because of the political degeneration of Croatian middle-class nationalism, the resistance had, at its inception, no crystallised centres of direction. It sprang up spontaneously, mainly among the peasants. As time went on, the peasant partisans came more and more under Communist influence, which was further strengthened by military assistance from Russia.

National, religious and social antagonisms were reflected and further accentuated by the tactical controversy. General Mikhailovitch's policy was dominated by his desire to economise his forces for the decisive and final phase of the struggle. Hence his reluctance to engage in frequent and costly skirmishes which bring upon the civilian population the most sanguinary reprisals. The policy of the partisans, on the other hand, can be described as a policy of permanent insurrection. This was the line recommended by local Communists as well as by propaganda from Russia. The fighting areas of the Chetniks and the partisans have frequently overlapped. Each side has tried to impose its policy upon the other; and the controversy has resulted in armed clashes between them, which have at times assumed the character of a civil war.

Towards a Unification?

The question is whether a unification of the resistance in Yugoslavia can be achieved, and how. Some recent developments suggest that unification may perhaps have become more than a possibility. Since the beginning of the year, the partisans have adopted a more moderate line. The attempts which were made at an earlier stage to set up rural Soviets have now been condemned by the partisans' leaders. Their new "six-point" programmes, published early in the year, speaks of "the inviolability of private property" and states

THE BUSINESS WORLD

Finance and Banking

Discount Market Consolidation

The trend towards integration and consolidation in the structure of the discount market is still making headway. The movement is twofold in character, in some instances taking the form of an influx of additional capital to individual firms, in others involving the fusion of previously independent houses. The latest manifestation of this trend, namely the deal between the Dominion Trust and Ryders Discount, belongs to the first of these categories. It is understood that negotiations are now proceeding for another such operation, namely the strengthening of the capital of one of the medium-sized houses which only recently announced a substantial increase of capital. Progress is also promised in the second category of consolidation deals, two of the private firms in the market being in process of arranging a merger.

The market has during the past week shaken off all traces of the credit stringency which for some weeks previously had never been wholly absent. The clearing banks have recovered their appetite for bills and have been buying July and August maturities freely. The Treasury, for its part, has seen fit to allow public departments' balances at the Bank to run off by £7,286,000 and the reduced immobilisation of credit has helped the credit position. The Bank return reflects the easing of the position in a rise of £14,048,000 in bankers' deposits, which have thus recovered to the comfortable level of £157,668,000. An increase of £10,530,000 in Government securities has provided a source of further help, this movement being offset by an expansion in the circulation to the extent of £2,569,000 only. The discount market received a 47 per cent allotment of its application for £90 million of Treasury bills last week, but in view of the banks' ready purchases of bills has found no difficulty in taking up this exceptional quota of new bills.

Scottish Bank Notes at Par

An agreement between the clearing banks was announced last week by which these institutions undertook to make no charge when accepting Scottish bank notes for encashment at any of their branches in England and Wales. In the past the clearing banks have as a rule cashed at par the notes issued by their own Scottish bank affiliations, but for other Scottish notes the practice had varied widely. In some cases a commission of sixpence was charged, though this was usually waived when the payer was a valued or importunate customer. The justification for making such a charge was that the notes in question were not legal tender in England, and that the recipient bank might be out of its money for a few days pending their return to Scotland. The matter has recently attracted more attention than usual owing to the influx into England of notes carried by Service men stationed in Scotland and spending their leave in England. Troops stationed in Scotland are normally paid in Scottish notes, and though local paymasters have been instructed to issue Bank of England notes to men going on leave to England, Scottish notes have nevertheless been finding their way south of the border in unaccustomed quantities. The fact that these notes could only be cashed at a discount at certain banks provided a convenient excuse for restaurants and other recipients of such currency to take a wholly excessive rake-off when accepting them. There is now no justification for such deductions.

Marine Underwriting in 1942—

The accounts of insurance companies now appearing show very substantial additions to marine premiums in 1942—in one or two instances premium income approaches

double the 1941 figure—coupled with a much less favourable underwriting experience. Both these features arise chiefly from the participation of British offices in war risks insurance transacted in the New York market. The entry of the United States into the war brought heavy losses on these commitments in the period of adjustment to the new conditions, the more so in relation to the low scale of premiums prevailing at the time. Corrective measures produced a reduction in losses in the latter half of the year, while upward adjustments in rates account for the rise in premium income. Many insurance chairmen make appropriate comment in their statements to shareholders. Thus Sir William Goschen, the chairman of the Sun (whose subsequent death will be greatly deplored in insurance circles), stated that "war risks premiums on USA shipping and the losses sustained on this section of the account were largely responsible for the increases (in premiums and losses)," and that he feared there would be "little or no profit on the 1942 account." Mr P. R. England, chairman of the Royal, indicated that in 1942 war losses falling upon their American business were "particularly heavy" and that the account "may well close with a debit balance." Mr R. Olaf Hambro, governor of the London, suggested that the 1942 account is not likely to show much in the way of profit, this being accounted for "by the incidence of war casualties consequent upon increased enemy activity following the entry of the United States into the war," and Mr Ernest Hicks, chairman of the Norwich Union, refers to the "very heavy drain" on the companies in 1942, particularly in America. How important an element in marine companies' accounts war risks insurance has become is shown by the disclosure, in Sir Frederick Rutter's speech to the London and Lancashire shareholders, that premiums on these risks reached £2,061,000, against £1,709,000 for the usual marine business.

—and the Outlook

A tribute to the vigorous steps taken by the American market to put its house in order was paid by Mr James L. Mounsey, chairman of the Scottish Union and National, who is hopeful that from now onwards the American business will once again be on a satisfactory basis. The likelihood that income from war risks insurance in America will materially decline in 1943 is mentioned in the review of Mr A. Harold Bibby, chairman of the Sea, the reason being that a large percentage of this business is now being underwritten by the USA Government. The general outlook for marine underwriters remains unsettled. Sir Bertram Hornsby, chairman of the Commercial Union, stated that "with the utilisation of shipping to its full extent and the delay of repairs up to the point where seaworthiness is affected, it is more than ever difficult to forecast the result of present hull underwriting." Mr R. Y. Sketch, in his statement to shareholders of the Phoenix, mentioned that the "paramount necessity of secrecy in regard to shipping movements and other developments arising out of the war, and in efforts to combat U-boats, combine to increase the difficulties of our underwriters in obtaining a reasonable spread of business," and fluctuating results must accordingly be expected. The same point is made by Mr P. R. England, chairman of the Liverpool and London and Globe, who said: "The full extent of the risks we are covering cannot obviously be known to us, and only time will show whether the present charges are adequate." Co-operation between underwriters in the home market is now at a high level, and Lord Bicester, governor of the Royal Exchange, made reference to the establishment of a joint cargo committee which has already accomplished useful work and from which further benefits are expected in the future; a joint hull committee has been functioning for many years and its influence has "greatly facilitated the

satisfactory transaction of hull business and tended to prevent rates from fluctuating too widely." The traditional conservatism of British insurance is manifested in the moderate transfers made to profit and loss in 1942 on account of 1941 and prior years and the general policy of maintaining strong funds specifically earmarked for marine contracts.

Hongkong and Shanghai

The management of the Hongkong and Shanghai Banking Corporation have succeeded in the extremely difficult task of presenting a balance-sheet of the position of the bank as on December 31st last. With the head office in Hongkong and 33 out of the 37 Eastern branches in the hands of the enemy, this document necessarily departs from its traditional form. The position it shows is remarkably strong, the liquid sterling assets amounting to £33,486,000

against which the current liabilities, other than those in the currencies of countries in enemy occupation, amount to £27,231,000. The directors report that they are unable to recommend the payment of a dividend for the report subsequent to June 30, 1941, in respect of which the last distribution was made, and they suggest that the consideration of any such dividend be deferred until the extent of the losses incurred by the bank in the Far East can be measured. The bank has learned that the Japanese are attempting to liquidate its business in Hongkong and Shanghai, and that the Yokohama Specie Bank has been entrusted with the task. The directors place great confidence in the prospects which China will offer after the war.

The country waits to be laced with railways, roads and airlines. Her rivers wait to be harnessed, her towns to be rebuilt and modernised, and her minerals to be mined. In this development and that of her foreign trade your bank will be ready and anxious to co-operate to the best of its ability.

Investment

Capital Profits or Liquidity?

The past three weeks have seen a further falling off in the number of bargains received, with a disproportionate decline in the money value of turnover, and a further general sagging of prices. According to the figures of *The Financial News*, fixed interest stocks have fallen almost steadily at the rate of two per mille per week. The same authority shows a net fall in industrial equities almost exactly equal in amount, but the daily figures have fluctuated considerably. As has been repeatedly stated, the effects of any but the most startling military developments have been insignificant, or, at the most, very short-lived. It is the money position that really directs the general trend of prices. Even so, it is a little surprising that, despite a number of increased dividends, prices should have fallen rather than risen for over a month. The popular explanation is that the Wings for Victory weeks have been considerably more successful than their predecessors in concentrating the attention of those with savings upon the necessity of lending them to the Government. This may well explain the weakness of some gilt-edged stocks, and the fact that more than one of these looks definitely more attractive than the existing "tap" issues. But does it explain why equity prices are sagging now, whereas a year ago they were fluctuating with a sharply upward trend? As the Wings for Victory weeks will shortly be over, there should be an early opportunity to test the validity of this argument. There is no doubt that it has some force, and, in a closed economy, where the total supply of equities is virtually static, a rise in values would be expected at any time when there is no incentive sufficiently powerful to neutralise the profit motive. This is, however, subject to one qualification: the relative attractions of possible capital profits and of liquidity. The equity index in question is now some 22.78 per cent above the level of a year ago, while the fixed interest figure is exactly what it then was. Evidently, the relative attraction of liquidity is much greater than at that time, since there has been virtually no increase in the general rate of dividends paid. Further, repeated discussions of post-war plans have attracted attention to the difficulties of the transition period, and have, so far, served to lay stress upon the uncertainties as to the reward which will be allowed to the private capitalist. It seems probable that the general level of equities will rise further, mainly by a further appreciation in so-called recovery shares, but partly by actual expansion in the physical capital, in the ownership of shareholders, employed in the war effort. The rise is, however, likely to be of a rather tentative character as compared with the movements which occurred in the second half of the three years 1940-42, when the rises were of the order of 30, 10 and 20 per cent respectively.

Raleigh-Rudge Deal

The news that the Raleigh Cycle Company has acquired from the Gramophone Company the whole capital of Rudge-Whitworth is interesting from more than one point of view. The Raleigh group has grown to very considerable importance, both by natural expansion and by the acquisition of other concerns. Thus, a further purchase is in line with past policy. To a considerable extent, the two concerns cover very similar ground, and the whole question, from the

standpoint of the Raleigh Cycle Holdings proprietors, is whether the terms were favourable or the reverse. As neither the existing capital of Rudge-Whitworth nor the amount of the purchase money is disclosed, no opinion can be formed on this point, but it is probable that the cost was not, absolutely, very great since, when taken over by the Gramophone Company in 1934, the total capital of Rudge-Whitworth was of the order of £250,000. The Gramophone Company is one of the operating concerns of Electric and Musical Industries. It was taken over to keep some of the plant of the group occupied during the trade recession which preceded the rearmament boom. It is doubtful whether it was ever intended as a permanent extension of the activities of the group into an entirely new field, and the sale reflects the expectation that the money will shortly be required for expansion nearer home. In view of the recent rumours of a large-scale amalgamation in the radio industry, it is not surprising that the view should be held that the funds are required to help finance the acquisition of one or other of the radio firms named in this connection. This may be so, but there is no need to look further than the extreme probability that new plant will be required for the equipment of a section of this country with one or other of the new inventions undergoing development in 1939, of which television is, perhaps, the most obvious choice.

Great Boulder Meeting

A circular, issued to shareholders of Great Boulder Proprietary, convenes a meeting for June 24th, the main purpose of which is to stay all proceedings in the voluntary liquidation. This will finally transfer control to the new board, and the important question is, therefore, whether this board is satisfactory to the proprietors as a whole. In addition to two groups of shareholders in this country, both represented in the negotiations by the Shareholders' Resumption Group, there have to be considered the Australian holders. The new board consists of Mr Alfred Sims, chairman, who also occupied that position on the Shareholders' Resumption Group, Messrs Coulson and Grundt, members of the shareholders' committee, Mr Binns, a mining engineer and chairman of Wiluna Gold, representing the Australian shareholders, and Mr Gardner, a chartered accountant and director of Sons of Gwalia. There is no mention of any representation of Mr de Bernales, former chairman of the company, but he has approved the composition of the board. There is a good deal of the internal history of the recent negotiations which is far from clear. In particular, it would be interesting, if, indeed, it is not crucial, to know the present voting strength of the original parties to the dispute. Shareholders should by this time have had an opportunity of forming an idea as to how far the present members of the board really represent their various points of view. If they are satisfied as to this matter, they will be well advised to vote for the stay of liquidation, since there is little hope of the affairs of the concern making any real progress while they are in the hands of a liquidator. What the new board can do to improve receipts in the conditions now prevailing in Australia it is difficult to say. Shareholders are naturally anxious to receive some payment out of recent profits, but the first duty of the board must be to assure that the foundations of future prosperity are soundly laid.

Anglo-Iranian Royalties

The wartime set-up and in particular the shortage of shipping, the manufacture of synthetic rubber from US oil, and the probability of very heavy requirements of oil in the Pacific area suggest strongly that production in Iran, and, so far as is possible, refining in that area will continue to expand rather than to contract. For these reasons, it seems likely that the new agreement under which the royalty payment to be made by Anglo-Iranian Oil is fixed at the 1940 minimum of £4,000,000 is favourable to the company, and, therefore, to Burmah Oil and the British Government, since both are large shareholders. The new agreement is for the duration of the war. It would be useful if that expression could be more precisely defined. Does it mean until actual hostilities cease in the major European theatre, or until there is official acknowledgement that a state of peace exists between the present antagonists in all theatres? Uncertainty on this point is, however, only one of several doubts which make it impossible to place any reliable valuation on the shares of this and other oil companies. As has been stated in these columns before, the most important of these may well prove to be the attitude of the Government and the oil companies to the wartime developments of refining technique which promise some revolutionary changes in the immediate post-war period. So far as is known, this country is not at present in any way equipped to play its part in these developments.

Company Notes

Cable and Wireless Results

The accounts of *Cable and Wireless (Operating)* for 1942 show, for the fourth year in succession, a rise in income from net message receipts, at £9,271,458 against £8,479,464, while total receipts are up rather more steeply at £9,907,530 against £9,075,649. Expenses show only a very moderate rise from £6,147,300 to £6,528,812. After charging £2,100,000 for taxation, equity earnings amount to £1,278,718 and there is £78,718 for addition to the carry forward after meeting the 4 per cent dividend. The accounts also disclose that a settlement has been agreed as to the amount of the outstanding EPT

	Years to December 31,		
	1940	1941	1942
Net message receipts	7,090,669	8,479,464	9,271,458
Total income	7,494,871	9,075,649	9,907,530
Maintenance fees, etc.	5,119,100	6,147,300	6,528,812
Taxation, EPT, etc.	...	2,840,000*	2,100,000
Earned for dividend	2,375,771	88,349	1,278,718
Dividend	1,200,000	1,200,000	1,200,000
Dividend, per cent.	4	4	4
General reserve	...	200,000*	...
Carry forward	1,613,607	301,956	380,674

* Sums provided after the date of the 1941 accounts.

liability and this has been retrospectively deducted from the accumulated carry forward. The total sum transferred in settlement of EPT and other charges amounts to £2,840,000. This should be spread over the period of the tax. The general effect of the provisions is that, for the period 1939-42 inclusive, £200,000 has been added to general reserve and £353,207 to the carry forward, after making all provisions for taxes and other matters arising out of the Treasury agreement. It is highly satisfactory that despite the implications of the Far Eastern losses, message receipts should have continued to increase. The balance sheet shows a rise in both debtors and creditors. There is also a jump in holdings of Government securities from £7,343,494 to

£9,021,990. It is possible that this holding has been reduced since the date of the accounts in liquidation of the outstanding tax liability of £6,225,000 against which only £4,250,000 had been deposited with the Inland Revenue authorities. It is the presence among liabilities of the substantial tax provision, against nil in 1941, which mainly accounts for the drop in net liquid assets from £7,567,924 to £5,759,709. Net loans to subsidiaries and associates of £195,965 have been replaced by net borrowing of £189,728. The total of reserves and surplus at £2,452,830 is substantial. The results reflect higher charges for some services and the increase in forces overseas. The settlement of the EPT liability clears up the wartime earnings position. The ordinary stock of the Holding company at 78½ ex dividend yields £5 2s. per cent., less tax at 8s. 11d.

J. Lyons Accounts

The full accounts of *J. Lyons* for the year to March 31st last show total disclosed profits, after virtually all charges, of £918,513 against £909,585. Dividends absorb the bulk of this, leaving £43,697, which raises the carry forward to £399,579. The statement of Mr Harry Salmon conveys the impression that the rise in distributable profits, despite all wartime difficulties, is mainly due to enforced saving in costs—the inability to employ more labour for which self-service has been substituted, and the zoning of road transport, which has cut petrol consumption to less than one-third of the pre-war figure. Apparently, an increased sale of Lyons' products in certain areas has to some extent compensated for their virtual exclusion from other areas. The chief feature of the balance-sheet is the piling up of cash items. There is a serious depletion of stocks, which stand at £2,277,682 against £3,259,214, while holdings of 2½ per cent National War Bonds are £300,000 higher at £425,000. This accumulation is due in part to the inability to maintain stocks and in part to the rise in unexpendable depreciation reserves. Cash holdings have also increased from £298,919 to £646,881. The rise of creditors from £2,496,987 to £3,052,976 is due to the fact that in the previous year tax reserve certificates were deducted from tax liability, while in the latest year they are shown in the balance-sheet at £1,291,650. The net change in liquid assets is a rise from £1,699,257 to £2,047,952. The accounts, emasculated as they are, convey the impression that the management has carried through a successful adaptation to wartime conditions and that the 20 per cent dividend is not in danger. Resources for eventual reconstruction are ample. The £1 "A" ordinary shares, at 110s. ex dividend, yield £3 12s. 9d. per cent.

Forestral Land Accounts

The full accounts of *Forestral Land* for 1942 show a rise in trading profits from £547,318 to £623,404. There is no fortuitous transfer from depreciation account as in 1941, but, despite this, total income is up from £643,175 to £661,424. Thus, the decline in equity earnings from 12.5 to 9.9 per cent is due solely to the jump in tax provision. This is up from £250,000 to £375,000, but £56,000 of the rise is due to the method of charging tax on the preference dividend. The 9 per cent ordinary distribution is maintained, and is paid less tax at some 7s. 8d. against 10s., in view of the operation of Dominion Income-tax Relief. The distribution is, however, narrowly covered by current earnings, and it is only possible to repeat the transfer of £50,000 to general reserve by bringing in £52,968 capital profit on realisation of an investment. The carry forward is raised from £144,409 to £163,879. There was an allocation of £4,900 to war charities after the date of the previous accounts. The directors say little of the trading experience of the group, but it is significant that consolidated net profits, before British taxation, rose from £779,365 to £808,522, the highest level since 1937. The balance-sheets of the group and of the company show a rise in cash items, due no doubt to an inability to maintain stocks at the customary level. There is increased investment in Government securities which, in the consolidated statement, including the acquisition of £280,000 of tax reserve certificates, rose from £871,244 to £1,385,121. Net liquid assets of the group rose from £5,068,133 to £5,647,051 and net loans of the company to subsidiaries are some £50,000 higher at £277,798. Consolidated stocks stand at £2,576,353 against £2,988,273, a level which should be adequate for current needs. Since the date of the accounts, Forestal Land has apparently disposed of an investment in an associated concern valued at £196,951. The valuation of the Hendon Research Laboratory has also

been written down from £6,068 to £1. The group has, of course, considerable tanning interests outside Argentina, and is not influenced by the economic stagnation in that country to the same extent as many of the Argentine companies. The £1 ordinary stock at 32s. ex dividend yields £5 12s. 6d. per cent, less tax, at some 7s. 8d.

Goodlass Wall Report

According to the accounts of Goodlass Wall and Lead, trading profits before income-tax in 1942 declined from £305,346 to £287,864. The latest figure, however, is struck after an undisclosed provision for EPT, which, the chairman, Mr Clive Cookson, states more than accounts for the apparent decline in earnings, which were up on the year. It is difficult to see what purpose this all too frequent policy of non-disclosure serves, apart from nullifying any value the accounts may possess for the shareholder. A reduction in income-tax by some £34,000 to £165,572 explains the rise in distributable earnings from £105,339 to £121,792. After meeting both the preference and preferred charges, and doubling the 1941 allocation of £5,000 to pensions fund, the board is raising the previous year's 6 per cent distribution to 7 by the addition of a 1 per cent cash bonus, last paid in 1939. This still permits the addition of £2,053 to the carry forward, now totalling £82,076. The consolidated balance-sheet shows stocks, valued at common base prices, some £55,000 higher at £1,128,235. New holdings of £276,500 of tax reserve certificates are explained partly by the disappearance of £150,000 deposit and a reduction in cash by some £60,000 to £258,757. Despite an increase of some £110,000 in the omnibus creditors item to £1,339,480, net liquid assets are some £64,000 higher at £1,629,810. A fall from £704,383 to £539,847 in net liquid assets of the parent company arises from the reduction of its inter-company liability on current account by some £150,000 to £564,494, the cash item, now totalling £46,897, bearing virtually the whole brunt of the transfer. The lead side of the business has found an adequate outlet for its products in official demand, but the paint producers have been affected by the restriction on building. The post-war possibilities of the group are good, especially in view of its widespread overseas subsidiaries, which continue to show satisfactory results. The 10s. ordinary shares, quoted at 14s. ex dividend, offer a conservative return of £4 16s. 6d. per cent.

Oil and the State

It is to be regretted that the board of Venezuelan Oil Concessions should feel obliged still further to curtail the profit and loss statement, with the result that development expenditure is concealed. The latest report reveals a rise of £12,481 to £1,966,616 in the 1942 net trading profit, provision for taxation having been made out of existing reserves. The gross profit for 1941 was £6,510,976, of which tax provision accounted for £632,000, and depreciation £787,269. Last year some £23,000 less was set aside for this latter purpose. For the fifth successive year, the ordinary dividend is made up to 16½ per cent by a final distribution of 11½ per cent, covered by earnings, after meeting the preference charge, of 18.2 against 17.1 per cent. The surplus of £42,111 against only £7,524 in the previous year raises the carry forward to £181,973. The chairman, Sir Andrew Agnew, discloses in his report the results of the protracted discussions with the Venezuelan Government. The upshot of the new agreement is that the company receives an extension to 1983 of its period of tenure, against 1957 under the old Aranguren concession, in exchange for rather heavier fiscal duties. Other than these, the most important charge appears to be the new income-tax, operative since January 1, 1943, which will require, in the case of VOC, some 12 per cent on profits. Numerous details, however, remain to be settled. Sir Andrew notes with satisfaction the President's statement on the introduction of the new Law of Hydrocarbons, that their capital will be more than ever guaranteed. Everything considered, this assurance, if reinforced by action, is in these difficult times not a small consideration in exchange for heavier taxation. The concern, according to the balance-sheet, appears well equipped for further operations, net liquid assets now totalling £1,703,301, a rise of over £420,000; British Government securities and cash, accounting for £2,313,136. As part of the new arrangement, the company has reduced its holdings in the Bolivar and Maracaibo districts by 131,300 to 412,761 hectares, which will save the company some Bs. 786,000 in the costs of conversion to the new law, which requires a payment of Bs. 6 on each hectare

The Baltimore and Ohio Railroad Company

SUMMARY OF ANNUAL REPORT FOR THE YEAR 1942

The annual report of the President and Directors covering operations of the Company for the year 1942 is being mailed to its stockholders.

RESULTS OF OPERATIONS

The audited income account of the Company for the year 1942, as compared with 1941, is summarized as follows:—

	Year 1942	Year 1941	Increase over 1941
Railway operating revenues	\$306,254,193.49	\$227,503,021.56	\$78,751,171.93
Railway operating expenses	204,241,198.76	160,918,417.51	43,322,781.25
Net railway operating revenue	\$102,012,994.73	\$66,584,604.05	\$35,428,390.68
Railway tax accruals (including Federal income)	25,054,012.87	15,780,105.71	9,273,907.16
Railway operating income	\$ 76,958,981.86	\$ 50,804,498.34	\$26,154,483.52
Equipment and joint facility rents—Net Debit	7,400,263.88	4,507,373.81	2,892,890.07
Net railway operating income	\$ 69,558,717.98	\$ 46,297,124.53	\$23,261,593.45
Other income	8,070,683.14	8,306,748.01	363,935.13
Total income	\$ 78,229,401.12	\$ 54,603,872.54	\$23,625,528.58
Miscellaneous deductions from income	1,685,984.95	2,004,180.92	D 318,195.97
Income available for fixed and other charges	\$ 76,543,416.17	\$ 52,599,691.62	\$23,943,724.55
Fixed interest and other charges	19,863,257.08	20,141,033.67	D 277,776.59
Income available for other purposes	\$ 56,680,159.09	\$ 32,458,657.95	\$24,221,501.14
Other interest charges contingent only as to time of payment	11,356,562.50	11,366,775.00	D 10,212.50
Audited net income	\$ 45,323,596.59	\$ 21,091,882.95	\$24,231,713.64

(D) Denotes decrease.

This summary does not give effect to an appropriation for capital fund which is deductible from "Income available for other purposes" and before contingent interest charges; to the appropriation from net income for sinking fund; nor to certain adjustments to conform to the provisions of the Modification Plan of August 15, 1938, all of which are dealt with fully in the annual report.

There was a net decrease of \$11,572,108.85 in outstanding interest bearing obligations made during the year, including \$3,000,000 of Cincinnati, Hamilton & Dayton R. R. Co. General Mortgage 5% Bonds which matured June 1, 1942.

The recorded investment of the Company in property used in transportation service as of December 31, 1942, is \$1,005,867,783.46 against which depreciation has accrued in the amount of \$118,647,600.50, leaving the net recorded value \$887,220,182.96.

Through the medium of a conditional sale agreement three multiple-unit Diesel electric freight locomotives were acquired and placed in service during 1942 and there were also acquired and placed in service 687 new steel freight-train cars. To accommodate increased traffic 50 caboose cars were constructed at Company shops. Four locomotives, two passenger-train cars, 81 freight-train cars, and some work equipment were rebuilt and modernized at Company shops. During the same period 28 locomotives, two passenger-train cars, 173 freight-train cars and some miscellaneous equipment were retired from service because of obsolescence or other causes.

In March, 1942, the Company placed orders for early delivery of 1,000 box cars and 1,000 hopper cars, each of 50 tons capacity, but because of restrictions emanating from the War Production Board this equipment was not allotted to the Company; however, under a directive recently issued by that Board, the Company is permitted to acquire 525 composite hopper cars which are expected to be received some time in 1943.

The Directors of the Company authorized the acquisition of three multiple-unit Diesel freight locomotives and 25 Diesel switching locomotives, and it is now anticipated that, pursuant to orders placed with manufacturers, a number of these units will be delivered during 1943. Recently, orders were placed for 20 heavy freight locomotives which have been scheduled for delivery during the closing months of this year.

Ten Diesel switching locomotives were ordered last year for service within the Chicago switching area, six of which were delivered in 1942 and four in the early months of this year, and the acquisition of nine similar locomotives, for service in the Staten Island area of New York City, has been authorized.

Railway tax accruals, an-uncontrollable item of expense, for the year 1942 aggregated \$25,054,012.87, an increase over 1941 of \$9,273,907.16, or 58.77%, of which \$18,085,239.16 is for Federal income, pay roll and capital stock taxes, and the remainder, or \$6,968,773.71, for state and local taxes. Taxes for the year absorbed 24.56 cents out of each dollar of net operating revenue and were equivalent to \$4.00 and \$8.85 per share respectively on Company's preferred and common stock outstanding, on which no dividends were paid and, together with miscellaneous tax accruals, were equivalent to \$463.51 per employee.

converted. At the current price of 35s. 7½d. ex dividend the 13s. 4d. ordinary shares offer the reasonable yield of £6 6s. 3d.

June Kaffir Payments

Reductions in June kaffir dividends have in a number of cases exceeded expectations. Many of the cuts have, of course, been long discounted, and there was no noticeable effect on the markets except where reductions had not been anticipated. The analysis of the last four half-yearly payments made by the *Central Mining-Rand Mines*, *Union Corporation* and "*Johnnies*" groups, provided in the table in the next column, makes it plain that the latest reductions are not generally more severe than those which preceded them. The cuts made by *Central Mining-Rand Mines*, as in 1941 and 1942, are more drastic than those made by the two other groups, while *Union Corporation* again makes the best showing. For the first time since 1935, there is a reduction in the Rand Mines dividend of 6d. to 3s. 6d. for the half-year. Thus, ten mines of the *Central Mining-Rand Mines* group announce reductions as against December, 1942, and only two, Modder East and Rose Deep, show no reduction over the past two years. There are no increases, and Geldenhuis Deep has passed its dividend, which amounted to 1s. 6d. a year ago. The results of the "*Johnnies*" group are little better. The cuts are in most cases smaller, but only Witwatersrand Gold has maintained its dividend. Langlaagte, as was to be expected, pays nil, against 4½d. a year ago, and there is again no payment from Van Ryn Deep. The *Union Corporation* announcements make a striking contrast. There is only one reduction, from 9d. to 7½d.—the same as a year ago—for Van Dyk. Three of the distributions are constant, and there is again a 3d. increase in the Grootvlei dividend to 2s. 9d. The reductions made by the other two groups are easy to explain. The shortage of labour and materials in the Rand is now serious, and has in many cases, notably those

of Langlaagte and Van Ryn, reduced tonnage milled below a profitable level. The rise in the Grootvlei payment is due to its rapid expansion. The stability of the remaining *Union Corporation* dividends may be due to the development of

* Financial Year ends June 30.

subsidiary interests such as the production of small arms in the mining workshops. It is unlikely that kaffir dividends in general have yet reached their war time trough, and the experience of *Union Corporation* appears to be exceptional.

Industry and Trade

Industrial Research

There has been a refreshing tendency in industry lately to stress the importance of research, both theoretical and applied. If Great Britain is to remain in the forefront as an industrial power, organised research on a much bigger scale than before the war will be essential. In the past, this country has been an outstanding contributor to scientific knowledge and to its application in the workshop. With certain notable exceptions, however, progress was less marked during the inter-war years than it had been, in relation to other industrialised countries, especially in the application of new ideas to the factory. There is no reason why Great Britain should not be able to hold once more a pre-eminent position as a source of new ideas and in their practical application in industry. If present indications are any guide, the stage seems to be set for rapid progress after the war. The vista of post-war possibilities has already prompted a number of industries and professional organisations to formulate plans designed to stimulate abstract and applied research and to establish closer contact between the two in order to speed up the practical application of new ideas. Two recent examples are the proposal for the establishment of a Housing Production Council and for the setting up of a British Electrical Research Board.

The Cost of Houses

During the debate on post-war building in the House of Lords on June 2nd, Lord Portal, Minister of Works, drew attention to the enormous rise in building costs which is illustrated by the very high tenders received by the Ministry of Health for farm cottages. (These are quoted on page 786.) Lord Portal emphasised the need for bringing costs down after the war by working at greater speed with new methods. He has already taken steps, he declared, to ensure that no means of making economies are neglected. A Controller of Experimental Building Development has been appointed at his Ministry to test new ideas and methods. There is scope for a substantial reduction in real costs, especially if the Government succeeds in its aim of ensuring a large and

uninterrupted volume of building for a period of ten years after the war. This is the conclusion reached by the Committee for the Industrial and Scientific Provision of Housing—a private organisation—in a first report on housing production. In the view of the Committee, there is a strong case for the extension of the factory or mechanised production of parts of houses and the development of assembly methods. The Committee recommends the creation of a Housing Production Council, drawn from all the trades and professions in the building industry, but "independent of any specific interests," to promote and co-ordinate technical research; and to assist in the development and adoption of new production methods by helping to set up the necessary organisations, by spreading the knowledge of new methods and improvements, and by encouraging collaboration between the trades and professions engaged in building. The resources that this country will be able to devote to building after the war are not unlimited; and the volume of construction will depend in no small measure on the cost of houses and other buildings in terms of working hours and materials.

A British Electrical Research Board

The proposal for a British Electrical Research Board comes from the Post-war Planning Committee of the Institution of Electrical Engineers. In the view of the Committee, scientific research, "this vital instrument of national welfare," has not been used to the greatest advantage in this country, "owing largely to the absence of any national co-ordination of effort." At present scientific research for the electrical industry is largely carried out by the individual components of the industry, assisted by the Electrical Research Association and by the National Physical Laboratory; research is also undertaken in large laboratories under the Service and Supply Departments. True, the Electrical Research Association acts as co-ordinating agency, but its activities cover only about 10 per cent of the electrical research work carried out; moreover, the fact that it conducts its own research is held to render it unsuitable to

function as the focus of research for the industry as a whole. The British Electrical Research Board has therefore been proposed as the appropriate "instrument to secure the maximum progress in the application of scientific research in the electrical industry." The Board would not itself engage in research, but would establish contact between the various laboratories, act as a kind of clearing house for information, and foster the training of personnel. The Committee also proposes that

As a condition of membership of the Board, constituent organisations would be required to undertake that all their patents would be available for the use of the members of the Board on a Licence of Right basis, subject, of course, to existing commitments.

The Committee holds, however, that if post-war industry is expected to be "on the same highly competitive basis as heretofore," there would seem to be little scope for the "beneficial organisation of research." Here it treads on highly dangerous ground. The elimination of competition in the electrical industry would be a high price for the establishment of a research board.

Railway Wages Dispute

The latest development in the railway wages issue has been the decision reached by the unions last week to appeal direct to the Minister of War Transport rather than to set in motion the normal machinery of arbitration. The reasons that led the unions to adopt this course are, first, the deadlock that has arisen between the workers and the Railway Executive Committee. The three unions at their meeting in March presented the Committee with a claim for an all-round increase of 10s. a week; the companies made a counter-offer of 3s. 6d., which the unions have rejected. Secondly, the unions do not want a repetition of their experience with the Railway Tribunal last year and hope that the appeal to the Government may bring about a speedy decision of their claim. Their action represents a departure from the traditional policy of the railway unions, which have always adhered to the negotiating machinery. It is bound to have repercussions on other industries and, in the immediate future, on the passenger transport workers, whose claim for increases in their war wages and improved working conditions was recently rejected by a special tribunal. In a sense also it presents a challenge to the whole machinery of national arbitration in wartime, by which the Minister of Labour sets great store. The whole position seems to emphasise the need for the Government to arrive at some decision in regard to wages policy, which so far it has failed to do.

Quality v. Quantity

In the production of goods there is usually a choice between producing a large quantity of poor quality goods and a smaller quantity of better quality articles. It has been well proven that, for example, a good suit will outlast two or three of shoddy quality. It appears that, at any rate for some articles of utility clothing, the former policy has been adopted by the Board of Trade. Complaints have been strongest about socks and stockings. In answer to a question in the House of Commons last week, it was said that steps were being taken to improve the quality of socks. Better utility stockings are already appearing. Over the whole range of utility clothing it should be considered whether greater economy could not be achieved by improving quality, even at the sacrifice of quantity. A smaller clothing ration would cause no hardship if coupons could always be exchanged for good quality articles. That there is a demand for quality is proved by the greater expenditure per coupon which has been lately evident.

Agricultural Wages and Hours

The Agricultural Wages Board has made certain changes in the Country Minimum Wages Orders which come into operation on June 20th. Hours are to be reduced, where necessary, so that they do not exceed 52 per week in the eight "summer" months and 48 in the winter, on an average over the whole year. The chief new provision is the extension of the principle of the guaranteed minimum weekly wage to women agricultural workers in every county. This minimum is to be 45s. a week for women over 18

for a week of 50 hours during eight months of the year, and 48 hours in the remaining (winter) months. In five areas the hours worked are fewer, and the minimum wage will be correspondingly less. There is no provision for an increase in the wages of adult male workers. For juvenile males, a minimum weekly wage of 56s. for those aged 20-21 years is proposed, 52s. for 19-20-year-olds, 48s. for 18-19-year-olds, and proportionately lower rates for younger workers. Standards are laid down for girls, and for children under 14 it is proposed that the rate should be 5d. an hour. Two rates of overtime have been decided upon: For the five week days, these will be 1s. 5d. per hour for men and 1s. 1d. for women; for overtime on the weekly half-day, Sundays and public holidays, men will get 1s. 9d. per hour and women 1s. 4d. Rates for casual and part-time workers will be at least *pro rata* to the appropriate weekly minimum. None of the proposals prejudice the paying of higher rates. The minimum weekly wage for women will be welcomed, though it is substantially below that for men; the national minimum for male adult workers was first fixed in July, 1940, at 48s. a week, and it was raised to the present figure of £3 in December, 1941. A new claim for the minimum to be raised to £4 a week has been made and will be discussed by the Wages Board early in July.

Points Foods Distribution

The general principles of the rationing of foods by the points system are well understood. The ration per head is fixed for each four-weekly period in the light of the quantity of food which can be released. The retailer converts the points he collects into vouchers, by the surrender of which he can replace his stocks; thus his turnover depends on how much custom he can attract. The main advantage to the consumer is freedom of choice, both of food and of retailer. The scheme was begun by putting retailers on a roughly equal footing as far as some points foods were concerned. Lend-Lease canned foods, which were new to the British market, were allocated according to consumer registrations for other rationed foods. Canned fish was distributed according to pre-war trade, with allowances for changes in population; the same applied to canned fruit, tomatoes and peas as they were included. Consumer demand controls the flow of points rationed foods to the shops, but occasionally some friction arises, and the Ministry of Food has adopted various devices to smooth the path of equitable distribution. Difficulties sometimes arise through cautious buyers sticking to "safe lines," which always have a sure sale, and in this way some shops become relatively overstocked in one article at the expense of others. To overcome this tendency, it is necessary to limit allocations of some foodstuffs. Dried fruit, for example, is now allocated according to sugar registrations, although a retailer is not compelled to take up his full ration. When the points value of different foods is changed, as it often is, to equate supply and demand, retailers are not normally compensated for loss of points; nor are some of their points cancelled when a change reacts in their favour. In certain circumstances, however, compensation can be claimed, as in the case, recently, when home canned fruit was removed from points rationing. For the retailer, points rationing means that his buying skill, which might have deteriorated if all foods were allocated on the basis of fixed rations, is allowed full play. His turnover and custom depend more on his ability than on any other factor.

Co-operative Reconstruction

Those responsible for the direction of the retail co-operative societies in Britain are seriously concerned about trading prospects after the war. The rivalry of multiple shop organisations is being felt in many departments and the registration of customers has stemmed the former influx of members. Many societies have been unable to maintain their customary level of dividends on purchases. The practice is growing of declaring a lower dividend, plus a small bonus; but, as rationing continues and supplies are

CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in Canada with Limited Liability).—Dividend Notice. Preference Stock. At a meeting of the Board of Directors held to-day, a dividend of Two per Cent. on the Preference Stock in respect of the year 1943 was declared payable on 3rd August, 1943, to stockholders of record at 8 p.m. on 30th June, 1943. By Order of the Board, FREDERICK BRAMLEY, Secretary. Montreal, 14th June, 1943.

COMPANY MEETINGS

HONGKONG AND SHANGHAI BANKING CORPORATION

HEAD OFFICE AND MANY BRANCHES IN ENEMY HANDS

MR A. MORSE'S STATEMENT

The ordinary general meeting of the Hongkong and Shanghai Banking Corporation will be held at Winchester House, Old Broad Street, London, E.C., on the 30th instant.

The following is the statement of the chairman (Mr A. Morse) circulated with the report and accounts:—

The balance-sheet as at December 31, 1942, which is before you today, has been drawn up on lines which are unprecedented in the history of the bank, but when it is understood that the head office in Hongkong and 33 out of 37 of our Eastern branches are in the hands of the enemy, I am sure that the necessity for departing from the customary form will be fully appreciated.

Prior to the outbreak of the war with Japan, steps had been taken to enable the head office, if necessary, to be transferred temporarily to Singapore. However, events progressed with such rapidity that this move became impossible, and our chief manager, Sir Vandeleur Grayburn, was unable to leave Hongkong. On December 13, 1941, a message was received from the Colonial Office stating that information had been received from the Governor of Hongkong that it was thought best that the head office of the bank should be temporarily transferred to London, and it was Sir Vandeleur Grayburn's wish that I should take charge as acting chief manager. On December 16th the Secretary of State for the Colonies gave me the necessary authorisation of His Majesty's Government to carry on the affairs of the bank from this country. In order to regularise the position of the bank it was necessary that an Order-in-Council should be passed amending the bank's ordinance and regulations. This Order-in-Council was finally passed on January 13, 1943, with retrospective effect as from December 16, 1941.

DIFFICULTY OF PRODUCING A BALANCE SHEET

In normal circumstances, accounts as at December 31, 1941, would have been prepared in Hongkong for submission to the members. But for several days before the fall of Hongkong we were cut off from the colony where all the records and data which are necessary for the building up of accounts were maintained. Further, as the enemy advanced, more and more of our Far Eastern branches fell under his control, and in the disruption of our business and in communications which followed, returns and information which might have proved sufficient for us to prepare approximate accounts as at December 31, 1941, never reached us in London.

After close examination of the scanty information available here had been made by the executive of the bank and the auditors, your board decided that any attempt to establish the position as at December 31, 1941, would prove fruitless, and all efforts were then concentrated on obtaining the figures and other information from abroad which would be sufficient for the purpose of producing a balance-sheet as at December 31, 1942.

In view of the fact that all branch returns were sent, in the normal course of business, to Hongkong, our great difficulty was in establishing the position of the occupied branches as at the last dates on which business was carried on under the bank's own management. The task of obtaining figures and information relating to our Far Eastern business has proved to be a long and a difficult one, but as time has gone on we have been able to surmount the major difficulties which precluded us from

publishing a balance-sheet at an earlier date. It will be observed that the currency liabilities in occupied countries and the assets unrealisable owing to the war are shown in totals only, and as they are incapable of valuation under present conditions, there is no point in showing them in greater detail. Although the work involved in the dissection of the records available has occupied a considerable time, it was essential that this should be done in order that the important question of the bank's position in the currencies of free countries should be established. I think that you will agree that the figures before you of the bank's resources in free currencies show a position of great strength and liquidity.

DIVIDEND DECISION

Although the balance-sheet is not presented to you in the usual complete form and it has been found impossible, owing to the difficulty of ascertaining the extent of the losses incurred in the Far East, to prepare a profit and loss account which would even remotely reflect the results since December 31, 1940, the fact that we are able, in all the circumstances, to publish a balance-sheet at this date is a considerable achievement. Your board regret that they are unable to recommend the payment of a dividend for the period subsequent to June 30, 1941. I feel sure you will agree that the only prudent course open to us is to defer any question of dividend until we are in a position to measure the extent of our losses incurred in the Far East as the result of enemy occupation.

FUTURE OF CHINA

In past years it has been the custom for your chairman to review at some length in his speech to members the political, currency and trade conditions in the Far East. It will be obvious to you that this is impossible this year, as much of the trade concerned is at present controlled by the enemy. Such information as we have appears to show that the Japanese are doing their best to exploit those territories in their occupation without regard to the welfare of the local population.

But in China, where we are most closely concerned, there is a ray of sunshine in the oft-quoted tenacity and recuperative powers of the Chinese which qualities have been confirmed once again during the present war. All friends of China will have admired her resistance for over five years against an aggressor so much superior in modern war equipment must hope that the day is not far distant when, with the material aid of her allies, she will be able to sweep the enemy out of China. Meanwhile, as an indication of the harmony between China and her Allies, it was welcome news that Great Britain and the U.S.A. have signed treaties with the Chinese Government, immediately renouncing their extra territorial rights and privileges in China. This will open up a new era in the relations between the Foreign Powers and China. During the years of the Concession period, large modern cities and great ports have been built up on what formerly were mud swamps. The Municipal Governments of Shanghai, Tientsin, Canton and Amoy have been models for any community. Generations of foreigners of every nationality have co-operated with the Chinese in devoting their energy, enterprise and administrative ability to the success of these communities. We feel

confident that China will give full recognition to these past services.

China, we may be sure, is destined to play a big part in the post-war world. The country waits to be laced with railways, roads and airlines. Her rivers wait to be harnessed, her towns to be rebuilt and modernised, and her minerals to be mined. In this development and that of her foreign trade your bank will be ready and anxious to co-operate to the best of its ability. In this connection I may mention that the bank has opened an office in Chungking.

OTHER COUNTRIES

Such is the position as far as China is concerned. But what of the other territories in which we are interested but from which we have been temporarily excluded—Hongkong, Malaya, Burma, Java, and the Philippine Islands? All will require a reconstruction programme which will involve heavy demands on finance.

Though these are dark days for our bank with our earning power and powers of service very greatly curtailed, I firmly believe that we have good reason to look forward with confidence to the time when we will again take a prominent place in financing the requirements of those territories with which we have grown up.

Meanwhile, our offices operating in India and Ceylon are participating to a satisfactory extent in the large volume of trade emanating from these countries, and the clearing up of our Rangoon office is proceeding at Simla. Our offices in London, New York and San Francisco are mostly occupied in dealing with matters arising from the position in the Far East and endeavouring to dispose of cargoes in which we have a financial interest.

Shareholders not resident in enemy occupied countries who have not received a copy of the report and balance-sheet should communicate their present address to the temporary head office, 9, Gracechurch Street, London, E.C. 3.

DUBARRY PERFUMERY COMPANY, LIMITED
A WONDERFUL YEAR
RECORD TURNOVER

The twentieth annual general meeting of the Dubarry Perfumery Company, Limited, was held on the 9th instant, at the Royal Pavilion, Brighton. Mr. H. W. K. Pears (the chairman) presided.

The Chairman said: The turnover for the year far exceeded any previous record. The profit, which rose from £60,811 in 1941 to £104,310 in 1942, an increase of over 71 per cent., also constitutes a new highest level since the formation of the company.

Those shareholders who subscribed for the Ordinary one shilling shares have in the twenty years since the foundation of the company received £4 7s. 6d. for every rs. invested, an average of 43½ per cent. for every year of the company's existence, including the four war years. The extent of our liability to excess profits tax has at last been agreed at £53,920 for the period up to December 31st, 1941. The E.P.T. for 1942 has not yet been settled with the Inland Revenue, but we estimate it to be £88,800 for the year, making a total up to December 31st, 1942, of not less than £142,720. The extent of our contribution to the national revenue will be realised if one considers that the total capital of the company is £200,000, so that a sum equal to more than seven-tenths of the capital will have been paid by your company to the Exchequer in addition to satisfying the heavy demands of income-tax.

E.P.T.

We may derive satisfaction from the fact that, on our present basis of payment of E.P.T., should a period arise when we are making neither a profit nor a loss, we should recover from our E.P.T. fund sufficient to pay the 7½ per cent. Cumulative Preference and 15 per cent. Ordinary dividend for a

period of over six years, and, as far as we are able to judge, this compulsory insurance fund will continue to grow. We suggest that this is a safe and desirable position on the attainment of which we are to be congratulated.

In the event of no necessity arising for claiming any refund of E.P.T., the Chancellor of the Exchequer has pledged his word that 20 per cent. (i.e., £28,544), less income-tax, of our excess profit payments of £142,720 may be carried to a reserve for after-war reconstruction and development.

Although the sales in our luxury goods are severely controlled, the volume of business which can be transacted by our subsidiary companies Quality Chemists, Limited, the Standard Tablet Company, Limited, and Laking Chemical Company, whose products are purely medical, is limited only by the amount of energy we can throw into it, combined with success in fighting against the weariness that naturally ensues from working incessantly at extreme pressure without immediate reward. The only recompense we at present receive is the knowledge that we have done a good job in spite of the most adverse circumstances, and that we are piling up an insurance fund which we hope we will never have occasion to draw upon. ●

THE OUTLOOK

Owing to the necessity of diverting to war purposes alcohol, glycerine and many other products, which we formerly largely used, a large portion of our very valuable stock of foreign perfumery raw materials is temporarily frozen. The freezing of these stocks may prove a blessing in disguise; the temptation of disposing of them in manufactured goods does not exist, and since for a long time after the oppressed nations are freed from their present tyranny there must be a long period of recovery and reconstruction before they can start marketing the natural products which our climate prevents us producing here—these carefully husbanded products will later on enable us to reap a golden harvest instead of waiting anxiously for the flow of imports to be resumed.

We are indeed very fortunate in being able to switch over our activities to the production of goods which have had the outstanding results on the company's profits I have outlined, and you may rely on the fact that we are producing only goods which will have an enormous goodwill value and a continuous and increased demand after the war.

My personal thanks, and I am sure I may tender those of the shareholders, to the entire staff whose tireless efforts have produced the results I have set before you. The fact that I can tell you that I have personally contributed little to their attainment will be a source of satisfaction to you, since it is comforting to know that the younger generation is able in these difficult times to run alone.

The report was adopted.

VIROL LIMITED

The forty-third annual general meeting of Virol, Limited, was held in London, on the 16th instant. Mr. L. F. Matthews, general manager of the company, who presided, said:—

During the year, in common with most manufacturing companies, we have experienced the difficulties inherent in war-time trading. Nevertheless, I am pleased to say that we have been well able to maintain our position.

The gross profit on trading is slightly down, reflecting reduced output, whilst operating expenses have been reduced, leaving us with a net profit some £2,000 higher than last year. The Preference dividend for the year has been paid, and the Directors now recommend the usual 10 per cent. dividend on the Ordinary shares, and increasing our carry forward by £800.

The report and accounts were adopted.

SMITH'S POTATO CRISPS (1929) LIMITED

SIR HERBERT MORGAN'S SPEECH

The fourteenth ordinary general meeting of Smith's Potato Crisps (1929), Limited, was held, on the 16th instant, in London, Sir Herbert E. Morgan, K.B.E. (the chairman), presiding.

The chairman, in the course of his speech, said: The profit for the year is £203,459, as against £212,268 last year, but after deducting the smaller provision necessary for taxation, the net profit at £83,761 is slightly higher than the net profit of £80,065 shown last year. The directors propose that a dividend of 20 per cent. and a share bonus of 5 per cent. should be paid, the same as last year.

We have had another satisfactory year in our subsidiary company, Smith's Potato Estates, Limited, and a free of tax dividend of £18,000 has been brought in from this source, the same as last year.

UTILISATION OF HOME GROWN FOOD

Many of us realise that the activities of Lord Woolton have been directed towards the wiser utilisation of food grown in this country. This policy should prove to be of lasting benefit to the whole community and should tend to make these islands less dependent on foreign produce. My excursion into these problems could not have been made unless I was convinced that Smith's Potato Crisps could pass any test connected with real nutritive value, attractiveness, economy and convenience in use. They rank in the country among those articles that are in the forefront of good food.

It must be remembered that for 2d. a packet we provide a nourishing meal, perfectly prepared, which can be eaten hot or cold. Crisps can be taken with any meal, consumed at the desk or bench, on a seat in the park, or they can help stock the haversack, bicycle bag, picnic basket or

luncheon box. One finds it difficult to conceive any other national product that can make these claims or are such a standby to so many households, particularly under present conditions of rationing.

The company supplies every section of H.M. Forces as well as men and women engaged in Civil Defence, and vast numbers of munition workers. The supply is quite inadequate, but we have been attempting to persuade the Government that as we are so fully co-operating in their policy of increasing the consumption of potatoes they should extend further assistance to us. Given the facilities, so eager is the demand for Crisps that we believe we could utilise a further 100,000 tons of potatoes a year in their production. The shortage of supplies has emphasised the great demand of the public for our Crisps and has brought much pleasing evidence of their popularity.

DEVELOPMENT OF AGRICULTURE

Our valuable estates in the Eastern Counties continue to prosper and are of great service to our business in general. We are glad to be playing our full part in the recent wonderful development of the agricultural industry of Great Britain in which the Government are rendering vigorous and full support. Fears are sometimes expressed as to the continuance of Government support, but I feel this is a matter largely in the hands of the people of this democratic country. The people must never let their soil down and must take a whole-hearted interest in supporting any steps or legislation intended for its benefit.

We must all express our gratitude to our managing director, Mr. Frank Smith. The founder of the business has devoted the whole of his great capacity and enthusiasm to its development for nearly a quarter of a century. His courage never wavers and our difficulties serve to bring out his resourcefulness.

The report was adopted.

Speaking at the 74th Annual
(Ordinary General) Meeting of the
LONDON & MANCHESTER
ASSURANCE COMPANY LIMITED

on June 16th, 1943

The Chairman, Mr. A. H. DAWES
reported:

- ★ Since the beginning of the war we have invested a total of £4,671,800 in the new War Loans.
- ★ Total funds passed the £25 million mark.
- ★ Our holdings of British Government Stocks exceed £10 million and represent 40.8 per cent. of our total invested assets.
- ★ Death and survivorship claims paid during the year exceeded £1½ million. Total war claims paid since the beginning of the war, £234,877.

Chief Office: 50 FINSBURY SQUARE, LONDON, E.C.2

FORD MOTOR COMPANY, LIMITED

BIG CONTRIBUTION TO THE WAR EFFORT

LORD PERRY'S REVIEW

The fourteenth ordinary general meeting of Ford Motor Company, Limited, was held, on the 16th instant, at the registered office, 88, Regent Street, London, W.1.

In the absence of the Right Hon. Lord Perry of Stock Harvard, K.B.E., LL.D., the chair was taken by the Hon. Roland D. Kitson, D.S.O., M.C.

The following is Lord Perry's statement circulated with the report and accounts:—

The death of Mr Edsel Ford has been announced. I knew that he had been ill for some weeks, but the news of his decease, in the prime of his life, is a great blow to me personally and to the company. He was a man of the highest honour, possessing outstanding ability and charm. I am sure all members will desire me to express their deepest sympathy to his wife and family and to Mr and Mrs Henry Ford in this sudden heavy loss.

LIQUID POSITION FURTHER STRENGTHENED

As was the case last year, I am following accepted war-time practice in issuing a statement instead of addressing you from the chair. This year additional restrictions are imposed by official limitation on the amount of paper which may be used for the accounts, directors' report and chairman's statement. My comments, therefore, are brief. The company's financial position is fully disclosed in the annual accounts and directors' report now in your hands. These documents record the results of a year's hard work and constant endeavour which have been instrumental in making substantial contribution to the national war effort. It is the policy of the directors to conserve and augment the already strong liquid position. In view of the immense difficulties and demands which must inevitably surround post-war reconstruction, I am sure you will endorse and approve the wisdom of this policy.

We have under our direction in the United Kingdom an executive and production staff of men and women which is three times the number of our peace-time establishment, and I take this opportunity to record appreciation of complete and unswerving loyal and untiring service during a period when national emergency circumstances and conditions have been very exacting. We have 2,953 employees now in the Services. I deeply regret having to report that 65 employees have given their lives in the nation's service and I am sure you will wish to join with us in expressing to their families our sincere sympathy.

Some of our associated companies are in enemy or enemy-occupied countries and we know little of their activities. Other associated and subsidiary companies have been active and fortunate in being able to contribute appreciably to the cause of the United Nations. We look forward to the unrestricted resumption of trading and personal relationships with all of them.

The holding company has earned a profit and its liquid position is being strengthened, so that, in case of post-war needs, assistance may be given to Continental associated companies which are in countries at present occupied by the enemy.

GOOD RELATIONSHIP WITH EMPLOYEES

Regarding the general problems of industry in relation to national activities, much has been heard recently of State ownership, private enterprise, social security and allied matters, particularly with regard to their effect on post-war responsibilities and development. Throughout the arguments for and against the many plans and schemes that have been propounded there seems to me to be one

policy on which everyone is in agreement, and that is the necessity (and I use the word deliberately) of proper understanding and good relationship between employer and employee. This necessity holds good whether the employer is the State or not, but I am not at all sure that the State has always fully realised its responsibilities in this connection. Some private employers, too, may have been lacking, but the great majority have worked hard over many years to improve conditions for their employees and to help them in innumerable ways. For this work industrialists have received but little credit, and the facts should be more widely known.

The existing emergency has been described as "a Time for Greatness"—whether looked at from an international, a national or an individual point of view—and it would be well for us to review the experience of the past so that it may be used in our plans for the present and the future. Our company's past record in this regard is one of outstanding leadership. I took the opportunity in my statement last year to make known to you in some detail the practical application of the company's policy and of our continual efforts to maintain good relationships and working conditions, which I am happy to remind you have always received your unanimous approval.

It is with pleasure that I inform you that in these matters we have not stood still during the year now under review. The many facilities and amenities which we have inaugurated and provided have been improved; the scope of the various pension, benefit and other funds has been, and is being, reviewed to provide expansion of aid to employees and their dependants, and in the day-to-day contact between employees of all grades we have achieved a practical and satisfactory working basis which stands us and the country in good stead during the present difficult times.

NATIONAL SAVINGS EXCEPTIONAL ACHIEVEMENT

I would be doing our employees less than justice if I did not draw specifically to your attention their exceptional achievements in the field of National Savings. When I issued my previous statement in July of 1942 the position of our Ford National Savings groups was that over 80 per cent. of employees were members and that contributions then exceeded £325,000. What is the position now? The latest figures available show that membership has increased to 94 per cent. and that the recorded savings of our people now exceed £732,000. As a contribution to the national economy this is magnificent and is a source of great satisfaction to us as evidence of the fine spirit existing among the men and women who labour so efficiently on the production of war material. The National Savings Campaign has had, as its main 1943 feature to date, "Wings for Victory" Weeks. Included in the above total of £732,000 is no less than £68,728 which employees at our various undertakings have contributed during those weeks through the Ford groups concerned.

With the basis of understanding and mutual good will which we have established we may look forward to the future with confidence, although it is idle to pretend that the remaining war years and the post-war years will be easy. There are many factors which, according to their method of future application, may have a decisive effect on the well-being of the country and the individual. It is difficult to visualise the full extent and nature of the problems with which even our own industry—that of motor vehicle and tractor

manufacture—may be faced, but there is one thing certain—everybody concerned, employers and employees alike, must work and work hard. This being so the importance of good understanding and co-operation between employer and employee becomes apparent and I feel that in our own way we in this company have endeavoured, with no small success, to show how this result may be achieved.

TRIBUTE TO EMPLOYEES

I have already referred to the employees' year of hard work, of which we are very appreciative, and I would also like to thank my colleagues and the executive staff for their able and enthusiastic support at all times.

Our organisation of dealers has earned the gratitude of all concerned for the excellent work it has done in maintaining good service to vehicles and tractors. I would also like to thank suppliers for their efforts and their success in maintaining a steady flow of the many components the company has required and last, but by no means least, officials of His Majesty's Government for their unfailing courtesy and co-operative understanding and assistance at all times.

As already mentioned, it is considered that the best interests of the company demand the conservation of cash resources to the fullest extent. Accordingly, the directors recommend that a dividend of 6 per cent., subject to income-tax, be declared, which is the same rate of dividend paid each year during the war.

The report and accounts were unanimously adopted.

The retiring directors (Mr Henry Ford and Hon. Roland D. Kitson) were re-elected, and the auditors (Messrs Mellors Basden and Mellors) were reappointed.

A hearty vote of thanks to the chairman, directors and staff concluded the proceedings.

WHITEHALL ELECTRIC INVESTMENTS, LIMITED

The twenty-first ordinary general meeting of Whitehall Electric Investments, Limited, will be held on the 23rd instant, at Winchester House, London, E.C.

The following is a summary of the report of the directors for the year to March 31, 1943:—

The consolidated gross income, including £36,212 profit on Investments realized, amounts to £208,378, and the net income after expenses and the transfer of £55,765 to reserves for depreciation is £133,736. After providing for income-tax and the payment net of the Preference dividends—namely, 2½ per cent. arrears and 7½ per cent. for the year—a total of 202,887. The undistributed balance at £374,205 shows a reduction in the year of 69,151.

The sale of the company's interest in Lecrin, Spain, produced a net amount of £483,587. The proceeds of this sale and other liquid resources of the company led to the proposals made by the directors in January last—namely, to repay 50 per cent. of the Preference stock capital, to reduce the dividend on the remaining Preference stock from 7½ per cent. to 6 per cent., and to offer to the Preference stockholders a participation in the equity of the company. The proposals were embodied in a scheme of arrangement which was submitted to the stockholders at meetings held on February 17th, when the necessary resolutions were passed. The scheme of arrangement was sanctioned and the reduction of capital confirmed by order of the Court dated March 15th, 1943.

The consolidated balance sheet shows investments and net floating assets at cost, less

capital and other reserves—
namely..... £6,826,980

The investments have been valued by the directors at March 31, 1943, as follows:—
West of England, at cost..... £865,000
Other investments..... 2,401,991
Net floating assets..... 65,017

Total, excluding any valuation of Athens..... £3,332,008
The investment in the \$6 Preferred stock of American and Foreign Power remains unchanged, and at March 31, 1943, the market price was \$61, compared with \$19 at March 31, 1942.

MILNERS SAFE COMPANY, LIMITED

SUCCESSFUL RESULTS

SIR J. E. T. RITCHIE'S STATEMENT

The annual general meeting of the above company was held, on the 16th instant, at the registered offices of the company, 21 Humpstead Lane, N.6. The following statement was issued to the shareholders by the chairman, Sir J. E. T. Ritchie, Bt.

I am pleased to be able to preface this statement by informing you that the latest news of Major J. B. Dodge, who is a prisoner of war in Germany, is that he is at least in good spirits.

Once again it is my pleasure to present to you a balance-sheet showing that things continue to go well with this old-established company.

The works continue to be fully employed and the past year has shown a record turnover.

It is not possible for me to refer to our specific activities, but, when the time is opportune, shareholders will, I am sure, be proud to hear how we have pulled our weight in the national effort during these momentous times.

STRONG FINANCIAL POSITION

In directing your attention to our financial position, you will, no doubt, be interested to notice that the bank loan, which was necessitated by the erection of our new works, has been repaid. This is no small achievement, and it means that our factory buildings and equipment, which have been financed out of the company's resources, now constitute a most valuable asset, which after the war will, I am satisfied, prove their value when we turn once again to our peacetime products. You will remember that, although theoretically this is described as leasehold property, the lease is for 999 years from 1938.

Amongst many other improvements for staff and workpeople, the canteen has been

Greece remains in enemy occupation and no information is available regarding the Athens undertakings.

An estimate of the consolidated net income available to the company during the current year has been made, and it is expected that before allowing for possible losses on realizations of investments and with no income from Athens it will be not less than £130,000. Compared with this the 6 per cent. dividend on £1,250,000 Preference stock requires an amount of £75,000. The directors are not intending to recommend the payment of a dividend on the Ordinary stock, but to utilize the surplus in increasing carry forward or in making transfers to reserve.

enlarged and extended and special facilities are now provided for social activities and health maintenance. I am sure that these amenities have greatly contributed to the good spirit which prevails amongst all who work there.

Again, in spite of the volume of work with which our plant and machinery have to cope these days, we are nevertheless maintaining them in a high degree of efficiency, and at the same time providing for depreciation along sound lines. In this connection, you will notice that certain additions have been made to our plant, which, after making adequate provision for depreciation, stands at £28,523 this year, as against £21,809 in last year's accounts.

We have made some provision out of our cash resources for taxation liabilities by the purchase of £25,000 Tax Reserve Certificates, and we invested £20,000 in 3 per cent. Savings Bonds, 1960-70, during the London "Wings for Victory" Week.

TAXATION BURDEN

I should like at this point to add a few words about taxation in general. During the first half of the last decade your company passed through difficult times, and, on that account, had certain tax deficiencies, which have, up to now, largely offset our liabilities during recent years. This has helped us to restore our finances to a sound position, but I should advise you that these deficiencies are nearing exhaustion, and we are now having to face the demands of Excess Profits Tax. Our standard years are based on the output of our old factory in Smithdown Lane, which had very limited potentialities compared with those existing in our present works. Income tax laws, as they exist at present, penalise a company in our position. As has been

recently pointed out in some quarters, there appears to be something wrong in a principle which enables a company with a high standard profit and making no extra war effort to provide more adequately for post-war conditions than a company having a low standard and making a great war effort. On the other hand, be that as it may, we are glad and proud to be in the position of being able to help the country with all the resources at our command, and take some comfort from the hidden reserve in the form of a 20 per cent. rebate on E.P.T. payments, which the Government have indicated will be available after the war.

During the year the board have instituted a staff contributory pension and group-life scheme, and we feel that this progressive step will have the approval of the shareholders. I should like to add also that the response of all employees to the company's Savings Group continues to improve and every new appeal by the management brings increased support.

THE DIVIDEND

Your directors are recommending a dividend payment this year of 7½ per cent., with a bonus in addition of 2½ per cent. Since Milners' was floated as a public company in 1874 the policy of the directors has been to ensure reliable service to the public, a reasonable return to shareholders, and at the same time to maintain adequate reserves for emergencies and development. This consistent, if somewhat conservative, policy has placed the company in a sound financial position, and, I am sure you will agree, has been fully justified; it is with this policy in mind that the directors have made their recommendation.

TRIBUTE TO MANAGING DIRECTORS, MANAGEMENT, STAFF AND EMPLOYEES

I must once again place on record the splendid co-operation which exists between the management, staff and all employees; all have continued to combine harmoniously with good will and the utmost energy in the cause of production, and this has contributed in great measure to the results you see before you. I also send greetings to those employees of the company who are serving in the Forces, whether at home or abroad.

I cannot close this statement without paying a particular tribute to our joint managing directors. In their respective spheres they have worked tirelessly and most cheerfully at the increasingly complicated problems which present themselves almost daily in an organisation like ours—among many others—the whole impetus of which has been diverted into unfamiliar channels by the war. At the proper time I hope it may be my privilege to be able to tell you how much we all owe to those two most loyal executive officers of your company.

(Continued from page 799.)

smaller, the bonus may be dropped. The cost of maintaining large stores and branches continues to rise. To overcome these difficulties, a mutual aid scheme will be submitted to the forthcoming Co-operative Congress. The distributive societies will be advised by the Co-operative Union to guarantee an annual contribution of 1d. in the £ on sales (yielding approximately £1,000,000) to render assistance to the societies. The Board of Inland Revenue has agreed to regard such contributions as admissible deductions in computing profits for taxation purposes. The recently-instituted CWS Retail Co-operative Society, Ltd., is operating in half-a-dozen areas, having taken over local societies that were in difficulties. The CWS is also responsible for the supervision of others. This expansion policy is being keenly criticised and consultations between the CWS and the Co-operative Union are in progress.

Meanwhile, plans for the co-ordination of trading facilities by neighbouring large and small societies are being made in several districts. They are suggestive of the serious view taken by the retail societies of the keen competition expected in peace time. This, too, is realised by the two wholesale societies, which are in negotiation for amalgamation into one British unit. During the last twelve months the English CWS had a record turnover of £157,000,000, and its sales totalled over £3,000,000 a week. But two-thirds of this was from marketing the goods of other manufacturers. In amalgamating with the Scottish CWS the aim is to produce more, to realise the ideal of the Rochdale Pioneers in 1844 that co-operators should become their own employers as well as their own suppliers. To emphasise this an appeal is being made for £250,000 to extend the Co-operative College which instructs in business and administrative methods, as well as training the future leaders in the principles of the co-operative movement.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

NEITHER before nor after the holiday was there any improvement in conditions in the stock markets. Turnover was even lower than of late and the majority of prices fluctuated without particular trend. The gilt edged market was firm if quiet, both Local Loans and 3½ per cent. Conversion Loan advancing ½, while among the short-dated issues 2½ per cent. National War bonds gained the same amount. Absence of any particular movement in the foreign bond market reflected the general inactivity prevailing there. Among junior home rail stocks, LMS and GW ordinary were prominent with net gains of ½ and ¼, profit taking in midweek reducing the earlier advances. Both the senior stocks and preference issues, however, were quietly steady. Sharp increases were recorded for Argentine rail stocks on the resumption of buying after the recent setback. Shortage of stock was largely responsible for such gains as the 2 point advances for BAGS and Central Argentine debenture stocks. Gains for junior stocks seldom exceeded ½ and profit taking in midweek reduced many of the earlier improvements. Elsewhere, Canadian Pacific ordinary lost ½, and the preference stock ¾.

Changes in the industrial market were numerous, but seldom exceeded a few pence either way. Brewery shares were irregular, most changes being downwards, but tobacco issues were steady. Motor shares were heavy, Albion, Leyland and Morris all weakening. Exceptionally, Standard rose 1s. 9d., but among aircraft issues, De Havilland fell 1s. 6d. Colliery issues were firm in the heavy industrial section, where, however, Swan Hunter and Firth Brown both lost 9d. Neither shipping nor textile shares displayed any definite tendency, while stores issues were, generally, dull. Dollar stocks fell back this

week in sympathy with the decline on Wall Street.

No developments of note accompanied the dividend announcements in the *kaffir* market. Some Cape buying raised several Far Western Rand issues ½. Western Reefs in particular advancing 1s. 7½d. Rubber shares were steady, but minor changes either way were scattered throughout the tea market. Oil shares were quietly firm. Anglo-Iranian improved slightly on the new agreement with the Iranian Government, while Trinidad Leaseholds were firm on the annual report. Shell was bought in midweek, gaining ½.

New York

CONCERN at the prospect of new taxes and drastic anti-inflation measures considerably restricted activity on Wall Street over the past week. Occasional selling led to widespread declines ranging from 1 to 2 points, although adequate support was forthcoming at the lower levels. Later, indications that corporation taxes might be postponed induced a steadier tone.

COMMODITY AND INDUSTRY NEWS

Glue Control.—The Control of Glue, Gelatine and Size (No. 1) Order (S.R. and O. 1943, No. 816), which comes into force on July 1st, issued by the Minister of Supply, prohibits, except under licence, the acquisition, disposal and consumption of animal glues and gelatines and fish glue in excess of the following quantities per quarter: glues and gelatines other than edible gelatine and fish glue, 6 tons; edible gelatine, 5 cwt.; fish glue, 3 cwt. The Order does not apply to gelatine or stock arising in the course of the manufacture of meat products and used in these meat products; nor does it apply to gelatine pre-packed under licence granted by the Minister of Food.

Cereals Research.—The Ministry of Food has, by arrangement with the Department of Scientific and Industrial Research and the flour milling industry, taken over for the period of the war the laboratories at St. Albans which were previously occupied by the Research Association of British Flour Millers. The Ministry will have

the advantage of the use of these laboratories and the existing staff for the consideration of all food research problems, but they will continue to be used in the main for specialised work connected with cereals and cereal products. The laboratory is now known as the Cereals Research Station of the Ministry of Food. The transfer took place on June 1st.

Chocolate and Sweets.—The Zoning Scheme for chocolate and sweets will come into force on June 27th. After that date retailers and wholesalers will not be able to obtain chocolate and sweets from any supplier situated outside their zone, subject to certain exceptions. In order to enable the consumer ration to be met, it will be necessary to allow certain manufacturers in special circumstances to deliver outside their own zone. The manufacturers concerned have already been informed. There will be four zones. To assist each retailer and wholesaler to get a fair share of the supplies available in his zone (subject to the transfer of personal points), it has been

Finance

GOVERNMENT RETURNS

For the week ended June 12, 1943, total ordinary revenue was £31,799,000, against ordinary expenditure of £28,437,000, and issues to sinking funds of £245,000. Thus, including sinking fund allocations of £1,818,077, the deficit accrued since April 1st is £37,098,000 against £607,574,000 for the corresponding period a year ago.

(Continued from page 804.)

Food. The Bakers' War Time Association has grouped households to which bread is delivered so that each baker serves a block as near as possible to his bakery. Some striking results are expected; for instance, the 80 odd bakers concerned at present deliver in 9,044 streets; this is reduced to 1,764; one baker is reduced from 17 streets to one street in which he has been allotted the same trade, another from 49 to 3. Progress is being closely followed by the Ministries of Food and War Transport.

THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

CAPITAL (PAID-UP) - £3,000,000
RESERVE FUND - £3,000,000

Branches and Agencies throughout INDIA and the EAST
AFFILIATED BANK IN INDIA

THE ALLAHABAD BANK LTD., with 15 Branches & 90 Sub-Agencies
The Bank offers a complete Banking Service and provides exceptional facilities for financing every description of trade with the East.

Deposits for Fixed Periods or repayable at call or at short notice are received at rates which may be ascertained on application. The Bank also undertakes Trusteeships and Executorships.

Head Office: 38, BISHOPSGATE, LONDON, E.C.2

West End Branch:

28, CHARLES II STREET, HAYMARKET, S.W.1

Manchester Branch: 52, MOSLEY STREET

New York Agency: 65, BROADWAY, NEW YORK CITY

NATIONAL BANK OF INDIA LIMITED

Bankers to the Government in Kenya Colony and Uganda.

Head Office: 26 BISHOPSGATE, LONDON, E.C.2.

BRANCHES:

Aden and Aden Point	Cochin (S. India)	Madras	Kisumu	Kenya Colony
Amritsar	Colombo	Mandalay	Mombasa	British E.A.

Soldier into Statesman

THE announcement last week-end of the translation of Field-Marshal Sir Archibald Wavell from Commander-in-Chief in India to Viceroy was a surprise. The new Viceroy is the first serving soldier to be appointed to govern India. Thirty-three years ago, King Edward's wish to see Lord Kitchener Viceroy was not satisfied because His Majesty's Government did not believe that a soldier was a suitable person to lead India along the path of constitutional reform. Inevitably, beneath the discretion with which the new appointment has been generally received, some fear has been shown, both in Britain and in India, that it may mean, in effect, a reversion to military rule—with Field-Marshal Wavell and General Auchinleck, his successor as Commander-in-Chief, in joint control.

It will be Sir Archibald Wavell's first and urgent task to dispel this fear; to insist upon his exclusively civilian status; to prove by his manner and his actions that to be a Governor-General is to be a General no longer. Already he has told the press in London that there is "no intention to set up anything in the shape of military rule," or "to withdraw or weaken in any way the pledges and offers made to India." The new Viceroy has presumably been chosen not for his professional qualifications but for his personal qualities, which are high and well known. If

he can make it plain that when he puts on his robes of state he puts off his uniform, it is by no means a disadvantage that he should have the closest first-hand knowledge of the military problems of India at war. It is obvious (as he pointed out on Tuesday) that "India's progress must depend on the successful prosecution of the war." Nor is it necessarily an unfavourable omen for his success in India that he should have been disinclined, on at least one recent occasion when in active command in another theatre of war, to share his responsibilities with extraneous civilians, demanding rather sufficient power to do his duty properly. It is imperative that the Viceroy and his Council, mainly of Indians, should have liberty of action in the search for an acceptable and agreed approach to Indian independence.

The decision of India's future does not lie in the Viceroy's hands, but in those of the Indians themselves. Sir Archibald Wavell will be the King's representative in India. Within the framework of the policy laid down by the British Parliament, and set out, in all its essentials, in the Declaration of Independence which Sir Stafford Cripps took out, without avail, in March last year, he will be responsible for, if not yet to, the people of India; and it is in the discharge of this responsibility that his and India's opportunity lies.

It is worth recalling the precise nature of this opportunity, as defined in the Cripps Declaration.

The object is the creation of a new Indian Union, which shall constitute a Dominion, associated with the United Kingdom and the other Dominions by common allegiance to the Crown, but equal to them in every respect, in no way subordinate in any aspect of its domestic or external affairs.

The method proposed for achieving this object was to set up, "immediately upon the cessation of hostilities," a Constituent Assembly, chosen by the entire membership of the lower houses of the Indian provincial legislatures sitting as "a single electoral college." This Constituent Assembly, charged with the task of framing a new constitution, would at once assume full responsibility for the future government of India by making a treaty with the British Government, transferring responsibility from British to Indian hands. The right of any Province of British India to contract out of the new constitution, and to retain its present constitutional position, would be reserved; and any Indian State would similarly have the right to contract into the new arrangement. Provinces not prepared to enter the new Indian Union would also have the right, should their electorates so desire, to seek Dominion status on their own account by making an independent constitution in the same way as that proposed for British India as a whole.

This offer stands. Far too little justice has been done in India and in Allied countries to the sweeping character of its proposals. In them is contained the promise of everything that Indian nationalism has asked for, and its fulfilment depends entirely upon the will of India, not of Britain. It imposes no form of constitution or method of government, except for the protection of racial and religious minorities by treaty with Britain. It leaves the Indians at liberty to choose their way of life, to decide whether the British or the American or the Russian constitution shall be their model, and to determine what degree of representative and responsible government is proper to the condition of India.

During the months before his entry into office, Sir Archibald Wavell has to decide why this remarkable offer was rejected; to assess what evidence there is of a change of mind; and to work out a programme of policy that will encourage such a change. The reasons for the rejection appear to have been three. First, there was the habitual Indian distrust of British motives. Secondly, there was a general desire among the Indian parties that independence in some form should be granted, not "immediately upon the cessation of hostilities," but at once. Thirdly, there was the inability of Hindus and Moslems to agree upon the proposals permitting Provinces to contract out of the new Indian Union—the Hindus demanding complete integration, the Moslems partition outright. The former Commander-in-Chief is not likely to decide that a major change in Indian government is possible while hostilities continue—and while the Indians themselves are in sharp disagreement about the direction it should take. Nor is it possible, in justice or expediency, to impose either integration or partition upon free India from above; the present demands of Congress and the Moslem League are irreconcilable. But mutual suspicion between Indians and Britons can, and should, be dealt with.

It is first of all a psychological change in the atmosphere of Anglo-Indian relations that is needed; and, secondly, the emergence of a new, more confident and more realistic leadership among the Indians themselves. The distrust of British intentions that is held by the politicians of the two largest parties, which still formally speak for politically-conscious India, is a legacy of the past; and there have been faults on both sides in its making. Nor are there many hopeful signs that either the totalitarianism of Congress or the separatism of the Moslem League, or the opposition-mindedness of both, is likely to be abated by a change of heart among their present leaders. The question is whether these distrustful extremists really represent to-day either the wishes or

the interests of all India. In the past, official and non-official India have seemed incapable of speaking the same language, socially or politically. The new Viceroy has a great chance to create a new atmosphere of ease and understanding.

In the effort to find a meeting-ground for Britons and Indians, the content of government is at least as important as its form. The only important question in the last resort is what is best for the Indian people. Certainly at the moment, economics are more immediately important than politics to most Indians, affected as they are by wartime dislocation and shortages. Americans come back from India even more impressed by the poverty of its common men and women than they are by the "repressiveness" of British rule. To them India is the "deep south" of the British Empire. It is true, as a comparison with other crowded eastern peasantries would show, that Indian poverty is almost certainly less under the British Raj than it would have been without it. But poverty is the basic fact of Indian life; and there could be no better foundation for a common cause between Britain and India than the formulation, first by way of short-term relief and then by way of long-term reconstruction, of a practical programme of social and economic rehabilitation. And as many Indians as possible must be associated with determining and taking the steps required. By looking first to these bread-and-butter requirements and by renewing the appeal for Indians representative of Indian opinion to undertake responsibility for Indian welfare, the Viceroy could give a new direction to the national pride and hope that is at present lost in political frustration. Secure Defence, Social and Economic Reform and the Indianisation of Government—these are the principles of policy that may attract Indians able and willing to take up the chance of independence where the present leaders of Congress and the Moslem League threw it down.

There appears to be no hope, while Mr Gandhi, Pandit Nehru and Mr Jinnah speak for India, of any agreement inside India or settlement with Britain; in their very different ways these men are equally Bourbons, who learn and forget nothing. Congress attempted last year to stage a pointless, violent, brutal and anti-Indian revolt. The Moslem League stood cynically and unhelpfully in the wings, while the Government of India, with distaste and no enthusiasm, dutifully put down the revolt with a firm hand. But the main feature of these unhappy events was that the revolt did not obtain popular backing. It did not stir India as a whole, except to alarm or anger, and the Government did not lose ground by its firmness. However tenacious old allegiances may seem, and however pervasive the influence of the imprisoned Mahatma, the past year has seen the bankruptcy of both Congress and its chief rival plainly revealed. India needs new men as well as new measures.

So far no alternative leaders to the old guard of extremists have appeared. Nobody with both constructive views and wide popular support has emerged. The liberals and moderates, Sir Tej Sapru, Mr. Rajagopalachari and the rest, are still heads without a body. "The voice of the younger generation (wrote Professor Coupland a year ago) can be heard asking for new ideals and policies to meet the needs of a new age." Sir Archibald Wavell can do much to give faith to these voices and substance to their demands. India shall be safe, India shall be fed, and India shall be free; these aims should be his guide.

To Sir Archibald Wavell falls the task of seeking and preparing the way for an honourable abdication. He should firmly set aside the many British officials whose manner and outlook, whatever their ability or integrity, impede co-operation and advance. He must discover among the Indians themselves whether, within the next decade, the unity of an independent India is practicable or partition inevitable. Above all, he must find out whether Congress is capable of diversion from its present blind alley to become the agent of responsible nationhood. These are the preparations that must be made, and these the questions that both India and Britain must be able to answer, when the day appointed for independence arrives.

Doctor and Patient

ON the great question of the post-war system of international order, either a great silence or a great vacuum reigns in Whitehall. It is all the more unfortunate that the Labour Party conference last week should have had equally little to say on this central issue, and that the time and interest of the delegates should have been taken up in a wrangle on Vansittartite lines over the goodness and badness of Germans.

In the context of post-war British foreign policy, this particular quarrel is really irrelevant. The German problem is only part of the wider problem of securing a functioning international system. As the Labour conference debate showed, even if a great majority of the British people were to come to definite conclusions about the Germans' moral make-up, their Government would still be left with the problem of devising a policy to fit the facts of post-war Europe.

In 1918 there was a policy—a detailed policy of which the political corner-stones were the institution of the League of Nations and the system of Collective Security. The policy collapsed, not mainly because the Germans were wicked or vengeful or addicted to National Socialist aggression, but because the victors of 1918 had not energy and resolution enough to uphold the international order which they had planned. True, the patient—Germany—was prone to a relapse. But the doctors—of whom Britain came, by the departure of some and the weakness of others, to be the most important—had not the strength of mind to carry on the very difficult cure they had devised. The unwillingness of the doctor to impose his pattern of health was more crucial than the tendency of the patient to fall back into delirium. And since fate will almost certainly once more thrust the rôle of chief doctor in Europe on the British people, and the attitude of the British people can be judged and influenced here in Britain, it is much more important at this stage of the debate on foreign policy to find out what cure Britain is willing to prescribe and support than to assess the exact degree of frailty among the Germans. It is the doctor, not the patient, who needs to be diagnosed.

That this is so is borne out by another lesson from the inter-war years. The Germans, by a persistent and successful propaganda, were able to mobilise the British conscience against itself. The Treaty of Versailles came to be almost as fiercely attacked in Britain as in Germany. Versailles was certainly not one of the great vindictive treaties of history; its basic principle was that, within half a generation from the Armistice, Germany was to be re-admitted as a free and equal member of the society of nations.

Yet the British were so upset by its "discriminations" that fifteen years later they were prepared to condone Hitler's abrogation of the whole peace settlement. What, then, would be their future reaction to a really bitter and vindictive peace? Obviously an even greater revulsion, leading inevitably to an even weaker handling of a resurgent Germany. The decisive reason for considering the British rather than the German reaction to a possible peace settlement is the plain fact that, if the new Treaty were to arouse orgies of penitence in Britain in fifteen years' time, the British would not uphold it. And if they did not, its provisions, however perfect, would be as ineffective as was the League Covenant after Manchuria and Abyssinia.

The first need, therefore, is not to decide whether Germans are good or bad, but to evolve a peace system which there is a good chance that British public opinion will uphold in ten or fifteen years' time. The other victors will have to make the same research into their own intentions; but our chief concern is necessarily with the British attitude. One of the difficulties about the moral argument is that it is only the two extreme positions that provide a clear indication for practical policy. If the German people are worthy to be treated on exactly equal terms with the victors on the morrow of the victory; or if they are so congenial in their wickedness that there is no hope of redemption—in either case the moral to be drawn for policy is precise and obvious. But if the truth lies anywhere between the two extremes—as it most certainly does—there is a very wide range of possible variance on policy. If, however, this whole argument is dismissed as irrelevant, and the construction of policy is firmly based on a diagnosis of the British people's attitudes and intentions, it should be possible at once to draw a number of practical conclusions.

It is almost certain, for example, that the British people is willing to insist on restitution, as complete as may be possible, of the physical and territorial possessions that Germany had taken from other countries since the rise of the Nazis, and on a thoroughgoing purge from German public life of all those who have played any consenting part in the Nazi regime. Not only is the British people now willing to insist on these policies, but the overwhelming probability is that it will stay willing for the comparatively short period necessary to enforce them. There is a very general body of support for the view that Germany should not only be disarmed when the war is over, but kept in a position of inequality in armament, if not permanently, at least for as far ahead as the mental

eye can see. By a most fortunate accident, military strength in these days depends on clearly defined and easily identified mechanical devices such as aircraft, tanks, heavy guns and warships, not on things like muskets (which are easy to conceal) or trained men (who are difficult to define.) The enforcement of disarmament will, after this war, be technically easier than ever before; it may be that, assisted by this fact, the British and other Allied peoples will be willing twenty, thirty and forty years after the Armistice to enforce unilateral disarmament on Germany. If so, unilateral disarmament is a practical policy. If not, it is a very dangerous policy to embark upon. In neither case is it relevant to discuss how much disarmament the German people deserve.

Is there anything else that the victors can be relied upon not merely to demand on the morrow of victory, but to enforce for decades thereafter? Should Germany, for example, be deprived of her heavy industry as a means of making disarmament doubly sure? Almost certainly not; for this would involve a differential lowering of the German standard of living, which would be contrary to the victors' real interests, and would lie very heavily on their consciences. Should Germany be partitioned? Certainly not—unless, indeed, as is most unlikely, she spontaneously partitions herself; for nothing would be more likely to boomerang back in a dozen years than an ill-considered and hasty policy of piecemeal dismemberment. Would the British or the American people be ready in twelve years' time to go to arms to prevent, say, the Germans in the Rhineland from reuniting their province to Germany? Last time, it was only just over four years after the Armistice that British public opinion sided with the Germans against Poincaré and his separatists. Should economic disabilities, such as reparations, be imposed on Germany? Again no; for a prosperous Germany is necessary for a prosperous world, and the logic of this argu-

ment is certain, in the long run, to outweigh any present passion.

In the determination of policy on all these points, discussion of the goodness and badness of the German people is not only irrelevant, it is positively dangerous. If British policy is determined by a sentimental conviction that the Germans are ordinary decent people, who would never dream of aggressing again, the British people may be lulled into inertia, and its leaders lack the stern will and determination necessary to create a system of security, and to make it work, against German or any other aggression. But a passionate conviction that Germans are mad dogs would have much more disastrous consequences. The imposition of a really brutal and vindictive settlement would arouse such a reaction in this country that the reappearance of the appeasement mentality would be a matter of only a very short time. It is no coincidence that many ex-appeasers are among the champions of brutality now. The swing the other way would be as rapid.

If the German problem is approached not from the German, but from the British end, it is possible to concentrate on the essentials—the need for a vigorously upheld system of security against aggression from any quarter, German or otherwise. If such a system exists, and is championed by the peace-loving Powers, there is some reason to hope that the Germans, a malleable people, will fall in with the general trend. It is the existence of an international vacuum that gives the Hitlers their chance. But for that system to be vigorously maintained by Britain, it must be reasonable and just; otherwise the revulsion will set in. The Vansittart debate, by suggesting that realism and vindictiveness, reasonableness and weakness are always paired, does infinite harm to British policy. It must be reasonable—and realistic. If it is vindictive, one day it will certainly be weak.

War Pensions

A SECOND reading was given this week to the Bill establishing tribunals to hear appeals against decisions of the Ministry of Pensions. There is no doubt that Members would have liked to have used the occasion to bring up again the dissatisfaction that is felt with the rate of war pensions and the principles governing their award. But procedure prevented this, and the discussion was on the whole limited to the terms of the Bill, and for the Government's reply to the complaints, Sir Walter Womersley's promised statement must be awaited.

With the first charge—that the present rate of pensions is too low—it is surely impossible to disagree. The pension given to a totally disabled private soldier is 37s. 6d. a week, with allowances of 9s. 2d. for his wife, 7s. 1d. for his first child and 5s. 5d. for each other child. The pension is 2s. 6d. lower than that given to a Great War pensioner, and the allowances a few pence less. This discrepancy the Government explains by the far higher cost of living when the last war's pensions were finally fixed, a logical explanation, but one that ignores the changed attitude towards social service payments in the last twenty years and the gradual approach to the provision of a subsistence income. Even allowing for the fact that, thanks to the revolution in the treatment of the disabled in recent years and to the Ministry of Pensions' own work in restoring the capacity of war victims, even a totally disabled man can often supplement his pension with wages, there can be no doubt that the rate of disablement pension is too low.

The rate for the widows of men who have been killed is even more inadequate, for in cases where there are children, the widow is compelled either to live in poverty on her pension or to leave her children to the care of others and work herself in order to obtain another means of living. Suppose she is the widow of a private and has three children. She would receive 25s. a week for herself, 9s. 6d. a week for the first child, 7s. for the second, and

5s. 6d. for the third—a total weekly income of £2 7s. Can she really be expected to bring up her family adequately on that, let alone in the way they would have been brought up if she still had her husband as a wage-earner? Women with children are exempted from industrial conscription and from direction to part-time work. But the state is compelling war widows with children to take up work by refusing to give them adequate means of support.

It is, of course, impossible for money payments to compensate a woman for the loss of a husband, parents for the loss of a son, children for the loss of a father, or a man for the loss of a limb or his eyesight. But what can at least be done is to base the rate of pensions, not as at present on a level which is something below the wage rate for the lowest paid worker in the country, but on the average wage rate. The principle should be that the men who are called up to serve the community, and their dependants, should not suffer financially if they happen to be victims of the misfortunes of war. The principle cannot be applied in each case individually, but it can be applied on the average. The wounded heads of households, and the dependants of those who are killed, should be no worse off on the average than they would have been if there had been no war. This is the ideal, and it is easily attainable. It is very far from being attained as matters stand at present.

But a far more difficult question than the rate of pensions—and one that is just as much a source of grievance—is who is to receive them. The Ministry of Pensions is quite definite on this point—to receive a war pension, you must be a war casualty, or a dependant of one. Stated simply, this principle cannot be disputed, but then argument arises over what is a war casualty. When a man is killed or wounded in action, the answer is easy. But what is the position of a man who dies a natural death while in the Armed Forces, or is invalided

out for some disease? Under the terms of the Royal Warrant, a man's death must be directly attributable to military service, or due to a wound, injury or disease which was materially aggravated by such service, before his dependants can receive a pension. The same stipulations—attributability or material aggravation—apply to pensions for disability. If, therefore, a man dies of malaria contracted while serving overseas, or is invalided out of the army because of it, he is a pensionable case, for quite clearly it was his military service which sent him to a malaria region. But if he dies of cancer, then his widow is in exactly the same position as the widow of a civilian who dies of cancer. Cancer cannot under any circumstances be regarded as attributable to military service; the man who dies from it is not, therefore, a war casualty, in spite of his war service; and his widow is not eligible for a war pension.

It is difficult to see anything wrong with this principle. War pensions are for war casualties, not for the thousand natural shocks that flesh is heir to. As Sir Walter Womersley said the other day:

I could not recommend that the state should be made liable for the whole range of ailments which affect the population as a whole merely because they occurred during a period of service without being in any way influenced by its conditions.

If the principle were relaxed, it would mean introducing yet one more discrepancy into the system of social service payments. A widow of a miner who dies of cancer now receives 10s. a week, plus 11s. if she has three children. A widow of a soldier who died of cancer would receive £2 7s. Yet if both men had been working side by side on a farm, they would have died just the same. If anything should be done, it is to increase the rates paid to widows and children under the Old Age and Contributory Pensions Acts—if £2 7s. a week is inadequate. How much more so is 21s. Nor is it likely that real war casualties and their families would welcome it if pseudo-casualties were given the same pension as themselves.

But, say the critics of the Ministry of Pensions, though we agree with the principle, we do not agree with its interpretation. Surely, if a man has been passed A1 at his medical board, any illness he may subsequently contract must be due to his military service. The argument has only to be stated for its absurdity to be apparent, but this is in effect what the supporters of the slogan "Fit for service, fit for pension" are really claiming. Banks, to take one example, have new entrants to their staffs medically examined, but if any of them certified as perfectly fit subsequently die of cancer or a coronary thrombosis it is not held that those diseases are attributable to their banking service. What the medical boards do is to try to find out if a man has any disability when he is called up or had any disability in the past which might recur during military service. They are, however, hampered by the fact that they often have to rely for past medical history on the man's own statement, and

over and over again when a man has subsequently been discharged for some complaint, it has been found that he concealed symptoms and past medical history at his original board.

This concealment of symptoms is particularly true of those suffering from what is now called psychoneurosis and sometimes in the last war shell-shock. Awards of pensions in the last war were granted on the same principle as they are now, that is, the disability had to be attributable. But it was held that shell-shock cases were attributable, as well as neurasthenia and other nervous complaints. Pensions were accordingly granted, and one of the most frequent complaints brought against the Ministry of Pensions today is that in this war it has refused to allow psychoneurosis, except in a few cases, to be called an attributable disease.

The reason for the change of view is two-fold. Far more is known about neurosis to-day than in 1914-18. It is now realised that it is possible to be born with a neurotic or psychopathic temperament. The circumstances of life may bring out neurotic symptoms, but the underlying tendency is always there. Most soldiers who passed through the awful ordeal of Dunkirk suffered no more than a temporary nervous instability. Those on whom it left permanent traces were nearly always those who were subsequently found to have had a past history of nervous symptoms. The other reason for not granting pensions in cases of psychoneurosis is that it is not in the interest of the sufferers themselves. The shell-shock cases of the last war were gross compensation hysterics. They produced their paralysed arms and legs—albeit unwittingly—because they were mentally unfit for army life. They continued to have paralysed arms and legs—and sometimes loss of sight—because after one motive had been removed, by their discharge from the army, another motive was granted in the form of a war pension. It cannot be too strongly urged that those who plead for pensions to be given today to psychoneurotics who are discharged from the Armed Forces, even if they were at Dunkirk or have been torpedoed, are being kind only to be cruel. If psychoneurotics are to have a chance of being active hard working members of the community they should not be given war pensions.

This class of disabled is important, not only because on the face of it a man suffering from nervous symptoms after bad war experiences seems to qualify as a war casualty, but because of its size. In 1942, the proportion of men invalided out of the army for neurosis was 17 per cent of the number invalided out on account of all diseases. Seventeen per cent was also the figure given recently for the proportion of rejected pension claims accounted for by psychoneurotics. But there should be added to the number diagnosed as suffering from psychoneurosis the very large number discharged as suffering from gastric and similar complaints. More and more it is being realised that many disabilities are physical symptoms of a neurotic temperament, and the true pro-

portion of psychoneurotics among those discharged from the Armed Forces is probably more like 25-30 per cent.

Does, then, the whole case against the Ministry of Pensions, in its award of pensions, fall to the ground? The main charge certainly fails, but there still remain a large number of doubtful cases and hard cases where the letter of the regulations is being adhered to too strictly. It is quite true that, in all stories of hard cases, only one side is heard. The public is never told, unless the matter is raised in Parliament, of the Ministry's version of the story. An applicant's past medical history is not revealed. The Ministry of Pensions claims that in

dubious cases the applicant is given the benefit of the doubt—and the fact that pensions are now given more freely in cases of tuberculosis, a doubtful service disease, bears this out. Nevertheless, there still remain anomalies and hard cases. Some of these will, it is expected, be dealt with in Sir Walter Womersley's forthcoming statement, and the new appeal tribunals should tend to rectify the others. But while the Ministry of Pensions can be supported on the main principle, a little more generosity in carrying it out can still be pleaded for. Grievances on the subject of war pensions there will always be. But they should not be allowed to be genuine.

Balkan Strategy

JUNE 22nd has come and gone. This is the classic time of the great German offensives; only this year there are apparently to be none. The vast war machine is switched to the defensive, and everywhere in German Europe the change in strategy has brought with it far-reaching modifications in the policies of puppet governments and the lives of their subject peoples. In 1941 and 1942, when all the emphasis was on delivering a knock-out blow, the satellite Powers were expected to make their contribution in the shape of divisions for the Russian front. The blows failed. The armies were decimated. Meanwhile, the drawing away of manpower and horses from the predominantly agricultural South-East led to a serious economic breakdown in the various Balkan countries. With output declining and food supplies falling short, they threatened to become a liability to the German war machine.

Now the strategy has changed, in tune with the change in Germany itself to "total mobilisation" and the "battle for production." If the Continent is to maintain itself without the addition of booty from further conquests, the Balkans must be restored to their pre-war rôle, that of supplying large agricultural and mineral surpluses to the German economy. In four years of war, the surpluses have largely disappeared; they must now be restored. The first step in the new German strategy—which was doubtless exhaustively discussed in the series of spring meetings between Hitler and the puppet leaders—is to demobilise the satellite armies and to return them with all speed to agriculture and industry. The troops of Hungary, Slovakia and Croatia have all come home by now. There is only a token force of Roumanians in the Kuban. In all the South-Eastern countries, stringent laws of total mobilisation are in existence. With a few exceptions, this mobilisation now covers all men from the age of 12 to 70. Although they are being returned in the first place to agriculture and to such special German needs as the copper mines in Southern Yugoslavia, some labour in Greece and occupied Serbia is attached to the Todt organisation, and is working on railways, roads and defences. In Roumania, too, hundreds of workers needed on the land are engaged in improving communications.

In this division of labour, the fighting falls to the Germans. Whether by choice or necessity, they are meeting the needs of defensive warfare out of their own resources. The only foreign troops are the various *Waffen SS*, recruited from among the toughest Axis supporters in the South-East. The *Volksdeutschen*—the German minorities scattered through the Balkans—are the backbone of these special volunteer divisions.

The Germans clearly expect an onslaught from the South-East. For months now defence workers have been busy rebuilding the Metaxas Line, constructing defences the length of the Athens-Belgrade railway, fortifying the Greek coasts and some of the islands—Lemnos is said to be very heavily fortified. The evacuation of Salonika and its environs has been reported. In Bulgaria the mountain passes have recently been fortified, and Burgas and Varna on the Black Sea have been converted into effective naval

bases. The Italians do not seem to be playing a decisive part in these preparations. They are no longer responsible for the defence of Greece, where all the key points are controlled by the Germans. They maintain garrisons in Albania, Dalmatia and Croatia, but the crucial fighting against the guerillas in Montenegro and Serbia has been the Germans' responsibility, while a good deal of police work in Serbia, Macedonia and Thrace has fallen to the lot of the Bulgarian army.

It is possible, from these dispositions, to guess at the Germans' general strategy of defence. Their aim in the Balkans must be to defend Roumania (for its oil), and to prevent a break-through into the great plain of Central Europe. The loss of Greece, of Italy, even of the Adriatic coastline would not necessarily give the Allies access to the key areas in the South-East. On all these perimeter defences, the Germans are probably thinking in terms of very tough rearguard actions, but not of an all-out defence. The Balkan terrain is in any case very unfavourable to an attack from the South, since the main lines of communication northwards run through mountainous and easily defensible country.

The pivots of the German defence system are Bulgaria and Hungary. The greatest military activity just now is reported from Bulgaria, where German headquarters are stationed. All the aerodromes have been taken over, and strong German air units are reported to be concentrating there. The flat lands give the Germans defenders great advantages in terms of airfields, and they can there deploy mechanised force which cannot be used in the mountains, and which the Allies would have difficulty in bringing up with them in an overland advance. Hungary is the second point of concentration. Here again, the flat territory would give the German defenders considerable advantages in terms of air bases, while Allied armies would be fighting mainly in mountainous country. The Balkan defence system, thus conceived, would be mobile and elastic, and the Germans can hope that the Allies, after exhausting themselves in expensive attacks on the outposts, would have to face a heavy counter-offensive from the air, and heavily mechanised armies operating from well prepared and equipped supply bases.

The plan is soundly conceived; but it has some dangerous flaws. In the first place it will not be possible, however much the men are returned to the land and to industry, to put a stop to the steady decline in Balkan productivity. The reasons for this vary from country to country—for example in Hungary, economic policy is caught in a dilemma between the need to divide the big estates, and thus arrest the steady drift to the cities and the need to preserve the estates as large scale and efficient agricultural units. In Roumania, the smallness of the peasant holdings and the lack of agricultural machinery make it impossible to increase production. The German-inspired attempt to group peasants together in voluntary *Kolkhozes* has not been a success. In Croatia and Bulgaria, too, inefficient peasant organisation is at the root of declining output. In all the South-Eastern countries, inflationary tendencies are very much out of hand. In all

of them the peasants refuse to give up their supplies, either to the towns or the Germans. Except perhaps in Hungary, none of the political administrations are efficient enough to introduce a proper system of rationing and price control. The results are, of course, inevitable—a skyrocketing cost of living and, everywhere, recourse to extortionate black markets.

The economic and political uncertainties of the area are obviously increased by the extent to which Yugoslavia and Greece are still in the fighting war. Every German attempt to stamp out the activities of the guerillas in Yugoslavia and Macedonia has been ineffective and costly. After their recent four-week drive in Montenegro, the Germans claimed that the area had been "finally cleared." This is probably the tenth time in two years that such an announcement has been made. The Germans know that when the invading armies strike, there are organised armies on Balkan soil waiting to strike with them. Given a successful landing, there is no knowing how far or how quickly the spirit of resistance will spread. In all their Balkan outposts the Germans are walking on mined ground.

The pivotal points of their defence system—Hungary and Bulgaria—look more secure. These two nations are the "Haves" of the Axis system. The Vienna Award, the dismemberment of Roumania and Yugoslavia, were all to their advantage, and their only hope of preserving their privileged position is the maintenance of German hegemony. Yet, even here, there is uncertainty and uneasiness. Both nations have used their importance to Germany to manoeuvre for a certain minimum freedom of action. The growth of criticism in the opposition parties in Hungary was rapid enough for the Government to close Parliament on May 4th. In Bulgaria, too, the Vice-President of the Sabor has been dismissed, and all pro-Axis officials

have lived for the last six months under the threat of assassination. There is a strong opposition movement in both countries, and only the combined pressure of Regent and Government in Hungary, and King and Government in Bulgaria, prevents a more vocal and violent reaction.

Finally, it is generally reported that the morale of the German soldiers, on whom, ultimately, the whole defence plan turns, is none too good. It is easier to organise high spirits for victory than for a long defensive campaign among the inhospitable mountains and even more inhospitable peoples of the Balkans.

Amphibious operations in South-Eastern Europe, if the Allies undertake them, will be hard and costly. The Germans have the advantage of the terrain. Their plans have been shrewdly made. They can count on a certain amount of quisling support. Against this, the United Nations can set their growing strength in the air and on land, the support of thousands of trained fighters inside the peninsula, and the growing uncertainty among the puppet governments who know that Germany's hour has struck. Of these, the support of the guerillas is probably the most valuable asset. That is why it is essential, on the eve of the operations, to repeat unequivocally the call for unconditional surrender. Greeks have not died in Thrace and Macedonia in order to provide King Boris with an easy way out of the German alliance. The partisans are not fighting in Croatia for the political future of the Hungarian Prime Minister. Concessions to the satellites at this point would lose the Allies the actual support of thousands of seasoned fighters as well as the potential support of all those who, underground, have fought German predominance in Hungary and Bulgaria. If the Allies stage a successful landing, the quislings will appease them in any case. It is useless to compromise the enterprise in advance by appeasing the quislings.

NOTES OF THE WEEK

The Third Year

The second anniversary of Russia's entry into the war found a protracted lull on the eastern front. Last summer Hitler could still afford to discount the danger of a Second Front in Europe. He plunged into the second act of his Russian venture, which was again to end in defeat. Now, the threat of an Allied invasion of Europe is real and imminent; and the German High Command has so far been deterred from beginning large-scale operations in Russia. Even apart from this threat, German experience in 1941-1942 does not offer much hope, to say the least, of a strategic decision in the east. Russia has stood the test. The first year tried the strength of its political regime; defeats and retreats produced some critical effects, but the defence of Moscow in December, 1941, worked powerfully to overcome the strain on morale and to stabilise the structure of government and leadership. The second year tested the economic strength of the Soviets; and Russia's "rump economy" showed itself capable of sustaining the fighting fronts. The war of attrition has had a severe effect on Russia's economic life. The losses in material alone are put officially at 35,000 guns, 30,000 tanks and 23,000 planes lost on the battlefields; and these are only the three most important items on a very long list. Although the gaps in Russia's productive capacity have been to some extent made good out of Lend-Lease deliveries, Russian production is severely handicapped by shortages of labour, raw materials and plant. In various parts of the country the civilian population has been reduced to a state of semi-starvation. Thus attrition goes on, even though there is a lull in the fighting. Yet the enormous strain has not produced the crisis the Nazis hoped for. Russian morale is excellent, and securely grounded in the people's belief in the justice of their cause. This confidence has inspired the Russians with an amazing spirit of endurance. Allied victories in Africa and in the Mediterranean have heightened Russian morale still more, and the Russian people look beyond the lull to its end. As the Soviet statement on the two years' fighting put it:

Without a Second Front in Europe victory is impossible. Should the Second Front be postponed this would cause a serious setback to the common cause. It would prolong the war and increase the casualties on the Allied side.

* * *

Policy in the Ostland

In the course of the first, and until late in the second, year of the campaign in Russia, Hitler hoped to achieve victory by purely military means. Relying on strategic success, he discarded nearly all the political trump-cards he might have used. The collective (*kolkhoz*) system was not destroyed in the parts of Russia occupied by the Germans because it was expected to serve as a convenient instrument for requisitioning supplies. No attempt was made to set up a Russian quisling administration, because the conquerors of the *Ostland* were carried away by their racial contempt for the Slavs and considered any such administration to be superfluous. The old pledges given to the Ukrainian nationalists to set up a Ukrainian state were broken for the same reason. Contempt for politics and an almost superstitious belief in the omnipotence of armed force were the two chief points in *Ostland* policy. Now that the German war machine has failed, an attempt is being made to revive political warfare. The collective farms in occupied territory have been officially dissolved, and the peasants have been allowed to share out the land among themselves. A Russian quisling army under one Vlasov is being organised, and once again the Germans are turning to the Ukrainian nationalists. But it is rather late in the day for successful political warfare. The gift to the peasants is not impressive, for they are getting the land minus all the tools and livestock which the Germans have already looted or destroyed—and minus most of its produce, which the Germans requisition. The unknown puppet Vlasov cannot hope for any appreciable response—after Stalingrad. And how much are the Ukrainians likely to listen to the new appeal, now that Eastern Galicia has been incorporated into the General Government of Poland, and

of each Service, for technical and tactical reasons, will be more needed than others for the Pacific fighting, or for occupying Japan and other territories. It is indeed essential that demobilisation should be as far as possible fair, but it cannot ignore considerations of efficiency and economy. And these considerations apply behind the lines as well as at the front. If the transition from war to peace is to be more orderly than last time, some workers will be needed more than others when peace industry is starting up, and the process of re-equipment and reconstruction is begun. Industrial demobilisation, like military demobilisation, will at first be partial. Not all the capacity of the munitions industries will be needed to supply the Pacific theatre. Some will be retained on war service; some will be freed to take up peace work. Unless a clear-cut policy is made and explained, there will be bitterness between employer and employer, and between worker and worker, as well as between soldier and soldier. Certain principles of industrial demobilisation can perhaps be roughed out: that capacity capable of working directly for export should be freed from war obligations as soon as possible; that food, clothing and shelter should come before luxuries; that industries capable of being reconverted to peace work without expensive re-equipment and re-tooling should be allowed to turn over as soon as practicable, in order to economise the resources needed for immediate reconstruction; that British demobilisation, both of machines and men, should be an integrated part, not only of the continuing war effort of the United Nations, but also of the joint plans made by them for relief and reconstruction on a world scale. Sir William Jowitt is right. There must be no pointless argument. But the Government must make prompt decisions, and they must be made known and fully explained. Only in this way can acrimony possibly be avoided.

the Minister of War Transport, the railway workers' wage claim has at last been settled. On June 18th, the executives of the three unions accepted a general increase of 4s. 6d. a week, to date from April 26th, and to apply to over 400,000 workers, including women. There will be much relief that this issue is now out of the way. But though the railway workers' claim has been settled, other wage claims are pending. The demand for a 10s. a week increase for 120,000 railway shopmen is still under discussion. The bus workers, whose application was recently rejected by a special tribunal, are presenting a fresh claim, while the decision of the AEU (referred to on page 830) to formulate a comprehensive long-range programme for higher wage standards may lead other unions to follow suit. These developments are probably inevitable at the present time; with full war employment, labour's bargaining position is strong, and its aim is to safeguard future wage standards against the pressures that may develop in less favourable conditions. There is a strong case for raising the wages of the lowest paid workers, for equalising the rates of men and women on the same job, and increasing the general level of women's wages, and for ironing out specific anomalies and injustices. But looked at objectively, it is difficult to justify the claim for generally increased wage rates at the present moment; the cost of living has been kept stable by means of subsidies (it is actually down a point this month), and though prices of secondary goods, such as furniture and household equipment, have soared, this could be corrected by the extension of utility production and increased price control. It cannot be imagined that the main object of the workers in pressing for wage increases is that they may have more to "lend to defend." *The Times* has, somewhat disingenuously, argued in connection with the railway workers' increase that "the existence of comparable wage standards will ease the necessary adjustments" in the post-war period, that is, facilitate the flexibility of labour, one of the basic conditions for the achievement of full employment. But recent trends have not been in the direction of a general levelling of wages; on the contrary, the increases secured have tended to be in proportion to the previous rates, and the strongest and probably the most highly-paid sections of the working-

Introspection in Australia

For a week, the French National Committee wrestled unsuccessfully with the problem of army control and reorganisation. Although the chief points at issue were rather obscured by the spate of plans and counter plans, the controversy seems to have turned on two questions: the degree of authority to be exercised by General de Gaulle and the speed with which the reorganisation was to be carried through. The debate was closed by Allied intervention. General Eisenhower intervened to press the point that Allied interests were involved, that a change in the French High Command in North Africa would be unwelcome, since General Giraud had proved an able and loyal collaborator, and that any "purge" which upset the fighting efficiency of General Giraud's forces could not be tolerated. This intervention made the position occupied by General de Gaulle untenable, since it excluded him from control and gave Allied support to the Giraud thesis of a more cautious reorganisation. The moment of crisis had thus arrived. Would General de Gaulle withdraw from the Committee? Would the attempt at unity founder within a week? It says much for the authority of the new Committee and for the strength of the pressure for unity that the catastrophe was averted. A compromise has been reached which, while leaving the forces in North and West Africa under General Giraud's command, and the forces in the rest of the liberated Empire under General de Gaulle, sets up a military committee composed of the two Generals and their chiefs of staff for land, sea and air, to arrange a fusion of the two commands in the shortest space of time. The good point in this compromise is the existence of this military committee, presumably under the general authority of the National Committee which created it. There is thus some central direction which will be further strengthened by the fact that the financing, equipping and provisioning of both commands will be centralised in the National Committee. The bad point is, obviously, the continuance of a division based on personalities, in the centre of the French war effort. The most urgent task before the French is to ensure that the new military committee does its work of unification speedily and well. The withdrawal of a number of high officers (among them Admiral Michelier, General Prioux and General Poupinel) who were most unacceptable to the de Gaullists will immediately help to create a better atmosphere in which to carry on the task of fusion.

Strategically and diplomatically, a great change has taken place in the position of Australia in the past twelve months or so. Early in 1942, it was tough and go; Australia was in great danger, and its harassed and anxious Government was out of temper with the earlier strategy that had placed Australia's front line in the Middle East. Britain was down in the Government's esteem and the United States, to whom they looked for salvation in the Pacific, was up. Now things are very different. A few weeks ago, Mr. Curtin pronounced Australia safe from invasion. Dr Evatt, Minister for External Affairs, who has been visiting this country, has expressed himself well satisfied with the war strategy and material aid of both Britain and the United States. The recent decision of Mr Churchill and President Roosevelt, when together in Washington, to pursue the campaigns against Germany and Japan "with the same vigour," "concurrently" and not "consecutively," has obviously found generous recognition in Australia—whatever doubts it may have raised in the minds of those who believe, probably rightly, that the quickest way to end both wars is by the concentration of forces. In Australia itself, however, there is no such happy atmosphere. The recriminations which have waned abroad are waxing at home. Mr Curtin has chosen to repeat his charge that the Menzies Government neglected the defence of Australia; and the Opposition parties have come together this week to support a vote of no confidence in Mr Curtin. The Prime Minister is accused of permitting the trade unions to endanger the war effort and, generally, of an undue deference to labour which is preventing the war from being placed upon a total basis. According to brief and incomplete reports, Mr Fadden has even suggested, somewhat surprisingly, that the burden of war taxes on present taxpayers and on industry could have been abated and that the shortage of commodities is in some way the Government's fault. These events should not, perhaps, be taken too seriously. An election in October, if not before, is certain, and the rival parties are taking up their platforms with a flourish of trumpets. The danger is that the party bitterness which is so characteristic of Australian politics may, despite the professions of the contenders, weaken the united and unstinting effort which they both claim to support. The relaxation of immediate danger has not proved an unmixed blessing.

On Thursday, last week, Sir William Jowitt, Minister without Portfolio, spoke again of the problems of demobilisation after the war, and their complexity. He rightly said that it would be foolish—and he might have added dangerous—to involve the members of the fighting Forces in any controversy now about rival schemes. Demobilisation will be difficult enough without being prejudiced in advance by embittered discussion. Nevertheless, silence is no solution. The very fact that it will be difficult to devise a programme that will be both fair and efficient requires, first, that a policy should be decided upon promptly, and, secondly, that it should be explained intelligently as soon as possible to prevent misunderstanding later on. The Government is committed in general terms to release men when the war is over according to their age and length of service. There are several reasons why it will not, in fact, be possible to base demobilisation entirely on these principles. The first is the fact that there will be no clean-cut break between war and peace. After Germany has been beaten, there will be Japan to deal with. There will, moreover, be a need for armies of occupation. Demobilisation, that is, will be partial; and the choice between keeping one man and releasing another will in part have to be decided on grounds quite other than age and length of service. Transport, for instance, will obviously be an influential factor. Inequitably, but probably inevitably, troops already in or near the East will tend to be called first into the Eastern fighting. Moreover, the Army, Navy and Air Force are not homogeneous bodies. Some sections

Wage Increases

After many months of negotiation, with successive claims and counter-offers, and finally a direct approach to

***"We are very proud
of you"*** HM the QUEEN

H.M. the QUEEN
IN A BROADCAST MESSAGE
TO WOMEN OF THE EMPIRE.

WE are all proud of them—the hundreds of thousands of young women who are serving their country. But we are especially proud of those who go overseas—not least of the nurses who care for the men of our fighting Forces in North Africa and elsewhere.

Think what it means to these women to have Y.W.C.A. huts, leave hostels and mobile clubs to brighten their hard-earned leisure. And wherever swift moving events open up a new need the Y.W.C.A. will be there, if funds permit. This is YOUR part—help us not to fail our women.

class have set the pace. The movement is one of "catch-as-catch-can," and it is surely time for the Government to take stock of the whole position.

British Aircraft

Post-war civil aviation is an exciting topic of discussion. The latest contribution comes from the aircraft industry in the form of a report entitled "The Future of British Air Transport," issued by its organisation, the Society of British Aircraft Constructors. The industry which, according to the report of the SBAC, now employs "nearly two million workers," is faced with the prospect of drastic curtailment after the war. Sir Stafford Cripps stated, on June 4th, that the industry could not maintain more than one-tenth of its present output in peace. Its interest in civil aviation is therefore natural. Although military demand must remain its mainstay, the industry foresees a rapid growth in civil aviation. The SBAC, anxious that the industry should be able to meet the demand for civilian types of aircraft after the war, suggests that, "as a first step, it should be allowed to adapt existing bomber types for use as transports, and to put them into large production immediately." Any transfer of resources from the manufacture of military aircraft to the manufacture of civilian types must be at the expense of the former—a fact which is recognised by the SBAC; and the decision to make such a major change in the British production programme could only be taken by the military authorities of the United Nations in concert. On June 1st Mr Attlee informed the House of Commons that arrangements were in hand for the adaptation of existing types, and that it had been possible to allocate the design for some four types of new planes to certain firms. For the future organisation of air transport, that is, of operations as distinct from manufacture, SBAC is strongly in favour of competition—within limits—and against the policy of the "chosen instrument." Its views are based largely on the experience with Imperial Airways.

Not one all-metal aircraft designed and built for Imperial Airways was ever sold to another operator. In fact, some Imperial Airways contracts for aircraft included a clause which forbade the constructor to offer the aircraft elsewhere—and this at a time when American aircraft companies, stimulated by a competitive, virile and rapidly expanding domestic airline system, were able to offer to airline operators all over the world efficient, stressed-skin, all-metal aeroplanes.

Quite legitimately, SBAC is in favour of a policy which will enable the British industry to supply machines not only to British but also to foreign operators on a competitive basis. SBAC holds that any subsidies which may be needed after the war should be given not to manufacturers, but to operators. The critics, who have lately been very vocal about the alleged charmed circle, made up of the Society's full members, will, according to their temperament, be relieved or still unimpressed by the stress laid, very properly, in this report on the need for equal opportunity for all members of the industry—which would involve "adequate assistance" to the smaller and newer companies.

Jugoslav Cabinet Crisis

A crisis in the Yugoslav Government began over a week ago after the visit of the Russian Ambassador, M. Bogomolov, to King Peter and the subsequent withdrawal of M. Jovanovitch from the office of Prime Minister. His departure has been greeted with some relief, for the strongly anti-Croat bias of his Government made it certain that no way out would be found from the difficulties and divergences which at present divide Serb and Croat, Chetnik and partisan in Yugoslavia itself. The Jovanovitch Government had also earned the dislike of Yugoslavs in exile. The Union of Yugoslav Journalists recently protested against the measures taken by the Government to prevent hostile criticism, and some of M. Jovanovitch's own colleagues in the Cabinet were alienated by his autocratic methods. It is one thing to get rid of a Ministry. It is quite another to form a new one. Most unhappily, the attempt made last week by M. Baujamine has split on the reef of pan-Serb Chauvinism. It was M. Baujamine, a Serb of Croat origin, who framed the Corfu Agreement, which, in the last war, was the basis of Serb-Croat collaboration; and it was widely hoped that where he had succeeded once he would succeed again. His failure has been followed by a new attempt, this time on the part of M. Bobitch. He is a Serb, a former Mayor of Belgrade, and unfortunately his

political record does not give much hope that the Yugoslavs will reach an agreement under his aegis. The prolonged crisis is only one example of the tragic way in which the Governments of Europe are still unable, even after the lesson of Hitlerism, to come to terms with their minorities. Czechs and Slovaks are still divided, though less than before Munich. The Poles and the Polish Ukrainians have not discovered a common language. The tension between the Serbs and the Croats, which was the unhealed sore in the side of Yugoslavia for twenty years between the wars, is still there to poison the relations between the two peoples. It must be hoped that as a result of their common experience of oppression the men in occupied territory have learnt greater mutual respect and tolerance than the émigré politicians.

Extension of Monopoly?

The progress of trade associations, fortunately for the consumers of the products that they control, is not all plain sailing—even in the favourable circumstances of wartime restriction. The Proprietary Articles Trade Association, which is made up of both the producers and retailers of the perfumery, toilet and medicinal preparations with which in the main it deals, is one of the strongest of its kind, and its methods are characteristic. It has a comprehensive "protected list." It fixes and maintains retail margins. It watches vigilantly for the cutters of margins or prices and black lists offenders. Its methods have been widely copied. Yet, until the war, the PATA always felt that there was a gap in its organisation. The prices of most of the well-known and largely advertised lines of goods with which it dealt were fixed and maintained, so far as chemists and the large multiple stores were concerned; but it was not easy to ensure that these fixed prices would be observed by the many hairdressers and perfumery shops who also sold these classes of goods. The war came to the Association's rescue. Owing to the shortage of supplies, the cutting of margins by these outsiders practically ceased. Indeed, the restriction of supplies was followed by an extension of the restriction of trade. It is reported that a Hairdressers' Trade Association has been formed which is (to quote the *Perfumery and Essential Oil Record*)

like the PATA, an organisation with manufacturers, wholesalers and retailers, with a constitution and rules based upon those of the latter association . . . it may be expected that, in due course, the effective price maintaining of proprietary perfumes, toilet and hair preparations throughout the hair-dressing trade will be noticeably extended through the instrumentality of the Hairdressers' Trade Association.

Among the members of the manufacturing section of the new hairdressers' association are firms which figure largely in the PATA. The PATA, in fact, has gained a considerable extension of strength. But elsewhere there is trouble—with another trade association. Proprietary articles include, in addition to perfumery and toilet articles, proprietary medicines; and among these are many medicines which pharmacists like to regard as their own exclusive preserve. This is where the conflict arises, since the PATA "protects" other vendors of medicine than the pharmacist proper. This led some time ago to the formation, on the suggestion of the National Pharmaceutical Union, of an organisation called the Chemists' Friends. This organisation asks manufacturers to limit the sale of their proprietary medicines to pharmacists only; if they agree, they get the privilege of a place on the Chemists' Friends List. So here is yet another device to monopolise the channels of retail trade. PATA complains that the Chemists' Friends are

prohibiting traders under penalty from granting, if they so desire, normal display facilities to the manufacturer-members of the PATA.

It looks as if two trade associations, two quasi-monopolies, are starting a fight. Unfortunately, when this has happened in the past, it has usually ended in a friendly understanding to make the monopoly complete.

Labour in the Eastern Dependencies

Major Orde Brown, Labour Adviser to the Colonial Office, covers Ceylon, Mauritius and Malaya in his latest report (Cmd. 6423) on labour conditions in the colonial empire, dependencies which are very different in their stage of development, both politically and economically. Yet they have much in common in their labour conditions.

All three territories, when they were first opened up, had to depend on an imported labour supply. The indigenous people of Ceylon were unwilling to renounce their independent lives as peasant proprietors, living on a subsistence economy, to work as whole-time labourers on the new coffee and later the tea and rubber plantations. There was consequently an outlet for the people in neighbouring over-populated India; and to-day the Tamils employed on estates number some 660,000. Indians have similarly migrated to Mauritius, where they number about 270,000, a figure which is nearly double the whole of the rest of the population put together. In Malaya, the percentage of Chinese in the population is about 40. Almost all the labour force in the tin mines is Chinese, whereas on the estates the Indian population heads the list with 185,000 males and 119,000 females, against 72,274 and 13,731 respectively for the Chinese and only 17,446 and 11,953 Malays. Except in Mauritius, where the Indian population has settled down and where there is a strong local pride, this dependence on migrant labour which periodically returns home has had an unsettling effect on labour conditions. But before the war the Indian population, particularly in Ceylon, was beginning to be more stabilised. There has consequently arisen in that island a danger of over-population, intensified by a natural increase in the population of about 100,500 per annum. Unemployment is serious in the towns, and the preference given by the Ceylon Government to the employment of Ceylonese rather than Indian immigrants has embittered relations with the Indian Government. Major Orde Browne considers that if the increasing population is to be maintained without a persistent depression in the standard of living, the discovery of additional agricultural resources is necessary—but when new land is cleared for cultivation a serious practical difficulty arises in the outbreaks of malaria that occur. In Malaya and Mauritius, the danger of over-population has not yet arisen. In the latter, the chief problem is how to improve the health of

a poorly-paid, under-nourished, sickly population, capable only of such a limited output of work that an increase of wages offers little promise of improved performance.

In fact, in all three territories, but particularly Mauritius and Malaya, there is an urgent need to improve the people's diet. The provision of a meal to labourers on the estates is urged where possible, but in Malaya the introduction of

cooked rations would, Major Orde Browne believes, meet with insuperable objections from the workers themselves because of social and religious prejudices. He also considers that in the past the Governments of the territories have left far too much to the estate owners in the provision of education, housing and other welfare facilities for the immigrants. This shifting of responsibility, which means that welfare becomes dependent on the market prices of rubber, palm oil, sugar and tin, has been mainly due to the pre-war principle that a colony should only spend on such things what it could afford from its own financial means. Now that this principle has been abandoned, the estate owners and mine owners should be relieved of a responsibility which ought never to have been placed upon them.

Shorter Notes

A Gallup poll taken in Canada on the subject of the Dominion's post-war status showed that 49 per cent of those questioned (most of them of British stock) would like Canada to remain in the Commonwealth, 24 per cent (mostly French Canadians) would prefer to be wholly independent and 21 per cent (mainly immigrants) would prefer adhesion to the United States. (The remaining 6 per cent were undecided). These results are much as might be expected, and they should not be regarded as alarming. More than twice as many Canadians prefer the present arrangement as would vote for either alternative.

According to a parliamentary answer, the number of papers and periodicals published in this country in foreign languages or under foreign auspices, which receive assistance from the Ministry of Information or other Government Departments to enable them to obtain paper, is 87. Eight are dailies, 2 are twice weekly, and 18 are weeklies; the rest are published fortnightly or monthly or less frequently. Their consumption of paper is at the rate of 27.4 tons per week. There are also a considerable number of other periodicals published by foreign interests without any assistance from the British Government.

Letter to the Editor

Personal Incomes

THE EDITOR OF THE ECONOMIST

SIR,—Your article in *The Economist* of May 22nd on "Personal Incomes" concludes that wage-earners have had the absolute real value of their incomes increased during the war, and that, as a consequence, the wage-earner is likely to be permanently better off, both absolutely and relatively, after the war. This may or may not turn out to be true; but so far as the evidence in the National Income White Paper is concerned, there appear to be several points on which your deductions from that evidence need qualification.

Because of EPT and heavy income-tax, business firms are at present having to withhold very large sums from distribution in order to maintain their additions to reserves; this is very clearly shown in the White Paper. The fact remains that these sums are still property incomes, even if the State does take a large part of them in taxes and if the companies keep the remainder to themselves. So far as post-war prospects are concerned, attention should be addressed to total private incomes, impersonal as well as personal.

For this purpose, transfer payments must be added to national income; public authority income from owning property, running trading services or holding National Debt must be deducted. Transfer payments include National Debt interest as well as social insurance benefits. Since a large part of the latter goes to wage-earners, as an alternative to wages when there is unemployment or sickness, it is easiest to include the whole of them along with wages. To do so involves merely an approximation of the same kind as your inclusion of the whole of National Debt interest in property incomes. The table then reads:

	PRIVATE INCOMES (£ million)		
	1938	1942	1942 in 1938 pounds
Property income, including National Debt Interest	1,774	2,751	1,897
Salaries, etc.	1,081	1,408	971
Wages, etc., and social security payments	2,065	3,677	2,536
TOTAL	4,920	7,836	5,404

On this showing "wages" have risen 22.8 per cent in value, property incomes have risen 6.9 per cent (not, as you suggest, fallen 17.6 per cent).

It is worth while asking what the 22.8 per cent increase in "wages" covers. How much of the increase is due, not to wage-earners being better off, but to there being more "wage-earners"?

Wage-earners here include all the men and women in the Forces who are not officers. A good many of them were salary-earners before the war; most likely they will return to that status after it. The fact that "salaries" have fallen by more than £100 million since 1938 does not mean that individual salary incomes have been reduced but that there are fewer of them—and correspondingly more "wage-earners." On your methods of calculating real change, salaries and wages together have risen less than 12 per cent in value.

Next, there are all the women who have gone into industry, of whose pre-war labours the national income calculations take no account, because they were unpaid. Your observations on the income distribution given by the White Paper surely go astray on this point. Your statement that well over a million persons, on balance, entered the £250-£500 group in the period 1940-41—1941-42 could only be rightly deduced from the table of the Board of Inland Revenue

ceased to recognise marriage. A man's income—for tax purposes!—may cross the £250 line not because he gets a rise to £5 a week, but because his wife starts going out to work. The table is a guide to family incomes, not to individual wealth.

Thirdly, one must take account of increased hours of work. Because of overtime rates, ten men working the normal hours of twelve are likely, in fact, to be more costly than two more men at work.

Lastly, one needs to remember that, at the present time, an abnormally large number of people are working in the engineering trades, where wages are unusually high. It remains to be seen whether after the war, when a more normal industrial structure is restored, the average level of wages will be so high.—I am, Sir, etc.,

"MANDRAGON."

[Our correspondent makes five points:—

1. What has happened in wartime will not necessarily last into peacetime. This is true. All that our article said was that the experience in this war has been similar to that of the last war, that last time the effects were "in greater or less degree" permanent, and that events would very probably follow the same course.

2. If the gross profits of companies are aggregated with personal incomes, total property incomes can be shown to have increased in purchasing value—though, even so, less than wage incomes. But it is surely improper to aggregate excess profits with personal incomes, when it has been agreed policy for three years past that they are not to be allowed

to accrue to the benefit of persons. EPT—as is shown by its being levied at 100 per cent—is not so much taxation of certain sorts of personal incomes as a device to prevent one part of the national income-flow from ever accruing to the benefit of persons. (The post-war refund is a concession to the impossibility of achieving perfect equity in definition.)

3. The increase in labour incomes is partly because wage-earners and their wives are working harder. Granted. Nothing in the article was in conflict with this. And it is also true of salaried persons, the total of whose incomes has fallen.

4. The fall in the total of salaries may be due to there being fewer of them. True, it may be—though it would be very difficult to reconcile any such trend with the increase in the number of incomes in the salary ranges. But the article nowhere said or implied that the individual salary-earner had lost in purchasing power. What it said was that "virtually all those with incomes over £500 have lost." Our correspondent can hardly dispute that.

5. In saying that "280,000 persons crossed the £500 line," we should have said "280,000 persons or married couples." This is correct; the word "persons" was inaccurate. But our correspondent is not right in saying that "the table is a guide to family incomes." His word "family" is just as inaccurate as our word "person."

Why should people like our correspondent be so anxious to deny the manifest fact that the war has improved the relative position—and probably the absolute position—of the wage-earners? Are they ashamed of it? *The Economist* is not.—EDITOR.]

AMERICAN SURVEY

Opportunity and Jobs

(From Our Washington Correspondent)

THE word "plan" is getting around these days. For the better part of the 1930s the word had only two uses. It was uttered with millennial fervour by bright young proponents of a planned society; and it was flung back in their teeth by citizens who regarded planners as the slide rule fringe. (There is probably some truth in the allegation that under another name the National Resources Planning Board might have escaped its annual annihilation by Congress.)

The present company that the word is keeping shows as well as any single sign the change of mood between the 1930s and the 1940s. Mr Eric Johnston, President of the Chamber of Commerce of the United States, in his annual report made at the end of April, said:

There was a time, not so long ago, when we uttered the word "capitalism" softly and apologetically, and there are still a few who search in the dictionary for euphemisms and evasions. But I believe capitalism has no need of mealy-mouthed apologies. Despite all of its faults, all of its frailties and all of its failures, it glows with the colours of perfection when compared with the other two systems. Our system of private enterprise has lived through crises—and emerged with new vitality.

(The word that this newly confident capitalism is searching the dictionary to paraphrase is "plan," for the process it signifies is in wide use by capitalists.) Mr Johnston continued:

The new capitalism, as I prefer to call it, is shedding the last traces of its nostalgic memory of unbridled individualism. It acknowledges that the severe economic and social dislocations accompanying war and depression during the last quarter of a century have caused Government to assume responsibilities which necessarily tend to burden and hamper the capitalistic mechanism. Such new functions as are justified in the public interest will require an extra effort by private enterprise. It has a right to insist that so far as possible the Government limit itself to formulating the rules of the game and supervising their enforcement. More than that, it insists that the rules be so devised that they stimulate rather than suppress the immense motive power of individual initiative and ambition.

Most of the institutions which American business is creating to examine what sort of bridles individualism will henceforth need for its direction carry names which have a reassuringly pre-1930 sound: witness the Committee for Economic Development, formed at the end of 1942 to survey

post-war possibilities; Mr Johnston's very speech was entitled: "America Unlimited." But under this protective colouring, new projects are afoot; planning is going ahead.

In proposing new scope for private enterprise in the post-war future, business is showing itself aware of the difference between the general possibility of individual advancement which businessmen have historically meant by "opportunity" and the specific means of attaining security which people of the depression decade had in mind when talking about "jobs." Having witnessed the political attraction of an Administration which placed the provision of security high on its agenda, business is accepting first-hand responsibility for a reasonably full measure of post-war employment. The Committee for Economic Development is forwarding a plant-by-plant survey of possibilities. Under a structure which is regionally devolved, and starting from some test communities (Peoria, Illinois, is one) the Committee proposes to find out what business—and that means specific businesses—thinks it is going to do when war production is over, and how many people it will be in a position to hire to provide the manpower to do it.

Such assumption of overall responsibility contrasts sharply with the very particularised responsibility felt by businessmen at the onset of the depression, responsibility to the stockholders of the firm of their concern. Men who then voted retrenchment as the only course consistent with the protection of the interests with which they dealt were in many cases fully conscious that what they did aggravated the necessity for their doing it; but they did not deduce from this knowledge any necessity for action. The people who were fired took action at the polls.

From then until production of war material, beginning in 1940, revived enthusiasm, the mass of American citizens looked sourly upon the economic process. A decade which longed above all else for security shied from the idea of risk inseparable from capitalist development, and felt a moral discomfort at profits which seemed, more likely than not, to represent someone else's expense.

Work relief, public works, social security were the alternative interests of the time, with trade union organisation following when there was enough economic activity to organise. These interests, however, were never integrated with the country's pre-depression interest in production.

The rift between business and the Administration, with its bilateral bitterness, prevented that. The fact that emergence from the depression, though started by public assumption of responsibility for some measure of security, was completed only by war orders has left a sense of dubiousness, not only about the past, but about the future.

The fact of the war orders, however, has forced a business-and-government relationship in the course of which executives on both sides have discovered that their jobs are not interchangeable, that there are special skills associated with each. The fact of war orders, the spurt in production and most of all the spurt in invention, has also given business the confidence, and the economic base, on which to look ahead with some largeness of view.

Many businessmen are now recognising that if public action to arrest a slump is taken very shortly after the slump begins, the proportion of publicly managed economic activity to the total economic activity of the country will be relatively small; if such action is deferred until the wheels of private activity are practically ceased to go round, Government will be the dominant feature in the situation, and political cries for ham and eggs will be inevitable. In such a mood, business's best means to prevent Government dominance appears to be prevention of the kind of situation in which it is inescapable: prevention through the provision of jobs under private auspices.

In this connection business attitudes toward social security programmes are undergoing revision. The report on "The Domestic Economy" issued as a supplement to the December *Fortune* summarises this trend:

We propose that the Government should underwrite permanent prosperity: that it be established Government policy, whether Republican or Democratic, to maintain reasonably full employment in the US . . .

The first and most important step is for the Government to see to it that private industry, which produces the vast bulk of goods and services and employs the vast bulk of the working population, has every chance to operate at capacity and to invest as much of the nation's savings as it can absorb. Hitherto the Government, in its economic policy, has tended to consider itself an impartial umpire among individual Economic Men. This rôle is obsolete. . . .

The second way to implement a full-production policy is to increase individual security by direct means. These means are chiefly a greatly extended system of unemployment insurance, old-age pensions, and other forms of social security. They include a great deal more Government responsibility for public health, housing, and nutrition, as well as more and better schools. . . .

Fortunately such a social-security programme is also a definite aid to full employment. For it maintains consumer income, and hence effective demand. It sets a certain minimum standard of purchasing power on which industry can count in measuring the overall size of its market.

Under a system in which the fear of insecurity had been removed by such substantial measures as those here listed, an atmosphere favourable to risk and profit-taking in the large part of the economy not concerned with the provision of social services might foreseeably be regained. A society assured of a basic minimum might enthusiastically encourage experiment in the application of the wealth of wartime scientific discoveries of whose unannounced existence every one is aware. (The dream of a new car, looking like a plastic bubble, and with the engine withdrawn from its position

of substituting for a horse and placed in its proper location over the rear axle, has become so fascinating to a nation riding on thin rubber that Mr Sloan of General Motors has just felt moved to prick the bubble by announcement of the probable similarity, in the interest of quick reconversion, between the 1942 models and the models of the first post-war year.)

Acceptance by both business and the people at large of a post-war economy defined as partly an economy of risk, initiative, and invention, spark-plugged by profit, and partly an economy of guaranteed minima, undergirded by public action, might dispel the underconfidence which currently causes many Americans to be troubled about their country's mood. Business's current feeling around for such a formula is reflected in the lead paragraphs of an article on "Post-war Manpower and its Capacity to Produce" in the US Department of Commerce's April *Survey of Current Business*:

The desired goal for the domestic economy after the war might be described in several different ways. The businessman might well insist, for example, that it should be an economy of opportunity as well as of abundance; that it should provide for security, but in such a way as to strengthen incentives to individual initiative and expand opportunities for business enterprise. Other desirable characteristics might be included.

It is fundamental, however, that none of these things is possible unless productive jobs can be provided for the vast majority of those seeking employment; and, that in providing these jobs, the volume of production could go far above any pre-war level.

American Notes

Week of the Long Knives

The long-awaited Congressional revolt on the home front has begun. In the House, growing disaffection on the part of the Southern Democrats led many of them to join with the Republicans in a series of slashing attacks on Administration Agencies, whose appropriations were up for passage. The Bureau of Economic Warfare scraped through with only 15 votes to spare, but the Office of Price Administration and the Office of War Information were less lucky. The National Resources Planning Board fared worst of all, receiving notice to wind up its affairs. In addition to cutting the ordinary appropriation for the OPA, a rider was attached in the House to the Independent Offices Bill specifically prohibiting the payment of subsidies to keep down the cost of living, a step which will probably block plans already well advanced for "rolling back" butter, meat, and coffee prices. In an even greater display of finality, the NRPB was allotted \$50,000 to liquidate itself—all its records and files to be delivered to the Archives, in order to prevent any transfer of its functions to another agency. Yet another major operation was performed on the Office of War Information when the House, by a vote of 218 to 114, voted to eliminate funds for its entire domestic branch. The motion was put forward by Mr Starnes, of Alabama, who declared "America needs no Goebbels or Gayda in Washington." The vote to cut an already reduced appropriation nearly in half was carried by 160 Republicans, 55 Democrats, and 3 minor party

representatives. The boiling up of hostility against the OWI appears to have been touched off by several incidents. One was Mr. Elmer Davis's injudicious attack on the coverage of Washington news, and even more damaging still was Southern hostility to an OWI release on the negro question. Underlying these surface manifestations, however, is the bitter hatred of the President, the Administration, and what is sneeringly called "New Dealitis." It is, of course, hardly possible to run an American information service without reference to the President of the United States; but this, apparently, is what the critics would like. The nightmare vision of a vast Government agency busily turning out propaganda for a fourth term has a firm grip on some less disciplined imaginations. Mr. Davis has threatened to resign, and indeed it is difficult to see how the foreign branch of OWI could function without the domestic, which acts as a feeder and collector of information. It is possible that the Senate may modify some of this "legislation by hysteria," as the *Herald Tribune* has called it. There has been a substantial rallying of forces to defend both OWI and OPA.

Out Again, In Again

The third coal stoppage in seven weeks is over. The United Mine Workers' policy committee has ordered the miners to return to work until October 31, provided that the Government remains in control of the mines. There is no statement about any agreement reached between Mr. Lewis and Mr. Ickes other than the assurance that minimum wages and conditions already prevailing will continue; but it is significant that Mr. Lewis's statement included a strong hint that the miners now expect the Government to treat them well. Mr. Lewis appears to have attained at least two of his ends. He has succeeded in retaining Government control of the mines, and he has snubbed the War Labour Board with impressive finality. Last week the War Labour Board issued a directive rejecting the union's demand for "portal-to-portal" pay and ordering an extension for two years of the wage provisions of the old contract, with a new clause outlawing strikes for the duration of the war. This was only a majority decision, with the four labour members of the board opposed; but having issued the directive, the Board unanimously requested President Roosevelt to use all his powers to enforce it. While any wage adjustment which may be determined between Mr. Lewis and Mr. Ickes may, of course, be submitted to the Board, it looks as though the Board's evocation of authority had been addressed to thin air. The settlement of the strike will, to some extent, reduce the pressure on the President to allow the anti-strike Bill to become law, although he still has an almost intolerably difficult decision to make. The Bill specifies conditions under which strikes might be permitted—the secret ballot and 30-day cooling-off period. This, actually, is widely regarded as a retreat from the general anti-strike pledge, to which the national leaders were committed, for if local ballots are to be taken, evidently much of their authority will be transferred to less responsible local leaders. According to labour groups, on the other hand, the bill is so drawn that it might re-establish the old doctrine of conspiracy, and impose criminal penalties on quite innocent people who spoke at union meetings.

Ceiling Plus

Mr. Prentiss Brown, the Price Administrator, did some plain speaking last week. He admitted frankly that prices have broken through the ceilings, and that a recent survey showed that food prices on the average were running 5 per cent above the ceilings. This condition, he said, was brought about by gaps in the controls: the failure to absorb surplus purchasing power; the inability to stabilise wages before October of this year; inadequate powers over farm prices; and inadequate use of subsidies to absorb higher costs of production. The pressure on prices forced the Office of Price Administration continually to rewrite its regulations, "with growing complexity and unworkability." This week has seen the closing of most meat packing and slaughtering establishments in Cincinnati, because the packers contend they are forced to sell at prices lower than those they pay. But it is not only the inability to hold down prices which continues to blacken the name of OPA, often quite unfairly. There have been severe shortages and muddles in the distribution of rationed foods. The fact that coupons for meat and fats were interchangeable has made it almost impossible for the trade to estimate the demand for each, with resulting

spoilage and waste. There are local shortages of meat and even potatoes, owing to transport difficulties and man-power shortages. War production centres still appear to be supplied on the basis of their pre-war populations. But although OPA's techniques have been imperfect, its major troubles are due to the sharing of its powers with other Government agencies, principally the Department of Agriculture, and to its inadequate funds. Provision for policing the new "dollars-and-cents" price ceilings appears to be pathetically small. And the political atmosphere is tending, not to increase OPA's powers and funds, but to do the exact opposite. The anti-subsidy drive is gaining ground. There is now a campaign on the part of the farm bloc and the conservative press to deprive OPA entirely of its control over food rationing and prices. There is an obvious case for centralisation of authority; but that the interests of the community—apart from the farmers—would be served by transferring control from OPA seems unlikely. Meanwhile, the mention of new rationing programmes "in the mill" has let loose another buying spree, hastening the day of restrictions and making it certain that the ration—when it is established—will appear niggardly. Every day brings the whole technique of rationing and price control into greater disrepute, and with them the prestige of Government.

Riot in Detroit

This week's race riot in Detroit makes ugly reading, particularly as it follows so quickly on the heels of the disturbances in Los Angeles. Detroit is alive with rumours, and until there is a Federal investigation it will be impossible to apportion the responsibility for the outbreak. According to some stories, the negroes were inflamed by stories of the murder of a negro woman and negro children. Another source finds the origin in a single tussle between a white man and a negro. Whatever the original incident, the results were appalling. At least twenty-five negroes and three whites are dead, hundreds are in hospital, hundreds more are in jail, houses in Paradise Valley, the negro quarter, were fired; there was sniping, looting and at least one scene of open warfare. Order was not restored without an extraordinary proclamation from President Roosevelt calling upon all persons engaged in "unlawful and insurrectionary" proceedings to disperse; the introduction of soldiers; and the imposition of modified martial law. War production has been disorganised by the very natural reluctance of negro workers to leave the protection of their homes. This is not the first indication of the existence of racial tension in Detroit. There were riots last year over the presence of negroes in a Government housing project. But it is alarming to find how quickly the violence usually associated only with race relations in the South has followed the migration of both negro and white workers to northern centres of war production. It is even more disquieting to see how well race rumours withstand transplanting. Among the wilder stories current in Detroit was one to the effect that negro reinforcements were marching on the city from Chicago. This is of a piece with the rumours which have swept the Southern States from time to time, and Federal investigators will have the job of determining whether these were deliberately put about, and, if so, whether by the Ku-Klux-Klan, enemy agents or some of the still existent Fascist-minded groups. It should not be imagined that this was an entirely unprovoked attack. The negro press, particularly in Chicago and Detroit, has often been provocative and unwise in its leadership, particularly in view of the tension in a city with large foreign groups and difficult living conditions like Detroit.

Shorter Notes

Total Lend-Lease aid in May amounted to \$790 millions, compared with \$783 millions in April. Figures for goods actually exported in May are not yet available, but April's exports reached the record figure of \$839 millions, presumably due to accumulation of goods transferred in earlier months for which shipping facilities were not then available. Mr. Stettinius pointed out that the exports to the USSR have now reached \$2,123 millions, 26 per cent of all Lend-Lease exports, despite the fact that she did not begin to receive aid until the latter part of 1941.

THE WORLD OVERSEAS

Canada's Mutual Aid Plan

(From Our Ottawa Correspondent)

May 24th

THE essential meaning of the Mutual Aid plan approved by the Canadian Parliament rests upon a distinction drawn between it and the United Kingdom Financing Act, 1942, to which it serves as successor. The former Act, as Mr. Ilsley stated, was a gift of money to the British Government, from which Canadian goods were bought. The Mutual Aid plan is a contribution of goods, specifically war supplies, in return for which Canada will require whatever reciprocal arrangements are practical. The Canadian Act was modelled on the US Lend-Lease legislation. A declaration of policy, found in the preamble of the Mutual Aid Act, said:

It is essential to the defence and security of Canada and to the cause of world freedom that Canada should make the utmost contribution to the victory of the United Nations; and it is necessary that the products of Canadian war industry be made available not only for use by Canadian forces, but also to other United Nations, in accordance with strategic needs, in such manner as to contribute most effectively to the winning of the war; and it is expedient that the conditions upon which Canadian war supplies are made available to other United Nations should not be such as to burden post-war commerce or lead to the imposition of trade restrictions or otherwise prejudice a just and enduring peace.

The intent of the Canadian plan, therefore, is familiar already within the terms of reciprocity in war commerce based on Lend-Lease. A series of agreements will flow from it, and they may become, as President Roosevelt said of the US Lend-Lease agreements, "key instruments of national policy, the first of our concrete steps in the direction of affirmative post-war reconstruction." But a realistic appraisal of Canadian mutual aid policy does not, at present, lead to any conclusions of this kind. Mr. Ilsley was emphatic on this point when questioned in Parliament. "To the specific question," he said, "whether we are fitting this measure into the Lend-Lease Acts of other countries, I say no." He declared that the legislation contained no power to enter into a trade treaty, as some critics suggested, behind the back of Parliament. The effect of reciprocal agreements entered into by Canada, in furnishing mutual aid to other United Nations, will be limited to the post-war usefulness of any supplies and equipment furnished.

The Mutual Aid plan is a logical development of earlier arrangements, notably the gift to Britain of \$1,000 million in 1942. The extent to which Canadian goods received distribution, under that arrangement, to other nations within the sterling area, received considerable attention in debate. Speaking of Canadian goods provided, through Britain, to other British Dominions, India, the British colonial empire, certain Middle Eastern areas, and Russia, Mr. Ilsley made two points: (1) that Canada now proposed to deal directly with these countries; and (2) that Canada felt that the Canadian source of this assistance should be clear to the countries receiving it.

A difficulty in presenting a precise accounting to the Canadian Parliament of the billion dollar gift of 1942 arose over the fact that it represented only part of British imports of goods and services during the period. The gift period extended from April 1 to December 30, 1942, and in that time sterling area payments in Canada amounted to \$1,440 million, of which, therefore, Canada supplied 71 per cent of the funds required. In response to demands, Mr. Ilsley made an arbitrary allocation of this amount, as follows:

(Millions of Dollars)	
A.—PORTION ATTRIBUTED ARBITRARILY TO CANADIAN GIFT	
I.—Munitions of War	
Aircraft and parts	31
Armoured vehicles and transport	343
Chemicals and explosives	32
Guns and small arms	50
Shells and ammunition	179
Other, including naval and other vessels, instruments, etc.	54
	689
II.—Foodstuffs and Raw Materials	
Wheat	87
Bacon and pork products	75
Lumber	28
Cheese	20
Base metals (in part)	101
	311
	1,000
(Of this total, supplies valued at \$61 million were known to have been transferred to Russia, including tanks and armoured vehicles, \$49 million; shells and ammunition, \$3 million; and base metals, \$9 million; and mechanical transport valued at \$71 million to Australia, New Zealand and other parts of the sterling area.)	
B.—PORTION ATTRIBUTED ARBITRARILY TO OTHER SOURCES OF FINANCING	
I.—Commodity Exports	
(a) To United Kingdom:—	
Foodstuffs	60
Base metals	19
Wood products	29
Other	32
	140
(b) Other sterling area	79
	219
II.—Services, etc.	
Freight	70
War services (incl. air training)	91
Interest and dividends	9
Capital for munitions	28
Other capital	11
Miscellaneous	12
	221
	440

This is the best accounting so far given in Canada of the billion dollar gift of 1942. It covered a period of nine months, now seen as a transition phase in which an abnormal deficit of Canadian dollars was incurred by the sterling area. It was a phase in which armed forces in the sterling area were being equipped with Canadian arms. The organisation of 35 RCAF squadrons in Britain, primarily by drawing Canadian airmen from the RAF and placing them on the Canadian pay-roll, is one factor that will reduce future deficits. Canadian expenditures on other Canadian forces in the sterling area will undoubtedly increase steadily. But where any such deficit arises in future it will be taken care of under the Mutual Aid plan.

Freed Tunisia

[BY A CORRESPONDENT]

THE Allied authorities in Tunisia and the French administration there are confronted with problems made familiar by experience in the other North African possessions of France. Economically, Tunisia, like Algeria, was dependent on normal trade relations with metropolitan France. The following table shows the main items of Tunisia's agricultural and mineral output before the war:

	(In metric tons)	Production	Exports
Wheat	480,000		68,400
Barley	200,000		34,000
Oats	28,500		11,800
Olive oil.....	50,000		18,800
Wine (hectolitres) ..	1,500,000		960,000
Iron ore	950,000		950,000
Rock phosphates ...	1,800,000		1,900,000

Thus, the main items in the export trade were phosphates, iron ore, wine, wheat and olive oil. The chief imports were engines and boilers, cotton goods, raw and refined sugar, motor-cars and cycles, and so on. Like the other French possessions, Tunisia, too, suffered under the one-way traffic imposed by Vichy. Its stocks of grain and wine were exported in increased quantities, whereas the usual imports of textiles, fuel and sugar fell off almost completely. The shortages of foodstuffs have been made even more acute by the prolonged fighting of recent months. The devastation due to hostilities has not yet been fully measured; but a semi-official statement says that the railway network has not been excessively damaged; only two large rail constructions have been put out of order. It has also been claimed at Algiers that the industrial establishments of the country will soon be able to resume work. It is estimated that only about 20 per cent of the industrial capacity has been destroyed through hostilities. Harbour installations have suffered the main damage.

Tunisia's economy has to cope with a labour shortage. The mobilisation orders, which were issued immediately after the liberation of Tunisia from the Axis, affect almost the whole French male population of military age. It is, however, hoped that the bottleneck will be overcome to some extent by using the labour of Axis prisoners of war on the spot. The French Army alone has taken 40,000 German prisoners. It has been stated that they will be employed in labour camps under conditions identical with those imposed on the French prisoners of war in German camps. Their first job is to repair the damage done by the retreating Axis forces, to build roads and so on. The French farmers, however, are apparently anxious to get the prisoners transferred to work on the land to enable the farms to make good the arrears in this year's work.

Speedy relief has been necessary to help the population to recover from the recent shortages. Allied supplies of oil have been made available to farmers. Meat and milk have been distributed. In Tunis the daily bread ration has been increased from 250 to 500 grammes. It is, however, only natural that the food position will remain difficult for some time to come, possibly until the new harvest and the vegetable resources of the Cap Bon area alleviate the shortages. The inflation of prices is another sore point. It is hoped that the extension of the North African currency regulations, together with the organisation and control of supplies, will help to restore conditions to normal.

In the political field, Tunisia has many problems in common with the rest of French North Africa, but it has its own peculiar features as well. The *Révolution Nationale* left a burdensome legacy. The *Légion des Combattants* and the *Service d'Ordre Légionnaire* were organised under the armistice regime into a fairly wide network. The SOL colla-

borated with the Axis and severely persecuted all those suspected of Gaullist and pro-Allied sympathies. The *Légion des Combattants* attempted to harness a section of the Arab nationalists to the policy of collaboration, and 12,000 Moslems were enlisted in its ranks. At present, the ban on the *Légion* issued by General Giraud has been applied to its Tunisian branches, and, immediately on the entry of Allied forces into Tunis and Bizerta, the Frenchmen who had previously been persecuted for their "disloyalty" spontaneously took revenge on the leaders of the SOL and their agents. A court martial under General Giraud's authority passed death sentences on five leading French collaborationists, who had, however, escaped to France, together with the former Resident-General, Admiral Esteva.

Tunisia has for long been reputed to be the centre of the strongest Arab nationalist movement in the French Empire. The nationalist camp has been split into two factions, the old Destour—the conservative wing—and the new Destour in which leftist, radical and fascist tendencies were strangely intermingled. Some sections of the Arab nationalists allowed themselves to be used as tools of the Axis. One of the Destour leaders, Habeeb Rukebah, who had been imprisoned in Marseilles, was released by the Germans about the time of the Allied landing in North Africa. Together with a group of his supporters, he went from Marseilles to Rome, where he was ostentatiously welcomed. From Rome he was reported to have returned to Tunisia. Little has been heard about the activities of his group since then. But it is quite clear that the administration in Tunisia is now confronted with the delicate task of sifting the various Arab elements, among whom there are many who have not been involved with the Axis. The deposition of the old Bey of Tunisia and the enthronement of the new Bey, Sidi Al Amin Pasha, has been a move in that direction. The deposed Bey was generally regarded as the real leader of the "old" wing of the Destour. The new Bey has kept aloof from politics, and has not been entangled in Axis activities.

The Italian population is another complicated problem. The number of Italians is only slightly less than that of the French, amounting to about 95,000. Many Italians in Tunisia supported Fascism, but large sections of the local Italian population are definitely anti-Fascist. Some of them left their country for political reasons, and most were poor peasants from Sicily and Sardinia who migrated in search of employment. Judged by the statements made so far, the administration has taken a cautious line with regard to the Italian colony, avoiding any wholesale reprisals. The Italians have been given an assurance that they will not be deported, although the Italians themselves, in their day-dreams about the conquest of Tunisia, threatened all French nationals with deportation. Instead, the Italians have been warned that the next six months will be a period of test and trial. During that time the authorities will watch their behaviour very closely, and all Italians who do not indulge in hostile political or other activities will be left unmolested.

The reorganisation of the French administration is only just beginning. General Giraud has nominated General Maste as the Resident-General in place of Admiral Esteva. The general legislative measures taken in the rest of French North Africa are gradually coming into force in Tunisia. In official documents *l'Etat Français* has been replaced by *La République*. The elected Assemblies are to be revived, and the ban on "secret organisations" has been lifted.

Blockaded China

[BY A CORRESPONDENT]

BLOCKADED by the Japanese from the north, east, south and south-west, Free China's supply problems have become exceedingly difficult. The only open land route to the outside world, the north-west highway to Soviet Russia, leads to a country which is itself involved in a life and death struggle. Moreover, this highway, like the air services from India, has but a limited carrying capacity, and even under more favourable conditions could supply only a small fraction of China's requirements of essential military and civilian goods. The fullest possible use of its own resources has thus become more vital than ever for Free China. Recently, a national production conference, convened by China's National General Mobilisation Council, was held at Chungking to work out the details of a programme for accelerating and extending the country's war production. The conference was attended by 270 dele-

gates, representing the Central and Provincial Governments as well as agriculture, mining and industry. The opening session was addressed by Generalissimo Chiang Kai-shek and the Minister of Finance, Dr H. H. Kung, who both stressed the urgency of the task before the conference. No fewer than 400 proposals have been submitted by the delegates for discussion, and many of them resulted in tangible recommendations. This conference was preceded last month by China's first industrial reconstruction and planning conference, which met at Chungking for ten days and worked out a five-year plan for the readjustment of China's industrial production.

Meanwhile, the Chinese Government has not awaited the outcome of the conferences to secure a speed-up in war production. As was pointed out in *The Economist* of October 17, 1942 (page 483), the industry of Free China can be divided into three groups—the heavy industries developed and controlled through the National Resources Commission; the industrial co-operatives; and the private factories. The industries under the control of the National Resources Commission, which in the main comprise the mines, the metal refining industries, including iron and steel, and the electrical power plants, have for some years been primarily directed by war needs. Their output has been consistently expanded and improved, and is conducted on modern lines. In the co-operatives and private factories, mobilisation for war has so far been less advanced, although most of them are supplying a large part of their output to the armies and for essential civilian needs. Great variations in the size of these factories and in their equipment have rendered full mobilisation difficult; but the growing supply difficulties after the closing of the Burma Road have recently forced the Government to adapt every industrial plant and workshop in the country to war and essential civilian production.

This task is being carried out by the Industry and Mining Adjustment Commission of the Ministry of Economic Affairs. The encouragement of private enterprise continues to be a basic principle of China's industrial policy, but the war has necessarily led to increased Government interference with private management. This is felt in four ways. First, small industrial units are, wherever possible, amalgamated into larger units. Secondly, production is more strictly controlled to assure that materials, machines and labour are not wasted on the manufacture of unessential products. Thirdly, an attempt is made to improve the standard of the work and the equipment of the factories, and to adjust the location of the factories to the supply of materials, labour and transport.

In the industrial co-operative movement, the progress so far achieved in these directions appears to be greater than in the private factories, as the Central Co-operative has for years done useful work in industrial and administrative research as well as in the training of labour. For the private factories, a central organisation did not exist, but, as a direct result of last month's reconstruction and planning conference, a Chinese Industrial Federation was recently formed to extend private planning and research in industry.

As a result of the work of the National Resources Commission in improving the quantity and quality of raw materials, a great part of the requirements of the factories is being met. Only supplies of high-grade steel and liquid fuels are very difficult. Supplies of machinery are still a big problem, although the National Resources Commission and some co-operative and private works are to-day producing a surprisingly large variety of machines and machine tools. The most serious handicap in China's war production, however, is the shortage of skilled labour. To-day, the number of fully trained technicians and engineers in Free China is fewer than 15,000, while semi-skilled workers, of whom only a small percentage could act as foremen, number fewer than 200,000. The Government and the industrial co-operatives are devoting much energy to the training of labour, but this process is necessarily difficult and slow. In order to assure the maximum employment of the labour force, therefore, the Central Government recently issued an essential work order, under which all workers employed in factories and mines, whether public or private, must register with their respective authorities. Workers are not allowed to leave their place of employment without the permission of the authorities, while employers cannot dismiss workers unless they violate the Government's employment regulations.

Though this new order is likely to reduce the labour turnover in China's industries and the unnecessary waste of man hours, it cannot increase the supply of skilled labour, which is essential if a fuller use of China's vast natural resources is to be made.

Splitting the mighty atom

It is recognised now that coal is a means to an end—or rather to many ends. Not merely something to burn for its heat, but a source of numerous valuable substances that will be the basis of Britain's post-war prosperity.

The carbonising industries point the way to this modern treatment of coal. The process of gas-making splits up the coal into many different parts and extracts every ounce of value from it. Every 100 tons of coal used in the gas works produce 7,500 therms of gas, 50 tons of coke, 1,000 gallons of tar, 250 gallons of benzole, 2,500 lbs. of sulphate of ammonia and 300 lbs. of toluene. And the Gas Industry carbonises over 18 million tons of coal annually.

These valuable by-products of gas-making in turn yield over 2,000 chemical substances of tremendous value. Among them are explosives; drugs such as M & B 693, novocaine, acriflavine and aspirin; sulphuric acid for electric batteries; food flavourings; baking powder and saccharine; camouflage paints; agricultural fertilisers; aviation spirit; and the chemicals from which plastics are made for use in a hundred and one ways from the ubiquitous ashtray to the essential fittings of our fighter aeroplanes.

The Gas Industry in war, as in peace, plays an important part in the national economy.

BRITISH COMMERCIAL GAS ASSOCIATION · LONDON · S.W.1

THE BUSINESS WORLD

Coal Production

DURING the nine months that have passed since coal was last debated in Parliament, output has steadily declined and is now well below the national target figure of 4,161,800 tons a week. In Wednesday's debate, many reasons were advanced for the present state of affairs, all of which contained some truth, but not the whole truth. The situation is one of peculiar complexity in an industry about which the Samuel Commission wrote in 1925 that "the only generalisation that is safe, is that no generalisation is possible." No single factor can be held responsible, and no uniform solution can be applied to the industry as a whole.

In its White Paper last June, the Government stated that output would be increased by (a) enlarging the manpower and (b) raising the output per man employed. Various steps have been taken to deal with the decline in manpower, which is the root of the trouble. The foolish policy pursued after Dunkirk of allowing large numbers of men to leave the industry has been reversed, and in the last two years about 58,000 men have returned from other industries and the Forces; last year's wastage of 25,000 has been reduced to 19,600 and, if optants are included, to 17,000.

But in the words of the Select Committee on National Expenditure (8th report, May, 1943): "The country faces the certainty that by the end of this year the number of men engaged in the industry will be smaller than at the present time." Moreover, the quality of the labour has not been maintained and the proportion of productive to surface workers has remained too low. Considerable attention has been paid to the question of attracting young workers to mining, but the plain truth is that colliers are reluctant to send their sons to the pits, to what they are coming to regard as a 20th-century form of slavery. The eminently constructive proposals of the Forster Committee on the training and advancement of juveniles bear on the long-term, rather than on the immediate, problem though their latest recommendation for a national minimum wage rate for juveniles might have a directly beneficial effect on recruitment. The net result is a steadily ageing labour force. Out of a total of 708,000 miners, over a fifth are over 50. This fact has undoubtedly contributed towards the present dilemma, though it is hardly enough by itself to account for the decline in output during the past year.

The second part of the Government's scheme was to raise output by increasing the efficiency of the industry. Productivity has slightly risen; output per man shift is 1.045 tons as against 1.036 tons last year. The Government's policy included the concentration of available men and machinery on the more productive pits and the extension of mechanisation. But little has been heard about the results of concentration, regarded by the Government a year ago as "the most direct means of securing an early increase" in output. Such a programme obviously takes time to put into operation and goes against the natural inclinations of both owners and miners in this highly individualistic and conservative industry; but it should have been bearing fruit by now. Transfers from one area to another raise acute housing and transport difficulties, but concentration within a district or pit presents fewer obstacles. Progress in concentration largely depends upon the geographical and social conditions in a particular area, but also upon the energy and forcefulness of the Regional Controller. The Minister announced that 50 schemes have been put into operation and over 40 pits concentrated internally, but it is impossible to regard this rate of progress as satisfactory.

There has also been regrettably little evidence of the extension of mechanisation. Deliveries appear to have been slow and the long-awaited American power loaders are not expected to be generally in operation before the autumn. In Britain as a whole, coal-getting is far less mechanised than in other coal-producing countries (55 per cent as compared with about 98 per cent in the Ruhr and Belgium and 80

per cent in the United States), though there are wide variations between individual coal fields. In North Staffordshire the proportion of coal mechanically cut and conveyed was 92 per cent and 91 per cent respectively in 1938, as against 26 per cent and 45 per cent in South Wales. While it is true that some pits do not lend themselves to mechanical cutting and conveying there is clearly room for increased mechanisation in the backward districts.

The Select Committee reached the conclusion that a reduction in voluntary absenteeism was the most fruitful line of approach. The rate of voluntary absenteeism is high at week-ends and after holidays, when it may amount to 30 or 40 per cent, and if all miners worked their full time on Mondays production might be appreciably increased. Major Lloyd George has repeatedly claimed that absenteeism is no higher in coal mining than in other industries, but comparisons are difficult, owing to the absence of comparable records. In the debate he stated that out of a rate of absenteeism of 11 per cent, only 44 was avoidable, but its elimination would still yield another 4,000,000 tons a year. The worst offenders in the mines are among the young men in the 18-25 age group, which includes many coal-getters, and they are also the worst in the matter of indiscipline. This minority is in danger of bringing the whole of the mining labour force into disrepute, and speedier and more direct measures to deal with offenders are obviously necessary. In some areas, arrangements are being made (after agreement with the union) for the Regional Investigation Officer, with an assessor from each side, to impose a fine of £1 on the spot, the money to be refunded if the offender makes good. It is too early to judge the results of this procedure, but it seems fair.

Last June, the pit production committees were relieved of all responsibility for dealing with absenteeism and instructed to concentrate on production matters proper. It is not easy to estimate the positive effects of the committees, as they are now constituted. Where they function smoothly and co-operation is good, they have undoubtedly been beneficial, and Major Lloyd George stressed the relationship between good output and good committees. In good committees, output figures, the supplies and manpower positions are freely and frankly discussed week by week, and many have started production bulletins and notice boards; the men's suggestions for improving production are welcomed, and arrangements made for regular meetings between different groups of workers, the committee, and the colliery officials. But in many committees there is a lack of contact between the men's representatives and the productive workers, and the former, if they do their job properly, tend to be regarded as "bosses' men," while less far-seeing managements resent the intrusion of the miners into their province. The adoption of a pit bonus scheme, in place of the present district scheme, would probably facilitate the work of the committees and provide greater incentive for production. There are many specific grievances among the men, which the committee may or may not discuss, the most prevalent complaint being lack of food. Miners are entitled to extra cheese, and some can supplement their rations at the colliery canteen—full meals service will soon cover 61 per cent of the collieries. Unfortunately, only about a third of the men use the canteens, partly due to conservatism, partly to domestic and transport difficulties, and, in some places, to the absence of a pithead bath, since the miners do not want to go straight to a meal when they come off duty. The validity of the miners' case for adequate nourishment will not be disputed, and there is a strong case for extending and popularising canteens and for increasing the degree of differential rationing. Other grievances, which are more or less common to all industrial workers—such as income-tax, workmen's compensation, clothing rations, fire-watching and general fatigue—seem to be more pronounced among miners.

It is difficult to secure the necessary conditions for co-operation, which is essential not only for the working of pit

committees but for the improvement of production generally. The history of the industry during the past 25 years has left an indelible impression. Miners feel that they are being asked for "blood, toil, tears and sweat" today, in their difficult and dangerous occupation, whereas yesterday they were the "forgotten men" of industry. The establishment of a national minimum wage and national wages and conciliation machinery is perhaps the greatest advance yet achieved in the history of the industry and the most hopeful for the future. On the management side, there is criticism that the Essential Work Order has relaxed authority and discipline, and many managements resent the imposition of wartime control. Both managements and miners are uncertain and worried about the future outlook for the industry.

Not very far in the background lies the great issue of nationalisation. In a context, not of the immediate needs of wartime, but of the larger future, the case for some drastic and thorough reorganisation of the industry, under the initiative of the state and probably with public ownership, is overwhelming. It is 24 years since Lord Sankey recommended that "the principle of state ownership of the coal mines be accepted," and there is every indication that this view would now command the support of a large majority of the country. The owners were given their opportunity after 1930 to improve efficiency through voluntary amalgamation, but the results were most inadequate. As a post-war policy, some form of socialisation ought certainly to be insisted upon.

The more urgent question is whether immediate nationalisation would help or hinder the expansion of output in the next few months. The miners' case is that nationalisation would have an immediate psychological effect on their

willingness to work—a contention that can be neither proved nor disproved, but will leave most observers somewhat sceptical. Reorganisation to increase efficiency would be fully possible in a nationalised industry; but it would take time. The Government's case a year ago was that the disturbance would reduce output and that there were better ways of securing an increase. The disproof by events of the second half of this contention naturally casts doubts on the truth of the first half. The present system is neither fish nor flesh, but merely a good red herring. It is operational control without financial control, responsibility without ownership, negative control without positive initiative. It is a compromise and, like all compromises, depends upon the willingness of all parties to work it. Even the very limited exercise of their wartime powers by the Government in taking over one colliery and appointing a controller in another evoked a great deal of protest. The Government, in order not to endanger national unity or to precipitate a crisis, will continue to compromise, although dual control cannot be justified from the standpoint of efficiency. Within the framework of the compromise and the White Paper, there are measures that can be taken—the pursuit of efficiency at all levels, irrespective of sectional interests; the investigation and remedy of the miners' legitimate grievances; speedier action against absentees; the strengthening of production committees; the transfer of the bonus system from a district to a pit basis. More and more, the onus of proof lies on those who believe that these measures will achieve the object. With every month that passes, the question becomes more fully one of asking why the permanent, thoroughgoing reform of the industry, which will certainly be necessary after the war, should not be undertaken now.

Finance and Banking

Special Assistance

The approach of the turn of June has been unmistakably apparent in the money market. The banks have been rather diffident buyers of bills, and as the discount market obtained a bumper 42 per cent allotment at last week's tender for Treasury bills, the task of taking up the new bills presented some difficulty in the early part of the week. As a result, special assistance had to be sought from the official brokers to whom the market sold fair lines of July bills. One of the factors making for the banks' unwillingness to buy bills has been the size of their Treasury deposit receipt payments, namely, £70 million against nominal maturities of £65 million and effective maturities at least £5,000,000 below this figure. Next week the market will again be taking up its quota of a £90 million offer of Treasury bills. In the normal course it would concentrate its applications on bills payable in July while taking the bulk of the week's maturities in June. This method of shifting the burden of the half-yearly window-dressing to the shoulders of the Treasury cannot be operated with the old deliberation and completeness, for the discount market is now expected to spread its applications for bills with some approach to evenness over the whole week. The fact that the market may be paying for some bills in the final days of June and that the banks will probably be abstaining from bill purchases may again lead to some special assistance to the market over the turn of the half-year. The concerted window-dressing which will be taking place at the close of the month will lead to an exceptionally large turnover of funds, as bankers' deposits are shown by the latest Bank returns to have fallen by £8,758,000 over the week to the moderate total of £148,910,000. A reduction of £9,618,000 in Government securities is the principal causal factor. On the evidence of the Bank return the turn of the half-year promises to be difficult.

Bank of England Issue Profits

In reply to a question in Parliament, the Chancellor of the Exchequer this week gave precise details of the agreement between the Bank of England and the Treasury governing the allocation of the profits of the Issue Department. The income received on the securities held in the Issue Department, including adjustments of interest or

discount, are first credited to the note issue income account kept at the Bank of England. The following items are then debited to this account: (a) the current expenses of the Issue Department; (b) in the case of stocks standing above their redemption value, a proportionate writing down on each dividend day of this excess book value; (c) the value of old notes presented after having been written off; (d) the composition paid by the Bank of England under the Bank Charter Act of 1844 and the Bankers' Composition Act of 1856 to other bankers in consideration of the discontinuance of the issue of notes by these bankers. The only item which needs explanation in the above list is (c). Under the existing legislation the Issue Department is entitled to write off bank notes of £5 and over if they have been in circulation for 40 years without returning to the Bank and after 20 years for notes of £1 and 10s. The amount of notes thus written off and credited yearly to the note issue income account is small and probably does not exceed £15,000. If any notes thus written off reappear after their long period of circulation, they are duly honoured and the amount must be debited to the account. A working balance is maintained in the account and the remainder is paid monthly to the Exchange Equalisation Account.

More Capital for the Discount Market

The process of consolidation in the London discount market is gathering momentum. News was given this week of an important increase in the capital of Smith St. Aubyn and Company, which raises the resources of the firm from £415,000 to £820,000. Of this new capital, £300,000 takes the form of 5 per cent cumulative redeemable preference shares, which are being placed privately with Hambros Bank and Morgan Grenfell and Company. The balance of £105,000 is being put up by the present proprietors in subscribing for 15,000 additional ordinary shares of £1. This raises the ordinary capital from £30,000 to £45,000 and the premium goes to create a capital reserve of £90,000. The terms on which the additional ordinary capital is being subscribed provide an interesting indication of the current value of the equity in this firm. The main interest in the transaction is, however, provided by the appearance of two acceptance banks and issuing houses as buyers of the newly-created preference shares. It does not follow that the two banks are putting the whole of these shares in their own investment portfolios, but it is probable that a certain permanent interest in the firm of Smith St. Aubyn will be maintained by them. This is clearly a case in which the operation represents no more than the investment by these two banks of temporarily redundant resources in what appears to them to be a safe 5 per cent investment. The shares subscribed by them are preference shares and the operation involves neither immediate nor potential change in the control of the business.

*

There is an element of paradox in this transaction, since the search for domestic investments by merchant banks, of which this particular operation is one of many recent illustrations, arises to some extent from the dearth of acceptance business, which in its turn must react adversely on the volume of discountable paper. Any contraction in the volume of commercial paper has, however, been swamped by the increase in Government paper—bills and bonds—handled by the discount market. It is to keep pace with that expansion and to provide the required safety margin for the larger proportionate holding of bonds by the market, that this strengthening of the capital structure both of the market as a whole and of its individual units is needed. There is widespread satisfaction in the City that this process should, to an increasing extent, be taking the form of an influx of fresh capital into existing firms. The trend in preceding years had been towards integration by amalgamation, which had more than halved the number of firms in the market over the past decade. If this tendency had been maintained, the discount market would have reached the desired degree of consolidation, but at the price of ceasing to be a true market and of losing the personal element which has always been part of its strength.

Investment

Markets Still Idle

Another week during which there has been talk of a growing firmness of tone, with occasional bursts of enquiry from the investor, leaves the principal indices of stock market values unchanged and the number of bargains received scarcely above the lowest for recent months. The record is now just over a year old and it is possible to give a straight comparison for the first time since the new system was adopted. The market is certainly more impressed by the dearth of trade than it was a year ago, but the total of bargains received is some 44 per cent. higher than it was then. There is a partial explanation of this in the fact that bargains in gilt-edged are slightly less numerous this year than last, while some of the more speculative items, such as South African mines, account for a substantial part of the increase in total. It is generally accepted that the average size of the bargain in the Funds is much larger than in any other section of the market. The revival in business in this section during the past week has been comparatively modest, but it has raised some prices a full $\frac{1}{4}$ point and removed some maladjustments. On the assumption, still generally adopted, that securities carrying interest at 3 per cent or less will run for their full life, while others will be converted at the first opportunity, it is now once more impossible to obtain

French Currency Plan

The series of bilateral currency talks between representatives of the US Treasury and of the various Allied nations which have been proceeding in Washington for the past two months culminated in a round-table conference last week, at which a more general, though still wholly inconclusive, discussion of the problem of post-war exchanges took place. Most of the discussions have been focused on the American and British currency plans, and reports from Washington suggest that, while most of the delegates from the smaller nations express the greatest admiration for the Keynes approach to the problem, they cannot altogether free themselves from the argument that it is on the Morgenthau side that their bread will be buttered. These two plans, however, have not occupied the whole of the stage. The leading French representatives, M. André Istel and M. Hervé Alphand, produced a scheme on their own personal initiative which differs from the British and American plans in its technical approach and in the matter of timing rather than in fundamental objectives. The French plan is less ambitious than the Keynes and Morgenthau schemes. It suggests that to make the scheme all-embracing from the start is to invite unnecessary difficulty. It would begin with an exchange agreement between the great nations based on the lines of the Reynaud-Simon agreement of the first 10 months of war, and would let the smaller nations attach themselves gradually to the nucleus of exchange stability thus created. It also places more specific stress on the fundamental problems of international trade and investment, and suggests that closer attention to these basic questions will pay greater dividends in terms of prospects of exchange stability than any blue-print for clearing unions, however ingenious or meticulous. The Reynaud-Simon agreement was that by which France and Great Britain undertook to maintain exchange stability and to accumulate whatever amounts of the other's currency might be required by the course of their mutual payments during the war, leaving the settlement of the balance to be made after the end of hostilities. It was an effective wartime arrangement; but it should be noted that it provided no machinery whatsoever for maintaining the initial equilibrium between the French and British cost-and-price structures expressed in the fixed exchange rate of 176 $\frac{1}{2}$ francs to the £. The agreement can hardly serve as a peacetime model for maintaining exchange stability. Its probable behaviour under peace conditions was indicated by the experience of the Tripartite agreement. This provided in theory for an agreed machinery by which exchange adjustments were to be made after full consultation with the other parties. In fact, all major changes in exchange rates during the Tripartite regime were of a unilateral character and took few people more by surprise than the Treasury officials and central bankers of the other participating countries.

as much as 1 $\frac{1}{2}$ per cent, with profit or loss on redemption, after paying tax without taking a stock with over twenty years to run. The best yield obtainable is some £1 11s. 3d. on Funding 2 $\frac{1}{2}$ per cent. 1956-61. The next highest is £1 10s. 5d. on the old series of the present "tap" issue of 3 per cent Savings bonds 1960-70. There are always some people who are prepared to sacrifice true yield to a higher current income and the explanation of the relatively high yield to redemption on the former is that its flat yield is the lowest in the list of long dated stocks. It is interesting to note that 3 $\frac{1}{2}$ per cent. War loan gives a return to redemption in 1961 of only £1 8s. 10d. As this is now regarded as definitely repayable at that date, there are only some £700 millions of "irredeemables," namely Old Consols and 2 $\frac{1}{2}$ per cent. Locals.

* * *

Cable and Wireless Investments

The report of Cable and Wireless (Holding) for last year appears without the usual comments of Lord Pender, presumably because of the paper rationing. Income from the three old cable companies remains unchanged, while there is a fall of some £6,500 in receipts from outside investments more than offset by a rise of £9,580 in dividends from Marconi's Wireless Telegraph. This is a result of

purchases of an additional 12,637 £1 preference shares and some £124,200 of ordinary capital at average prices of about 73s. 9d. and 63s. odd, respectively. The preference carry a 7 per cent cumulative dividend with participation and the payment on the ordinary has in recent years been 7 per cent. The consolidated balance sheet of the group shows modest falls in fixed assets and trade investments, presumably due to depreciation. Investments in securities quoted in London and New York have a balance sheet valuation £1,914,347 higher than a year before, at £18 millions odd, and the market value of these at the end of last year showed a depreciation, against book valuation, of only 5 per cent, compared with 11 per cent in the previous year and 19 per cent at the end of 1940. These are the counterpart of the pre-amalgamation holdings of the old cable companies, and it is to be noted that they are not regarded as liquid assets. Of the latter, the deposit with the Inland Revenue shows a rise of £2,850,000 and stocks one of over £1,020,000. Despite a rise of over £4,000,000 in the total figure to £14,434,469, it falls short of current liabilities by £1,323,043 against a surplus of £1,897,436, owing to the fact that EPT liability is included among creditors for the first time. Taking in investments at market, not balance sheet, value, the surplus of liquid assets over current liabilities is still down, from £16,310,616 to £15,835,791. It is extremely difficult to say what sums may be required for post-war reconstruction, but it is reasonably certain that some funds which have been locked up for a substantial period will be re-invested in the business.

* * *

Barrow Haematite Assets

The accounts of Barrow Haematite Steel for 1942 give some of the information which should have been available before the offer of the Ministry of Supply was accepted. Fixed assets had increased from £897,216 to £965,219, of which £304,910 were sold to the Ministry of Supply, leaving, after depreciation of £30,000, £630,308. The remainder of the purchase price was for liquid assets, and a *pro forma* statement shows the results of the transaction. The effect of the transaction is greatly to

strengthen the liquid position of the concern. Not only are net liquid assets up from £316,070 to £438,009, but gross liquid assets are 260 per cent of current liabilities against 140 per cent at the end of 1941. A further piece of information, largely responsible for the sharp rise in the quotation for the £1 shares, is the statement that works and plant, standing in the *pro forma* balance sheet at £630,308, are valued for war damage insurance purposes at £1,413,023. The 1942 profit was £160,700 against only £60,315; both are subject to outstanding claims, but the more recent figure has the assistance of £45,883 credited from 1941. It is thus far from clear what the true earnings of either period were and the sale makes it even more difficult to assess future profits. The market was clearly very well satisfied with the showing, for the price was raised 2s. 3d. to 16s. 6d., at which the yield on the 5 per cent dividend is £6 1s. 3d. per cent. The repayment of the debentures and bank loan will benefit the equity considerably. The yield on the shares is appreciably above the average of *The Actuaries' Investment Index* for the iron and steel group, but it is clear that the prospects of the concern are considered to have been improved by the sale.

San Paulo Disappointment

By reason of possessing a short main line, carrying a very heavy concentration of traffic, the San Paulo (Brazilian) Railway has always occupied a privileged position. While the fortunes of the Argentine concerns were going from bad to worse, San Paulo only once failed to earn 2 per cent tax free on its ordinary capital during the six years 1936-41, while the average payment for that period was 2 $\frac{1}{2}$ per cent. Last year, however, the combined effects of rising fuel costs, growing taxation and higher wages brought the company to a position in which only half the preference dividend was covered by current earnings. The final preference payment and 2 per cent tax free on the ordinary are met by drafts of £60,000 on the reserve and of some £22,000 on the carry forward. Nor is this all, for it has been thought desirable to transfer £225,000 from reserve to provide against the contingency that certain tax cases, now subject to appeal, will go against the company. A number of recent decisions have already rendered the company liable to taxes from which it was previously exempt. After the drafts mentioned, the general reserve and carry forward still exceed £1,357,000. The report shows a negligible increase in traffic on the main line section, with a 10 point rise in the expense ratio to 84.81 per cent, while the Bragantina section secured a considerable increase in traffic with a correspondingly heavy rise in the loss ratio. There is nothing in the report to indicate that these developments are of a transitory character, although the company has since the report secured some relief by permission to increase charges and can, in common with other lines in the less developed countries, presumably, rely on some fall in fuel prices after the war. The ordinary stock fell several points on the report to 60, but has since recovered to 65, at which it yields some £6 7s. gross.

Company Notes

Doncaster Amalgamated Collieries

Net profits of Doncaster Amalgamated Collieries for the year to March 31st last show a small rise from £421,445 to £463,712. There is an increase in depreciation from £179,939 to £186,546, but war damage requires some £13,000 less, so that there is a rise in the equity surplus from £172,307 to £221,077, representing 8.5 against 6.7 per cent. Ordinary stock receives 1 per cent more, making 5 per cent, the highest dividend since the 1937 merger. Of the surplus, the transfer to general reserve is raised from £50,000 to £70,000, and the remainder goes to increase the carry-forward from £121,588 to £143,182. There is nothing in the accounts that sheds light on the improvement in net income. The balance sheet shows modest reductions in debtors and creditors, so that there is a possibility that turnover declined. There is, however, a rise in net loans to subsidiaries from £493,323 to £572,524. Most probably, the higher income is due to reduction in costs. It is not likely that output was increased. The drop in stocks from £776,295 to £643,471, while partly due to inability to replace certain items—in particular steel—is, according to the chairman, Mr William Humble, mainly due to the sale of wooden pit props of sizes not now used by the concern. Mr Humble also announces the registration of Doncaster Coke and By-Products, a company controlled jointly with Staveley Coal and Iron. Capital additions last year amounted to only £141,838 against £208,412. The post-war prospects of the group appear favourable, but at the ex dividend price of 14s. 6d., the £1 ordinary shares yield £6 17s. 8d.

* * *

Griffiths-Hughes Investments

The full accounts of the holding company, Griffiths Hughes Proprietaries, show receipts of £76,672 for the year to March 31st last, exactly the same as for the previous year. Thus, the 6 per cent ordinary payment is again under-earned by 0.1 per cent and the rise in the carry-forward from £6,131 to £7,986 is due solely to the inclusion of £2,259 against £2,002 income tax recovered. The operating company, E. Griffiths Hughes, actually shows a decline in income from £232,414 to £222,915. Liability for income tax is reduced from £132,000 to £122,500, and the 44 per cent tax-free dividend which is paid to the holding company is covered by tax-free earnings of 57.1 against 57.2 per cent. The carry-forward is again substantially increased from £25,623 to £48,273. In each of the last two years, the income of the subsidiary company has been higher than in any

year since 1936-37. The most substantial grounds for expecting a further rise in profits is the news conveyed by the chairman, Mr Harry Marland, that further interests were acquired last year and are now being developed. The acquisition is reflected in the expansion of net loans to subsidiaries in the balance sheet of the operating company from £13,196 to £40,184. The acquisition seems to mark the entry of the group into a rather different field, and new, first-class research laboratories have been set up entirely independent of the existing establishments. Stocks are also higher and there is a small rise in net liquid assets from £374,043 to £375,798. It is probable that the limits of the group's ultimate expansion have still not been reached. The chairman states that the difficulty of securing shipping for exports has in part been met by the production of overseas factories. The £1 shares of Griffiths Hughes Proprietaries, at 19s. 4½d. ex dividend, yield £6.3s. 10d. per cent, a level which implies considerable market caution in assessing post-war prospects.

Selection Trust Accounts

The accounts of *Selection Trust*, the important finance company with substantial interests in Rhodesian copper and in the *American Metal Company*, show a rise in income from £249,869 to £268,271 for the year to March 31 last. The majority of charges against profits are reduced, but there is a rise in tax liability from £44,500 to £70,300. Thus, equity earnings are rather lower at £151,788 against £153,488, representing 12.9 against 13.3 per cent. Despite this, the directors announce an increased distribution of 8½ per cent less tax at 8s. 3½d. against 7½ per cent less tax at 8s. 6d. The surplus goes as to £28,479 to write off debenture conversion expenses, as to £20,000, against £40,000, to exploration reserve, and the remainder to raise the carry forward from £136,165 to £136,456. The outlook for the coming year is good, since the current accounts reflect the reduced dividends distributed in 1940-41 by *Rhodesian Selection Trust* for which the absence of any *Mufulira* payment was mainly responsible. The resumption of dividends will be reflected in the accounts of the current period. The rise in income of *Selection Trust* in 1942-43 is stated to be due mainly to an increased payment from *Consolidated African Selection Trust*. There is no change in the distribution of *The American Metal Company*. Further grounds for expecting a higher surplus in the current period is that last year £419,220 of 5½ per cent. debentures were replaced by £400,000 of 3½ per cent. stock. There is a gross saving in interest of some £9,000. The balance sheet shows a very strong liquid position and net liquid assets are rather higher at £574,703 against £572,298. The market value of quoted investments, which is unfortunately not given, is said to be much in excess of the balance sheet valuation of £2,698,567, including

£424,673 of Government securities. The *Selection Trust* 10s. stock at 20s. yields £4 7s. 6d. per cent less tax at 8s. 3½d.

Further Kaffir Payments

Dividends announced by two more gold mining groups at the past four half-years are analysed in the following table. The latest payments announced by the *Anglo American* group are comparable with payments made a year ago and not with those distributed in December, 1942, since this group makes a habit of paying higher final than interim dividends. This June, there are in fact five reductions against the payments of a year ago. Two of the young mines, East Dagga and New Era Consolidated, are paying the same dividends as in June, 1942, while Western Reefs is paying 1s. 3d. against 9d. a year ago—the same as in

* Years ending June 30. † Crushing operations began January, 1942.

December, 1942. All the indications are that development in this mine is proceeding sufficiently fast to offset the effects of wartime shortages. There is nothing unexpected about the trend of the *Consolidated Gold Fields* payments. The steady reduction in dividends paid by the veteran Sub Nigel is continued with a further cut of 6d., as is the downward trend of the Venterspost payments. Simmer and Jack, as in June, 1942, pays nil, against 2d. last December, and no dividend has yet been declared by Vlakfontein, which came into production in January, 1942. For the rest, payments are steadier than might have been expected. There is every prospect that the Rand will have to face even more acute shortages of labour and supplies in the coming half-year, and this must be expected to prejudice the December payments.

Industry and Trade

Engineers in Conference

The Amalgamated Engineering Union is now the second largest trade union in the country, with a membership of 839,000—an increase of 211,000 during the past year—and it is also the richest, with reserves, amounting to £5,000,000. Its increase in strength and influence, together with the fact that all its members are engaged on vital war work, lent more than usual significance to the 1943 meeting of the National Committee at Southport this week. Mr Jack Tanner has shown signs of a long-sighted and realistic outlook, beyond that of the run of trade union leaders. The greater part of his presidential address was devoted to the war, and the need for increased production. But he also outlined some of the problems that will face the engineering industry in post-war Britain. Revolutionary changes in technique have occurred during the war; complicated production processes have been broken down into simpler component operations; many new methods and materials have been introduced. All this may have profound effects on the technique and personnel of the engineering industry and on craft traditions. Mr Tanner also showed realism in advising the committee to reject the demand for general wage increases all round, and to accept, instead, a resolution formulating a comprehensive long-term policy, which would lay the

foundations for future wage standards. The main points of this programme would be: (1) the establishment of national minimum wage rates for all classes of workers—the amount was unspecified, and it would presumably be left to the union to negotiate the most advantageous terms possible; (2) equal pay for equal work, and a minimum rate for adult women not less than that of the male labourer—this demand was made at the recent conference of AEU women, who were represented at the National Committee for the first time in history; (3) the complete consolidation of national bonuses in the basic rate—the unions are concerned lest the advances secured during the war might be whittled away in the light of post-war conditions; (4) the application of the recent 6s. award to all time workers—the fact that only a small proportion of time workers have benefited by the full increase has caused great dissatisfaction, and led in some areas to strike action; (5) the restoration of the pre-1931 conditions in regard to overtime and Sunday work—a claim which had been rejected by the National Arbitration Tribunal. The presentation of the programme would be worked out in consultation with the other engineering unions in the National Engineering Joint Trades Movement. This action will thus be a further step in the direction of consolidation which was started when the 40 unions presented

their collective wage claim last September. Consolidation and amalgamation of the engineering unions has been widely discussed, but, so far, no clear picture of the structure and organisation of "one big engineering union" has emerged.

Agricultural Statistics

The Ministry of Agriculture* last week gave some figures, under various headings, showing the effect of the war on agricultural output in the United Kingdom. For security reasons, these figures give only the general outline; more detailed statistics will have to await the end of the war. The overall increase in output of the United Kingdom (excluding that derived from imported feeding stuffs) is 70 per cent measured in terms of calories. The first three sets of more detailed figures show the percentage change in 1942 compared with the pre-war position. "Pre-war" is intentionally left undefined.

	Percentage Change compared with Pre-war 1942
<i>Acreage</i> :—	
Total cultivated area (including grassland, but not rough grazing)	-2.0
Arable	+33.7
of which tillage	+52.8

The fall in the total cultivated area (which includes grassland, the percentage of which transferred to arable uses is not given) is due to the loss of land to military and industrial use; much land has been reclaimed to offset this loss. All arable land, bare fallow and temporary leys are included under "arable." The tillage area is the arable area minus temporary leys.

	Per Cent.
<i>Crop Acreage</i> :—	
All cereals	+65.7
Wheat	+35.6
Oats	+72.0
Potatoes	+80.4
Vegetables	+55.1

Cereals include wheat, oats, barley, rye and mixed corn.

	Per Cent.
<i>Livestock</i> :—	
Cattle	+4.6
Sheep	-17.8
Pigs	-51.9
Poultry	-24.2

The increase in the total cattle population is due to the rise in the number of dairy cattle; other cattle are fewer in number. The pig and poultry figures take account of commercial keeping only. If domestic poultry were included, the decrease would be less than 20 per cent.

	Pre-war (million tons)	1942-3
<i>Feeding Stuffs</i> :—		
Imports	8.5	1.3

The pre-war tonnage includes imports of actual feeding stuffs and feeding stuffs derived from imports. The 1942-3 tonnage consisted entirely of feeding stuffs derived from imports; no feeding stuffs as such were imported.

	1939	1942
<i>Farm Machinery</i> :—		
No. of tractors	55,000	150,000
tractor implements	200,000	1,175,000

These figures show clearly the important part played by mechanisation in increased production.

	Percentage of Total Sugar Consumption	
<i>Sugar</i> :—	Pre-war	1942
From home-grown beet.....	23	35

The larger percentage of sugar consumption derived from home grown beet is due more to reduced consumption than to increased home production.

	Pre-war	1942
<i>Allotments</i> :—		
Number	930,000	1,675,000
<i>Private Gardens</i> :—		
Estimate no. cultivated for vegetables	3,000,000	5,000,000

The Ministry's "Dig for Victory" campaign has been successful; little further increase in allotment holding can be expected; the emphasis now is on better planning and higher yields. The figures for private gardens are rough estimates.

<i>1943 Cropping</i> :—	
Grassland ploughed, 1942-3	1,250,000 acres
Expected increase in :—	
Tillage over 1942	750,000
Increase in wheat area over 1942	25%

Grassland excludes temporary leys, and is defined as land which has been under grass for at least seven years. Increases are expected in barley and potato acreages.

	June, 1939	May, 1943
<i>Labour</i> :—		
Men, regular	545,100	...
casual	71,700	...
Women, regular	54,400	70-80,000
casual	38,300	...
Women's Land Army	...	65,400

The June, 1939, figures come from the *Ministry of Labour Gazette*, and are for England, Scotland and Wales. Some male farm workers are now in the armed forces. The number of prisoners working on the land is not available. In addition to the WLA, casual workers are more numerous.

A Record of Expansion

The picture of British wartime agriculture unfolded by these statistics is one of remarkable expansion. Before the war Great Britain imported nearly two-thirds of its food requirements; now British farmers supply nearly two-thirds of the war-time diet, if at the expense of variety. How has this measure of expansion been made possible? The total cultivated acreage is slightly lower than before the war. But within this area there has been a big change. The ploughing up of grassland has added a third to the acreage under crops; this has meant an overall reduction in livestock, but the number of dairy cattle has actually been increased. But this is not all. The arable acreage has not only been increased, but is being more intensively cultivated than before, without a corresponding growth in the labour force of agriculture. Exact figures of employment on the land are not available. There has been a "slight fall in the number of regular male workers," but this has been offset by the recruitment of the Women's Land Army, now numbering over 65,000, and by the employment of prisoners of war. The total labour force in agriculture is probably not much greater than before the war. The expansion in output, in fact, appears to have been achieved largely by mechanisation; the number of tractors has been increased nearly threefold, and that of tractor implements nearly eightfold. Agriculture is now probably more highly mechanised in Great Britain than in any other country—certainly than in any other European country. The farming industry deserves high praise for the vital part it has played in economising scarce shipping tonnage, and nobody would bear a grudge to farmers for having increased their aggregate net income or to the workers for having secured a wage more in line with earnings in industry. Nevertheless, it would be foolish not to count the cost. This has been substantial; last December the Ministry of Agriculture's index of farm prices (including subsidies) was 80 per cent above the average for 1938, an increase double that for all consumers' goods and services. Undoubtedly the price is not too high in wartime, for what is being bought is security against starvation. But the criteria will be different when peace returns.

Design of Dwellings

The Society of Women Housing Managers has produced an interesting memorandum on "The Design of Dwellings" for a sub-committee of the Central Housing Advisory Committee of the Ministry of Health. It is based on a questionnaire answered by 2,077 tenants on estates managed by members of the Society, whose wide experience has also been incorporated into the report. The

TO RECOVER FREEDOM AFTER THE WAR

from unnecessary official controls there is only one way—to eliminate all restrictions at the ports. The growth of internal bureaucracy, began with restrictions on imports which in turn brought quotas, price controls, marketing boards, all the paraphernalia of "planned industry" and the officials required for administration. The only way to kill the planners is by a return to Free Trade under which our Country prospered.

COMPANY MEETINGS

TUNNEL PORTLAND CEMENT
COMPANY, LIMITED

DEMANDS ALL MET DESPITE DIFFICULTIES

POST-WAR PROBLEMS

MR N. M. JENSEN'S ADDRESS

The thirty-second annual general meeting of the Tunnel Portland Cement Co., Limited, will be held on the 29th instant at the registered office, 2, Seamore Place, Park Lane, London, W.

The following is the speech which the chairman and managing director, Mr N. M. Jensen, proposes to make on that occasion:—

Ladies and gentlemen, unfortunately the paper restrictions have not made it possible this year to include a copy of my speech to the shareholders with the report and accounts, as has been the custom for several years. Before dealing with the details of the accounts I would like to mention that we have made some modifications in the form of the balance-sheet in accordance with more recent accountancy practice. These modifications incidentally show more clearly the strong position of your company, and I hope they meet with your approval.

The only items in the balance-sheet which call for some comment from me are under stocks and sundry debtors. Stocks have increased by £105,544, which is due to a larger quantity of clinker, cement, coal and other stores and also to the increased cost of these. There is an increase of £40,625 in the amounts due from subsidiary companies and there is an advance to an associated company of £50,000. This last item refers to money lent to Ribblesdale Cement, Limited, and it will interest you to know that that company has paid off its outstanding debenture stock and, therefore, your company has been released from the guarantee given in connection therewith.

TRADING PROFIT

The profit on trading is reduced by £39,828, but, as pointed out, last year's profit included about £30,000 which related to previous years. The profit is arrived at after the necessary adjustments under the pooling arrangement regulating the war-time conditions of the industry. Interest and dividends on investments show a reduction of £50,496, with which I will deal a little later. The provision for taxation is this year only £170,000, as compared with £260,000 last year. As mentioned in the directors' report, your company has built up a tax reserve which now enables us to base our provision for taxation on current year's profits.

In addition to our normal depreciation, the directors have felt it desirable to add £25,000 to depreciation reserve so as to be able to meet expenditure which may become necessary owing to the additional wear and tear involved in production under war conditions. After payment of dividend on the two classes of Preference shares and the interim dividend on the "A" ordinary shares and the "B" ordinary stock, there remained, together with the sum brought forward, a balance of £248,515.

In view of the delay in completing the accounts, your directors decided to pay a second interim dividend of 12½ per cent., less tax, on the "A" ordinary shares and "B" ordinary stock, making 20 per cent., less tax, for the year. At the same time, it was intimated that no further dividend would be recommended. The second interim dividend absorbed £57,239, and left a carry-forward of £191,276.

INCOME FROM INVESTMENTS

Our total income from investments at £91,669 is nearly 5 per cent. on the amount at which our investments stand

in our books, but as it is a substantial reduction on last year's investment income, I should like to refer specifically to the same dividend as for the previous year.

Among our subsidiary companies, the Helwan Portland Cement Company, Near East Cement Products, and Tunnel Asbestos Cement Company, Limited, have paid the same dividend as for the previous year, but Tunnel Cement (Pitstone), Limited, and Clyde Portland Cement Company, Limited, show a reduction in profits and, consequently, a lower dividend, which is largely due to adjustments under the trade pooling arrangement.

Among other investments, Ribblesdale Cement, Limited, also show a lower earning and a reduction in dividend for the same reason. Alpha Cement, Limited, paid no dividend for the year ended December 31, 1941, owing chiefly to the low profit standard of that company and the need for building up adequate staff reserves. This means a reduction of our investment income of about £25,000 from this source alone. The position is somewhat better for 1942, but the improvement will only be reflected in our 1943 accounts.

Cement, Limited, of Dublin, in which your company holds a substantial capital, has for the past two years paid 8 per cent. dividend. Our American investment, the National Portland Cement Company, of Philadelphia, only made a small profit, after depreciation, during 1942 and was, therefore, unable to recommend the payment of any dividend.

IMPROVED HOME TRADE

There has again been a slight increase in the home trade, but a decrease in export. I am happy to say that the cement industry has been in a position to meet all the demands the Government has made upon it in spite of increasing difficulties due to the demand of the Services upon the available labour. At no time has there been any shortage of cement, and your company has assisted in overcoming the difficulties due to inclement weather by the increased production of our cold weather cement.

PROSPECTS FOR THE FUTURE

With regard to future prospects of the cement industry, I would like to say that I cannot see how we can hope to get through the war period without diminution in the demand for cement, but let us hope that such period will be of short duration only. We all know that there is bound to be an increased demand for cement when the nation's efforts can once more be turned towards peaceful aims, but I personally think it will be at least two years after the cessation of hostilities before the demand for cement will begin to exceed the present productive capacity of the industry.

How much the demand is then likely to increase further will depend largely on the amount of labour that it is possible to absorb in the building industry and in civil engineering work. The cement industry, I may mention, is fully determined that, whatever happens, there shall be no shortage of cement, and, with that in mind, plans are now being considered for extending existing works and building new ones. Your company fully intends to take its proper share in this work.

TRIBUTE TO EMPLOYEES

Before I conclude, I should like to pay a well-deserved tribute to all the members

of our staff and our workpeople who have carried on their work during very trying circumstances. I should also like to send our good wishes to those of our employees who are serving in His Majesty's Forces and wish them a speedy and safe return. Our sympathy goes out to the relatives of those who unfortunately will not come back.

EAGLE STAR INSURANCE
COMPANY, LIMITEDSIR EDWARD MOUNTAIN'S
STATEMENT

The ordinary general meeting of the Eagle Star Insurance Company, Limited, will be held in London on the 29th instant.

The following is an extract from the statement by the chairman and managing director, Sir Edward M. Mountain, Bt., circulated with the report and accounts:—

Life Department: We issued during 1942 1,895 policies for £12,928,886 gross. Rather more than one-half of this business was in connection with staff pensions. Our mortality experience continued to be favourable and our expense ratio was reduced to 10.03 per cent. The premium income and the total funds again show increases, whilst the net rate of interest earned is £3 10s. 11d. per cent., approximately the same as last year.

Fire Department: Fire losses in the United Kingdom for 1942 have been heavy, whilst the losses in America were lighter. Fire business in other parts of the world had been favourable.

The accident and general departments had a very good year.

Investments: A valuation of the Stock Exchange securities at market prices ruling on December 31st showed a considerable margin on the values in the balance-sheet in all the various life funds. In the shareholders' funds there has also been a substantial improvement in the value of Stock Exchange securities and, taking the values at market prices at the close of the year, there is over £1,200,000 available for future contingencies.

The net interest income has increased in spite of a higher effective rate of tax and the dividend is covered by interest earnings alone. The profits transferred from the fire, accident, motor and marine departments total £268,000, and, after making full provision for taxation and other expenses, the amount carried forward in profit and loss account is increased by £78,348 to £632,602.

HENDERSON'S TRANSVAAL
ESTATES, LIMITEDMR W. L. CASTLEDEN'S
STATEMENT

The thirty-first ordinary general meeting of Henderson's Transvaal Estates, Limited, was held on the 23rd instant in London. Mr W. L. Castleden (chairman and managing director) presiding.

The chairman said: In the balance sheet now before you changes calling for attention are an increase in investments in Government securities amounting to £29,938 and in other securities £600, cash being reduced by £3,067. Sundry debtors are mainly dividends outstanding and practically all since recovered.

Revenue this year shows a decline which is accounted for largely by a reduction in profit on share transactions.

We are glad to be able to report that on our annual valuation of investments the market value of our quoted securities marks an improvement and is slightly in excess of book cost. At the same time our valuation of the unquoted holdings is substantially above the figure at which they stand in our books.

The result of the year's working is that we are able to recommend the payment of a dividend of 10 per cent. and to carry forward £40,184.

The report and accounts were unanimously adopted.

J. LYONS AND COMPANY, LIMITED

SATISFACTORY RESULTS OF DIFFICULT YEAR

MR HARRY SALMON'S STATEMENT

The forty-ninth ordinary general meeting of J. Lyons and Company, Limited, was held, on the 23rd instant, at the Trocadero Restaurant, London, W.

REPORT OF THE DIRECTORS
FOR THE YEAR ENDED MARCH 31, 1943

The directors report that the balance of the trading account for the year ended March 31, 1943, after providing reserve for contingencies, is £905,305, which, together with the balance of £355,882 brought forward from last year, makes a total of £1,261,187 available for distribution. The sum of £490,353 has been paid or provided for dividends on preference and preferred ordinary stock to March 31, 1943, and the sum of £92,814 has been paid for interim dividends on ordinary, "A" ordinary and proportional profit stock and "B" proportional profit shares.

The directors propose to deal with the balance by paying a final dividend of 3s. per £1 unit of ordinary and "A" ordinary stock, absorbing £249,941, and a final dividend of 7.2d. per £1 unit or share respectively on the proportional profit stock and "B" proportional profit shares, absorbing £28,500. The balance to be carried forward to next account is £399,579.

The dividends received from subsidiary companies have been included in the company's trading account. In the aggregate the results of the subsidiary companies' trading show a profit. Losses of subsidiary companies so far as they concern this company have been dealt with in this company's accounts.

During the year Mr W. H. Gaunt was appointed an employee director.

Messrs S. I. Salmon and A. H. Salmon, ordinary directors, and Messrs H. H. G. Bennett and L. H. Lampitt, employee directors, retire and, being eligible, offer themselves for re-election.

Messrs Turquand, Youngs, McAuliffe and Company, the auditors, retire and are eligible for re-election.

(Signed) HARRY SALMON,
M. SALMON,
Managing Directors.

CADBY HALL, LONDON, W. 14.
June 9, 1943.

CHAIRMAN'S STATEMENT

The following statement of the chairman had been circulated with the report and accounts, and was taken as read:—

The report and accounts which accompany these remarks are those of the forty-ninth year of the company's trading.

There are few figures which call for comment. The increased figure for trade and other creditors, etc., is due to the fact that last year such Reserve Certificates as we had were deducted from the tax provisions, whereas this year they are shown on the assets side as a separate figure.

Amongst the assets, the reductions in land, buildings, plant, etc., and in stock-in-trade are mainly brought about by war conditions, as also is the increase in Government securities and in cash. The very substantial reduction in stock and the accumulation of depreciation and maintenance reserves which we are unable to expend either in replacements or in development have caused us to accumulate funds.

As is mentioned in the report, Mr W. H. Gaunt was appointed an employee director during the year. Mr Gaunt has been with the company for some 24 years in charge of our transport and distribution service, and we are sure stockholders will share the pleasure we feel in now having him as a colleague on the board.

FORESTAL LAND, TIMBER
AND RAILWAYS COMPANY,
LIMITED

IMPROVED RESULTS

The thirty-seventh ordinary general meeting of the Forestal Land, Timber and Railways Company, Limited, was held on the 24th instant in London.

Mr Louis H. Kiek, the vice-chairman, said that it was a source of satisfaction to the directors, as it would be to stockholders, that the results of their operations and those of their subsidiary and associated companies for the year ended December 31, 1942, again showed an improvement on the figures of the preceding year. Income from trading and investments and dividends distributed by their subsidiary companies amounted to £661,424, compared with £643,175 for 1941, and the net profit after deduction of the parent company's administration expenses, etc., to £614,376 as against £593,683. To that had to be added £52,968 realised on the sale of an investment.

That result, achieved during a period in which the difficulties and complications inseparable from war conditions had certainly not diminished, reflected the greatest possible credit on all concerned at home and in the countries where their subsidiary and associated companies operated. They recommended a final dividend of 3 per cent., less tax, and a bonus of 3 per cent., less tax, making a total distribution for the year of 9 per cent., less tax.

SOUND FINANCIAL POSITION

Pride of place in the contribution to their income belonged again to the Argentine Forestal Company, their investment in which figured in the balance-sheet at £4,991,299. The satisfactory dividends which the Argentine Company was now able to declare derived in no small measure from the prudent financial policy which it had consistently followed. Subject to the vagaries of exchange and to general conditions in that great and progressive country, that investment stood in their books at what they regarded as a very conservative figure indeed.

The only changes of importance in the parent company's balance-sheet, compared with the previous year's figures, arose from the repayment by the Argentine Company of £200,000 of that company's 4½ per cent. debentures, reducing the amount outstanding and owned by the parent company to £800,000, and a reduction of some £69,000 of a similar debt owing to them by one of their associated companies. Their investments in British Government loans, including Tax Reserve Certificates, had now passed the million pound mark.

The parent company's balance-sheet disclosed a satisfactory financial position and the consolidated balance-sheet would satisfy them that the situation of the subsidiaries added very materially to the strength of the entire structure. At the end of their financial year—after making full allowance for depreciation of Argentine currency—there was a surplus of close on £2,000,000 on the figure at which the group assets stood in the parent company's books. Incidentally, the statement showed that the Group's currently realisable assets alone now more than covered the whole of the parent company's preference as well as ordinary capital.

THE OUTLOOK

With regard to their Quebracho timber reserves, they might reasonably assume that the present scale of annual production could be maintained for many years to come and, at the rate of depreciation which they had found it prudent to apply, their forest lands would be written down to a very moderate figure. Their three million acres of land would therefore continue to represent a substantial and ultimately saleable asset capable of being usefully developed in the interest of the country and the company alike.

The report and accounts were unanimously adopted.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes.

In time of war the value of this practice is greatly enhanced because *The Economist* provides valuable information which is not otherwise available to investors, who therefore read it more carefully than ever.

Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, Brettenham House, Lancaster Place, W.C.2.

BRITISH ELECTRIC TRACTION COMPANY, LIMITED

VALUE OF PRIVATE ENTERPRISE

The forty-seventh ordinary general meeting of the British Electric Traction Company, Limited, was held on the 18th instant in London.

Mr Richard J. Howley, C.B.E. (the chairman) said that for many years past they had been able to show increases in their gross revenue, but this year they had to record a slight decrease. The revenue amounted to £760,293, compared with £767,588 for the preceding year. The reduction was due in the main to smaller distributions by two of their subsidiary companies necessitated by the incidence of taxation. Apart from taxation, their expenses amounted to £59,868, an increase of £4,902. Taxation required £51,553 compared with £105,750 in the preceding year and, after providing for debenture stock interest, their profit was £569,393, an increase of £42,000. The directors recommended the payment of the same dividends as last year.

Of their many interests the most important was their large investment in companies providing road passenger transport services in the provinces. The B.E.T. group of companies owned some 8,500 omnibuses, which operated approximately 243 million miles during 1942 and carried some 1,400 million passengers. Their operating companies had established a reputation for the excellent public services they provided. That he attributed to enterprise in providing for the public needs, economy in operation, and civility and attention to their passengers. All that had been achieved with capital provided by this company and other shareholders; in other words, the capital had been found at no cost to the taxpayer or ratepayer.

The report and accounts were unanimously adopted.

VENEZUELAN OIL CONCESSIONS, LIMITED

LAW OF HYDROCARBONS

The twenty-seventh ordinary general meeting of the Venezuelan Oil Concessions, Limited, was held, on the 18th instant, in London, Sir Andrew Agnew, C.B.E. (the chairman), presiding.

The following is an extract from the chairman's statement circulated with the report and accounts:

The profit for the year 1942 is £1,256,668. There have been discussions for a considerable period between the holders of oil concessions in Venezuela and the Venezuelan Government on the subject of a new Venezuelan Law of Hydrocarbons. These discussions originated from the Government's desire to secure an increased revenue from the oil industry and to place the entire industry on one and the same basis. The outcome was a new law, which was passed by Congress on March 13th last with effect as from that day.

The Board has considered it prudent, in the interests of shareholders, to apply for conversion of its original concession to new concessions to be granted under the new Law of Hydrocarbons. Virtually all other oil companies having concessions in Venezuela are taking similar action and will in future be operating under identical terms.

While the company's burdens have been substantially increased, we have obtained security of tenure for a term considerably exceeding the unexpired period of the original Aranguren Concession, which was due to terminate in 1957. In addition, President Medina gave an assurance to shareholders of oil companies operating in Venezuela that the security of their capital will be more than ever guaranteed under the relationship between the companies

and the Venezuelan Government established by the legislation which has now been promulgated.

It was clearly desirable in the company's interest that we should reduce the area of our holdings before conversion to the new terms. Accordingly, areas aggregating approximately 131,300 hectares have been surrendered, reducing the company's concessions in the Bolivar and Maracaibo districts to a total of 412,761 hectares.

Another new feature affecting our operations is the introduction of income tax in Venezuela, with effect as from January 1, 1943. The rate of tax in our case will be approaching 12 per cent. on profits, but many points affecting the exact application of the tax remain to be clarified.

The report was adopted.

BRITISH TIMKEN, LIMITED

E.P.T. AND TERMINAL LOSSES

Mr John Pascoe, B.A., deputy chairman, addressed the shareholders at the twenty-third annual general meeting of British Timken, Limited, on the 17th instant, at the company's registered offices in Birmingham, the chairman, Mr Michael Dewar, O.B.E., J.P., M.A., having only just returned to this country. Mr Pascoe said:

To-day we have the very great pleasure of welcoming back Mr Michael Dewar on the completion of his mission in the United States of America.

The profit for the year 1942, before taxation, amounted to £117,096, an increase of £8,172 over the previous year, which, however, is insignificant compared with the increase in turnover. Provision for taxation is £3,000 higher at £63,000.

Your company's earnings do not reach its excess profits standard, and I express a hope that when the Chancellor of the Exchequer comes to ease the burden of E.P.T. to assist manufacturers in meeting terminal losses, he may extend any concessions so as to cover the case of a company such as yours, which operating on a scale far exceeding anything approached in pre-war days, nevertheless finds its E.P.T. standard quite out of reach.

The balance of current assets over current liabilities and provisions of £170,000 is approximately the same as last year, the item of fixed assets and subsidiary companies showing an increase over last year of approximately £23,000.

We look back on almost four years during which the whole resources of your company, both human and material, have been extended to the utmost. In so far as the problems which may lie ahead can be resolved by the ability, energy and loyalty of your staff and workpeople, we face them with confidence.

PROGRESS OF FISCHER BEARINGS COMPANY, LIMITED

The experience of your subsidiary company, Fischer Bearings Company, Limited, during the year has been in essence similar to our own, and, under Mr Moritz's able direction, the company continues its expanding contribution to the needs of industry.

I will ask you to pass a vote of cordial thanks and commendation to the managers, staff and workpeople of your company and Fischer Bearings Company, Limited. Shareholders will be gratified that one of the British Timken, Limited, staff, Mrs. Cox, has been awarded the British Empire Medal for services to industry. Mr G. W. Smith, of the Fischer Bearings Company, Limited, staff, has also been awarded the British Empire Medal for showing great pluck in carrying on production work when injured.

The honour thus conferred upon them, and indirectly upon your company and its subsidiaries, has been duly acknowledged to them by its directors.

This resolution was carried and the report and accounts were adopted.

KONONGO GOLD MINES, LIMITED

The ninth ordinary general meeting of Konongo Gold Mines, Ltd., was held on the 23rd instant, in London, Mr Robert Annan, M.Inst.M.M. (the chairman), presiding.

The following is an extract from the statement by the chairman which was circulated with the report and accounts for the year ended September 30, 1942:

A slight decrease in tonnage milled was more than offset by the higher grade of ore treated; gold production at 53,513 fine ozs. being 2,260 ozs. higher than in the previous year. Working costs, in spite of continued rise in the cost of all supplies and of increased wages, only show an increase of 6½d. per ton, a result which reflects great credit on the management.

Development was further restricted by shortage of supplies and the footage driven at 7,404 ft. is 1,673 ft. less than in the previous year. Most of the work was concentrated on the Odumase vein, where the results were highly satisfactory. The 10th and 11th levels on this vein are now being opened from winzes, and driving north on the 9th level has encountered a new ore-shoot on which development is continuing.

Ore reserves at 401,675 tons, averaging 12.02 dwts. per ton, show a decrease of 6,508 tons, but an increase of 1.42 dwts. in value.

In order to conserve vital supplies, a scheme of concentration was brought into force by His Majesty's Government. Four of the mines have closed down and have been put on a care-and-maintenance basis. Seven mines, including Konongo, remain in production, and on these a levy will be made to provide for the cost of maintenance of the mines closed down under the Order. Operations will be maintained at a rate estimated to produce 50,000 ozs. of gold per annum, and the distributable profit at this rate of output should not be less than at present.

The report and accounts were adopted.

FORSTER'S GLASS COMPANY, LIMITED

TRADING PROFIT MAINTAINED

The twenty-fourth annual general meeting of Forster's Glass Company, Limited, will be held on the 29th instant at the May Fair Hotel, Berkeley Square, London.

The following is an extract from the statement by the chairman (Colonel Charles E. Ponsonby, T.D., M.P.) which was circulated with the report and accounts:—The trading profit for the year has been maintained more or less at last year's level. Your directors consider this result to be satisfactory having regard to the increasingly difficult trading conditions.

The profit for the year amounts to £69,255, as against £65,989 last year, and from this has to be deducted a provision of £19,250 to meet the income-tax liability for the past year, leaving the net profit at £50,005. The directors recommend the distribution of a dividend of 10 per cent. and a cash bonus of 5 per cent. on the ordinary shares, both less income-tax, making 15 per cent. for the year, which is the same as last year.

Turning to the balance-sheet, the important change on the liabilities side is the elimination of the 5 per cent. mortgage debenture stock. The outstanding amount of £7,000, together with the £80,000 stock held by the bank, has been redeemed and cancelled during the year. It is satisfactory to note that there are now no charges of any kind on the company's assets.

Further capital expenditure has been incurred during the year in connection with the special work with which we have been engaged, and appropriate depreciation has been written off these assets.

As far as the present year is concerned, I can only say that results continue to be satisfactory, but owing to the concentration of certain industries and the quota system in others, there is a tendency for demand to fall, though in our own case the results have so far not been serious.

SELECTION TRUST, LIMITED

The ordinary general meeting of Selection Trust, Ltd., will be held on July 1, 1943, at Selection Trust Building, E.C.2. Following is a summary of the report of the directors embodying the annual statement by the chairman, Mr A. Chester Beatty.

Gross revenue of £268,271 was £18,402 more than last year, and the profit was £222,088, compared with £197,989.

The directors recommend payment on July 5th of a dividend of 10½d., less income-tax at 8s. 6½d in £.

The value of the quoted investments held by the company and its subsidiary, Seltrust Investments, Ltd., on basis of market prices at March 31, 1943, was substantially in excess of their book value.

The American Metal Co.'s surplus for 1942 was \$2,624,477, compared with \$3,135,495 for 1941. The 1942 earnings include only \$245,650 for dividends from Roan Antelope Copper Mines and Rhodesian Selection Trust, as against \$466,112 in 1941; further dividends amounting to \$749,974 from those sources were not received in time to be reflected in 1942 accounts. Earnings of Duquesne Smelting Corporation have come fully up to expectations. Among special activities entered into during 1942 are two large operations undertaken for account of the Defense Plant Corporation—the melting and recasting of Government-owned silver loaned to war plants for industrial purposes, and the designing, construction and operation of a new plant for producing magnesium from dolomite.

Roan Antelope Copper Mines paid a dividend of 6d. for year ended June 30th last. The progress of mining operations brought certain problems entailing considerable changes in method of mining, and this has temporarily interfered with output.

Mufulira Copper Mines resumed dividends last year, enabling Rhodesian Selection Trust to pay a dividend of 7½d. Production from Mufulira was highest recorded for that property, but heavy taxation continued to absorb greater part of earnings.

Consolidated African Selection Trust paid dividends totalling 7½d., free of tax, for the year ended June 30, 1942. Operations at mines in Gold Coast and Sierra Leone proceeded satisfactorily, and aggregate diamond sales were substantially higher than for preceding year.

The Ultramar Co. is concerned with development and exploitation of extensive oil concessions in Venezuela. Exploratory work continues to be encouraging, but is curtailed by war conditions. Efforts are being made to bring the concessions to the stage of production as early as possible. New share capital is being issued, and Selection Trust is participating in the underwriting.

No field operations have taken place during the past year on the properties in Orange Free State, in which the company is maintaining its interest.

(Continued from page 831)

outstanding impression left by the report and its recommendations is of their sound practicability and common-sense, although a warning note is sounded that at present prices, the houses they recommend would be beyond the means of the tenants. There is no demand for Utopia; the recommendations are of minimum standards, and prudence and moderation are behind the opinions expressed. The tenants questioned all live under good landlords, and can be classified roughly as those who employ no paid domestic help. There is evidence of some distrust, on grounds of unfamiliarity, for certain amenities which elsewhere are considered necessities. An example is the provision of constant hot water from an outside source (its reliability was questioned, but, oddly enough, the idea of central heating was liked), although the Society recommends its

LEA-FRANCIS ENGINEERING (1937), LIMITED

SUCCESSFUL RESULTS

The fifth annual general meeting of Lea-Francis Engineering (1937), Limited, was held, on the 21st instant, at the Masonic Hall, Coventry.

Mr G. H. Leek (chairman and managing director), addressing the shareholders said:

The accounts of this, the fifth, year of trading are presented in the same form as last year, with the exception that paper restrictions have reduced the size of the balance-sheet, and the comparison figures are shown again in pounds only, without shillings and pence.

If you will refer to the profit and loss account you will see that the gross profit on trading has increased from £51,000 to £90,000.

EPT hits this company severely, and we have had to provide £72,000 for EPT, income-tax and any contingencies. I would like to say that in this amount provision has been made for all income-tax on profits earned up to date.

Your directors have considered it desirable to write off the whole of the underwriting commission of £2,880, and £2,385, being 25 per cent. of preliminary expenses. I am sure that this will have your approval and I hope that it will not be long before the remainder of the preliminary expenses is eliminated from the balance-sheet.

After making this appropriation, it is proposed to pay a dividend of 8 per cent., which you will observe leaves a balance of profit of £2,298 to be carried forward. This amount compares favourably with £410 brought forward from last year.

It is hardly necessary for me to point out that both the debenture and mortgage have been paid off. The repayment involved other financial matters, and your directors authorised the borrowing temporarily of £10,156, which amount was repaid within three weeks.

As you are aware, I am allowed to say very little on the company's activities, but I am pleased to state that our relations with the various Ministries, and with the main contractors with whom we have been associated since January, 1939, are most happy.

The works are engaged day and night, and the financial result has been brought about by the wholehearted support and loyalty of the employees, both executive and productive. A good proportion of them have been associated with me for more than 25 years and there is no doubt that this long association of mutual understanding is reflected in the good results obtained.

The chairman concluded by moving the adoption of the report and accounts and the payment of a dividend of 8 per cent., less income-tax. This was seconded and carried unanimously.

The retiring director, Mr A. H. Perkins, was re-elected, and the auditors, Messrs Leech, Evans and Co., re-appointed.

The meeting closed with a vote of thanks to the chairman, who, it was stated, since the blitz of November, 1940, spent five nights every week at the works.

CABLE AND WIRELESS, LIMITED

(THE OPERATING COMPANY)

DIVIDEND OF 4 PER CENT.

The fourteenth ordinary general meeting of Cable and Wireless, Limited (the "operating" company), was held, on the 23rd instant, in London.

Sir Edward Wilshaw, K.C.M.G. (chairman and managing director), presided.

The accounts for the year 1941 showed a balance of £3,341,956 to be carried to the next account (subject to excess profits tax and other payments). From this sum a provision of £2,840,000 has now been made to meet excess profits tax, income-tax, and transfer to special account in accordance with the agreement with H.M. Treasury. Further, a sum of £200,000 has been added to general reserve. These appropriations leave a net amount of £301,956 to be carried to 1942.

The profit for the year, 1942, after meeting expenses and making necessary provisions, amounts to £1,278,718, and, adding the net amount brought forward from 1941, there is a sum of £1,580,674 available.

Out of this the directors have already paid an interim dividend of 1½ per cent., and they now recommend the payment of a final dividend of 2½ per cent., making 4 per cent. for the year. These dividends require £1,200,000, leaving £380,674 to be carried forward to the next account.

The directors regret that they have again to record casualties among the staff of the company. During the past year some have lost their lives while they were engaged in the service of the company, and the directors are still without news of the fate of many of the staff who were formerly employed in the Far East.

TRIBUTE TO THE STAFF

Sir Edward Wilshaw, expressing a tribute to the staff, said: It is fitting that I should again place on record here the pride I feel in the staff, whose fine and devoted service throughout these long years of war has enabled the company to play its vital part in the struggle. Their work has been arduous and exacting, but whether it was in times of depression and adversity, in situations of peril on the high seas in our ships or in transit to their posts, under bombardment in this country and in such stations as Gibraltar and Malta, under invasion in the Far East, or in brighter and more hopeful days, they have risen magnificently to every call upon them to get vital war traffic through in the face of difficulties of which only they can realise the full extent.

It is a matter of pride and gratification to me that several specific cases of individual bravery in the execution of their duty on the part of members of the staff of the company have been honoured by recognition from His Majesty in recent Honours Lists.

The chairman then moved the adoption of the report and accounts and the payment of the dividends as recommended.

Admiral H. W. Grant, C.B., seconded the resolution and it was carried unanimously.

installation wherever possible. The primary conclusion is that space and privacy must be the first consideration. It is perhaps for this reason that the numbers who preferred flats (even though some were flat dwellers) was small. Of those now living in cottage estates in the provinces and outer London, only three per cent preferred flats, but in London itself 21 per cent preferred them. Special attention has been paid to the living room problem, and its relation to the scullery and the parlour. It appears that a scullery in which meals can be taken is wanted, and that there is a great demand for parlours to supplement the living room, and not merely "for visitors." Space outside the dwelling (a function of the desire also for privacy), with sunshine and "greenery," is almost as important as the dwelling itself. Inside, the size of rooms wanted is moderate—a minimum of 180 square feet for the living room, although

there is a demand for more bedrooms than is at present laid down by housing standards. Cooking and heating facilities, gardens, cupboard and storage space, facilities for laundering, and the special needs of different sized families and the aged are all examined. The report provides a well-balanced and sound basis for discussion of the post-war homes of families with small incomes

Colliery Freeholds

Under the Coal Act, 1938, by which the State acquired the ownership of the coal royalties and unified their control through a new Coal Commission, colliery undertakings owning freeholds were given the right to a lease on terms "so framed as to secure that their financial position in respect of working the coal shall neither be adversely affected nor improved." They were to receive their agreed compensation payments, but on condition that these were returned together with the value of the relief from Mineral Rights Duty and the Royalties Welfare Levy "in the form of a rent payable for the period in which it was estimated that the coal would be worked out." When the measure was under discussion the colliery owners pleaded for the insertion of a clause giving them the option of handing over the compensation and receiving in return a lease at a peppercorn rent. This application was opposed by the Government, and the original clause enacted. Experience since July 1, 1942, when the Act became operative, has proved the clause (sub-

section 2 of Section 13) to be unworkable. When introducing an amending Bill in the House of Lords, on June 8th, the Earl of Munster pointed out that it was not possible to state precisely beforehand either the period it would take to work the coal out, or to estimate the rate of output per annum. Moreover, economic and financial conditions have changed so much since 1938 that it is now thought impossible to determine whether the financial position of the freeholder would be adversely affected or improved by the terms originally contemplated. The new Bill, therefore, amends the principal Act to provide that the colliery freeholder shall refund his compensation to the Coal Commission, and take a lease at a peppercorn rent, but carrying the same liabilities as he did as a freeholder. It is possible, however, that after further discussions of the Bill the proposed amendment will be withdrawn, and only the latter part of sub-section 2 of Section 13 repealed. It appears that during recent discussions between the Commission and the Ministry of Fuel a suggestion was made that the Government would be prepared to adopt this course if the owners retained their compensation, and took a lease on terms that were fair between landlord and tenant in the ordinary way. Apparently, most of the colliery freeholders are agreeable to this procedure, particularly in view of the burden of the present high income-tax and of their continued liability for the mineral rights and royalty welfare levies under a peppercorn lease. The views of the different districts of the Mining Association have been ascertained during the past week, and they have been communicated to the Government.

RECORDS and STATISTICS

STOCK EXCHANGES London

Note: all dealings are for cash

SOME improvement in both turnover and prices has been evident in the markets during the past week. Numerous gains ranging from $\frac{1}{2}$ to $\frac{1}{4}$ were registered in the *gilt edged* market, reflecting, in part, the virtual conclusion of the country-wide savings drives. Activity in the *foreign bond* market was at a low ebb, and there was practically no improvement in prices on some inquiry for European and South American bonds. Little interest was displayed in the *home rail* market where apart from scattered declines for the equity and marginal stocks, quotations were hardly changed. Argentine rail stocks were dull throughout, losses for junior and senior issues ranging from $\frac{1}{2}$ to 1 point. San Paulo, which had fallen some 9 points on the accounts, recovered 5 on the news of an increase in charges.

There was little of note in the *industrial* market, where fluctuations were generally insignificant. Brewery shares were slightly firmer than of late, while, among tobacco issues, Imps advanced $\frac{1}{2}$. Movements in the motor and aircraft section were erratic, De Havilland gaining $\frac{1}{2}$ on the week, while AEC and Leyland fluctuated widely, with little change on balance. Heavy industrial stocks were dull early this week, but in a later recovery Powell Duffryn was outstanding, with a rise of 1s. 3d. on the increased distribution. Courtaulds, Lancashire Cotton and English Sewing Cotton were prominent in a firm textile group, while among shipping shares, Anchor Line was outstanding with a gain of 1s. 6d. Dollar shares recovered strongly on the news of the settlement of the coal dispute after earlier setbacks, and elsewhere Radiation and Sudan Plantations were well supported.

The lower dividends had been largely discounted by the Cape, and prices this week in the *kaffir* market responded sharply to demand from that quarter. In particular, Far Western Rand issues were bought, Blyvoors advancing 5s. 6d. on the week. Others to advance were West Wit Areas, Rand Mines and Geduld. *Diamond* shares were active on news of the record sales at the "sights," De Beers, Consolidated Diamonds and Anglo-American Trust all advancing strongly. In the *tea* market, Indian issues were in favour, but there was

little of note in the *rubber* market. In contrast to recent weeks, oil shares were strongly supported. Burmah and Anglo-Iranian both advanced $\frac{1}{2}$ and Shell $\frac{3}{4}$, while among other shares, Trinidad Freeholds were outstanding with a rise of $\frac{1}{2}$.

New York

ANTICIPATION of early developments in the European theatre of war resulted in some of the slowest sessions on Wall Street this year. With both buyers and sellers holding off, prices fluctuated narrowly without trend. The effect on prices of the revival of the coal crisis was slight and markets were irregular on the settlement.

CONVERSIONS AND REPAYMENTS

Bengal - Nagpur Railway.—The £2,000,000 4 per cent. debenture stock outstanding will be repaid on January 1, 1944.

Shorter Comments

Oreogum Gold Mining Company of India (£000s).—Profit for year £93 (£74). To income-tax £60 (£20). NDC and EPT £6 (£3). Machinery £20 (£20). Contingency £3 (£3). Ord. dividend nil (5). Forward £15 (£9).

Nitrate Railways Company (£000s).—Gross receipts £198 (£168). Working expenses £190 (£167). Net surplus £7 (Dr £16). Divs. on ord. and pref. conv. ord. shares 1½ per cent. as before. Carry forward £196 (£183).

Antofagasta (Chile) and Bolivia Railway (£000s).—Balance on net revenue account 1942 £272 (£247), which it is proposed to carry forward. The balance is struck after making provision for income tax, full year's interest on debenture stocks and contributions to renewals and staff benevolent fund.

GOVERNMENT RETURNS

For the week ended June 19, 1943, total ordinary revenue was £26,519,000, against ordinary expenditure of £91,601,000, and issues to sinking funds of £135,000. Thus, including sinking fund allocations of £1,953,077, the deficit accrued since April 1st is £802,315,000 against £668,305,000 for the corresponding period a year ago.

COMMODITY AND INDUSTRY NEWS

Control of Soya Flour.—The Minister of Food has made a new Order controlling soya flour. The effect will be to prevent the pre-packing of soya flour after June 30, 1943. Holders of stocks will, however, be granted adequate time to dispose of their holdings. Soya flour will, in future, be used primarily by manufacturers, but in order to assist vegetarians, etc., a quantity of loose soya flour will in due course be available at a price not exceeding 5d. per lb. The soya flour referred to is distinct from low-fat soya products for incorporation in sausages.

Export Control.—By the Export of Goods (Control) (No. 6) Order (S.R. and O., 1943, No. 842), which comes into force on July 5th, control is extended to cover putty, silica bricks, spectacle lenses and blanks; and additional metal goods, machinery, rubber manufactures and chemicals.

Argentine Linseed.—Recent events in Argentina do not appear to have had much effect upon export trade. Shipments of linseed are taking place from ports other than Buenos Aires. Plate is offered in volume by the Grain Board, and is in demand by the American Economic Committee for account of the United Nations.

Sugar for Jam.—The sugar ration will be doubled for the weeks beginning July 11th and 18th, making it 1 lb. per head weekly. This concession is for jam-making. In addition, the option to take sugar instead of preserves (1 lb. of sugar in

place of 1 lb. of preserves), which began on April 4th and was to end on June 26th, has been extended until August 21st. The concession is for the benefit of those who grow their own fruit, but the Ministry of Food announced this week that the plum crop should be good (though not as heavy as last year's crop), and some should be on sale at the shops.

Transport for Harvest Workers.—Arrangements for the conveyance of large numbers of additional farm workers required for gathering in the harvest have been simplified by a Ministry of War Transport Order which allows the use of motor goods vehicles for this purpose without the issue of the public service vehicle permits and road service permits which are normally necessary. The Order, which took effect on June 21st, will remain in force until November 30, 1943. Motor vehicle insurers have agreed that the arrangements for insurance cover for the carriage of farm workers on motor goods vehicles shall be effective during the 1943 harvesting season as they were during the corn harvest in 1942.

Soft Drinks.—The Minister of Food has made the Soft Drinks Order, 1943, prescribing maximum prices and ingredients for an approved range of soft drinks. The Order also revokes previous Orders governing the production and distribution of soft drinks, viz., The Soft Drinks (Current Prices) Order, 1942, the Soft Drinks (Licensing and Control) Order, 1942, the

Soft Drinks (Marking of Containers) Order, 1942, and the Soft Drinks (Returnable Containers) Order, 1942, but re-enacts their operative provisions in a single consolidating document which thus forms a Soft Drinks Code. In this Order soft drinks are defined, as previously, under the headings of concentrated and unconcentrated. The Order lays down that liquid soft drinks shall only be sold in containers of prescribed sizes, which must be filled to normal filling level, and sets out maximum prices for soft drinks so sold. Provisions regarding maximum prices and ingredients come into effect on June 27, 1943, in respect of licensed manufacturers, and on July 31, 1943, in respect of other sales. The Order requires all manufacturers and packers of soft drinks to be licensed.

COMMERCIAL HISTORY OF 1942

Vol. CXLIV

MARCH 13, 1943

No. 5194

**FIRE DAMAGE CAUSED BY 1,000 FIRES A DAY
HAMPERS WAR EFFORT**

*Half the fires in the country are caused
by matches and cigarette ends*

*Most fires are caused
by 'careful' people*

Don't just be careful—take EXTRA care

ISSUED AS PART OF THE FIRE OFFICES' COMMITTEE CAMPAIGN AGAINST FIRE WASTAGE

Land Army and prisoners of war. The numbers of the Women's Land Army employed full time in agriculture rose to 53,000 in England and Wales. For 1943, a considerable increase in the area under wheat has been demanded, to attain which another half-million acres of grassland must be ploughed.

Manpower and Labour Conditions

No new principles affecting manpower policy were introduced during 1942, but the year saw increasing stringency in the application of existing regulations, the extension of the Minister of Labour's powers of direction and the introduction of measures designed to accelerate the call-up procedure and to reach hitherto untapped sources of manpower. Towards the end of the year, it was announced that about 18 million men and women had been registered under the National Service Acts and Registration for Employment Order, and that out of 33½ million people between 14 and 65, some 23½ million were engaged on full time work of national importance. The Royal Proclamations of March 5th and October 22nd provided for the calling up of men between 18 and 46, and of women between 20 and 31. By the Registration of Boys and Girls Order, the 16-18 year-olds were registered, interviewed and encouraged to join recognised youth organisations. At the beginning of the year the system of occupational block reservations was replaced by individual deferments, and the age of reserva-

tion was raised by one year each month. The chief drive, however, was in the direction of recruiting women in order to release men for the fighting services. The Employment of Women (Control of Engagement) Order was applied in February to women between 18 and 30. Many measures were taken to promote part-time employment, but their success was rather limited; some 250,000 women were working part time, but an increase to a million or more was hoped for. By the end of October some 7 million women, of whom 2½ million were married and 1½ million subject to the National Service Acts, were occupied in the armed Forces or industry. The extent to which women are engaged in industry can be seen from two examples: women represented 13½ per cent of the labour force in industries covered by the Iron and Steel Control, as compared with 3-4 per cent before the war, and 60 per cent of the total labour force of Royal Ordnance factories.

By the end of the year, it became clear that the most important problem was how to achieve maximum efficiency and productivity from the existing labour force, since little fresh intake could be looked for. Some improvements were effected in the provision of training facilities both inside the factories and in special training centres, but there was often considerable delay in "upgrading" women. Increasing recognition was paid during the year to the need for developing welfare both inside and outside the factory. There was a substantial extension in industrial canteens, pithead canteens and British restaurants—by the end of the year there were 7,500 industrial canteens and 1,900 British restaurants in operation—and in order to encourage the recruitment of married women the number of wartime nurseries was increased, and by December was well over 1,000. Increasing attention was also paid to health and safety, though much remained to be done in improving working conditions, billeting arrangements and transport facilities for war workers.

By the end of the year, 54,000 factories, employing 7½ million men and women, were scheduled under the Essential Work Orders; proceedings against workers for absenteeism amounted to only one in 30,000.

The most important development in industrial relations during 1942 was the establishment of Joint Production Committees in the engineering and allied industries and in coalmining. By December there were 2,000 such committees in engineering works, covering nearly two million workers.

During the year substantial claims for wage increases were put forward by nearly every branch of industry. The accompanying tables show the course of wages and the cost of living, and also the progressive decline in unemployment and the slight increase in trade disputes.

Commodity Prices

THE general trend of costs and prices continued upwards in 1942, but the rate of advance was small, a reflection of the effectiveness of price control. Wage rates showed a further rise, but a large part of the rise in actual weekly earnings was due to increased productivity.

Apart from the increase in coal prices, the upward movement in the prices of basic materials was comparatively small. Where the pressure of demand necessitated the utilisation of high-cost capacity, control ensured that average prices were not determined by marginal costs. The *Economist* index of wholesale prices, reflecting the course of the prices of primary and semi-manufactured products, rose only slightly, from 108.5 (1927 = 100) at the end of 1941 to 112.7 at the end of 1942. (Details of the index are given on page 27.)

There is no satisfactory index showing the movement of the prices of manufactured goods, distinguishing between civilian and war supplies. But in both spheres price control has become more efficient. The standardisation of consumers' goods has facilitated price control.

The Ministry of Labour's cost of living index has remained almost unchanged throughout the year; advances in some directions have been offset by reduction in others. But stability has only been achieved by some increase in subsidies.

Outside the range of controlled prices—those now comprise practically all essentials—upward movements have been substantial, especially in luxury articles. On the whole, however, the Government has so far been fairly successful in putting on the brake. It must be remembered, however, that 25 years ago the major upward surge in prices took place after the war.

Finance and Investment

The Stock Exchanges

As far as equities are concerned, 1942 was almost a repetition of the previous year. But whereas in 1941 the markets had taken their lead from the funds, which, supported by the proceeds of periodic vestings, steadily improved, the rôles were last year reversed. The reasons were twofold, the considerably reduced disbursements on vesting operations and the extremely low yields obtained on fixed interest

New Capital Issues

In 1942, for the first time since the outbreak of war, there was a check to the expansion of new capital issues. The first two tables below, in the first case excluding and in the second case including, issues by "permission to deal," show that official borrowing, apart from floating debt and

tax certificates, declined from £1,497.5 millions to £1,457.1 millions. On the wider basis, the total of all issues declined from £1,509.8 to £1,467.2 millions; on the narrower basis the index, 1928 = 100, is down from 406 to 398. The growth in official control of the new issue market, which has been a feature of development since the outbreak of war, is, however, accentuated.

TOTAL BORROWING, INCLUDING STOCK EXCHANGE "Permission to Deal" (Million £)

Calendar Years	British				Empire	Foreign	Total Issues

* Including County and Public Board Loans.

The total of non-official issues shows a relatively steeper decline than that of Government issues from £12.3 millions to £10.1 millions. The apparent decline is much more than offset by net issues of tax certificates so far as official loans are concerned, while the need of the Treasury to borrow was reduced by ability to draw on the gift from the Government of Canada of some £225 millions. There is no reason to conclude that the upper limit of Government borrowing has been reached. It is too early to conclude that the entire productive capacity of the nation is working to the limit,

FULL EMPLOYMENT

A series of articles and letters in *The Economist* on the ways and means of securing Full Employment after the war have been reprinted as a pamphlet. Copies are still available (price 6d.); and applications should be made to The Economist, Brettenham House, Lancaster Place, London, W.C.2. (Tel. Temple Bar 3316.)

Industrial Profits

FOR the fourth successive year the net profits after debenture interest, as published by companies during the year, have fallen. The figures show a smaller decline than in other recent years, except that for 1940, but as the figures are not strictly comparable, it is doubtful whether any real significance can be attached to this fact. Actually gross profits before tax are tending towards stability. Movements over the past decade are shown below:

COMPANY REPORTS PUBLISHED IN CALENDAR YEARS 1932-42

	No. of Companies	Net Profits*		"Chain" Index, 1928=100

* 1940, 1941 and 1942 figures are not strictly comparable with previous years.

† Whole year. New basis.

The figures for the final quarter of 1942 are based on the new gross profits. As these contain the tax on reserves, excluded from earlier calculations, the proportion of the total going into this section and the yield on ordinary shares are increased, and the proportions going to the payment of preference and ordinary dividends, but not the payment on the latter, are correspondingly reduced.

The Money Market

WITHIN the framework of a steadily expanding structure of bank credit the position in the money market remained exceptionally stable during 1942. The average rate for Treasury bills was about 1-32 per cent over 1 per cent, and the weekly rate only fell fractionally below 1 per cent when special applications by official quarters had to be satisfied irrespective of the rate at which the bills were issued. The authorities kept a light rein on the short loan market, and if ever serious shortage of credit developed as a result of the temporary disequilibrium between Government receipts and payments, the position could always be adjusted by the appropriate open market operations. The whole year passed without any necessity for the discount market to seek assistance from the Bank of England at the customary official rates. Whenever assistance was needed, it was given through open market operations on open market terms. The volume of bills and bonds carried by the market was probably greater last year than it was in 1941, though the short loans of the clearing banks showed little change on the figures for 1941, the averages being £133 million for 1942 and £134 million for 1941. The year-end balance sheets of the discount companies, however, all showed a much higher ratio between these companies' capital resources and the bills and investments they were carrying at the end of the year. From the point of view of the banks, bills yielded further to Treasury Deposit Receipts as the channel for employing funds that must be held liquid. The bill holding rose from £171 million at the end of the year to £108 million at the end of 1942. These TDR's were extensively used by the banks as a means for meeting sudden and large calls made on their funds by subscriptions to the tap loans of the Government. The special facility by which TDR's can be encashed before maturity and without penalty in order to finance such subscriptions was found most useful in preserving the even keel of credit conditions throughout the year.

Foreign Exchanges

THE mechanism of the sterling exchange control had been brought to a pitch of considerable efficiency by the close of 1941 and the year 1942 saw no important amendments introduced. The list of official rates of exchange remained unchanged over the whole year. The only important change in exchange relationship introduced during the year was the fixing of a rate between dollars and sterling on the one hand and North African francs on the other. The first rates chosen immediately after the Allied invasion of North Africa was 300 francs to the £. Following representations and complaints, this was subsequently altered to 200 francs to the £—and correspondingly, from 75 francs to 50 francs to the dollar. The rate fixed for the Italian territories of North Africa was 480 lire to the £. The occupation of North Africa led to the interesting precedent of an issue of sterling notes by the British Military Authority. These notes are legal tender only in the occupied territories for which they are intended and were issued to meet the immediate requirements of the military authorities.

Two additions were made last September to the list of "specified currencies," i.e., currencies which must be surrendered to the Treasury if held by any resident in this country. They were the Brazilian milreis and the Uruguayan peso. In each case the decision was an indication of a change in the balance of payments between these two respective countries and the sterling area. That balance moved in their favour and consequently created a need for their currencies which the Treasury had until then not felt. Soon after the end of the year arrangements were made to merge three types of sterling accounts held in this country by residents in the United States. They were, registered accounts, sterling area accounts and "old" or "free" accounts. They have all become registered accounts carrying the right of conversion of the sterling held in them into dollars at the official rate. The move involved the final disappearance of the free sterling market in New York.

The Bullion Market

THE gold market remained rigidly stable and almost lifeless throughout the year. The official price of gold was at 168s. per ounce during the whole of the year, with sovereigns at 39s. 3d. each. Business in gold was chiefly

confined to a few sales to the Bank of England, most of which were by order of the Custodian of Enemy Property and concerned gold which had been held for safekeeping in London since before the war. As from January, 1942, the Bank of England has been prepared to supply gold to the market through authorised dealers for certain specified industrial purposes. The volume of sales made under this head has been negligible.

The silver market in London remained completely isolated from the vagaries of the price of the metal in such centres as New York and Bombay. The level of prices was fixed by the readiness of the Bank of England to sell silver for recognised essential purposes at 23½d. per standard ounce. Only on rare occasions did the open market in London dip below this ceiling, and the year's range of prices for spot silver, namely 23½d. to 237-16d., was the smallest ever recorded in the history of the London silver market. The feature of the silver position in the

United States was the enlistment of the metal in the ranks of war workers. Treasury silver has been made available to US industry and it has been promised to the United Nations on Lend-Lease terms. On August 24th the price of imported silver was raised from 35c. to 45c. an ounce, partly as a gesture of help to Mexico, but also to accelerate the production of a metal which, owing to the shortage of tin, had acquired considerable strategic importance. In India the free market in Bombay has been left to its own devices since February 20, 1942, when the Reserve Bank ceased to supply silver at a fixed price. Owing to persistent hoarding demand the quotation rose from the figure of Rs.64 per 100 tolas, at which the Reserve Bank has been selling, to Rs.117 per 100 tolas. This was above the minting point of the old rupee coinage, which is Rs.109 per 100 tolas, and the quotation has since relapsed below this minting parity, hovering for the most part between that ceiling and Rs. 100 per 100 tolas.

Overseas Countries

United States

FOR the first time in history, war has become this country's principal business. This was never really the case during World War I. Even in the peak spending year, 1918-1919, the war costs represented only one-sixth of the current income. By contrast, defence spending in the calendar year 1942 totalled close on \$55 billions, or about 47 per cent of national income. In 1943 it is estimated that it will amount to \$90 billions, or two-thirds of the estimated national income, possibly rising to \$100 billions for the fiscal year ended June 30, 1944.

It is scarcely surprising that spending at such a prodigious rate should have tested to the limit the nation's resources in materials, men and productive power. That such was the case is abundantly clear from all the economic statistics, as well as from particular examples chosen more or less at random. Typical of the latter is the

case of the automobile industry. Production of civilian vehicles began to be curtailed during the latter part of 1941, but it was not until February, 1942, that the last passenger car rolled off the assembly line. Nevertheless, the motor industry was able to report at the close of the year that it had had far and away the biggest production year in its history. It turned out war equipment valued at \$6.6 billions. That is the equivalent of an output of 8.5 million passenger cars, or nearly 60 per cent more than were produced in 1929, the industry's greatest peacetime year.

Even more spectacular, if anything, was the performance of the country's shipbuilders, who, side by side with an unprecedented naval building programme, were able to produce 8 million tons d.w. of merchant shipping (and who propose to double that in 1943). This compares with a previous record of 1.85 million tons in 1918. The performance has been made possible by two factors: first, the

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

building of some 25 ship-ways for every one that was in existence four years ago; second, enormously improved production efficiency, which has reduced sensationally the time required for a ship's completion. In the course of a single year the average time required for building a "Liberty ship" has been brought down from 180 days to 56 days. The best time made in World War I for the same type of ship was 212 days.

The production index of the Federal Reserve Board, which had averaged 123 in 1940 and 156 in 1941, averaged 180 last year. The mark of 191, reached in November, represented a rise since September, 1939, of 77 per cent. The index of durable goods production was up in the same period by more than 150 per cent. Steel production rose to 86.1 million tons, against 52.8 millions for the last pre-war year; building contracts were at an all-time high of \$7,915 millions, compared with \$6,627 for the record peacetime year of 1928; power production was 45 per cent over the 1939 level; and factory pay-rolls showed a rise since the beginning of the war of nearly 150 per cent. Another index is being watched more closely, if anything, than that of the Federal Reserve Board. This is the index of munitions production recently prepared by the War Production Board. How rapidly the American war effort has expanded since 1940 is emphasised by the table below showing the course of that index:—

MUNITIONS PRODUCTION
(Nov. 1941-100)

	1940	1941	1942
January	...	41	163

September	22	83	370
October	27	91	382
November	34	100	...
December	50	133	...

Labour.—In 1941, the unemployment of the 1930's finally disappeared. At the end of October, 1942, the National Industrial Conference Board placed the number of persons in uniform or gainfully employed in business, in the factory or on the farm at 59.5 millions, which would indicate "negative" unemployment of four millions. That is, four million persons were working who are not included in the normal reservoir of employables. The figures of Paul McNutt, Manpower Commissioner, are somewhat lower than this, but he indicates that, by the time the armed forces reach their maximum strength of close on 10 millions at the end of the present year, the total number of persons fighting and gainfully employed will be in the neighbourhood of 65 millions. This would compare with 48 millions employed in the boom year 1929.

National Income.—The national income, whose peacetime high in 1929 was \$82.4 billions, soared to \$117 billions last year, and it is expected to reach \$135 billions in 1943. Wages and salaries accounted for 70 per cent of all income paid out, while interest and dividend payments, held down by wartime taxes, represented only 8 per cent of the total, against a pre-war 12 per cent. Corporation net income before taxes was 10 per cent higher than in 1941, but showed a decline after taxes of 33 per cent. It is estimated that taxes absorbed 72 per cent of corporate net income in 1942, which compares with a maximum of 45 per cent in 1918 during the last world war. The farmers had easily the best year in their history, cash income totalling \$15.6 billions, a full billion dollars more than that of the previous best year, 1919.

Prices.—The question of inflation has loomed as a major problem throughout the year. Wholesale commodity prices have behaved better than in World War I, when they rose 80 per cent in the first thirty-nine months; nevertheless, they had recorded an extreme rise by the end of 1942 of 33 per cent. Farm and food prices, which rose by 81 per cent and 55 per cent respectively since August, 1939, were the main factors in the advance. The price control machinery was tightened under the general price ceiling regulations of May and the stabilisation decree of October, but the pressure on prices is becoming more severe.

Canada

DURING 1942, Canadian industrial activity moved beyond the stage of construction of productive facilities into the stage of peak production, which was expected to reach a

maximum volume early in 1943. The programme of expansion has added \$1,000 million in value to Canadian productive capacity. The construction in the Saguenay region of a hydro-electric power station and dam, which is among the world's largest, has been disclosed. Producing 1,020,000 horsepower, it will be a permanent addition to national capacity. Steel capacity was expanded to an annual rate of 2,900,000 long tons, compared with 2,412,000 tons in 1941 and a pre-war capacity of 1,400,000 tons.

War Production and Trade.—In producing export surpluses of munitions and war equipment, Canada occupied third place, after the United States and the United Kingdom. Thirty per cent of Canadian war production was retained for Canada's armed forces, the remainder going to the United Nations. Distribution has been through two main channels, shipments financed by Canada under the \$1,000 million gift account from which allocations were made by the United Kingdom Government and United States contracts amounting to \$900 million. Canadian industrial war production reached \$2,500 million in value, and in addition the production of raw materials and food-stuffs for allied countries reached \$800 million. One half of Canada's production was devoted to war purposes, with 55 per cent of all industrial machinery engaged on war production. Exports in 1942 were valued at \$2,385 million compared with \$1,641 million in 1941. This total includes heavy shipments of supplies to the theatres of war.

Agriculture.—The Dominion Bureau of Statistics estimated the value of field crops in 1942 at \$1,180,131,000, which is \$500 million higher than in 1941 and the highest figure for more than 20 years. The wheat crop alone was worth 73 per cent more in 1942 than in 1941; its volume was 615 million bushels, exceeding the previous record wheat harvest of 566,700,000 bushels in 1928. Total farm income in 1942 reached an estimated \$1,800 million.

A year-end review of farm production showed that output had been attained in excess of previous records in commodities of special war importance:—

Beef cattle	1,111,372 head
Calves	739,231 "
Hogs	6,251,000 "
Sheep and lambs	809,934 "
Chickens	193,288,000 doz.
Eggs	266,500,000 lb.
Factory cheese	200,000,000 "
Creamery butter	281,000,000 "
Evaporated milk	182,000,000 "
Condensed milk	24,210,000 "
Powdered milk	11,500,000 "

Finance.—The Canadian national income rose in 1942 to an annual rate of \$8,000,000,000, of which 50 per cent was derived from wages, 22 per cent from farm income, 10 per cent from investments and the remainder from salaries and sundry sources. The problem of financing Federal Government expenditures of \$3,900 million, provided in the Budget of 1942-43, has been intensified by the fact that war requirements have substantially exceeded the estimate, and total expenditures are expected to reach \$4,500 million, with tax revenues \$2,225 million. Including the Third Victory Loan, which yielded \$992 million, the total issue of Dominion Government securities of all kinds, including refunding but exclusive of Treasury Bill financing in the 12 months to October 31st, was \$3,150 million. This total included \$645 million of the new $\frac{1}{2}$ per cent deposit certificates sold to the chartered banks from July to October. Of these, \$205 million had been redeemed in November.

A report at October 31, 1942, on the chartered banks of Canada showed:—

(Millions of Dollars)		Compared with previous year
Loans	3,102.4	-168.1
Investments	2,378.9	+736.0
Deposits—Demand	1,609.1	+473.5
Savings	1,708.7	+117.0
Total Deposits	3,317.8	+590.5
Foreign deposits	528.3	+68.2

Price Control.—More stringent and direct controls over civilian consumption and supplies have been elaborated during 1942. Consumer rationing became necessary, though rationing at the manufacturing level had been in operation previously. The second year of the price ceiling began on December 1st, and, by then, coupon rationing had been applied to sugar, tea, coffee and gasoline, the latter by the Oil Controller of the Department of Munitions and Supply. The Wartime Prices and Trade Board's programme of

simplification and standardisation, designed to reduce costs in order to reduce subsidies, was greatly extended. The use of metals, for instance, was prohibited in the manufacture of 600 miscellaneous articles. A turning point in price control was reached in December, 1942, when the Minister of Finance announced that direct subsidies would be paid on food items, starting with milk, oranges, tea and coffee, in order to reduce the cost of living.

Manpower.—Shortages of labour began to replace shortages of materials as the critical factor in Canadian production during 1942. The Bank of Canada estimated that the number of workers directly employed in war industry had exceeded 900,000 in September. The degree of mobilisation was revealed in the bank's estimate that the total number of employed persons, including those in agriculture and the armed forces, had reached 5,500,000 by September, or 48 per cent of the entire population. The Government's programme of selective service was launched in March, and the permit system of labour control was introduced. Initial difficulties arose in organising the machinery of Manpower control, and the employment office system of the Unemployment Insurance Commission was greatly enlarged.

Australia

Finance.—The expenditure of the Commonwealth Government in the financial year 1941-42 amounted to £A420.9 millions (including £A319.5 millions on the war), compared with the budget estimate, made in October, 1941, of a total annual expenditure of only £A325 millions. The Budget estimate for the financial year 1942-43 provides for an expenditure of £A549 millions (including £A440 millions war expenditure), of which £A300 millions are to be raised by borrowing (compared with £A210.9 millions in 1941-42). Deposits in Australian cheque-paying banks increased from £A444.1 millions in the third quarter of 1941 to £A490.6 millions in the third quarter of 1942; saving bank deposits rose from £A263.6 millions in October, 1941, to £A301.5 millions in October, 1942; subscriptions to war saving certificates amounted to £A19.9 millions in October, 1941, and to £A29.4 millions in October, 1942.

Employment and Industry.—Between 400,000 and 500,000 men and women were directed to war work during 1942. The unemployed percentage of the total number of workers fell, according to trade union statistics, from 3.2 per cent in the third quarter of 1941, to 1.6 per cent in the third quarter of 1942. It was then particularly low in the following trades: wood, furniture, etc. (0.9 per cent); engineering, metal works, etc. (1.1 per cent); clothing, etc. (0.6 per cent); books, printing, etc. (0.4 per cent). It was still comparatively high in the food, drink, tobacco, etc., industry (4.3 per cent), in the building industry (2.3 per cent), and in the mining, etc., industry (3.6 per cent). The

employment in Government ordnance factories rose from 74,600 to 113,100 between December, 1941, and September, 1942, while employment in other factories decreased from 612,300 to 593,700 in the same period; the latter figure includes only about 200,000 persons employed on strictly civilian work. Employment in retail shops decreased from 165,500 in December, 1941, to 137,000 in September, 1942. The average working week in the six State capitals was 43.77 hours in the first half of 1942, that is, slightly less than in the first half of 1941 (43.91 hours).

Trade.—Retail sales continued to rise until April or May, 1942; in the later months of the year the Government's austerity campaign and the growing exhaustion of stocks combined to reverse this trend. Retail sales in Sydney in the three months ended September, 1942, were 6 per cent smaller than in the corresponding period of 1941, in spite of a 9 per cent rise in the Australian retail price (cost of living) index over the same period; the Government, however, still regards this decrease as insufficient. Prominent among "austerity" measures taken in the summer and autumn of 1942 is the introduction of ration cards for tea (8 oz per five-weeks period); sugar (1 lb per week); and for clothing and footwear. The number of permits for new dwellings in Australian State capitals was only about 30 per month between July and October, 1942, compared with a monthly average of 1,486 in 1940-41. The Government initiated a large-scale programme for the manufacture of utility goods.

Transport.—Australian railway activities during the twelve months ended August, 1942 (with previous twelve-months' period in brackets) were as follows:—Freight carried per day, 17,114,000 (14,171,000) net ton miles; number of passenger journeys per day, 1,314,000 (1,153,000); net revenue per month, £A1,723,000 (£A1,055,000).

New Zealand

External Trade.—External trade figures for recent years compare as follows:—

Year Ended August 31st	EXTERNAL TRADE £ Millions			
	In New Zealand Currency		In Sterling	
	Exports	Imports	Exports	Imports
1938	60.24	56.36	48.20	45.07
1939	57.94	55.08	46.32	37.05
1940	67.82	47.00	54.26	43.38
1941	63.96	45.43	51.17	36.35
1942	80.84	52.04	64.67	41.63

The excess of exports for the year was £NZ28.80 millions, of which about £NZ 12 millions would normally be needed to meet the passive balance of invisible payments.

Under war conditions, both the nature and direction of trade are closely controlled. Exports are mainly of produce

covered by the war agreement with Britain, and imports are confined chiefly to the most essential goods. The latter now include more war materials and raw materials for local manufactures, which have expanded considerably in the last three years. The limiting factor of production, both for export and local consumption, appears now to be manpower, which constitutes a difficult problem despite extensions of working hours, overtime, and the calling up of many women for essential industries. Shortages of labour and petrol, normally imported, have almost eliminated unessential road transport, but rail transport has profited thereby and, owing partly to import difficulties and partly to war demand, manufactures are growing rapidly.

Banking and Finance.—The following figures show the chief changes in the bank returns during the year ended September, 1942:—

COMBINED BANK RETURNS

£ NZ Millions			
End of September	1941	1942	Increase
Liabilities:—			
Note circulation.....	17.70	22.59	4.89
Deposits.....	86.12	103.92	17.80
Totals.....	103.82	126.51	22.69
Assets:—			
Advances to Govt. and Govt securities.....	42.29	55.86	13.57
Other advances.....	47.81	42.40	-5.41
Net overseas funds.....	25.68	40.39	14.71
Totals.....	115.78	138.65	22.87

Over the year, bank money in the hands of the Government and public increased by £NZ22.69 millions. Government advances from the Reserve Bank and Government securities held by the trading banks increased by £NZ13.57 millions, while trading bank advances to customers declined by £NZ5.41 millions, so that the net expansion due to internal causes was £NZ8.16 millions. To this must be added a further £NZ14.71 millions which reflects the expansion of funds held overseas. At the end of September, the Reserve Bank's reserve ratio exceeded 50 per cent, the highest figure reached since 1938. Money has been very abundant and there is evidence of hoarding of notes. The Reserve Bank's discount rate has remained at 1½ per cent throughout the year, and the trading banks' minimum overdraft rate at 4 per cent.

For the financial year 1941-42 state receipts totalled £NZ116.3 millions, including £NZ68.14 millions from taxation, and £NZ36.37 millions of loan money, while expenditure amounted to £NZ112.39 millions, of which £NZ34.47 millions was for the Consolidated Fund, £NZ13.53 millions for the Social Security Account, £NZ11.95 millions (loan money only) for national development, and £NZ52.44 millions for war expenses. For the present year development expenditure from loan money is reduced to £NZ4.5 millions and social security expenditure increased to £NZ15.93 millions. Consolidated Fund expenditure is slightly lower at £NZ33.1 millions, while war expenditure is estimated at £NZ133 millions, making a total expenditure of £NZ186.5 millions.

During the year ended August, the retail price index rose by 4 per cent; the wage index, which records minimum award rates and not total earnings, by 4 per cent; the wholesale price index by 10 per cent; and the export price index by 1 per cent.

South Africa

Finance.—National expenditure increased enormously during the year 1942, and a further increase was forecast by Mr Hofmeyr in his recent Budget speech. Whereas the estimate in 1941-2 was £72 millions, it was £80 millions in 1942-3 and the total expenditure for 1943-4 is estimated at £100 millions, of which defence accounts for £96 millions. The bulk of the new expenditure will be met out of increased taxation, and the shareholders in gold mines have been asked to make a greater contribution. The public debt at the end of the year stood at £416 millions, of which the greatest part was held in South Africa. The note circulation increased by about £7 millions over the previous year, and by the end of the year amounted to nearly £37 millions. The table shows the estimates of revenue 1942-3.

Trade.—The year saw a further decline in overseas trade. Imports fell in value from £101 millions in 1941 to £84 millions in 1942. The curtailment of world markets and shipping difficulties resulted in a great falling off of exports. Perishable crops, such as deciduous and citrus fruit, could

not be exported; the wool clip sold under agreement with the British Government could not all be exported, and a considerable balance accumulated. To a minor extent the restriction in overseas markets was compensated by increased local demand, and the decline in exports of agricultural produce was offset by an increase in exports of minerals.

Agriculture and Industry.—Climatic conditions were unfavourable for agricultural production. The severe drought in the second half of 1941 adversely affected the wheat and maize crops in the North-East Cape Province and the Orange Free State, and also sugar production in Natal. Wool production, however, benefited from a 15 per cent increase in prices paid by the United Kingdom Government. To meet the situation of reduced production and increased demand, caused by the rise in general purchasing power, the system of controls was strengthened.

The war has provided a great stimulus to the development of secondary industrial production, and the Union has become a major supply depot and repair shop for the Middle East, in particular for ship repairing. There was also a great expansion in the iron and steel and engineering industries. The general index of employment in October, 1942, was 1911 (July, 1925=1000), compared with 1903 in October, 1941, and an average of 1780 in 1940.

Prices.—There was a steady increase in prices. The wholesale price index rose from 1398 in 1941 to 1611 in September, 1942 (1910=1000), while the retail price index rose from 1091 in September, 1941, to 1184 in September, 1942. In 1939 the index was 1146 and 993, for wholesale and retail prices, respectively.

Northern Ireland

UNEMPLOYMENT has declined from a total of 28,164 on December 8, 1941, to 20,450 on December 14, 1942. The decline has been principally among women and girl workers, of whom only 6,605 were recorded as out of work in December, 1942, compared with 16,337 a year earlier. There has thus been considerable progress during the year in absorbing into employment, mainly connected with the war, the considerable numbers of women unemployed as a result of the slackness in the linen industry due to shortage of raw materials. In the case of male workers, the position is not quite so satisfactory, and there has been a slight increase in the number of men and boys unemployed, from 11,827 in December, 1941, to 13,845 in December, 1942. This is probably principally due to the slackening in the volume of constructional work and the consequent discharge of numbers of unskilled labourers. In the second half of 1941, constructional work was proceeding at a high rate, but the programme of building for

air-raid shelters has now been largely completed. According to information given in the Northern Ireland Parliament, some 3,200 houses were destroyed in Belfast during the air raids which occurred in April and May, 1941, and more than 53,000 were damaged—3,962 of them badly. Considerable progress was made with repair work during 1942, and it is reported that about 41,000 damaged houses have now been made habitable.

Activity in the shipbuilding yards and the engineering trades generally has continued on a high level, almost exclusively on direct war work, for the volume of maintenance work in connection with the textile trades has been reduced to a minimum.

The principal peacetime industry in Northern Ireland was agriculture, and here the expansion of production has continued uninterrupted since the war started. In 1942 every landholder was required to have at least 40 per cent of his cultivable land—normally the area of crops and grass on his holding—under the plough. In 1943, this proportion will be increased to 45 per cent. The ploughing-up campaign in 1942 resulted in an increase of 5 per cent in the total area under crops, compared with 1941. Potatoes increased by 20 per cent, but there was a decline of an almost similar percentage in the area under flax, and to encourage production in 1943, a subsidy of £10 per acre has been announced for this year's crop. The cattle population increased by 5 per cent over 1941, but there was a fall of 22½ per cent in the number of pigs. There has been an increase in the milk supply in the western parts of the country, and a complete reorganisation of the arrangements for handling and marketing milk is being carried out. During the winter, a large shipment of milk has been organised from Northern Ireland to Scotland.

Eire

THE acreage tilled increased as a result of the compulsory tillage order. In June, 1942, the area under wheat had increased over that in 1941 by 111,533 acres, and the area under all corn crops by 232,719 acres; the area under root and green crops had decreased by 48,609 acres; the area under flax and fruit increased by 4,175 acres, and the area under pasture decreased by 157,922 acres. The number of live stock decreased; there were 7,129 less horses, 66,835 less cattle, 216,438 less sheep, and 244,988 less pigs, than in 1941. Agricultural prices rose, and the farming industry enjoyed prosperity. Urban industry continued to suffer from restricted supplies of imports of raw materials. Severe unemployment was avoided only by means of extensive emigration to Great Britain and Northern Ireland. In the twelve months ended November, 1942, imports amounted to £34,852,864, and exports to £34,497,803. As Eire is a strong creditor country on invisible account, the total balance of payments was very active, and considerable sterling balances accumulated. The monetary circulation in September, 1942, amounted to £27,684,903, compared with £22,090,709 in

1941. Bank deposits increased in the same period from £186,524,000 to £205,858,000. In the first nine months of the financial year (April-December, 1942), revenue amounted to £25,231,449, and expenditure to £29,399,597, compared with £23,424,230 and £28,492,665 respectively, in the corresponding period of last year.

India

Public Finance.—The Central Government budgeted for a deficit in 1942-43 twice as large as in 1941-42. The estimates, compared with the previous two years, are as follows:—

(In Crores of Rupees)

	1940-41	1941-42†	1942-43*
Revenue.....	107.65	129.62	152.00
Expenditure.....	114.16	146.89	187.07
Deficit.....	6.53	17.27	35.07

† Revised estimates.

* Budget estimates.

The decrease under Customs receipts has been more than offset by the large increases under railway contributions and income and corporation taxes. The defence expenditure has increased from Rs. 74 crores in 1940-41 to Rs. 102 crores in 1941-42 and Rs. 133 crores in 1942-43. The total expenditure on defence is vastly more than this, and the amount recoverable during the current year from the British Government under the financial settlement exceeds Rs. 400 crores. By January 5, 1943, with the complete repatriation of India's sterling debt, the sterling interest liability is substantially reduced.

Currency.—The increase in the note circulation reached unprecedented levels during 1942, responding to the monetary demand coming from rapidly expanding production and large defence expenditure. The total notes in circulation increased from Rs. 258 crores to Rs. 410 crores at the end of 1941-42. On December 18, 1942, the notes in circulation reached a record figure of Rs. 563 crores, an increase of 37 per cent in seven months. The pre-war figure was Rs. 179 crores. The sterling securities in the Issue Department of the Reserve Bank of India, in spite of the reduction due to the repayment of the sterling debt, amounted to Rs. 393 crores on the same date.

Prices.—The trend of prices caused more concern than any other single factor during 1942. The Calcutta wholesale prices index number (August, 1939=100) showed in 1941 an increase from 121 to 154. During 1942 the index moved up from 155 to 227. The actual rise was even greater in the case of certain articles of food. The situation was aggravated by transport difficulties and the failure of price control. So critical did the conditions created by high prices and black markets appear, that the problem of the cost of living threatened to overshadow the war itself. The abnormal increase in purchasing power and the absence of any determined attempt to mop it up resulted in highly inflationary tendencies.

BARCLAYS BANK (CANADA) - - - - - Montreal and Toronto

Industries.—The increased industrial activity continued during the first quarter of 1942. The slight decrease in the second quarter was followed by a decline of 13 points in the third, as shown by the indices of industrial activity. The Roger Mission projects were advanced with the arrival of plant and machinery from abroad. That many industries are working to capacity is shown by the tightness of key materials such as steel, chemicals, etc. The new orders placed up to October, 1942, on war account through the Purchases Department alone amounted to Rs. 400 crores, of which Rs. 137 crores took place during April to October, 1942.

Agriculture.—On the whole, agriculture escaped severe strain during 1942. Money crops, such as jute, cotton and oilseeds, have, in view of limited markets and the lack of shipping, tended to become less important. The problem of food supply is becoming urgent, and the attempt to make good the deficiency may cause a more radical readjustment.

Foreign Trade.—During 1941-42 imports of merchandise totalled Rs. 173 crores, compared with Rs. 157 crores in the previous year. Exports from India, including re-exports, amounted to Rs. 253 crores, against Rs. 199 crores in 1940-41. The year closed with a favourable balance of Rs. 79 crores, against Rs. 42 crores in 1940-41. Manufactured articles constituted the largest item in both imports (54 per cent) and exports (46 per cent). The half-yearly figures of seaborne trade for April-September, 1942, indicate a considerable reduction in imports from Rs. 102 crores to Rs. 57 crores, principally affecting manufactures. The value of exports has fallen from Rs. 113 crores to Rs. 97 crores, the decrease being mainly accounted for by raw materials.

Banking.—Deposits recovered in March, 1942, after the large withdrawals in January. Later, a pronounced increase in demand liabilities accompanied a decrease in advances and bills discounted. Compared with the end of 1941, demand liabilities rose by Rs. 130 crores to Rs. 343 crores on December 11, 1942. Investment in gilt-edged displaced advances, and money conditions were easier throughout.

The Soviet Union

Industry.—The year was as eventful and exceptional in the economic sphere as it was in the military field. The beginning saw most of Russia's industries in the Ukraine and Western Russia evacuated to the East. The main reception areas were: the Volga regions, the Urals and Western Siberia. Evacuation was only the first step towards putting those industries back to work. The most difficult task was to reassemble the plants; to find accommodation for machines and workers; to secure the supply of raw materials, etc. The first months of 1942 brought a temporary decline in actual war output. Not until late in the spring did many of the evacuated factories resume work; the process of re-establishment was more or less finally achieved only in the summer.

Industry was also confronted with all the difficulties due to the loss of important sources of raw materials and fuel and to the shortage of labour. More than half of Russia's iron ore and coal was gone. The Moscow coal region was recaptured during the winter offensive in 1941-42, but its share in Russia's total coal output was only about 6-7 per cent; the pits were damaged, and their restoration took about six months. In the second half of the summer a new German advance deprived the Russians of the Donetz basin.

Most of the difficulties were overcome by very energetic and drastic measures. Millions of skilled and semi-skilled industrial workers were evacuated to the East, together with factories and plants. Masses of new workers were drafted from Siberia and the Urals. Women and children were hurriedly trained for industrial jobs on a mass scale, and towards the end of 1942 press reports mentioned foremen in factories aged fifteen. The shortage of iron ore and coal was remedied by placing all the available resources at the disposal of the war industries and by expansion of output in the Urals and in Asia. The iron ore output of the Urals may have reached some 14 million tons, and the coal output of the Kuznetsk and Karaganda basins was also considerably stepped up, in spite of recurrent acute crises in production.

The Urals, previously predominantly a raw material base, was turned into an important centre of metal manufactures; metal working and engineering accounted for 70 per cent of its output compared with only 40 per cent a year before. The industrialisation of Western Siberia is illustrated by

the fact that the share of industrial output in the economy of Kazakhstan rose to 75 per cent.

The production of weapons and munitions reached a very high level. The output of aeroplanes, for instance, was 75 per cent higher in 1942 than in 1941, and the output of tanks is officially said to have increased several times. The transport system was adapted to the needs of the moment by the complete elimination of all civilian traffic and by a radical switch over to the use of peat and wood instead of coal.

Agriculture.—The position in agriculture was very critical after the loss of the Ukraine. It was made even worse by the temporary loss of the Don region and the Northern Caucasus. The Government sought to avert the danger of famine by an extension of the sown area in the East. The results achieved were very impressive. Some five million acres of new land were brought under the plough in the course of the year. But this amounted to barely a fraction of the losses—the sown area of the Northern Caucasus alone was 30 million acres. The recapture of the Don region and the Northern Caucasus will relieve the position substantially in 1943, though normal crops can hardly be expected. The recaptured areas also used to account for some 70 per cent of the Russian output of oleaginous plants and for about one-third of the tobacco crop.

The position in agriculture remains difficult owing to the dislocation in its mechanised equipment. A substantial proportion of the tractors and harvester-combines have been immobilised or diverted to war purposes. The cadres of tractor drivers and agricultural specialists have been depleted by the call-up. The food position was not easy in 1942; and the industrial population had to live on the barest minimum of essential foodstuffs.

Financing the War.—Practically nothing has been disclosed about the financial aspects of Russia's war economy. No budget estimates for 1942 and 1943 have been published. On the whole, the financial side of Russia's war effort has probably been easier to tackle than in other belligerent countries, owing to the fact that the state is the only industrial employer and producer. Even so, some inflationary trend has appeared in wages. Wages for skilled workers and bonuses soared to a very high level in the course of 1942. Most of the newly created purchasing power of the population was drained by large-scale "donations for the army" which were made only partly on a voluntary basis.

Portugal

THE year 1942 was marked by a smaller volume and a higher value of both imports and exports; sharp increases in living costs coincident with the rising prices of prime commodities; and an unprecedented expansion of floating capital, as shown in banking deposits, the absorption of bond issues and increased dealing in real estate. The national revenue at the end of September showed a net surplus over the estimates of 80,000 contos (1 conto = £10), but this does not mean that the country as a whole is more prosperous. Portugal is predominantly an agrarian peasant community—so much so that modern financial dealings—banking, shareholding and similar activities—affect only a relatively small percentage of the population.

Insurance companies.....	280.08	415.75
Colonial companies.....	103.19	251.14
Transport.....	101.02	110.00

Figures of the National Institute of Statistics are as follows:—

	COST OF LIVING (Weighted Index)	
	December, 1941	October, 1942
Foodstuffs.....	137.7	145.7
Light and fuel.....	114.8	130.6
Average total.....	133.8	143.2

Such figures are academic to the ordinary consumer. He knows only that the cost of everyday foodstuffs is at least half as much again as it was in the winter of 1941, and even so is not always to be had without a long wait in queues. Olive oil, charcoal and dried cod have again and again been in short supply. Transport difficulties, due to shortage of petroleum products, have hampered distribution, but the real reason for many unwarrantable price increases has been hoarding, chiefly for speculative reasons, and sales abroad by the same few speculators. The Government has tried hard to limit retail prices to official scales, but innumerable prosecutions and heavy fines have had little effect on the general situation. All-round wage increases have helped the working classes to some extent, but not enough to counterbalance price increases, now averaging 50 to 70 per cent above the levels at the end of October, 1941.

Egypt

THE stir caused by the second occupation of Benghazi in the opening days of 1942 quickly subsided, and confidence gradually waned up to July when Rommel was halted. Thereafter, sentiment slowly recovered until the victories of the Eighth Army and the Anglo-American landing in French North Africa caused a burst of enthusiasm.

The belated adaptation of agriculture to war conditions has been finally carried through. A crop of only 3,836,000 cantars was picked, against 8,679,618 cantars in 1941. The rice crop was far in excess of the country's needs, while the crops of the two staple cereals, wheat and maize, will fully

cover domestic consumption with prospects of a further expansion next summer. Industry operated at capacity throughout the year with record earnings, but workers displayed greater restiveness following the sharp rise in the cost of living. Imports were considerably restricted, but stocks were still fairly large. The Anglo-Egyptian purchase of the whole 1941 cotton crop, together with the ever-growing expenditure of the Allied forces which may be placed at about £E80 millions, created an extraordinarily favourable balance of payments. The main result of this was a big expansion in the note circulation (£E77,600,000 on November 31, 1942, against £E52,700,000 on November 12, 1941) and a Stock Exchange boom. Both were enhanced by the official increases in the price of agricultural produce (50 per cent for rice and cereals and 22-45 per cent for cotton) and of house rents (from 8 per cent to 40 per cent). For the new cotton crop, the Egyptian Government has offered to buy the whole production at 25 tallaris fully-good-fair Giza, 7 and 20 tallaris f.g.f. uppers. Consequently, the cost of living rose from 200 in January to 269 in October.

Palestine

THE outstanding feature of the economic development of Palestine in the third year of the war was its growing part in the war effort and its industrial expansion. The threat of invasion was removed after the summer, but it had stimulated recruitment. The number of Jews enrolled in the military or defence forces of Great Britain and the Allies rose to about 28,000, and the number directly serving military needs exceeded 60,000. Some 15,000 factory workers were engaged solely on Army orders, another 15,000 in military camps and workshops and 5,000 in transport. Nearly 10,000 Arabs also were enlisted. Army orders rose from £P4,000,000 in 1941 to £P10,000,000. Besides this striking increase in the home market, exports for the year were nearly three times the value of the exports of 1941. In the first six months the value of industrial products exported increased from £P165,000 to £P580,000, of unmanufactured goods from £P135,000 to £P400,000, and of

foodstuffs from £P200,000 to just on £P400,000. The principal items of industrial production were clothing and chemical and pharmaceutical products. Another industry making great strides is diamond cutting, in which nearly 3,000 workers are now employed. The imports for the year were double the value of the previous year. It was notable that the orange crop, which has been greatly reduced by the conversion of the younger orange groves into other forms of agriculture, was entirely utilised. Only about half a million boxes are exported; but a larger quantity is converted into citrus oil, and the rest is consumed in the country or by the armed forces. Corresponding to the fall in orange growing is the increase in the production of cereals, vegetables and dairy produce.

The Government finances are satisfactory. The revenue expected for the year 1942-43 was £P6½ millions, of which £P2 millions was from Customs, a similar amount from direct taxation and licence fees, and £P700,000 from the newly introduced income tax. It was possible during the year to convert the Palestine Government loan issued in 1927 at 5 per cent to a loan of £P3½ millions at 3 per cent; £P850,000 of the original issue was repaid. The currency in circulation continued to rise—from £P13 millions to £P20 millions—and bank deposits to increase. The rise in the cost of living, which amounted to nearly 200 per cent over the level at the outbreak of the war, led to further Government measures, including rationing, price control and control of profits. The new defence regulations included comprehensive measures for the prevention of profiteering, the first law of its kind in the Middle East, which had an immediate effect on commercial life. The price of the principal foodstuffs was controlled in the municipal areas, and the Government also took control of the principal raw materials in the country and of the principal imports.

Argentina

Foreign Trade.—In spite of all the difficulties inherent in wartime—loss of markets, shortage of shipping and the absence of export and import priorities—the value of Argentine foreign trade during the first eleven months of 1942 totalled 2,811,834,000 pesos, as compared with 2,461,231,000 pesos in the same period of 1941. Higher values and the development of Western Hemisphere markets, together with a considerably increased trade with Sweden, have been responsible for this increase, as exports dropped by 14.8 per cent in volume, from 5,770,000 to 4,915,000 tons, and imports by 29.5 per cent, from 5,870,000 to 4,140,000 tons. The creation of the Argentine Merchant Fleet by the purchase of Italian and Danish ships immobilised in Argentine ports, offset, in some part, the ever-increasing shipping shortage. During the twelve months ended October 15, 1942, the Argentine Merchant Fleet carried 371,433 tons of exports and 256,655 tons of imports, of which 199,186 tons went to the United States and 228,942 tons were brought from the United States to Argentina.

It is notable that, as a result of industrial development, Argentina is now actually exporting certain products which were hitherto purchased from overseas. An outstanding case is the edible oil industry. Prior to 1934, Argentina imported over 60 per cent of its edible oil requirements from Italy, Spain and Greece. In 1940 the country not only supplied its own needs, but exported 2,350 tons. In 1942 over 100,000 tons were shipped, 66 per cent of which went to the United States.

Following are the total figures for exports and imports for the first eleven months of 1941 and 1942:—

	1941	1942	Increase
	Paper pesos	Paper pesos	Per cent.
Exports	1,328,542,000	1,624,702,000	22.3
Imports	1,132,689,000	1,187,133,000	4.8
Export surplus ..	195,853,000	437,569,000	

Industry and Agriculture.—In recent years Argentine industry has become increasingly important. According to figures published by the Argentine Industrial Union, capital amounting to 200 million pesos has been invested in industry in the years 1939 to 1941. In 1927 the value of the country's agricultural and pastoral production was 3,580 million pesos and the value of industrial output, excluding the cost of raw materials, 1,541 million pesos. In 1941 the comparative figures were 3,381 million pesos and 3,400 million pesos respectively. The ultimate outcome of this rapid industrial growth can, at present, only be a matter for speculation; but, while it may always be reasonable to suppose that Argentine meat and grain surpluses may always

find a place in post-war world planning, it is very much less certain that Argentine industrial production, which, through extraordinary circumstances, is now finding an overseas market, will be able to maintain this market when traditional countries of supply re-enter the field. Nor is increased industrial output likely to be absorbed internally if the present rigid immigration laws are maintained in the post-war period.

Meanwhile, Argentina has exportable surpluses of 8,000,000 tons of wheat, 9,000,000 tons of maize and 3,000,000 tons of linseed. In the last four years assistance to agriculture has cost the Government 500 million pesos. In May, 1942, the Government announced a new plan to assist farmers and diversify production. This included the provision that purchases of maize from the 1941-2 crop would be limited to the small producers, and then only in cases of real need.

German Europe

AFTER the losses suffered during the winter battle of 1941-42 in Russia, Germany's war economy was drastically reorganised under the new Minister for Armaments and Weapons, Albert Speer. A new phase of concentration and rationalisation opened in the spring of 1942 for Germany as well as for all the occupied and dependent countries. The Armament Council set up by Minister Speer instituted direct technical control in the armament industry. Civilian production was at the same time cut down to the absolute minimum, and by the end of the year it was generally recognised that the reorganisation of Germany's war economy had been completed. Economic activity in the occupied countries decreased considerably during the year because of raw material difficulties, and the concentration of war production in German factories. The second general collection of textile materials in Germany, and a comprehensive drive for scrap iron and metals, which included the collection of obsolete plant, machinery and semi-finished manufactures, shows that the greatest economy in raw materials was necessary. Much material and labour were used in constructing fortifications on the Atlantic coast, and the occupied Russian provinces were exploited for the immediate needs of the armies fighting in Russia.

Labour.—Shortage of labour was Germany's main difficulty. Gauleiter Sauckel was appointed labour dictator for Germany, and his power of directing workers was later in the year extended to all occupied countries. More women, and workers still employed in civilian industries, were directed to war factories and the import of foreign workers reached new records. The number of foreign civilian workers employed in Germany increased from roughly 2,100,000 in February to 3,500,000 at the end of the year. At the same time, more prisoners of war were employed, particularly in agriculture.

Agriculture.—The exceptionally hard winter in 1941-42 damaged winter crops in Germany, and in almost all other European countries. The ration for bread and for meat was reduced; after the harvest the former ration was allowed, but a greater percentage of barley made up the loss of wheat. Drastic measures were required to deal with the deteriorating livestock situation because of the growing shortage of feeding stuffs. The pig and cattle population in Germany is decreasing, and it does not appear that the decline in the livestock population in occupied countries has been arrested. In Germany, as well as in most of the other countries, a comprehensive system of premiums has been introduced as an incentive for farmers and peasants. Premiums are either paid in cash or in kind. The shortage of draught animals, fertilisers and machinery became more pronounced last year.

Industry.—The German coal, iron and steel industry experienced great difficulty in maintaining output. The growing demand could only be met by reducing exports to allied, dependent and neutral countries, and by cutting civilian consumption. It may be assumed that the output of weapons and munitions was maintained, but there are signs of deterioration in quality. Repair work not absolutely essential was stopped, and any experimental work on peacetime designs of manufactures prohibited. The compulsory exchange between factories of patents, methods and experience is ordered by the controlling engineers responsible to Minister Speer. Rationalisation concentrated on machine tools, and considerable success in the rationalisation of working processes was reported. This may have partly compensated for the continued decline in individual efficiency resulting from the number of unskilled women and foreign workers employed in Germany's war industry.

Finance.—Germany's war expenditure increased considerably during the year. Various measures were decreed designed to keep public borrowing, especially short-term borrowing, as low as possible. Apart from certain exceptions, advance payments by the Wehrmacht to manufacturers were stopped. The result was an increase in advances made by the banks. The house-rent tax was abolished, and estate owners had to pay the capitalised rent into the Exchequer. Yet public borrowing increased at an even greater rate than in 1941.

	REICH DEBT (Rm. Billiards)		
	August	December	November
	31, 1939	31, 1941	30, 1942
Long-term debt	25.01	64.17	83.96
Short-term debt	12.32	64.33	97.73
Total debt	37.33	128.50	181.69

The total debt probably stood at Rm. 186,000 millions at the end of the year, which means that the total of public borrowing since August, 1939, is equal to the total borrowing during the whole of the last war. During 1941, the increase amounted to Rm. 42,160 millions, and during 1942 to Rm. 60,000 millions. In August, 1939, short-term borrowing covered 33 per cent of the total, and, in November, 1942, 53.8 per cent. This change occurred in spite of a determined effort to keep down short-term borrowing. Small savings deposits increased by Rm. 14,000 millions to Rm. 50,000 millions, against an increase of Rm. 10,000 millions in 1941.

The regular publication of revenue figures has ceased, but official sources indicate that it has risen as follows:—

	(In Million Rm.)		
1939-40	23,600	1941-42	32,500
1940-41	27,000	1942-43	35,000

The rate of increase is thus much smaller in 1942-43 compared with 1941-42. If the war contribution of communes, the tribute paid by Bohemia and Moravia, and the costs of occupation are included, total revenue is estimated in 1942-43 at Rm. 49,000 millions. Borrowing can be estimated at roughly Rm. 60,000 millions, and the total available for expenditure is thus Rm. 109,000 millions, against Rm. 90,000 millions in 1941-42. In other words, nearly 55 per cent of the total finance available is now covered by borrowing, against 50 per cent in 1941-42. Semi-official sources state that during 1941 and 1942 roughly Rm. 14,000 millions were bought in the form of Treasury bonds by foreign countries.

There was another increase in the bank notes in circulation, from Rm. 19,325 millions to Rm. 24,375 millions.

France

Industry.—The past year was one of further decay in France's industrial life. Stocks of raw materials and fuel became exhausted. Most French industries became dependent on the supply of raw materials by Germany. The metal shortage is most strikingly illustrated by the "metal-tax"—certain taxpayers have to pay fixed proportions of their rates in metal. The number of textile factories was reduced to about 8,000 (against 12,200 before the armistice). Shortages of fuel and lubricants were aggravated in 1942; the shortage of timber props hampered coal output. A further concentration of industry was carried out under the direct control of the Germans.

Agriculture.—The year's wheat crop was below six million tons compared with a pre-war average of 8.5 million tons. The wine harvest was somewhat better—about 33 million hectolitres, which still leaves the country with a deficit of more than 10 million hectolitres, owing to German demands and the increased use of alcohol as fuel. The sugar beet crops improved; about seven million tons were delivered to the State in 1942. The numbers of livestock again declined owing to the acute shortage of fodder.

Labour.—The main problem was the *relève*, that is, the more or less compulsory transfer of French workers to Germany. The Laval-Sauckel agreement provided for an exchange of prisoners of war for skilled workers at the rate of one prisoner for three workers. The German demands grew with the development of the crisis of manpower in Germany until they reached 250,000. The *relève* met with stubborn resistance; and in the summer it gave rise to a strike movement in Vichy France which forced Laval to make temporary concessions. But, after the second German occupation, the *relève* was resumed with more ruthlessness; and towards the end of the year large parties

of French workers were reported to be on their way to Germany almost every week.

Labour conditions in France itself grew worse. The bargaining power of the workers was dwindling, and wages did not increase in spite of an inflationary rise in the cost of living. Masses of workers sought to evade the *relève* by fleeing to the countryside and working as farm labourers.

Finance.—The 1942 Budget estimates were 105.5 milliard francs for ordinary expenditure and 33 milliards for extraordinary expenditure. Revenue was expected to yield about 80 milliard francs; the estimated deficit was 58 milliards. Revenue, in fact, reached about 90 milliards. The Budget did not include the indemnity to the German army of occupation, which added 109.5 milliard francs to the deficit.

Banknotes in circulation rose from 263 milliard francs in December, 1941, to 379 milliards towards the end of December, 1942. Currency inflation dominated the whole financial position and gave rise to a very pronounced flight from the franc. This was reflected in a prolonged boom for industrial shares on the stock exchanges. The boom was interrupted twice: in May and June and later on in August. The occupation of North Africa by the Allies gave a further stimulus to the flight from the franc. The boom for industrial shares made the credit position of the Treasury somewhat difficult, and the Minister of Finance tried to counteract the upward tendency of the bourses by restrictive measures.

Industry and Trade

Foodstuffs

THE increasing strain on shipping, inland transport and manpower brought further extensions of rationing in 1942 and a stricter control over food manufacture and distribution. Points rationing was extended; confectionery and soap were each rationed separately; details of changes in the domestic rations are given on page 18. Concentration was applied to a number of food manufacturers, in order to release factory space and labour for other purposes. To economise in transport, wholesale distribution was rationalised, each manufacturer or distributor of similar products being allowed to sell in one area only. In some cases, this zoning was planned and executed by the trades concerned; in others, notably fish, the zoning was imposed by the Ministry of Food. In order to ensure the supply of green vegetables at reasonable prices, the Ministry offered contracts to growers at stated prices for delivery in specified months. The National Milk Scheme and the distribution of fruit juices to small children were continued.

Imports

Cereals.—The following statistics of wheat production in the four principal producing countries are taken from the *Corn Trade News*, together with forecasts of the end of season stocks in the cereals year 1942-3:—

	Production			Estimated Stocks on		
	1940-1	1941-2	1942-3	1941	1942	1943
USA	851	946	981	387	627	830
Canada	551	299	593	480	424	690
Argentina ..	276	224	242	130	198	255
Australia ..	84	167	152	65	122	165
Total ...	1,762	1,636	1,968	1,052	1,371	1,940

The carry-over of wheat in these four countries on August 1, 1942, was about 1,370 million bushels; to this huge surplus has been added the excellent harvests of 1942, in which an exceptionally good yield per acre was obtained in North America. Exports from these four countries are believed to have been about 320 million bushels of wheat in 1941-2 (including flour in terms of wheat), and exports in the current season are not likely to vary greatly as a whole; the carry-over into the 1943 season may therefore approach 2,000 million bushels, unless a quite exceptional quantity is used as animal feed. The Canadian wheat crop of close on 600 million bushels was harvested from a slightly smaller area than in 1941—21.3 million acres as against 22.4 million in 1941; exports of wheat and flour as wheat in the cereal year 1941-42 totalled 222 million bushels (231 million bushels in 1940-41), but with increased production and a higher wheat extraction rate in the United Kingdom exports in the current season may not be as large. The minimum wheat price guaranteed by the Canadian Government was raised from 70 cents per bushel to 90 cents for the 1942 crop for the marketing quota of 280 million bushels. In order to stimulate the feeding of grain to livestock, the Federal Government allowed rebates on transport from the Western Provinces of surplus production to the livestock areas in the East; it has also been announced that the 1943 wheat marketing quotas, on which alone a full price will be paid, will be reduced to 250 million bushels. In the United States, the problem of storage became acute in 1942, and is likely to be intensified in 1943, as the old crop moves off the farms. The loan price offered by the U.S. Government (based on the calculated "parity" price) was 116½ cents per bushel; farmers were urged to use wheat for livestock, and to divert as much land as possible in 1943 to the production of other crops. Exports of Argentine wheat in 1942 were about equal to the 80 million bushels exported in 1941, but with a larger crop paid for by guaranteed minimum prices, the carry-over into 1943 was considerably greater than at the end of 1941. No statistics have been published of Australian wheat exports; the entry of Japan into the war automatically cut off Australian

exports to the Far East, but it is possible that this loss was partly counterbalanced by exports to the armies in the Middle East. The area licensed for wheat-growing in Australia for the 1942-3 harvest was reduced by 15 per cent, compared with that licensed in 1941-2 (not all of which was planted); growers in Western Australia had their allotted area reduced by one-third, owing to the special difficulties of shipping and storing the crop of that state. Representatives of these four major wheat-exporting countries and of the United Kingdom attended an International Wheat Conference in the summer of 1942; it was agreed to set up a relief pool of 100 million bushels of wheat which would be distributed free to European countries after the war as part of the emergency feeding plans.

Dairy Produce, Meat and Bacon.—The shortage of shipping led in 1942 to a further shift in the normal channels of international trade in foods. The British output of cereals for human consumption has been increased by the growing of more wheat, the raising of the extraction rate in April, 1942, to 85 per cent, and by the admixture of oats and barley to the loaf, announced to begin early in 1943; at the same time consumption has been steered on to potatoes, in order to reduce still further the import of wheat. To offset the fall which must have occurred in British production of meat and dairy products, and to increase the supplies of protein-rich food from the low level of 1941, overseas countries have been stimulated to export more meat, bacon and dairy products. In the contracts made with exporting countries in the autumn of 1941 for the 1941-42 season, the Ministry of Food asked for more cheese, if necessary at the expense of butter, more dried eggs and milk, and an increase in bacon exports. The 1942-43 (April-March) contract for Canadian cheese asked for exports of 125 million lb., and the production in the first six months of 1942 of more than 83 million lb. showed an increase of two-thirds compared with the same period of 1941. The number of pigs in Canada increased from 4.3 million in June, 1939, to 6.1 million in 1941 and to 7.1 million in 1942; a further increase has been planned for 1943, in order to meet the increased home demand for pork as well as the British bacon contract. The 1941-42 contract is believed to have asked for 600 million lb., while the 1942-43 contract may have been as large as 700 million lb. An increasing proportion of British imports of meat are shipped either boned or canned, in order to economise in cargo space. Both in Canada and in Argentina, the output of beef has been stimulated by larger exports and higher prices, combined with low feeding costs.

Home Production

PRICES of livestock products were increased in January, 1942, to cover the rise, in December, 1941, in the minimum wage from 48s. to 60s. per week; crop prices were raised for the 1942 harvest for the same reason.

Wheat.—The basic price for wheat (which increases throughout the season) was fixed at 16s. per cwt. for the 1942 crop; it has been announced that a price of 14s. 6d. per cwt. will be paid for the 1943 crop, plus an acreage payment of £3 per acre. This will assist the new grower on indifferent soil, whose yields are likely to be lower than those obtained in the old arable areas.

Barley.—The price of malting barley was controlled for the first time in August, 1942, at a maximum of 35s. per cwt., which will be reduced in 1943 to 27s. 6d. per cwt. The feeding of barley for animals (except in special cases) was prohibited in November, in order to obtain increased supplies for mixing with wheat flour.

Oats.—Maximum prices for the 1942 crop began at 14s. 9d. per cwt. for milling oats and 14s. 6d. for feed oats directly after the harvest, with a minimum price of 14s. per cwt.; these prices increase throughout the season to compensate farmers for the cost of keeping oats in stock.

Potatoes.—The acreage subsidy was maintained in 1942, while growers' prices were raised by 5s. a ton. Retail prices were kept low by a subsidy (estimated to cost £20 millions

a year) in order to stimulate their consumption and thus to reduce that of imported wheat.

Sugar Beet.—The prices paid under the 1942 contract—85s. 8d. to 87s. 8d. per ton of 16.9 per cent beet—are to be continued for the 1943 crop.

Milk.—The increase in consumption continued, under the stimulus of the National Milk scheme, while production is believed to have been a little larger than in the earlier war years. Restriction of sales to non-priority consumers, begun in the winter of 1941, was continued throughout 1942, except for a few weeks in the peak period of production. From the beginning of the new contract year (October, 1942), the Ministry of Food became the sole buyer of liquid milk from all farms, so that supplies could more easily be allocated in accordance with demand. The fixing by the Ministry of new trade margins, which gave higher allowances to the larger firms who also undertook extra services, aroused much criticism. Farmers' prices were raised by 1½d. per gallon in January-March, 1942, compared with the same months of 1941, to allow for higher costs; and by 2d. per gallon for the succeeding twelve months to March, 1943. For the summer of 1942, the average pool price in England and Wales was thus 17.35d. per gallon and for the six winter months of 1942-43 it was 29.21d. This stimulus to winter milk production was intensified by an inter-regional competition to increase farm sales of milk and by the allocation of milk "targets" to each county.

Livestock.—Prices were raised gradually from January, 1942, to give farmers an extra 6s. 6d. per cwt. on fat cattle and 13d. per lb. on sheep and lambs. The price of pigs was raised by 1s. to 24s. per score, and the weights for which this price was paid were increased in order to encourage the production of heavier animals. The Ministry of Supply allowed an average increase of 2d. per lb. on wool of the 1942 clip.

Poultry.—The six-monthly summer and winter prices for eggs were abolished in March, 1942, together with differential prices for grades; from March 5th, producers were paid a flat price of 30s. 10d. per 120 for eggs of all sizes. In the first year of the full control scheme (ending in June, 1942) 2,442.5 million shell eggs were collected, of which 1,658.5 million were home produced. From July, 1942, the amount of balancer meal allowed to domestic poultry-keepers was limited to supply only one hen per person, and meal could only be obtained by the surrender of an appropriate number of shell egg rations; it was stated that about 4.3 million persons in Great Britain had surrendered their shell egg rations in order to get food for their hens.

Vegetables.—The National Vegetable Marketing Company, which had been set up to deal with the marketing of carrots and onions, was wound up in the summer of 1942 and the Ministry of Food took over its functions. The Ministry also offered contracts for the supply of certain types of winter greens during the winter of 1942-43, in order to ensure adequate supplies at reasonable prices.

The price indices calculated by the Ministry of Agriculture for farm products are given below:—

INDICES OF AGRICULTURAL PRICES (a)

(a) Including Government Subsidies, 1942.

(b) Provisional.

Rationing

SOAP and additional foods were rationed during the year. Soap rationing was begun on February 9th, each person being allowed four coupons for each four-weekly period. The values fixed then have not been changed. Each coupon

is worth 3 oz. toilet soap, 4 oz. household soap, 3 oz. soap flakes, or 6 oz. of 12 oz. (according to soap content) of washing powder. A saving of 20 per cent in consumption has been achieved. Chocolate and sweets were rationed on a points system on July 26th, and for this purpose a personal ration book was issued. The ration began at 8 points, or ½ lb. of chocolate or sweets in each four-weekly period; it was raised to 1 lb. on August 23rd, and lowered again on October 18th to 12 oz. No registration is required for these new rations, and they can be bought at any shop. Confectionery coupons are cut out and soap coupons marked. The points rationing system was extended to include additional foods. On January 26th, whole rice, sago, tapioca, dried peas and beans, lentils and dried fruits "went on points." On February 23rd fruit, tomatoes and beans in brine, all in tins, were included. Condensed milk and prepared cereal breakfast foods were added to the points ration on April 6th. Syrup and treacle were transferred from the preserves ration on July 26th, and from August 23rd points were required for biscuits. Changes in the points value of the various goods were made from time to time. On January 12th, the fats ration, which had been raised for two months, reverted to 8 oz. a week. Tea coupons were cut out by retailers from April 6th, and on July 26th

* May be taken in margarine.

† Ordinary consumers. Not a ration, but an individual allowance.

‡ Fresh meat 1s. corned beef 2d., until April 26th (excluding offals). Half rations for children under 5.

§ 12 ozs. to certain workers; raised to 1 lb. on July 26th.

§§ Unrestricted until August 29th.

¶ For two weeks an extra half-pound was issued for jam-making.

†† Withdrawn from children under 5.

the ration was withdrawn from children under five. Between April 6th and August 22nd, 1 lb. of sugar could be bought instead of the ½ lb. ration of preserves, and an extra ½ lb. was allowed for two weeks from July 27th. The production of milk was larger than in 1941, and priority consumers' allowances were unchanged. National household milk was available during the winter months to supplement fresh milk. During the summer, unrestricted milk supplies were allowed to ordinary consumers, provided priority allowances were met. The allocation of shell eggs to ordinary consumers was about 29 during the year, and that to priority consumers about 116. Shell egg registrations were required to be surrendered from July 27th by domestic poultry keepers to obtain balancer meal, the ration being enough for one hen for each registration. Dried eggs made their first appearance at the end of June, and a packet equivalent to a dozen eggs was allowed for about two months. A cooking quality was sold without restriction at the end of the year. Allocations of fruit juices to children were extended, and they were made available to pregnant women. The white loaf disappeared on March 23rd, by the raising of the rate of extraction of flour to 85 per cent. Although bread was not rationed, an "Eat More Potatoes" campaign was instituted to increase consumption of these. Consumption of potatoes in January, 1943, was 18 per cent above that in January, 1942. Reductions were made in the allocations of raw materials for manufactured goods, and specifications laid down for them. Production of some goods was concentrated. Zoning schemes were begun to save transport, and restrictions were placed on retail deliveries.

Price Control

THE Ministry of Labour's index of retail food prices, given in the accompanying table, shows the trend of food prices throughout the year:—

MINISTRY OF LABOUR'S INDEX OF RETAIL FOOD PRICES

	Sept. 1939	Dec. 1941	Mar. 1942	June 1942	Sept. 1942	Dec. 1942	Jan. 1943
July, 1914=100	138	165	162	159	160	164	164
Sept., 1939=100	100	120	117	115	116	119	119

The rise in the index between September and December was due mainly to rises in the prices of bread, flour, bacon and butter. The prices of sugar, potatoes, fish and eggs were lowered slightly. During the first quarter of the year, the total cost of subsidies was at the rate of £127 million per annum, compared with about £109 million the year before. The individual subsidies were as follows:—Flour, bread, oatmeal and feeding stuffs, £40 million; meat, £23 million; potatoes, £20 million; sugar, £13 million; the National

Raw Materials

THE United States' entry into the war and the loss of the rich Pacific sources created difficult supply problems. Alternative supplies had to be secured, a task which coincided with much increased raw material requirements for the extended Allied war production programmes.

The solution of the raw material problems of the United Nations was facilitated by the complete pooling of all resources through the Combined Raw Materials Board. This Board, which was set up on January 26, 1942, is composed of one British and one United States representative, and acts mainly through an Advisory Operating Committee, on which the main United States and British Government Departments interested in raw material supplies are represented. The Board not only allocates supplies from available sources (including non-Allied sources) to the various United Nations, but is also actively engaged in the development of new sources of supply, the conservation of materials, the co-ordination of purchases in order to exclude competition, and the planning of raw material shipments.

As a result of careful planning, world production of raw materials increased in 1942, and some of the more critical supply problems created by the loss of the Pacific sources, as in tin and oilseeds, have virtually been solved. In spite of the generally increased supplies, the raw materials supply position was fairly stringent throughout the year, a direct result of the unprecedented demand for materials for war production. It was only natural, therefore, that civilian supplies were cut to a minimum and that the flow of materials into munitions plants had to be canalised to assure the completion of the more urgent parts of the war production programmes according to schedule. This task entailed complete Government control over all phases of the raw materials trade.

In the United Kingdom, the control system was virtually completed before the beginning of the year, and with the exception of the extension of state control over the coal industry there were no decisive changes in the British raw materials control system in 1942. In the United States, the War Production Board believed that its raw material supplies were ample enough to assure a satisfactory distribution through the full utilisation of the simple priority system, which had been introduced for the more critical materials a year before the country actually entered the war. By the spring of 1942, however, it became obvious that the issue of priority certificates against all war contracts and the more important civilian contracts was leading to a rapidly expanding "inflation of priorities," in which sometimes even the contractors of important munitions contracts found it impossible to secure the necessary materials for the completion of their production programmes. In the middle of the year, therefore, the War Production Board decided to design an allocation system under which the issue of raw material permits would be limited to the total of materials available within each quarterly control period. The result was the "Production Requirements Plan," which came into general operation on October 1, 1942. For the three most important war metals (steel, copper, aluminium) the War Production Board in November, 1942, announced a special "Controlled Materials Plan" by which the contract-placing Government Department is switched between the contractor and the raw materials allocation body (the WPB

Milk Scheme, £18 million; other milk, £2 million; eggs, £11 million; tea, £3 million; other foods, including milk products, bacon and ham, and carrots, £7 million. The total of these items is £137 million, but £10 million was saved on other foods. At the beginning of the year, the number of price orders in operation was 90, and it had risen to 105 by the end of 1942. Nearly all the important foods were price controlled by the beginning of 1942, but during the course of the year the following products were added: biscuits, cakes and flour, confectionery, sweets and chocolates, cucumbers, rhubarb, pears, mustard seed, coffee essence, meat products and cooked meats, fish cakes, most varieties of game, and soap. A number of producers of manufactured food were required to label their products with the permitted maximum prices. Some price schedules were simplified, notably those for meat and jam. A maximum price of 5s. per meal in restaurants was imposed during the year, and certain restaurants were permitted to make an additional house charge. The Ministry of Food's *Official Retail Price List* was first published on April 7th, and supplements are issued at the beginning of each four-weekly period, to cover amendments.

Requirements Committee) in order to secure maximum control over the use of these materials within the war production programme. This plan, however, will not come into operation before the middle of 1943.

Both the United States and Britain continued to pursue the policy of stabilising prices. There were only a few raw material price changes in 1942, none of which was of great importance. In order to prevent low metal prices from hampering production, the United States Government in February, 1942, introduced a production premium system, by which producers of copper, lead and zinc receive substantial premiums over the official prices for all increases in their production over the 1941 total. Last October a general price bill was adopted in the United States designed to stabilise prices and wages at the level of September 15, 1942.

Coal

THE past year was a period of more Government intervention and of greater spectacular changes in organisation and methods of control than at any other time since the outbreak of the war. The problem of supply was again the chief preoccupation, and its most urgent aspects were manpower and its efficient employment. During the winter of 1941-42 national stocks were reduced from 31 million tons to 14 million tons; in the spring and early summer months production was stationary, if not declining, while the requirements of essential industries were stated to be expanding; and when at the end of September the Minister of Fuel was budgeting for the 1942-43 winter he estimated a deficit of about 14½ million tons at the current rates of production and consumption. The most important of the practical measures taken by the Government were the provision of more miners, restrictions on the supply of house coal, and the enforcement of economies in all forms of consumption. But the release of ex-miners from the Army and Air Force, transfers from other industries and the recruitment of school-leaving boys and of men between 18 and 25, who could choose between service with the armed forces and in coal-mining, the number of wage-earners employed during 1942 averaged approximately 710,000 (in spite of the natural wastage at the rate of between 25,000 and 28,000 per annum), compared with 698,000 in 1941 and with a pre-war total of 765,000. Transport facilities were also more favourable than in the previous year; canteens capable of supplying full meals to 60 per cent of the workmen were either in operation, under construction or in preparation, and exceptional incentives to higher outputs were given in the form of a general wage increase of 2s. 6d. per shift as from June 1st, and after September 5th of a bonus of 3d. per shift for every complete one per cent gain in output above a standard figure fixed for each district by the colliery owners, the miners' leaders and the Greene Board of Investigation.

Of these measures the most effective was the economy campaign. The Ministry of Fuel aimed at a saving of at least four million tons in the supply of coal for domestic consumption, and in a broadcast on February 17th last he stated that this target had been "already nearly reached." In the iron and steel industry requirements are estimated to have been reduced by from 5 per cent to 7½ per cent, and in other branches of industry as well as in the public utilities relatively even greater economies have been effected. The national output, however, fell slightly below that of 1941, amounting to approximately 212½ million tons (pit-head weights), compared with 213.4 millions tons. The chief causes of the decrease, in spite of the employment of more manpower, were increased absenteeism (particularly at week-ends) and a reduced output per manshift worked. Among coal-face workers the average rate of absenteeism from all causes ranged from 13 per cent to nearly 15 per cent, against about 11.16 per cent in 1941 and just under 8 per cent in 1938, and the output per manshift fell to about 57.3 cwt., compared with 58.8 cwt. in 1941 and 59.6 cwt. in 1939; for all persons employed below and above ground the rate of absenteeism was over 11 per cent, compared with 9.03 per cent in 1941 and 6.44 per cent in 1938, and the output per manshift worked, about 21 cwt., compared with 21.52 cwt. in 1941 and 22.96 cwt. in 1938. There was an estimated loss of approximately 900,000 tons in the national output owing to disputes, against 360,000 the previous year.

In March the President of the Board of Trade asked Sir William Beveridge to report on the most equitable and effective methods of restricting and rationing household consumption; but Sir William's coupon points rationing scheme was not adopted because of Parliamentary opposition, and on June 3rd the Government submitted its own proposals covering production, consumption and the organisation of the industry. The Government ostensibly assumed full control over the operation of the mines through national and regional machinery, giving the Minister of Fuel full and undivided responsibility for the policy and general conduct of mining operations and the finances of the industry. It authorised an increase of 2s. 6d. per shift as from June 1st, thus raising earnings per shift by between 55 per cent and 60 per cent above the pre-war level, and the introduction of a scheme for the redistribution of the net proceeds of the industry so as to secure, if possible, a minimum credit balance, partly adjusted to past performance, for each coalfield, and averaging between 1s. 6d. and 2s. per ton of commercial disposals for the industry as a whole. To finance these transactions and other commitments (including cost of the guaranteed wage, assistance to necessary undertakings, but excluding that of Government

operational control) the price of coal has been increased by 4s. per ton (apart from differential concessions to some districts), and a levy of 5s. per ton, payable into a central pool, imposed on sales. As regards industrial relations, the outstanding event of the year was the formation of the National Wages Board, in the negotiation of which the Greene Board of Investigation collaborated actively with the Joint Standing Consultative Committee of the Industry.

Oil

INCREASED military demand for tanker tonnage put an end to the British basic petrol rations in 1942. For goods vehicles the basic ration was stopped on March 7th, for private motor cars it terminated on June 30th. Since then petrol has only been allocated for essential purposes. On August 1st, the Ministry of War Transport issued a direction according to which no vehicle is allowed to operate on substitute fuel for purposes which would not justify an issue of petrol or diesel oil. The planned conversion of 10,000 vehicles to producer gas made but slow progress in 1942, but in February, 1943, Lord Leathers informed the House of Lords that the conversion is now proceeding rapidly and will be completed in the summer. For the time being, there will be no extension of the conversion programme beyond the limit of 10,000 vehicles, as fuel remains a limiting factor. Since the British price changes in February, 1942, described in last year's *Commercial History*, quotations have remained unaltered.

Transport remained the crux of the Allied oil problem. According to Admiral Land's annual review, 62 tankers were delivered into service by United States shipyards in 1942, but no figures are available about the tonnage of these tankers. The tanker supply position, however, remained extremely tight and enforced further restrictions in United States domestic supplies. From October 15th, fuel oil supplies in thirty states were limited to two-thirds of their normal requirements, and from the middle of November gasoline rationing was extended to the whole country. For the latter move, however, the necessity to economise in the use of rubber and spare parts was primarily responsible. The internal United States oil transport problem will probably be eased in 1943 as a result of the completion of certain pipe-lines and the authorisation in December, 1942, of a programme for the construction of oil barges, tow-boats, tugs and terminal facilities. These small craft alone are to bring 150,000 barrels daily from Texas to the Atlantic coast.

The complicated position of the United States oil industry induced President Roosevelt at the beginning of December, 1942, to establish a "Petroleum Administration" with extended powers. The first Administrator is Mr Harold Ickes, who had previously acted as Petroleum Coordinator. In February, 1943, Mr Ickes demanded the drilling of 4,500 new wells in 1943, an increase of 50 per cent on the normal figure. There are no longer official production statistics, but it is known that last year United States production, owing to reduced requirements and transport difficulties, showed its first substantial fall for years. Outside the United States the main event has been the fight for the Russian oil. As Mr Stalin stated in his Revolution Celebration speech, the German High Command had planned to occupy Baku by September, 1942. They never came even as far as Grozny, and the Maikop oilfield, the only Russian oilfield they occupied, was completely destroyed by the retreating Russians. The Maikop area was re-occupied by the Russians early in 1943, who also restored the Volga communications by wiping out the German armies at Stalingrad. Russia's oil supply in 1943 thus seems assured, while the fight for Russia's oil must have caused a very substantial further drain on German oil reserves. The effects of this drain are reflected in the suddenly enforced compulsory conversion towards the end of 1942 of essential goods vehicles and agricultural tractors in Germany and occupied European countries to producer gas.

Non-Ferrous Metals

WITH the exception of tin, production of all non-ferrous metals and light metals advanced strongly in 1942. There are no reliable statistics to show the extent of the advance, but it is more than likely that in almost all individual cases new world records were established. These new maxima must have been especially impressive in the cases of aluminium and magnesium, where the start of production in a number of new works in North America has been

With its widespread connections, this Bank offers every facility for the conduct of all classes of Banking and Exchange business with Australia.

reported in the course of the year. The Combined Raw Materials Board divided the responsibility for the metal development programme in the various producing countries between the United States and Great Britain, a move which assured an intensive and centrally directed effort.

In spite of the record production the supply of metals was, in most individual cases short, a direct result of the rapidly increasing requirements for war purposes. Lead was the only base metal which was available as a substitute for other metals. Wherever possible, however, non-metallic materials, especially plastics, were used instead of base metals, and many metal standard specifications have been revised to assure greater economy in the use of the scarce metals.

Tin, through the loss of the rich Pacific producing countries, which in normal times supplied two-thirds of world production, provided a special problem at the beginning of 1942. This, however, has been gradually solved as the year progressed. The problem was tackled from both the production and consumption sides. Production outside the Pacific region—especially Bolivia, Belgian Congo and Nigeria—has been stimulated by all possible means, and although labour difficulties and the difficult preparatory work temporarily slowed down production in Bolivia, the total output of the non-Pacific producing countries has undoubtedly surpassed that of any previous year. On the consumption side revolutionary changes have taken place in 1942, of which the extension in the use of the electrolytic process of tinplating, one of the greatest tin-saving devices ever introduced, may be permanent. A number of emergency measures—like the substitution of lacquered steel-plate for tinplate, the reduction of the tin content in bronze, bearing metals and solder, and the restrictions in the use of foil and other tin products—which saved much tin in 1942, will probably disappear again after the return to normal conditions. According to the US War Production Board the United States used only 65,000 tons of tin last year, a reduction of over one-third on 1941. Present plans aim at cutting US tin consumption in 1943 to half the 1941 total. As the United States and British tin policies have been closely co-ordinated, it is likely that the cut in British consumption approximately equalled that in the United States. One important event in the history of tin in 1942 was the start of operations at the Texas City tin smelter on April 5th. This smelter closed the gap in Allied tin-smelting facilities created through the loss of the Straits and Banka smelters and is at present the largest tin smelter.

British prices for the main base metals remained unchanged throughout 1942. In the United States copper, tin and zinc prices remained unaltered, but the lead quotation was raised from 5.85 cents to 6.50 cents per lb. (spot New York) in January, 1942. The rise did not indicate an alteration in the country's metal price policy, which continues to aim at the stabilisation of existing basic prices. In order to prevent the relatively low prices hampering production in high-cost mines, the United States Government in February, 1942, agreed to pay producers a premium of 2.75 cents per lb. in the cases of lead and zinc and one of 5 cents per lb. in the case of copper, for any increases in their output above the 1941 total. This arrangement, which was originally designed to run till the end of June, 1944, shortly before the end of the year was extended to the end of January, 1945.

Textile Raw Materials

BOTH world production and world consumption of cotton declined materially in the 1941-42 season. According to the New York Cotton Exchange Service, world production amounted to 26,710,000 bales, against 28,683,000 bales in 1940-41. Of this quantity, 10,950,000 (12,305,000) bales were accounted for by American cotton. World consumption of all types of cotton declined simultaneously from 26,542,000 bales to 25,806,000 bales. The decline in consumption was entirely due to the reduced consumption of "outside growths." Consumption of "American cotton" showed an advance from 11,867,000 bales in 1940-41 to 12,355,000 bales in 1941-42. This increase directly reflects the strong increase in United States cotton consumption (from 9,722,000 to 11,300,000 bales), which has now become the main factor in the international cotton position. British

cotton consumption, according to the New York Cotton Exchange Service, continued its fall last season by reaching only 1,742,000 bales, against 2,110,000 bales in 1940-41. The new (1942-43) United States cotton crop will show a considerable advance on the season. The last (December 1st) official estimate put the expected crop at 12,982,000 bales, against 10,976,000 bales a year before. United States consumption at the end of 1942 was continuing to advance, although the rate of expansion has slowed down. The main event in the British raw cotton position was the liquidation on March 31st of Cotton Importers and Distributors, Ltd. Since that date the Government Cotton Control has employed individual merchants, selected from a voluntary list, for its commercial transactions. This practice has strengthened the Control's hold over all phases of cotton distribution and is reported to have proved cheaper than the transactions of Cotton Importers and Distributors, Ltd.

The Japanese advance into the South Seas greatly intensified wool shipping difficulties and caused the Government to curtail raw wool allocations still further. The 1941-42 Australian clip reached 3,656,000 bales, an increase of 44,000 bales on the good clip of the preceding season. In New Zealand an increase of 37,600 bales to 985,812 bales has been reported. The British Government continued to acquire the whole of the Australian and New Zealand clips and the bulk of the South African clip. The remaining free supplies, especially those from South America, are being absorbed by the United States, which also received regular supplies from British purchases in Australasia and South Africa. As from July 1, 1942, the British Government raised its wool buying prices in the three wool-producing Dominions by 15 per cent. Before that date prices had remained unchanged since the beginning of the war. British domestic raw wool prices, however, remained unchanged throughout 1942, although export prices were increased by one-fifth in the autumn.

Amongst other textile fibres, the flax position of the United Nations continued to improve owing to increased production in the British Empire, including the United Kingdom. The United States in 1942 started a hemp-growing programme, which aims primarily at replacing lost supplies of manila hemp and sisal. Sisal production was greatly expanded following the lifting of restrictions as a result of the Far Eastern war. Jute production and consumption, however, continued to be curtailed and silk remained very scarce, although Free China had become a silk producer of growing importance and some progress with silk production is reported from Mexico.

Rubber

FOLLOWING the loss of the Pacific resources, rubber has become one of the most critical of all raw materials in the United Nations' camp. A big synthetic rubber production programme, aiming at the production of over 1,000,000 tons of various types of synthetic rubber, has been initiated in the United States. Following a slow start, this programme is now making better progress, but large supplies will not be forthcoming until fairly late in 1943 and adequate supplies will hardly be available before 1944. In these conditions, the utmost economy had to be practised in rubber consumption in 1942 in order to make stocks of crude rubber last till the output of synthetics improves supplies. The various economy measures include in both the United States and in this country the virtual discontinuation of rubber consumption for civilian purposes and stringent restrictions in the use of tyres. In this country a car tyre census, covering all laid-up cars, has been taken to provide a tyre reserve for essential purposes. Scrap collection and the intensification of reclaimed rubber production is being actively pursued, and a natural rubber production drive has been initiated in all potential producing countries still open to the United Nations, with Ceylon and Brazil ranking first. The stringent rubber supply position has resulted in a further strengthening of the control organisation. In this country Mr E. Gore-Brown was appointed Rubber Controller in December. He is assisted by three "Directors" dealing with crude rubber, tyres and the uses of synthetic rubber respectively. In the United States, a Rubber Director (Mr William Jeffers) with wide powers was appointed in September.

Manufactures

THE proportion of Britain's industrial capacity devoted to the manufacture of goods for the civilian consumer and for export was further reduced in 1942, in order to make room for expansion in war production. The output of consumers' goods was confined to essentials and quantitative control was tightened. Of the civilian goods which are still manufactured, the greater part was made to utility specifications by the end of the year. Moreover, production was further concentrated; in all, some 250,000 workers and 137 million square feet of factory space have been released for other purposes by concentration. The building industry remained fairly active until the autumn when the volume of its work tended to decline with the completion of the greater part of the Government's construction programme. The output of iron and steel was raised in spite of difficulties to satisfy the enormous demand for steel by the munitions industries. The aircraft industry has grown into Britain's biggest single industry; the weight of aircraft produced in 1942 was 50 per cent greater than in 1941. The output of artillery was nearly, and that of filled shells and small arms ammunition more than, doubled. Production of both naval and merchant shipping tonnage substantially exceeded that of 1941. Neither the statistics nor the space are available for a detailed record of industrial production; iron and steel, shipbuilding and shipping, and the principal textile industries have been selected for brief reference.

Iron and Steel

THE iron and steel industry's production programme was heavier than in 1941. It had to make good, as far as possible, the reduction in imports from the United States; it had to rely, more than in 1941, on home-produced iron ore and scrap; and it had to produce a still larger proportion of special steels.

According to *The Iron and Coal Trades Review* of January 8th, the steelworks laid out to supply heavy materials for the shipbuilding and structural steel trades were very busy, except for an occasional lag in the demand for large sizes of joists and sections. Demand for steel plates from the shipbuilding, wagon, tank and other trades has been heavy. The steel trade was also active, though there was a slackening in March and April when, owing to the shortage of spelter, the manufacture of galvanised sheets was prohibited, except for special orders.

Great though the demand for ordinary carbon steels has been, that for alloy steels was even more marked. Difficulties had to be overcome owing to the loss of sources of raw material supplies in the Far East. They were overcome by changes in specifications, where substitutes could be employed. A technical advisory committee was set up to this end, and serious hold-ups in the production of munitions were avoided.

The electric steel milling process has made rapid strides. New high-frequency furnaces were installed, which rendered possible an appreciable expansion in the output of alloy steels which are essential to the production of aircraft parts, tanks, heavy armament and other weapons, as well as to the manufacture of engineering tools.

Except for minor adjustments, prices have remained unchanged since November, 1940, but costs of production continued to advance.

Shipping and Shipbuilding

WHILE the publication of shipping losses has been suspended, it is known that they were again heavy in 1942. Although the output of naval and merchant ships in British yards was bigger than in 1941, only the phenomenal expansion of launchings in the United States prevented a serious shrinkage in Allied carrying capacity, and brought the volume of new construction above the rate of loss.

The U-boat has been the enemy's chief means of sapping Anglo-American striking power, or, rather, of preventing the translation into effective striking power of the enormous resources at their command. At the end of 1942 Anglo-American carrying capacity remained inadequate for the full deployment of their combined strength.

The heavy shipping losses have focused attention on ways and means of countering the U-boat menace. The production of escort vessels was increased; aircraft were enlisted in growing numbers to bomb U-boat bases and centres of manufacture, and to patrol the seas.

There was a good deal of controversy about the speed of merchant ships constructed in British shipyards to Government specifications. Ships of 11½ knots were regarded by many as too slow, and it was suggested that vessels of 15 knots and more would enjoy a greater measure of safety. Normally more carrying capacity can be provided with a given volume of resources—labour and materials—by the building of the slower variety; the faster type absorbs about 50 per cent more labour and materials than the slower, and it competes for machinery with the escort vessel. But, in view of their greater safety, the Government decided to build as many fast ships as possible without misusing resources; at the beginning of 1943 about one-third of the merchant vessels under construction in British shipyards were of the faster type.

Cotton Textiles

DURING 1942 production in the cotton textile industry was almost entirely concentrated on meeting the needs of the fighting Services, and with the extension of the war to the Far East, exports were greatly restricted. There was a great extension of control and supervision in the industry. A planning department was established by the Cotton Control for the production and distribution of goods, and at the end of March, the Controller took over the responsibilities for supplies and consumption of raw cotton previously exercised by Cotton Importers and Distributors, Limited.

The concentration of production scheme, which came into operation in 1941, resulted in an output of yarn and cloth equal to only about 60 per cent of capacity. A few mills were restarted during the year, but no large-scale development was possible owing to the labour shortage. Even the nucleus spinning mills were unable to work to full capacity, and few manufacturers were able to work all their looms. On June 24th it was decided to increase the allowance for the care and maintenance of stopped spinning mills, towards which all the nucleus firms contributed, from £7,000 a year per 100,000 spindles to £10,000 a year—an increase which was welcomed by the trade.

Several steps were taken to relieve the labour shortage. From the beginning of the year, the entire cotton industry was placed on a war footing with munitions, and the Essential Work Order was applied to the weaving branch—it had been applied to the spinning section in October, 1941. In May, the Minister of Labour agreed that some thousands of cotton operatives employed in other industries would be redirected to spinning mills. Between January and August, four hours' overtime a week were worked in spinning mills, and a certain number continued to operate the 52-hour week until the beginning of November. As a result of these measures, the output position improved, though there is no doubt that the hours were too long for many of the young persons engaged in the industry. At the beginning of the year yarn production was held to be about 15 per cent below essential requirements. By June, the Cotton Control announced that output had reached a record level, though it was still below the desired amount. In the cloth market, demand in general far exceeded supply, though producers of fine materials did less well than manufacturers of coarse and heavy materials; the utility cloth scheme worked satisfactorily. Controlled prices for cloth were introduced in April, and covered about 80 per cent of weaving production.

The entry of Japan into the war caused a further decline in exports; operations in Egypt and the Near East were also restricted, and the main outlets were West Africa, South Africa and South America. In the nine months ended September, 1942, shipments of export yarns amounted to 14,239,000 lb, as compared with 22,995,000 lb in the same period of 1941; while exports of cloth during the same period of 1942 were 369,420,000 square yards, as against 556,629,000 square yards in 1941 (January-September).

The operatives in both spinning and weaving sections

put forward wage claims for percentage increases on current earnings which were the subject of protracted negotiations throughout the year. The issue was referred to national arbitration, and in the end flat rate increases of 5s. a week for adult operatives were granted.

During the year increasing attention was paid to the post-war prospects for the industry, and discussions took place between the Board of Trade and the industry. The subject about which there was most discussion was the desirability of the Cotton Control remaining in existence.

Wool Textiles

AS with the cotton industry, the wool textile trade came under an increasing degree of control during 1942, and production for ordinary civilian consumption was further curtailed. The rationing procedure was generally tightened up, and production was directed mainly towards meeting military requirements. The order for priority established was, first, military requirements, secondly the utility clothing scheme, thirdly approved export trade and, lastly, non-utility civilian goods.

The general wool supply position was well maintained. Australia's production was 3,656,013 bales as compared with 3,611,923 bales in the previous season; New Zealand's was 985,812 as compared with 948,163, and South Africa's 250 million pounds as compared with 241 million pounds. At all these centres of supply, balances of unsold or unshipped wool accumulated.

Prices remained very stable, largely owing to the introduction of the utility scheme which fixed prices and profit margins at every stage of production and distribution. Issue prices for wool and tops for the home civilian trade were unaltered, but those for export yarns or fabrics were increased in July in order to offset an increase of 20 per cent in issue prices of wool and tops for the export section. The prices for civil yarn trades rose slightly, from about 1d. per lb. to 4½d. per lb. in certain qualities.

There was a general falling-off in overseas trade in wool textiles, following upon the export licensing and market allocation system which was introduced on February 1, 1942. The course of exports since 1938 is shown below:

	(In 1,000s.)		
	Woolens sq. yds.	Worsted sq. yds.	Totals sq. yds.
1938	58,919	31,573	90,492
1939	59,400	34,077	93,477
1940	45,487	37,558	83,045
1941	58,195	28,144	86,339
1942	47,800	25,446	73,246

During the year an agreement was reached with the Canadian Government with the object of ensuring the best

possible use in Canada's war economy of supplies of wool yarns and woven wool tissues exported from the United Kingdom.

The chief problem which the wool textile industry has faced is that of labour shortage, in particular shortage of skilled labour. The worsted spinning section was most affected, and, to a lesser extent, worsted weaving. The situation was improved by the application to most firms, except woolcombers, of the Essential Work Order.

Rayon

THE feature of the year in the rayon industry was the development of the utility scheme. Until the full specifications were introduced in the summer, the industry was scarcely affected. From the limited range of yarns permitted a satisfactory range of cloths has been produced. The limits placed on the diversity of yarns crowned a process of rationalisation which the rayon producers had been endeavouring to bring about for some years. It released labour and material, and cheapened costs, yet a wide selection of good materials at low cost is available. A prominent part is being played by the newer staple fibre fabrics. Crease-resisting finishes recently developed were incorporated. The utility scheme was, however, a heavy blow to firms with branded names, and others, who by a system of "quality-control," had gone far towards the object which the Government attempted in utility. There is a general satisfaction about the scheme as a whole so far as war conditions are concerned, but a desire for freedom as soon as possible after the conclusion of hostilities. In the knitting trade, the largest possible supply of rayon and staple fibre was arranged. In the hose trade, difficulties were considerable, owing to the necessity of supplying seamless stockings, and efforts have been made to overcome them. Official encouragement was given to the use of rayon or staple fibre in underwear in place of wool. The industry continued to supply increasing quantities of rayon for Service requirements for clothing and for other war purposes. While there was less rayon available for export, considerable trade was done in yarn with Argentina, Australia and Canada, and in piece-goods with the Dominions and West Africa. The entry of Japan into the war has created great shortages in the East, particularly in India. The rayon companies have, on the whole, disclosed satisfactory working conditions, and are optimistic regarding the ultimate future of the industry. It is increasingly obvious that the line between rayon and plastic producers is growing thinner, and that big developments both in this and in new textiles made synthetically will take place. Apart from a necessary increase in staple fibre, prices remained constant throughout the year.

Retail Trade

SUPPLIES of goods for civilian consumption were reduced during the year, and from August 1, 1942, important changes were made in the system of limiting supplies. The manufacture of certain items of jewellery, gold and silver-smiths' wares, cutlery, toys, leather goods, glassware and fancy goods was entirely prohibited. The manufacture of some classes of goods, including floor coverings, hardware, fountain pens and mechanical lighters, was prohibited except under licence. Quotas for other categories of goods were reduced. The full effect of these measures cannot be shown statistically, but changes in the value of retail sales are indicated in the accompanying tables. The first table shows the changes in the different categories of goods during the year ending January, 1943. The value of stocks (at cost) is given at the end of January, 1943. Sales and stocks are set out by districts. Prices of non-food merchandise continued to rise during the year, but by the end of the year price control Orders had been applied to a large number of civilian consumption goods. The second shows the percentage change in the average daily value of retail sales, month by month, compared with the corresponding month of 1941. The value of food sales was higher in 1942 than in 1941, and the rise was fairly consistent throughout the year. The fluctuations in the value of non-food merchandise sales were partly due to the dependence on coupons of clothing purchases.

AVERAGE DAILY VALUE OF RETAIL SALES AND STOCKS IN GREAT BRITAIN COMPARED WITH A YEAR AGO

Clothing and Utility Goods

THE clothing ration for the period June 1, 1942, to July 31, 1943, is 60 coupons, compared with 66 for the first ration period of twelve months. Manual workers received ten extra coupons. Children under seventeen were granted ten to thirty additional coupons, according to age and size. There were a few changes in coupon values. On July 14th values of infants' footwear and other clothing were slightly increased, as were women's woollen stockings and domestic overalls. Most furnishing fabrics required coupons from that date. On October 11th towels were included in the clothing ration, and the coupon values of men's woollen underwear and women's fully fashioned stockings were raised. Women's unlined jackets and men's short-sleeved non-woollen shirts required fewer coupons. Officers of the Army, RAF, ATS and WAAF were issued with 88 coupons to replace the system of signing bills.

Supplies of utility clothing greatly increased during the year. The effect of the removal of the purchase tax from utility clothing on August 3rd and the increased supplies is clearly demonstrated by the fall in the clothing component of the Ministry of Labour's cost of living index. For six months until the end of July, 1942, the index showed a rise in clothing prices of 95 per cent above the level at September 1, 1939. Between July, 1942, and January 1, 1943, there was a fall amounting to nearly 12 per cent. In the first year of clothes rationing a saving of a quarter of a million tons of shipping space was made, and nearly 400,000 workers were released for the Forces and war industries. Utility clothing now amounts to 80 per cent of production for civilian purposes, and control covers prices of cloth and clothing and qualities of cloth.

Household textiles are entirely utility produced; price schedules and quality specifications are laid down. Purchase tax is chargeable. Only utility furniture was permitted to be manufactured after December 1, 1942, and control is complete: it covers price, quality, design and raw materials. It can be bought only by newly married persons and those whose furniture has been destroyed by enemy action. Utility furniture is not subject to purchase tax. The principles of utility schemes were applied to domestic pottery. No other schemes are contemplated at present.
