The second main proposal of the Board is for a youth programme to equip young persons beyond the school-leaving age for the responsibilities of citizenship and earning a living. Three types of measures are recommended. The first is the provision of educational grants by the Federal Government to ensure educational opportunities for those who desire, and can benefit by, further schooling. Secondly, the Board is convinced that school curricula should be arranged to provide work experience for all young people during the school-attendance years. And finally, for those who are neither at school nor in private employment, the Board propose special youth work projects, which would in the main, be educational and would instil good habits of work and familiarity with the use of tools. These projects would not be limited to those in need. Special facilities for youth guidance should be provided both by the schools and the public employment service. The youth work programmes should be administered and financed nationally, with local participation where appropriate.

For the attainment of a basic minimum of security the Board places great reliance on an improved and broadened system of social insurance. National social insurance did not exist in the United States until 1935, when an Act was passed providing for old age, unemployment insurance and for Federal aid to the states for public assistance. At the time it was passed, the law was open to criticism on a number of grounds. The section of the present report dealing with insurance is mainly concerned with eliminating the gaps, the overlapping, the unwieldiness and certain inadequacies of the present law.

No provision has yet been made for disability insurance on a national scale. This is the most glaring omission in the present social insurance system, and the Board recommends that it be remedied to provide at least partial compensation for loss of income due to temporary or permanent disability.

It is generally agreed that the unemployment compensation provisions were the most cumbersome part of the Social Security Act, largely due to an attempt to preserve the authority of the individual states. A 3 per cent payroll tax was imposed on employers by the Federal Government, but 90 per cent of the funds received under the scheme were returned to the states, who were left to draw up and administer their own laws. The remaining 10 per cent was allocated to the costs of administration, and was divided between the Federal and state governments, at the discretion of the Social Security Board, presumably with the idea that a state could be penalised for failure to reach minimum standards. But there have been wide differences in the adequacy of state laws, in their requirements for eligibility, the duration and amount of benefits.

The Board recommends the replacement of joint Federal and state administration by a wholly Federal organisation, and the creation of a single unemployment insurance reserve fund, in place of the 48 now in being, to spread the risk and provide for more efficient use of reserves. If this is not done, it suggests that at least a "reinsurance" system, accompanied by Federal standards about eligibility, duration, and amount of benefit should be adopted. Part of the unemployment fund should be drawn from general tax

A TRIBUTE TO THE
MEN AND WOMEN WHO SERVE
CABLE AND WIRELESS
LIMITED

the all-British overseas telegraph company which operates the largest telegraph system in the world, with 300,000 miles of submarine cable and oversea wireless routes.

THE SUN has never set, nor sleep descended, on the men and women who carry to you dispatches, news or greetings from the world at war.

¶ In daylight, darkness, in dust of debris or under fire, the task, the ever-growing burden of service, is the same.

¶ From every fighting zone and every sea these men have carried you news, and when defeat has laid them low they have, though overborne by force, stood by their posts and sent the last defiant messages of hope and faith.

¶ Their lot is a silent watch, a ceaseless service, but in their very silence and in their quiet unfaltering duty they deserve unsought acclaim.

¶ For in the end they give their service or risk their lives that *you* may know how battles go, that *you* and all those overseas may know how the ever-changing hazards of war have treated you and yours.

sources. This is fundamental, in view of the existence of a national labour market, and the varying financial capacity of the various states. Among its other recommendations, the Board proposes that the duration of benefit should be extended to 26 weeks (the average is now 16); and that coverage should be extended to seamen, employees of non-profit making institutions and in general to all firms employing one worker or more. Consideration should be given to including in the scheme domestic, agricultural, and other lower-paid workers now excluded. Finally, the scale of benefits should be made adequate for self-support, and dependants' allowances should be instituted, and eligibility—now generally dependent upon earnings in a base period—might be made dependent on the duration of past employment.

The *old-age and survivors insurance* now in operation draws its funds from equal contributions from worker and employer, at present at the rate of 2 per cent of earnings from each. It is scheduled to rise to 3 per cent from each in 1949. The Planning Board in this case confines itself to recommending that the principle of a governmental contribution should be embodied in legislation; that coverage should be extended; and that study should be given to revising the benefit formulas and eligibility requirements, so that more of those covered may qualify for benefits, and the system may offer significant monthly benefits to a larger proportion of low-paid workers.

Insurance, however, will fail to meet many cases of need, and the Board, therefore, recommends certain changes in *public assistance* policies to eliminate gaps and provide adequate aid. At present, the Federal Government, under the Social Security Act, guarantees contributions to state assistance equal to benefits paid by the state up to \$15 a month. It follows that the wealthier and more generous states draw a larger Federal grant, and that the resident of a poor state is doubly penalised. The Board, therefore recommends that Federal grants be made to reflect differences in need and in fiscal capacity of the various states. The states should be required to distribute their funds to their local subdivisions on the same principles. It is here that a gleam of fierceness enters the sober pages of the report. If a state refuses to participate, or to comply with Federal standards, the Federal Government is to have the power to operate the programme in that state with its own staff, provided that a public hearing be held within the state. The states' programmes should provide, in the opinion of the Board, that assistance may not be withheld on account of race, sex, marital status or employment status or failure to have resided within the state for more than one year.

Social Services

The final pillar of the Board's edifice is the extension of *public social services* throughout the whole country, but particularly in regions at a financial disadvantage. First is the provision of adequate *medical care*, with special attention to the health of mothers and children. In addition, the expansion of state and local *child-welfare* services is recommended; the provision of *free lunches* for all school children; and that *surplus commodities* should be made available to the whole low-income population through the food stamp plan.

A number of general principles on the *financial administration of public aid* are included in the report. It is urged, for example, that reliance on consumption and ear-marked taxes should be avoided; and that public aid should be provided for as a normal and continuing expense of the general budget. Although emphasis is placed upon *Federal leadership*, the Board stresses the advantages of *de-centralised administration*, particularly on a regional basis, and lays down tests for the allocation of responsibility between the Federal government and the states and local governments. The importance of highly trained and experienced personnel, particularly in the employment service, which the Board makes the centre of its employment and training programmes, is urged.

American Beveridge

It was inevitable that the Board's report should have been nicknamed the "American Beveridge." It is inspired by the same principles, but in fact the two reports are very different. The Board's terms of reference were much wider than Sir William Beveridge's. Under the heading of employment it makes important proposals, whereas Sir William had to be content with assumptions. Again, the

social background and existing provisions for social security in the two countries is very different. Sir William's task was to unify an existing system of social security and to fill in gaps; the Board found many of the corner stones still missing and, for America, its proposals may seem correspondingly sweeping. Of Sir William's six fundamental principles the first, flat rate of subsistence benefit, is hardly applicable to America with its regional differences in standards and needs; there is no reference, in the summarised version to the second, the rate of contribution; the remaining four—unification of administrative responsibility, adequacy of benefit, comprehensiveness and classification—are to be found in the Board's report, adapted to American conditions. The report does not contain an estimate of the cost of its proposals; many of the financial details have still to be filled in; unofficial estimates range from \$5,000 to \$10,000 millions a year.

The proportion of welcoming articles which followed its publication was abysmally small. The genuine New Dealers in Congress have been delighted, but their voices have been drowned in an outburst of accusations of "Outright Socialism," "Bureaucracy Run Riot" and similar reactions on the Right and even in the middle.

Action during the present session of Congress is unlikely. But the cries of business, the horror of the conservative press, and the hostility of Congress will not necessarily bury the plan, although they will delay and perhaps modify it. There is every reason to believe that in this matter, as in so many others, President Roosevelt has correctly gauged the long-term development of the American temper. Experts on social security are unanimous in urging the speedy expansion of social security to provide a cushion for the post-war changeover to a civilian economy. But from the political side, this is, perhaps, not the ideal moment to convince the citizen of the urgency of action. Earnings are swollen; memories are short. In the end, however, there is no doubt that the American people will demand a more comprehensive and effective system of economic and social security. In great measure, such a scheme will unavoidably draw upon the principles laid down in the report submitted by the National Resources Planning Board.

American Notes

Lend-Lease

The Lend-Lease Act has been extended to June 30, 1944, without conditions or overt reservations. When it came to a vote, the opposition proved to be almost non-existent. The surprisingly solid vote for Lend-Lease was due, in large measure, to its own merits and to the good sense of both Houses. It was due also to the very great ability with which the Administration's case was handled by Mr Stettinius, the Administrator, by Mr Spiegelberg, the Recorder of the General Purchasing Board of the Army in the European Theatre of Operations, and by the host of other witnesses who testified to the invaluable part played by Lend-Lease in the prosecution of the war. Mr Stettinius, in particular, has been indefatigable and comes out of the investigation with a greatly enhanced reputation. Interest in the debate centred, not so much on the extension of the Act, which was considered a foregone conclusion, as in the fate of a series of amendments designed to turn Lend-Lease into a bargaining instrument and to introduce into its Administration a degree of Congressional control. None of these materialised. The amendment which, though it was not adopted, secured the greatest measure of support, was that introduced by Mr Vorys, Republican, from Ohio, providing for Congressional approval of the final settlement of Lend-Lease accounts and all master agreements entered into after June 30, 1943. This was defeated by 178 votes to 118. It shows, however, that it was the post-war implications of Lend-Lease that aroused the greatest uneasiness; not, it should be said, the question of repayment, but the possibility that the Administration might present Congress with an accomplished programme of reduced tariffs.

The total of Lend-Lease aid from March 11, 1941, to March 1, 1943, amounted to \$9,630 millions. Four-fifths of this amount was provided in the year just ended, and only one-fifth in the previous year. Of the total, \$7,831

millions represents the value of munitions, industrial materials and food transferred; \$1,801 millions is the value of services rendered. Perhaps most heartening was Mr Stettinius' statement that 90 per cent of the goods transferred have been shipped. The character of Lend-Lease has changed substantially since 1941. During the first year, munitions were only 35 per cent of all transfers; in the last three months, they have been 60 per cent, with industrial materials 24 per cent, and agricultural products, 16 per cent, providing a poor second and third. Over the whole life of Lend-Lease, aid to Britain, valued at \$4,430 millions, heavily outweighs that which has gone to Russia, \$1,826 millions; that to Africa and the Middle East, \$1,573 millions; and that to China, India, Australia and New Zealand, \$1,344 millions. But the emphasis is changing. In the second year of Lend-Lease, more than half of all shipments went to the fighting fronts in the Middle and Far East and Russia, against 68 per cent to Britain in the first year. The outstanding trends in the first two months of 1943 were the increase in shipments going to Russia; the sharp rise in the amount of food for Russia; the assignment of additional planes to the India-China air transport routes; and, finally, shipments to General Giraud's army and to the civilian population of French North Africa. For a vivid measure of America's industrial contribution nothing could surpass Mr Stettinius' statement that

In the past twelve months we shipped to our Allies under Lend-Lease or in fulfillment of previous direct purchase contracts 30 out of every 100 bombers we produced, 38 out of every 100 fighter planes, 28 out of every 100 light tanks, and 33 out of every 100 medium tanks.

Congressional Backing

This week four Senators have let it be known that they propose to submit to the Senate a resolution putting that body on record as authorising American initiative in setting up a United Nations organisation to co-ordinate military and economic resources in the prosecution of the war; to establish temporary administrations in liberated territory; to administer relief and economic rehabilitation; to establish machinery for the peaceful settlement of disputes between nations; and finally, to provide for a United Nations military force to suppress any future attempt at aggression. The document was said to have Mr Welles' tentative approval, and it has been discussed with the President; but support in Congress was not forthcoming from either. Recently in the United States there has been widespread and growing concern over the possibility of a split on foreign policy between the Administration and Congress. A number of plans have been put forward designed to clarify the position of Congress on post-war issues. It has been proposed, for instance, that Congress should vote on its adherence to the Atlantic Charter. An optimistic movement is under way to amend the constitutional provision that ratification of treaties must secure a two-thirds vote in the Senate, which makes minority obstruction possible. It is not necessarily true that attempts to put Congress' intentions on the record are always designed to strengthen the hand of the Administration. Some of the impetus behind these proposals comes from the desire to remind the world of the Congressional power of veto. The latest resolution is not one of these. Senator Ball, the main sponsor, is a Stassen Republican and has supported the President's foreign policy; and the two Democrats, Senators Hatch and Hill, are Administration supporters. Only Senator Burton has an isolationist record; but, although he

CREDIT BALANCES.

opposed entry into the war, he has worked for international co-operation in the past. If the resolution provokes a definitive debate—and a firm answer—on Congressional intentions, this time before the peace, rather than after the settlement, it will serve a healthy and, perhaps, historic function. It should be said, however, that all the omens do not point to a speedy and favourable conclusion.

Run, Willow Run

The whirlwind Kaiser technique is now to be applied to the production of aircraft on a large scale. The famous shipbuilder has just been appointed to be chairman of the Board of Directors of the Brewster Aeronautical Corporation, which has plants in Pennsylvania, New Jersey, and New York. Brewster is only one of three aircraft concerns on which the Truman Committee is said to have put a finger, owing to disappointing production records. The others are the great Ford plant at Willow Run and the Curtiss-Wright dive-bomber plant at Columbus, Ohio. The explanations advanced for the failure of Willow Run to keep up with its schedules have varied. There is no doubt that tooling took longer than was expected; and it is sug-

gested that more attention to experienced aircraft experts is needed. But the principal difficulty appears to be wit labour. The *Wall Street Journal* is quoted as saying:

The world's largest factory will be this country's large armament flop unless ways are found to attract tens of thousands of workers to the Ford bomber plant and to make living conditions desirable enough so that they will stay. The main reason why it is so hard to keep workers at Willow Run is the lack of adequate housing. It will be remembered that last year the US Housing Authority had worked out plans for a "Bomber City" to house workers at Willow Run. This scheme was abandoned largely owing to opposition from the Ford Company, which insisted that the labour requirements of the new plant had been vastly exaggerated. It was also reported that Ford's opposition was based, in part, on certain external considerations—the unpleasant prospect of having, after the war, a city of unemployed at his doorstep; the possible change in the political complexion of the country and a less favourable tax position. These theories may do less than justice to the Ford Company. What is now clear is that the Housing Authority was right and Ford was wrong on the issue of the need for more accommodation near the factory. If Willow Run is to fulfil its promise as Bomber City, or some part of it, must be built.

THE WORLD OVERSEAS

Dismembered Yugoslavia

(By a Correspondent)

March 15th.

FOR almost two years, Yugoslavia has been under German, Italian, Hungarian and Bulgarian domination. The present territorial frontiers, as can be seen from the map showing the position in the Balkans to-day, which appeared in *Das Reich*, are even more complicated than in 1913-14. Important provinces have been incorporated in Germany, Italy, Hungary and Bulgaria. Croatia is an independent kingdom governed by the Ustachi. The former Serbia is under the direct military administration of Germany. Montenegro is under Italy; Bulgaria incorporated the greater part of Macedonia; and Hungary secured the fertile Banat. Since 1941, war has never ceased in the whole country, and all attempts at establishing a stable economic and political administration in the various new sections have failed. The activities of the guerilla bands seem to be directed mainly at communications, and the course of the fighting is indicated by periodic announcements that railways are either being put in working order again or being destroyed. So-called public works, organised by the Croat Government, or by the German military administration, concentrate on road-building and on the repair and construction of railway lines.

The copper, lead and zinc mines in Serbia are worked by German firms with forced Serbian labour, and occasional references in German papers show that the copper

mines are being exploited with the most modern machinery imported from Germany. It is the greatest single source of copper ore at the disposal of Germany, and it can be assumed that the annual output exceeds 1,000,000 tons. The output of the bauxite mines in Croatia seems to have declined further after it had already fallen in 1940 to 5 per cent of the record output in 1938. There is no indication whether the manganese, chromium, antimony and mag-

Cross hatching shows the new Serbia under a German military commander. The eastern tip of Greece is also under German military administration.

The new kingdom of Croatia is shown by horizontal hatching. Yugoslav provinces incorporated in Germany are marked by diagonal hatching.

Arrows extending from the Yugoslav territory which is shown white in the map indicate the parts occupied by Italy, Hungary, Albania and Bulgaria. Another arrow shows the part of Greece occupied by Bulgaria.

nesite resources, mainly situated in Croatia, are being exploited as energetically as the copper mines. But there has evidently been some agreed division of labour between Germany and Italy, for the entire manganese output of Croatia was put at the disposal of Italy. Yugoslavia's cement

Italian Industry

[BY A CORRESPONDENT]

THERE are strong indications that the situation of Italy's war industry has gone from bad to worse in recent months. The programme for hydro-electricity, which used to be the special pride of the Fascist State, has been postponed indefinitely because of the shortage of materials; it had been planned to increase the electricity supply by approximately 50 per cent, to about 30,000 million kwh in 1945 or 1946, and thereby to make a further extension of the country's industrial capacity possible. It is also admitted that the cost price of electric current has greatly increased in recent years, and the power supply of all factories, except those of special military significance, has been reduced to 85 per cent of their 1941 consumption. The supply of copper is particularly inadequate, and this metal is admittedly being replaced by other materials in the manufacture of certain instruments, even though the experiments made with these substitutes have not yet produced a definite result. No information is available about the present volume of coal imports from Germany, but the Germans admit that it is difficult for them to maintain the supplies at the agreed level of a million tons per month, and they intend to replace them partly by the transmission of electric current. The household coal ration in the city of Milan was again cut down this winter; the official ration was only about 20 per cent of the pre-war amount, but in practice no coal at all was available for many Milan families, at least until late in December. Special efforts are being made to increase the domestic output of coal and lignite, but the shortages of transport and of labour combine with geological difficulties to make this task extremely hard. A recent decree provides for the release from the Army not only of all miners, whether skilled or unskilled, but also of soldiers who have had no mining experience but who are considered suitable for work in the pits.

More generally, the manpower shortage, which has developed during the last twelve months, makes it impossible to use the traditional expedient of employing large numbers of unskilled workers instead of a few skilled workers combined with a great deal of high-grade machinery. This shortage affects particularly the war industries proper; industry, concentrated in Split on the Dalmatian coast, is directly in Italian hands. The meat and fruit canning industries are hampered by the low agricultural output, and by the lack of tinplate and other material. Last year's good crop of sugar beet could not be completely converted into sugar because of the bad state of the sugar factories. The chemical and textile industries suffer from a similar lack of machinery, and also of raw material. It may not be far from the truth to state that the entire industrial output is now, at the end of the second year of the occupation, below 50 per cent of the output of 1940. Another factor is the considerable shortage of labour. Out of 350,000 Serbian prisoners of war, 100,000 are employed in Germany; from Croatia 120,000 workers have been sent there, and 50,000 more are to follow soon.

Roughly, 80 per cent of the population of Yugoslavia are peasants. The greater part of them work on small plots, which have again become primitive self-contained units. The agricultural organisation of Croatia, modelled after the German *Reichsnaehrstand*, has remained a plan. In Serbia, the German Economic Commissar, Neuhausen, decreed the compulsory organisation of peasants in co-operatives, for the purpose of enforcing deliveries of cereals and particularly wool. In some parts of the country, machinery has been pooled in the villages, but it becomes more difficult to replace simple agricultural implements. Against this background, the new plans for increasing the yield per acreage or for the change-over to new crops, particularly oilseeds, are useless.

Food Shortages

No figures have naturally been published about the harvests in 1941 and 1942, and it must be doubted whether the different governments and administrations are even able to make an estimate. Generally speaking, it seems to be accepted that the cereal and root-crop harvests have fallen to some 50 per cent of the pre-war results. There is thus an actual shortage of bread grain and feeding stuffs. Effective rationing of foodstuffs is only possible in towns if the administration is able to force peasants to deliver cereals and other foodstuffs. Control is, however, very difficult, and can only be enforced by the prohibition of private threshing. The most important products which can still be forcibly exported are either prunes or pulses, small quantities of tobacco and some vegetable oil. In towns in Croatia, as well as in Serbia, so-called workers' kitchens have been established because of the lack of foodstuffs. Clothing, shoes and even tobacco are also rationed. Yet the rationing system is ineffective. Shopkeepers are forced regularly to declare their stocks, and it is clear that price control is useless. In Croatia, as well as in Serbia, maximum prices are regularly declared for all important foodstuffs, but the actual prices paid are four times, and even five times, the maximum prices. Black market activities are widespread, and there is no organisation to prevent them.

In spite of the general shortage of foodstuffs and materials, it is officially reported that, for the first full year after the defeat of Yugoslavia ending in September, 1942, exports from Croatia amounted to 1,970,000 tons, valued at Kuna 3,494 millions. Imports were, however, only 643,000 tons, valued at Kuna 5,004 millions. Germany's share in imports amounted to 59 per cent, and in exports to 57 per cent. The difficult food situation is indicated by the import of potatoes from Germany, although it has been reported that the acreage under potatoes increased in Croatia as well as in Serbia.

Recently, greater Italian interest has been reported, particularly in Croatia and in Montenegro. An Italian transport company has been founded, and Italian capital is said to have been used in the construction of an aluminium plant in Croatia, with an annual capacity amounting to 20,000 tons. German companies are, on the other hand, particularly interested in developing a mineral oil industry in the valley of the river Mur. Before the war, Yugoslavia's pig iron capacity amounted to 100,000 tons, of which two-thirds are located in Croatia. German concerns dominate this industry, but the output is probably very low at present. There is no coke production in Croatia, and imports have virtually come to an end.

Croatia's budget expenditure for 1943-44 is estimated at Kuna 16,374 millions, an increase of Kuna 5,483 millions compared with 1942-43. State enterprises require 48 per cent of the total. Revenue is estimated to balance expenditure. Yet the so-called national defence demands extraordinary expenditure amounting to Kuna 4,750 millions. The deficit is covered by the issue of Treasury bonds, which have already reached a total amounting to roughly Kuna 3,000 millions.

HEALTH AND FOOD RATIONS

WHAT IS A HEALTHY DIET?

Before the war many people suffered from malnutrition because they picked the wrong foods from large and varied supplies. Now, the way to be well fed is to make sure of picking the right foods which are still available, even though supplies may be restricted.

Keep a few good sound principles well in mind. *Natural foods are the best*—vegetables contain important vitamins and become plentiful from time to time; National Wheatmeal bread has many valuable elements which were lacking in white bread; milk is available for children, who need it most. Fish liver oil—another natural food—contains the protective and bone-forming vitamins and is an essential supplement to everyone's diet, whether grown-ups or children.

The newspapers, the B.B.C. and the Ministry of Food are constantly publishing excellent recipes. You will find it pays you well to follow them. Diet should be varied if you are to make the best use of it.

Think carefully about food selection. It is well worth your while

This is one of a series of announcements issued in support of the Government's food policy by the makers of

CROOKES'
HALIBUT LIVER OIL

it is known, for instance, that more than 25 per cent of the metal workers in the province of Turin are at present women, and most of them lack any previous experience. Manpower is also wanted, very urgently, for the replacement of recent war casualties and for the formation of new Army divisions; furthermore, the Germans want more Italian miners, factory workers, etc., to be transferred to the Reich. But no reports have been forthcoming in recent months of any further additions to the Italian labour force in Germany; their number may still be in the neighbourhood of 300,000 men and women.

The Germans naturally want their allies to adopt policy similar to that adopted in the Reich to cope with this emergency; they forced the Italian Government, in their trade talks last summer, to provide for the "rationalisation" and concentration of their manufacturing industries; in other words, for the closing down of unessential concerns. But the Italian Minister of Corporations declared even after he had yielded to the German demands, that it was still his policy to maintain a nucleus of export industries with a view to future development; the Italians are frankly concerned lest a further reduction of their "civilian" industries will prejudice their industrial status after the war. Even the announcement that the major part of Italy's toy manufacture would be closed down, in the interest of the war, was criticised in the Fascist press last year.

Various measures have recently been taken for the mobilisation of the country's manpower and womanpower though the tempo of this procedure has been, in some cases very slow. Until the middle of last year, the great majority of Italy's textile establishments was only allowed to work 32 hours per week or less, so that the available work might be spread among as many factories as possible. A minimum working week of 48 hours has now been decreed for all factories; but this decree does not come into force until April, 1943. Another decree, of January, 1943, provides for the conscription for war work of all males between 14 and 70 and of all females between 14 and 60 years of age. In spite of its drastic wording, this decree merely repeats a principle which was already formulated over a year ago; its practical effect will depend on how it is put into practice. It is, in any case, strange to note that the date when various lists of men eligible for war work are to be handed over to the employment exchanges, as a preliminary step to conscription, is as late as May 18th. As for the mobilisation of women, Stefani recently wrote that, in this respect, Latin countries should proceed with tact, in order not to disturb the national conscience. Other recent measures for the mobilisation of labour include the prohibition or reduction of various non-essential production processes and the extension of the scope of Italy's Essential Work Order.

Few Reserves

It is probably true to say that certain untapped resources of manpower are still available in Italy; but these resources are by no means unlimited—quite apart from the ability of the authorities to make use of them. The problem is complicated by the fact that the urban sector of national economy is comparatively small, while the land cannot be deprived of too many workers. The closing-down of unessential industrial establishments will certainly set free a number of workers, although Signor Gayda was probably justified in saying, in July last year, that many of these men and women cannot easily be transferred to more essential occupations. It is also interesting to note that the Italian press, while commenting on the "large numbers" of independent artisans, reports that these craftsmen often secure exorbitant remuneration, as their number is not up to existing requirements. Shopkeepers, professional men, etc., might still be combed out, but their usefulness for the war effort is certainly limited.

The Italians will do their utmost to maintain their munition industry on as high a level as possible, in order to avoid a greater dependency on the trans-Alpine supply routes in the present emergency. The Germans will only be able to secure for themselves an appreciable number of skilled or semi-skilled Italian workers if they risk a further deterioration in the war potential of their most vulnerable ally. They will hardly be able to resume the transfer of Italians to German fields, factories and coal mines on the same scale as in the earlier stages of the war.

THE BUSINESS WORLD

Finance and Banking

Keynes White Paper

After the leakage of certain details of the undisclosed "Keynes" plan for post-war currency arrangements, the Government has decided to publish the plan as a White Paper. The barrage of questions on this subject in the House of Commons on Tuesday elicited little specific information, except the negative assurance that the Bank for International Settlements plays no part in it. Sir Kingsley Wood repeated his recent assurance that, before any decisions are reached on this or any other scheme of monetary reconstruction, the House of Commons will be given full opportunity to discuss the matter. It is to be hoped that publication of the "Keynes" plan will be followed by publication of the American counterblast to the scheme. This is a plan generally attributed to Mr Harry White, an assistant of Mr Morgenthau, Secretary to the US Treasury. The White Scheme at present commands no ranking higher than that of a personal memorandum—similar to the status of the Keynes plan before it was accepted as a Treasury plan. It provides for an international gold stabilisation fund to which all gold-owning countries would contribute in the first instance, and which would provide an initial *masse de manœuvre* for setting international trade and finance in train again after the war. The scheme goes into considerable legalistic details about reserve requirements and other technical matters, but falters somewhat on the more realistic aspects of maintaining international equilibrium. Pump priming is not enough, however colossal the initial stimulus may be. In all discussions of these schemes sight must not be lost of the relatively subordinate role which exchange machinery will play in solving the basic problems of post-war trade. If, owing to tariffs and other obstacles, fundamental disequilibrium remains, no amount of pump priming, no ingenuity of multilateral clearing systems will prevent the machine from seizing up again.

Credit Management

The aftermath of London's Wings for Victory week has affected the position in the money market no more than did the abnormal movements of funds during the week itself. The Bank of England's management of the credit position during this exceptional period has achieved complete insulation of the cash basis from the large flow of funds to Government accounts. In the main, the insulation was achieved by the maturity and pre-encashment of Treasury Deposit Receipts, while the banks had themselves prepared for the rigours of last week by acquiring substantial amounts of the Treasury bills maturing in that period. A certain amount of deliberate delay in the machinery of cheque clearing was also brought into play, while good care was taken to hasten, within the possible limits, the flow of Government disbursements last week. The result was that at no time have the banks or the money market been at all conscious of a strain in the credit position. The test of the management is provided by the exceptionally low level to which the authorities succeeded in keeping the level of public deposits at the Bank of England. On Wednesday of last week the total was £4,743,000. The latest Bank return shows it to be £6,863,000. As is now usual, the minimum of credit is kept immobilised in Government accounts. This week again, the market has had ample supplies of short loan money. The Bank return shows a fall of £4,326,000 in bankers' deposits, but at £156,064,000 these are at a level still indicative of easy money conditions. The circulation continues to expand, the latest weekly movement amounting to £1,033,000, which carries the total of notes outstanding to the new record of £927,383,000.

Estimates Exceeded

The Exchequer returns covering the second week of March show both revenue and expenditure to have exceeded the original budget estimates for the first time.

With little more than two weeks of the financial year to go revenue has topped by £37,400,000 the estimate of £2,627,100,000 for the whole financial year. The expenditure at £5,299,792,000 is £13,313,000 in excess of the original estimates, but still £407,001,000 short of the figure subsequently revised for supplementary estimates. Barring quite abnormal alterations in the rate of revenue and expenditure in the final weeks of the year, the final outcome should provide a deficit not far removed from the figure of £2,659 million which appeared in the original estimates—an astonishing feat of prognostication, given the magnitude of Government revenue and expenditure and the arbitrary and unforeseeable influences to which expenditure, in particular, must be subject. The yield of income tax has already passed the estimate by £22,996,000 and on current indications is likely by the end of the financial year to exceed the estimate by about £100 million. The other sources of revenue which promise to show substantial surpluses over the estimates are miscellaneous revenue, which is already £66,103,000 above the estimated total, and excise whose yield to date—£404,800,000—is £38,095,000 in excess of the estimate for the whole year. This last comparison suggests that any calculations the Chancellor may have made as to the likely deterrent of higher duties on the consumption of beer and spirits have gone considerably astray. If it is the desire of the authorities to restrict such consumption and economise the materials and labour involved, the evidence of the Exchequer returns is clearly an invitation to "hit harder next time." The only sub-

Voice of the North

ASK TO SEE IT AT YOUR CLUB, LIBRARY OR NEWSAGENT

stantial source of revenue which looks like falling short of the estimates is EPT and NDC. The combined yield of these to date is £66,318,000 below the estimate for the full year, and unless the rate of collection is considerably hastened between now and the end of the month, the estimate will not be reached. It is believed that the responsible factor in this case is not a shortfall of the profits assessable to these taxes, but difficulties and delays which have been experienced in making the assessments.

Bank of Canada's Operations

The annual report of the Governor of the Bank of Canada to the Minister of Finance is a model of the information which a central bank should provide on the subject of its credit policy and the technical operations through which that policy has been implemented. Whereas in the United Kingdom the would-be interpreter of central banking policy has to grope through the hearsay of market gossip and through an anachronistic and uninformative Bank return, in Canada, as in the United States, the facts are divulged clearly in the periodic reports issued by the central banks. The only loser from this candour is the ill-disposed critic who batters on the secrecy and mystery which all too often veils banking operations, and central bank operations in particular. Among the factors that had to be taken into account by the Bank of Canada last year were sterling operations with the Foreign Exchange Control Board and the adjustment of the chartered banks' cash basis to the expansion in credit which accompanied the banks' direct participation in Government issues. During the latter part of 1941, the Bank of Canada

had begun to accumulate sterling sold to it under a repurchase agreement by the Foreign Exchange Control Board (this was the sterling which Canada began to accumulate in payment for war deliveries when the United Kingdom resources of Canadian dollars began to give out). By March 25, 1942, this sterling holding reached \$474 million. On March 27th, this sterling was repurchased by the Foreign Exchange Control Board and sold to the Government. The transaction took place in two stages. The Government used part of the proceeds of the Second Victory Loan to repurchase sterling at the end of March, and in June the Government sold \$193 million of short term securities to the Bank of Canada to obtain funds for the same purpose. The Bank of Canada's holding of Dominion and Provincial Government securities increased by \$107,929,000 during the year. In the first two months, \$175 million of short term securities were sold by the Bank of Canada to the chartered banks to offset an increase in the banks' cash reserves, which otherwise would have taken place as a result of the increase in the central bank's holding of sterling. These securities were repurchased early in March to offset the effect of the transfer of Dominion Government balances to the Bank of Canada pending the purchase of sterling by the Government. In the latter half of 1942, the Bank of Canada bought considerable amounts of securities on the market in order to maintain the cash reserve of the chartered banks at the usual ratio to deposit liabilities. The report also states that the Bank of Canada was called upon to grant credit facilities to banks subsequent to the issue of the Second and Third Victory loans. The chartered banks' holding of securities rose by \$485 million during 1942, these taking the form mainly of deposit certificates maturing within six months and bearing interest at $\frac{3}{4}$ per cent.

Investment

Taxation in Accounts

The Council of the Institute of Chartered Accountants are to be congratulated upon having circulated to their members a number of further recommendations for the reform of accounting practice. On this occasion, the suggestions—they are still not more than that—are mainly directed to the supremely important question of the treatment of taxation, and they are designed to make it clear how far the Inland Revenue and the shareholders participate in profits. The first group covers actual tax provisions. It is laid down as fundamental that the charge for income tax should be based on profits earned during the period of account. Where only the minimum legal liability has in the past been provided, this ought gradually to be brought up to the full amount due. The two sums and the bases for them should be stated separately. It is further suggested that taxed revenue should be shown gross and the tax included in the company's liability. With regard to EPT of holding companies, it should be indicated whether the charge is in respect of the group or whether part has been spread over the subsidiaries. If the amount falling to be provided for any tax is reduced by credits from the past, or if provision is made for the future, beyond the full provision on profits earned to the date of the accounts, these items should be separately stated. It is also recommended that future provisions should be included in the balance sheet, not as current liabilities, but either as deferred liabilities or as reserves. These are all matters of principle, and the changes suggested appear excellent and will go a long way both to clarify the position and to prevent the establishment of secret reserves. It is to be hoped that means will be found to give them even more force than is ensured by their origin.

*

Having established the need to give additional information, the Council goes on to prescribe the form in which income tax should be presented in accounts. This is a vexed subject among accountants, and it does not appear that the Council is prepared to be very dogmatic about it. Their first recommendation is that interest, royalty and similar payments should be charged gross and that dividends should be charged net, but they go on to say that, where a company continues to provide for dividends gross,

the narrative should indicate that the distributions are subject to income tax. These requirements fall considerably short of what is desirable, unless the earlier recommendations are to include a clear statement of the rate at which tax is calculated. Without such a statement on the accounts, it is impossible to calculate the gross cost of a tax-free dividend, which is stated net, or the net receipts by shareholders of less tax dividends which are stated gross. Of the three things, gross cost of dividend, net cost, and rate of tax applicable, two must be stated in the accounts. The final recommendation again refers to a matter of method, namely the inclusion in accounts of proposed profit allocations. Where these are subject to later confirmation by shareholders, many concerns still exclude them from the accounts, with the result that they have to be taken into those of the subsequent year. Uniformity is very desirable and there can be no question but that the practice of including items that have still to be sanctioned is the clearer. The Council, therefore, recommends the adoption of this practice by all, with the proviso that the items in question should be described as being subject to confirmation. With the possible exception noted above, these recommendations constitute a satisfactory advance, and no effort should be spared by all concerned to see that they are generally adopted.

The Railway Speeches

Despite the ban on publication of full railway results, it was hoped that the speeches of the four railway chairmen might contain information that would throw light on the post-war prospects of the lines. Unfortunately, such little information as was forthcoming was largely of a negative character. For the most part, the speeches were devoted to insisting that the railways had done a magnificent job and that they were enabled to do it, in part at least, by sacrifices of the shareholders in accepting low dividends in order that their property might be maintained in full efficiency. That the country should be grateful to the railway managements for the wisdom of their policy is true, but the policy has been of benefit to the shareholder as well, for, even if it comes to a sale of the property, its post-war state will be a potent factor in determining its

value. When the boards attempt, however, to put forward the existing volume of traffic carried as a criterion of what they can, and should, be allowed to do in peace time it is not easy to follow them. It is by no means clear that traffic in the present volume or the present distribution—either geographical or as between one class of traffic and another—will persist for any considerable period in peace time. Nor is it apparent, even if it does, that anything like the present distribution between rail and other forms of transport is desirable. Until these factors are known, no forecast of the railways' legitimate position can be made. Sir Charles Hambro has made it apparent that, when the Government White Paper appears and discloses the relation between gross and net traffic, that proportion will have little relevance to post-war probabilities, since it has been achieved under conditions of control which, it is thought, would not be tolerated, except during a period of emergency. If the chairmen had been able to point to substantial technical improvements of a permanent nature, there might have been good hopes for the stockholders. But of these there were few. Even economy in the use of wagons, through pooling and general speeding-up, is not, necessarily, permanent in its effects, and there were few other indications of economies. One point does, however, emerge, namely, that the railway managements are less wedded to either Government control or Government ownership than are the leaders of some other industries.

* * *

New Drapery Scheme

The revised capital reorganisation scheme of *Pete, Robinson* is now made public, and it is difficult to say whether it constitutes any great advance on the original, dealt with in *The Economist* of November 28th. The scheme is to be criticised mainly from the standpoint of the 7 per cent cumulative preference holder. He is now to receive $5\frac{1}{2}$ per cent instead of 5 under the first scheme, and this is to become cumulative two years earlier, namely, from January 31, 1946. This is all gain, and, insofar as preference shareholders must be presumed to desire security of return, they will probably regard this as an important achievement. There is, however, a further matter to be considered, the compensation for abandoning arrears of dividend, giving up cumulative rights for a period, and accepting a permanent cut in them. From this aspect, the new plan is in some respects less satisfactory than the old. Under the old, the preference shareholder received virtually half of any money it was decided to distribute, after meeting the preference and preferred ordinary dividend, up to a further 5 per cent, but the right to participate in their holdings of preference capital. Now they are to receive rather less than one quarter of the equity capital. Their participation is reduced, but a saleable stock is received. Evidently, the new scheme is more favourable to the preference shareholder if the company does so badly that no ordinary dividends are possible, or so well that it can pay over 10 per cent. No one can tell which will happen, and the scheme ought to be deferred until the position is less obscure. It is, therefore, disappointing to find that the shareholders' committee, who stated in their first circular that no action should be taken until it was possible to assess the extent of capital losses and of future earning capacity, are now convinced that the present is the right time for the scheme to be put through. It is to be hoped that the arguments which produced this change of opinion will be made public without delay. It is understood that the accounts for the year to January 31st last show profits after tax of £22,844. Those of the previous year were £17,832, while there was a loss of £12,155 for 1940-41. The shareholders are invited, also, to sanction changes in the directors' remuneration. No proxy forms have so far come to hand, and it is not apparent on the face of the documents available that the requirements, recently set out by the Committee of the Stock Exchange, have been complied with in this case.

Company Notes

Heavy Industrial Results

The preliminary figures of *Vickers* for 1941 show a certain measure of recovery from the previous year's considerable setback. Net profits are shown as £962,600 against

£908,905. Equity earnings are up from £596,852 to £650,548, representing 21.1 against 19.4 per cent, and the 10 per cent ordinary dividend is repeated. For the third year in succession there is a transfer of £250,000 to contingencies, so that the carry forward is raised from £690,786 to £783,447. The results of the subsidiaries, so far announced, have tended to suggest a modest improvement in the revenue of *Vickers*, and it is probable that the disclosed total, struck after all tax, is back at around the level earned in 1940. The 10s. ordinary stock, at 19s. 4½d., yields £5 4s. 10d. per cent.

*

The preliminary statements of *Hadfields* and *Coltness Iron* for 1942 suggest a contrast in experience. *Hadfields* report an increase in net profits from £198,904 to £202,264, so that, after meeting preference dividends, there is a rise in the ample cover for the ordinary payment, maintained at 22½ per cent, from 35.6 to 36.2 per cent. No details are provided as to the allocation of the surplus. Net profits of *Coltness Iron*, after depreciation of £85,000, as in every recent year, are reduced from £138,265 to £135,563. As before, staff funds receive £4,000, so that, after preference charges, equity earnings are down from £108,515 to £105,813, and the ordinary payment is underearned. Ordinary shareholders receive 18½ per cent, as before, against 20 per cent in 1939 and 1940, but the rate of earnings is reduced from 18.4 to 17.9 per cent. The deficiency is drawn from the carry forward, which is reduced from £261,823 to £259,355. These results suggest that a further cut in the ordinary payment may be inevitable unless there is a recovery in profits in the current period. The contrast between the results of the two concerns is probably to be explained by the concentration of *Hadfields* on the later stages of production of goods from steel, while *Coltness Iron* is heavily interested in the earlier stages, where control of profit margins is more severe. There was also little improvement in coal mining conditions. The labour shortage remained acute, and *Coltness Iron* is apparently hampered by exceptionally low stocks of industrial raw materials. The 10s. ordinary stock of *Hadfields*, at 31s. 6d., yields £7 6s. 4d. per cent; the 15s. ordinary shares of *Coltness Iron*, at

GUARD YOUR STAFF against INFLUENZA

STAFF is more precious than ever. Safeguard against depleted Staffs by the right use of "SANITAS", the antiseptic and germicide recommended by Doctors and Medical Officers for very many years. It is safe and non-poisonous.

SPRAYING ROOMS—Spray all offices and workshops with undiluted "SANITAS" at least once a day. If an epidemic has already taken hold, spray more often.

Freshens and purifies the air by **RELEASING OXYGEN** and the odour of pine trees into the atmosphere.

MOUTH and THROAT WASH—"SANITAS" contains Thymol, recommended for this purpose by the Ministry of Health.

Keep a bottle in the Staff Washrooms, and post instructions for use.

AFTER WORK—a little "SANITAS" added to the personal wash after work is a wise precaution against spread of germs.

Widely used in Hospitals, Institutions and Public Buildings.

At Chemists, 1/1½ & 1/8½ (incl. Pur. Tax)

SANITAS
THE SAFE ANTISEPTIC

ON REQUEST—Valuable War Memorandum on prevention and treatment of infectious diseases. Write (enclosing 1d. stamp) to: SANITAS CO. LTD., Dept. BCO/3C, 31 Clapham Road, S.W.9.

46s. 3d., return £5 18s. 11d. per cent. These figures suggest that the basis of *Hadfields'* recovery over the past eight years is not regarded as lasting.

Bradford Dyers Preference Payment

With the publication of the results for 1942, the directors of Bradford Dyers announce the payment of a further two and a half years' dividends on preference capital, thus bringing distributions up to December 31st last. As the full accounts show, this decision is amply justified by a rise in profits, after tax but before depreciation, from £376,497 to £388,583. Depreciation receives £146,309—some £10,000 more than in the previous year—so that there is £170,717 against £166,826 for dividends. The preference payment requires £159,327, as in 1941, and the surplus of £11,390, against £7,499, is added to the carry forward, raising it to £19,563. On the basis of charging one year's preference dividend only against profits, equity earnings amount to 9.4 against 9.1 per cent. If the present level of profits can be even approximately maintained, there is now some prospect that ordinary stockholders will receive a payment on the results of the current year, the first since just over 4 per cent was distributed for 1930. It is, however, essential that something shall be done to strengthen reserves, which are less than £190,000, including £93,484 reserve against investments. There is every reason to suppose that the concern is now fully adjusted to war-time conditions and that operating results will remain more or less stable. The balance sheet position is satisfactory and indicates an expansion of business. In the company's statement, net loans to subsidiaries have risen by rather more than £100,000 to £192,452. The consolidated balance sheet shows an increase in net liquid assets from £1,499,322 to £1,829,901. Debtors, creditors and cash items are all higher. There is a small decline in stocks, inevitable in present conditions, from £957,128 to £950,139, but it does not appear that the concern will be seriously hampered by this deficiency. Total investments, including tax certificates, are some £311,000 higher at £695,632 as a result, in part, of an interesting switch of £109,056 from short term deposits with building societies to marketable securities. The £1 ordinary stock now stands at 15s. 9d.

Dorman Long Report

As far as the distribution of profits is concerned, the full report of Dorman Long for the year ended September 30th adds nothing to the preliminary statement discussed in *The Economist* of March 6th. Taxation, which last year absorbed £429,421, is not disclosed this year, and it is only possible to compare net profits which have risen from £759,957 to £1,058,397. It is quite clear that these results arise from a considerably increased output and trading profits have almost certainly exceeded the record 1938 earnings of £1,498,517. The 8 per cent dividend on the ordinary shares is just covered by earnings of 8.4 per cent, after repeating the allocation of £275,000 to depreciation, which the chairman, Lord Greenwood, states approximately equals the wear and tear allowances for tax purposes. In addition, however, the company has increased the provision for renewals and repairs, deferred owing to war-time conditions. The balance-sheet confirms the impression of the company's intensive activity. Net liquid assets have risen from £3,623,576 to £4,342,222, excluding the amounts owing by subsidiaries which have fallen some £200,000 to £347,292. Cash has been almost exactly trebled, but the present figure of £927,748 is considerably below the level of the period 1938-40. Debtors are practically £500,000 higher at £3,932,082, while stocks are slightly reduced to £2,779,722. An increase of some £200,000 in the tax liability to £1,383,838 provides no indication as to the year's demands on the company in this respect, but creditors are some £80,000 lower at £1,651,855. Lord Greenwood puts forward a plea for the more equitable treatment of the iron and steel industry in respect of War Damage Act charges, which he admits have actually been reduced this year. It

is doubtful whether the small potential saving on this charge would do anything to provide a solution to the post-war problems of the industry; rather does the remedy lie in its own hands. For the immediate future, however, the prospects are quite good. The £1 ordinary shares now standing at 24s. 9d. ex dividend, yield £6 9s. 3d. per cent, compared with an average yield of £5 8s. 3d. on 18 similar shares calculated by the *Actuaries' Investment Index*.

Higher Electrical Equipment Earnings

The preliminary results of a number of electrical equipment concerns, reporting to December 31st last, suggest that the improvement in net profits realised by *British Thomson-Houston*, whose results were discussed in *The Economist* of March 13th last, has been general. The trend and allocation of the profits of the largest concern whose figures have been announced recently, *British Insulated Cables* are analysed in the following table. It is estimated that equity earnings rose by 0.9 per cent to 29.9 per cent. The reduction in the carry forward of some £50,000 to £428,227 is due to the allocation of £50,000 against nil to staff funds. The jump in net income of *Enfield Cable* from £132,340 to £181,623 is even more striking. There is no rise in the ordinary dividend, at 12½ per cent, but the cover is increased from 16.8 to 29.2 per cent, the highest level since 1937. It is not possible to calculate earnings for ordinary capital of *Lancashire Dynamo and Crypto*. Net earnings, after fees and depreciation, but before allocation for staff funds, have risen from £111,015 to £122,000.

British Insulated Cables	Years ending December 31,		
	1940	1941	1942
Profits after tax*	786,232	810,385	831,107
Fees, etc.†	18,333	15,713	26,603
Depreciation	209,622	247,324	247,324
Deb. interest	383	Nil	Nil
Pref. dividends	57,500	57,500	57,500
Ordinary stock:—			
Earnings	500,394	489,848	499,680
Paid	400,000	400,000	400,000
Earnings %	28.7	29.0	29.9
Paid %†	20	20	20
Reserves§	100,000	100,000	150,000
Carry forward	488,699	478,547	428,227

* Except tax on dividends. † Estimated in 1942.
 ‡ Including 5 per cent cash bonus.
 § £100,000 in each year to war contingencies; £50,000 in 1942 to staff funds.

The directors announce an increase of 2½ per cent to 22½ per cent in the equity dividend, which in the previous year was covered by a rate of 32.6 per cent. *Associated Electrical Industries*, the holding company which controls *BTH*, is doing no more than maintain the 10 per cent payment on ordinary stock, but if the experience of other subsidiaries is in line with results so far announced, a rise in revenue seems probable. There can be little doubt that all companies producing any electrical equipment worked to capacity last year, and possibly even increased output. The general rise in profits, in existing circumstances, can hardly be explained other than by improvement in the EPT standard of the various concerns through a further expansion in working capital employed. *Lancashire Dynamo and Crypto* is, of course, increasing its ordinary capital from £400,000 to £660,000. Yields are low. The £1 ordinary stock of *BIC* at 10s. ex dividend yields no more than £3 19s. 3d. per cent, less tax, at 9s. 10½d.; that of *AEI* at 51s. 3d. £3 19s. 7d. per cent.

International Nickel Expansion

The report of International Nickel for 1942 shows for the third year in succession a modest decline in net profits from \$34,356,401 to \$33,301,829. Tax liability fell rather more steeply by some \$1,249,000 to \$25,079,285, so that the setback in the face of higher output was presumably due to a rise in operating costs. After meeting preferred payments, there is some \$31,368,000 against \$32,422,000 for common shares, and the customary \$2 dividend is covered by earnings of \$2.15 against \$2.22 per share. Profits in the last quarter of the year were above those of a year before, but still slightly lower than those of 1940. Mr Robert C. Stanley, the chairman and president, pointed out that expenditure

on the company's expansion programme is now mainly complete and that the target of an increase of 50 million lbs. over output in 1940 was attained. It must be expected that the company has by now nearly touched maximum production and this appears to be adequate for wartime needs. As Mr Stanley points out, the threatened shortage of supply did not develop. It remains uncertain whether demand for nickel can continue at anything like the present level when the war is over and, consequently, whether the concern may not be saddled with considerable excess capacity. The chairman places his hopes in an increase in the technical uses for the metal. No doubt the conservative financial policy of the management has also made provision to take care of recent installations until such time as the secular upward trend absorbs them. The common shares of no par value at \$51½ yield 3.883 per cent.

Boot and Shoe Results

The latest results of six boot and shoe companies, both manufacturers and distributors, reveal that earnings have not suffered in the first full year of rationing. Five companies have maintained their equity payments, while one, *Freeman, Hardy and Willis*, which is primarily concerned with distribution, has restored the 25 per cent, tax free, dividend from last year's reduced payment of 15 per cent, also free of tax. *Saxone Shoe, Public Benefit Boot and Greenlees* are the only concerns to reveal their profits before tax. The first two have improved on last year's results, although taxation accounts for part of the increased earnings. On this point, the board of *Saxone Shoe* deserve commendation for revealing separately the charges for income tax and EPT. *Greenlees*, however, has suffered a minor setback in profits, which are reduced from £88,831 to £80,993, the cover for the 10 per cent equity payment declining from 15.5 to 11.6 per cent. Of those companies

† Tax free.

showing profits after tax, *J. Sears* and its subsidiary, *Freeman, Hardy and Willis*, have both done rather better, although *H. E. Randall's* net profit figure is barely maintained at £25,424. Common to all concerns is the considerable reduction of stocks, generally accompanied by a compensating rise in either cash, gilt edged stocks, or tax reserve certificates, but *Greenlees* have used the cash released to halve creditors, now standing at £107,075. Mr W. T. Sears, chairman of *J. Sears*, explains this trend by the fact that public demand far exceeds the industry's permitted output under Government licence, while, according to Mr F. W. Panther, chairman of *Freeman, Hardy and Willis*, a considerable volume of current production is devoted to Army boots and utility footwear. It is clear that this applies to all concerns in the industry, and in view of the low profit margin on this class of product, together with the reduced stocks available, it is not improbable that operations in the current year may not be quite so successful.

British Aluminium Recovery

In 1942, net profits of *British Aluminium* rose from £517,332 to £569,869, in each year after £50,000 for depreciation. Thus, after meeting preference dividends, there is £479,869 against £427,332 for equity capital representing 21.9 against 18.5 per cent, the same level as in 1939, when gross profits reached a record for the past decade. There is no increase in the 10 per cent ordinary dividend. General

reserve receives £150,000 against £100,000, and the carry forward is raised from £222,128 to £251,997. Since the company certainly had to meet very much higher taxation last year than in 1939, there is every reason to expect that total income considerably exceeded the £1,075,796 earned in that year. The fact that the recovery in gross earnings has in part been retained for the benefit of the ordinary capital, presumably, denotes an increase in the working capital employed in the concern. Last year, *British Aluminium* became more completely adjusted to the situation resulting from the inability to continue importing bauxite and finished goods from France after June, 1940, which has, presumably, called for an expansion in capacity. The management is no doubt wise not to restore the pre-war dividend level of 12½ per cent, although at no time during the war has there been any absolute inability to meet this distribution. The £1 ordinary stock, at 49s. 6d., yields £4 2s. 0d. per cent.

Radiation Progress

For the third year in succession, *Radiation*, the holding concern controlling various manufactures of gas appliances, reports a rise in net profits. In 1942, disclosed income rose from £130,432 to £145,913, after all tax including tax on dividends. There is no indication as to whether the concern is again making an allocation to war damage reserve, which received an initial transfer of £25,000 in the previous year, but, on the assumption that no provisions of this nature in either period should be charged against profits, equity earnings are up from £97,806 to £113,287. There is a two point rise in the ordinary dividend to 8 per cent, covered by earnings of 10.1 against 8.6 per cent. Although income is not restored to the pre-war level, this payment is the best since 1938, when the equity distribution was reduced to 12½ per cent, against 17½ per cent paid in the four previous years. The improvement is probably due both to new building for official purposes and to the return of a large proportion of the population into areas served by gas since the cessation of heavy bombing. It is certainly in line with the recovery in earnings of the London gas supply companies. It is well known that the demand for gas appliances in domestic use substantially exceeds the supply, and the upper limit to net profits during the war will be set by shortage of materials and manpower. The £1 ordinary stock of the holding company, at 47s. 3d. ex dividend, yields as little as £3 7s. 9d. per cent, a level which clearly looks to a spurt in post-war earnings.

A Tobacco Result

The report of *Gallaher, Limited*, for 1942 shows a slight improvement in trading profits after EPT from £852,599 to £872,338. The 1941 report reveals total profits at £921,599, which suggests that EPT then required some £70,000. Possibly the company has had to pay more this year, but income-tax has been reduced £33,000 to £430,000. The equity dividend is maintained at last year's figure of 27½ per cent, including the final 5 per cent bonus, covered by earnings on the ordinary capital of 41.4 against 35.9 per cent. This permits the board to raise the contingencies reserve appropriation from £50,000 to £120,000, although pensions reserve, which last year received £20,000, obtains nothing. There is the normal insignificant rise in the carry-forward of £1,000 odd to £192,141. These results are in line with those of the industry in this country, arising, as the acting chairman, Mr John Mulholland, states, from the fact that demand still exceeds available supplies. A welcome addition to the accounts is the consolidated profit and loss account and balance-sheet. The former confirms the results of the company, group taxation having fallen from £497,950 to £450,141 on profits of £888,103 and £904,265 respectively. The sharp rise in stocks in the company's balance-sheet from £2,741,837 to some £3,253,000 reflects the increased price of tobacco arising from the 10s. per lb. duty of the last Budget, and is largely responsible for the rise of just over £1,000,000 to £3,223,419 in debtors. Creditors now stand at £4,013,356 against £2,256,318, while bank overdraft has been reduced from £246,344 to a mere £10,945, net liquid assets remaining practically unchanged at £2,256,544. Whatever the present difficulties, tobacco companies should have little difficulty in maintaining earnings, even though the coming Budget impose further demands on the smoker. The current yield on the £1 ordinary shares standing at 122s. 6d. ex dividend is £4 9s. 9d.

Industry and Trade

Industrial Health

Last week, Mr Bevin announced the appointment of an Industrial Health Advisory Committee to the Ministry of Labour. The Committee is a very large and representative one, consisting of, in addition to doctors, representatives of employers' associations and of trade unions, engineers and chemists, and members of the Factory and Welfare Advisory Board. In part, of course, the need for such a body is another admission of how signally National Health Insurance and Workmen's Compensation, between them, have failed to cope with the problems of industrial ill-health and accident. But the Committee means much more than that. Its large membership shows what a vast new field industrial health is now recognised to cover; and it is concerned far more with prevention than with treatment and cure. As Mr Bevin said:

Industrial medicine and hygiene requires study of the work and the capacity of the individual to do it, and study of the place where he works and of the effect of the work on him and what should be done if injury to health results.

It has thus gone far beyond the requirements of the Factory Acts in respect of sanitation and accident prevention, though such factors, together with proper lighting and, still more important, good food, are even now too often regarded by employers as impositions rather than as positive aids to higher output. Thus, what is now wanted most of all is the means of bringing home to employers the fact that it is in their own interests that the health of their workers should be maintained at the highest possible level. Nor are employers the only ones at fault. Not infrequently, doctors may certify that a person is fit only for light work, and the labour exchanges then send him to build airfields. It is high time that it was realised by all concerned that placing a person in a job for which, owing to some disability, he is unfitted, means a waste of manpower, not an addition to it.

Rates of Hire for Tramps

For some time the Ministry of War Transport and representatives of the shipping industry have been engaged in the review of the original rates of hire paid by the Government to shipowners. The rates for requisitioned liners and deep-sea tramps were given in *The Economist* on January 23rd and March 6th. Agreement has now been reached between the Ministry of War Transport and owners of "intermediate" tramps; formerly these vessels were grouped with coasting and home-trade tramps for purposes of requisition payments. "Intermediate" tramps are those between 2,500 and 5,000 tons deadweight mainly engaged outside the coasting trade, which in effect means practically all ships within these tonnage limits, other than coastal colliers; the total tonnage involved is, however, relatively small. Higher rates of hire will be paid retrospectively from June 1, 1941, and additional increases take effect from May 1, 1942, and February 1st last, the present rates varying between 10s. 9d. and 14s. 11d. per ton deadweight per month according to size. The rates are based on assumed average values of £11 per ton for the largest ships up to £14 15s. 6d. per ton for vessels of 2,500 to 3,000 tons. The rates and conditions are in line with those applicable to the deep-sea tramps, and the higher payments are intended to cover increases in costs, chiefly wages.

Concentration of Small Builders

Details of a scheme to group small builders into voluntary groups were described in the House of Commons last week by Mr George Hicks, Parliamentary Secretary to the Ministry of Works and Planning. The proposals have the approval of the Ministry of Labour and the industry. The maintenance and small works section of the industry is affected and the scheme is being applied to the repair of

bomb-damaged houses. The groups, which are voluntary, comprise about ten firms, employing fewer than 25 workers and local labour over 51 years of age not required for urgent Government work. The firms' immobile labour is being pooled and will be available to the group as required. The Essential Work Order will be applied to such work. Operatives will remain under the supervision of their old employers as far as possible. Overheads and profits will be shared between the firms on the basis of the amount of work done by their respective employees. About 2,000 firms will be included in the scheme, which is designed "to assist the better preservation of this portion of the industry," in order to undertake the repair of bomb-damaged houses with economy in labour, materials, time and costs, and to assist in post-war reconstruction.

British Rayon Federation

Negotiations have recently taken place for the establishment of a British Rayon Federation. Rather more than a year ago, the Rayon Council, comprising representatives of every section of the trade, was formed to deal with all matters of common interest. For many years previously, the rayon industry was represented by the Rayon and Silk Association, a body whose interests were originally silk but which adopted rayon as a partner in its later years. The Cotton Board also included representation, in a small degree, of rayon interests. While the Rayon Council spoke with authority for the industry, it was not in a position to claim that it was the only voice, for there was nothing to prevent the Rayon and Silk Association expressing a different view from that of the Rayon Council, nor to prevent the Cotton Board, including its minority rayon members, from differing from both. It has been suggested, therefore, that the rayon industry should be represented by a single representative trade association and that, to this end, the Rayon and Silk Association should revert to being a silk association and that the Rayon Council should be given a more formal constitution and its name changed to that of Rayon Federation. The Federation, which, it is reported, may be formed shortly, will include all the organised sections of the industry; it will consist of the Rayon Producers' Committee, the Rayon Weaving Association, the Rayon Warp Knitters, the Rayon Staple Spinners' Association, the National Federation of Hosiery Manufacturers' Association, the Flat Dyed Rayon Group, the Rayon Crepe Dyers' Group, the Spun Rayon Fabric Dyers' Group, the Federation of Calico Printers, the British Rayon Crepeists' Association, the Processers' Association, the Rayon section of the Cotton and Rayon Merchants' Association, and the London Rayon Merchant Converters. The decision of the rayon industry to close its ranks marks a new and interesting stage in its development.

Digging for Victory

Although the country has cause to be grateful to farmers for increased food production, probably nearly two million families are self-supporting, or nearly so, in vegetables. The increase in allotments since the war has been well over half a million, an additional acreage of 50,000 converted to food production. The latest figures of allotments relate to April, 1942, when there were no fewer than 1,586,888, covering 172,861 acres. These figures include allotments on railway land and approximately 150,000 private gardens growing vegetables, on over 10,000 acres. Figures of production are not available, but some guide to amounts produced may be gained from the records of the produce of one hundred well-planned 10-rod allotments in 1940-41. The average weekly yield was 19½ lbs. (edible weight) in the winter, 11½ lbs. in the spring, 12½ lbs. in the summer, and 14½ lbs. in autumn. These are, of course, exceptional figures, and higher than average yields. The "Dig for Victory" campaign has been organised by the Ministry of Agriculture, which has done much valuable educational work. The press is still the most popular source of information, with broadcasting a close second. Nearly half the gardeners and allotment holders read the Ministry's leaflets. The Ministry considers that the number of allotment-holders has nearly reached a maximum, and is now concentrating its efforts on better planning to increase yields. "Dig for Victory weeks" are being held; demonstration plots have always been part of the campaign. The work of the National Allotments Society, Limited, has been of great value; a quarterly journal is published,

and facilities provided for obtaining seeds and fertilisers at reduced prices. A survey of allotment-holders undertaken recently disclosed that only one in twenty took an allotment to help in the war effort. Other reasons given were: to save money (17.8 per cent); to obtain fresh food (55 per cent); for fresh air and exercise (14 per cent); and to save shopping (7 per cent). In spite of these varied reasons, all gardeners are, in fact, assisting the war effort.

The Clothing Ration

The clothing ration of 60 coupons which was to have lasted for fourteen months has been extended for another month; a new book of coupons will be issued for use from September 1st. The present coupons will remain valid at least until December 31st and four weeks' notice will be given before they expire. The reduced ration will release more labour and materials. In the first year of rationing, at 66 coupons a year, consumption was cut by half. The present rate of 48 coupons a year is equivalent to a cut of nearly two-thirds of pre-war consumption. About 400,000 workers were released in the first year and the second rationing period should therefore result in the release of nearly 150,000 more. The labour force of the making-up trades has been surveyed and reductions are planned. For some time the Board of Trade has been running a campaign to educate the public in making clothes last longer. Exhibitions showing wise planning of coupon expenditure in relation to the family wardrobe are being held in various parts of the country. The "Make Do and Mend" campaign was launched last autumn, and women's organisations and local authorities are running classes, demonstration and advice centres. A number of clothing and shoe exchanges have been set up by schools, the WVS and in some cases by shops. The prospect for the new ration period is that the ration will be smaller. One coupon per head less would release 8,000 workers and 5,000 tons of raw materials, the equivalent of a complete outfit for half a million soldiers.

(Continued on page 376.)

To every man and woman smoker

Will you help to reduce the appalling loss of vital material caused by fire damage?

THOUSANDS of tons of foodstuffs completely destroyed, a clothing factory in flames, destroying hundreds of thousands of garments—fires like these are costing the nation £12,500,000 a year! More important than the money is the labour, the raw material and the shipping space which must be diverted from the war effort to replace the loss.

And the facts are, undeniably, that most fires start from some little act of carelessness by a normally careful person. A match thrown away still smouldering, a cigarette end left burning, an electric iron left switched on—simple acts of carelessness like these are making tragic inroads into the nation's reserve of materials. Will you help to stop it?

Be more than careful with lighted matches and cigarette ends—be sure! Stub your cigarette ends till they're right out and never throw away a match or spill unless you know it's out. Your help, everybody's help is needed, to reduce the loss to the war effort by fire.

Most fires are caused by "careful" people

ISSUED AS PART OF THE FIRE OFFICES' COMMITTEE CAMPAIGN AGAINST FIRE WASTAGE

3 SAFETY FIRST RULES FOR SMOKERS

1. You know a match is out when you can do this.

2. Stub your cigarette end right out.

3. Look twice, when you're in any doubt.

COMPANY MEETINGS

THE
BANK OF AUSTRALASIACHANGES IN BANKING
CONDITIONS

MR A. WHITWORTH'S STATEMENT

The annual general meeting of the Bank of Australasia will be held, on the 25th instant, in London.

The following are extracts from the statement by the chairman (Mr A. Whitworth) which has been circulated with the report and accounts:—

The balance-sheet presented shows a large expansion in the total, the figure having risen by £5,329,403 over the total of last year, which was itself a record. In spite of this, the profits are less. On the liabilities side the chief movements are a decrease of £2,217,916 in deposits at interest and an increase of £7,226,664 in current accounts. On the assets side, specie, bullion, etc., has increased by £9,400,779 to the very high figure of £14,198,613. Then, for the first time, there appears the special wartime deposit account with the Commonwealth Bank. This represents this bank's share of the deposits which all the trading banks are now required to lodge with the Commonwealth Bank, as they are regarded by the Central Institution as investible funds surplus to our and the other trading banks' requirements. These are lent to the Commonwealth Bank at the low rate of interest of 15s. per cent. per annum in the same way as similar excess requirements are lent to the Treasury by the clearing banks on this side. Advances to customers and other accounts are down by no less than £3,300,620, showing a definite and serious loss of earning power, compensated in part, however, by a welcome saving in interest on the deposits at interest shown on the other side of the balance-sheet.

FIXED RATES FOR ADVANCES AND
DEPOSITS

As from March, 1942, regulations were enforced by which the maximum rate for advances was fixed at 5 per cent. per annum, and by way of compensation for this deposit rates were reduced by ½ per cent., but this reduction only operates gradually as deposits mature from time to time. The increase in current accounts brings in very little, if any, profit, as under the Wartime Banking Control Regulations the trading banks are severely restricted in their advance business, so a large portion of our customers' money goes over to the Commonwealth Bank and earns the low rate of 15s. per cent. per annum. The bank's advance business is, of course, the main source of its earning power, and the fact that the figure of £31,940,226 is the lowest since the accounts of October, 1934, is one of the prime causes of the decline of the bank's profits.

IMMENSELY STRONG POSITION

The only satisfaction we can derive from this state of things is, firstly, that it is not exceptional to other Australian banking institutions, and, secondly, that it shows your bank to be in an immensely strong position. Cash balances are 5s. 6d. in the £ of total deposits, as against 3s. 3½d. last year, and if we include our investments as additional security to deposits the relative figure is 12s. 3d. in the £, as against 9s. 9d. last year. This, of course, is a position much too liquid for our liking, particularly when the ratio of advances to total deposits works out at only 61.69 per cent., the lowest for many years past. If the position of this bank is thus one of great strength, so is that of the Australian banking system as a whole. Since the time of the great crisis in the early '90's, when each bank had to look after itself, and this bank

was one of the very few that kept its doors open and weathered the storm, a great change has taken place.

The Commonwealth Bank, originally started in opposition to the trading banks, has gradually taken over the additional functions of a Central Bank, and is the pivot of the whole banking structure, so if your bank is unable to maintain the higher rates of dividend to which at one time we were accustomed, it is not due to any weakness in our position nor to losses made, but to fundamental changes in Australian and New Zealand banking conditions. These changes, beginning ten years ago with control of the exchange rates, were accelerated by Governmental control, particularly in New Zealand, over primary products, which has, of course, been greatly extended owing to the war, since when such profits as we have made have been much reduced by higher taxation and increasing expenses.

THE DIVIDEND

The proprietors were warned by the chairman last year how difficult it was for banks operating in Australia and New Zealand to make sufficient profits to maintain their previous rates of dividends, and the reduction of our interim dividend paid in October last must have prepared them for the further fall in the final dividend now declared, making a distribution of 6 per cent. for the year.

BRITISH ASSETS TRUST,
LIMITED

The forty-fifth annual general meeting of British Assets Trust, Limited, was held, on the 11th instant, at Edinburgh, Mr W. H. Fraser, chairman of the company, presiding.

In moving the adoption of the report and accounts, the chairman said: Colonel Basil G. Ivory is still serving with H.M. Forces overseas and is therefore unable to be present to-day.

Our gross income for the past year amounted to £343,595, against the previous year's figure of £332,949. I think you will agree that this is a very satisfactory result, particularly in view of the reduction of income which, as anticipated a year ago, we have suffered from our holdings in companies which have interests in the East. Management expenses are again lower, partly as the result of a further saving on our American expenditure. Taxation is higher, due to the increased revenue on which income tax is payable. After deducting expenses, debenture interest and preference dividends, there remains £48,191, which is equivalent to earnings on the ordinary stock of 19.6 per cent., against 17.3 per cent. for the previous year. We recommend payment of a dividend of 12 per cent. for the past year. This will leave a surplus of £18,672, and this sum, together with £103 from the carry forward and £6,225, being arrears of dividend in excess of one year's income, totalling in all £25,000, has been added to the general reserve fund.

PROVISION FOR TAXATION

There has also been added to this fund, which now stands at £600,000, a further sum of £25,000 in regard to which I would give the following explanation. It has been our practice each year to provide for taxation on the whole year's income at the rate ruling at the close of the company's financial year. Since the beginning of the war the rate of tax has twice been increased under a supplementary Budget, with the result that the rate of tax ruling at the end of the year during which the increase took place was considerably higher than the rate at which tax had been deducted at the source during a large part of the year. During the years in question, the amount provided for income tax was therefore in excess of the amount actually paid. A further over-provision for income tax has arisen owing to a change in the basis on

which the company pays British tax on foreign income. The total amount over-provided during the three years ended January 15, 1942, is approximately £31,000, and as the reasons for the over-provision of such large amounts may be considered as non-recurring, we have transferred £25,000 out of this over-provision to the general reserve fund.

THE INVESTMENTS

Turning to capital, our investments stood in the balance-sheet at January 15th last at £6,859,884, which compares with a market value at that date of £7,223,459, and represents an appreciation of 5.3 per cent. over the balance-sheet figure, as against a depreciation of 4.09 per cent. on the corresponding figure a year ago. In the past we have only published the valuation figure when there has been depreciation; it seems, however, only fair to our stockholders to disclose the market valuation irrespective of its relation to the balance-sheet figure. I may in this connection mention that, in arriving at the market valuation figure, we have for some years valued our holding of ordinary shares in Second British Assets Trust, in which we own the great majority of the shares, at par. This may appear a low figure in view of the dividend of 8 per cent. which that company is now paying, but it is difficult to arrive at a fair valuation, and this consistency tends to minimise fluctuations in our own annual valuation.

THE FUTURE

As regards the future, the problems of a change over from a wartime to a peacetime economy, which are now being studied in authoritative quarters, will call for much clear thinking and mutual understanding, and may render it necessary for trust companies during the transition period to place capital security before income return. If, however, the capital position is sound a temporary fall in income need not give us cause for anxiety, particularly in view of the substantial fund we have built up for equalisation of dividends. We are planning ahead as far as we are able, and while we must be prepared for difficulties and setbacks, I believe these can and will be overcome, and in regard to the company's future I am not pessimistic.

The report was adopted.

LONDON AND RHODESIAN
MINING AND LAND
COMPANY, LIMITED

The adjourned ordinary general meeting of this company was held, on the 16th instant, in London, the Right Hon. Viscount Elibank (the chairman) presiding. The following are extracts from the chairman's statement circulated with the report: The net profit for the year is £70,777, compared with £55,715 in the previous year. A dividend of 5 per cent. was paid in February, 1942. The directors have declared and distributed an interim dividend of 5 per cent. on account of the current year.

We have during the year considerably increased our holding in Henderson's Transvaal Estates. This company is in a strong position and, we believe, should continue to be a steady revenue-producer. Developments on the Cam and Motor Company's properties have proceeded steadily. The ore reserves are now standing at nearly 1,750,000 tons.

The South African Coal Estates (Witbank) maintained its dividend of 12½ per cent. Development of the Vubachikwe mine has been steadily proceeding, with the gratifying result that the ore reserves at June last amounted to just on 100,000 tons of an average value of approximately 7dwt.

There has again been a small increase in profits on our ranching business. To sum up, I think stockholders will agree that compared with the previous year our position as a whole has improved.

The report was unanimously adopted.

UNITED KINGDOM PROVIDENT
INSTITUTION

"HIGHEST FORM OF SECURITY"

SIR ERNEST BENN ON NATIONAL EXTRAVAGANCE

RISK OF INFLATION

The annual general meeting of the members of the United Kingdom Temperance and General Provident Institution will be held, on the 24th instant, at the head office, 196 Strand, London, W.C.

The following is an extract from the statement of the chairman (Sir Ernest J. P. Benn, Bt.) circulated with the report and accounts:—

As the report and balance-sheet now presented will show, we have maintained the general attitude outlined in my speeches ever since the outbreak of war. Victory is our first consideration, and we have in your name done everything within the capabilities of a life assurance office to facilitate the national war effort. We are proud to think that our contribution, like so many others, has been in fact, if not in form, wholly voluntary. In September, 1939, our staff rushed to the colours, causing strain and inconvenience, gladly borne by loyal colleagues. We damped down our normal new business endeavours long before the Kennet Committee recommended that course. We have supported every War Loan to a greater degree than was thought possible, and, in fact, we are unaware of any aid we could have given to the great cause of freedom which has not been freely given by our directors on your behalf.

This is essentially a peace business. Proper life assurance knows nothing of war, and is one of many typical British industries born, bred and operated in a spirit of peace. Our pre-war members who insured for their own lawful peaceful purposes are fully covered against the personal risks of war, as, indeed, with few exceptions, they are covered against every danger to life. But we have never been willing to gamble with our funds when, in fact, war was afoot, or offer to share with the foolish virgins the care and forethought of the wise. Such business as we have written during 1942 is confined to the very highest class.

Our expense ratio has fallen to the low figure of 12.5 per cent. Our rate of interest calculated on the book value of our fund shows a very moderate fall considering our very large holdings of War Loans. Our mortality experience, notwithstanding war deaths, has been favourable, both as regards numbers and amounts of claims, the temperance section again showing a marked superiority. In so far as our figures are representative, they point to a very satisfactory national position after more than three years of total war.

LOW FIGURE OF SURRENDERS

We have to turn back 15 years to find the item of surrender values paid appearing in the revenue account at such a low figure as £118,000. The genuine surrenders amount to even less, only £80,000, for the figures in the account are swollen by book transfers from old to new policies. It is a remarkable testimony to the public appreciation, both of the security afforded by the institution and of the wisdom of maintaining their life assurance cover, that only £80,000 out of £26,000,000 should have been withdrawn.

Your assets are still calculated on 1938 values. We have ignored the substantial statistical appreciation caused by a national, closed, controlled, and planned economy, because that appreciation is directly due to war, and we have yet to learn the effects of war-time plans on peace values. Our liabilities, as explained last year, are calculated on the more stringent basis then adopted. The balance-sheet thus maintains our unbroken reputation, and displays a degree of security which, although the word now means less than formerly, is the very highest attainable.

HIGHEST FORM OF SECURITY

The British insurance market has its own post-war plans ready. It is prepared, from the very moment when peace arrives, to resume all those services to our own people, and to the peoples of the whole world for which British insurance is framed, and which cannot be so well performed by any other market, agency, or plan. It may indeed be reckoned among our many and varied national glories that all the peoples of this planet look upon British insurance as the highest attainable form of security. For financial protection from earthquakes in San Francisco to the most trivial of human hazards there is no equal to British private enterprise. The point has a special importance when it is remembered that here we have an invisible export ready made and waiting for the moment when exports will rank among the first of our national needs.

In estimating Britain's rightful place in world affairs it is helpful to remember that, while many millions of other nationalities have always sought the protection of British insurance, the British demand for foreign cover is insignificant.

FIRE AND ACCIDENT SUBSIDIARY

The United Kingdom Fire and Accident Company, now in its third year, is justifying our high expectations. The compulsory shrinkage in motor business has been counter-balanced by the growth of the fire account. As was anticipated, our members are finding convenience in the widened services offered at our branches, and also appreciate the advantage of placing their fire and general business with an office belonging to the Mutual Institution in which each has his or her full share of interest.

LONDON AND LOMOND
INVESTMENT TRUST,
LIMITED

APPRECIATION IN VALUES

The 12th ordinary general meeting of London and Lomond Investment Trust, Limited, was held, on the 17th instant, in London.

The Hon. W. B. L. Barrington (the chairman) presided.

The following are extracts from the chairman's statement which was circulated to the shareholders with the report and accounts:—

When I addressed you a year ago it was anticipated that owing to the extension of hostilities to the Far East, our total revenue would this year show some falling off. The loss of revenue on this account, however, was more than offset by increased income from investments elsewhere, and our total revenue, amounting to £75,963, represents a small increase. Once again the charge for income-tax is higher, and, due to this, the amount available for the ordinary stockholders is equivalent to 12 per cent. before deduction of income-tax as compared with 13 per cent. in the previous year.

After placing £5,000 to general reserve, which is thereby increased to £80,000, we recommend payment of a final dividend of 5½ per cent., making a total of 7½ per cent. for the year. There remains a sum of £690, which, added to the amount brought forward, makes a total of £20,997 to be carried forward to the current year.

The market value of the investments has increased substantially, there being an appreciation of £160,400, as against a depreciation a year before of £12,189. In addition £6,213, being profits on changes of investments and other receipts of a capital nature, has been added to capital reserve, which now amounts to £104,199.

It is not anticipated that there will be any material change in our income for the current year.

The report was adopted.

RUBBER PLANTATIONS
INVESTMENT TRUST,
LIMITED

REVIEW OF TEA AND RUBBER

The 34th ordinary general meeting of The Rubber Plantations Investment Trust, Limited, was held, on the 17th instant, in London.

The following are extracts from the statement by Mr Eric Macfadyen (vice-chairman) circulated with the report:— Our net revenue amounted to £24,608, or £59,709 less than the net revenue of the preceding year. The earning capacity of a large number of estates in which we are interested has come to an end for the time being owing to enemy occupation; we must anticipate further shrinkage in our income.

During the past year arrangements have been made for the co-ordinated purchase by the Ministry of Food of the entire quantities of tea available for export from India, Ceylon and East Africa. The price paid by the Ministry is based on the prices obtained by the estates during the years 1936-38, plus an allowance of 2½d. in the case of India and 4d. in the case of Ceylon.

Since the date of the last meeting the supplies of crude rubber available to the United Nations have come from Ceylon, India, Africa, and South and Central America. Total output is at present under 200,000 tons per annum. Ceylon and Indian production has already been stepped up to near the maximum.

The sudden loss to the United Nations of so large a proportion of one of the chief munitions of modern war has stimulated an intensive campaign for the development of synthetics in the United States. Various synthetics have been manufactured there for some years, but only in small quantities. A production of over 400,000 tons is aimed at in 1943.

The report was adopted.

MIDLAND ELECTRIC CORPORATION FOR POWER DISTRIBUTION, LIMITED

CONTINUANCE OF SUCCESSFUL PROGRESS

SIR ALEXANDER ROGER'S STATEMENT

The forty-fifth ordinary general meeting of the Midland Electric Corporation for Power Distribution, Limited, will be held at the Exchange Hotel, Tithebarn Street, Liverpool, on the 31st instant.

The following is an extract from the statement circulated to the shareholders by the chairman, Sir Alexander Roger, K.C.I.E., in lieu of the speech which would normally be delivered at the meeting: The directors' report informs you that proper provision has been made for depreciation, while I may state that the plant has been maintained in first-class order. I also give you the assurance that your company continues to make satisfactory progress, and that the value of your investment has been amply maintained.

Development is necessarily restricted to the urgent needs of the present, but one field of endeavour remains open to us, and that we continue to cultivate intensively for the growth of goodwill. In this direction our management and engineering staff have been able to give valuable advice and assistance in the economical planning and operation of electrical plant, services which have been greatly appreciated.

In addition, we initiated a conference with our friends in the gas, water, and other utility services, and together formed an association for mutual help in war emergencies. Suggestions arising from the conference have been adopted to the general good.

PRIVATE ENTERPRISE

In the post-war framework as now being planned, the industry in which this company is engaged is considered to be vital. There is a trend towards public control of electricity distribution, mostly from incompletely informed sources. In the early days of electricity supply the large towns, with their concentrated industries and population, accepted the obligation to supply within their own borders, a safe field for development, leaving private enterprise to embark on the much greater risks associated with urban districts and rural areas. The greater risks were accepted, and by their enterprise and research the company undertakings have made possible the widespread electric service which is now available.

Private enterprise, with its drive and pioneering spirit, has been the main force behind practically all the forward movements that have made our country great. It equally has been the force behind the development of the electricity supply industry. It appears to me to be timely and necessary to emphasise the facts of the progress of electricity supply. No comparable industry has shown such steady progress, such wide expansion of services, such co-operative endeavour to review progress, and such desire to frame new policies for improving the efficiency with which its statutory obligations are carried out.

PUBLIC INQUIRIES

This is not entirely a personal opinion. No industry has been subjected to so many and so frequent investigations as to progress and the manner in which it was fulfilling its obligations. The reports of the investigating committees have been published, and pay tribute to the efficiency of private enterprise. Of these investigations the McGowan Committee (1936) made the most complete survey.

The main suggestions were a substantial reduction in the present number of undertakings, and reorganisation based on the retention of the larger and more efficient of the existing undertakings and the absorption by them of the smaller undertakings. Discussions and negotiations were pro-

ceeding to this end when they had to be suspended, due to the more urgent considerations arising from the disturbed condition of Europe.

The recommendations of the McGowan Committee remain to-day as the most complete and weighty pronouncement on the future of electricity supply. It is interesting to note that the committee presided over by Lord Cooper, which reviewed the development of electricity distribution in Northern Scotland, for the same reasons which influenced the McGowan Committee six years earlier, rejected the theoretical advantages of transferring existing supplies to a public corporation, on the grounds that such a scheme could not be carried into effect without very serious and needless dislocation of electricity supply. In addition, the committee were not satisfied that consumers would derive any compensating benefits.

POSITION OF M.E.C.

The area of your company is in the sphere of influence of the West Midlands Joint Electricity Authority, and has been developed and served as well as any in the country. When the scheme for joint authorities was included in the 1919 Act, your company, together with the Corporations of Wolverhampton, Walsall, and West Bromwich, established the West Midlands Joint Electricity Authority for joint generation. We paid 40 per cent of the initial costs, and I have no hesitation in saying we have made a substantial contribution to its success. We are justly proud of the development, and we stoutly hold the view that the organisation in this area is definitely to the advantage of consumers and should be continued.

A SUGGESTION

Instead of talk of the superficial advantages of public control and the elimination of that perfectly justifiable thing which is dubbed the profit motive, I would suggest that the basis of the M.E.C. Order be offered to electricity undertakings of reasonable size, public and private alike. I do so, feeling that it would be for the good of the industry and its consumers. It retains the drive, enterprise, and efficiency which comes from gainful employment together with a balanced control of profit.

The Order includes a standard tariff for electricity supplied and a standard profit on capital employed in the business. All profits above those permitted have to be returned to consumers in flat percentage reductions from the standard tariff, but permitted profit is increased by $\frac{1}{2}$ per cent. in respect of each 2 $\frac{1}{2}$ per cent. by which the charges for electricity have been reduced below the standard tariff throughout the whole year.

It is essentially a co-operative Order between the consumers and the company, its main principle being freedom of direction up to a permitted profit, and thereafter a fixed division between service to the community and reward for development and efficiency.

This appears to me to be the best Order in existence. It was hammered out over a period of four years by the Electricity Commissioners, representatives of 20 Local Authorities, and the company, and I can see nothing but good to consumers in offering similar terms to publicly owned undertakings. Give them the opportunity for development and a measure of gain for their energy, with freedom to use that gain for the general betterment of the area for which they are responsible. I should then expect a new spur to development to the lasting advantage of industry and an inevitable reduction in charges to consumers.

NATIONAL PROVIDENT INSTITUTION

STRONG FINANCIAL POSITION

The following is a summary of the address to be submitted by the chairman, Mr. Robert E. Dickinson, at the annual meeting of the National Provident Institution, to be held, on the 23rd instant, in London.

Our new business shows a welcome recovery, though by pre-war standards it is still small. Our mortality experience, in spite of the effect of war conditions, has been satisfactory. Our interest yield continues to fall, owing to the impracticability of making new investments at rates comparable with those earned on our old investments.

1942 was the closing year of our triennium. We have accordingly made the usual valuation of our assets and of our actuarial liabilities. Our Stock Exchange securities stand in the books at or below the market selling prices, less accrued interest, on December 31, 1942. In the aggregate the margin between the market values and the book values when we closed our books exceeded £1,000,000.

We have decided that in present circumstances it would be proper to make a distribution in respect of the three years ending December 31, 1939. Bonuses will accordingly be allotted to policies entitled to share in respect of the years 1937 to 1939 on the scales set out in the valuation report, and in the case of full profit whole life policies the rate of bonus is £2 per cent. per annum. In the case of full profit endowment assurances the rates vary with the maturity ages, and on policies maturing at age 60 the rate is £1 12s. per cent. per annum. This distribution will cost approximately £530,000, so that we shall carry forward undivided the substantial sum of nearly £700,000 as an additional reserve. We have, I think, every reason to be gratified with the results of the past three years, and we are well equipped to meet the future.

DORMAN, LONG AND COMPANY, LIMITED

VISCOUNT GREENWOOD'S STATEMENT

Statement by the chairman, the Rt. Hon. the Viscount Greenwood, P.C., circulated with the report and accounts for the year to September 30, 1942, in place of the customary speech at the annual general meeting.

As already explained, it was found impracticable to complete the report and accounts and to hold our annual general meeting during 1942.

In accordance with our usual practice, we have provided for all taxation based on the profits for the year.

The directors are glad to recommend the allocation of a sum of £15,000 under the heading of pension fund. Part of this, as in former years, will be devoted to augmenting the staff pension scheme.

Cash at bankers shows an increase. Substantial payments have been made since the date of the balance-sheet in respect of debenture interest and taxation, and further sums will be required for the dividends now recommended.

Premiums payable under the provisions of the War Damage Act, 1941, have been reduced in respect of the year to September 30, 1942. This reduction has been general to all trades and industries. In view of experience available and to safeguard prospects of future employment, the necessity of more equitable treatment of the iron and steel industry cannot be too strongly pressed upon the Government.

Additions to capital expenditure amounted to £28,839, and realisations aggregated £10,128. The provision for depreciation has been maintained at £275,000, which

approximately equals the wear and tear allowance for taxation purposes.

So far as has been possible in the circumstances, we have continued to make improvements to our plant and equipment and to maintain the whole of it in a proper state of repair. We have considered it advisable to increase the provisions for renewals, relinings and repairs to cover expenditures which have been deferred by reason of wartime conditions.

There has been no allocation out of profits to the workmen's compensation reserve fund during the past year. The increase of £7,025 represents accrued interest and a surplus arising on the realisation of an investment. The investments are in trustee securities and the market value at the date of the balance-sheet was £435,179. The investments are held by trustees under the terms of a special trust

deed setting forth the conditions under which they are held.

We continue to provide facilities for National Savings and additional staff and more employees have joined Savings Groups during the past year.

Although it is not permissible for me to give particulars of production figures for our various departments, they constitute an essential and important factor in the war effort.

Our thanks are due to the management, staff and all employees for the services which they have rendered to the company and the country during the year under very difficult conditions.

The adjourned fifty-third ordinary general meeting of the company will be held at Winchester House, Old Broad Street, London, E.C. 2, on the 25th instant, at twelve o'clock noon.

MIDLAND COUNTIES ELECTRIC SUPPLY COMPANY, LIMITED

PRIVATE ENTERPRISE OR STATE CONTROL

MR. WILLIAM SHEARER'S ADDRESS

The thirtieth ordinary general meeting of Midland Counties Electric Supply Company, Limited, was held, on the 17th instant, in London.

Mr William Shearer, chairman of the company, presided, and in the course of his remarks said:—

The results disclosed in the accounts reflect another year's satisfactory operation of our extensive undertakings. During the year we successfully met all demands made on our electricity supply and transport undertakings, thereby contributing in no small measure to the war effort in the areas we serve.

A year ago I mentioned that we had just put into effect certain revisions of the tariffs for electricity supply. We have now under consideration further revisions of the various tariffs, and expect to be able to intimate these to consumers at an early date. Some of you may think that in reducing charges in two successive years, during a period of war when we are experiencing rising costs, we are taking an unduly optimistic view of future trading. We are pursuing this policy, however, with confidence, knowing that our business has been built on a strong foundation, that the financial structure is thoroughly stable, and that the sound commercial principles by which we have been guided during the 30 odd years of the company's existence will enable us not only to face, without undue anxiety, any temporary depression or setback that might be experienced, but on the conclusion of the war to continue a policy of intensive development, leading to still further reductions in charges.

SERIOUS DISLOCATION INEVITABLE

I make these remarks, however, with one reservation, namely, that if, as is suggested in certain quarters, the great supply industry, which hitherto has not cost the taxpayer a penny, is to be thrown into the melting-pot of party politics, that the power companies are to be wound up and supply undertakings are to be run by new bodies *ad hoc* or otherwise, getting their "inspiration" and directions from Whitehall or its vicinity, serious dislocation must inevitably ensue, with results which, I believe, would be permanently detrimental to the interests of consumers and, indeed, of the whole community.

What should be the real standards by which the position of the supply industry should be judged? There are three main considerations—first, that it should be in a position of giving a reliable and efficient supply to meet all demands at a fair and reasonable price; second, that the management should be skilled and efficient, and

that employees should have adequate security of tenure with good and, indeed, generous conditions of employment; and third, that the requisite finance is provided on prudent and reasonable terms.

The first of these considerations naturally implies close collaboration with our great electrical manufacturers and engineers to see that the most efficient plant and equipment is installed, and I believe that British manufacturers in all branches of the industry have given, and are giving, the supply undertakers of this country and their consumers every satisfaction in technical design and production. No one can dispute the fact that the vast majority of electricity supply undertakings in this country have a high standard of efficiency. Then again, it is essential to establish satisfactory relationships between the various undertakers and their consumers. So far as we are concerned, and I am sure, this is the experience of other supply authorities throughout the country, these are of the most harmonious nature.

HIGHLY SKILLED STAFF

The next consideration which I mentioned affects staff and employees. It has been the endeavour of the supply industry to provide a highly skilled executive, capable of dealing with every branch of the business in all its aspects and of establishing with the employees a bond of mutual respect; coupled with due and even generous recognition of services rendered. In this I can say that great success has been achieved and particularly emphasised by the excellent experience since the commencement of the war.

Then there is finance—the ability to provide adequate financial resources on the cheapest possible terms. By prudent management the accumulated reserves in our operating companies are neither excessive nor inadequate under present-day circumstances for an undertaking of this nature, and I feel confident that, if not subjected to undue interference, we can make a substantial contribution to the re-establishment of peace-time industry on a healthy and prosperous basis in the extensive areas we serve.

In making these observations I should make it clear that the industry is by no means unmindful of the desirability of further co-ordination and certain technical and other improvements, which would tend to greater flexibility and still higher efficiency.

POST-WAR RECONSTRUCTION

Meantime there is a good deal of propaganda being assiduously spread around as

to the necessity for vital and far-reaching changes in the whole structure of the industry, as part of the so-called post-war reconstruction programme.

I think it is essential that consumers, employees and stockholders of all supply companies, ratepayers of local authorities and taxpayers generally, in their own interests, should examine proposals of the nature put forward from motives which I suspect are by no means altruistic, with meticulous care, so that they may not be misled by specious promises.

It is to be hoped that those in whose hands our post-war destiny may lie will realise how much the real necessities of the country depend not on Utopian plans, but on the efforts and personal freedom-loving people encouraged to work to the highest possible efficiency on sound commercial lines, proper regard being had, of course, to the welfare and security of all those employed in each particular industry.

The war has inevitably brought in its train a very considerable measure of control and bureaucratic influence in every phase of industrial and social activity. This control may have to be continued in some directions in the immediate post-war years, but it is the duty of everyone who wishes Britain to remain great to see that it does not become a permanent feature of the nation's economy.

You will have noticed in the Press proposals affecting the undertakings in London and the home counties. Do not let us pay too much attention to these grandiose schemes emanating from a body known as the London and Home Counties Joint Electricity Authority. These proposals have been thrown into the floodlight of publicity with somewhat indecent haste in the hope, no doubt, that they might capture popular imagination at a time of national crisis.

The report and accounts were adopted, and a final dividend of 5 $\frac{1}{2}$ per cent., making 8 per cent. for the year, was declared on the ordinary stock.

CONSOLIDATED MINES SELECTION COMPANY, LIMITED

The forty-seventh ordinary general meeting of the Consolidated Mines Selection Company, Limited, will be held, on the 23rd instant, in London.

The following is an extract from the statement by the chairman (Mr S. S. Taylor, C.M.G., D.S.O.) circulated with the report and accounts for the year ended December 31, 1942:—

The market value of the company's investments at December 31, 1942, was £1,293,030, as compared with £1,225,405, whilst the cash position was also higher at £61,675, as compared with £45,236. The profit and loss account, however, reflects the serious loss of income from one of the company's major assets—namely, its holding of shares in Mawchi Mines, Limited—and a substantial reduction of income from its interest in Rhodesian Anglo-American, Limited. The net profit for the year was £55,453. It is recommended that a dividend of 5 per cent., equivalent to 6d. per ros. unit of stock, less income tax, should be paid.

I think it can be reasonably anticipated that the results for the current year will at least not fall below those of last year.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes.

In time of war the value of this practice is greatly enhanced because *The Economist* provides valuable information which is not otherwise available to investors, who therefore read it more carefully than ever.

Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, Brattenham House, Lancaster Place, W.C.2.

(Continued from page 371)

Tin Supplies

The steps taken to overcome the tin supply difficulties caused by the loss of the rich Pacific sources of supply were discussed in *The Economist* of November 28, 1942 (page 682). Since then further progress towards the solution has been made. On the production side, the labour difficulties in Bolivia, which temporarily slowed down exports from that country—at 34,952 long tons during the first eleven months of 1942 they showed a decline of 2,178 tons on the year—were settled early this year. The fall in Bolivia's exports has been offset by the rise in the production of the Belgian Congo; according to a recent public statement by M. A. De Vleeschauwer, the Belgian Minister of Colonies, output rose to 21,000 tons last year, compared with about 18,000 tons in 1941. Total extra-Pacific tin production in 1942 probably surpassed 85,000 tons—the output of the year ended October 31, 1941. In 1943 production may show a further increase. Apart from the fact that the threat of labour unrest in Bolivia has receded, production development in Africa is going ahead. The Belgian Congo, according to the Belgian Colonial Minister, aims at raising its output to at least 35,000 tons by 1945; tin mines in Nigeria have now received supplies of equipment through the intervention of the Combined Raw Materials Board. South Africa is going ahead with the development of its tin resources, including a promising newly discovered mine in South-West Africa.

The main contribution towards the solution of the tin supply problem, however, comes from economies in con-

sumption. According to a recent statement by the War Production Board, United States consumption of tin in 1943 will be cut to about one-half of the 1941 total of 100,000 tons. As that country's consumption in 1942 totalled 65,000 tons, this means a further cut of roughly 15,000 tons. If the cut in British consumption is of similar order, it should not be higher than 15,000 tons this year. A substantial margin between Anglo-American requirements and prospective extra-Pacific supplies in 1943 will thus remain from which the requirements of the other United Nations can be met. While in 1942 the major part of the economies in American tin consumption was accounted for by the replacement of tinplate by lacquered steelplate, the reduction of the tin content in bearing metals and bronze, the many prohibitions for the use of tin and materials containing tin, the increased savings in 1943, apart from the more extensive application of last year's economy measures, will be largely secured by a reduction in the tin content of solder and by the increased production of electrolytic tinplate. An order reducing the maximum tin-content in solder for general use from 30 to 20 per cent has recently been introduced by the War Production Board. The order was the result of extensive experiments with low-tin solders in 1942, in the course of which the technical problems connected with the greater heat requirements in the application of the low-tin solders have been solved. Electrolytic tinplate production, which in 1942 represented only 4 per cent of the United States' total tinplate output, will account for 60 per cent of the total output in 1943. According to WPB estimates this will cut tin requirements for tinplate to 11,000 tons, against 21,000 tons in 1942 and 48,700 tons in 1941. In sum, the Allied production programme is unlikely to be held up for lack of tin.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

TURNOVER in the markets continues at a low level, business in general failing to affect prices to any extent. The undertone is steady, and although there has been a slight recession this week, the *Financial News* ordinary share index last Friday touched a new high at 97.4. The *gilt-edged* market attracted little support this week and prices in consequence tended to ease slightly. In the *foreign bond* market, Greek loans were in demand, but the earlier gains were lost as the week advanced. Japanese issues were marked down slightly, while minor losses were recorded for Brazilian and Chilean stocks. Absence of interest, rather than any real selling, occasioned a fairly general decline in the junior issues of the *home rail* market, LMS and GWR ordinary shares in particular, falling $\frac{1}{2}$ and $\frac{1}{4}$ point respectively. The prior charges, however, remained steady. Following on last week's improvement, Argentine railway stocks were subjected to some profit taking. Central Argentine 4 per cent debentures lost 2 points, while among the junior stocks declines ranged from $\frac{1}{2}$ to $\frac{1}{4}$. Elsewhere, Canadian Pacific ordinary fluctuated erratically, easing $\frac{1}{4}$ on balance.

Changes in the *industrial* market were small and relatively insignificant. Leading brewery shares were marked down on fears of the coming Budget, Guinness and Bass both losing 1s. For similar reasons, Imps lost $\frac{1}{2}$, but other tobacco shares were steady. In the motor and aircraft section, Rolls-Royce were prominent with a loss of 1s, but the general tendency was upward. De Havilland and Hawker Siddeley both advancing 6d, among smaller gains. After a steady rise on hopes of an increased distribution, Swan Hunter lost 2s. on the news that the dividend was unchanged. Elsewhere in the heavy industrial section, Wm. Cory and Bolsover were firm. Cunard failed to retain an earlier rise of 10d. in a firm shipping section, several other issues gaining a few pence. Brad-

ford Dyers were strong on the settlement of the preference arrears, but there was little of note in the textile group. Electricity supply stocks were dull, while among electrical equipment issues Enfield Cable lost 1s. 6d. on the lower earnings. Among the dollar stocks, International Nickel fell a point on the year's results, and Brazilian Traction was persistently weak. Elsewhere London Brick and Radiation were prominent with gains of 1s. 3d. and 1s. respectively.

The recent strong Cape demand for *kaffir* shares did not continue this week. Quotations were generally easier, losses ranging from $\frac{1}{2}$ to $\frac{1}{4}$ for both developing and dividend-paying mines. General Mining and Union Corporation were exceptions to the trend, advancing $\frac{1}{2}$ and $\frac{1}{4}$, respectively. The *rubber* market was neglected, but *tea* shares were in demand. Among leading issues to improve, Jhanzie and Doora were outstanding with gains of 1s. 3d. each. Oil shares displayed a rather easier tendency throughout for lack of support. Leading issues were generally $\frac{1}{2}$ lower on the week.

New York

WAR developments failed to stimulate Wall Street this week, but extensive buying on investment account resulted in numerous 2 point advances for steel, rail and rubber issues in particular, raising many quotations to peak levels since November, 1940. The effect of a reduced volume of support at the reopening on prices was intensified

by profit taking, which in general climaxed previous gains.

GOVERNMENT RETURNS

For the week ended Mar. 13, 1943, total ordinary revenue was £72,843,000, against ordinary expenditure of £120,196,000, and issues to sinking funds of £430,000. Thus, including sinking fund allocations of £13,877,212, the deficit accrued since April 1st is £2,649,169,000 against £2,559,470,000 for the corresponding period a year ago.

(h) Annual figures for 1929 and 1932 do not include District Bank.

COMMODITY AND INDUSTRY NEWS

Headwear Quotas.—The quota for supplies of headwear between March 1st and August 31st has been fixed at 15 per cent, by value, of the supplies during the year 1941. It is estimated by the Board of Trade that this quota will allow for the employment of persons not suitable for more important work, but it implies no guarantee of enough labour to fill the quota.

Gas Control.—The Inter-Departmental Committee on the supply of gas and other fuels for war factories is now under the chairmanship of Mr. Tom Smith, Joint Parliamentary Secretary to the Ministry of Fuel. Mr. George Everts (a director of a number of companies) has been ap-

pointed Gas Advisor to the Ministry, and the gas staff has been strengthened. Dr. W. E. Smith, Director-General of Gas Supply, Ministry of Fuel, has resigned.

Shop Assistants' Wage Increase.—The National Joint Industrial Council for the Retail Drapery, Outfitting and Footwear Trades has agreed certain wage increases to begin on April 5th. The minimum wage for managers and managerses will be raised by 4s. or 5s., according to the size of staff. Wages will then vary from 65s. to 90s. a week according to sex and locality. For sales assistants, cashiers, clerks and other male employees, the rise ranges from 1s. 6d. a week to 4s., according

to age and sex. Minimum rates will vary from 17s. to 72s., according to age, sex and locality. The increases do not apply in certain areas described as "depopulated."

Correction.—In a note in these columns in last week's issue, entitled "Women's Wages in Agriculture," it was erroneously stated that a minimum wage of 45s. a week had been fixed for women in agriculture. The question of women's wages is still being discussed by the Central Agricultural Wages Board, which is now referring its proposals to the County Agricultural Wages Committee for their observations.

Declaration of Purpose

MR CHURCHILL is a great leader because he is a good democrat. Time and again, he has proved this in the conduct of the war. He responds to the spur like a classic racehorse, however much he may toss his head and heels from high mettle. His reluctance to discuss the problems of peace before the war is won remains; but it is no longer a refusal. On Sunday, he stated the agenda for peacetime planning; he has entered himself for the peace stakes.

There has been a disposition among a few of the more anxious tipsters to look this gift horse in the mouth. Their comment has concentrated on the many things that the Prime Minister did not say in the broadcast rather than on the welcome and heartening things he said. There is little excuse for this niggardliness. It is not shared either by the people of this country or by those of the world at large, who have taken Mr Churchill's declaration of purpose at its face value. Continually for nearly three years, Mr Churchill has been asked to identify himself with the minimum basis of agreement that already exists about the shape of post-war policy, to add the cachet of his unique authority to the hopes and aspirations bred by the common effort and sacrifice of war. On Sunday, he did precisely this. The agenda he stated for security abroad and at home could not be comprehensive or complete, because agreement

is neither. All the Prime Minister could do, and did, was to state the essential minimum of a sound settlement after present afflictions. The only valid criticism of this remarkable broadcast is that it might helpfully have been made many months ago.

This is not to suggest that there was anything final or definitive about what Mr Churchill said. His speech was the beginning not the end of policy-making, the premises not the conclusions. His vigorous passing jab against those people who have pressed for this pronouncement was immediately belied by the fact that he still thought fit to make it. Nor, perhaps, was he on sounder ground, in his short polemical introduction, when he spoke of the impossibility of Governments binding themselves or their successors in advance on matters of policy. It is not necessary that democratic Governments should be bound to live from hand-to-mouth; nor is it historically true to say that they have ever been so bound. The essence of democratic government lies, not in the inability of one Government to commit its successor, but in the right of its successor, or the people, to decline to be bound. The doctrine of discontinuity which the Prime Minister adumbrated on Sunday would be the negation of government. Every Government in the past that has laid down a battleship, made a treaty, or passed an Insurance Act has limited the freedom of manoeuvre of the Government

that have followed. "The life of policies is not bounded by the arbitrary divisions of years or of Parliaments; and it is a weakness, not a strength, that the finances of the nation, both current and capital, are framed in rigidly annual periods. Mr Churchill's Government has both the right and the duty to propose a post-war plan, even before the war is over; it will then be the right and duty of the statesmen who follow, sustained by the popular vote, to dispose or accede as they please.

The Heads of the Proposals

What has Mr Churchill proposed? The details have been displayed in every newspaper in the world in the past week; some are discussed in Notes on pages 386 and 399. Broadly the speech fell under three headings: the proposal for a Concert of Europe—and Asia—after the war; the sketch of a Four Year Plan for post-war domestic government; and the exhortation to let these matters rest until the war is over. The Prime Minister ended as he began, with the plea "Let us get back to our job." It was perhaps hardly necessary, addressed as it was to a nation fully mobilised and embattled as it never has been before. The truth is that effective means of "averting that horrible, devastating slump" and "that squalid epoch of bickering and confusion which mocked and squandered the hard-won victory we gained a quarter of a century ago" are the obvious and necessary reward of the all-out effort that is now being made. There can be no vestige of dissent from the Prime Minister's appeal that not a single ounce or moment of endeavour should be relaxed, for any reason, from the task of winning the war. "No promises about the peace, but every possible preparation"; that is Mr Churchill's own formula, heard with relief by the whole free world on Sunday as a great conversion, the turning of Saul into Paul, the belated admission by the first statesman of democracy that the planning of peace is part of the winning of war.

Mr Churchill was brief but blunt about post-war collective security. He called for a representative Council of Europe—and one of Asia—made up, on the one hand, of the Great Powers whose weight in the industrial arts of modern warfare must be decisive and, on the other, of broad confederations of the smaller states, who individually must be helpless. The problem is to mobilise might in the cause of peace while preserving right in the fully protected dues of small nations. It is doubtful whether the sum of two or three small Powers, whether or not it is called a confederation, is one Great Power; and the essence of any such arrangement, however devised, must be the tolerant respect by powerful nations of the personality and independence of their smaller neighbours. The test is the possibility of infusing international relations with the spirit of confidence that makes majority rule in the democratic process tolerable and workable. Given such confidence, the machinery that Mr Churchill roughed out, with its provision for a court of justice and a common police force, is the only apparatus for an enduring peace. The concept of geographical Councils has been questioned in some quarters abroad, not altogether unfairly, for its suggestion of regional separatism. The United States must be as concerned with the preservation of European peace as Britain will be concerned with the maintenance of peace in Asia and the Pacific. The problems of peace and war may be regional; but collective security, like war, is world wide.

It would indeed be a carping tongue or pen that found food for radical criticism in the Prime Minister's rough headings for a Four Year Plan for Britain. He approved outright "national compulsory insurance for all classes, for all purposes from the cradle to the grave." He stated strongly the right and duty alike of all, of every class, to work. He placed a national health service and the war against disease, with the maintenance of an improved agriculture, high in the list of priorities. He proclaimed the need for a broader and more liberal system of education in which all must have their chance. He placed his imprimatur upon schemes to replan and rebuild cities,

towns, villages, roads and workplaces. He spoke with feeling about the paramount need for a stable price level to guarantee a due reward for thrift and work during the transition from war to peace.

No intelligent man, and certainly not Mr Churchill, would suggest that to state this agenda is to supply solutions. Whether national insurance, first proposed by Pitt, lately elaborated by Sir William Beveridge and now supported, in tune with his own political record, by the Prime Minister, is yet taken to imply the prevention of want as a first charge upon national wealth, side by side with the charges of defence and debt, remains undecided. Whether the right and duty to work is to mean state control over the process of investment and over the transfer and training of labour has still to be settled. Whether the national health service can be made a reality by the multiplication of expert institutions and trained personnel has still to be worked out in terms of practical policy. Whether it is right or just or economical or expedient that an agricultural policy will be pursued which will levy a high charge upon industrial Britain in order to sustain an industrial standard of living in the countryside has still to be expressed in terms, to use Mr Churchill's own phrase, of "national housekeeping." Whether the present population trends, which threaten to stabilise, to age and then to diminish the numbers at work and alive in this country, can be reversed by children's allowances and better welfare is still an open question. Nothing Mr Churchill said, except perhaps in his few words about agriculture, prejudiced or anticipated these answers and solutions; and upon them any plan, for four years or forty, must depend.

Mr Churchill stated principles as well as goals. He defined the function of the state as being to influence social and economic development in such a way as to bring these goals within reach. He insisted that, while the responsibility must always in the last resort rest upon the community, enterprise must be permitted its reward, and thrift its privileges. He emphasised that, high though taxation must inevitably be after the war, it must not be so high as to remove personal incentive or to destroy initiative and enterprise. By implication, he painted a picture of positive public policy, aimed at giving state aid in every venture where social motives must for social reasons precede considerations of private profit; at furnishing state projects for the future employment of men and machines when private projects are likely to fall short; and at providing safeguards and assurances for the fruitful use of the life, labour and talent of every independent and willing British citizen. This is, admittedly, much more than a literal translation of what he said; but it is not an unreasonable one. Into his statement can be read the shadowy formula for a supple and sinewy economy based on adaptability and work.

Politics and Policy

Perhaps the main significance of Mr Churchill's broadcast, when these tributes have been paid, lay in the hints it gave of the political means by which the ends he stated are to be attained. At the outset, he spoke with some acerbity of "party strife." Later, he spoke, somewhat ambiguously, about the need for a National Government, made up, alternatively, of all parties or of all the talents, "comprising the best men in all parties who are willing to serve." What does this mean? In some quarters, it has been interpreted as a suggestion that Mr Churchill, on the basis of the present coalition and the present distribution of seats, will seek to extend his present tenure of office during the reconstruction period by a coupon election. But Mr Churchill has grown up in Parliament. He knows the vigour and worth of party politics, as well as its defects and failures. He knows as well as any critic that it will not be possible to be non-controversial about these vital issues in peacetime. "Friction," he said in Parliament on Tuesday, "is healthy, and is widely and almost universally dispersed." It has also been suggested, and denied, that Mr Churchill may be preparing to collect behind him the men who will strive for the purposes he has declared, as a Centre Party; the political

issue is plainly whether the communal purposes which his broadcast echoed shall have precedence over sectional claims. It is most likely, however, that he merely meant to warn the Whitsun Labour Conference that, if the Labour Party repudiates the electoral truce, it may lose its leaders as it did in 1931. But whatever agreement there may be about the purposes declared on Sunday, there are fundamental disagreements about their interpretation and about the ways and means of their achievement. It is the high duty of British democracy in the coming years to hear these clashing views and to decide upon the programme as it proceeds; and if Mr Churchill's intention were to stifle discussion and disagreement, he would be gravely in error. Any deliberate attempt to repeat the manoeuvre of 1931 would be a poor service to all that Mr Churchill himself stands for.

The nation has heard his words. They know his aims. Now, even before the war is over, they look for proof. He has set out, in his own idiom, the minimum of agreement from which the forging of policy must start. He has admitted, in plain terms, the dangers of a hiatus between war planning and peace planning. He has described the disorder and disillusionment into which the nation fell after the last war. He has spoken, vaguely, of "preparation including preliminary legislative preparation." The

The Year of Decision

IN his report to the nation, Mr Churchill sketched both a time table of victory—the crushing of the Germans in 1944 or 45—and a framework for peace once victory has been achieved. Few people will quarrel with the Prime Minister's forecast for victory. The peace that will follow must, as he said, hinge on the co-operation of the Great Powers; and Europe must achieve some form of super-national unity, which will nevertheless preserve the individuality of the historic nations. So much is clear and very generally agreed. But one doubt must remain, and it arises, not from Mr Churchill's plan, but from the time table. Will a victory achieved in 1944 or 1945 bring world collaboration and unity to Europe? May it not, unhappily, be one year too late?

Since the magnificent winter victories in Russia, the people of this country have heard a great deal about the Germans' desperate condition—the shortage of manpower, the lack of oil, the Fuehrer's collapse. They have forgotten the terrible cost at which the Russians gained their victories. Even the reserves of Russian manpower are seriously overtaxed. Six million of their best fighters are lost; millions more men and women are in occupied territory or have been deported to Germany. The agricultural situation is grave. Only a percentage of the area harvested last year can be sown in this. Famine faces large areas. Can this nation, shattered, decimated, its economy dislocated and its war effort overstrained, fight on for another year, as it has done for nearly two, still, possibly, bearing the main brunt of the war? The Russian answer is an emphatic "No." As Alexander Werth pointed out in his Russian Commentary, broadcast on Tuesday, victory in 1944 or 1945 means nothing to the Russians. They want the assurance of victory this year, and from their Allies they expect the only assistance which is likely to put a term to their agony—the Second Front.

The Second Front has become the test which Russia applies to the sincerity of British and American intentions. It is no use complaining that, in the light of relative war preparedness or the shipping position or the lone plight of Britain in 1940, the criterion is unfair; or that Allied aid, direct and indirect, is substantial. The Russians regard the Second Front, not only as the urgent and imperative military need, but also as the sole test of confidence. Any hope of a lasting peace based on the co-operation of the United Nations depends, as much as the outcome of the war itself, on the events of 1943.

In the grim arena of the Russian front, the two nations fight like boxers in the last round but one. Both are

proof turns upon whether "preparation" means preparedness, in the sense that Mr Churchill called for preparedness four years ago—when Mr Chamberlain was "preparing" for war. Will the Government be ready when peace breaks out? This cannot be assured by research and drafting in the War Cabinet Offices or the Departments, however industrious or however expert. The test is whether, out of all this effort, there will emerge, before the war is over, actual Acts and actions to be passed upon by Parliament and public opinion in free debate. A Ministry of Social Security; a comprehensive Education Act; children's allowances; the root-and-branch reform of health insurance and workmen's compensation; laws against monopolists and all their practices; a Royal Commission on Unemployment Prevention; the perfecting of the new National Income technique of public finance, in place of the old Treasury approach—even the first items in the list of deeds that cannot wait are many. Mr Churchill may be wise to give no promises. His broadcast has given a vast deal of encouragement. Now the people and Parliament will look for positive signs that post-war policy will be prompt and apt from the moment of the cease fire. Time, like money, George Eliot once said, is measured by our needs.

staggering under the punishment. The Russians argue that if their Allies enter the ring now the defeat of Germany is assured. The collaboration of war will be crowned by a joint victory, which is the only kind of victory that can lead to collaboration in peace; even if the Russians strike the knockout blow alone, their victory is not likely to lead to collaboration.

Two main and apparently contradictory strands are woven into the fabric of Russia's external relations. One is the strand of security through isolation; the other that of collective security. Both have been a function of confidence. During the first Five Year Plan, when the outside world was still considered hostile, the Russians took no part in the League's attempts to build up collective security and used the Communist International to undermine the solidarity of the Western Powers. This phase of defensive mindedness lasted a decade. With the rise of Germany and Japan and the world-wide reaction against their systems, Russia moved to the policy of collective security at Geneva and of the Popular Front in the International. After Munich a new twist: the Russians, under cover of the Russo-German Pact, occupied a "strategic frontier," the Communists preached a people's peace. Since 1941, the policy of collaboration has been given another trial. The Russians have sought security in isolation when they distrusted the outside world, in collaboration when they thought there was a chance of a genuine alliance. It is beside the point to argue whether or not they were hag-ridden by false fears. Confidence is not a fact but a state of mind.

There are disturbing signs that the mood of confidence of 1941 is slipping away. The dispute over the Polish-Russian frontier has been followed by the appointment of M. Korneichuk to be Vice-Commissar for Foreign Affairs. M. Korneichuk wrote the recent article in *Pravda* attacking the Poles and proclaiming the unity of the Ukraine. If Russia believes itself to be abandoned and isolated, it will work as a minimum for the so-called "strategic frontier" of 1941. If not, there is no reason to suppose that the Soviet Union would not be ready to reach a solution acceptable to the United Nations, for the Russian Government would then be interested in preserving collective security and in avoiding any arrangements which would jeopardise it.

There have been many discussions in Britain and America in recent weeks about the future of Europe. The American press has gone far in saying bluntly what kind of frontier settlement would be unacceptable to American

opinion. The London press has, in a more veiled form, discussed the question of Allied co-operation in general and the particular questions raised by frontiers, spheres of influence, regional groupings, and so forth. Mr Churchill's broadcast stated the highest common factor of these busy discussions. But all plans or projects, fears

or hopes are academic unless they hinge on confidence. There is no automatic way—collective security, balance of power, isolation—of securing peace. Security rests upon the extent to which the nations desire collaboration, and as far as Russia is concerned, that question now turns on the Second Front.

The "Utility" Principle

THE Board of Trade's "utility" scheme is the child of wartime scarcity. It was designed to secure economies in manpower and materials; to ensure a measure of equality in the distribution of essential personal and household goods; and, so far as limited resources permitted, to guarantee reasonably high standards of quality. The realisation of the first and third objects meant simplicity of design and, in some cases, standardisation. To this end, the Government, in consultation with production and marketing experts, has issued specifications to the trades concerned. To achieve the second object, the Government has earmarked a proportion of materials and productive capacity for the manufacture of utility goods, and introduced price control at every stage of production and distribution, while exempting some of the goods from purchase tax. The scheme, which comprises goods of an annual retail value of at least £300 millions at present prices, was first applied to clothing in the summer of 1941, and it has since been extended—with variations to suit each group of products—to household textiles, pottery, furniture and cigarette lighters. It represents, in one respect, the application to certain essential non-food items of the policy applied to food, with the important exception that utility goods are not sold below cost.

Within the limits of wartime conditions, the utility scheme has not been unsuccessful. A comparison made by the Ministry of Labour has shown that, on the average, the prices of utility clothing are lower than those of non-utility goods (exclusive of purchase tax) of corresponding quality. It has been suggested that, instead of dropping the scheme after the war, it might, with suitable modifications, be made part and parcel of peacetime economy, with the object of guaranteeing an ample supply of low-priced and good quality essential and conventional consumption goods, and as one means of avoiding postwar inflation. Undoubtedly, there is much to be said for retaining the utility scheme during the difficult period of transition from a war to a peace economy when scarcity will still predominate. The question is whether the scheme will have outlived its usefulness when the transition is over.

The value of the "utility" principle as an instrument of peacetime policy must be considered in relation to economic and social aims. How far is it likely to contribute to an increase in the general standard of living through reductions in real costs of production? How far will it assist the Government to translate into practice the growing demand that the provision of the essentials of life—the National Minimum—should be made a first charge upon the nation's resources? The need for the detailed planning of the use of scarce resources in war, has, not unnaturally, focused attention on the advantages, rather than the disadvantages, of detailed planning in peace. There is an inevitable temptation to elaborate a neat plan for taking over the utility scheme bodily into peacetime practice, that is to draw up a scheme whereby the Government would issue specifications, earmark productive capacity and materials, control prices and promote technical efficiency to ensure an adequate and cheap supply of almost all consumers' goods.

Actually, it is very doubtful whether the utility principle could, or should, be applied *in toto* in times of peace to such a wide range of consumption goods. The first step in translating the National Minimum into practice, as a peacetime objective, is to define it, to set out the essential needs of food, clothing, housing and so on. This is a task mainly for the health experts, though it must be

largely influenced by habits and conventions. Although great progress has been made in recent years in the assembly of data about essential needs, there is no such thing as an absolute minimum applicable to all persons. The present wartime minimum can hardly be a satisfactory criterion for a peacetime minimum. People must be free to choose in their basic spending.

Certainly the Government might well undertake the task of setting standards of quality for essential goods, in collaboration with producers and representatives of consumers, a principle which is by no means novel, though its application was limited before the war. There is scope for its extension, especially in relation to housing and household goods. But it could hardly be applied to the whole range of personal and, especially, fashion goods. Nevertheless, the setting and enforcing of adequate standards where these are not already provided by private enterprise could contribute considerably to an improvement in the quality of essential consumers' goods.

The question is whether and how far the Government should undertake the task of setting consumption, as distinct from quality, standards. It may be argued that, provided quality standards are enforced and money incomes are adequate for the purchase of essentials, money demand will do the rest. But experience has shown that money demand does not always ensure the desirable consumption standard—that is, people do not get what they really want and need, as, for example in housing. The problem is to a large extent one of educating the consumer to know and to choose what he really wants. But there are instances where Government intervention might be of assistance. In housing, the Government might conceivably insist that certain amenities, such as refrigerators, considered essential by some experts, should be incorporated in new dwellings. The public authorities responsible for water supplies might be asked to provide water-softeners where this is considered necessary. Supplies of personal goods, as in the past, must be determined by public taste; but a good deal can be done by education to raise standards of consumption.

The root problem is to ensure that necessities will be on sale at reasonable prices, which must involve progressive cost reductions wherever possible. In their pamphlet, "Economic Reconstruction after the War" (The English Universities Press, Ltd., 4d.), Miss M. Joseph and Mr N. Kaldor suggest that the Government should take over the rôle which competition has filled hardly adequately and fix maximum prices at levels sufficiently low to enable only the most efficient firms to survive. This method, though undoubtedly attractive, is obviously not suitable for application over the whole range of consumers' goods; its usefulness is probably limited to articles whose manufacture can be standardised. Even within this limited range, it is not necessarily the best means of securing efficiency. Messrs. Marks and Spencer and Prices, Tailors, for example, have secured substantial price reductions simply by the economy of organising mass production from the retail end. This does not mean that the Government should stand aside entirely. The power must be reserved, where heedful, to examine the costs of producers and traders as a means of preventing monopolistic practices and of ensuring that the prices charged to consumers for essential goods are socially and economically reasonable. Subject to this power to examine costs, the initiative in securing cost reductions may best be left with private enterprise and prices determined on the market—except where it is plainly desirable that specific goods and services should be provided by the

community to the individual free of charge, or below cost price. During the war, the Government is deliberately subsidising food prices in order to bring rations within reach of all. Some commodities, such as milk, are sold at differential prices to increase the consumption of those who need it most. These social motives will not disappear with conditions of wartime.

The utility principle, in sum, while necessary in wartime and during the period of transition to a peace economy, as a means of making the most economical use of scarce resources, will not be suitable, in its entirety, in peacetime conditions. Even during the war its application has been limited. For particular commodities, the control of specifications and prices may be the most convenient means of providing ample supplies at low prices. But the field of its peacetime application may well be very limited. Standards of quality, where these are not already set by

private enterprise, may well be set more widely. Much can be done by education. Costing will be essential wherever prices are to be kept down to reasonable limits by deliberate action. There is no single formula which is applicable to every commodity and every essential service. Rigid control over designs and prices is hardly compatible with the degree of flexibility that is necessary to progress and expansion. But this object can best be achieved by empirical methods, by applying to each commodity or service the methods which are most likely to ensure both the essentials of life to everybody and a progressive rise in the standard of living above the minimum. Always provided that an adequate supply, in quantity and quality, of the essentials of life is given priority, which is the sole criterion for direct interference, no restrictions should be placed upon the free choice of consumers and the enterprise and initiative of producers.

Coup de Reste

THE White Paper (Cmd. 6430) published on Wednesday by the Government of India on the responsibility of the Congress Party for the recent violent disturbances adds nothing to a solution of the Indian problem. As its preface admits, almost all the facts contained in it are "already within the knowledge of the public." The claim is repeated that the Government is in possession of "a large volume of evidence which it is not desirable to publish at present." It was this evidence that was asked for when the Government of India was pressed to document these frightful and futile happenings. It was widely felt that the time had come to strip the veil of secrecy from both the crimes committed and the punishment meted out.

There is a kind of move in chess which is called a *coup de reste*. It is made when the player wishes to wait for the intentions of his opponent to reveal themselves. This week's White Paper, together with all recent official utterances about the Indian problem, represents such a move. There was no real doubt, even before this statement came to hand, that the Congress Party and its supporters were deliberately involved by their leaders, including Mr Gandhi, in action of a revolutionary character—a fact which serves as a full and adequate reason for the continued imprisonment of the Mahatma and his colleagues, unless they will pledge themselves explicitly to refrain from further incitement. This they have refused to do, and the blame for deadlock rests upon them.

But this by no means exhausts the needs of the situation. The statement that India is a test case may be tiresomely trite, but it is also true. It is a test, not only of British statesmanship, but also of Indian wisdom and capacity and of understanding in other lands. To say that the Cripps mission failed because the main Indian parties refused to agree or co-operate is to state a fact, which has been made still plainer by Professor Coupland's new volume on Indian politics 1936-1942.* The further fact that Congress leaders plunged India into internal strife and external danger last year with their eyes open is reinforced by the White Paper. But these are matters of history, not of policy. The situation in India must get better or worse. What are the prospects?

In India itself, the prospects seem exceedingly poor. As Professor Coupland puts it, the war has greatly strengthened the desire, in Britain as well as in India, that India should be free.

Yet the stronger grows the desire, the darker seem the prospects of its fruition. The relationship between Britain and India has ceased to be the major question. . . . The major question now is the relationship between Indians and Indians. . . . Whether a system or systems of government can be devised under which the different sections and communities of India, provinces and states, Hindus and Moslems and the rest, can agree to live together.

* *Report on the Constitutional Problem in India. Part II.* By R. Coupland. Oxford University Press. 344 pages. 7s. 6d.

Outside India, the question is what aid can be given to a solution; and it is this question to which no answer has been forthcoming since Sir Stafford Cripps failed. Professor Coupland expresses the hope that "the common sense of Indian patriots" may in the end prevail. Many Indian patriots have been hard at work for many months conferring and negotiating about the possible basis of an agreement. Like Sir Stafford Cripps, they have so far failed; and it would be only an obstinate optimist or a doctrinaire who would suggest that, by some sudden magic, the efforts of Mr Rajagopalachari and Sir Tej Sapru to bring Congress and the Moslem League together can be made successful. The communal clash in India is not a British invention. The present Moslem and Hindu leaders refuse to work with or trust each other. Yet something more can probably be done to assist the tide of genuine patriotism that surges inside the main Indian parties as well as in these centre groups. Certainly no efforts in this direction will be wasted. To complete the Indianisation of the Viceroy's Executive Council, and to give to that body the task of drafting a viable constitution for an independent India, and power to co-opt for this purpose every willing Indian from whatever party, would be fresh proof of the abiding desire to find a solution and a renewed appeal to Indian "common sense."

It is indeed ironical that, as Professor Coupland has again made plain, the root cause of these troubles should be the decision and determination of Britain to set India constitutionally free. It is because this decision and this determination can be taken for granted that India's extreme politicians can act intransigently, without fearing that the consequence may be the withdrawal of the offer of freedom. It is as certain as night follows the day that the independence of India will follow this war as the independence of Ireland and the Statute of Westminster followed the last war. The fact that this is realised on both sides of the present controversy should properly be an aid not an obstacle to the progress so far denied. Probably the main cause, on the British side, of the present paradox, is the melancholy fact that, while the movement towards independence has been pressed forward piously ever since 1919, the gap between the temporary British tenants of India and the Indian people, in status and understanding, has not been appreciably narrowed. If it is not narrowed by constructive action on both sides now, the inevitable goal of independence may be attained by way of a bitter and needless rupture, grievously damaging to India, Britain and the world alike. What must be looked for urgently at this belated hour is not further proof from either side of the other's lamentable responsibility for past events, but a pointer and a pathway to peaceful advance. If the leaders either of India or of Britain stand in the way, it is they, and not the settled course of Indian destiny, who must step aside.

NOTES OF THE WEEK

On the Move

The Battle of Tunisia has been joined. It has taken the form of a series of encircling moves by the Allies designed to link up with and support one another. The Eighth Army launched a frontal attack from Medenine towards Mareth. At the same time, a daring and dangerous thrust was made to the rear of the Mareth line aimed at the road junction of El Hamma, to the west of Gabes. General Giraud's forces, advancing from the Tozeur sector, are converging on the same point. Further to the north two American prongs have been thrust out from Gafsa; the northern one has reached Maknassy, from which point the coastal road from Gabes to Sfax—Rommel's only line of retreat—can be cut; and the southern one, moving along the road from Gafsa to Gabes, represents another threat to the more distant rear of the Mareth line. All these moves, if developed and co-ordinated with the necessary speed and punch, may spring an almost perfect trap. The fact that Rommel has made up his mind to fight inside the trap is a remarkable instance of tactical self-confidence and skill. He is trying to make the fullest use of the advantage of interior lines. He has been moving such armoured forces as he possesses from one danger spot to the other with an astonishing degree of flexibility. First, he countered the threat to his immediate rear at El Hamma. Then his "armoured fist" met the frontal attack on the Mareth line. Further to the north, Axis counter-attacks have been attempting to keep the French and the Americans at bay. There is no reason to assume that Rommel will be able to throw the Allied schemes out of gear. His counter-attack on the Mareth line was probably hardly more than an episode in the larger context of the battle; and it seems reasonable to take for granted that General Montgomery has been holding back his main forces for the final assault. Rommel's aim appears to be to prolong the delaying battle in the south as long as possible; and to keep his line of retreat clear. He evidently hopes to inflict severe losses on the Allies before he is forced to withdraw to the north, so that the next stage of the battle in central or in northern Tunisia can be opened only after a lengthy pause for Allied replacement and reinforcement. The next week will probably show whether his game has been more than merely a bold and skilful gamble.

Neighbourlike and Sensible

"We must seek," said the Prime Minister on Sunday, "international arrangements and agreements more neighbourlike and more sensible than before." Mr Churchill stated briefly the aims of such arrangements: to repair the ruin of the world's wealth; to preserve employment and production at a high level; and to secure the interchange of goods and services between men and between nations "under the best conditions and on the largest scale." Nothing definite is known about the progress that has so far been made in these directions. It is plain, however, that discussions are taking place on the central topics of currency and the exchanges; the prices of primary products; and the international guidance of investment. It appears that Lord Keynes has produced a series of interlocking plans covering these crucial questions; and it is difficult to see why these plans should not be thrown open to the test of public scrutiny and debate. A good deal of surmise is proceeding on the basis of rumours, and some of the technical aspects are discussed in a Note on page 399. The rumours suggest that all three plans, for the exchanges, for world prices, and for investment, share the common feature of being designed to achieve the two objectives of optimum expansion and optimum regularity in world economic relationships; to promote by joint machinery and international consultation the maximum flow of goods and capital and the minimum of fluctuations in the volume of commerce and the prices of products. It may be taken as probable that the currency and exchange plan, which was discussed in an article in *The Economist* on March 13th, envisages a system of multilateral clearings by which, with the aid of continuous international consultation, the balances of payments between the nations will be struck at the highest possible level of trade; and that the inten-

tion is to remove the onus which has been placed upon debtor nations in recent decades to cripple domestic activity in order to maintain fixed exchange relationship with other countries. The plan for stabilising the prices of basic materials, according to report, has the same object of securing stability without restriction, by means of international pools and clearing houses. The plan for international investment, too, is said to be contrived to direct the flow of capital from rich to poor or impoverished countries in order to secure the utmost utilisation of world resources and, in consequence, the utmost output and interchange of goods and services.

Clearly, these plans aim at the right targets. Equally clearly, their success will depend, not simply upon their own mechanical ingenuity, but on the willingness of the nations concerned to accept certain political and economic postulates. One prime condition of all international economic collaboration is mutual confidence and assured collective security. The other is the readiness of countries which wish to sell their products or to receive payment on their loans and investments to buy the products of other countries. The problem of combining domestic policies of full employment with the freedom of international exchange upon which such policies must ultimately rest is immensely difficult; and it may be that the plans at present under discussion, which include many more than those of Lord Keynes, may lead to the advancement of "more neighbourlike and more sensible" arrangements than before. But no plans, however good, can be automatic. Even the gold standard, in its heyday, was dependent for its efficient working on mutual respect for certain rules. The new order will require respect for rules no less; and, above all, it will involve the willingness of all the nations, severally and jointly, to relate their home and foreign policies, in economic matters, at every step, so that they do not grasp with one hand what they push away with the other.

Personal

Mr Churchill mentioned only two men of the day in his broadcast. Rightly, he paid tribute to Mr Bevin's great feat of national mobilisation. This was obviously a firm answer to Tory attacks on the trade union connections and alleged bias of the Minister of Labour; and it was timely. Actually, Mr Bevin's critics might do better to consider the implications of Mr Bevin's trade unionism for peacetime politics than to give vent to these doubts and suspicions about its effects on the war effort. The other person singled out was Mr Greenwood, who recently described pounds, shillings and pence as "meaningless symbols." Rightly, again, Mr Churchill pointed out that these "meaningless symbols" represent the legitimate claims of workers and savers upon real resources. While war has shown, and peace will show no less, that the nation's wealth and strength rest in its manpower, plant and materials, it is plainly untrue to say, either in war or in peace, that money does not matter. Money is the instrument by the distribution and use of which real resources can be brought into full employment; and upon its allocation, to individuals and classes, depends the justice and efficiency with which the national product is divided. War has not proved that money does not matter. What it has proved is that to permit financial or monetary considerations to impede the production or distribution of goods and services, national or international, is a crime and a folly.

Putting Milk into Babies

Mr Churchill was as unspecific over the place of agriculture in post-war Britain as he was over the other social and economic measures he listed. He spoke of what Britain has owed to cheap and abundant food, without which it would never have become a great power. "Abundant food," he said, "has brought our 47 million Britons into the world. Here they are, and they must find their living." Then in the next breath he went on to say, "It is absolutely certain

that we shall have to grow a larger proportion of our food at home." In a measure, of course, this is perfectly true. But does this imply renunciation of cheap and abundant food? Or does the Government think that the technical improvements in British agriculture since the war, which Mr Churchill mentioned later, will enable it to be maintained at a lower cost than before the war? It is not reassuring that Mr Churchill gave warning that

if the expansion and improvement of British agriculture is to be maintained, as it must be maintained, and a reasonable level of prices is to be maintained, as it must be maintained, there are likely to be substantial charges which the state must be prepared to shoulder.

Nor is it reassuring that, on the same day as it reported the Prime Minister's broadcast, *The Times* printed an article by its Agricultural Correspondent stating that some farmers would like to stop milk production and concentrate on arable production, because milk prices are not high enough. It seems that the public is to have no say, not only in the amount of food which is to be produced at home—and therefore in the price it must pay for its food—but also in what food is to be produced. Mr Hudson said last Saturday that the public had consumed more milk this winter than in any previous winter, and Mr Churchill said "there is no finer investment for any community than putting milk into babies." Is the rise in milk consumption to be encouraged after the war, or is it to be checked by a persistent increase in prices?

Spring in Russia

In Tunisia the coming of spring has eliminated weather obstacles from the battle-field and given scope to strategy. In Russia, the season is having the opposite effect: strategy is bogged down in deep mud. The great battles of the winter are nearing their end; and it may be that for some time no great drives will alter the outline of the fronts. During the past week, both sides have lost their full powers of manoeuvre. No conclusive results have been achieved by the German attacks in the south. After the capture of Byelorod, the Germans officially declared that their counter-offensive had come to a standstill. The violent attacks at Chuguyev have been repulsed by the Russians; and the eastern banks of the Donetz are still in their possession. It is now doubtful whether the Germans will be able to add Kursk to their other re-conquests, and, equally, it is unlikely that the Russians will be able to go on battering at the Orel salient. West of Moscow, the Russians are about midway between Vyazma and Smolensk. Only at the extreme north at Staraya Russa, is the ground likely to be hard enough to allow for further fighting.

The calendar, which has played so prominent a part in the winter campaign and caused havoc to communications and operational plans, will continue to influence the fighting later in the spring. The unusually early thaw means that this year's summer campaigning will probably start considerably earlier than in the last two years. Normally, the mounting of large-scale offensives in Russia cannot be completed before the end of June. This year it is possible that May will bring the opening of massive operations. Both sides will make the best use they can of the shorter pause. The Germans are already mustering their fresh reserves. They will have to speed up the process to forestall a possible Russian offensive. This means that there will be less time left for training new recruits, and that the quality of the enemy's forces in the east may show a drastic deterioration. On the other hand, the German High Command has reconstituted its strategic reserve behind a shortened front. And the size of that reserve must still be formidable, to judge by the fact that in their recent thrust against Kharkov alone the Germans were able to use not less than twelve panzer divisions. This figure is nearly twice as great as the number of armoured divisions used in the whole Polish campaign and not many less than those deployed in the battle of France. On the Russian side, the High Command has managed to preserve the bulk of its forces—the German counter-offensive failed to achieve any spectacular encirclements. But it should not be forgotten that for the winter offensive the Red Army had to draw mainly on its Siberian manpower; and the list of casualties must have been high on both sides. It is likely that the position of reserves

on both sides is one of precarious equilibrium, which may be upset at a stroke. A similar state of equilibrium may have been reached in the sphere of strategic leadership. The Russians "have learned," as General Dittmar says, "to move big tank formations in the offensive." A successful summer offensive by the Russians has become a distinct possibility. But nobody is able to gauge the degree of exhaustion on either side. A very slight margin of superiority on the one side or the other may suffice to bring about a strategic dénouement in the east this year. It is up to the Allies in the west to tilt the scales.

MacHeath's Dilemma

Even at this late hour, there is still need to stress the extreme urgency of effecting a genuine union among all Frenchmen opposed to the Axis. General de Gaulle has not yet left for Algiers. The movements headed by the two generals are still separate. The incident of French Guiana has increased the confusion and brought into sharper relief the distress of the simple-minded whose sole dislike is pro-Axis domination. Last week, a *coup d'état* in Cayenne displaced the pro-Vichy Governor, M. Weber, who subsequently left the colony. This, at least, may be food for thought for the recalcitrant Admiral Robert in Martinique. The *coup* was followed by contradictory announcements from Algiers and London that French Guiana was determined to adhere now to General Giraud, now to General de Gaulle. The tragedy is that the announcements should, in fact, take a contradictory form. It should be possible to opt for both the generals—now that both are pledged to the republican constitution. Eye-witnesses report from Cayenne that the crowds who thronged the streets acclaimed both leaders. Only one thing was clear to them—that Vichy must be dispossessed. MacHeath's dilemma—How happy could I be with either, were I other dear charmer away—must not be allowed to undermine the solidarity of French patriots. Within the framework of diplomatic assumptions, political differences must take second place; questions of prestige must have no place at all. Agreement in principle is no longer adequate. The generals must meet without delay and

To MEMBERS of the Scottish Widows' Fund

Most of our new-business staff is on war service but the utmost will be done to maintain the Society's life assurance service.

In two ways MEMBERS can do much to help:—

1. Keep correspondence with the Society at a minimum, and
2. Either to us or to your agent, give introductions to likely new members.

REMEMBER, we cannot now send anyone to urge you to increase your own life assurance—just DO IT WITHOUT BEING ASKED.

Write to your agent or to the Secretary.

SCOTTISH WIDOWS' FUND

Head Office:
9, St. Andrew Square, Edinburgh, 2

settle their differences. French Guiana is right; both leaders are patriots. United, they will compel support and respect; in conflict they weaken themselves and the cause of France.

Heroes' Day

The speech given by Hitler on Heroes' Day was simply a re-hash of the familiar themes of world Bolshevism, international Jewry and decadent plutocracy. The only point of interest was the figure given of German killed so far—542,000. Yet even this is not very interesting, for it is certainly false. The importance of the occasion is the light thrown by the speech on Hitler's own position. First of all, the rumours that he is dead have been effectively scotched. But though he is not dead, the Fuehrer is apparently something of a political corpse. His tired, dispirited voice and evident reluctance suggested that he was paraded before the public against his own will, because the party leaders thought it advisable. Behind him stood the real rulers of Germany—Himmler, head of the Gestapo, and the Chiefs of the Armed Forces—Keitel, Doenitz, Milch and Bock. At the broadcast of the ceremony the commentator said "Hitler now steps on to the dais. Behind him is Reichsmarshal Goering and the Commanders of the three branches of the Wehrmacht." From this it is possible to infer a number of changes in the German High Command. Goering is no longer in charge of the *Luftwaffe*—he is mentioned separately. Field Marshal Milch, who hitherto has been Goering's deputy, must now have taken over command. Doenitz is known to be the new commander of the Navy. Field Marshal Keitel is still in his old job, in charge of the High Command of the Wehrmacht—that is to say, of the War Ministry. Since Keitel is a political general and has never held any big command in the field, it seems to follow that Field Marshal Bock must now be the actual Commander-in-Chief of the Army. He commanded the First Army group in the central sector in Russia and he was the first general to be brought back to command after the winter crisis of 1941. Under him, the commanders of the three army groups in Russia are Kuechler, in the northern sector, Kluge in the central sector and Manstein in the south. Yet, although Bock is apparently Commander-in-Chief, it has been strongly emphasised since Heroes' Day that there has been no change in the High Command of the Army and that Hitler is still Commander-in-Chief. The confusion is only apparent. Hitler may be a puppet; he is also a potent myth. To still the anxiety caused by rumours of his death, he had to be produced, and having suggested at the Heroes' Day meeting that he is no longer Commander-in-Chief, the party has apparently been obliged to return to the earlier fiction and continue to spread the magic of Hitler's name over the operations in Russia. The effective direction lies where it always lay—with the German General Staff.

The Health Services and the BMA

The publication in the *British Medical Journal* of a statement by the secretary of the British Medical Association on the present consultations between the Ministry of Health and the medical profession confirms suspicions that their aim is, not to discuss how a policy can best be made to work, but to decide what policy will best please the doctors represented at the discussions. The statement included a letter from the Secretary of the Ministry, which declares *inter alia*:—

The Minister appreciates . . . that views expressed on your side must not be taken as committing the profession as a whole, and similarly he does not contemplate announcing in the course of the discussions any final conclusions on the part of the Government. What he desires is a frank expression of the opinions of those best qualified to judge both issues of a technical and professional kind and—what is no less important—as to the probable attitude of the profession towards any proposals that may be put forward.

The letter then goes on to make the extraordinary statement:—

We contemplate that at some stage it will no doubt be convenient to the profession, and indeed to all concerned, if a statement is published indicating in general terms the kind of measures which the Minister would have in mind to submit to Parliament on behalf of the Government.

It is surely fantastic that publication of the proposals for a national health service should be described as, possibly

convenient to the nation. The public has the right to know as soon as the doctors know what form of national health service the Government intends to set up. Nor are the BMA's comments on the letter reassuring. It states that the Minister has given an undertaking that the discussion will not take place on the basis of any preconceived plan but "from the ground," and adds that, before any final decision is reached on the proposals to be put before Parliament, the scheme will be submitted to the various medical bodies represented in the discussions. If these methods had been used before Mr Lloyd George's national health insurance scheme had been drawn up, it would probably never have seen the light of day.

The Foreign Service

The reforms of the Foreign Service (Cmd 6420) were debated on March 18th and, at the instance of Mr W. J. Brown, put to the House. The result was naturally an overwhelming vote for acceptance. But the tone of the debate, while friendly to the proposals and appreciative of the good intentions behind them, had a critical edge. There was no quarrel at all with the reasons given by Mr Eden for the proposed reforms—that the Foreign Service had got out of touch with modern conditions, recruited its staff too narrowly, and showed a lamentable lack of grasp on economic and social matters. But there was some doubt whether the new methods would give the Service either the new efficiency it needs or the new blood. The fusion of the diplomatic and consular services met no adverse comment. It was the revised conditions of entry that aroused very lively criticism. Many members were apprehensive of the proposed experiment of admitting up to 25 per cent of the candidates on the basis of an interview only. The competitive examination was introduced to counter the danger of nepotism and influence; and, it was argued, it would be a retrograde step to restore any opening for it. University education—or its equivalent—is almost certainly an essential preparation for the diplomatic service. The injustice, if injustice there is, lies, not in laying it down as a condition of entry, but in keeping this kind of training inaccessible to so many who might profit by it. On one other point Mr W. J. Brown's criticism of the proposed reforms also struck home. He quoted the almost grandiloquent preamble to the proposed reforms:

By introducing the reforms hereinafter described it is intended to re-equip the Foreign Service to meet modern conditions and to create a Service which . . . shall be better able not merely to represent the interests of the nation as a whole, but also to deal with the whole range of international affairs, political, social and economic, and so constitute an adequate instrument for the maintenance of good relations.

And he added:

I assert that between the great phrases of the introduction of this document and the concrete proposals contained in the document there is not the slightest relation whatever.

The attack is overstated, but it is shrewd. No speaker, not even Mr Brown himself, dealt with the really fundamental question: Will the reforms fulfil the very large purpose which the White Paper lays down? The foreign interests of a modern nation are so varied and specialised that they cannot be adequately covered by "all-purpose" diplomats, even if some economics and social training have been thrown in. The range of problems and questions an Ambassador has to review are more akin to those of a Prime Minister than of a Foreign Secretary. Washington to-day, with its British Information Service and British Food, Supply, Military, Financial and other missions alongside the Embassy, represents the complexity of the new diplomacy; and the lack of co-ordination there reflects its confusion. This can be mastered by the Foreign Office swallowing up all the separate branches—information, trade, labour relations. Or the relevant Ministries and Departments—including the Foreign Office as a Ministry of Diplomacy—can be grouped together under the Foreign Secretary, who would then be, not merely the head of the Foreign Office, but a genuine Secretary for Foreign Affairs.

* * *

The Distaff Side

Mr Eden's decision to postpone the question of admitting women to the Diplomatic Service until after the

war was hotly contested by Lady Astor and opposed by many of the other Members who spoke in the debate. The reasons advanced for the exclusion of women are familiar by now—their supposed ineptitude for economic and commercial affairs, an ineptitude which, it was argued, would be an even greater obstacle now that the diplomatic and consular services are to be fused; the alleged unsuitability of their mental and emotional make-up; the unwillingness of many countries to receive woman diplomats; the complications introduced by the problem of their marriage, particularly to foreigners. Mr Law and Mr Harold Nicolson between them covered the list, Mr Nicolson adding whimsical excursions into history in support of his view that the interruption of women into diplomacy has always been disastrous. Lady Astor made a number of telling points. She pointed out that the committee of 1934 had divided equally on the question of admitting women to the Diplomatic Service, but six of the eight had suggested that the question should be reconsidered if women continued to gain ground in spheres of employment hitherto closed to them. Now that the general competence of women has been proved a hundredfold by war, surely the time for reconsidering the question is overdue. But apart from Mr Pethick Lawrence's unassailable principle that ability must be used wherever it can be found, the case for admitting women into the Diplomatic Service did not emerge clearly from the debate. Taking the particular criticisms first, it is simply not true that women lack commercial capacity. To give only one example, the principal overseas buyers of many large firms are women. Again, it is not true that women with trained minds are more emotional or instinctively unstable than men with a corresponding education. "Failure of a Mission" is proof of this. Sir Nevile Henderson's feelings about the Nazi bosses were a determining factor in his disastrous conduct of affairs. If Mr Nicolson must rake up history, Catherine the Great, Elizabeth or Maria Theresa overshadow his "Helen of Argos." There remains the problem of marriage—admittedly an important one. Mr Nicolson's bland assumption of immutability for the laws governing the nationality of British women on their marriage to foreigners can be dismissed. The question is broader than this. It is a matter of general principle. Is the need of the British nation to avail itself of the best capacity available to be the overriding consideration, in all branches of the Civil Service, business, industry and trade, as well as the Diplomatic Service. Are women of ability and proved intelligence to be assisted to combine marriage and motherhood with the pursuit of a career? Some women may prefer Mr Nicolson's "perpetual spinsterhood." Are those who do not to be penalised or encouraged? The Government still speaks with two voices—one for the war factories, another for the Departments of State.

Flowers and Logistics

On Thursday last week Mr Noel-Baker, Parliamentary Secretary to the Ministry of War Transport, informed the House of Commons that the ban on sending flowers by rail, imposed last November, was to be lifted from March 25th. The suspension, made possible by the fact that the railways can handle a bigger volume of traffic in the summer when the hours of daylight are longer, is conditional. No special trains are to be run for the carriage of flowers or plants; they will only be carried subject to the prior claims of perishable goods, other essential traffic, and passengers; there will be no guarantee of transport facilities. As Mr Noel-Baker said, there is no need to impose austerity for the sake of austerity, and there is no waste of transport resources in filling free space with flowers. As far as possible, however, traffic should be arranged so that there is a minimum of free space. The handling of flowers requires manpower, and, in any case, austerity has already been imposed on all but the few by the rise in prices. How essential the conditions imposed on the lifting of this ban may be can be illustrated by actual figures. During a period of six months last year, no fewer than 365 special flower trains were run. By comparison, in moving the North African expeditionary force from billets and depôts to ports, involving 185,000 men, 20,000 vehicles and 220,000 tons of stores, three times as many special trains—440 troop trains and 680 freight trains—had to be run during a period of three weeks—a significant idea of the magnitude of the extra strain that will be imposed upon railway facilities

"They pay a bonus"

When do Defence Bonds pay a bonus?

After 10 years they pay a bonus of £1 for every £100 invested.

What interest do Defence Bonds pay?

3% per annum which is paid half-yearly, January 1st and July 1st. Income Tax, if payable, is not deducted at source.

What are their other points?

They never fluctuate in value. You can cash them at six months' notice, or in case of private emergency, you can apply to the Savings Bank at which your bonds are registered for repayment of the purchase price, subject to a deduction equal to six months' interest.

Yes, they certainly are attractive. How do I buy them?

Defence Bonds cost £5 each. You can buy them outright or in instalments by sticking 6d., 2/6 or 5/- National Savings Stamps in your Savings Stamp Book.

Where can I get them?

From any Bank, Stockbroker, Post Office or Trustee Savings Bank. But no individual may hold or have an interest in more than £1,000 worth.

3% DEFENCE BONDS

this year by the movement of large contingents of troops, and of the ruthlessness with which less essential traffic must be cut at every point, large or small.

The Nurses' Bill

On Wednesday, a second reading was given to the Nurses' Bill, which brings into force one of the recommendations of the Athlone Committee on the Nursing Services. The title of the Bill is a misnomer, for it is concerned, not with the fully qualified registered nurse, but with the "assistant nurse," that is, the nurse who is not a trained nurse or training for admission to the State Register. The Athlone Committee recognised that many of these women, working under trained supervision in hospitals and other institutions, are doing very valuable work. But many of them leave hospital to work in private nursing homes or to join nurses' co-operations from which they are sent out to nurse patients in their homes. The drawbacks of the present situation are, first, that, from the point of view of the public, a person does not know whether he is employing a trained or untrained nurse unless he takes the unlikely course of asking for her qualifications; and, secondly, that from the point of view of the nursing profession, the standard of nursing tends to be lowered, because it often happens that a probationer who has failed her examinations, and then joins a co-operation, is sent by it to her old hospital as an assistant nurse at a much higher salary, with the result that other probationers resign before their training is completed in order to follow her example. The Committee recommended, therefore, that the General Nursing Council, which keeps the State Register of trained nurses, should keep a Roll of Assistant Nurses. This would ensure that they had certain qualifications, and the new Bill enables the Council to make rules regulating admission to the Roll and requiring that applicants should have undergone prescribed training at approved institutions or in the service of the armed forces. The second part of the Bill provides for the licensing of agencies for the supply of nurses, and prohibits them from supplying persons other than registered nurses, enrolled assistant nurses, certified midwives and other prescribed classes such as nurses in mental hospitals. Thus, with the adoption of the Rushcliffe Committee's salary scales for assistant nurses, their position is now being regularised. This should encourage many older women, who have not been able to take up a profession until late in life and would consequently be unwilling to do the full nurses' training, to become assistant nurses, which will strengthen this valuable supplement to the nursing profession. But it does not solve the main problem of finding large numbers of trained nurses.

Help for the Jews

The Archbishop of Canterbury voiced the anxiety of the country when, in the House of Lords, he pointed to the delay in bringing in measures to save the Jews from massacre at the hands of the Germans and asked "Whether it might not be possible to speed things up a little?" He pressed that visas for Palestine be granted more promptly; that arrangements be made with the European neutrals to support refugees on their soil and later to transfer them to British or American territory—in this way "the channel through which the trickle percolates will not be blocked"; he also urged, though not "with the same confidence," that the German Government be approached to release a certain number of Jews to be sent to British and Allied territory. There was general support for the Archbishop's motion, which the Government accepted; but Lord Cranborne did not do much more than assure the Lords that the Government was "pegging away to relieve the situation." He insisted on the immense difficulties involved and the limited resources available. "To suggest there are large surplus food supplies in this country is a most dangerous illusion. The difficulties are no less in the colonial territories." He gave, however, one reassuring figure, that 800 refugees a month are entering Britain. If the Dominions and the United States were to take a proportionate figure, the "trickle" could grow to a reasonable size. Obviously the question cannot be met except on an international basis; but the danger of international discussions is the time taken in sounding opinion, referring back, or consulting all interests. What this country chiefly demands is an assurance that the undoubted difficulties are being used as a spur, not as a deterrent, to action.

War Pensions

It is a little strange that Sir Walter Womersley, Minister of Pensions, whose department is attacked over and over again in the Commons, should be the only Minister who has remained constant in his office since the war began. Probably it means that, in spite of the series of complaints directed at him, he is generally regarded as doing a difficult job very well. It is certainly recognised that he gives every case full and sympathetic consideration; and, even in this week's debate on war pensions, when every Member who spoke attacked the Government's policy, there was no personal attack on him. What is at issue are the principles fixed for the award of pensions, not the administration of them. There are two main complaints: that pensions are not large enough and that they are not granted freely enough. It is certainly anomalous that a totally disabled soldier of this war should receive 2s. 6d. less a week than a similar pensioner of the last war. There is also much force in the argument that family allowances should be given to disabled pensioners who marry and have children after their disability has been contracted. The reply that such a system would be open to abuse, such as death-bed marriages, could be equally applicable to old-age pensions or any form of social service payment. But the Government is on stronger ground in its refusal to grant pensions except where the disability is due to war service or materially aggravated by it. In the last war, as has now been realised, pensions were given too freely, with the result that in a not inconsiderable number of cases invalids for life were created. In others, a liability was assumed by the Ministry of Pensions, which ought not to have fallen upon it. There is every reason why independent appeal tribunals should be established as soon as possible—though the difficulties of staffing them, since it is specialists who are needed, are great—so that each applicant can feel he has had a fair hearing. But the principle on which the Ministry acts in awarding a pension is sound. Probably, fewer disputes would arise if there were proper provision for those who are suffering from some physical illness which is not attributable to war service. In other words, there would be fewer complaints to Sir Walter Womersley if national health insurance payments, treatment and rehabilitation were not so inadequate. The Minister who should really receive the knocks is Mr Ernest Brown.

Shorter Notes

The following table gives the number of civilian casualties in air-raids since September, 1939:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940.	1,494	1,980	3,474
Sept.-Dec., 1940.....	22,282	28,522	50,804
Total, 1941.....	20,863	21,839	42,702
1942:—			
January to June....	1,838	1,922	3,760
July.....	411	871	1,282
August.....	403	509	912
September.....	207	238	445
October.....	229	370	599
November.....	24	38	62
December.....	109	201	310
1943:—			
January.....	328	507	835
February.....	252	347	599
Totals to date....	48,440	57,344	105,784

Of those killed in February, 93 were men, 136 were women and 23 were children under 16.

The ballot conducted among members of British Equity on the Sunday opening of theatres has resulted in a vote of 1,031 for and 361 against. The number of members circulated was 2,514 in the profession and 322 in the Forces. The votes of the latter have still to be added, but, out of 103 ballot papers returned by serving members by the end of last week, 88 were in favour of Sunday opening. The total membership of Equity, according to the return submitted to the TUC, is 3,575.

AMERICAN SURVEY

Milwaukee in this War (From Our Washington Correspondent)

ON December 14, 1942, the Navy reported Lieutenant Carl Frederick Zeidler missing in action. He had volunteered for service ten months before in the midst of his first term as Mayor of Milwaukee. Zeidler's enlistment was part of the mobilisation which the people of his city undertook as the United States entered the war. This January, production in local factories was at the rate of \$100 millions a month; 1942 registered a gain of 27.5 per cent over 1941 output, most of which was prime war or sub-contract work, done on an "expedite emergency" basis.

This expansion was tied to a process of conversion. A few new plants were built where absolute necessity demanded, but, in the main, increased production was achieved within the existing structure of widely diversified manufacturing establishments. Automatic machines that used to turn out pens and pencils are whirling out fuses; big steel presses formerly engaged in hammering out transcontinental pipe lines are turning out bomb cases. Refrigerator makers have focused their attention on the production of 105 mm. guns. Shells and shell casings are being turned out in quantities numbering millions by firms whose peacetime products were construction materials. A firm that used to make many different items, from electric motors to farm equipment and huge turbines, is building superchargers for planes. Refuelling trucks for the Air Force, parts for propeller assemblies, cargo ships and motorcycles, are among some of the other items of current production.

These converted facilities are running around the clock; factory lights, blazing through long winter nights in all sections of the city—since a thousand miles lie between Milwaukee and the coast to the east, and two thousand to the west, there is no dim-out—brighten spirits of both workers and observers with a feeling of getting things done. Since there has been no mushrooming of plants, nor any great influx of workers—the city has increased its man-hours largely by drawing on its women—these lights are the most spectacular part of what is otherwise a forceful rather than a dramatic effort. The city has neither show-places of concentrated war work nor cluttering of trailer camps. Housing is about as usual. Hours of stores, factories and schools have been fitted to meet the needs of transportation.

That's the record, in spite of the fact that the 1940 census still rated Milwaukee as the American city with the largest proportion of German stock, with foreign white stock of German origin running as high as 20 per cent of the total population of 587,472. (The 1930 census classified 158,249 residents, or some 27 per cent of the then total population, as of German origin; the decrease is due to the death of older Germans, whose descendants are classified as native-born Americans.) Rated as the third city in the number of persons speaking German (only New York and Chicago outrank it), Milwaukee has 109,580.

In 1939, then, it is understandable why a German agent sought industrial workers in Milwaukee. One Eugene Buerk, a draftsman who was a resident for ten years, but not a citizen, recruited men for work in Germany's industrial plants. It was reported that nearly 300 persons entrained on the specials leaving for Chicago and New York, where they sailed on the *Bremen* for Germany. In New York the Milwaukee contingent joined several thousand other recruits from Chicago, Cleveland, Detroit and Flint. One of them, Walter Drews, returned in February, 1940, to tell of promises not kept. His pictured bubble of "steady work at good wages" in Germany had burst. He said he was told that other Milwaukeeans recruited for work there wanted to get back, but couldn't.

Last Time

Has Milwaukee's character changed since World War I? Recruiting for the Army, Navy and Marines after Pearl

Harbour speak an emphatic "Yes." In 1917, of course, there had been no direct attack on the United States; evidence that not all Milwaukeeans were for the war is contained in the fact that recruiting officers found it necessary to seek aid from the District Attorney's office in suppressing troublesome agitators. In the first two weeks of the last war, these offices enlisted only 304 men in the Army—a number far below their quota—and 139 in the Navy. The draft law was enacted, and young men suddenly decided to marry. Licences were issued at the rate of more than 400 a month, or twice the normal rate. This time, in the four-week period following Pearl Harbour, 860 Milwaukee men enlisted in the Army, 203 in the Navy, 304 in the Marines, and 25 in the Coast Guard.

At the same time, less of the hysteria attendant on the elimination of everything that was even remotely tinged with German is apparent in the present conflict than in World War I. Devotees of German cooking, of which the city retains a tasty share, may enjoy their *apfel plannkuchen*; *sauerbraten* with noodles and *wiener schnitzel*, without fear of upbraiding or pressure for renaming in the manner of 1917, when *sauerkraut* became liberty cabbage with no lessening of its aroma. Changing of proper names was of great importance in 1917. Towns lost their identity in new appellations. Schlesingerville became Slinger, Fredericksdorf was shortened to Frederics, Leuchenberg to Layton. Numerous loyal citizens of German extraction changed their names to lose their identity with the "Fatherland."

Newspaper files show that up to April, 1917, 68.3 per cent of children in the elementary schools were studying German; it was practically compulsory; in high schools, where it was optional, 24 per cent of the students selected German. On April 13th, however, a school principal's association committee voted 9 to 0 to recommend dropping German in the lower four grades; subsequently, it was dropped entirely from the elementary schools. To-day, Latin and Spanish are the favoured languages in high school; German, Italian and French are dying.

This war has brought no need for editorial crusading. Fully reported and talk of the town was the suicide, on June 15, 1942, of George Froboese, Milwaukee leader of the *Volksbund*. He was decapitated by a train at the little way station of Waterloo, Indiana, while on his way to appear before a Federal grand jury in New York. Only about 100 persons attended the German-spoken funeral services, while about 200 of the curious lingered outside. "Justice was done" seemed the general consensus. To-day, local spirit is in accord with the national action. One of the submarines or subchasers being launched on nearby inland lakes and bays may avenge Lieutenant Zeidler.

Planning for Peace

THE terms of reference of the National Resources and Planning Board's report on Social Security were wide. But the scope of its second Report—on Demobilisation and Post-war Problems—is wider still. Beginning with the unexceptionable statement that "We shall not be content this time to give each young man \$60 in cash and a ticket home," the Report deals with the immediate problems of demobilising men and machines. It sketches the basic policies for an expanding economy, including very wide improvements to the physical equipment of the country; and includes sections on security, public health, fiscal policies and administrative problems. The result is not a plan in the same concrete sense as the security report. It is rather a series of

notes and suggestions designed to aid Congress, the Administration and its agencies in the formation of a plan.

Demobilisation

The immediate problem after the end of hostilities will be the return of men, plant and equipment to peacetime uses. The Report points out that this is likely to cover a considerable period if, as seems likely, fighting continues on one front after victory has been achieved elsewhere. The main aim is to make it an orderly process, avoiding the extremes either of deflation or an inflationary boom.

The demobilisation of men from the Forces is already being studied by several committees, one set up under the Selective Service Act, and another, under General Osborn, which is dealing with the problem of interrupted schooling. On this point, therefore, the recommendations are brief. The Board suggests that a dismissal wage or allowance for men leaving the Forces might be considered. It urges that security protection must be provided for men entering reserved occupations as well as those who left them to join up. It is particularly concerned that programmes of vocational education be provided, both in schools and in industry, to equip young men for earning their living again.

Military demobilisation will, in the end, release, perhaps, 11 million men for whom jobs must be provided. Industrial demobilisation will throw many more on to the labour market. Between 20 and 30 million are now employed in war industry. The armistice will not force all these to hunt for new jobs, but over a period of time a substantial number will need some sort of provision. The authors of the Report are attracted by the idea that nationwide extension and liberalisation of the unemployment compensation system might be the most effective means of providing a transition allowance. Public works, the Board states, with unusual reserve, "may also be appropriate."

The demobilisation of plant and equipment, and the liquidation of contracts, will not, of course, be complete. The Board suggests that war plants to be kept in operation or stand-by condition should be selected before the end of hostilities, so that the communities and industries concerned can adjust their plans. Selection of these plants should be guided by the need for better regional distribution of defence manufacturing, particularly from the point of view of vulnerability, and the comparative difficulty of establishing production of civilian products and plants in certain areas.

The problem of conversion back to civilian production is twofold. In some war plants there is no Government investment; others in which there is an urgent public interest have been constructed with Government funds. The Board suggests that Government aid should be extended to the private operator in the form of plant rehabilitation grants; the immediate provision in the Federal tax laws for the establishment of a "Post War Conversion Reserve," and loans at low interest rates.

The Report is greatly impressed with the danger of creating monopolies by the disposal of Government financed plants especially in the basic metals and materials. It argues that these should be distributed among numerous operators to assure competition; but it goes further than this. The Government, it urges, should participate in decisions as to what areas are to be exploited and what concerns are to operate after the war. The Board is convinced of the desirability of new forms of partnership between private enterprise and the Government in industries of national importance like aircraft, shipbuilding, magnesium, aluminium and others, where great investments of public money already exist. These "partnerships" might take the form of mixed corporations, or some degree of Government participation might be assured by the granting of security for loans. Assistance of various kinds to small enterprise is recommended. The authors of the Report are most reluctant to see these basic sectors of the nation's economy and defence returned to uncontrolled private management.

The Report also emphasises the need for Government encouragement of research, to develop new industries and processes and improved products. In addition, the Board proposes increased grants for private research; aid in distributing information on new processes and products; and the maintenance of free access to both new and old processes, "unhampered by the misuse of the patent system." Special provision should be made for public access to inventions fostered by publicly supported or tax-exempt institutions.

The section of the Report dealing with the immediate problems of demobilisation concludes with observations on the relaxation of wartime controls. It is obvious that, for a period after the war, the rationing both of scarce raw materials and of consumers' goods will have to continue. Some price and wage controls will be necessary. These, presumably, will be temporary. The Board would like, however, to see some controls made permanent, particularly those over industries supplying raw materials; those with rapidly diminishing reserves, like the oil industry; those supplying power, fuel, transport, and other public services. In respect to labour, the Board feels that more—rather than fewer—controls will be necessary in the early postwar period, if labour standards are not to collapse under a flood of unemployed.

Post-War Expansion

Up to this point the discussion is limited to the period immediately after the war, although some of the policies have long-term implications. The Report goes on to consider broader problems of public policy. Under a section entitled "Plans for the Development of an Expanding Economy through Co-operation of Government and Private Enterprise" it is suggested that the Government should take measures to encourage "healthy and aggressive private enterprise"; to prevent the abuse of economic power and the waste of national resources; and to eliminate avoidable uncertainties and needless burdens in the laws affecting enterprise. There is no enlargement on these goals. The authors feel on surer and more fertile ground in discussions of positive Governmental action. On fiscal policy they have concrete suggestions to make. The various branches of the Government must work according to a general plan, in order that policies affecting purchasing power, like public works, social security, and the like, of Federal, state and local authorities, should not cancel out. They recommend a sharp reduction of consumption taxes; the retention of a progressive tax structure, and a broadened base, with the major emphasis on income taxes and less on the corporate income tax; adequate programme of public works; expansion of public welfare expenditures, partly to reduce state and local reliance on property and consumption taxes; and international collaboration on policies designed to maintain employment, open outlets for foreign investment, and promote the most effective use of world resources. The fields particularly suitable for private initiative, with or without Government participation, both in financing and management, are, in the opinion of the Board, urban redevelopment; housing; transport and terminal reorganisation; and energy development.

Further sections of the Report deal with measures to secure collective bargaining and labour participation in management, with fair shares for the farmer and with plans for services and security.

The Government should assume the responsibility of assuring jobs at fair wages. Attention is given to the importance of adequate nutrition; and the revolutionary proposal is made that action should be taken by Government to enable people to budget for medical care over a period of time, and to adjust their payments to their ability to pay, at the same time protecting the income of medical personnel.

Although the Board has recommendations to make about decentralisation of administration, on the whole it makes no bones about its belief that the Federal Government must, in the main, provide the lion's share of stimulus, plans, and funds for post-war adjustment, for large-scale development of the nation's resources, and for the assurance of economic democracy and security. It is to be regretted that there has not been, as yet, more informed comment about its specific recommendations. But it should be remembered that for many Americans dependence on Government is still obnoxious. Senator Burton put the issue as many Americans will feel it.

I agree that it is important to do some planning for our internal stability after the war, but I think that the emphasis should be placed on industrial recovery rather than on social security.

So far Mr Roosevelt has carefully refrained from associating himself with the NRPB Reports. Until he does so, they are likely to be shelved. But if, as some observers suggest, he hopes to fight the 1944 elections on a programme of full employment, social insurance, and public works, the struggle will come, not over details of policy, but over this fundamental and as yet undecided question of Government responsibility.

American Notes

American Commentary

The Prime Minister's broadcast made an immensely favourable impression in the United States. Its tone of resolution and confidence was applauded everywhere, but what surprised and, on the whole, delighted American listeners was the coherence and concreteness of British plans both for war and peace. As the leader in the *Herald Tribune* observed:

His was a picture of a future worth fighting for: a future no doubt controversial in many of its aspects, but definite, with some substance and meaning to it within the present powers of prophecy. One cannot help contrasting it with that vague and elusive mist of contradictions which is all as yet that confronts the inquirer after the future policies and purposes of the United States.

The force of what Mr Churchill had to say was the greater because of his earlier reluctance to prophesy or to discuss post war policies; and the *Tribune* was not alone in feeling that here was a friendly challenge to join Britain in the creation of a brave new world. The progressive nature of the Prime Minister's proposals caused particular surprise. Comment varied widely, of course, according to its source. It is symptomatic of the continued divergences in American opinion that, while Senator Ball's doubt about the advisability of too much stress on "regionalism" before a world organisation is established appeared to be shared by many, the *World Telegram*, though welcoming the regional principle, objected to the thought that the United States might be expected to join a European Council, "with its political problems and military commitments." The "Pacific School," as was to be expected, took issue with the course of the war as described by Mr Churchill, and its interpretation of what he said does less than justice to Mr Churchill's intention. The *Scripps Howard* press, according to reports, for example, argued that his main aims were the defeat of Hitler and the immediate commencement of a four-year construction plan in Britain. Criticism from this source, however, is largely a matter of routine. To the vast majority of Americans the broadcast served as a timely reminder of British daring and determination in matters of post-war policy at home and abroad.

The Times on Russia

The recent leading article in *The Times* on Anglo-Soviet relations has provoked much speculation in the United States, dismay in some quarters, and comment everywhere. Some exception has been taken to the proposal for joint Anglo-Russian guardianship of European security and what is interpreted as a demand for advance approval of Russian frontier demands; and a disclaimer from Mr Eden was necessary to allay the fear that Britain was relying on a post-war Anglo-Soviet bloc rather than on a concert of the United Nations. The *New York Times* in a highly critical editorial said:

American opinion will not look favourably on any proposal to put the small nations of Europe on the auction block in order to purchase Russian confidence and co-operation. . . . If there is one method to drive America back into isolation, it is to question the fundamental basis for international co-operation among the United Nations laid down in the Atlantic Charter.

The article goes on to argue that "appeasement of Russia" is no more likely to succeed than appeasement of Hitler; that it would discourage resistance in the occupied countries; and conveys the warning that appeasement at the surrender of principle would also "arouse like appetites in possibly unexpected places." The identification of British policy with Russian security aims is fairly widespread. The *Washington Post* comments:

It is not news that influential British opinion wishes to see Britain become Russia's second in seeking America's recognition of Russia's security programme. . . . The blue-print in the minds of our British and Russian friends will not make much appeal to the American people. He would make a great mistake who imagined that we would have a part in a return to the old alliance or quasi-alliance system for maintaining peace.

There has also been some feeling that it should not be necessary for Britain to act as a bridge between Russia and the United States. But encouragement can be drawn from a growing understanding in some quarters that the Russian programme is in part a result of uncertainty over American

intentions toward the maintenance of security. The *Herald Tribune* in an able editorial pointed out that so far

there is no official act committing the United States to any form of collective security which might tempt Russia to forgo the search for boundaries that would offer individual security. . . . In advance of a really convincing demonstration that this country accepts the fact that she is part of the world and intends to act on this idea in peace, it is hardly likely that Russia will make commitments on matters she considers vital to her security.

The realisation that to other countries the great uncertainty is the line that American policy will take is not yet general, but it is growing.

Wages Formula

The War Labour Board has rejected the petition of the American Federation of Labour to scrap the "little steel" formula for wage increases. This formula limited increases to 15 per cent of the wage-rates paid in January, 1941, on the ground that such an increase would compensate for the rise in the cost of living. It should be noted, however, that the four labour members of the Board voted against the formula; it is the employers and public members who have maintained it for the time being. It is also significant that the petition came from the American Federation of Labour, which has previously been the formula's most loyal supporter. Mr John L. Lewis has for months been denouncing the formula as "miserably stupid" and designed to starve labour while fattening profits. The Congress of Industrial Organisations has registered its opposition in more restrained terms, arguing that, by fixing increases on a percentage basis, it makes hardship for the lower-paid groups, and maintaining that the rise in the cost of living has already reached 20 per cent above the level of January, 1941. The CIO would like to see the War Labour Board take more advantage of the provisions for flexibility embodied in the Price Stabilisation Act. It is these "escape clauses" for eliminating inequalities and sub-standard wages that the Board will have to invoke—admittedly with some straining of their meaning—if a compromise on wages in the soft coal industry is to be kept even nominally within the letter of the present regulations. Mr Lewis' miners have already had more than the allotted 15 per cent rises, and Mr Lewis has declared bluntly that they will refuse to be bound by the formula. His demands include a \$2 a day basic increase, on the present \$7 a day rate. The intervention of the President, on the request of the mine owners, has averted the likelihood of strike action on April 1st, but only by forcing from the owners the concession they previously were unwilling to make, namely that any wage increase granted by an arbitration tribunal will be retroactive to April 1st. If Mr Lewis, by the use of the big stick, is able to secure further gains for his miners, it is obvious that the dissatisfaction of the more co-operative labour leaders will have to be replaced by something stronger if they are not to see their leadership undermined. The way will then be open to inflation, not by leaps and bounds, but inch by inch, and the demand for anti-union legislation will be strengthened.

Shorter Notes

In some comments on the NRPB social security report it is suggested that it should be financed by a 10 per cent payroll tax. This figure was at one time mentioned by Madam Perkins, the Secretary of Labour; it is not clear whether it was advanced by the Board in its full Report, which is not yet available in this country. This would constitute a substantial difference from the flat-rate contribution proposed in the Beveridge plan.

Anti-fourth term resolutions are being introduced into a number of state legislatures and have already been passed in four. In Illinois a resolution has been adopted petitioning Congress to call a convention to propose an amendment to the Constitution limiting Presidents of the United States to two terms. Other states which have adopted or are introducing similar resolutions are Iowa, Michigan, Missouri, and Wisconsin.

THE WORLD OVERSEAS

Polish Agriculture

(By a Correspondent)

POLISH agriculture is at present dominated by the fact that for three and a half years the country has been divided into three parts. In each of them, the war has had a different effect. Western Poland, the Warthegau, has been incorporated in the Reich since 1939. It used to produce the bulk of Poland's agricultural surplus. The agriculture of central Poland, the General Government, was less productive. The pre-war yield per hectare of nearly all crops was lower there than in western Poland. For wheat, it was 12 quintals, compared with more than 16.5 quintals in western Poland, and for rye, barley, oats and sugar beet the figures were 11.5 against 14.7; 10.9 against 16.7; 12.4 against 15.2; and 201 against 221. Only in the case of potatoes was the yield per hectare higher in central than in western Poland. The incorporation of the western provinces in the Reich was, therefore, carried out for economic as well as political motives. Poznan and Pomerania were the first foreign granaries conquered by German arms.

The agriculture of eastern Poland has undergone many changes. It was subjected to the Soviet land reform of 1939, when its big estates were shared out among the peasants. Later on, the experiment of collectivisation was started by the Soviets, though it was not pushed very far. The Soviet reforms were only partly undone under the German occupation.

In each of the three parts, the Germans pursue a different policy. Their main preoccupation in the Warthegau has been to strengthen the German elements there, and to squeeze out the Poles. A policy of German settlement was started immediately after the conquest, which up to 1942 was carried out fairly intensively. During 1942, however, the pace of colonisation slackened abruptly. Apparently, the shortages of manpower began to tell in this sphere too; candidates for settlement were probably not available. The colonisation has resulted in the transfer of some 38 per cent of land property in the incorporated provinces to German newcomers. About 50 per cent of the cultivated land has still been left in Polish hands, though a considerable proportion of Polish property is under German "trusteeship." From a purely economic point of view, however, agriculture has suffered in western Poland less than in the other provinces. For the very reason that the Third Reich has regarded Poznan and Pomerania as German lands, more care has been taken to preserve the agricultural wealth of the province. Deterioration in productivity here has probably not exceeded the similar deterioration in the agriculture of Germany itself. The acreage under cultivation and the yield of grain per hectare have not fallen substantially below the pre-war level; and they have probably been maintained at that level by the big estates. The aim has been to keep the output of rye—the staple grain of the country—stationary and to expand root crops and oleaginous plants at the expense of fodder, and especially of barley. The area under oil plants has, according to German sources, been increased by 30,000 hectares, and that under root crops by 50,000 hectares. The decrease in cattle population has been comparatively moderate; it is estimated at 10 per cent for horses and at 15 per cent for horned cattle.

Losses in the East

The devastation of agriculture in eastern Poland contrasts sharply with the conditions in the Warthegau. The area now under cultivation is not likely to be more than three-quarters of the pre-war acreage; and the average yield of grains per hectare has dropped by about one-third. The losses in the cattle population have been enormous. About 60 per cent of the horses and 50 per cent of horned cattle and pigs should be written off. This devastation has been due not so much to the "normal" shortages of fodder as to the requisitioning of animals for war transport. Eastern Poland has been much nearer the front, and this has severely affected its agriculture. The land reforms carried out under

the Soviet rule have not been undone root and branch. The restoration of property to previous owners has been made conditional on their political "loyalty," and on the delivering of full quotas of foodstuffs. German colonisation has not been attempted here; the political problem is the relations between Ukrainians and Poles. During the inter-war period, the Poles sought to increase their numerical strength in the east by colonisation of the countryside. Most of these Polish settlers were deported into the interior of Russia in 1939-41 during the period of Soviet rule; thus the strength of the Polish element has been weakened on the eastern borderlands.

The General Government holds, geographically and economically, an intermediate position between the incorporated provinces in the west and the eastern lands. Its agriculture has not been affected by the economic *Drang nach Osten*. Such expropriations as have taken place have been carried out for strategic reasons. They have taken place quite recently in the defence belt on the Bug, where 50,000-60,000 peasant families have been cleared out of scores of villages. The deterioration in agriculture has not been so grave as in eastern Poland, but much more so than in the Warthegau. The area under wheat, barley and oats has been reduced by about 30 per cent. The acreage under rye has remained stationary, but the yield per acre has fallen by about 20 per cent. The losses in cattle have been very high; in 1941, about one-third of the horse stock was diverted to war transport.

The average losses of Polish agriculture as a whole are summarised in the following table computed by Polish agriculturists:—

	Percentage decreases on pre-war figures
Area under grain (excluding rye).....	30
Yield of cereals per acre	20
Pig population	30
Horned cattle	35
Horses	40
Sheep	30

Although the losses are grave enough, they are not so grave as to prevent a relatively quick recovery of Polish agriculture after the war. Only the decrease in the number of horses and horned cattle is bound to have more lasting effects. But these average figures tell only part of the story. It should also be pointed out that the losses are by no means evenly distributed geographically or socially. The big estate in western and central Poland has suffered far less than the small peasant holding, partly because the invader's policy has favoured the big estate as being more convenient for controlling deliveries, but partly, too, because of the greater power of resistance of the big estate. The small holding has more frequently than not lost most of its cattle through requisitioning, whereas the big estate has rarely been deprived of more than a small part of its stock. The proportionately heavier loss of cattle has deprived the small holding of manure, almost the only kind of fertiliser used by the Polish peasant. The big estate has only rarely suffered from a shortage of manure, and it has also had chemical fertilisers allocated to it. The quotas of deliveries have been fixed per acre, so that the small holdings have been left with hardly any marketable surpluses. The big landowner has remained the main beneficiary of the fantastically high prices on the free and black markets. It is, therefore, the destruction of the small peasant economy which will present the most difficult problem for post-war Poland. It should not be forgotten that before the war more than 64 per cent of Polish rural holdings were primitive dwarf holdings under 5 hectares, 25 per cent of which were under 2 hectares, while 89 per cent were under 10 hectares.

The problem has been complicated by a new factor for which there has been no analogy in any other of the occupied countries. In one half of Poland, the one that

has experienced Soviet occupation, the big estate has been broken up and destroyed. In the rest of Poland, it has survived. On the assumption that Poland regains its eastern provinces, a radical agricultural adjustment is inevitable. Any attempt to unscramble the land reforms carried out by the Soviets, and to restore the big estates, would be fraught with civil war. But to leave two such different agricultural structures within the framework of one state would hardly be feasible. The big estate is not likely to gain a new lease of life; on the other hand, the small holdings will hardly be able to recover from the ravages of the war—which was preceded by a not less devastating and protracted agricultural slump—unless the peasant economy is at last reorganised on a modern co-operative basis. This would in its turn involve large imports of agricultural machinery.

Labour Troubles in Bolivia

[FROM A CORRESPONDENT IN LA PAZ]

January 15th

IN recent months, there were a series of labour conflicts in Bolivia which have seriously affected its tin output. The first occurred in the Potosi mines of the Compañía Minera Unificada del Cerro Potosi. The miners demanded the abolition of the company's stores, which were supposed to put at their disposal certain necessities at below cost price—which meant that their wages were also kept on a relatively low level. The abolition of compulsory purchases in these stores ought, it was maintained, to have been accompanied by a wage increase, amply justified in the miners' view by the recent rise in tin prices. But the Arbitration Committee appointed by the Government delayed the award for four months and finally endorsed the company's standpoint. A strike was only averted by the promulgation of the Busch Labour Code and by the efforts of the Labour leaders in Potosi.

About the same time, the miners of the Patiño group in the Catavi area asked for a large increase in wages. An agreement on a basis of a 30 per cent increase seemed imminent but for the intervention of a leading mine-owner, who was reported to have alleged that the obligations of the new Labour Code, together with wage increases, would impose too heavy a burden on the already overtaxed mining industry. He also argued that it would create a precedent for his own group. Their petition being refused, the Catavi miners scheduled a strike for December 14th. Meanwhile, Colonel Cuenca, military commander of the Oruro area, took matters in hand. On December 13th, a conference which he called for negotiations with the miners' leaders ended with the arrest of the latter. The miners attempted to release their leaders, and in the subsequent clash one miner was killed and several wounded. As a result, some 10,000 miners went on strike, involving about 50 per cent of Bolivia's tin output. The Government, for its part, decreed martial law in the mining districts of La Paz, Oruro, Potosi, Cochabamba and Chuquisaca.

Mediation Refused

The Bolivian Labour headquarters immediately offered its mediation, which was refused by the Government. Instead, the residences of its leaders—most of them members of the PIR, the party of the Left—were searched, and, in one of them, a document was found which, in the Government's view, proved beyond doubt that the strike was being fostered by the PIR to promote "the social revolution." Nearly all the leaders of the Bolivian working class have been put under arrest under a charge of subversion. Meanwhile, another clash occurred between the military and the workers in Catavi, in which more miners were killed.

What seems to have occurred was this. At the recent conference of the PIR, a draft was submitted suggesting what should be the tactics of the party if its candidate for the presidential elections of 1944 were elected and then deprived of his success by an electoral fraud. The author of the draft, with a lack of political maturity characteristic of Bolivia, proposed that, in this event, strikes should be fostered all over Bolivia in order to provoke a revolutionary crisis. The proposal was not even considered.

The fact that the Minister of the Interior published only

part of this document, creating the impression that it referred to the strike at Catavi, and that he accused the PIR of having accepted the proposal as its official programme—a statement which had to be modified later—had a painful effect. It was felt that Bolivian Labour, whose contribution to the Allied war effort was so important, had not been given a fair chance to defend itself against, to say the least, questionable charges. This impression was strengthened by the fact that the daily, *La Calle*, generally regarded as sympathetic to the Axis, joined the campaign against the PIR, accusing it of being controlled "by a foreigner, Lombardo Toledano, agent of Yankee imperialism and defender of the Jews." (Toledano recently visited Bolivia and was sharply attacked by *La Calle* because he called on Bolivian Labour to give wholehearted support to the Allied war effort and on Bolivia to enter the war.)

Anti-Labour Bias

It was felt that there is a strong anti-Labour bias in certain Government circles, and that it could only be in the interests of German sympathisers to foster the belief that Bolivian Labour was, at this crucial period of the war, engaged in "subversive activities," whereas, in fact, the Bolivian Labour Centre adopted the following resolution on the occasion of the continental labour demonstration against the massacre of the Jews: "Our statutes, declaration of principles and Congress resolutions bear witness that the organised workers of Bolivia are mortal enemies of Nazi Fascism, Falangism and their Fifth Column."

According to press reports, the strike came to an end on December 24th, but as a result of the reprisals an exodus of miners from the Catavi area began, while about 40 labour leaders are still confined. The Unified Socialists, one of the biggest parties of the Chamber of Deputies, protested to the Minister of the Interior against the killing of the Catavi miners, but the Minister only made an unconvincing reply.

In the meantime, it has been estimated that the tin output in 1942 is at least 10 per cent, if not 15 per cent, below that of 1941.

Banking in Eire

[FROM OUR DUBLIN CORRESPONDENT]

February 27th

THE results of the Irish banks' operations in 1942 show that profits have risen by £70,105 to £1,102,131. This is a welcome contrast to the decline of profits in the earlier years of the war. The explanation of this increase is to be found in the expansion of the banks' resources. Deposits rose by £24,487,221 to a record total of £240,543,621. In contrast to the experience of English banks, advances and bills discounted did not decline. While the advances of several banks fell, the advances of others rose, with the result that total advances were up by £403,871 to £81,795,747. The Irish banks did not expand the type of low-yielding assets that have figured so prominently in the balance-sheets of the British banks during the war. They do not hold any Treasury bills, and, with the exception of one bank, do not hold TDRs. The bulk of their additional assets take the form of investments which yield a reasonable return. The rise in profits was, no doubt, partly the result of the increased charges for keeping accounts.

The banking statistics reflect the consequences of the war on Irish economic life. The expansion of deposits has been most marked among small depositors, mainly of the farming classes, and there has been an increase in the number of accounts, showing that the banking habit is growing. The stability of the amount of advances indicates that farmers are not demanding accommodation, owing to the shortage of supplies of fertilisers and other working capital. The chairman of one of the banks has complained of the unfair competition for agricultural advances by the Agricultural Credit Corporation, which receives a Government subsidy. This corporation has reduced its rate on loans, old and new, to 4½ per cent, and has arranged for the conversion of its more onerous debentures. The chairman of the corporation has complained of a shortage of demand for loans even on the more favourable terms now offered. The plethora of conditions in the Irish banking system suggest that the present time is particularly favourable for public borrowing for the programme of Government expenditure which will become necessary after the war.

The annual meetings of the banks have all been held, and the chairmen have made their speeches to shareholders on the usual conventional lines. It is surprising that the opportunity provided by these meetings is not utilised to reply to some of the criticism of the banks which is persistently made in certain quarters. The example of the English banks in this matter might well be followed. Some account, on the lines of Mr McKenna's speech this year to the shareholders of the Midland Bank, of the services which the banks actually contribute to the smooth working of the everyday economic life of the community would help.

The Central Bank began business on February 1st. The opening of this institution, which takes the place of the Currency Commission, will not immediately affect the working of the Irish banking system. Bankers are required to make a moderate deposit with the Minister for Finance, and to take out a licence to carry on business. Facilities are provided for rediscounting bills, which, however, are not likely to be widely utilised. There are certain contingent powers in the Central Bank which, if used without discretion, might prove embarrassing to the banks. The Central Bank can, if the Board is of opinion that the assets within Eire of a bank are insufficient, require the bank to deposit a sum free of interest. It can also take control of external clearings. The possession of these powers puts the Central Bank in a position to interfere considerably with the conduct of the banks' business, but it is improbable that they will be used except with the utmost discretion.

Transport in India

[BY A CORRESPONDENT]

THE construction of 20,000 tons of additional coastal craft was recommended last year by a committee investigating the possibility of developing waterborne transport off the west coast of India. This is a reminder of the strain felt by India's transport system and particularly by the Indian railways. Whereas "native" craft are transporting 1½ million tons of cargo per season along the west coast between Karachi and Cochin and the recommendation aims at the diversion of another 681,000 tons from the railways, the whole Indian railway system last year carried nearly 93 million tons of goods.

As regards inland transport, India has a very low mileage of roads—one of the lowest in relation to the size of its population. The total mileage of extra-municipal roads is round 290,000. Of this, only 186,000 miles are motorable roads, and of this total again only 83,600 are motorable all the year round. "Motorable" is a very relative term, and the position is perhaps better indicated by the statement that about one-quarter of the road mileage is metalled. The distribution of roads in India varies greatly. The province with the greatest road mileage is Bengal, with 91,000, of which only some 3,900 have a modern surface or macadam. Madras, out of a total mileage of 35,700, has 21,440 modern roads, while Bombay, out of a total of 19,570, has 11,130 with modern surface or macadam. Two of the few outstanding main trunk roads of India are from Calcutta to the mouth of the Khyber Pass and from Bombay to Delhi.

In the road building of the nineteenth century, the first consideration was strategic necessity and next the convenience of the civil authorities in connecting headquarters with the sub-divisional headquarters and the latter with the district headquarters. About half the mileage of railways in British India has a metalled road parallel with it, and some 25 per cent of the metalled road system is parallel with the railways. Emphasis on the desirability of feeder roads to the railroad came much later in the day, and was brought more to the fore by the development of motor transport. That new main road, as distinct from feeder road, construction ought not to be developed to such lengths as to raise serious competition with the State-owned railways was never far from the minds of the authorities when motor transport grew. In great areas of India, there is no local material suitable for building first-class roads, so that it is often about as expensive to build and maintain such a road as to construct a railway—the latter giving more promise of a direct financial return on the outlay. Obviously, productive road propositions were hard to come by, and it was a misfortune that when the possibilities of more roads for rapidly developing road transport were seriously considered, the period should have coincided with the depression period. The Provincial Governments were thus unable to undertake road-building programmes on any scale. The administration of roads has been principally in the hands of Provincial Governments, delegating downwards to municipalities and district local boards. To aid road development, the revenue from the petrol tax, collected by the Central Government, is put into a special account, which is allocated to the Provinces and States in a ratio based on their petrol consumption. At the end of March, 1940, the balance in the fund available for allocation was just under £9 millions, of which the gross receipts for the previous twelve months were but £1,312,500. It is estimated that at least £30 millions would be required to provide India with an adequate system of roads.

Mobilising the Bullock

The Indian cultivators' standard transporter—the bullock cart, of which there are estimated to be some 10 millions—is being pressed into service for the war effort. At the September meeting of the Transport Advisory Council, it was said that there was some reserve of bullock carts available for transport, not only in slack seasons but throughout the year. The Council considered that the best way of utilising bullock power would be to create local demands by closing railway stations for booking. The Provincial Governments are sending in lists of stations which can be appropriately closed to achieve this purpose.

Before the war, there were some 50,000 motor buses and lorries in India, but, during the war, the military authorities

March 27, 1943

THE ECONOMIST

397

have increased supplies of motor transport considerably. Ordinary motor transport in India (there were about 100,000 cars and taxis licensed) has been severely curtailed by petrol rationing. Early in 1942, the Government of India announced that they would arrange priority for the import of the necessary plant from the United States to turn molasses from the Indian sugar factories into power alcohol; there were only two or three such plants in India, but India's sugar crop is very large. The use of producer gas from charcoal is also being encouraged. At the Transport Advisory Council meeting last September, it was announced that 6,000 vehicles had been converted to producer gas, and quotas of steel had been obtained for the conversion of another 12,000 vehicles in the succeeding six months.

As a substitute for mineral lubricating oils, castor oil is proving useful. Its qualities as a lubricant have enabled it to stand comparison with mineral oil lubricants—even in such peculiar conditions of strain as racing cars and aeroplane engines. The oil is stated to lack stability over a long period unless suitably treated, but some time ago the Indian Industrial Research Bureau reported that investigations have resulted in the discovery of several chemicals which are effective stabilisers when used in vegetable oils, including castor, ground-nut and cotton-seed oil.

The Indian railways, in view of the limitations on other forms of transport, have had to bear the full strain of the country's extra transport requirements under war conditions. To start with, the railways handed over, for military purposes, 200 locomotives and 10,000 other vehicles. Some of these transfers have been used outside India. Recently, the opening was reported of a new railway linking Iran with India which will speed up supplies to Russia. It was built at the rate of a mile a day by Indian personnel, and the rails and rolling stock all came from India.

Railway statistics show that in 1941-42, compared with the last pre-war year, there was a rise of 30 per cent in ton miles of goods carried and of over 16 per cent in passenger miles; this meant an increase of 3,000 million passenger miles and 6,500 million ton miles. The operating efficiency of the railways has increased by as much as 25 per cent, and compares well with the best American practice. This is all the more remarkable seeing that, from almost a decade prior to the war, the State railways could not make ends meet financially, so that presumably renewals were cut down and existing locomotives more intensively utilised. Locomotive manufacture in India itself only became a live issue just before the war, for it was not a paying proposition with the current rate of demand to establish a domestic industry. Now the plans for limited construction in existing railway workshops are not fructifying as quickly as expected owing to the difficulties of obtaining certain essential import requirements.

Letter to the Editor

French Seamen

TO THE EDITOR OF THE ECONOMIST.

SIR,—In the issue dated March 20th of *The Economist*, p. 351, it is stated that "a number of French seamen were detained by the Fighting French authorities at Dundee because they wished to transfer to General Giraud."

After careful enquiry with the authorities of the Free French Navy, I am in a position to state most definitely that no French sailor is or has ever been detained in Dundee or elsewhere for the reason mentioned, nor for any political reason whatsoever.

We feel that such a statement, if it is spread and believed, may not be helpful to secure the unity of all Frenchmen, which is the goal our Allies and ourselves are trying to attain.

Yours sincerely,
J. SOUSTELLE.Comité National,
Commissariat National à l'Information.

[The statement referred to in this letter was based upon what *The Economist* regarded as reliable and trustworthy information. There has never been any wish on the part of this paper to embarrass Fighting France by retailing mere rumour.—EDITOR.]

Gas helps
to make it

The Gas Industry is helping to build, equip and arm our tanks. Not only does gas itself fire the furnaces to treat the metals for their construction, but the by-products of gas-making provide their ammunition and the many plastic fittings with which they are equipped.

Gas-making releases a wealth of chemical by-products—coke, tar, benzole, ammonia and sulphur—which play an important part in the war effort. Gas helps to win the Battle for Fuel by providing half a ton of coke from every ton of coal used at the gas works. From tar, ammonia, sulphur and benzole, thousands of valuable substances are obtained—explosives, fertilisers, creosote, life-saving drugs, anaesthetics, acids for electric batteries, dyes, metal-replacing plastics and motor spirit.

But although more gas and by-products are needed for war industries, gas-making plant is not elastic; there is a limit to the amount of gas that can be made in a given time. You can help by SAVING MORE GAS. Even the smallest economy helps.

HOW TO SAVE GAS. Ask for helpful pamphlets at your Gas Showrooms or from British Commercial Gas Association, 1 Grosvenor Place, London, S.W.1.

THE BUSINESS WORLD

A Future for Cotton

THE extensive demand which is to be expected as a result of replacement needs immediately after the war will involve important decisions of policy on the re-expansion of concentrated industries. The transition from a concentrated state to one of free production will in no case be easy. But in those industries which in pre-war days were suffering from long-term depression, the need is for a comprehensive long-term policy on which it will be particularly difficult to find agreement. In the case of one industry—namely, building—these difficulties will be largely solved by the preparation of a long-term construction programme. But where there can be little hope of utilising the full productive capacity of an industry there is no such easy solution.

The cotton industry is an outstanding example. Is it going to be the policy of the Government to put back into commission all the mills closed as a result of the concentration scheme? Admittedly, this concentration was carried out in a somewhat arbitrary manner; yet it is virtually impossible to run all the mills in Lancashire on an economical basis, if only because of the shortage of labour. And if this is so, is the Government to encourage the recruitment of new labour?

The recruitment of labour, indeed, presents itself to the cotton industry as an immediate and crucial aspect of the post-war situation. It was to discuss this problem that the Cotton Board organised the meeting of representatives from all sections of the trade which was held in Manchester on Wednesday. Mr R. A. Butler and Mr George Tomlinson represented the Government and expressed their support for the setting up of a committee "to formulate, supervise and execute a planned programme to promote organised recruitment, selection and training for the industry." Proposals concerning technical education, closer cooperation between schools and industry, the improvement of welfare arrangements and others were discussed and found general agreement.

It may seem strange that an acute shortage of labour is experienced now and expected in the future. For fifteen years before the war, the industry suffered from heavy, almost unrelieved, depression. Unemployment in places such as Oldham exceeded 20 per cent for many years, and if short-time working—which is the customary method of spreading employment in Lancashire—is included, there are few trades which can parallel the unenviable record of unemployment in cotton.

Yet at the present time, despite the application of the Essential Work Order to the industry and the concentration of the productive plants, a nucleus mill is fortunate if it succeeds in obtaining 75 per cent of its labour requirements; and the position in the manufacturing sections is, if anything, worse. Many operatives moved into munitions before the Essential Work Order came into force, and many others joined the Forces, but this would not of itself have caused the present shortage. More important has been the migration of labour from cotton to other industries, and from the cotton districts of Lancashire to other parts of the country, which has proceeded on a very large scale, particularly since 1930.

Even more important has been the heavy reduction in the inflow of new recruits to replace those who, from age and other causes, have left the industry. As the President of the Board of Education pointed out, even between 1921 and 1931, juvenile entrants to the cotton industry fell by 54 per cent, and this left the average age of the workers in the manufacturing section at 48 shortly before the war. Technical schools have been empty and parents have been generally averse from allowing their children to enter the trade.

It is because of these factors that the shortage of labour is expected to continue while replacement demand, at any rate, is maintained at a high level. The number of spindles in Lancashire fell from 59.3 millions in 1914 to 35.8 millions in 1940, and is slightly lower to-day. But the

available labour supply has fallen more than in proportion, so that it is expected that after the war only about 70 per cent of the available productive capacity could be used.

Even to reach this total, it is necessary that the workers who have left the industry since the start of the war should return. It is here that the proposals made on Wednesday are important. There will be a considerable disinclination on the part of cotton operatives who have experienced the working conditions of other industries to return to cotton, and it is only if the working and social amenities of the industry are greatly improved that the trade can hope to attract anything like all of them back. But the more fundamental question of the recruitment of new labour remains. Improvements in technical training and working conditions, however thorough, can hardly be sufficient to alter the opinion of parents who have lived through the vicissitudes of the cotton industry in the last 20 years.

The one question asked, and the one question which has as yet received no satisfactory answer, is whether the cotton industry offers prospects of steady employment over a long period. The outlook here, unfortunately, cannot be said to be very encouraging. On the side of technique, the adaptation of ring spinning to the finer counts lowers still further the relative advantage of the skilled Lancashire worker, needing as it does less highly trained operatives. The actual fabric of the mills, too, is becoming out of date. A "new" mill in Lancashire is one built in 1906-7 and the majority were constructed in the nineteenth century. This is in marked contrast to the plants of overseas countries, whose capacity, incidentally, is being further extended during the war. It is all-important that Lancashire should not repeat the folly of a price boom and widespread recapitalisation after this war. The finances of operating mills are notably sound at present after the extensive capital reorganisations of the last few years. But the need for large capital expenditure to renovate the older mills should not be underestimated. It is also important for cotton that the exchange parity of sterling after this war should not again be fixed at a conventional level which after the last war penalised all export industries and cotton in particular. Presumably, some form of control will remain after the war, in view of the economies shown in the experience of the Cotton Control and some scheme of reorganisation may be enforced.

While Lancashire must expect a reduction in its proportion of the world's cotton trade, it is to be hoped that the total of the world's cotton trade may increase and to some extent compensate the fall in Lancashire's share. There are some who have recently advocated trade barriers and price control as a method of maintaining Lancashire's trade. The lead in technique which alone can justify Lancashire's position in the world's trade cannot be preserved by these means, but only by progressive methods and efficiency.

If Lancashire is to have a prosperous trade in the future it must spend not less but more than its competitors on new experiments and developments. An immediate start is indicated in more than one direction, of which the development of viscose yarns is not the least important. Unless some indication can be given that the cotton industry has these steps in mind there can be little justification for an attempt to recruit labour on a scale sufficient to enable all the mills to run at an economical level. In sum, Lancashire's real problem after the war will be to find steady buyers for its wares, buyers who are willing to pay prices which will enable it to pay good wages. There is room for an efficient, if shrunken cotton trade, with emphasis on quality products. During the past three years wages in the cotton industry have been brought more into line with the average for all industries. If the industry can offer good wages and security in peace, it will have no difficulty in recruiting an adequate labour force.

Finance and Banking

Expansion in Credit Base

As so often since war began, the ease of credit conditions this week has taken the market somewhat by surprise. The week's TDR call represent at least £45 million of new money. Savings are running as a fairly high level, and one or two banks have been making-up, a combination of circumstances that might well have produced a certain stringency. Yet the Bank return, in fact, shows a rise of £13.5 million in bankers' deposits to the very comfortable level of £169.5 million, with public deposits again below the £6 million mark. Though there has been little clearing bank demand for bills, the supply of overnight money has been adequate. The addition of some £15 million to the Banking Department's securities holding can thus be ascribed with some confidence to Ways and Means borrowing, and not to special buying of bills. The rise in the note circulation continues, withdrawals since the January low now totalling £20,657,000, against £12,630,000 in the corresponding weeks of 1942.

Mr Churchill on Money

Mr Churchill's remarks on monetary policy in his recent broadcast were confined to stressing the need for reasonable stability of prices in order to safeguard the real value of savings and of long-term contracts expressed in money. Subscriptions to Government loans, post-war refunds of income-tax and war damage compensation, as he pointed out, are all obligations expressed in pounds, shillings and pence. Without being wedded (in 1943) to "undue rigidity in the management of the currency system," the Prime Minister therefore believes, very rightly, that over a period of ten or fifteen years there ought to be "a fair, steady continuity of values." It is difficult to make sense of the plaint that this attitude overlooks "the extent to which a dynamic social and economic policy can create the new wealth out of which it is financed." To safeguard the value of savings is merely to avoid a sweeping rise in prices; and no recognised monetary theory, however modern and enlightened, has yet been advanced in support of inflation. It is true that investment must always generate its own

savings. So long as there are unemployed resources to be drawn into production and to increase the output of consumption goods, these will be real savings; but beyond that point, they will merely be forced savings. The real point, surely, is that to avoid inflation is merely the first approach to a monetary policy. Once the transition to a peacetime economy has been accomplished, the main problem, as has already been recognised in Government pronouncements, will be to stimulate demand and not to regulate it. The Prime Minister's emphasis on the danger of inflation might therefore have been disquieting, but for the insistence elsewhere in the address on the necessity to have projects ready to provide future employment. Incidentally, it is not certain that in demonstrating the need for reasonable price stability, Mr Churchill completely demolished the contention that pounds, shillings and pence have become "meaningless symbols." In a controlled system, such as the present war economy, money no longer determines the direction of production, and the possession of money is not the chief determinant of individual consumption. Money, therefore, has much less meaning than in normal times. Whether its normal functions are to be restored is, in one sense, the question at issue between the totalitarians and those who desire the eventual removal of direct controls.

Indian Silver Price

For almost a fortnight past, the Bombay silver price has remained above the level of Rs. 109 per 100 tolas, which constitutes the "melting point" for old standard rupees. On March 11th the price jumped by Rs. 4 annas 5 to Rs. 111 annas 8, and it reached its highest level on March 16th, when the quotation was Rs. 112 annas 2. This is equivalent to nearly twice the London price of 23½d. On the same day, the price of gold reached Rs. 71 annas 10 per tola. Since then prices have been somewhat lower, but silver has rarely fallen below Rs. 109. To some extent, moreover, these Bombay market quotations under-estimate the level of prices over the country as a whole. The up-country price of silver, for instance, is customarily several rupees higher than in Bombay. This recrudescence of speculative demand for gold and silver is mainly a reflection of

To every man and woman smoker

Will you help to reduce the appalling loss of vital material caused by fire damage?

THOUSANDS of tons of foodstuffs completely destroyed, a clothing factory in flames, destroying hundreds of thousands of garments—fires like these are costing the nation £12,500,000 a year! More important than the money are the labour, the raw material and the shipping space which must be diverted from the war effort to replace the loss.

And the facts are, undeniably, that most fires start from some little act of carelessness by a normally careful person. A match thrown away still smouldering,

a cigarette end left burning, an electric iron left switched on—simple acts of carelessness like these are slowing up production, as well as making tragic inroads into the nation's reserve of materials. Will you help to stop it?

Be more than careful with lighted matches and cigarette ends—be sure! Stub your cigarette ends till they're right out and never throw away a match or spill unless you know it's out. Your help, everybody's help is needed, to reduce the loss to the war effort by fire.

Most fires are caused by careful people

ISSUED AS PART OF THE FIRE OFFICES' COMMITTEE CAMPAIGN AGAINST FIRE WASTAGE

3 SAFETY FIRST RULES FOR SMOKERS

1. You know a match is out when you can do this.

2. Stub your cigarette end right out.

3. Look twice, when you're in any doubt.

pointed out a year ago that the falling level of fixed assets suggested the establishment of secret reserves of modest dimension. This year a revaluation has been effected, and roughly a quarter of the depreciation provided in the period 1935-41 has been written back, the amount of £13,109 thus provided being added to general reserve. The company has created a reserve of £5,000 against stocks, and raised that against bad debts to the same figure, both of these being shown as deductions from the relevant items. The result of all this, coupled with the detailed information as to appropriations for taxation, is a very much clearer picture of the year's results than is provided by almost any other company. Added to this, there is an eight-year comparison and analysis of balance-sheets and profit and loss accounts, with percentages. The revaluation of fixed assets somewhat disturbs the picture, but over eight years the percentage of these to total net assets, after deducting current liabilities, has fallen from 35 to 19, net liquid assets having risen correspondingly. Meanwhile the proportion of reserves to total capital and reserves has gone up from 20 to 47 per cent. Earnings showed a steady rise until after the outbreak of war. Since then there has been a decline, and the latest figure, before tax, is £48,709 against £61,790 for 1939 and £50,360 three years before. The dividend has, however, been unchanged since it was first raised to 40 per cent in 1938. In that year, net preference and ordinary dividends took almost 40 per cent of profit, and taxation rather over 35 per cent, while for 1942 the corresponding figures were rather under one-third of the reduced amount, and some 62 per cent, respectively, or, in absolute figures, the shareholders' receipts fell by almost one-third, while those of the state rose by 44 per cent.

It is announced that Morgan, Grenfell and Co., the private banking concern, is to reduce its issued capital from £2,000,000 to £1,500,000 by the return to shareholders of £500,000 of ordinary capital. After certain minor readjustments, the issued capital will consist of £750,000 in 4½ per cent preference shares and £750,000 in ordinary shares, the authorised capital remaining unchanged at £2,500,000. The operation has attracted some attention in the City, partly because a return of capital by a banking institution is so rare an occurrence, and partly because it follows so closely on the heels of the death of Mr J. P. Morgan, who was a director of the London associate. It is evident, however, that the decision to reduce the capital must have been taken some time before the latter event. The capital to be returned is, in fact, described quite simply as surplus to current requirements. A previous return of capital, in fact was made in 1939. Like many other first-class acceptance houses, Morgan, Grenfell have been somewhat less active since war began.

The market assumes that this means its own quotation, but it is less concerned with the amount of payment than with the larger implications of the acquisition by the Government of an important aircraft works. Shorts have a reputation at least for building flying-boats. There appears to be no provision for returning the control of the company to the public after the war. Investors in other competing concerns naturally ask themselves whether the Government will continue to run this new acquisition after the war in competition—probably subsidised competition—with the concerns in which they are interested. They, and industrialists and investors in general, are also anxious to know whether this extreme step is quite exceptional, or whether it represents a new technique. The indications are that the former is the case. But there has been no public statement on the subject. It is very desirable, things having come to this pass, that Shorts shareholders should be informed of their fate as soon as possible and that investors in general should be put in possession of the official view of the whole transaction.

During the week, the Stock Exchange held its fourth wartime election for the Committee. There were 35 candidates, of whom 27 were retiring members, for the 30 seats. All the old members were re-elected and the house accurately assessed the chances of the remaining candidates. There were the usual minor fluctuations in the proportion of votes received by the principal officials, but the feature of the ballot was the fact that as many as 1,140 papers were completed, a record for recent years, although there is no great controversy in the air and none of the new candidates was outstandingly popular. In so far as this may reflect an increased interest in the affairs of the market, it is welcome. There were the usual discussions as to the method of voting, which is that members must vote for not less than 25 and not more than 30 members. This type of voting results in many votes being cast for members of whom the voter knows little. This is clearly undesirable, but it is difficult to solve the problem, and a study of the actual votes received does not suggest that the actual composition of the committee would have been different under another system.

It is extremely disappointing to shareholders in Great Boulder Proprietary that nothing has so far come of the hopes expressed some months ago by Mr Manning, the new liquidator. On Monday last, Mr Justice Bennett continued the hearing of an application that the liquidator should summon a meeting of shareholders to appoint directors and effect a stay of all further proceedings in the voluntary winding-up. The application was not granted but is to stand over for three weeks, on the understanding that an attempt is to be made to get any of the various interests engaged together with a view to appointing directors who shall be acceptable, if Mr Justice Bennett is correctly reported, to *the majority of the shareholders*. It seems that the intention is that an independent board should be elected, but, if the accepted version that the de Bernales group control the majority of the votes is accurate, it is not clear what the next step will be. So far, all efforts to secure agreement on a board have failed. But if the Court is able, and willing, to put control of the company in the hands of a minority in value which represents a majority in number, some real progress may be possible.

It is probably a coincidence that the recommendations of the Chartered Accountants have been followed at an interval of ten days by the presentation of the accounts of Harding Tilton and Hartley, makers of the Van Heusen products. It is certainly not a coincidence that they faithfully implement the recommendations, and, it may be hoped, forecast others. It would be strange if they did not, for Mr F. R. M. de Paula, joint managing director of the company, is vice-chairman of the Taxation and Finance Committee of the Institute which is, presumably, responsible for the recommendations. It was pointed out in *The Economist* of March 28, 1942, that these accounts were a model to be followed, even if they still fell short of perfection. This year there are two improvements. The itemisation of fixed assets has been carried a step further by stating separately freehold land and buildings. It was

As suggested in the discussion of the preliminary statement in *The Economist* of March 6th, the full accounts of *Cammell Laird* for 1942 reveal a rise in total profits from £248,980 to £275,001. This is more than accounted for by a higher trading profit of £144,882 against £106,929,

Write for particulars to H. O. Leach (General Manager for British Isles)
SUN OF CANADA HOUSE, PALL MALL EAST, LONDON, S.W.1

struck after provisions for tax, deferred repairs and contingencies, investment income having declined from £141,770 to £129,834. The allocation to deferred repairs reserve is raised from £40,000 to £60,000, and after distributing the usual 10 per cent ordinary dividend, £100,000 is once more placed to general reserve. The higher earnings clearly arise from a much expanded output, only partially reflected in the balance-sheet. Stock and work in progress are doubled at £1,473,750 but, since this is struck after deducting instalments received, the actual position is obscure. Cash, however, has risen from £374,786 to £638,422, although debtors have declined slightly. Creditors, including tax, deferred repairs and contingency provisions, stand at £3,198,870 against some £2,553,000. Investments in Government securities and tax certificates total £800,000, comparing with the previous year's sum of £886,700 in loans to municipal authorities and Government stocks. Excluding the *Metropolitan Cammell and English Steel Corporation* holdings, net liquid assets have increased from £607,893 to £725,888. The latter company's total profit, struck on the same basis as the parent's figure, is up from £662,347 to £708,958. Comparison with the previous year's report indicates that £200,000 was placed to deferred repairs reserve before reaching the profit figure, but this year the appropriation is not disclosed. The deferred dividend is repeated at 17½ per cent tax free, covered by earnings of 22.0 against 17.9 per cent, also tax free, after which the carry forward is raised some £50,000 to £157,735. The balance-sheet shows cash has doubled at £3,068,642, while both debtors and stocks are about £200,000 higher at £3,381,365 and £5,411,778 respectively. Excluding inter-company items, creditors have risen some £1,630,000 to £9,563,223, net liquid assets now totalling £1,986,953 against £1,667,427. For both companies the immediate prospects are good, demand for their products doubtless exceeding their productive capacity, and while profits may increase to a limited extent, it is highly important that the available resources be conserved. At 9s. ex dividend the 5s. ordinary stock of *Cammell Laird* yields £5 11s. 1d.

'Baldwins' Accounts

It is unfortunate that the latest profits of *Baldwins* and of the wholly owned subsidiary, *Guest Keen Baldwins*, do not reveal the appropriation for deferred repairs. As the following table indicates, the accounts show a rise in income from £316,645 to £330,939 in 1942. The adjustment of the 1941 figures in the 1942 accounts shows that this allocation was £25,000 in 1941. In the accounts of *Guest Keen*

	Years ending December 31,		
	1940	1941	1942
Profits after tax	*360,411	316,645	330,939
Fees	5,863	5,840	5,863
Depreciation	*150,000	125,000	140,000
Preference dividends	59,150	51,312	51,179
Ordinary stock :—			
Earned	145,398	134,493	133,897
Paid	144,487	124,737	124,737
Earned %	10.1	10.8	10.7
Paid %	10	10	10

Carry forward..... 44,516 54,272 63,431

* These figures include an undisclosed amount for deferred repairs. The allocation for this purpose was £25,000 in 1941.

Baldwins, there is a discrepancy of £50,000 arising from the same cause, the latest profits of £661,043 comparing with £626,950. It is thus impossible to obtain a true comparison of gross earnings, but the effect of this juggling on equity earnings is nil. In the case of the parent company, there is a fall of 0.1 per cent to 10.7 per cent in the cover for the 10 per cent ordinary dividend and the carry forward is raised from £54,272 to £63,431. The vice-chairman,

Mr J. B. Neilson, states that the group has actually increased its output and range of alloy steels, and *Baldwins* balance sheet shows higher debtors and creditors with stocks stable. Net liquid assets have expanded slightly from £1,800,273 to £1,853,434, but net loans from subsidiaries of £66,093 have replaced net loans to subsidiaries of £14,066. The balance sheet of *Guest Keen Baldwins* shows a certain reduction in debtors and creditors, but it is fairly certain that for the group as a whole turnover has risen. Mr Neilson indicates that the subsidiary mainly concerned with the output of light alloys will be merged with the parent during the current period. The 4s. ordinary shares of *Baldwins*, at 6s. 1½d. ex dividend, offer a return of £6 10s. 7d. per cent, suggesting considerable doubts as to post-war maintenance of current results.

Shipbuilding Profits

The report of Swan, Hunter and Wigham Richardson for 1942 shows a sharp improvement in profits after tax and EPT from £397,995 to £446,014. After meeting the preference dividends and doubling the allocation to pension fund at £50,000, equity earnings for the 10 per cent dividend, unchanged from the previous year, have risen from £240,345 to £300,628, that is a rise from 18.1 to 25.1 per cent on the ordinary capital. The additional cover permits an increase of £55,000 to £125,000 in the transfer to reserve account, and a small addition of some £4,500 to the carry forward at £37,658. According to the chairman, Mr C. S. Swan, these results bear no relation to the actual work done, and in view of the company's none too favourable EPT standard, it is clear that the actual working capital must have been considerably expanded to achieve such net earnings. It is noteworthy that the expenditure on plant last year at £98,337 was more than double the previous year's outlay, while depreciation provision has been raised some £12,400 to £46,147. Stocks are little higher at £282,445. A contraction in cash from £714,786 to £558,174 is accompanied by a sharp reduction in bills receivable and a fall in debtors from £830,438 to £766,142. A new item is a holding of £300,000 in tax reserve certificates, while government stocks are some £50,000 higher at £659,211. Despite an increase of some £200,000 in creditors to £1,946,938, net liquid assets are some £235,000 up at £1,175,674. The current price of 38s. for the £1 ordinary shares is partly the result of recent optimistic hopes regarding the company's final distribution. The yield of £5 6s. appears relatively low in view of the post-war prospects of the shipbuilding industry, and is certainly below that obtainable on many heavy industrial stocks whose future prospects are not less uncertain.

London Brick Report

As was to be expected, there was a serious decline in the 1942 profits of *London Brick*, after tax except tax on dividends, from £386,210 to £298,467. There is no transfer for depreciation, against £100,000 in the three previous years, but the company is obliged to provide £35,757 against nil for war damage insurance. Last year, the 10 per cent ordinary dividend was covered by earnings of 12.8 against 15.1 per cent, and the allocation of £25,000, against £50,000, to reserve brings this fund to a total of £475,000. The reason for the decline in profits is, as the directors point out, both the falling demand for bricks, which was already apparent at the end of 1941, and the zoning scheme, which has eliminated long-distance deliveries. Building activity is, of course, still declining. Such construction as is still being undertaken on Government account has failed to compensate for the exceptional spurt of 1940 and early 1941. Whether or not there will be a substantial recovery before the end of the war depends upon whether the Government decides in the near future to proceed with an agricultural rehousing plan. The post-war outlook remains highly encouraging. The reduction in deliveries last year is reflected in the balance-sheet by a rise in stocks from £236,201 to £440,314, financed by a reduction of cash items from £1,150,432 to £923,175, including the elimination of the £150,000 interest-free loan to the Treasury. Creditors and debtors are both slightly higher, and there is a rise in net liquid assets from £973,605 to £1,014,777. The directors announce the acquisition of the works of the Grovebury Brickworks. The value of this property appears,

however, to be approximately offset in the balance-sheet by sales and requisitions. Total fixed assets now stand at £1,850,831 against £1,848,520, while total reserves and surplus amount to £580,970 against £553,390. The £1 ordinary stock, at 55s. ex dividend, yields £3 12s. 9d. per cent—a level which shows that the market takes an optimistic view of the present setback.

Two Motor Results

The reports of *Humber* and *Vauxhall Motors* for the years ended July 31, and December 31, 1942, respectively, suggest that the motor industry as a whole may have shared in the general recovery in earnings which took place among heavy industrial and aircraft companies. Profits, in both cases after all tax but before depreciation, rose from 1938, 377 to £203,437 for *Humber* and from £897,378 to £198,377 for *Vauxhall Motors*. The latter concern is now paying EPT for the first time. In both cases, equity earnings were higher. *Vauxhall* decreased depreciation from £417,290 to £396,769—the management is to be congratulated on disclosing this provision, which was concealed in the previous year. The ordinary dividend is maintained at the previous year. The ordinary dividend is raised from 15 per cent, covered by the considerable surplus of 60.1 per cent, against 51.9 per cent, and the carry forward is raised from £1,859,736 to £2,198,421. The management of *Humber* has decided to restore the deferred dividend from 10 to 15 per cent, paid in 1939, and covered by earnings of 73.1 against 42.1 per cent. There is no transfer, against £20,000, to buildings reserve, but general reserve receives £40,000 against nil, and the carry forward is slightly higher at £159,588 against £158,052. The directors of *Vauxhall* state that the reason for the rise in profits is a very marked increase in turnover, coupled with strict control of costs, and there can be little doubt that this also explains the *Humber* experience. Both balance-sheets show in the higher figures of liquid assets that business was on a larger scale last year, though the chairman of *Vauxhall*, Mr Leslie Walton, points out that the inability to increase fixed assets is also a partial explanation of the rise in cash items. Net liquid assets of this concern are up from £1,102,373 to £2,084,948. In the case of *Humber*, the expansion appears to have placed a certain strain on cash resources, and the surplus of current items is reduced from £298,223 to the level of £186,707. Both companies show a small rise in stocks. Managements are wise to conserve for reconstruction the wide margins between free earnings and dividends. The £1 6 per cent preference stock of *Vauxhall* ends at 21s. 9d. ex dividend, yields £5 10s. 4d. per cent; the 15 per cent 10s. preferred ordinary shares of *Humber* at 20s. yield £7 15s. 10d. per cent.

Higher Courage Dividend

The rise in profits of *Courage* in 1942 was not unexpected. Total income, after expenses, depreciation and tax, except tax on dividends, is up from £404,133 to £432,783. After meeting prior charges, there is £262,554 against £225,872 for equity capital, and the directors have decided to raise the final dividend by 1 per cent to 10 per cent, making 15 against 14 per cent for the year. Rebuilding reserve receives £20,000 more at £50,000; contingencies £25,000 against £20,425, and the carry forward is slightly higher at £101,332. The rate of cover for the ordinary payment is up from 22.1 to 27.0 per cent. These results can only have been realised by fully maintaining, if not expanding, turnover. There is no indication as to whether the rise in overall costs was checked last year, but it is possible that the saving from the further reduction in gravity of beer has more than compensated for the increase in labour and transport charges. In any case, the balance sheet shows that, in port terms, the stocks are actually higher at £345,846 against £293,974. There is a slight contraction in debtors, but an increase in creditors from £938,791 to £1,292,971, which has helped to finance a rise in investments of some £150,000 to £451,865 and the acquisition of £500,000 of tax reserve certificates at the cost of a reduction of only some £107,000 in cash to £213,096. A footnote to the balance sheet points out that adjustment in the value of certain assets, presumably fixed assets damaged by bombing, may eventually be required. For this purpose, the company holds a rebuilding reserve of £180,000 after the latest transfer from profits. Total reserves and surplus amount to £1,030,387. The £1 ordinary stock at 72s. ex dividend yields £4 3s. 4d. per cent.

Electric Power Profits

The veil which the absence for the duration of accounts published by the electricity supply undertakings has cast over their operations is only partly lifted by the reports of the holding companies. Of these, the results of four leading concerns with a wide geographical spread are analysed in the following table. The receipts of the holding companies showed little change last year. In two cases, there was a modest rise in equity earnings and in two cases a small decline. One company, *British Power and Light*, has restored the ordinary dividend to the 7 per cent paid in the three years 1937-39. It is clear, however, from such consolidated figures as are available that gross income rose very substantially in 1942 and that the revenue figures of the holding companies themselves by no means tell the whole story. Consolidated revenue of the *British Power and Light* group rose from £1,690,649 to £2,025,810 and total income, after operating and management costs, from £605,163 to £703,997. The greater part of this increase is eliminated by taxation, which, as the chairman, Mr C. E. Benson, points out, now amounts to 70 per cent of trading profit. The

* Struck before tax on dividends received by *British Power & Light*.

story is similar for *Scottish Power*, whose consolidated income rose from £977,046 to £1,032,675, and for *Midland Counties Electric*, which earned consolidated revenue of £1,412,450 against £1,223,848. In both cases, higher taxation absorbed the increase. Mr W. Shearer's speech at the meeting of *Midland Counties Electric*, although mainly devoted to special pleading for the continued freedom of the industry from state control, provided some facts about the development of business. Thanks to the influence of the campaign to save fuel, domestic consumption has been strictly controlled. The rising use of electrical power has come entirely from industry, and to a considerable extent from new industry which may be expected to maintain its demand after the war. The concern has been able to reduce consumption charges in two consecutive years. This is a welcome policy on which the management is to be congratulated, influencing as it does the whole structure of industrial costs and prices and forming a check to the upward movement of price levels. Yields on the ordinary stocks of the holding concerns range around the sound level of £4 per cent.

Chain Store Setback

The past year witnessed a minor decline in the trading profit of *British Home Stores* from £176,306 to £168,500, of which taxation required only £91,000 against £98,750. War Damage Act premiums were virtually £6,000 lower at £3,666, while interest on loans accounted for a mere £694 against £5,801. As a result of these savings, the board has been able to write off out of profits £7,785 on account of ARP expenditure, while earnings for the ordinary shares, which again receive 25 per cent, have risen from £24,319 to £28,951; equivalent to 42.8 against 36.0 per cent on the ordinary capital. The transfer to general reserve is doubled at £10,000, while the carry forward is raised some £2,000 to £19,521. A decline in stocks from £585,082 to £522,069 is largely accounted for by the fact that utility

goods are free of purchase tax, but cash is almost £30,000 higher at £163,399. Taxation reserve is considerably reduced from £171,683 to £113,432, while a contraction in both debtors and creditors reflects the reduced turnover. There is, however, an improvement in the liquid position of the concern, surplus assets now totalling £311,422 against £271,372. In view of the existing difficulties both of staff and supply, these results are not unsatisfactory. According to the chairman, Mr H. Moore, the food and catering departments are contributing their full quota to the year's results, while he approves of the introduction of utility lines, which have found increasing favour with the public. In connection with his company's proposals for the acquisition of Green Shops, it is now known that a considerable proportion of the latter company's shareholders has accepted the offer. While any advantages accruing from the merger will not be apparent in the immediate future, there is no reason why in the long run this expansion of British Home Stores' interests should not be mutually beneficial. Some indication of the company's future prospects is reflected in the current price of 9s. 1½d. for the 1s. ordinary shares, yielding only £2 15s. 6d.

Finance for Copper

It has been apparent for some time that the supply of copper to the United Nations, like that of some other commodities is less than sufficient to meet all requirements, and it is, therefore, not surprising to learn that the output of Rhodesia is to be increased. That being so, it is perhaps

natural that Nchanga Consolidated, whose development programme had been somewhat curtailed by war conditions, should be the mine chosen to expand. It is now proposed to raise £1,500,000, of which half will be in the form of a grant from the Ministry of Supply. The remainder will be provided by the issue of 412,696 £1 shares of the company at 28s. 6d. These are to be offered to Nchanga shareholders at the rate of four new shares for every £25 of ordinary stock held. The two principal holders are Rhokana Corporation and Rhodesian Anglo-American. The former is barred from subscribing itself, but its independent shareholders may apply for one new share in Nchanga for every £14 ordinary stock held in Rhokana. This gives them, individually, almost exactly the interest they would have held, collectively, had Rhokana applied. Actually these applications will be satisfied from the allotment to Rhodesian Anglo-American, and if all Rhokana shareholders exercise their right, and it is a valuable one with Nchanga standing over 31s., the "Rhoanglo" allotment will be exhausted. That company, together with Industrial Finance and Investment Corporation, is guaranteeing the issue for 1s. per share commission. Thus it is designed that all the shares to be issued should go to outside shareholders of ordinary capital in Nchanga and Rhokana. This appears to be the reverse of the usual Treasury policy, which tends to concentrate applications in few hands, but it is probably inevitable owing to the fact that the group is fully invested. Nchanga has, so far, paid no dividend. It is not clear how this particular type of finance, involving as it does official assistance, will affect the EPT position.

Industry and Trade

Growing Industries

Like Sir Kingsley Wood in the House of Commons on February 2nd, Mr Churchill, in his broadcast address last Sunday, gave an encouraging account of the industrial prospect. The Chancellor of the Exchequer singled out the chemistry of oil, plastics, light alloys and the processing of foodstuffs as examples of industries offering scope for rapid development. Mr Churchill mentioned the "ceaseless improvements" in wireless and the "wonders of radio-location"; he pointed to the "striking advances" open for both gas and electricity as the servants of industry, agriculture and the cottage home; he listed building, forestry, civil aviation and transportation in all its forms as industries providing "gigantic opportunities which, if used, will in time increase our power to serve other countries with the goods they want." The Prime Minister's list of the possibilities of industrial progress and expansion is certainly encouraging. But the opportunities must be seized, the possibilities must be turned into reality. The "intense demand," at home and abroad, for consumable goods, such as clothes, furniture and textiles, immediately after the war must not lull British industry into a sense of false security. Such a re-stocking movement is likely to be short-lived. A concentrated effort will be needed to put post-war expansion on a solid basis of efficiency and enterprise.

Statement of Aims

During the debate on the Air Estimates on March 11th Sir Archibald Sinclair made an important statement about the future of civil aviation on behalf of the War Cabinet. He said:—

Whatever form of international collaboration may be devised for postwar civil air transport, it will clearly be the duty of this country, both from our own and from an international point of view, to play a prominent part in the production and operation of civil aircraft.

Sir Archibald went on to say that the exploratory work is already in hand. Preliminary consultations are being held with the Dominions and India and the crucial discussions with other members of the United Nations are to follow. So far as the provision of aircraft is concerned, Sir Archibald pointed out that the Brabazon Committee had recommended that work should start immediately on the design of civil aircraft of new types and on preparing for the conversion of military aircraft. He felt confident that aircraft manufacture, now the largest industry, can make a real contribution to the development of civil air transport, and he agreed that the first thing to be done is to take the

necessary steps to provide aircraft of the types that will be required after the war for passenger and goods transport. Sir Archibald's statement on aims at least suggests that the Government is alive to Great Britain's need to play an important part in what is likely to be a rapidly growing industry after the war. At present the time and skill that can be devoted to this end is necessarily limited; but within these limits preparations should be pushed ahead as rapidly as possible. At the moment, the future relationship between state, public corporation and private enterprise in civil aviation seems no nearer a decision than the relationship between the nations in this field. Four directors of British Overseas Airways, including the chairman and the director-general, have resigned because they believe that the proposed arrangements for civil traffic on trunk routes under the new RAF Transport Command do not afford sufficient guarantees to the Corporation either for the present or for the future. The time for some explicit statement of the Government's design for post-war flying—and (in view of the purchase of Short's shares, discussed on page 400) for post-war aircraft manufacture—is more than ripe.

Higher Wages for Engineers

On Friday last week the National Arbitration Tribunal made the award on the claim of the engineering unions. The claim was for an 11s. a week all-round increase in basic rates, for an increase equivalent to 33½ per cent of basic rates to all plain-time workers, and for the restoration of overtime rates and other conditions which were amended twelve years ago. The employers went part of the way by offering to add 6s. a week in the form of bonus to the earnings of plain-time workers, and a corresponding readjustment of the earnings of the lower-paid piece-workers, and a consolidation of 20s. of the bonus with the basic rates, but with an adjustment of piece-rates designed to leave the earnings of the more highly paid piece-workers broadly unchanged. The Tribunal awarded an additional 6s. a week to the bonus of plain time workers, a consolidation of 20s. of the bonus with the basic rates, and an adjustment of piece-work rates and "bonus and basic times" to enable a worker of "average ability" to earn at least 27½ per cent over basic rates; an increase of 2½ per cent over the previous minimum. These formulae are all very complicated. Broadly, it means that time workers will receive an additional 6s. a week and that their overtime and other special earnings will in future be calculated on higher basic rates. Piece-workers will obtain a somewhat higher percentage of a higher b

rate. The advance in the rates of pay for engineers, already among the most highly paid occupations, will inevitably bring a crop of claims from other industries. The three railway unions have already tabled a demand for a further 10s. a week; other claims are pending, and more will follow. Meanwhile the stock of consumable goods is shrinking.

More Combined Committees

Following the formation of the Combined Steel Committee in December, 1942, and of the Combined Copper Committee last February, two new combined materials committees, the one dealing with rubber, the other with aluminium, have now been formed. The new committees, like the two earlier ones, are fact-finding and advisory bodies on matters not already dealt with by the Combined Raw Materials and Production and Resources Boards. Both rubber and aluminium are important and scarce, but the conditions of supply are different. The root of the present rubber supply difficulties is the loss of the rich Pacific producing areas, which until the end of 1942 supplied some 90 per cent of world production. The large stockpile of natural rubber accumulated by the United States and British Governments since the middle of 1940 have so far prevented a serious rubber crisis, but stocks are reported to be declining fast. In spite of strenuous efforts to increase production, the annual rate of supply to the United Nations, according to a statement of Mr Eric McFadyen at the annual meeting of the Rubber Plantations Investment Trust last week, is under 200,000 tons. The production of synthetic rubber undertaken by the United States is now making more rapid headway following a slow start. According to a statement by Mr Donald Nelson, chairman of the War Production Board, a special interim plan has recently been approved. This aims at raising the annual Buna-S capacity by mid-July to 435,000 short tons. After the completion of this interim scheme the remainder of the synthetic rubber programme, involving an annual capacity of more than 600,000 tons, is to be completed in balance with the other war production schedules. The new supplies of both natural and synthetic rubber at present in sight represent the minimum of urgent requirements. The main cause of the aluminium shortage is the very great speed with which the Allied aeroplane construction programme has been expanded. The North American aluminium production schedules have been regularly adjusted to these programmes, but there is a time-lag between the adoption of construction programmes and the start of operations in the new plants. Nevertheless, the rate at which Allied supplies of aluminium is increasing is a very encouraging one. There are no detailed figures for United Kingdom supplies, but according to the last annual report of the United States War Production Board, that country's aluminium supply at the end of 1942 was running at an annual rate of 1,027,000 short tons, against one of 409,500 tons a year earlier, and before the end of this year supplies will reach 1,339,000 tons per annum. Current allocations to United States war factories suggest that the present rate of supplies (of which about one-tenth is produced in Canada by plants financed by the U.S. Government) is already approaching 1,200,000 short tons per annum. This figure may be almost twice as large as total Axis supplies, but to meet the growing requirements still larger supplies are needed.

Holidays at Home

The Government has decided that industrial workers are to get one week's holiday this year, in addition to the Bank Holidays and the Saturdays preceding them. Wherever possible holidays should be staggered, in order to avoid dislocating production; firms are asked to consult with the Regional Boards of the Ministry of Production and the Regional Transport Commissioners in their areas. After four years of war, the need for a complete break is greater than ever, especially as hours are still very long in some factories, in spite of some improvements. Fortunately, the winter has been mild, so that sickness has probably been less than it might otherwise have been. This year, as last year, people are being asked to spend their holidays at home to avoid congesting the railways, and no extra travelling facilities will be provided. Fortunately many of our large industrial centres are within reach of moorland. The Central Council of Recreative Physical Training organised some highly successful holiday camps for war workers last

year, within cycling distance of their homes, at a low cost and with minimum catering difficulties. Thus camps were organised in the Thames Valley for war workers from Slough; on the Yorkshire moors for workers from the West Riding; on the Roman wall for those from Durham factories and Tyneside shipyards; and a further extension of these camps is planned this year. At the same time, some local authorities, such as Huddersfield, Sheffield, and Liverpool, led the way in organising holidays at home; they arranged excursions and entertainments, while such firms as Messrs Cadbury provided facilities within their own grounds. The experience of last year showed that holidays at home can be made attractive and provide rest and variety.

Lower War Damage Premiums

In view of the lull in air raids, the Government has decided to reduce the rates of premium payable under two of the three schemes introduced by the War Damage Act—the compulsory "business" scheme for the insurance of plant, machinery and business equipment and the voluntary "private chattels" scheme for the insurance of furniture and personal belongings. The rate of premiums under the business scheme has been reduced from £1 in every £100 insured during the year ended September, 1942, to 15s. during the year ended September, 1943. Last week, the Board of Trade announced the Government's decision to halve the rates of premium payable under the private chattels scheme; the new annual rates which will apply to all policies beginning on or after March 18th will be 10s. for every £100 insured on the first £2,000, 15s. on the next £1,000 and 20s. on the next £7,000. These adjustments are timely; they are a reflection of the lessened risks.

More Paper Restrictions

Sizes of note paper, cheques and dividend warrants have been limited by a Ministry of Supply Order, the Control of Paper (No. 59) Order (SR and O, 1943, No. 406), which came into force on March 22nd. It is somewhat surprising that this step was not taken earlier. Some business firms still exchange letters written on sheets as large as 10 inches by 8 inches, although voluntary efforts have cut down the consumption of paper. In future, headed note paper must not exceed 57 square inches (8 by 7½ inches). Cheques are limited to about 18 square inches, with an additional 1.5 square inches for cheques requiring more than one signature. Some banks have already adopted smaller cheques than the maximum now permitted, and others have saved by eliminating the separate counterfoil to each cheque. Dividend warrants or tax deduction forms may not exceed 21 square inches each. Paper used for company reports, accounts, and so on, is also limited in amount. It should have been possible to extend the range of limitation on the size of paper to all forms in commercial use, for example, invoices, accounts, and receipts.

Liverpool Steam Ship Owners

The annual report of the Liverpool Steam Ship Owners' Association, published this week, lends its authority in support of the convoy system. In the light of the evidence available to the association, the system has again proved the most effective method of defence against submarine attack, "provided there is available the full protection which is the essential feature of the system." The way to break the back of the campaign is to provide better protection, more and stronger surface escorts, and more air cover. Like the report of the Chamber of Shipping, that of the Association expresses concern about the depletion of its capital assets; it urges that the shipping industry should be given a reasonable opportunity to accumulate funds which will be needed to restore it to its former strength. The report criticises the EPT rules governing the treatment of lost capital assets which are bearing harshly on shipping companies. Thus, when a ship is lost, the owner's profit standard is reduced by a percentage on the capital value of the lost ship; if he can acquire a new ship, the new asset takes the place of the old one for EPT purposes; but if he cannot do so then the insurance money which he has received does not rank as an asset employed in the business. The loss of a ship that cannot be replaced thus lowers the EPT standard of its owner. In other words, the more ships an owner loses the harsher is the effect of EPT under these rules.

COMPANY MEETINGS

EQUITY AND LAW LIFE ASSURANCE SOCIETY

SATISFACTORY RESULTS

WAR RISK COVER TO CIVILIANS

SIR GEOFFREY ELLIS'S SPEECH

The annual general meeting of Equity and Law Life Assurance Society was held on March 25, 1943, at the Law Society's Hall, Bell Yard, London, W.C.2. Sir Geoffrey Ellis, Bart., M.P. (chairman), presided.

The chairman, in moving the adoption of the report and accounts, said:—

Gentlemen,—I rise to move "that the report and accounts for the year ending December 31, 1942, be received and adopted and entered on the Minutes." These have been in your hands for some days and, I assume, may be taken as read.

NEW SUMS ASSURED

The new sums assured placed on the books during the year amounted to £636,086, and the new annual premiums to £30,293; both figures are after deducting reinsurance: annuity considerations amounted to £297,575. All these figures show definite increases over the corresponding amounts for last year, and we have every reason to be satisfied with the quality of the business.

In connection with our new business, there are two retirements from our staff to which I wish to refer. Mr. Christy-Clarke, the manager of our Head Office Branch, is retiring at the end of this month after almost sixty years' work in the insurance world. Mr. Christy-Clarke has remained with us during the war long after the normal retirement age, and for this help and also for his long and faithful service to the Society we thank him. Mr. Gosnell, our branch manager at Croydon, retired at the end of 1942, after nearly fifty years' work in insurance. We are pleased to see both these gentlemen here to-day and we wish them every happiness in their well-earned retirement.

STAFF PROBLEMS

The war has created for us a number of staff problems, and I think that the following facts may be of interest to you. During the spring of 1939 40 per cent. of the clerical staff at head office joined the Territorial Army and were called up during the August and September of that year. The process of releasing men and women for the Forces has continued throughout the war, and only 30 per cent. of our original head office staff remain. We have met this strain by longer hours of work, by the engaging of temporary staff, and by the temporary closing of a large number of our branches. Many of our branch managers are now carrying out very responsible duties at head office, and the total staff employed at our branches is now one-third of our peacetime level.

You will see, therefore, that during the last four years your Society has made every effort to release staff to serve in various capacities; but I would add two comments—first, it is the earnest endeavour of those who remain to give to all who do business with us the best possible wartime service, and secondly, we feel that a Society such as ours has a very real part to play in encouraging saving, and in the smooth financial running of the country.

MORTALITY CLOSE TO EXPECTATIONS

The mortality experienced during the contribution was very close to actuarial expectation; in respect of annuities it was slightly

less favourable, and in respect of Assurances slightly more favourable than expected—the one balancing the other. We hope that mortality will again be favourable this year, but we must bear in mind the possibility of severe fighting.

The revenue accounts present no unusual features, but I would call your attention to surrenders, which were satisfactorily low both in amount and in number of policies.

HOLDING OF BRITISH GOVERNMENT SECURITIES

The balance-sheet shows a continuance of the investment policy which I mentioned in my remarks last year, and you will observe that our holding of British Government securities now amounts to more than £6,000,000—an increase of over £4,000,000 since the outbreak of war.

I do not propose now to refer in detail either to our investment policy or financial position; a triennial valuation falls to be made as at the end of this year and will provide a suitable occasion for fuller comment. I will say, however, that the satisfactory trend referred to last year continues. In this connection I must emphasise—and I have made this point in both my previous speeches to you—that it is the primary concern of your directors to strengthen the Society's valuation reserves.

WAR RISK COVER TO CIVILIANS

I want to conclude by referring to a subject which has received some publicity recently—the granting of war risk cover to civilians. Since the spring of 1940 your Society has granted such cover under new whole life and endowment assurances without additional charge. There has been a plea in the press for the issue of policies covering the risk of death from air raids only. It would be difficult to find circumstances in which an individual would require cover against air raid risks without at the same time requiring cover against the risk of death from normal causes. The only obvious case is that of a man who already has an ordinary policy excluding the risk of death from air raids. For this reason your Society has felt, and feels, that it is offering the best service to the public by including war risk cover for civilians, in normal cases, under its ordinary whole life and endowment assurance policies.

I would remind you that the vast majority of policies existing as at September 3, 1939, are free from all restrictions and thus cover not only risks to civilians from air raids, but also all the risks run by men serving with H.M. Forces.

TRIBUTE TO STAFF

The war depletion of our staff has rendered the work of our senior officers particularly difficult and has often necessitated very long hours. Our thanks are therefore due in greater degree than ever to Mr. Kirton, our general manager, Mr. Haynes, our actuary and secretary, and Mr. Whyte, our investment manager.

To our staff in general I would like to say "thank you" and "well done" for another year's good work in a very difficult time.

The report and accounts were adopted.

BRITISH INSULATED CABLES, LIMITED

PROFIT MOTIVE VERSUS PROFITEERING

The forty-seventh ordinary general meeting of this company will be held, on the 1st proximo, in Liverpool.

The following are extracts from the statement of the chairman, Sir Alexander Roger K.C.I.E., circulated with the report and accounts for the year ended December 31, 1942:—Profit on trading, dividends on investments, etc., after making provision for taxation and contingent reserves adjustment have increased by £20,722 to £831,107, but as depreciation and other charges absorb £10,890 more than in 1941, the net profit available from the year is only £9,822 higher at £557,180. Due to the effect of higher costs and the heavy incidence of taxation, the results only partially reflect the output achieved during 1942.

THREE ESSENTIALS

As I see it, a manufacturing concern should have three main motives, namely: (1) to produce goods of the highest quality by the most efficient means; (2) to pay an equitable remuneration to all employees and to assist them, or their dependents, after their service with the company has ended; and (3) to earn a reasonable profit for shareholders on the capital invested in the business.

The results of numerous investigations rightly made into our figures since the war, the trust and confidence placed in the company by Government Departments, and the production we have achieved prove that under existing conditions your company are fulfilling motive number (1). The same claim, we are confident, will be justified under more normal conditions.

With regard to (2), we have a loyal team of employees, all of whom are equitably remunerated whilst in the company's service. Furthermore, in the case of staff, a pension fund was created as long ago as 1916.

Although many factors exist to render difficult the operation of a similar pension fund for workpeople, the building up of the "provident fund for workpeople" will permit us to do even more than hitherto for our retired workpeople and their dependents.

Motive (3) involves what is commonly known as the "profit motive," a subject of much adverse and misplaced criticism. What the critics are tilting at is "profiteering," and this confusion of thought should be removed. There is a vast difference between the profiteering motive and the profit motive. Take the case of your own company. Over 50 years ago a few adventurers pooled their very limited financial resources to embark on the manufacture of an entirely new design of cables—a risky business. On more than one occasion money even had to be borrowed to pay the weekly wages, but the pioneering spirit of private enterprise persisted, and ultimately a reasonable return was earned. Original shareholders, if there be any, have benefited from this profit-motive policy, but surely, to an infinitely greater degree benefit has accrued to the common good. I think I am entitled to add that these beneficial results have not been disproportionately shared.

A WELL TRIED SYSTEM

It would be ridiculous to claim that the capitalist system is faultless, but I do claim emphatically that it has enormous advantages over any other economic system yet tried. Virtually every person in Britain to-day has become a capitalist, and to talk of the abolition of capital is to use a form of words which is meaningless. I would add another thought: the social security which is so dearly desired by all men to-day depends on the universal acceptance and practice of the profit motive, for social security in the ultimate must depend on the efforts and success of the individual.

BORAX CONSOLIDATED LIMITED

IMPROVED RESULTS

The ordinary general meeting of Borax Consolidated, Limited, was held, on the 23rd instant, at Winchester House, London, Major D. Abel Smith, M.C. (the chairman), presiding.

The following is a summary of the statement of the chairman, which was circulated with the report and accounts:—

The net profit for the year under review amounts to £367,658, representing an increase of £13,487 over last year.

We have already paid the sum of £44,000, less income tax, on the 5½ per cent. cumulative preference stock. Also an interim dividend of 3 per cent. on the preferred ordinary stock was declared on October 27, 1942, and paid on December 3, 1942, absorbing £18,000, less income tax, and we now propose the payment of a final dividend of 3 per cent. on the preferred ordinary stock, which will absorb a further £18,000, and to pay a dividend of 7½ per cent. on the deferred ordinary stock. After providing for these payments amounting, less income tax, to £88,750, and deducting £30,000 for war contingency reserve, the balance to be carried forward is £260,999, an increase of £908 on the previous year.

The war contingency reserve was raised last year by £50,000, bringing that total to £100,000, and in view of our widespread interests throughout the world we have deemed it advisable to transfer a further £30,000 to this account, bringing the total to £130,000, as a precaution against any unforeseen conditions. The following item relates to taxation reserve, against which this year's total amounts to £442,772, an increase of £92,987 on last year's figure.

MINES AND DEPOSITS

Under this heading you will notice an increase of about £69,000, accounted for mainly by the acquisition of a property previously represented by debentures in a subsidiary company; in consequence the following item "debentures at cost" has been reduced by £62,000, the balance referring to other property. The next item relates to stocks at mines, factories, warehouses and in transit. Here you will notice a further increase of nearly £248,000, which is explained by the welcome advent of the United States on the side of the Allies in December, 1941, and the consequent necessary precaution of building up stocks of all the many essential items required in connection with our widespread interests, as also by the distribution of substantial reserves of our products at strategic points, both to forestall increases in costs and to avoid dislocation of trade.

Cash, including tax reserve certificates, plus British and Foreign Government securities, totals £416,000, as compared with about £490,000 last year, a reduction due to increase of stocks just referred to.

I feel confident that you will agree that the results obtained must be regarded as eminently satisfactory. Increasing quantities of our products are now being employed for flame-proofing, and the trend to their more extensive use for vital purposes is generally apparent.

BORAX IN AGRICULTURE

The use of borax for fertiliser purposes, stimulated by the needs of the United Nations for maximum food production, continues to make steady progress, and is specially noteworthy in connection with the cultivation of alfalfa in the U.S.A. Further developments are anticipated as a result of surveys of the Boron status of the soil.

The products of the United States Potash Company enjoy a high repute, and our investment therein proves in every way satisfactory.

METROPOLITAN ELECTRIC SUPPLY COMPANY, LIMITED

POST-WAR DEVELOPMENT

The fifty-sixth ordinary general meeting of the Metropolitan Electric Supply Co., Limited, was held, on the 23rd instant, in London.

Major H. Richardson, M.C., J.P. (chairman and managing director), in the course of his speech, said that the results of the year's trading were satisfactory and the business had continued generally to increase.

The response to the appeal by the Minister of Fuel and Power for economy had shown hearty co-operation on the part of the company's consumers.

We were living in times when those who advocated public control as a cure for all human ills were producing an increasing flood of schemes and plans for the intended betterment of post-war existence. The successful business of electricity supply was very clearly included in these plans, though the terms "reconstruction" and "reorganisation," which were so freely used, were inappropriate to any schemes so far as the supply of electricity was concerned, where the essential requirement was the removal of restrictions in order to facilitate "development."

It was important that the public should appreciate the extent of the rapid development which had taken place in the provision and use of electricity which had been brought about by the energy, enthusiasm and good management of the different sections of the industry as at present constituted, in spite of restrictions placed upon it by out-of-date legislation.

With regard to the scheme emanating from the London and Home Counties Joint Electricity Authority, stockholders should not be unduly impressed by the document.

The report was unanimously adopted.

As notified in the Press, on August 12th last the United States Army authorities requisitioned the Tonopah and Tidewater Railroad. A formal protest was lodged at the time, and every necessary step taken to protect the bondholders' interests. However, the dismantling is proceeding and terms of settlement are still under negotiation. It is needless to add that the bondholders are fully secured by the guarantee of our company and that our present operations remain unaffected, as long before this requisition our mining activities were transferred to richer deposits which could be more economically worked, and were situate much nearer to our refining and shipping port.

THE FUTURE

In regard to the current year, so far as the first five months' trading enable the company to judge, there is a slight decline in the home and export figures, while the American trade continues to hold up well. When the United Nations have achieved their aim, and peace is happily restored, it is only reasonable to assume that all the countries previously supplied by us with crude and refined materials will by degrees revive their activities and seek to replenish their depleted or probably exhausted stocks with as little delay as shipping facilities permit. We look forward with confidence to our full measure of this revival in trade. The report and accounts were adopted.

THE SCOTTISH PROVIDENT INSTITUTION

INCREASED FIGURES

At the 105th annual general meeting held in Edinburgh on the 23rd ult., Mr. A. H. Bowhill, the chairman, stated that the result of the year's operations had been gratifying. The net new business, £1,125,094, the net new premium income, £47,481, the total premium income, £1,252,845, and the total funds, £25,345,772, all showed increases over the corresponding amounts for the previous year.

IMPROVED CAPITAL POSITION

The interest income represented returns of £4 18. 8d. per cent. gross and £3 18. per cent. net on the total funds, including the investment reserve fund, the effect of the Government's necessary policy of "cheap money" and high taxation having been to reduce the yield from investments. The whole of the excess income and a large proportion of the sums available for reinvestment had been invested in the new war loans. The continued rise in security values had improved the capital position and the market value of the Stock Exchange securities as at December 31st last exceeded the sum at which they stood in the balance-sheet.

The claims by death, £944,633, although including £76,000 due to the war, were less than for 1941. The fall in the amount paid on the surrender of policies continued and expenses of management were down by £15,700.

THE DISTINCTIVE SYSTEM

The call for drastic economy in manpower had led to the reduction in the number of staff to about one-third of the men and two-thirds of the women employed before the war, to the closing of branches and to the withdrawal of inspectors from agency work. Agents and members were asked to assist by recommending the institution, whose distinctive system of life assurance secures to policyholders in event of early death a very large sum assured for the premiums paid, and in event of survival beyond the qualifying period the valuable right to share in the surplus.

The report and accounts were adopted.

CITADEL OF HEALING

Last year at the Christie Hospital 4,864 new patients from all parts of England were examined, 45,223 investigations of patients were carried out and 17 Cancer Diagnostic Clinics maintained at Hospitals over a wide area. Funds are urgently needed for this work and for the extension of research into Cancer, still mankind's great scourge.

CHRISTIE CANCER HOSPITAL
HOLT RADIUM INSTITUTE

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

ALTHOUGH received with satisfaction in the markets, the actual effect of the Premier's broadcast and the first reports from Tunisia were slight. There has been a modest improvement in turnover during the past week, while some indication of the basic firmness of the markets is indicated by a new high level at 97.7 attained at the reopening by the *Financial News* ordinary share index. The *gilt edged* market was firm throughout, advances for long and short dated issues ranging from $\frac{1}{8}$ to $\frac{1}{4}$, while the 3 per cent redemption loan was prominent with a $\frac{1}{2}$ point rise. Turnover in the *foreign bond* market was generally insufficient to affect prices to any degree, although some South American issues displayed weakness. Brazilian loans, however, were harder in mid-week. *Home Rail* stocks attracted little attention this week, although quotations were fairly well maintained among the junior stocks. Several of the prior charges were marked up a $\frac{1}{4}$ point at the reopening. BA Western and Great Southern preference stocks were slightly easier this week in a generally steady *foreign rail* market, although the United of Havana 1906 debenture fell $\frac{1}{2}$ points.

The general tone of the *industrial* market was firm, main activity centring on issues with current interest, in particular radio, cinema and rayon shares. A. C. Cossor and Philco Radio were both firm on the talk of a proposed merger, while E. K. Cole advanced in sympathy. Emmies, however, were outstanding, with a net gain, after the mid-week decline, of 1s. 10d. Among Cinema shares, Gaumont British advanced 2s. and Odeon 1s. 3d. on steady inquiry. A gain of 1s. 9d. for Guinness was the feature of a slightly erratic brewery section, while among tobacco shares BATs and Gallaher were rather better. Aircraft issues turned dull on the announcement of the decision to transfer the publicly held shares of Short Bros. to the Government, although quotations were later steady. With the exception of a sharp rise of 1s. 9d. for Swan Hunter on the annual accounts, movements in the heavy industrial group seldom exceeded a few pence. Persistent demand for textile shares, in particular rayon issues, occasioned a fairly general advance throughout the section. Shipping shares were neglected, but occasional losses were insignificant. Among electrical equipment issues, British Insulated Cables rose

1s. 9d. on the annual report and the news of the proposed capital expansion. J. Barker was outstanding in the stores group with a gain of 2s. 6d., while Lewis's Investment Trust rose 1s. 6d. Among miscellaneous issues, London Brick lost 1s.; both Tunnel Cement and Radiation were firm.

After last week's buying of *Kaffir* gold mining issues, the Cape returned to the diamond market. A considerable turnover in De Beers deferred left the shares $\frac{1}{4}$ points higher on the week, while Consolidated Diamonds advanced 2s. Anglo American Investment was prominent with a rise of 2s. 9d. Gold mining shares derived strength from the Premier's broadcast, Libanon jumping 2s. and West Wit Areas $\frac{1}{2}$ point, apart from fairly widespread gains ranging from $\frac{1}{2}$ to $\frac{1}{4}$ for other issues. The *rubber* market, although not entirely devoid of changes, was idle. *Tea* shares were rather erratic, but neither losses nor gains exceeded 9d. Leading oil issues failed to attract any demand and quotations tended to slightly lower levels. Mexican Eagles, for no particular reason, advanced 1s. 9d., while Canadian Eagles improved $\frac{1}{4}$ d. in sympathy.

New York

LAST week's volume of business on Wall Street was rather below the level of recent weeks. Light selling and scattered profit taking were in general offset by occasional specialised investment demand, and early this week the Tunisian developments created a better tendency. Nevertheless, actual advances, mainly in rail, steel and rubber issues, were small.

Total share dealings: Mar. 18, 866,000; Mar. 19, 1,065,000; Mar. 20*, 484,000; Mar. 22, 851,000; Mar. 23, 1,192,000; Mar. 24, 1,161,000.

COMMODITY AND INDUSTRY NEWS

Cabinet Hardware.—The Board of Trade has made an arrangement with the Wholesale Cabinet Hardware Merchants' Association whereby the Association will centralise orders with manufacturers and arrange the distribution of hardware fittings for utility furniture. This has been done in order to ensure that designated utility furniture manufacturers, who might otherwise have difficulty in obtaining their relatively small individual requirements, will be able, through the Association, to obtain supplies of hardware fittings of a standard quality approved by the Board, at reasonable prices and without delay.

Ploughing Grant.—The grant of £2 an acre for ploughed up land which has been under grass for at least seven years was due to expire on March 31st. The Government has extended it for another year, presumably in view of the increased arable land required this year.

Shellac.—The Ministry of Supply announces that a representative of the United States Board of Economic Warfare is being sent to India to co-operate with the representative of the Ministry of Supply in the operation of the Indian Shellac Procurement Board.

public purchase of all shellac for importation into the United States and the United Kingdom will be continued and no change in the prices paid for shellac is contemplated. Defence Supplies Corporation, acting under the direction of the Board of Economic Warfare, will continue to be the sole buyer of shellac for importation into the United States.

Farm Tractors.—Farm tractors, licensed at the 5s. rate, may now be used anywhere on roads for hauling agricultural produce, or, or articles required for, any farm.

Shorter Comments

British Xylonite Co.—Consolidated trading profit of parent company and subsidiaries for 1942 £981,245 (£826,753). Tax provision £786,741 (£627,449). Company's gross income £63,492 (£74,423), ordinary dividend 10 per cent (same), carried forward £57,162 (£53,866). Consolidated balance-sheet shows tax reserve certificates £930,000 (nil).

Finance

GOVERNMENT RETURNS

For the week ended Mar. 20, 1943, total ordinary revenue was £54,513,000, against ordinary expenditure of £126,055,000, and issues to sinking funds of £192,130. Thus, including sinking fund allocations of £14,069,342, the deficit accrued since April 1st is £2,720,903,000 against £2,617,112,000 for the corresponding period a year ago.

market garden, provided the tractor is registered in the name of a person engaged in agriculture, or of a registered agricultural contractor, and is used primarily for work on land in connection with agriculture. Previously, tractors could only be used for hauling agricultural produce or requisites between one part of a farm and another, or between a farm and a railway station. The concession is a wartime measure to facilitate the lending of tractors and generally to assist in increasing food production.

Onion Distribution, 1942.—The quantities of onions delivered under the 1942 onion distribution scheme were in some cases below the amounts estimated in advance. This was due in part to disease which, particularly in one area, affected the keeping quality of the crop. The effect was that some wholesale distribution com-

mittees received less onions than it had been planned to supply to them; and in certain cases the shortfall was of sufficient proportions to prevent them supplying in full the local retailers' allocations for sale to the public.

Rubber Price.—The Ministry of Supply has recently raised its rubber selling price for ribbed smoked sheet, from 1s. 1½d. to 1s. 6d. a lb. The price was originally fixed in October, 1941. The new price has caused *The Economist* Sensitive Price Index (1935 = 100) for raw materials to rise from 172.7 to 182.3; a corresponding rise has occurred in the complete index.

Sugar for Jam.—Sugar may be bought instead of the preserves ration in the three four-weekly rationing periods from April 4th to June 26th, and 1 lb. will be allowed instead of 1 lb. of preserves. This concession is designed to enable those who grow fruit to make jam. The Minister of

Food has announced his intention to direct as much fruit as possible to jam factories, and has warned housewives not to rely on the possibility of buying fruit for jam making.

War Powers

THREE years ago, on the verge of disaster, powers were taken by the Government to use all property as well as all persons for the prosecution of the war. Today, when the danger of 1940 has been replaced by the opportunity of 1943, the need for full and efficient production is even greater. Yet, when Ministers use these and other powers to constrain this firm or that, they meet protests and suspicion in some quarters, despite widespread approval elsewhere. Why is this?

In part, these demonstrations are a function of the age of the war. It is a striking fact that after three years of fighting, there is no apathy or weariness. Restiveness there is: the restiveness of Labour that chafes against the electoral truce; and the restiveness of industry that is anxious about the post-war future. Interests and individuals are sensitive. Just as Mr Bevin finds the Conservatives in arms against his Catering Bill, Sir Stafford Cripps finds a company of doubters when he controls or takes over aircraft firms. There are accusations of bias, hints that axes are being ground, that nationalisation is being brought in by the side door and that monopoly, entrenched among the Government's advisers, is being reinforced. More widely, there is a very natural and reasonable demand for more information.

The Government's responsibility is twofold: to leave nothing undone, whatever the consequences to private persons, to win the war; and to give guarantees that

nothing is being done that is needless. The principles of action are plain enough. There should be no compunction in taking steps to maximise the war effort; no excess in the measures adopted to this end, beyond the needs of the case; no prejudice in war policies to the peacetime policies that have still to be democratically decided; and no discrimination between one interest or industry and another. Above all, there must be frankness, plain statements, when powers are used, of the reason why, and clear assurances that the future will not be compromised by the temporary devices of wartime.

When this is said, all support is due to Ministers who are acting with boldness and vigour to multiply the war output. When Sir Stafford Cripps left his Cabinet place in the making of political strategy, he was commissioned to a key tactical position, the provision of aircraft and radio. He was set to deal with the growing pains of an aircraft industry that has grown more than twentyfold since the war began, now the biggest national industry and the crucial one for victory. Several firms, through complacency, inexperience, incompetence or intransigence, were in a deplorable state. He has acted with decision. Wherever his advisers have thought fit, he has put in a Government controller to safeguard output. In one case, that of Short Brothers, he has taken over the entire shareholding and secured a new board of directors. No effort of his to place

more and better aircraft in the sky should lack national backing. The only valid complaint against such deeds would be that they were needless or wrongly directed. This is the plea of one firm, General Aircraft Limited, which alleges partisan pressure upon the Minister of Aircraft Production by the so-called aircraft "ring."

It is impossible for lay observers to give any final judgment. Whatever quibbles there may be about what constitutes a "ring," there is a circle of "approved firms," formed twenty-five years ago, not to limit competition for Government orders, but to ensure that facilities would be available for Government production. These firms still form the upper and sovereign tier of the Society of British Aircraft Constructors. The vast wartime expansion has made any privileges this group may enjoy, apart from criteria of experience and efficiency, quite anomalous. Obviously the pressure of facts has long since shattered any exclusive claim by these firms to contracts; and if it is true that any of the many outside firms now working to build up British air supremacy had been hampered or victimised by the influence of the group, it would be an intolerable state of affairs. It is the duty of the Minister of Aircraft Production not to abate one jot or tittle of his resolution to make aircraft output full and efficient, but to answer in terms the charge that advisers, drawn from the "ring," have biased any of his actions. Whether the particular firm that has made this protest is efficient or not is a matter of fact, and can be stated to Parliament and the public without infringement of security precautions. So far the Government has given no detailed answer to these charges. Lord Winstanley has told the House of Lords that General Aircraft is a byword for inefficiency; and the official spokesman did not deny it. Lord Sempill, on the other hand, has told the peers that this was a case of the persecution of an efficient manufacturer and of official mismanagement. A specific reply is overdue, together with an assurance that technical decisions at the Ministry, and the apportionment of contracts, are not made by men who have grown up too closely inside the peacetime circle of approved aircraft manufacturers—a suggestion which is hardly borne out by the action which the Minister has taken to control a number of "ring" firms.

The resolving of doubts about the bona fides of the Minister's policy is simple enough. In this case, he must say, with evidence, that his action was necessary and unprejudiced; in official circles there seems to be no doubt about the firm's shortcomings. In the case of the "ring" firm, whose shares have all been taken over, he must say, again with evidence, that this was the only way to ensure a continuous supply, in quantity and in quality, of the heavy bombers needed; and the nation will rightly support him. More, perhaps, is needed in this

second instance. The Minister may show that the vesting of all the shares in Short Brothers was inescapable for war reasons; but the Government must still convince industry and the public that this war measure is without prejudice to the private or public control of aircraft manufacture after the war. Efficient wartime production and long-term nationalisation are two different kettles of fish.

Indeed, there is need for a general Government statement on these issues. A large part of the aircraft industry, in the shadow factories, is Government owned. A large part of all the war industries is Government financed. What is to be its future? It will aid, not impede, the war effort to make this plain. In aircraft operation, too, there are similar questions to be answered. The bulk of the Board of British Overseas Airways has resigned on the ground that the arrangements for the new Transport Command of the Royal Air Force do not afford sufficient guarantees for the Corporation to maintain and prepare civil trunk routes. Almost certainly here, too, the Government's answer, on the ground of wartime necessity, will be convincing. Nevertheless, it aids neither the war effort nor preparations for peace that these doubts should go undisputed.

What is needed, therefore, from the Government is not a reversal of policy, but an explanation. The Minister's brief replies on Wednesday did not satisfy. The overriding requirements are those of war. The Minister of Aircraft Production, the Minister of Supply, the Minister of Fuel and Power and the Minister of Production, all merit greater support, not less, in every effort to multiply war production by every means. The campaign which is starting, in the form of a prayer to annul Regulation 54 CA, to limit their power to impose direct control must not succeed. It has too long been held out as the duty of Ministers to enforce the highest standards of technique and management for carping criticism or interested opposition to stand in their path now. But they have duties as well as rights; and it is reasonable to expect that for every use they make of their far-reaching powers, good and sufficient reason should be stated. They are still Ministers responsible to Parliament. But, above all, the policy must go forward without fear or favour. It is unjust and inexpedient that, while aircraft factories are controlled, railway workers should be permitted to strike illegally with impunity, or that the major blot on war production, the coal industry, should still be left largely to its own devices, despite the grandiose scheme of control that was substituted for coal rationing last summer. If the Government is ready and able to justify the use it makes of the powers it has been freely given, and if it applies those powers without discrimination and at every needed point, then the country will ask for more, not less, of this offensive spirit.

Keystone of the Arch

MR EDEN has ended his work in the United States and gone on to Canada. His aim has been, not to make a treaty, but to find the largest basis for agreement between British and American views on both the war and the peace. He has conferred, as no British Cabinet Minister has done before, with unofficial as well as official opinion. He has talked with the President and his administrators; with party leaders and with publicists; with Service spokesmen as well as civilians; and with the representatives of Russia and China in America. His visit may prove a turning point in Anglo-American relations, upon which so much now and in the future depends.

"If the Anglo-American part of the puzzle can be fitted together, much of the rest will fall into its place; if it cannot the pieces will long remain a jumble." These words were quoted in a recent issue of *The Times* from an article by Mr Herbert Feis in the current number of the

American quarterly *Foreign Affairs*. Without the text of the article it is impossible to tell what was the immediate context of the argument. But whatever Mr Feis's intention, his words have a general application. They are true of every aspect of the task of world reconstruction, whether political or economic. That is why Mr Eden's errand of exploration is so important.

Bismarck predicted that the dominant political fact of the twentieth century would be that the American and British peoples speak the same language. The fact is certainly dominant, but Bismarck misconceived its significance. The common language is not so much the cause as the symbol of the links between Britain and America. If the tie rested on language alone, it would indeed be a strong one, though not strong enough to dominate world politics. But we have inherited so much else in common with the Americans of which our common tongue is only the vehicle. We have inherited an instinct for personal

liberty—perhaps the only peoples in the world who have freedom in the marrow of their bones are those who speak English. We have inherited feelings of toleration and decency. We have inherited a whole array of the things that go to make up an outlook on life. Even this is not the whole story. In every sector of the globe, American and British interests—commercial, financial, strategic and moral—are mixed up together beyond the possibility of disentangling. To the extent that this was not so—or was not seen to be so—before, it is manifestly so in a world of air power and economic warfare. The interests are not always equal in kind or in magnitude—for example, America cannot keep attackers away from its own soil except with British aid, while Britain cannot defend itself at all against total assault except with American aid—but the interests of each are identical in direction. Neither can attain the objects of its high policy without the other. A war between them would not be an international war, a conflict between rival systems of power; it would be an internecine civil war, and the end of any civilisation in the West. When the relationship between two nations is of this nature, and when those two nations are the most powerful in the world, it constitutes a political fact to which modern history has no parallel. Jointly, America and Britain can shape the world. Separately, they can only frustrate themselves. If America and Britain did not possess a common tongue and a common spiritual inheritance, it would be necessary to invent them.

These facts need re-stating at this moment with all emphasis in each country alike, for in each country there is some tendency to overlook them. The need for Anglo-American co-operation is a platitude; but a platitude, as Lord Baldwin once said, is a truth that has been forgotten. In England, for example, the source of distraction lies in the more extreme implications that some people read into the Anglo-Soviet Alliance. That Alliance is one of the main foundations on which hopes for a firmer peace must be laid. It was certainly not intended to be in any way directed against the fullest understanding between the British Commonwealth and the United States. It will not, in practice, work out as an obstacle to British-American collaboration—unless its more ardent devotees make it so. But that is exactly what they have recently been doing, some wittingly, others unwittingly. One of the leading and most influential advocates of an Anglo-Russian policy for Europe has recently written in terms that have suggested to the Americans (however mistakenly) that they are being warned off the grass. It would be as disastrous to imagine that Britain and Russia will, by themselves, be strong enough to impose their wishes on Europe as it would be to imagine that Europe is the only continent with which post-war policy need be concerned.

Our Russian friends and allies are so accustomed to using blunt speech about Britain that they will forgive a little direct language in return. The major aim of British policy, during the war and after, is to remain on terms of

intimate collaboration both with Russia and America. If ever a choice is necessary between the two, it will be an irretrievable disaster for British diplomacy. But if that choice has to be made, it must not be supposed that the new Anglo-Soviet friendship, deep and sincere though it is, can take precedence over the ties of blood, speech, faith and interest that tie us to America. In this war, we rely on Russian aid for victory—and no words will ever discharge the debt of gratitude. But we have relied, over a longer period, on American aid for survival. We shall rely, after victory is won, on Russian co-operation to prevent another war. But if another war comes, we shall need American support to avoid defeat. Premier Stalin has entered into the alliance in a spirit of far-sighted realism, without any sentimental delusions. It is essential that we do the same.

The distraction in America takes other forms. In part, it is a popular affection for China almost as strong as the British popular emotion towards Russia. In part, it is the twisting of the lion's tail, chosen as the softer option by those Opposition politicians who do not quite dare to make an open attack on the foreign policy of the President. In part, it is merely the familiar irresponsibility of American public life, which prevents the best-intentioned publicists from appreciating the wider effects of their criticisms. But, whatever the cause, it is undeniable that there has been a tendency in recent months to forget that Britain is, on the record and by virtue of the facts, by a wide margin the principal ally of the United States, the only one that is fighting all its enemies, the one on which it must chiefly rely for assistance in carrying out its policies in war and peace. There is even a tendency among some sections of opinion which cannot possibly be represented as isolationist—among some of Mr Willkie's friends, for example—to speak of the United Nations almost as if it were an alliance between America, China and Russia, to which Britain could gain entrance only by repenting of its "imperialist" sins. This view is not that of the majority. Perhaps it only has to be taken seriously to be repudiated by its authors. But too much talk of this nature, even if it is only quizzical in intention, assists the unthinking to forget the facts of life among the nations.

There is no shadow of a suggestion in what has been written here that there should be anything exclusive about the British-American relationship. On the contrary every conceivable means must be taken to foster friendship and respect between Britain and Russia, between America and China. Let there be a cross-fertilisation of affection between every pair of the 30 United Nations. But let no one shut his eyes to the fact that there is, and can be, but one keystone of the arch which will hold the structure together once the immediate task is completed, and that is the willingness of the United States and of the British Commonwealth to walk together in majesty and understanding.

EQUITY & LAW
LIFE ASSURANCE SOCIETY

Established 1844

PROTECTION IN WARTIME

● Civilian War Risk Cover without additional charge is normally granted under new Whole-Life and Endowment Assurances — whether With-Profit or Without-Profit.

● A Guaranteed Bonus each year until 1946 inclusive is provided under all new With-Profit Policies — thereafter Bonuses are dependent upon Profits.

Head Office: 163/4, STRAND, LONDON, W.C.2
(temporarily transferred from 20, Lincoln's Inn Fields)

Telephone: TEMple Bar 0381

Ways and Means

WHEN the Prime Minister broadcast his Four Year Plan, his purpose was twofold: first, to show that the Government has a policy in the making; and, secondly, to show that there is a broad basis of agreement among all parties on the objectives to be sought. The list of objectives he gave was intended to demonstrate that, about the main aims—social insurance, full employment, agriculture, national health, education, rebuilding and price stability—there need be no quarrel in principle. To state principles, however, is only the first stage of policy-making. Policy is not made until ways and means have been worked out, until the agreed principles have been translated into practical and quantitative terms—on which agreement may not be so wide. How are these things to be done, and how much will they cost, in terms of real resources as well as of money?

Obviously, Mr Churchill could not possibly have gone into these details. The important thing is that the details should be being worked out, so that their administrative, economic and financial implications should be known and related in a single programme. What evidence is there that this process of getting down to brass tacks—defining principles, devising methods, and calculating costs—is going on in step? The three examples of social security, building and agriculture may be taken. The Beveridge Report, of course, was a practical and quantitative document. It set out ways and means in terms of both administration and cost. But the Government has so far committed itself neither to the principle of the prevention of want nor to the administrative reorganisation involved in a Ministry of Social Security nor to the tentative scales of charges laid down in the Report. There is still no policy. For building, there is already a quantitative programme implied in the recent White Paper on the drafting of building labour. But, even apart from doubts about whether the scale of building envisaged is practicable in relation either to the demand for building or to the total supply of resources and finance for all purposes, including building, there is still no clear Government policy, either on principles or on methods. A year ago, Lord Reith did announce that the Government would study and concert the methods needed to achieve the objectives laid down in the Barlow Report, namely, the relief of congested urban areas and the de-centralisation of industries and population. But the Scott and Uthwart Reports, both of which were made to indicate the steps necessary to carry out this policy, are still in the pigeon-hole. If the building programme implied in the White Paper is prepared without Government decisions on the planning powers and compensation methods recommended by these three reports, it will be executed in the same unplanned and unsatisfactory way as building was after the last war. Local authorities, who are being urged to prepare their housing schemes, will have no alternative to the line of least resistance; and another and more grievous Barlow Report on congested and depressed areas will be needed twenty years hence.

The third example of the need for precision, and, in some ways, the most important one, is agriculture. In his broadcast, Mr Churchill spoke of the need to maintain both the expansion and improvement of farming and a reasonable level of prices; and he gave the warning that this double policy would involve "substantial charges" on the state. It is important that the nation should be given some idea of the order of magnitude of the charges contemplated. About the broad objectives of any agricultural policy, there is a surprisingly wide measure of agreement. Most recent statements on agriculture, whether from impartial sources, like the recent peers' memorandum, or from organised farmers, like the interim report of the National Farmers' Union, have shown this. They concentrate on the double goal of prosperous farm-

ing and an efficient and reasonably cheap supply of food to consumers. They agree on the need to preserve farmers in the future from the fluctuations in prices and in the size of their markets that proved so disastrous in the past. In general terms, their recommendations add up to the policy which has often been stated, in somewhat plainer terms, by *The Economist*—increased wages for agricultural workers, stable prices and assured markets for agricultural produce, and adequate returns to enable farmers to maintain their capital. These are the agreed principles, but the crucial questions are how are the principles to be applied, and how much are they to cost? This is where controversy creeps in.

The Prime Minister made two points of great importance in his broadcast. First, this country has to purchase a large proportion of its food and raw materials overseas. Secondly, Britain has grown great on cheap and abundant food. He might have added a third; that, in the future as in the past, the prosperity of industrial Britain, and its standard of living—symbolised in the Prime Minister's speech by his references to milk for babies and to "modern methods of locomotion and the modern amusements of the cinema and the wireless, to which will soon be added television"—will continue to depend on cheap food and raw materials. Because this country is comparatively wealthy, it is possible to contemplate charges, over and above the cost of obtaining its food freely and impartially from all world sources, in order to maintain a prosperous and efficient agriculture of limited size. But the charge envisaged must be worked out and made known and the size set in precise quantitative terms. The heresies of Mr Hudson, who once implied in a speech that the more the people of this country pay for their food, the better off they will be, must not slip into the drafting of policy behind a cloud of good intentions.

What is needed first of all is a clear understanding by both the farmers and the Government that it is not possible to secure higher incomes for all the participants in the agricultural industry, and at the same time to increase the numbers engaged and the volume of production, without imposing a charge upon the public, in the shape of higher taxes or higher prices, which it will be neither willing nor able to bear. Agriculture can, and will, be subsidised for social and political reasons; but it can only be subsidised to a limited extent. No doubt, the advance made in technical efficiency during the war, under the pressure of shortage of manpower, may make a little larger the size of the farming industry that can stand on its own feet—the size of the output, that is, obviously not of employment; but it does not materially alter the nature of the problem. Economically, the question is not simply one of comparison between the efficiency of resources used in farming in this country and the efficiency of resources used in farming elsewhere; it is a question of the relative efficiency of resources used in agriculture or in industry in this country. The need after the war, when overseas income from investment and other services will be smaller, will be to concentrate even more than hitherto on the pursuits which can be done most profitably and most productively in this country; and these pursuits are still overwhelmingly industrial and commercial. The remarkable productivity of British war industry, referred to by Mr Churchill, has provided yet another and unchallengeable proof of this. If Britain had adopted a deliberate policy of restriction and autarky before the war, in order to maintain a large domestic agriculture, the war would have been lost three years ago, because so much of the manpower which has produced the aircraft, the weapons, the shot and the shell that saved the day would instead have been engaged wastefully in the countryside.

Let it then be accepted that the policy of guaranteed prices, markets and wages has come to stay in British

agriculture. But, at the same time, let it be known what the limits of this policy are to be. There must be limits, and they must be close ones. The programme which the farming industry has from time to time indicated might have cost this country something like £200 millions a year in subsidies, the remission of taxation, prices above world level, minimum wages and guaranteed markets had it been applied before the war. Is a programme involving a cost of this order, or higher, envisaged for the post-war period? The public is entitled to know the answer to certain questions. How large is the "substantial charge" to be? How is it to be raised, by taxes which are known and above board or by duties

The Middle East—III

The Federal Solution

NOW that the tides of war have, for the time at any rate, receded from the Middle East, the people of that wide region are beginning to ask what is going to come out of the struggle in which they have all been more or less involved. Few of them are in a position to decide single-handed their own part in the shape of things to come. They are looking to the Great Powers for some indication of their policy. The starting point must, of course, be the situation created by the war itself. And here the need has clearly been demonstrated for the regional organisation of the Middle East for defence, economic development and social policy.

The war has also shown that no such outcome is likely unless the Great Powers lend a hand. Britain has least chance of escaping responsibility. It has direct responsibility for Palestine and for Transjordan; it is linked by treaty with Egypt, Iraq, Persia and Turkey; and, by its behaviour during this war, it has earned a big capital of goodwill. It has protected Egypt without involving it in the war. It has not used the Rashid Galieni revolt to extort political concessions—on the contrary, the armistice with Iraq was a model of restraint. With Turkey especially, Britain's relations are more cordial than they have ever been. At the same time, everything that goes wrong in the Middle East will automatically be laid at Great Britain's door. It is very easy to dissipate reserves of goodwill.

What can be done? Ideally, of course, the solution would be a political federation and economic union of the whole Middle East. But this is probably not practical politics at the present day. There exists very little sense of a common purpose, for the pan-Arab movement is a strong factor only among those Arabs who have not yet attained political independence. It stands not so much for the union of Arabs among themselves as for the co-operation of Arabs against the outside world. Even in this negative sense, pan-Arabism means nothing to either Turkey or Persia. The leadership of any Middle Eastern federation is an insoluble problem. The Turks, the Persians and the Egyptians might claim it, each on the grounds that they are heirs of great empires, or Turkey, and to a lesser extent Egypt, on the grounds that they are developing into powerful modern states. Family difficulties complicate the position of Iraq and Saudi Arabia. Ibn Saud established his kingdom by driving out the Hussein family, who now rule in Iraq and Transjordan. There are many unsettled disputes—whether Transjordan or Saudi Arabia should control the port of Akaba; the boundary question between Iraq and Persia in the Shatt-el-Arab; the settled but perhaps still uneasy problem of the Mosul oilfields; and, worst of all, the problem of Palestine. The Middle East is rather like the Balkans, where an overwhelming need for political and economic union has always been frustrated by frontier quarrels, minority problems, and religious differences.

A positive beginning must be made, and British responsibility is strong. A start might be made by

and other means which are indirect and do not appear in the national accounting? How is it to be spent, by maintaining earnings in an efficient and prosperous industry of limited size or by maintaining a swollen army of earners at a lower and unsatisfactory level? Is it fully realised that the better Britain envisaged in all plans for social security, public health, child and maternity welfare, is entirely dependent on the provision of an adequate supply of cheap and nutritive foodstuffs? If the right answers can be given to these questions, in precise terms, then the three-fold process of policy-making—the statement of needs, the preparation of methods and the calculation of costs—will have been carried through in agriculture at least.

restoring the unity of Syria, not the French Syria of recent years, but the Syria of history, which includes Syria, the Lebanon, Palestine and Transjordan. The setting up of such a union would not frustrate the larger purpose of Middle Eastern federation, but could be a stepping stone towards it. At the same time, it might perhaps help to adjust the wellnigh insoluble problem of the Jews in Palestine. Not much news comes out of Palestine these days, but there is reason to fear that under cover of the war the extremists on both sides have been growing more intransigent. The Arab extremists want Palestine as an Arab state, the Jewish extremists, backed by influential Zionist circles in America, want a Jewish state. Neither solution is possible without the extermination of the minority that loses. The views might be considered of the distinguished Hebrew scholar, Dr Magnes, Chancellor of the Hebrew University at Jerusalem, the central figure of a group of Jewish and Arab moderates and himself an outstanding spokesman of the moderate cause. Dr Magnes urges the setting up of a federation of Syria, in which Syria, Lebanon, Transjordan and a bi-national Palestine would be the constituent states. The core of this is obviously the acceptance for Palestine of a bi-national—or one might almost say Swiss—constitution.

Such a scheme turns upon the problem of immigration. The Jews, even the moderates, are not ready to accept a complete prohibition on further immigration. Dr Magnes suggests that a degree of Jewish immigration could be combined with the preservation of the Arabs' majority position by the setting up of the larger, "Syrian" federation in which Arabs would be assured a permanent majority. In 1936 an offer was made to continue the immigration of Jews, but to control it to 40 per cent of the total population. When the plan was made, the Jewish population numbered four hundred thousand. It was estimated that by 1946 the Jewish population could be twice the original figure without jeopardising Arab predominance. It is especially important that the British Government should make some statement on its immigration policy. Uncertainty whether in fact it intends to abide by the 1939 White Paper has given rise to extravagant hopes and extravagant fears on both sides.

Another possible step towards Middle Eastern federation would be the strengthening of the Saadabad Pact between Turkey, Iraq, Persia and Afghanistan, which was automatically renewed for another five years at the beginning of this year. At present, it is an innocuous non-aggression document and is incomplete. With the addition of Egypt, Saudi Arabia and a new Syrian federation, it might become a regional security grouping within a larger world system.

One of the difficulties the Great Powers must face in proposing constructive policies is strong suspicion of their motives. Each Middle Eastern state is jealous of its independence. The cry of imperialism may easily be raised. The most hopeful way of meeting such suspicions would

be for the United Nations to plan their help in such a way that its economic and social advantages can be clearly demonstrated. It is impossible to divorce political schemes of reconstruction from plans for economic help. In the Middle Eastern Supply Centre, the British and the Americans have an instrument for encouraging the development of the Middle East. Projects for irrigation, flood control and electrification could be expanded; many suitable areas actually cross national frontiers, and the establishment of mixed national boards to control them would be a step towards the federal ideal.

The MESC has given help to the development of transport, though on the whole this has been in the hands of the military authorities. Its experience could be used for wider schemes after the war. The advancement of technical education in all these countries by the setting up of technical institutes, research centres and model farms would begin to diminish the lack of balance between the economic and social status of the various communities. At present, the young men who receive education tend to become either professional politicians or lawyers, with nationalism as their stock-in-trade. A new class of young man, trained constructively to play a part in building up the prosperity of the Middle East, would have a wider political outlook.

For the financing of the different schemes, a variety of methods is possible. Two might be adopted without great delay. One of the great difficulties of coping with the problem of hoarding, shortage and inflation in the Middle East at the moment is the excess of purchasing

power. This excess presses on the price level and is dissipated in building projects, the purchase of jewels or, as an Arab farmer was heard to say, "in the buying of more animals and wives." If it were possible in the very near future to float an international loan for long-term development schemes in the Middle East, to be carried out under the direction of the MESC, much of this purchasing power could be mopped up and a solid foundation laid for the MESC's future activities. The other possibility lies in the fact that although the oil of Iraq and Persia is controlled by their Governments, it belongs to English, Dutch and American companies. By mutual agreement, it might be possible to plough back a certain proportion of the oil revenues into the Middle East for joint projects to raise the level both of prosperity and of education.

All these schemes, political and economic, depend upon the energy and influence of the Great Powers, and particularly of Britain. It is important that the British should have an administrative machine in London capable of providing the necessary drive. The work of the Minister of State at Cairo and the MESC at present tends to be confused at the London end by the diffusion of their sphere of action between several Government Departments. If the MESC and the conception of regional control and development are to survive the war, two things are necessary: long-term policy-making by the United Nations in which Britain must give a lead; and an administrative organisation well integrated and flexible enough to meet the demands which long-term planning will make.

NOTES OF THE WEEK

The Mareth Victory

General Montgomery's victory on the Mareth line was due to a brilliant outflanking operation. The difficulties of terrain and communications overcome in the sweep to El Hamma serve to stress the exceptional character of this feat of arms. While the Eighth Army was still probing the Mareth line in the frontal attack at Wadi Zigzaou, Rommel was probably still sceptical about his opponent's chances to get at his El Hamma flank. German sources claimed that the British outflanking move had collapsed with heavy losses, and it is true that the first attack at El Hamma led to no conclusive results. But while Rommel was busily engaged in re-establishing his positions in front of Mareth, General Montgomery managed to reinforce his column at El Hamma and provide it with sufficient punch to succeed. Rommel had to abandon the Mareth line as suddenly as he had previously had to leave his positions at El Alamein. Some military experts were still debating how long he would be able to keep the Gabes gap, when the Eighth Army had already by-passed that gap and occupied Gabes and Oudref, on the road to Sfax. This phase of the fighting ended earlier than was expected. The next phase depended largely on the timing of the complementary moves of the Americans. The net in which the Axis forces had been caught had still a hole at the northern end. The Americans had not yet forced the distance from Maknassy to the coast. Rommel's aim was to escape through it before the Americans and the British could join hands in the south, and he was therefore more likely to try to by-pass the Americans at Maknassy than to strike at them, especially as he was already in danger of being shut in further to the north, by a new American advance from the Kairouan sector. The feature of the campaign so far has been the intense activity of the air forces in close co-operation with the attacking land armies. The coastal road to Sfax, crammed with retreating enemy columns, has provided a most sensitive target for all the technical resources of offensive bombing, and the reported naval bombardment of Gabes has turned the fighting into something like a combined operation. On the northernmost tip of the front—the scene where the last round will take place—the First Army has recorded a notable success by the recapture of Sejenane and an advance towards Mateur.

Saving Ships

All official spokesmen are agreed that the Achilles heel of the war effort is the war under water; but they speak with two voices about its progress. The Minister of Agriculture says that the shipping position is worse now than it has ever been. The Service Ministers, including the Minister for Defence, speak more encouragingly of the large and mounting excess of new building over losses, and of the growing successes of attacks on U-boats. The point is, of course, that these Ministers are talking about two different things. It is true that shipbuilding is going ahead astonishingly in the United States, and that U-boat sinkings are steadily on the increase. But it is also true that, judged by the crucial test, the rate of arrival and delivery, the bottleneck is narrower than ever, if only because of the greater shipping needs of this stage of the war. The bottleneck can only be split apart by mastering the U-boats. A newly aggressive policy is being pursued; escort vessels are at last coming forward in larger numbers from both sides of the Atlantic; and there is improved Anglo-American co-operation. But, meanwhile, the bottleneck can be eased by economising shipping space still further. In the main, wastage is indirect. The direct wastage of shipping due to bad organisation or to *bêtises* like the importation of high-powered cars or cement into this country has greatly diminished. Indirect wastage due to faulty agricultural and food policy has also diminished, but not yet by enough. Even last year the structure of prices and production sponsored by the Ministry of Agriculture still did not take fully into account the fact that, in terms of calories, it is ten to twenty times better to grow food for human use than to grow fodder to maintain livestock herds. An increase under crops of some five to six million acres has been mainly used to feed animals, including the feeding of barley to cattle. One estimate, of a somewhat speculative kind, has put the indirect wastage of shipping space because of an ill-balanced agricultural policy at nine million tons in 1940, six million tons in 1941, and three million tons in 1942. On this basis, the remaining room for improvement is plain. The Ministry of Food has done better than the Ministry of Agriculture. It has erred in the past not so much in balance or direction as in speed. Most rations, in the early stages of the war, were introduced too

tardily. Recently, its programme has been well rounded and effective—except for bread. Here the alternative policies of raising the ratio of extraction from grain, of adulterating wheat flour with other substances, and of rationing, stayed too long under consideration. The first has been done. The second has been started on a small scale. The third is still being toyed with. If bread rationing, or a more drastic use of the alternatives, could effect a saving of 10 per cent at the moment, when saving shipping space is more urgent than it has ever been, it would be a major contribution to victory.

Big Numbers

The billion—American-style, a thousand millions—has become a mere unit in wartime financial statistics. Total supply expenditure in the financial year 1942-43 which ended on Wednesday was just over £5½ billion; total ordinary expenditure (including interest and management of debt) was over £5½ billion; and total ordinary revenue was over £2½ billion. (The figures are given in full on page 445.) The most remarkable feature of the latest return is the size of revenue. Astronomical expenditure is taken for granted nowadays. The days before the last war when the total budget was still less than a scant £200 million now only seem a far cry; they have been forgotten. The present rate of expenditure of £15½ million every day is the measure of a total national effort in a total war. It will not diminish until the war is over, and will very likely increase slightly. Moreover, postwar budgets, which will measure the modern responsibilities of the state for the peacetime common weal as well as for defence, will be very much nearer £2 billion than £1 billion—compared with just over three-quarters of a billion in 1929-30. The level of state expenditure rises steadily from war to war (before the Boer War it was about £100 million) with the extension of Government functions and the expansion of the national income: it was nearly doubled between the 'nineties and just before the last war; between then and just before this war it was quadrupled; after this war it will probably be double again. But, even in the presence of these formidable historical forces, a total ordinary revenue of over £2½ billion from taxation and other receipts (excluding the Canadian Government's contribution of £225 million) is a staggering fact. It represents £54 per head of the population, man, woman and child. Income tax alone represents more than £20 per head; it has passed the billion mark, compared with just under a quarter of a billion in 1929-30, just on a third of a billion in 1938-39, just over half a billion in 1940-41—and .044 of a billion in 1913-14. It is a striking achievement to have met half this vast expenditure out of revenue; and, although he has obtained a 10 per cent increase over the estimated yield from Customs and Excise in 1942-43, the Chancellor of the Exchequer may think twice before he squeezes the consumer, in this indirect and regressive fashion, still further in 1943-44—though the deficit in 1942-43 was over £2½ billion and the National Debt stands at more than £16½ billion, compared with £8 billion before the war and .65 of a billion before the last war.

Distribution Debate

In a letter to *The Times*, on March 24th, Mr Samuel Courtauld opened a discussion about the need for securing greater efficiency in the distribution of goods as a means of bringing down costs to the consumer. Hitherto attention has been focused mainly on manufacturing costs, notwithstanding the fact that, on an average, something like half the price paid by consumers is absorbed in the process of distribution. Mr Alan J. Sainsbury finds the explanation of the high level of distribution costs mainly in the expansion of employment in distribution, and in the more elaborate services demanded by the public; but he draws attention to the marked difference in turnover per person employed by the retail trader in the main shopping centres on the one hand, and in the "back street" on the other. Professor Hermann Levy and Mrs Joan Robinson are, understandably, not satisfied with this simple explanation. High distributive margins in many retail trades, says Professor Levy, have been the result of agreements between industrial combines and their respective trade organisations on the one side, and retail trade associations on the other. Mrs Joan Robinson rightly poses the question:

Is it not rather the case that high distributive margins caused by the decline in competition and the growing prac-

tice of price-fixing attracted an unnecessary number of people to the job of selling?

In her view, high prices are not so much the consequences of higher costs, but the rise in costs is the consequence of high prices.

Free Choice

The need for greater efficiency does not stop at the manufacturing end. It is equally urgent in the transit of goods from producer to consumer. The way out is surely, in part at least, by eradicating the evil of price-fixing in all its forms, and by increased efficiency in distributive methods. There was progress in the technique of retail distribution before the war. The multiple stores, for example, showed what could be achieved by large-scale organisation of manufacture and distribution from the retail end. At the same time, the need for reducing distribution costs should not be used as an excuse for squeezing the independent retailer out of business by unfair means. The consumer is entitled to buy where and from whom he pleases, and convenience or habit will guide his steps, as well as economics. As Mr P. G. Arthur, of West End Stores, has pointed out in *The Times*, the "back street" trader is the housewife's larder. The important point is that his choice should be genuinely free, and not rigged by organised interests. The independent retailer will still have an important part to play in catering for special demands, and any discrimination against him by political or other pressure would be intolerable. It is unfortunate, as the Leeds and District Chamber of Trade has argued, that some of the smaller multiple firms should seem to be abusing the licensing procedure under the Location of Retail Business Order by purchasing independent retail businesses on first-class sites at prices which are at present attractive to the occupier. The effect of this, says the Chamber, is that after the war the multiple firms concerned will be strongly established on excellent sites, and the independent retailer, who has suffered most from the war, will be penalised.

Second Round

Having failed to defeat Mr Bevin's Catering Bill by frontal attack, the critics, led by Sir Douglas Hacking, resorted to tactics of attrition and obstruction. Some 200 amendments to the Bill were tabled and four whole sitting days were timetabled for the Committee stage. Mr. Maxton pertinently asked the Prime Minister whether it was really in the national interest to spend so much House of Commons time on the Bill. The Conservative amendments were mainly directed at limiting the Minister of Labour's powers, restricting the functions of the Catering Wages Commission and changing its composition. Instead of appointing Members who were not directly connected with catering, it was suggested that four representatives of both sides of the industry should serve on the Commission. Another amendment urged the deletion of the provisions empowering the Wages Boards to deal with matters affecting the "efficiency and development" of the in-

dustry. Another wanted to substitute the word "comfort" for "welfare"—an example of quibbling. On the first sitting day, after five hours' debate, only the first clause of the Bill had been carried—without a division—and only three amendments were considered. The first, raised by Mr Loftus, for the exclusion of family businesses from the scope of the Bill, was defeated by 214 votes to 70, the opposition having thus dropped in strength by 46 from the vote on the second reading. By the second day clause 6 had been reached—after a lengthy debate on the pros and cons of tipping. The Minister pointed out that one of the Commission's functions was to deal with tipping. Mr Bevin, throughout the debates, was imperturbable. He denied that there was any question of "sweating" in the trade, but repeated what he had said in the earlier debate about the desirability, from the point of view of postwar employment, of regulating catering workers' wages, hours and conditions. Once the Bill has been piloted through the House—and, on Thursday, the critics, realising that the Government could not be deterred, and would not be content to be obstructed for much longer, very wisely and sensibly made it plain that they were tiring of their Horatius rôle—the Minister may be able to give his full attention to a matter which has been exercising many minds and has been given a good deal of prominence in Parliament—the position of industrial catering staffs. The National Joint Industrial Council of the Industrial Catering Trade has repeatedly asked for the application of the Essential Work Order to all works canteens: at present, anomalously, those run by outside caterers are not scheduled and there have been many complaints of staffing difficulties. Mr Bevin has so far been unwilling to apply the Essential Work Order, for no very convincing reason, until the general catering problem has been settled.

Africa and Carlton Gardens

The reorganisation of the North African administration seems to be in full swing, and the direction it has taken has so far been altogether satisfactory. The transfer of M. Bergeret from the post of Secretary-General to a purely military post at Dakar, and the dismissal of M. Rigaud, have been followed by an overhaul in the lower ranks. The principle officially adopted has been to reinstall in administrative posts those Frenchmen who were "purged" by Vichy on account of their political "disloyalty" or racial origin. At the same time, the municipal bodies elected in 1940, and disbanded afterwards, have been called back to life, though M. Peyrouton's letter to the prefects has revealed to what an extent the position still remains abnormal. He has appealed to the prefects to "forget the circumstances which had caused the suspension of the elected municipalities," and asked them to give the necessary authority to the revived councils. General de Gaulle's statements are no longer ignored by the North African press and radio. The impression is that General Giraud is conscientiously clearing the ground for French unity. The contribution of General de Gaulle's headquarters towards the same goal is less clear. True, General de Gaulle himself has announced his imminent departure to North Africa, and General Catroux, his emissary, has arrived in Algiers for preparatory conversations. But the latest reports again speak of a postponement of the meeting between the Generals for several weeks. More important, the claim to exclusive leadership has not been given up by Carlton Gardens, and it is being supported by a curious kind of a plebiscite carried out as if on behalf of the French people by General de Gaulle's entourage. The unfortunate formula of M. Philip, that the "French people has already chosen its leader," is being repeated over and over again. Last week the French trade unionist, M. Guigui, recently escaped from France, assured the press that "the French Republic will organise itself around General de Gaulle and the National Committee." This sounds somewhat strange coming, as it does, from Socialists and trade unionists, who ought perhaps to realise that a republic or a constitutional monarchy cannot possibly "organise itself around" one exclusive leader, no matter how great his military and political merits.

The Best Organised

Last week-end, Mr Bevin lifted another corner of the veil over the mobilisation of Britain's manpower and womanpower. He stated that nearly three-quarters of a million men and women of pensionable age were at work. Most of

them presumably have either continued in their former occupations, or taken the place of those who have been called up to the services or war work. Thus, the figure is of greater interest in a Beveridge context than in a war effort one. Since the total number of men and women of pensionable age is about 4,500,000, it means that some 17 per cent have opted to work rather than live on their old age pensions. This, of course, may merely reflect the contrast between wages and pensions in wartime conditions. It does not follow that pensioners will be willing to continue in work in order to achieve an ultimately higher pension at a time when there will be less demand for their services, and when the initial rate of pension will be higher than at present. The other manpower figure given by Mr Bevin referred to single women of calling-up age. Ninety out of every hundred, he said, were on munitions, in the Services, or doing work of national importance. Obviously, the significance of this depends on how widely he intends the phrase "national importance" to be read. If, as is probable, he gave it the same meaning as his officials do in the calling-up of women—which is a pretty wide meaning—one is tempted to ask where is the missing tenth? Part of it will be physically unfit; another section will be unmarried mothers; some presumably have had their calling-up deferred on hardship grounds; but have some escaped the net altogether? Nevertheless, this criticism does not alter the fact that Mr Bevin can be justly proud of the mobilisation of Britain's manpower, which he described as the best organised in the world. Is it not, then, time that a complete picture, even if the details are left out, of the distribution of Britain's manpower was given to the world?

Northern Ireland Politics

The present Unionist Government in Northern Ireland has been in office continuously since the partition of 1921. This continuity of Unionist administration is not surprising. The Nationalist party is opposed to the whole conception of a separate government in Northern Ireland, and for the most part Nationalist members of the Ulster Parliament abstain from attendance or from any active part in Parliamentary proceedings. The number of Labour members is only three, and they are sharply divided among themselves. But not only has there been a Unionist administration for nearly 22 years, there has also been a minimum of change in the personnel of the Government during this period, other than that occasioned by death or ill-health. It is not altogether surprising, therefore, that there should have grown up within the Unionist party itself a demand for the reconstitution of the administration on a wider and more popular basis. The experience of the Government at by-elections since the war started has been distinctly unfavourable. Two Unionist seats in the Ulster Parliament have been lost by the Government in the only two by-elections that have occurred—one to an Independent Unionist and the other to Labour. Two recent by-elections for the Imperial Parliament resulted in one seat being lost to Labour. These election reverses have alarmed sections of the Unionist party. Moreover, the action of the Government in carrying out a measure of reform in the Belfast Corporation has increased its unpopularity in certain quarters. In addition, there is a genuine feeling that on account of the age of several of its members, it would be wise to introduce fresh blood into the Cabinet. The weakness of the movement for reorganisation within the Government is that it rests upon no particular movement of opinion in the country as a whole.

There is the further circumstance that in wartime the real power of the Northern Ireland Government has been considerably curtailed. A large number of matters for which the Government is technically responsible under the Government of Ireland Act are, in fact, being carried out under Defence Regulations, for which Ministers at Westminster are responsible. It is increasingly apparent, however, that if a separate Government is to continue in Northern Ireland after the war as an effective administrative machine, then there are a large body of problems which will require vigorous and constructive handling directly the Government of Northern Ireland is once again responsible for its own destinies. In wartime, a policy of acquiescence in whatever steps are considered necessary by the Imperial Government in the interests of the war effort is the only policy that a Unionist Government in Ulster can pursue. In the task of rebuilding the economic life of Ulster after the war, however, it will be necessary to provide definite leadership in Northern Ireland itself. The only alternative is government from

Whitehall—in fact, if not in constitutional form. Meanwhile Unionist back-benchers in the Ulster Parliament have been responsible for two private party meetings at which, it appears, proposals for the reconstitution of the Government have been canvassed.

The State of Denmark

The general election held in Denmark on March 23rd became a demonstration in favour of patriotic unity and passive resistance. The National Coalition Government secured 140 seats, and the loyal opposition, the *Dansk Samling*, three seats, out of a total of 148. The Danish Nazi Party, led by Fritz Clausen, held its three seats, and raised its poll by 12,000 votes; the semi-Nazi Farmers' Party lost one seat and 26,000 votes, and now sends only two representatives to the *Rigsdag*. These results were achieved in a record poll of 90 per cent of the electorate. Within the Government, the Social Democrats gained two seats and the Conservatives five seats. The German interpretation is that a vote of confidence has been given in the course of collaboration which Hr. Scavenius is alleged to be pursuing; and that the holding of freely democratic elections within Nazi Europe shows that the New Order is no straitjacket. But all reports from Denmark suggest that the election was, in fact, viewed—by nearly the whole of the electorate—as a demonstration in favour of national independence and democratic procedure. Fritz Clausen and the threatened advent of a Reich Commissioner were met by an emphatic "No," despite a hectic election campaign and some attempt to juggle with results by purchasing votes. The public hung out the Danish national flag, and celebrated the results as some eye-witnesses have pointed out, "as if the war was over." Actually, the Danes no doubt realise that, however much Dr. Goebbels may try to put a good face on the election results, there is certain to be a simultaneous attempt to put the screw on. The establishment of a Ministerial Department to watch the interest of the German minority, on the pretence that they are inadequately protected through normal democratic procedure, is a threat to undermine parliamentary government. Neither Denmark nor the Allies must be deluded by the superficial tolerance with which Hitler has so far treated the Danes into forgetting that the nation is as completely in the Nazi grip as Poland, Norway or Greece. Passive resistance and sabotage, moral dissociation from the New Order have been growing. It is not the fault of the Danes that in their country the wolf has worn sheep's clothing. The Danes who last week voted against Hitler displayed an enduring confidence in their values and institutions. There is nothing rotten in the state of Denmark.

Daventry Calling

Sir Richard Acland is persevering and persistent in his attempts to win back the vote for the vast number of electors who have been disfranchised by the war. This week it was Daventry's turn for a writ to elect a new Member—to take the place of the late Speaker—and Sir Richard formally opposed the motion. Again, he was easily defeated, but there were signs that the force of his, and his supporters', arguments and his determination are beginning to have some effect. Arguing the case of the general by the particular, in order to keep within the Speaker's ruling, Mr Cocks pointed out that Daventry had suffered from its proportion of the people who are estimated to have left their constituencies since the war began; that there are in Daventry a large number of young men and women who have reached the age of 21 since 1939, but have no votes; that there may be in Daventry pilots who saved the country—and Parliament—in the Battle of Britain, but who cannot vote for Parliament; and that the people of Daventry realise that the House of Commons is old and stale. Mr Churchill's reply was not very encouraging. But he did say that the Government is considering actively whether eligible persons can be enabled to vote at by-elections, that it is the Government's wish that they should be enabled to do so, and that a statement may be made before Easter. He warned the House, however, that at present "the prognosis is adverse," and it is not likely that any reform will be made at present. But Sir Richard's persistence will at least have prevented the case for new electoral registers in constituencies holding by-elections from going by default. The fact that any solution will necessarily be imperfect should not prevent the search for some improvisation which, at the least, would be preferable to the present intolerable state of affairs.

Export Merchants' Policy

The National General Export Merchants' Group, formed at the request of the Board of Trade in 1940 to assist in the export drive that was then necessary to secure foreign exchanges, has submitted to the Government a report on post-war trade policy. The report is confined to principles and contains nothing that is new; its interest lies in the emphasis the Export Merchants' Group places upon the conditions that must be fulfilled if overseas trade is to prosper. Not unnaturally, the first concern of the Group is to stress the importance of the merchant in Britain's export trade. Before the war, some two-thirds of all the exports from this country were handled by merchants. On the ground that the distribution of commodities requires qualities distinct from those needed for production, and, in general, can be carried out more efficiently and cheaply by specialists, it criticises the present tendency of many manufacturing industries to establish their own export organisations. Merchants cannot claim the overseas distribution of goods as a preserve. They will have an important part to play in the future, especially in handling the output of small firms; but direct selling, by individual firms or by groups of firms, should not be discouraged. The other main recommendations include the stabilisation of exchange rates, buttressed by exchange control; multilateral, as opposed to bilateral clearing; that every country should keep its exports of goods and services to the world in equilibrium with its imports from the world, placing upon each nation the onus of taking payment in imports for its exports; that trade barriers should be reduced, but each country should be free to make its own tariff reductions "when and as it thinks best"—to encourage imports and tariff reductions, overseas credits would be allowed to lapse after a period of years; that measures should be taken to ensure greater stability in the prices of primary products in terms of those of manufactures; lastly, the Group, though claiming advantages for combines and international cartels, suggests that they "should come under some definite form of legislation, having for its object the protection of the consumer." Many of the principles laid down are unexceptionable. But they require considerable clarification. Does the Group believe in the indefinite maintenance of complete exchange control? Does it really expect to secure substantial reductions in trade barriers by the piecemeal methods it suggests? How does it propose the production, export and import of primary products should be regulated and by whom?

New Brooms

Events have been moving rapidly in the affairs of British Overseas Airways. On March 19th, four out of five members of the Corporation, including the Chairman and Director-General, tendered their resignations to the Air Minister. Their reasons, set forth in a letter published as a White Paper, together with the Minister's reply and

THE WESTMINSTER BANK

is represented by an extensive system of branch offices in England and Wales with agents elsewhere, and is amply equipped to conduct your private and commercial banking business. The Manager of any branch will gladly give an interview to discuss or explain any point which will help a client, or prospective client, to a full use of the services available to the Bank's customers.

WESTMINSTER BANK LIMITED

Head Office: 41 Lothbury, London, E.C.2

memorandum on the relationship between the Corporation and the Air Transport Command, were that the proposed arrangements were indefinite, unsatisfactory and incompatible with the Corporation's expressed duty of securing "the fullest development . . . of efficient overseas air transport services." There has been a lack of clarity about the demarcation of functions; and the Corporation, rightly or wrongly, has been relegated to the position of junior partner. One solution, which would have been to transfer the Air Ministry's functions to the Ministry of War Transport, has not been attempted. Three new members have been appointed to the Corporation: Sir Harold Hewitt, a member of the Air Council, is Chairman pro tem; Mr Simon Marks, the energetic managing director of Marks and Spencer; and Mr John Marchbank, former general secretary of the National Union of Railwaymen, are the new members. In the meantime, the employees of the Corporation, whose disquietment with the direction at the top had recently been growing, petitioned the Air Minister to give them back Lord Reith, who used to be Chairman of the old Imperial Airways and was Chairman of the Corporation until January, 1940. The request has since been withdrawn—it is not clear how representative it was, but the fact that it should have been made at all is evidence of some dissatisfaction among the personnel. The new directors are faced with a perplexing situation. They have one great advantage over the old. None of them has any direct interest in other forms of transport, and their appointment represents a departure from the principle, hitherto generally applied, of appointing business men to control their own businesses. Of the late members, the Chairman was a director of the Southern Railway, and the Director-General was on the board of many shipping concerns and also of the LNER. As one commentator has put it, "If the Government had set out to find an Airways Board with transport interests conflicting with air transport, they could hardly have done a more thorough job." The setting of this house in order is as essential as the reaching of an international understanding, which remains as urgent as ever. Perhaps Mr Eden's return will reveal some measure of agreement with the Americans. The time is more than ripe. American Air Lines, Inc., advertising in the national press, have issued a challenge:

Attain the most powerful position in the air, and automatically we will become the greatest power for peace.

ment, on which a committee under the chairmanship of Lord Hankey is to advise the Minister of Labour. It remains for Mr Bevin and the other Ministers engaged in reconstruction and reform to see that the openings are in fact there.

Still Going Strong

Last Thursday was the twenty-fifth anniversary of the creation of the Royal Air Force. A week ago, Sir Archibald Sinclair broadcast a fitting tribute to the men who fought for and established a separate air command, and to those who nourished it through the adolescent years until it came of age and won its spurs in the Battle of Britain. This is an occasion to remember, too, Sir Frederick Sykes, Chief of Air Staff in 1918, who rather oddly slipped out of the Minister's roster, and, above all, the veteran pilots and commanders of the last war, who flew planes which were primitive and often ill-served with a staggeringly heavy crash rate. This week, the RAF has made headline news with still heavier raids on Germany. The latest raids on Berlin have been the heaviest yet; the cost has also been appreciable—forty-eight planes lost from a force of between one and two thousand on four nights last week-end.

But, materially and psychologically, the damage inflicted in Germany itself is a condition of victory, provided no need for aircraft in combined operations on land or sea, now or in the future, is prejudiced. To maintain the case for the offensive bombing policy of the Air Staff, as it is actually conducted, is not to plead for retribution or for indiscriminate attack upon the defenceless. It is simply to affirm the value to Russia, to the western democracies, and to submerged Europe, of attack carried into enemy territory and directed against military targets. The campaign of the Bombing Restriction Committee—Stop Bombing Civilians—is not contemptible; seen against the background of the ruins of Coventry and the City of London, it appears a generous counterpart to human hatred. But it fails to face the inescapable cost of making war. The bombing offensive will go on to achieve new records, and at some early point, it may earnestly be hoped, it will join hands directly with assault parties from the sea. If the German people are reaping the whirlwind, it is, after all, they who set the grim train of events in motion.

A Golden Jubilee

Little is heard in this country of Uganda, which celebrated its golden jubilee as a British protectorate on April 1st. Presumably this is because little has gone wrong with it. There are none of the obvious problems in this colonial possession which bring the others to the fore. There is no European settler population to complicate the work of the administration, as there is in the neighbouring colony of Kenya. There is no trading monopoly such as complicates the economic development of the West African territories. Almost the whole of the cotton growing industry, Uganda's staple crop, is in the hands of small native growers, and it is Africans, too, who are mainly responsible for growing coffee, the most important subsidiary crop. This absence of external complications has enabled the policy of indirect rule to be pursued more thoroughly in Uganda than perhaps in any other part of the colonial empire. There is also a large measure of indirect administration. The numerous dispensaries are largely staffed by Africans; there are training colleges for African teachers; and there is Makerere College, a centre for higher education for Africans, to which is also attached a hospital for training African doctors. It is well that the success of British rule in Uganda should be made known, because so much has been heard of colonial discontents that the idea is sometimes fostered, especially abroad, that the whole of Britain's colonial empire is in ferment. On the other hand, there is no need to be complacent, even about Uganda. Indirect rule may have justified itself there hitherto, if, as appears, the foundations of African government have been firmly laid. But it still remains to be seen whether indirect rule alone can lead to self-government, and it still remains to be seen whether an economy based on a small peasant agriculture is enough to ensure that the standard of living is continually rising. If these aims are lost sight of, there is a grave danger that the apparent happiness and placidity of life in Uganda may become merely an outward sign of inward apathy and stagnation.

AMERICAN SURVEY

The New Geography (From Our Washington Correspondent)

A COMPARISON of the respective effects of World War I and World War II on the map industry might be illuminating. World War I was a push-pin war, close-ranked rows of one colour pressed upon close-ranked rows of the other colour, while Mercator's projection inertly took the pricks. The geography of World War II cannot be treated that way. This war has made the world go round. From the Chief Executive and the Joint Chiefs of Staff to the man in the street new means of seeing it are being used. Among gadgeter's gazetteers, most conspicuous are the new 50-inch-diameter ball-bearing mounted globe in the President's Office, and the Map Room of the Joint Chiefs of Staff, with map walls, topped by clocks to show what time it is everywhere in the world, and magnetic devices to indicate the disposition of forces. On a scale for school and home use, newspapers and periodicals have been publishing special all-map supplements, which not only show the various theatres of war, but also serve as lessons in relativity, indicating how different geography looks depending on where you put your centre. *Life* magazine has been particularly prolific in this respect; the March 1st issue features a Dymaxion World Map, to be cut out and assembled by the reader, which equalises distortion by dividing the various areas into a series of segments, shows zones of temperature in colour, and provides statistics, by segments, on land and water area and population.

The idea is growing, moreover, that there is more to it than just geography. Much map-thumbings is now being done purely because of personal interest in location. This has been stimulated both by the travels of political headline figures and by letters from overseas as more and more American troops move abroad and it becomes known that Joe from down the street is on Guadalcanal, in Tunisia, or at the other end of the Alcan highway. But much is also being done out of interest that is more dynamic. Last year, geopolitics (American style) attained a success among intellectuals with the publication of a number of books, of which the most widely commented was Professor Nicholas Spykman's "American Strategy in World Politics." (Mr. Spykman is currently lecturing at the Army school for military administrators at the University of Virginia.) More recently, American geopolitics has been translated for general popular consumption—and the translation can be summarised by the single word "air."

The Uses of Advertisement

Both before and after American entry into the war, interesting use has been made of the paid advertisement as a means of communicating ideas. Consolidated Aircraft is printing a map of the northern hemisphere, exhibited by a boy to his father—"Your Child Can Show You a New World":

Many a time, when the going got tough, you've probably given your child a helping hand with his homework in geography. But now the picture is reversed. To-day your child can help you with your geography. His modern geography book is unfolding to him a world that didn't exist when you went to school. A world, for example, in which planes are spanning the Atlantic in a matter of 400 minutes—and a man can travel from New York to Moscow by plane in less time than he can go from New York to Miami by train—and the route from New York to Bombay is not a three-week voyage past Gibraltar and Suez, but a 40-hour flight where the way stations are Iceland, Oslo, and Moscow.

In this new world, the "rowboat" geography you studied as a child has been supplemented by to-day's "aviation" geography. The earth, and all the people on it, have become a global community. And rather a small one, at that. Barriers have been levelled off. Oceans are small bodies of water separating nations which must now become either friendly neighbours or close enemies. No spot on the globe is more than 60 hours distant from your local airport.

This is the world your child is being taught at school. And it is our world, as it really is. We must quickly learn

to understand it. For only then can we look beyond the horizons of the present toward the future and its promise. One thing is already as clear as though written in mile-high letters in the sky. Our growing air power is to-day become a mighty weapon in our hands for Victory. To-morrow it will be one of the implements with which freedom-loving nations can help build and enforce an enduring peace.

American Airlines illustrates a small globe (the world) inside a large globe (the atmosphere) with the following copy:

We submit this conception of our changed world as the basis for our war-thinking.

We exist upon one globe, and inside another globe. Our planet-earth is the centre of a larger airglobe. . . . It is like a small spherical kernel within a large spherical shell. Both globes, as one unit, follow the same orbit. We take our air with us—and always have.

The new factor that changes our world is the use of air as the only universal realm for transportation. In ratio as we do use it, we change the proximity and accessibility of all places, and effectively we make the world smaller.

With this conception as the basis for our war-thinking the world could make Peace permanent. . . . the human race now does possess the physical means of enforcing Peace. Consider the protective possibilities of air: Since air is everywhere, it is not possible for any person, clique or nation to hide anywhere upon the earth from air surveillance. If we have mastery of the air, we can reach the spawning grounds of the war plotters and prevent their preparations for war.

Consider the productive possibilities of air. To-day, all world markets are much closer neighbours than cities of the United States used to be. Air transportation makes possible a quicker post-war rehabilitation and a better world economic system.

Since it is primarily the use of air that makes this a Global War, it must follow inevitably that a dominant use of air can maintain Global Peace.

The United States has the beginning of the aviation machinery necessary to implement its democratic ideals and prevent a repetition of the war-crime by any nation. Attain the most powerful position in the air and automatically we will become the greatest Power for Peace.

Other companies tell the story in terms of the persons everybody knows. Following Casablanca, Transcontinental and Western Air, Inc., published a full page ad:

Thank you, Mr. President. Your flight to Africa shows the great faith you have in aviation. To the people of the United States your trip to Africa brought a tremendous lift in spirit and the assurance of great events to come. It emphasized your determination to carry this war to an early and successful end. . . . You have focused the attention of the world on the part air transportation is destined to play in communications between our own nation and every other nation on the globe. Thus, you have indicated to the thousands of young men in the air services of this country that their future after the peace is assured.

Alcoa Aluminium ("the metal that flies best") publicly avers:

Freedom of the Air is the Beginning of all Freedoms. It is now clear that Freedom of the Air is the crux of all we fight for. Our enemies planned to dominate the whole world by dominating the air. They have taught us that control of the air in ruthless hands can mean enslavement of the peoples, lands, and seas beneath. Now we see that Freedom of the Air is the beginning of all freedoms.

Here then is a high purpose that gives democracy meaning. Here is something bigger, more final, than our old earthborn belief in Freedom of the Seas. For we have found the controlling freedom, without which all others wither and die. America's very hope of existence as a good place to live depends on Freedom of the Air. With such a destination no sacrifice can be too great, no effort too much. For such a cause no American will hold back his substance, his hands, or his will.

The enormous public interest in aviation which these advertisements both reflect and stimulate has obvious political possibilities; of these, the Republican Party, currently in search of an appealing programme for the groundswell that is moving its way, seems to be fully aware. The hearing

—on all subjects—available to an aeronautical hero was clear enough before Pearl Harbour; it is clear again now in the case of Captain Eddie Rickenbacker, president and general manager of Eastern Air Lines, and ace of World War I who has kept his flying record up to date. On January 5th, before the Republican caucus as Congress reassembled, Representative Joseph Martin made a formal statement. (To call Mr Martin Minority Leader of the House is something of an understatement regarding a House composed of 222 Democrats, a large section of whom are Conservative Southerners, 208 Republicans and 4 Independents.) He said:

We shall co-operate fully in the winning of the war. There must be no partisan politics in the war effort, and as far as we Republicans are concerned there will be none. . . . We are determined the war effort shall be in charge of administrators selected solely for their ability and capacity to do the job, and not because of partisan or personal favouritism. . . . Aviation will be an important factor in the winning of the war. It will be an important factor in maintaining the future peace of the world. . . . We believe that while we concentrate on our war aviation needs, we must also plan the place America must occupy in air transportation in the post-war world. It shall be our purpose to demand a standing Committee of the House of Representatives to deal with our aviation problems and developments. America must rule the air, and to do this it is necessary for the Congress to plan intelligently for this air supremacy, following the war.

American Notes

The Battle for Stability

The fight against price ceilings is once more well underway. All the great union groups have professed, with varying vigour, their opposition to the present wage ceilings; and Mr J. L. Lewis is acting as a self-constituted spearhead of the movement to smash wage stabilisation. For their part, the farm organisations have not been idle. The administration has already made a number of concessions to the inflation blocs. Mr Henderson has gone. The use of subsidies to keep down the cost of living has been abandoned in deference to the farmers, who have a fancy for higher prices instead. Congress is teeming with legislation designed to force favoured treatment for the farmers. The Pace Bill, which provides that increased labour costs on the farm must be included in the computation of parity, has been passed by the House, and is now being mulled over by a Senate Committee. Labour costs in the last quarter of 1942 were 220 per cent of 1910-1914, against 154 per cent in 1941. Another Bill, which has been passed by the Senate, would forbid the Government to include its benefit payments to farmers in calculating whether particular prices had reached parity. This is a point on which Congress is especially sore, as it feels the Administration has wilfully misinterpreted its instructions in the Stabilisation Bill passed last autumn. This Bill would end the practice of adding Government payments to prices received when calculating whether a particular commodity has reached its ceiling. Now that the Administration has given way on subsidies, and agreed to small increases in ceiling prices where sufficient economies cannot be attained by reduction of costs, there is no hard and fast position to which it can cling. The way is open to mounting inflation through persistent nibbles. The Administration's line appears to be to warn the farmers that if it gives way to them it must also make concessions in other directions, notably to labour. But the effort to persuade the great pressure groups to stop in their tracks is weakened by the determination of Congress to oppose the Administration wherever it can do so with impunity.

Daily Bread

The meagre rations, by American standards, of meat, bacon, butter, margarine, cheese and cooking oils, now lumped together under a points system, is proof of the very real crisis in food distribution and production. The allotted 16 points a week per person cover very little more of the rationed foods than is available in this country, and in the case of meat, offal is included in the ration. It is, of course, a very substantial offset that milk, eggs, and preserves are as yet unrationed, and that poultry is plentiful. But it remains something of a shock to hear that Americans will be restricted to approximately a pound of meat a week, and to realise that—if the ration is forthcoming—to many this will mean an improvement. Conditions have varied widely over the country, of course. Aside from the meat shortage

in New York, it seems true to say that, as in this country, sufficient account has not been taken of changes of population, so that cities swollen with war workers, like Los Angeles, recently have been receiving only 61 per cent of their 1941 meat supplies. The present crisis is largely one of distribution, made tenser by the fact that war incomes are bringing new and bigger buyers to market. A strenuous effort is being made to convince the public that the food is going, not to Lend-Lease in any very great degree, but into their own kitchens, as well as those of the Forces. The more menacing problem, however, is that of this year's harvest. Unless the halcyon weather of 1942 is repeated—which is unlikely—there is little belief that the new farm goals can be reached, and a real possibility that the record of 1942 will not be maintained. The President's appointment of Chester Davis, head of the St. Louis Federal Reserve Bank, as War Food Administrator, with authority over all questions of production and distribution, is an admission that drastic action is needed if food supplies are to be kept up. It is now generally recognised that the War Production Board went too far in cutting the production of agricultural machinery; instead of 20 per cent of 1940 production, allocations of materials have been pushed up to make possible 60 per cent. It is also agreed that an end must come to the drafting of farm workers. Mr Roosevelt has announced that during 1943, 3,000,000 men in the draft ages will be deferred.

Controlled Materials

On Thursday the Controlled Materials Plan came into operation. This plan will regulate United States allocations of steel, copper and aluminium. According to an official announcement by the War Production Board, the quantities allocated under the plan for the second quarter of this year are 15 million tons (of 2,000 lb. each) of carbon steel, 2,000,000 tons of alloy steel, 600,000 tons of copper, and 300,000 tons of aluminium. All these figures, and especially the two latter, are higher than was expected as recently as the turn of last year, a proof that the various supply expansion schemes are making progress. Meanwhile certain changes in the CMP have been introduced. The number of "claimant agencies" (contract-placing Government departments) has been doubled. In addition to the original seven claimant agencies (Army, Navy, Maritime Commission, Aircraft Scheduling Unit, Lend-Lease, Board of Economic Warfare and Office of Civilian Supply), the War Production Board Facilities Bureau, the National Housing Administration, the Petroleum Administrator for War, as well as the offices of the Food Administrator, of Defence Transportation, of the Rubber Director and of the Power Director, are now recognised claimant agencies for the controlled materials required under their vital construction programmes. Contractors working on essential orders from Government Departments not recognised as claimant agencies under the CMP are represented in the WPB Requirements Committee through the Office of Civilian Supply. Another amendment by which procedure will be very much simplified is the decision that all allocations will be made on a quarterly instead of a monthly basis. In order to prevent the extension of the allocation period from leading to excessive orders in the first weeks of each quarter a clause has been introduced under which persons who receive allotments must not call for delivery of more than one-third of the total in the first month of the quarter. For the time being the list of controlled materials has not been extended beyond the original three groups although it had been widely expected that, owing to its growing scarcity, rubber would be placed under CMP. Under a new WPB order, however, Mr. Jeffers, the Rubber Director, has been authorised to allot rubber in future to Government departments acting as claimant agencies under the CMP and it appears that for the present this is to remain the only link between rubber and the CMP.

Shorter Note

The new development of rationing technique, which puts on a common points system such major articles of consumption as cheese, meat, butter, bacon, and margarine, allows very wide freedom of choice to the consumer, and for that reason is particularly suitable to a country with wide regional variations such as the United States. Until the system settles down, it seems likely that it may add to the difficulties of estimating consumption, but after an experimental period, it should prove possible to adjust point values to remedy any difficulties.

THE WORLD OVERSEAS

Industry and Labour in Holland

(By a Correspondent)

March 29th

AFTER nearly three years of occupation, Holland's economy conforms more closely to the original Nazi system than that of any other country under German domination. The alignment of German and Dutch economic conditions has gone very far, though the adaptation to the Nazi system was gradual. Mere collaborationists who tried to retain a measure of independence were finally replaced by Dutch Nazis in all important positions, and, at present, economic activities in Holland are directed under the same decrees which were introduced in Germany after the disaster of Stalingrad. Since the end of 1941, in fact, the time lag between a new economic decree in Germany and its introduction into Holland has shortened considerably, which shows that the administrative machinery has been thoroughly nazified. As in Germany, employers and workers of all kinds are now compulsorily organised. In agriculture, the *Landstand* is equivalent to the German *Reichsnaehrstand*. In industry, there are 28 "Economic Groups." Banking, insurance and commerce have their separate organisations, and the former trade unions have been replaced by a Dutch Labour Front.

There have been two distinct phases in Holland's economic development under German occupation. As long as Germany was chiefly interested in economic collaboration, that is, in placing sub-contracts with Dutch factories, a comprehensive system of rationing, price control and financial control was deemed sufficient. But when Germany was forced to concentrate industrial activity within the borders of the Reich, complete compulsion became necessary, and this was achieved by introducing the Nazi system.

During 1941-42, the greater part of Holland's industry, dependent on overseas supplies, came virtually to a complete standstill. Most of the large oil crushing mills were closed down, and the margarine, soap, tobacco, bacon curing and other food industries were heavily reduced. In July, 1942, private building was prohibited. During the phase of industrial collaboration, a great effort was made to start the thorough use of substitute materials, particularly artificial textile fibres, leather and plastics. But the plans were obviously far ahead of actual possibilities, and under the new concentration of industries most of them will have to be abandoned. A notable exception is the shipbuilding industry, which has been working at full capacity since the beginning of 1941. The large radio, electric equipment and signal instrument works are also fully occupied with orders for the German *Wehrmacht*. The diamond industry is working sporadically, according to supplies delivered by Germany. Great efforts have been made to maintain the coal output, but, in spite of compulsory Sunday work for miners, output seems to have fallen off during 1942. Poor food, lack of pit props, as well as increasing difficulties in replacing mining machinery and equipment, seem to be the chief cause. The only iron and steel works of importance, the *Hoogovens* and *Staalfabrieken-Ymuiden*, has reported a considerable decline in profits. The works are now owned by the *Vereinigde Stahlwerke*, the leading German steel concern. The German armament concern, *Rheinmetall-Borsig*, acquired the *Werkspoor NV*, manufacturers of machine tools and railway material. In the cement industry, a German-Dutch concern was set up, but the actual penetration of Dutch industry by German capital interests has remained relatively small. It seems that German capital acquired Dutch interests in the companies of other countries. Actually, all barriers between Germany and Holland have been removed in this respect, since the shares of Dutch companies are allowed to be quoted on German bourses.

The close proximity of Holland's coalmining district to important German industrial areas has induced the Germans

to make greater use of electric power generated in Holland. Several power stations have been linked to the German grid system. Naturally, rationing of coal and power became necessary, and the restrictions placed on passenger traffic on Dutch railways are as severe as in Germany.

The Labour Shortage

At present, a new concentration in the whole of industry, and especially in the retail trade, is being attempted to provide Germany with more labour. Shortly after the occupation, the total number of unemployed amounted to roughly 300,000. The following figures published by Dutch and German papers indicate the changes brought about by Germany's needs:—

	Unem- ployed	On Relief Work	Employed in Germany	Employed in France
End of 1941	123,000	70,000	150,000	29,000
October, 1942	42,000	33,000	223,000	37,000

These figures show that last year the total number of Dutch workers employed outside Germany had already reached 260,000. In addition, roughly 50,000 workers living near the German frontier cross the frontier daily to work in Germany—frontier-walkers (*Grenzgaenger*) as they are called. In other words, more than the 300,000 registered as unemployed after Holland was occupied are now work-

INFLUENZA GUARD YOUR STAFF

STAFF is more precious than ever. Safeguard against depleted Staffs by the right use of "SANITAS," the antiseptic and germicide recommended by Doctors and Medical Officers for very many years. It is safe and non-poisonous.

SPRAYING ROOMS—Spray all offices and workshops with undiluted "SANITAS" at least once a day. If an epidemic has already taken hold, spray more often.

Freshens and purifies the air by **RELEASING OXYGEN** and the odour of pine trees into the atmosphere.

MOUTH and THROAT WASH—"SANITAS" contains Thymol, recommended for this purpose by the Ministry of Health.

Keep a bottle in the Staff Washrooms, and post instructions for use.

AFTER WORK—a little "SANITAS" added to the personal wash after work is a wise precaution against spread of germs.

Widely used in Hospitals, Institutions and Public Buildings.

At Chemists, 1/1½ & 1/8 (incl. Pur. Tax)

SANITAS
THE SAFE ANTISEPTIC

ON REQUEST—Valuable War Memorandum on prevention and treatment of infectious diseases. Write (enclosing 1d. stamp) to: SANITAS CO. LTD., Dept. BCO/4, 51 Clapham Road, S.W.9.

ing outside Holland. At the same time, all persons aged 18 to 25 years are liable to serve in the Compulsory Labour Service. Recently, the number of labour camps was increased from 49 to 54, and it can be assumed that the labour service was extended at the same time. Compulsory labour after the German model was introduced some time ago, which makes it possible to direct people to work in Germany, too. In spite of the low economic activity, labour has become scarce in Holland, and the Nazis are at present trying to recruit more labour from domestic service.

Registration and control of labour are comprehensive. The first step was the concentration of communal and private labour exchanges under a Central Labour Office. The introduction of a work-book followed hard on the compulsory organisation of workers in a Labour Front, and the pernicious system of denying unemployment benefit and food ration cards makes it practically impossible to refuse work in war factories in Holland or in Germany. As in other occupied countries, short-time work was largely in operation during the first period of the occupation, but, last year, a minimum working week of 48 to 54 hours was decreed. This made it possible to send more workers to Germany.

Within the factories, the new Labour Front works on the same principles as the German Labour Front. The so-called social foreman is the latest means of securing political control over the workers. On paper, social insurance has also been adapted to the Nazi system. The main object is the centralisation of the different insurance schemes. Under the pretext of restoring the financial position of the insurance funds, new contributions have been introduced amounting to 4½ per cent of wages, of which employers will have to pay 1½ per cent.

Eire's Unemployment Problem

[FROM OUR DUBLIN CORRESPONDENT]

March 15th

At the beginning of the war, grave fears were entertained about the magnitude of Irish unemployment. At the present time, the number of unemployed is about 80,000. While this figure is, in all conscience, large enough, it is not so large as it would have been if it were not for the absorption of numbers of men in the Army and other defence work. Moreover, the drain of emigration has swollen to quite abnormal dimensions. The problem that is now engaging attention is that of finding work for the emigrants when many of them return, as they inevitably will, after the war. The intentions of the Government in this matter have been partially revealed by Mr de Valera in a recent speech in the Dail. While it is clear that the problem is being studied in official quarters, it is far from certain that anything approaching a satisfactory solution has been reached. The impression created by Mr de Valera's speech is that of good intentions rather than of specific proposals.

Mr de Valera is occasionally disarmingly frank in admitting the existence of difficulties outside the Government's control. While in his early days of office he appeared hopeful of greatly increasing employment in the country, he now apparently thinks that the problem of unemployment is insoluble without a degree of regimentation which no democratic country would stand. He made some extremely sound and sensible observations regarding the difference between conditions in wartime and conditions in peace. He pointed out that people in war-time are willing to make abnormal efforts and sacrifices and to suffer a degree of public regulation and control which is impossible in peacetime except in totalitarian states. Moreover, the standard of living is deliberately depressed by means of rationing schemes and taxation, and the consumption of capital is temporarily tolerated. In emphasising the fact that the disappearance of unemployment in wartime is the result of extraordinary work, saving, poverty and suffering, Mr de Valera struck the right note. He emphatically repudiated the suggestion that facile financial manipulation can act as a substitute for these real efforts and sacrifices.

The Land

In explaining the Government's programme for providing employment after the war, Mr de Valera emphasised that the continuance of the policy he had pursued for the last

ten years would produce the best results. He thought that the possibilities of industrial protection had not been exhausted, but he gave no concrete instances of industries capable of immediate expansion. The Government's housing programme would be resumed on a large scale. He expressed the hope that the scientific development of agriculture would enable a larger population to be maintained on the land. He stated, however, that the policy of land division which had been interrupted by the war would be resumed at an accelerated pace. These two agricultural policies would appear to be inconsistent. The scientific development of agriculture depends upon the creation of larger rather than of smaller farms. The Banking Commission emphasised very strongly that agricultural efficiency, especially in those branches of farming producing for export, had been materially impeded by the programme of land division. If the only object of the agricultural programme were to provide employment, the subdivision of holdings would be an admirable method of creating work for work's sake. That this consideration was not absent from his mind was revealed by Mr de Valera's reference to the beneficial effects on employment given in the actual process of preparing the land for subdivision.

Ever since the Treaty, much discussion has taken place on the possibility of providing employment by afforestation, land reclamation and arterial drainage. Commissions have investigated these subjects, and a certain amount of experimental work has been undertaken in regard to them. From the point of view of providing employment, these schemes are all rather disappointing. Mr de Valera stated that afforestation was not proceeding as rapidly as he would wish, but that it was impeded by many difficulties which caused delay. Land reclamation, while giving a fair amount of employment, is very costly, and the results seldom justify the capital outlay involved. Schemes of arterial drainage are to be pushed forward immediately. The labour content of such schemes is low in relation to the capital cost. It was recently reported by a Commission on the subject that arterial drainage could not be justified on economic or financial grounds, but that nevertheless it should be undertaken on a large scale for social reasons. Similar considerations are relevant to the electrification of rural areas. The social benefits to the countryside of such electrification would possibly outweigh the direct financial losses incurred. From the point of view of providing employment, electrification possesses many merits. The general impression produced by Mr de Valera's speech is that the problem of post-war unemployment is going to be an exceedingly difficult one, and one for which the Government at the present time appears to have no complete solution.

Portuguese - Spanish Trade

[FROM OUR LISBON CORRESPONDENT]

March 1st

THE signature of a fresh trade agreement, governing economic relations between Portugal and Spain during the current year, has been officially announced. Mutual dealings to a total of 240 million escudos on both sides are allowed for. This is twice last year's figures and five times greater than the annual average in the period prior to the Spanish civil war. Portugal is to supply tin, timber, manganese ore, chrome and antimony, old metals, rasps and files, china clay and whale oil, as well as colonial produce such as beans, coffee, sisal, palm oil, castor oil, copra and fish oil. Spain will send coal, iron, lead, potassium chlorate, chemical and pharmaceutical preparations, cigarette paper. Spain will also assist in the matter of transport facilities, more specifically providing maritime transport for petroleum products shipped to Portugal.

Germany at War

War Finance

ON the threshold of the new financial year 1943-44, the German papers are divided on the question of war finance. The disproportion between last year's small increase in revenue and the considerable rise in public borrowing has led to discussions about the limit of borrowing, new sources of revenue, and generally about the technique of financing. The old certainty that financing war presents no difficulties if production and distribution are well organised and efficiently controlled seems to have gone.

Apart from the regular publication of the national debt and infrequent global estimates of the revenue, figures are no longer published. The following table shows the level reached by taxation in 1942-43.

REVENUE (In 1,000 million Reichsmarks)			
April/March :	Total	Rm	Increase %
1939/40.....	23.5	5.9	33.3
1940/41.....	27.2	3.7	15.8
1941/42.....	32.5	5.3	19.1
1942/43.....	35.0	2.5	7.7

Income and wages taxes, the corporation tax, and the turnover tax account for the greater part of the revenue. The income and wages taxes have remained practically unchanged since the beginning of the war. The corporation tax, however, was twice increased. On July 1, 1941, a war surcharge amounting to 25 per cent was decreed, which was raised to 37.5 per cent in January, 1942. During 1942, a modified form of excess profit tax was introduced.

An indication that the limit of the wages tax had been reached was the introduction of the system of iron savings, which amounts in effect to a reduction of both this tax and the contributions to social insurances. Official sources gave contradictory estimates of the actual loss in revenue. At the end of 1942, house owners had to pay into the Treasury the capitalised house-rent tax, which gave the Treasury a total of roughly Rm 8,000 million. The annual loss of revenue by this abolition of the house-rent tax amounts to Rm 850 million. The new excess profits tax and an earlier increase in the excise on tobacco and alcohol cannot make up for this loss; and full effect of these reductions will be felt during the coming financial year. There is no hope that the income and wages taxes will give a greater yield during the coming year, even if a considerable number of women are additionally employed.

It is assumed that during 1943-44 total expenditure will remain at the level of 1942-43. This statement was made at the height of the campaign for changing over at last to "total war," and can only be taken as an unguarded utterance implying that no further actual increase in production is possible. In addition to this revenue, the Reich has at its disposal the war contribution of the German communes and the various tributes and occupation costs of occupied countries. These additions were officially estimated for 1942-43 at Rm 14,000 million. During the coming year no increase is possible. Economic activity in all occupied countries will probably decrease, because of the concentration of labour and material resources within the Reich.

Various suggestions have been made for an immediate strengthening of Reich finances. The so-called industrial levy, for example, could be capitalised like the house-rent tax. This would bring no substantial relief and would at the same time mean another reduction in revenue. It is also proposed to sell to mortgage banks the large mortgages held by the social insurance funds. These transactions cannot change the actual financial situation; by them, debts are merely shifted from one place to another and, as was shown last year, cannot arrest the formidable rise in public borrowing.

At the end of 1941, the total national debt was roughly equal to the national income. At the end of 1942, it had reached approximately 150 per cent of the national income. If there is no increase in revenue, and if expenditure remains at the level of 1942, the nominal national debt will be nearly twice the national income at the end of 1943. These are the considerations on which German papers are basing their discussions about the limit of public borrowing. The total national debt of the last war amounted to Rm 150,000 million. It was finally wiped out by the unlimited inflation of the currency. At the end of this war,

the Nazi regime hopes that the national debt can be reduced to manageable proportions by selling to the public land and property in occupied countries.

NATIONAL DEBT
(In 1,000 million Reichsmarks)

End of year :	Total	Rm	Increase %
1939.....	45.9	18.5	68
1940.....	79.5	33.6	73
1941.....	128.5	49.0	62
1942.....	185.6	57.1	45

There is a curious futility about the present financial discussions in Germany. The pretence of absolutely stable prices is still kept up and the wholesale price index actually shows an advance of only 1.9 per cent during the whole of 1942. The index of the cost of living rose by 2.2 per cent during the same period. The introduction of fixed prices for armaments is stated to have reduced armament costs; and the situation, it is said, makes it possible to decree a further reduction of 5 per cent. The greater part of the national income consists of wages and salaries. Yet the excess purchasing power from wages and salaries must be small. The increase in small savings, amounting to Rm 15,000 million during 1942 against Rm 10,000 million in 1941, comes much more from small shopkeepers and independent artisans than from workers. German papers state that most wage earners find it still difficult to save any money at all.

The problem of the excess purchasing power should rather be called the problem of excess purchasing power in relation to capital goods. The idle capital from sold-out stocks of commodities, postponed repairs and renewals in factories is growing in proportion to the concentration of industries and the length of the war. During the first period of the war, this fact was reflected by the tremendous increase in bank deposits. At a later stage, this excess liquidity created the continued boom in shares at the Bourse which has now been stopped by a virtual closing-down of the Bourses. Dealings are restricted to three days a week. A quotation stop has become effective and shares exceeding in value Rm 50,000 against the old limit of Rm 100,000 which have been purchased after September, 1939, can be called up by the Treasury to be exchanged into Treasury bonds. Once again, there is talk about the so-called self-financing of industry. But a considerable part of the idle money capital has been accumulated by the banks. Annual reports of two leading banks, available at present, show that during 1942 advances increased to a much greater extent than deposits.

The situation seems to be that, at the beginning of a new financial year, some drastic change in method is called for. The planning of production and distribution without respect to rising costs and to the actual losses of material by large-scale warfare is obviously at variance with the financial situation, with prices and wages, as well as the monetary situation. Speer, the supreme planner of production, like the agricultural leaders, would like to abolish the whole financial mechanism and replace it by a points system. The Minister of Economic Affairs, together with the Minister for Finance and the Price Commissar, on the other hand, seem to hold the view that the financial and monetary mechanism must be allowed to exert some control over production and distribution. This dilemma is at the root of German war finance. The wages stop actually stabilised wages, but prices are fictitious. All agricultural prices are heavily subsidised and the prices for manufactures are calculated and fixed on an arbitrary basis. Revenue cannot be increased unless the turnover tax is at least doubled. This, however, would reduce the purchasing power of the greater part of the population. The only way out is, therefore, a gradual increase in public borrowing, which was already roughly 54 per cent of total expenditure last year. German war finance has crossed the danger line.

THE BUSINESS WORLD

War Contract Prices

THE Seventeenth Report from the Select Committee on National Expenditure, 1941-1942, on Merchant Shipbuilding and Repairs, focused attention on price-fixing methods in Government contracts. The Committee deplored the fact that "under the present arrangement in the Admiralty Contract Directorate, the final price is not agreed until at or about the time of launching, and in some cases not until the ship has been handed over," in spite of the claim made for this system that "it approximates to a fixed price contract." The question at once arises, what is a fixed price contract? For all prices are, strictly speaking, "fixed." How is the genuine fixed price to be distinguished and what is the practice of the Government Supply Departments in placing war contracts?

Properly understood, a fixed price, as a previous Select Committee pointed out, is "a price which is fixed before production begins, or at a very early stage in production." In the absence of effective competition that would permit of competitive tender, a fixed price thus defined is the best possible arrangement. All three Government Supply Departments—the Admiralty, the Ministry of Supply and the Ministry of Aircraft Production—have been completely in accord in aiming at this. But for the major articles of supply, such as the air-frames and aero-engines of MAP and the tanks and guns of the Ministry of Supply, it has been

found quite impracticable to agree on a fixed price at an early stage in the contract negotiations. All these heavy stores are subject to constant changes and modifications in the course of their production. To lay down hard-and-fast rules about their price at the beginning of their manufacture is not possible, and it is in their differing methods of costing and pricing articles at a comparatively late stage in manufacture, not in their common agreement on the desirability of arriving at an early fixed price, that the practice of the three Supply Departments has to be distinguished.

Both the Admiralty and the Ministry of Aircraft Production have at their disposal a large Technical Costings Staff. The task of these experts has been defined as "the estimation of the costs likely to be incurred in production which has not begun or is in its early stages." In practice, however, they are often obliged to perform their work when production has been practically completed. In many cases the contract officers have to fall back, not on technical estimates, but on actual costs, in arriving at the definitive price. But MAP price settlements, even those arrived at late in the process of manufacture, are normally based on technical estimates, and there is no departmental machinery for ascertaining costs after production has been completed. It is, therefore, an error to apply such terms as "cost plus" or "time-and-lime" to these settlements. The term "fixed price" is applied by the Admiralty and MAP not, in the manner of the Select Committee of 1941, only to a "price fixed before production begins, or at a very early stage in production," but to a price fixed at any stage of production, not excluding the penultimate stage. The earlier the price is fixed, the nearer does it approximate to the hitherto accepted definition of a fixed price, while the later it is fixed, the nearer it must tend to approach the "cost plus" price arrangement.

Like the two other Supply Departments, the Ministry of Supply has always attempted where possible to secure early fixed prices, and there has never been a time when at least 50 per cent of their contracts were not on a fixed price basis. But, ever since the last war, there has been in the Contracts Branch of the War Office, which is now part of the Ministry of Supply, an alternative to the fixed price in the shape of the maximum price used in conjunction with a costings clause. A maximum price contract is one "in which a maximum price (which includes both cost and profit) is set before production, and the contractor is paid the costs actually ascertained by post-costing plus an agreed profit, subject to the maximum price not being exceeded." The Department secures the right to conduct post-costing investigations by incorporating in all maximum price contracts a costings clause. For not only may the maximum price never be exceeded, but the Ministry of Supply also reserves its right to withhold a percentage of the maximum price, if post-costing investigations show this to be fair and reasonable. A body of skilled cost accountants are specially employed by the Department to perform the work of post-costing.

The use of the maximum price by the Ministry of Supply was the subject of adverse comment in the Fourth Report from the Select Committee on National Expenditure, 1940-1941:

The fixing of a maximum price is an attempt to limit the extravagance that may arise from the simple cost plus arrangement. This introduces the need for some estimation of, and agreement on, what the final cost is likely to be; but unless it is combined with a target cost, it does not offer the contractor any direct inducement to reduce costs below the agreed maximum. In contrast with the target system proper, the maximum price in fact provides a target at which the contractor may aim, whereas the so-called target cost provides a figure below which the contractor is encouraged to work.

Later, the Select Committee went on to say that:

The Ministry of Supply took over this (maximum price) system (from the War Office) in spite of the fact that the

field of production covered by them is well adapted to the use of technical costing, and that the machinery for this is fully developed in all the more important firms concerned. The reluctance of the War Office to adopt this simpler and more efficient system, and the fact that the Ministry of Supply set up no organisation for this purpose, is the more surprising since the recommendation that they should do so is no novel one. Twenty-two years ago the Select Committee on National Expenditure of 1918 strongly recommended that full technical investigation should be the basis of contracts for supply, and with that recommendation the sub-Committee fully concur.

Here, then, are two distinct charges preferred against the price-fixing practice of the Ministry of Supply: the uneconomical character of the maximum price, and the failure of the Department to use technical costings. What answer can the Ministry give to these charges?

In the first place, during the expansion period of 1935-39, and the early period of the war, the Ministry did, in fact, employ the target cost, in conjunction with the maximum price, for a certain number of its purchases. The firms who beat the target received 25 per cent of the difference between the target cost and the actual ascertained cost. This was a substantial incentive to economy. Subsequently, the target cost was applied to shells and other munitions of war, including tanks. The producing firm normally received 25 per cent of the difference between the target costs and the ascertained costs. Although the Ministry of Supply still used target costs in the early stages of the war, that practice is now defunct. It is claimed that target figures are suitable to the early stages of production in that they encourage rapid and efficient manufacture and economy but are of little value when production is well under way. The charge, therefore, that a maximum price, unrelated to a target cost, militates against economical production still remains. In rebuttal, the Ministry of Supply can point to the Report of the Controller and Auditor-General on the Ministry of Supply Appropriation Account, 1939, which gives instances in which that inseparable accompaniment of a maximum price contract, the investigation of actual costs

has been successful in securing large savings to public funds as compared with prices which were based on estimates of

the cost of materials, direct labour and overhead charges, with an addition for profit.

This points the way to the answer to the second charge—the neglect of technical estimates. The Ministry claims that, when necessary, it has made use of the Technical Costings staff, a body intended to provide a common service for all Supply Departments. But it is pointed out with some justice that, for a fixed price based on technical estimates to be effective, the price must be agreed either before the contract is placed or as soon as possible after that event. If this cannot be done, it is better to fix a maximum price at once, rather than to insist upon a fixed price which, if determined at a late stage in production, may dangerously resemble a cost plus contract. But, as previously stated, the Ministry of Supply definitely prefers a fixed price, when the price can be fixed at an early stage of the contract, and regards the maximum price and the costings clause as only the second best solution to the problem of arranging "a fair and reasonable price" for its purchases.

In the light of the foregoing analysis, the attitude of the Admiralty towards contracts for merchant shipbuilding, and the recent criticisms of the Select Committee, become intelligible. The Admiralty cordially agrees that a fixed price should be secured wherever possible, but has always maintained that time was the vital factor, and that the advantages of a fixed price contract could only be obtained if the price was fixed either before the work was taken in hand or at an early stage of the work; and that in the large majority of cases it is not possible to say until the work has proceeded, often to an advanced stage, how much work will in the end be involved. The Select Committee hold out, in their turn, for the recognition of the principle that "cost plus methods should only be permitted on grounds of extreme urgency, where it is essential to begin and to complete the job within a matter of days." The problem of price fixing in Government contracts thus admits of no easy solution. The manufacture of new types, sudden changes in quantitative demand and the paramount need for rapid production: all are factors militating against the fixed price contract and in favour of the cost plus arrangements which all are agreed in condemning.

Finance and Banking

Bill Market's Low Quota

At last week's Treasury bill tender the bill market allotment dropped to the abnormally low level of 11 per cent, which is equivalent to about £8½ millions of bills. Only once in the war period has the market been less successful than this—on February 7, 1941, when it secured 10 per cent, on a total issue of £65 millions. To what extent this decline from the not unsatisfactory allotment ratios of recent weeks may have been due to special non-market tenders at fine rates, it is hard to say, but the fall in total applications suggests that such influences cannot have been important. The main explanation, undoubtedly, is that, although they concentrated upon the 91-day bills, the discount houses tendered at the same price at which they have lately been applying for 92-day bills, despite the fact that the shorter-dated bills included the normally covered June 30th maturities. In this they have shown a greater restraint than on former occasions; a year ago, they secured a 60 per cent allotment, but only at a price which showed a mere five-eighths of a penny margin over the basic money rate and the rate at which bills can be resold to the banks. Bill dealing is now conducted on such exiguous margins that applications on terms such as these clearly cannot be justified except at moments when portfolios have been abnormally depleted, and when their replenishment is imperative if the market is to perform such vestiges of its former functions as now remain to it—notably, the function of supplying the banks with the maturities they need. Such considerations evidently did not arise on this occasion. Even so, the syndicate's tactics are significant from another point of view. Their casual attitude towards the end-June bills is striking evidence of confidence, which experience in the London "Wings" Week must have consolidated, that the authorities both can and will ensure that the discount houses are not embarrassed by spasmodic disturbances in the short loan market. It is true that even in the cheap money period before the war, June 30th had begun to lose its terror for the market. But in those days the market often felt pretty

sure of getting special assistance, it rarely got it on terms which did not involve some sacrifice, however small by contrast with the former tradition of discounts or loans at or over Bank rate. Now the operation is both certain and painless. The implications of this distinction are more fundamental than has, perhaps, yet been fully realised.

* * *

Turnover since the War

This, of course, is not the only respect in which the bill market's lot has been eased by wartime conditions. Bill dealers as such have had to work to fine margins, but they have found compensation in the greatly increased volume of bills which they now habitually handle. The increase has been more substantial than is generally recognised outside the market itself, owing to the habit of looking at the percentage allotments rather than their actual amount. Except for the first year of the war, the market's percentages (even when expressed in terms of total bills issued, instead of individual applications) have indeed been somewhat lower than they generally were in pre-war days. The average percentage for the past quarter has, moreover, been one of the lowest of the war period; yet in these thirteen weeks, despite the very small allotment at last week's tender, the discount market has almost certainly taken up more Treasury bills than in any comparable quarter previously. On the assumption (which is probably not far from the truth) that the market syndicate now customarily applies for a quantity equal to the amount of bills on offer, market allotments in the quarter will have totalled £303 millions, an average of over £23 millions per week. This average, in the lean quarter, is a shade more than the larger pre-war syndicate secured at the best single tender in the last pre-war year, and is only a little less than twice the average allotment for the whole of that year. The following table, in the computation of which due allowance has been made for each of the main changes in syndicate tender policy so far as they have become known, plainly shows the wartime trend.

§ Quarterly average.

central banks. Secondly, there is the curious circumstance that when the weekly tender offer was raised to £80 million and £85 million in October and November, 1942, the market's share actually fell.

Heavy Special Buying

Even on the earlier days of the past week, credit conditions were on occasion unusually tight, notwithstanding the market's very low bill quota and the fact that transfers of virtually the whole of the £70 million call for Treasury deposit receipts was delayed until the final days. One or two banks, of course, have been making up. According to reports, some sections of the market have had to utilise the facilities of the special buyer on a substantial scale, but there is no evidence of such operations in the Bank return. On the contrary, Government securities have fallen sharply by £28.1 million, reversing the previous week's expansion in the credit base, and the chief counterpart of this movement is a decline of £25.2 million in bankers' deposits to £144.3 million. Presumably, the bill buying has been for account of public departments, the relief to the market being the avoidance of any immobilisation of funds on public deposits, which remain below the £6,000,000 mark. The note circulation has risen by a further £5,815,000, reducing the reserve of notes to £15,709,000, and a further increase in the fiduciary issue cannot be long delayed.

Floating Debt Contrasts

During March, Government expenditure exceeded receipts by £255.3 million; £72.1 million (out of £317.5 million) of revenue was transferred by the tender of tax certificates and £77.5 million of TDR's were encashed before maturity. In addition, TDR maturities totalled £140 million, so that the net result of the month's TDR borrowing was a net repayment of £31.5 million. In the light of these movements, it is not so surprising that even

London's savings week failed to disturb the ease of credit. Purchases of tax certificates amounted to £46.3 million, so that the outstanding issue declined by £23.8 million to £445.1 million, a fall of £48.8 million from the end of January peak. On balance, the floating debt showed a further slight rise during the month, contrasting with a contraction of over £130 million in March, 1942. At £4,096.9 million, total floating debt is some £68 million higher than at the turn of the year, whereas the corresponding quarter last year saw a net reduction of some £300 million. The contrast is mainly reflected in the level of the TDR issue, which at £969.0 million is £472.5 million higher on the year. The usual table showing the different ways in which expenditure has been financed will appear in the Budget Supplement next week.

Kennet Advisory Committees

Though the Government has never actually announced its formal adoption of the Kennet Report, it is known that the banks and other financial institutions have been carrying out staff changes on the basis of the recommendations. It is understood, indeed, that the banks have even made some beginning with the employment of part-time workers. A further step in the implementation of the proposals has now been taken with the appointment of three advisory committees, as suggested in the Report. In the case of the banks, for example, it was suggested that a body representing the clearing banks should report progress periodically to the Treasury, who would consider such reports with the assistance of an advisory committee, one of whose most relevant functions would be to make use of the information and advice available from the representatives of employees. The committees now set up comprise the members of the original panels, with some additions. The committees concerned with banking and industrial assurance are to assist the Treasury and the Industrial Assurance Commissioner, while the body concerned with ordinary insurance is to advise the Board of Trade.

Indian Sterling

At the time of the Budget debate in the Legislative Assembly, the Government of India was attacked for permitting the accumulation of huge sterling balances during the war. This criticism was carried a stage further recently in a statement made by the President of the Federation of Indian Chambers of Commerce and Industry. His contention was that the maintenance of Indian sterling balances in London, on the ground that they would assist India's purchases after the war, really meant that they were designed to provide an assured market for British exports. He maintained that such credits should be used for "constructive purposes" during the war, and that India should have a free hand to make purchases in the cheapest and best markets—outside Britain if necessary. One of the resolutions passed by the Federation was that sterling balances should be used to repatriate British commercial investments in India. All this has, of course, been heard before, and betrays the usual confusion of economic and political considerations. India's conversion from a debtor to a creditor nation in so short a space of time has been largely due to the fact that Great Britain has shouldered so large a proportion of the cost of Indian defence. This has enabled India to repatriate the whole of its public debt, and to accumulate sterling which, however much it may stimulate British export industries, will mean considerably more to India at a time when its reconstruction needs will be at a maximum. The statement that India should use these balances for constructive purposes now must be classed as purely propagandist. Now that the United States is in the war, what nation could supply India with goods, and in whose ships are they to be carried? Freedom to buy in the cheapest market after the war is, of course, a different matter. Whether it will be possible to convert overseas sterling balances into other currencies without endangering the stability of sterling must depend entirely on what success is achieved in establishing a truly international exchange and trading regime. Another criticism voiced by the Federation was that accumulated stocks of silver were being sold at a low price compared with that paid to US and Mexican sellers. This also is beside the mark. The silver which the British Treasury now sells at 23½d. was probably bought from the Indian Government some time before Bombay silver prices rose to their present inflated level. The fact that Great Britain may obtain Lend-Lease supplies of silver from the United States suggests that further shipments from India are not contemplated.

Investment

Gold Mines Again

As was indicated last week, the general course of markets has recently been upward. The attached chart of indices of the *Financial News* shows a 1½ per cent rise in equities, and a very minor appreciation in fixed interest stocks, to which the Funds made little contribution. The feature of the month has been the recovery in diamond shares and gold mining shares situated in the Union of South Africa, while towards the end of the month, internationals, foreign bonds and West African gold mining shares were also in demand. This general picture suggests strongly the belief among investors that there are greater rewards to be obtained outside this country than within it, at least until such time as the official attitude towards private enterprise is more clearly defined. That is, however, not the whole story so far as gold mining shares are concerned. The turnover in these, as judged by the number of bargains received, has more than once been rather greater than at the time of the sharp burst of activity in mining shares in November last. At that time, the market was perturbed at the course of events. There was talk of the dangers of ragged speculation, and special steps were, in fact, taken to curb it. On this occasion, not a word has been heard of such ideas in connection with the boomlet in Kaffirs, which is now considered not only respectable, but also soundly based. The reason for this change of attitude is, immediately, that the present buying comes from quarters which are normally considered to be reasonably well informed. Less directly, it is the belief that recent indications of post-war policy for the regulation of international exchanges point to the continued use of gold. Full particulars of individual plans have still to be revealed, and there is no certainty of an early agreement, but it is possible that the buyers are really better informed than the public. However that may be, it will effect the long-term outlook for the industry only. There is every reason to look for a further minor deterioration in conditions while the war lasts. Mr Carleton Jones, President of the Chamber of

Mines, stated at the annual meeting this week that the effect of the special contribution of the gold mines to the revenue of the Union was, in large measure, to nullify the revision of taxation granted in 1936, which was based on the encouragement of mining of low-grade ore. So long as the

FIXED INTEREST AND EQUITY SECURITY
MOVEMENTS (July 1, 1935=100)

(converted to new base) and 30 ordinary shares

present tax continues, it will restrict development and reduce the theoretical life of the mines. There can be very little doubt that South Africa will do her utmost to maintain the yield of this wasting asset once the war is over. It is, however, an asset of rather limited life, and every effort

REFUGE ASSURANCE COMPANY LIMITED.

CHIEF OFFICE : OXFORD STREET, MANCHESTER, 1.

Summary of Directors' Report for the year ended 31st December, 1942.

Total Income for the year, £14,285,019.

Total Assets at end of the year, £81,441,037.

Total Claims Paid in the year, £7,448,627. The Company has paid £147,917,102, in claims since its establishment.

The Total Assurances existing on December 31st, 1942, amounted to £85,010,818 in the Ordinary Branch and £129,074,681 in the Industrial Branch.

Ordinary Branch : Bonus of £1 per cent. for 1939, 1940, 1941 and 1942 declared on participating policies which become claims during the ensuing year. Surplus carried forward is £2,440,925.

Industrial Branch : £436,227 Profits allocated to Policyholders.

should be made to obtain a greater diversity of output from the Union. Whether the mines will be allowed to distribute large sums, or whether a high proportion of their gross output will be taken to assist new developments, is a matter on which there is, as yet, no information.

18B for Industry?

In reply to two detailed questions as to the reasons for taking over the shares of Short Brothers, Sir Stafford Cripps has refused all information, merely stating that the measure was essential to obtain control of the business. On a further point as to the return of the shares after the war, the Minister pointed out that Regulation 78 makes no provision in this respect, and stated that it would not be competent or appropriate for him to take steps now to ensure the return of the shares at the end of the war. He did say, however, that there was nothing in the existing position which would preclude the Government of the day from making such further provision, should it wish to do so. A situation is thus created in which the Minister can, without reason given, take over the shares in any company and control or alter its management. It is perfectly possible to conceive circumstances in which the total acquisition of a company is desirable in the national interest; where these are fulfilled it is the duty of the Minister to take the steps required. But all those concerned are entitled to a clear statement, so that they may themselves judge whether the step is right or not. The absence of any provision for divesting the Government of such holdings at the end of the war is alarming both to investors and industrialists, and is likely to be destructive of good-will in the one and initiative in the other. The matter ought not to be allowed to rest where it lies. Meanwhile the date to which the price-fixing mechanism is to apply has been fixed, but there is so far no indication of what the price is, in fact, to be. The appointment of an imposing new board will reassure the country as to the output of Short Brothers, but it has done nothing to allay the anxiety that has been expressed on the general issue.

Barrow Haematite Deal

The decision of the Ministry of Supply to take over part of the business of Barrow Haematite Steel Co., coming as it did on the heels of the Short Brothers vesting, has added to the questioning of investors and industrialists alike about the long-term intentions of the Government. Here again no explanation has been given. The concern is a vertical combine, and the Ministry is taking over the more advanced processes, namely, the steel works and the hoop and bar mills, with all assets attaching to them, including benefit of contracts. The payment for these is £335,000 for plant and benefit of contracts and £305,000 for products, stores and loose materials. This leaves Barrow Haematite with iron mines, limestone quarries, blast furnaces and investments. The shareholders are invited to accept this offer, but without being informed as to the value of the assets remaining. This is buying a pig in a poke with a vengeance. It is true that an opportunity for inspection of the contract is provided, but there will be few shareholders who can benefit from this permission or assess the value of the offer if they did. The directors have, admittedly, found the offer acceptable, and the cash will doubtless be useful at some later date for developing the properties which remain; but there can be no possible reason for withholding the only information upon which a reasonable assessment of the offer can be based. The Ministry of Supply ought not only to explain its reasons for the acquisition—if it was merely lack of finance, as seems to be the case, there are other means of providing that—it should also insist upon full information being given to shareholders.

Two-Way Proxies

The ease with which the best laid plans go astray has been strikingly illustrated in the case of the recent regulations of the Stock Exchange with regard to two-way proxies. As was pointed out in *The Economist* of February 20th, that institution prescribed, among its requirements in the case of schemes affecting shareholders' rights, that proxies should be so drawn that it was as easy

to vote against as for the resolution. Beyond that, no specific form of proxy was stipulated. Of late, there has been a growing practice of making a proxy just a voting paper, instead of actually nominating a stated person to represent one at the meeting. Some few weeks ago the Ceylon Amalgamated Tea and Rubber Estates sent such proxies to its shareholders in order that they might vote on resolutions which required a three-quarters majority to carry them. The chairman went to the meeting with proxies giving, very roughly, two votes in his favour for one against. The vote was thus lost. But the resolutions were put to the meeting and carried *nem. con.* on a show of hands. The company's solicitor thereupon advised the chairman that he had no alternative but to declare them carried. A Gilbertian state of affairs! The dissentients are testing the legality of this procedure by serving a writ on the company to restrain it from acting on the resolution. Nothing can be done until the position is cleared up. Whatever the law may prove to be, it seems desirable that there should be an assurance that proxy votes should in fact be used if taken. Ought the Stock Exchange to insist upon the rather cumbersome business of voting only through a properly appointed representative, or should it regard this case as quite exceptional?

Radio Amalgamation

There has been a further development this week in the matter of the negotiations for a fusion between A. C. Cossor, radio manufacturers, and another concern, variously stated to be EMI, Philco and others. It may be recalled that Sir Louis Sterling, chairman of Cossor, complained that Mr. Macauley had been negotiating without his knowledge. Sir Louis, who until a few months before the war, was managing director of EMI, has now resigned, and the negotiations are to be continued. It is not a matter of national importance whether or no A. C. Cossor is to be taken over by EMI or by another concern, although shareholders may feel that their chances are better as part of a larger organisation. The rise in the shares can, however, scarcely be justified merely by the prospect of a fusion until its terms are known. The rise is perhaps based on certain comment, appearing in some sections of the Press, which looks to the absorption of Cossor as merely the first step in a complete consolidation of the radio and gramophone industry. The argument is that trade associations are not enough to secure prosperity, and that complete financial control is essential. That is to say, an attempt is to be made to create a monopoly in one of the newest industries, and one in which the possibilities of development are still quite unpredictable. Such a project would be laughable were it not for the fact that there already exists a virtual monopoly in the supply of certain elements, and that it might be very difficult for a small firm which had to fight its way to break the ring. The comments may, of course, be the purest surmise, but it is to be hoped that the authorities, despite the admitted convenience of dealing with a minimum number of concerns, will set their face against any development which would threaten to reduce the element of effective competition in this, or any other, new and growing industry.

Still More Black-Out

The Paper Control has always been unfortunate in the orders it has made on matters concerning the investor. For many months it left the field of official forms untouched, although it was evident that a huge saving might be made without loss to anyone. At the same time, it attempted to impose regulations which would have completely dislocated the work of the stock market. Now, having for three years allowed great waste of paper in company circulars and annual accounts, it has made a regulation which, if complied with, must drastically restrict the information supplied. To insist that the statutory accounts, notice of meeting, explanation and chairman's comments are to be got within the space of 120 square inches means that the type will be so small as to be scarcely readable, or that much important information will be excluded. It further appears that the address of the recipient has to be included within this space, which further reduces it, probably by one-sixth. The sole concession is that, where consolidated accounts are presented, the space occupied may be increased by 50 per cent. Any one who has studied published accounts knows that there

is a very great variation in the space which is required adequately to set out the information which the shareholder ought to have. In the case of rubber companies in enemy-occupied territory, the publication of statutory accounts might be waived, on condition that certain particulars were stated, but, even in war-time, some concerns ought to be compelled to give more information than they do. Now there is to be every encouragement to secrecy, and there can be no doubt that many directorates will take full advantage of it. Meanwhile, the company which has performed its duties to its proprietors, and the public, in a reasonable manner is in future to be prevented from doing so. If so drastic a cut were absolutely essential in this particular form of publication, it would be a striking criticism of the control's past policy, but until economy has been carried much further in other fields it is difficult to believe that this step is unavoidable. If, however, the control is bent on securing a large economy here, the Ministry of Supply should at least grant a special dispensation to those who show that the information which they wish to give could not be brought within the prescribed limit. This would at least give some encouragement to those of good will. There is little danger that they would be so numerous as to cause the Ministry any embarrassment.

Company Notes

Armaments Profits

The full accounts of *Vickers* for 1942 reveal total profits struck after tax, deferred repairs and contingencies provisions, of £1,031,450 against £977,755. As stated in *The Economist* of March 20th, earnings for the unchanged 10 per cent ordinary dividend are in consequence slightly higher at 21.1 against 19.4 per cent on the ordinary capital. *Vickers-Armstrong*, the largest operating subsidiary, reveals a similar rise in profits, struck on the same basis, from £1,521,023 against £1,643,987. Comparison with the previous year's accounts suggests that some £410,000 was set aside for deferred repairs and contingencies, against an undisclosed sum this year. Depreciation, however, receives

£100,000 more at £850,000. The tax free ordinary dividend is raised from 5 to 5½ per cent, covered by earned rates of 5.7 and 6.1 per cent, respectively, while an addition of some £43,000 to the carry forward raises it to £318,494. A similar experience is revealed by the accounts of *English Steel Corporation*, dealt with in *The Economist* of March 27th, total disclosed profits rising from £662,347 to £708,958. A severe contraction in the liquid assets, excluding inter company balances, of *Vickers* from £2,643,099 to only £748,485 arises from the provision of additional finance to *Vickers-Armstrong*, its chief effect being to reduce government securities by some £1,122,000 to £1,462,864, while the actual loan outstanding to *Vickers-Armstrong* has risen from £6,395,155 to £8,517,007. The latter's balance sheet gives a truer impression of the group's contribution to the war effort. Stocks are over £10 millions higher at £61,316,080, while a 60 per cent increase in debtors brings this item to £14,199,069. Cash, however, is reduced by almost half at £1,117,559. Excluding the *Vickers* loan, net liquid assets have risen about £2,700,000 to £11,499,339. At best such figures can only provide the slightest indication of the actual scope of the country's largest steel and engineering undertaking, since the numerous shadow factories' accounts are excluded. Further, the failure to reveal the amount appropriated for deferred repairs makes it even more difficult than in the past to form any idea of the true position of the group. It is to be hoped that, in the national interest, the current year will bring still further expansion, but this will have to come from more efficient working rather than from increased supplies of manpower and machinery. The 10s. shares of *Vickers* at 20s. 1½d. ex dividend yield £4 19s. 4d. per cent.

Lancashire Steel Reserves

The profits of the *Lancashire Steel Corporation* for 1942 are struck after provision for estimated income tax and EPT. The net figure of £514,509 is presumably comparable with the previous year's record earnings of £511,796 after deducting £735,000 for taxation, but gross earnings have probably risen very materially. Depreciation takes

SECURITY and EFFICIENCY are essential features of well-regulated commerce.

Governments, Banks and Commercial undertakings throughout the world bear witness to the worth of **MILNERS' SECURITY.**

The same workmanship which has made **MILNERS' SAFES** and **STRONG-ROOMS** world-famous is embodied in **MILNERS' STEEL EQUIPMENT.**

Sound construction of well-planned equipment has enabled us to render invaluable assistance to large undertakings engaged in the war effort, for efficient and economic storage of materials and parts is a direct aid to production.

The Safe aid to efficiency.

MILNERS SAFE CO. LTD., 21, HAMPSTEAD LANE, LONDON, N.6. Telephone: MOUntview 6655

£200,000 against £175,000, and a further £60,000 has been allocated to deferred repairs, against £15,000 for plant replacement. Consequently, earnings, for the unchanged 7 per cent ordinary dividend, are reduced from 11.6 to 9.2 per cent. General reserve is increased by £35,000, or £10,000 more than in 1941, and the carry forward raised slightly to £84,684. Net profits of the *Wigan Coal Corporation*, the main subsidiary, have, after similar manipulation, increased from £102,512 to £103,030, the former figure being struck after tax payment of £124,000. The "A" and "B" ordinary shares again receive 2½ per cent out of unchanged earnings of 2.7 per cent. Both companies' balance sheets display expanded liquid assets to finance their increased outputs. *Lancashire Steel's* cash holding is some £323,000 higher at £889,666, while tax certificates total £812,150 against £637,500. Nearly half of the liquid assets of *Wigan Coal*, totalling £1,319,256 against £1,178,912, are represented by cash. Similar expansion is evident in the consolidated balance sheet of *Lancashire Steel*, which would benefit by comparative figures. This reveals an increase in net liquid assets of £153,000 to £1,505,654, cash alone standing at £1,052,148. The dominant feature of the official control has been the great improvement in the group's financial position. At end 1935, all reserves and undistributed profits totalled £678,876, rising to £1,425,544 by end 1938, while the latest figure is £2,444,664. In view of the increasing public interest in the equity of this company, this, and the experience of official control elsewhere in the industry, should be borne in mind. What constitutes adequate protection of the concern's assets in the uncertain post-war period may well become a much-debated topic. At the current price of 22s. ex dividend, the £1 ordinary "A" shares of *Lancashire Steel* yield £6 7s. 3d. per cent.

Department Store Accounts

The extent of last year's remarkable recovery in the earning power of the London department stores is underlined by the analysis of the profits of four leading concerns contained in the following table:—

Company (Years ending Jan. 31)	Disclosed Profits	Earned for Ordinary		Dividend	March 31, 1943	
		Amount*	Rate		Price	Yield
<i>John Barker</i> :						
1941.....	£ 1,398,672	£ 140,722	14.7	10	Ex div. £1 ord. shares at 62½	£ s. d. 3 4 0
1942.....	1,433,699	197,573	25.7	10		
1943.....	1,627,916	288,882	42.2	10		
<i>Harrods</i> :						
1941.....	1,951,760	135,609	5.3	4	£1 ord. stock at 46½	2 12 2
1942.....	2,029,877	115,120	5.4	5

1942.....	441,324	126,011	12.7	12½		
1943.....						
<i>Swan & Edgar</i> :						
1941.....	61,035	38,318	3.1	3	£1 ord. shares at 17½	4 14 1
1942.....	61,030	38,536	3.1	3		
1943.....	68,685	51,013	4.2	4		

* In all cases before tax on equity payments: for Harrods in 1943 after tax for two years, except tax on dividends.

No direct comparison can be made between the total profits figures disclosed by any two companies. Those revealed by *John Barker* and *Harrods* are struck before the main administrative expenses; those by *Swan and Edgar* and *Selfridges, Limited*—the newly constructed operating con-

cern—after administrative expenses, but still before all taxation. The figures of amounts and rates earned for equity capital are, however, generally comparable as between different companies. The improvement shown by *John Barker*, whose equity earnings have risen 40 per cent in the past year and trebled in rate in the past two years, is, of course, exceptionally good. The improvement shown by *Harrods* is an understatement, since two years' tax provision, covering estimated liability to January, 1944, has been provided from the latest accounts. Thus, the cover of 6.6 per cent for the ordinary dividend, raised from 5 to 6 per cent, should certainly show an increase this year, if earning power is maintained. The new *Selfridge* set-up has justified itself with a payment to the holding company of 12½ against 6 per cent, but the whole of the increased payment has been absorbed by prior charges, and it will be some time yet before the public receives a dividend. The 1 per cent rise in the *Swan and Edgar* payment to 4 per cent leaves *John Barker*, perhaps the most successful of the London stores, as the only one of the four concerns discussed here which has failed to raise its equity dividend. The reason is twofold. The management is attempting to implement a dividend stabilisation policy. Only in 1939-40 was the ordinary payment reduced—to 5 per cent from the customary 10 per cent level. Although total profits last year reached the highest level of the past decade, an increased payment would clearly be out of step with managerial policy. In the second place, the concern was interrupted by the outbreak of war in the middle of a far-reaching scheme of physical reconstruction. Allocations to reserves, rebuilding and depreciation are being maintained at a high level so that the completion of the scheme need not be delayed by lack of cash.

The Balance Sheet Aspect

Although the improvement in profits of the London department stores appears to have been general, the balance sheets of the various concerns by no means all tell the same story. In the absence of the accounts of all the concerns, it is too early to attempt to provide a complete explanation. But it seems likely that the recovery has been caused by a number of factors which have exercised a varying influence on the fortunes of individual companies. Thus, the balance sheets of *John Barker* and *Harrods*, two of the most successful concerns, show a rise in creditors and a decline in debtors. There is, however, a wide divergence in the movement of stocks which in the case of the former have fallen from £1,002,010 to £875,779 over the past two years while those of *Harrods* have risen in the same period from £1,116,165 to £1,517,072. There seems little doubt that all concerns have in some measure profited from a return of custom following the end of heavy bombing and from a tendency to purchase better quality goods. There is also a general saving on advertising and other expenditure now restricted by the Government. Both *Harrods* and *Barker* show an increase in cash holdings, evidence of inability to increase stocks. There is a rise in *Harrods'* net liquid assets from £481,552 to £563,157, and in those of *John Barker* from £593,417 to £795,533. The totals of free reserves and carry forward available for reconstruction are considerable; for *Harrods* £1,781,428 and for *Barker* £1,460,512. In both cases, the financial set up is completely satisfactory and the trading record, in the face of wartime difficulties, considerably better than could have been expected. None the less, at current yields, the ordinary capital of both concerns appears to be slightly overvalued.

hand, would include commodities subject to disturbing influences, such as the transition from war to peace, structural changes in production caused by the war, competition arising from different standards of living, the trade cycle, and the impact upon industry and trade of scientific progress and air transport. Such goods would be given special treatment by means of volume control, price control, buffer stocks, lend-lease exchanges, or exceptional tariff rates. No commodity would be eligible for Part II unless it could be shown that trade in it was clearly and substantially influenced by one of the five special factors, and that it formed an important percentage either of the trade between two

negotiating countries, or of the total economic activity of one of them. Third party countries would have to be informed beforehand of commodities for which special treatment was claimed, and, if some international economic council were formed, it should be informed of all Part II agreements which, moreover, might be subject to a time limit. If special treatment can no longer be justified for particular goods, these should be transferred to Part I; similarly, there should be provision for transferring goods from Part I to the group of commodities eligible for special treatment. Part II should not become a refuge of inefficiency. Sir Raymond's plan has all the apparent attraction of a neat, simple and logical solution of a difficult problem. But it would be self-deception to think that all that is needed for a smooth and expanding world trade after the war is a formula or a mechanism. The application of Sir Raymond's formula could lead to ossification as well as expansion. His maximum tariff under Part I might become a minimum. Pressure for special treatment might swell the list of commodities included in Part II—what commodities are not subject to "disturbing influences"? Countries with high standards of living might claim special treatment for the major part of their exports. In the last resort the channels of trade will only be freed from obstruction by nations which genuinely wish, severally and jointly, to do so.

Trade Disputes

It is, perhaps, inevitable, at a time when wage increases are being won in various branches of industry and the bargaining power of the workers generally is strengthened as a result of labour shortage, that industrial unrest should develop. During 1942, 1,527,000 working days were lost owing to strikes affecting 454,800 workers, compared with 1,079,000 days lost through strikes affecting 361,500 workers in 1941. These figures, however, compare very favourably with the record of the last war, when the number of working days lost as a result of trade disputes increased from 2,450,000 in 1916 to nearly 5,990,000 in 1918. That there have not been more strikes during the present war is a tribute to the workers' co-operation in the war effort and to the leadership of the trade unions. It is probably also due to the advances in earnings secured since 1939. It is therefore all the more regrettable when localised, unauthorised strikes should break out, dislocating production and penalising those workers who realise the adverse effect on output of stoppages. The most serious outbreak recently has been a crop of strikes in engineering firms in the West Riding over the award of the National Arbitration Tribunal. The award was framed in such complicated language that it is hardly surprising that its interpretation should have given rise to confusion. The Tribunal granted an increase of 6s. a week to the bonus of plain time-workers, a consolidation of 20s. of the bonus in the basic rates and an adjustment of piecework prices and "bonus or basis times" to enable an average worker to earn at least 27½ per cent over basic time rates, excluding the national bonus. The Yorkshire strikes, which affected some 3,000 engineers in 14 firms, were due to the fact that under a clause in the award the advance apparently did not apply to time workers who were already receiving 6s. a week or more through their firms' bonus schemes or merit-rating. The strikes have now been settled, the men having accepted the employers' offer to pay the 6s. increase to men working on other than piecework systems on the basic rate and to pay overtime computed on the new rate. Another unofficial strike is that of a few hundred railwaymen in the Stratford locomotive depot of the LNER. For three Sundays running the men have struck because a fireman was sentenced to imprisonment for spreading disaffection among the troops. This strike is frowned upon by the union leaders. A number of wage claims are now pending, the most important being the joint demand of the three unions of railway workers for increases, and those of 200,000 bus and tram drivers and conductors which are being considered by a special tribunal.

Retail Trade

During the retail year ended January, 1942, the average daily value of sales reported to the Bank of England was slightly smaller than in the preceding year; during 1942-43 there was a slight increase but, as the accompanying table, taken from last week's *Board of Trade Journal* shows, this was due to a rise in the value of food sales. Unfortunately, the Bank of England returns, while they are becoming more representative of the general trend in the value of sales—sales reported during the past year amounted to £420

millions, equivalent to about one-fifth of the total value of retail sales of the goods included—do not record changes in the physical volume of turnover. True, the official index of the cost of living has remained almost unchanged for two years; but there can be little doubt that the average prices of the goods included in the Bank of England returns

were somewhat higher in 1942-43 than in the preceding year and that the total volume of sales has shown a fall. The rate of decline last year appears to have been moderate; it may well be more marked in 1943.

Utility Furniture

More classes of persons now qualify for permits to purchase utility furniture. Couples with children, who propose to establish independent homes for the first time, can get permits regardless of the date of marriage. People rehoused by local authorities will be able to buy utility furniture. This provision will mean that the 3,000 agricultural labourers' cottages which are to be built may be furnished with utility furniture. The third new provision is that children may have their own chests of drawers. Previously these were supplied only for adults. The allocation of permits began in January, when 7,000 were granted. In February, the figure was 11,500, and it is believed that more were given in March. Nearly 40,000 applications were made during January and February, but the proportion refused because they were not included in the scheme was considerably lower in the latter month. About 100 appeals were made against decisions not to grant permits. The quantity of utility furniture being made is well within the demand, and production is increasing steadily.

Summer Fish

During the next six months larger quantities of fish will be landed, and the Ministry of Food has taken advantage of this fact to lower prices and to relax certain of the (Continued on page 443.)

Industry and Trade

A Plan for Exports

Sir Raymond Streat, chairman of the Cotton Board, outlined a plan for exports—or, rather, a revised version of an earlier plan—in an address to the American Chamber of Commerce in London last Tuesday. In this plan, post-war trade agreements would consist of two parts. Part I would comprise all goods not subject to "disturbing influences." For this group of goods there should be no quotas, prohibitions or discrimination, and no licences, except insofar as these may be temporarily necessary for reasons of exchange; and no country would be allowed to levy import duties higher than 25 per cent *ad valorem*. Part II, on the other

REFUGE ASSURANCE COMPANY,
LIMITED

ASSETS £81,400,000

INCOME EXCEEDS £14,200,000

FAVOURABLE MORTALITY

LOWER EXPENSE RATIOS

HOLDINGS IN NEW WAR LOANS £11,444,300

The seventy-ninth annual ordinary general meeting of the Refuge Assurance Company, Limited, was held, on the 31st ultimo, at the chief office of the company, Oxford Street, Manchester.

Mr J. Wilcock Holgate (chairman of the company) presided.

The secretary (Mr John W. Moss) having read the notice convening the meeting and the auditors' report.

The chairman, in moving the adoption of the report and accounts, said:—

Gentlemen,—I am glad to be able to put before you so satisfactory a report upon the work of the company during the past year. This success over the difficulties forced upon us by war conditions has not been lightly secured, and is the outcome of much anxious thought and of continual adjustments in our methods and organisation. Our responsibilities do not relate solely to the prudent management of the current affairs of the company, but also to its far-reaching obligations to millions of our fellow-citizens who rely on the "Refuge" for the payment in due course of the policy monies which mean so much when the contingency assured against occurs. In our industrial branch there are in force over 8 million policies, and in the ordinary branch over half a million policies, assuring in all a sum exceeding £200,000,000, covering all classes of the community over a very wide range of sums assured and exhibiting a common feature in that each policy is the individual choice of the owner and exists to fill an individual need; and we are responsible for securing that these needs are covered as they arise, as they will do throughout many years in the future.

We have to regret the loss by death on active service and through enemy action in this country of 32 members of our staff, and our sympathy goes out to those who mourn their loss. There are other members of the staff who are reported missing; and it is our earnest hope that good news will be received of them and that they, and all those other hundreds of our employees who are serving in the forces, will soon be enabled to return to their homes and families.

STAFF PROBLEMS

The question of staff has, of course, been one of our main problems. The number of our employees who have joined the armed Forces, or other forms of whole-time national service, is 2,983; and during the year our total staff suffered a further net decrease of 701. As regards the field staff the position has been met by the amalgamation of districts, by the enlarging of agencies, and by making increasing use of the services of women, and of men above military age; whilst in the chief office constant endeavours are being made to eliminate any form of work which is not absolutely essential, and the staff are working longer hours, which are bound to become even longer as more of our staff are called up. In this connection it is gratifying to record that the Kennet Committee in their Report on Man-power expressed the unanimous view that in the particular industries under review, of which life assurance was one, employers and employees alike had consistently demon-

strated the greatest willingness to perform all that is required in the national emergency.

LIGHT MORTALITY IN BOTH BRANCHES

A welcome though, in the circumstances, rather surprising feature of our operations during the year has been the unusually light mortality experienced in both branches. This feature was particularly evident in the industrial branch, where the percentage of actual to expected deaths was lower than for many years past. In the age group 20 to 29 as was perhaps unfortunately to be expected, this percentage in both branches was greater than 100, but from age 40 onwards to the extremity of age the experience was most favourable. It is very difficult to determine to what influence precisely this is attributable, but one is tempted to attach at least some importance to the effect on the national health of an overwhelming aim and purpose such as animate us to-day.

REDUCED EXPENSE RATIO

We are able to report a reduction in the expense ratio in both branches, and in this connection I might perhaps remind you that the costs of the services rendered to its policyholders by an assurance office must be met out of the premiums—just as the cost of labour and distribution appears in, and forms a very substantial part of, the price of any commodity; but just as the test applied to any purchase is whether the article is worth the money and not how the price is built up, so, in the case of life assurance, the true test is a comparison of the benefits secured, including the service given, with the premiums paid for them.

LOW RATE OF DISCONTINUANCE

Another interesting feature during the year was the extremely low rate of discontinuance in both branches, again particularly in the industrial branch. It has been the constant endeavour of the company to avoid wherever possible any termination of a policy other than by claim, and though the present unusually favourable experience is undoubtedly due in considerable measure to the abundance of employment existing to-day, yet it remains true that for many years we have recorded a steady reduction in the rate of termination, which, in the industrial branch, is to-day barely one-fifth of what it was ten years ago.

RESULTS OF YEAR'S WORKING

Turning now to the results of the year's working you will see from the accounts before you that our total premium income increased by £710,464 to £11,645,087. Our total claims were £7,448,627, which included £4,573,933 by way of maturities alone. The aggregate surplus in both branches amounted to £3,543,664, which includes £2,044,487 brought forward from the previous year, and the total assets now stand at £81,441,037, having increased by £3,714,932 during the year. I may here mention that from the outbreak of war to the present time the company, as a result of war conditions, has paid the sum of £554,627 in death claims on policies upon

the lives of members of H.M. Forces and of civilians.

ORDINARY BRANCH

In the ordinary branch the number of new policies issued was 36,620, as compared with 35,385 issued during the previous year. The new sums assured amounted to £7,027,046, a sum greater by 13 per cent. than the corresponding figure for 1941. In this branch the premium income for the year was £4,994,763, a figure greater by £335,524 than that of the previous year, and the net interest amounted to £1,329,409. The expense ratio was 12.01 as compared with 12.43 in 1941, and the life assurance fund now amounts to £41,262,815, in addition to which there is an investments reserve fund of £2,250,000. A net premium valuation, using the A24-29 ultimate table of mortality with interest at 2½ per cent. was made for the life assurances, the annuities being valued with interest at 3 per cent., and the resulting surplus was £2,604,379, which included £1,838,284 brought forward from the previous year. It is proposed to allocate to the shareholders £16,345, to set aside £147,109 for allocation to policyholders, and to carry forward the materially increased sum of £2,440,925 to meet any contingencies which may arise out of the present world situation or to be dealt with subsequently as the board may determine.

INDUSTRIAL BRANCH

In the industrial branch the premium income amounted to £6,650,323, showing an increase of £374,939 over that of the previous year. The net interest income was £1,295,001, and the life assurance fund now amounts to £34,177,405, having increased by £2,343,908 after the transfer of £200,000 to the investments reserve fund, which now amounts to £2,850,000. The expense ratio was 31.15, as against 32.58 in respect of 1941. The valuation was made on a 2½ per cent. net premium basis, additional provision being embodied to meet prospective adverse mortality due to the war, and the resulting surplus, which included £206,202 brought forward from the previous year, was £939,285. As I have already stated, the sum of £200,000 has been transferred to the investments reserve fund, and it is proposed to allocate to the shareholders £96,155, to carry forward £206,903, and to set aside £436,227 for allocation to the policyholders. The amount set aside for policyholders is allocated by way of permanently increasing the sums assured by certain policies, and by making the payment of claims arising by death or survivorship of endowment terms during the ensuing year on the basis of the latest and most favourable scale of benefits as regards those policies which have not been placed permanently upon this latest scale by this or previous allocations of surplus, together with an addition of 2½ per cent. in respect of policies, with certain exceptions, dated prior to January 1, 1938, and subsequent to July 1, 1927.

BONUS DISTRIBUTION

Having regard to the continuance of war conditions, we propose to repeat the modified form of bonus distribution in the ordinary branch adopted since the outbreak of war. The distribution to policyholders takes the form of a bonus on participating policies which become claims by death or survivorship within the twelve months commencing March 20, 1943, at the rate of £1 per cent. on the sum assured in respect of each full year's premium due and paid in 1939, 1940, 1941 and 1942 respectively. It is proposed also until further notice to allow an interim bonus on policies becoming claims by death or survivorship at the rate of £1 per cent. on the sum assured.

LARGE INCREASE IN HOLDING OF BRITISH GOVERNMENT SECURITIES

You will already have observed that the outstanding feature as regards the investments is the increase during the year of

£5,400,830 in our holding of British Government securities, bringing the aggregate under this heading to £39,372,477, which represents 48.34 per cent. of the total assets and 58.94 per cent. of our Stock Exchange securities. In this connection you will be interested to know that since the outbreak of hostilities the company has taken up, and still holds, various new War Loans amounting to £11,444,300, which is included in the above figure.

I am pleased to inform you that the aggregate value of our Stock Exchange securities materially appreciated during the year under review, and again exceeded considerably the value at which they appear in the balance-sheets, leaving intact the investments reserve funds which, on the passing of these accounts, will exceed £5,000,000.

INTEREST YIELDS

As regards the interest yields per cent. on our assurance funds, in the industrial branch the gross yield has fallen from 4.8s. 3d. in 1941 to 4.6s. 6d., and the net yield from 4.4s. 2d. to 4.0s. 1d. In the ordinary branch the gross yield has fallen from 4.11s. 2d. in 1941 to 4.9s. 0d., and the corresponding net yield from 3.6s. 9d. to 3.6s. 6d.

The geographical distribution of our investments shows the following changes during the year:—

	1941	1942
	Per cent.	Per cent.
Great Britain	88.53	91.01
Indian and Colonial	8.47	6.41
Foreign	3.00	2.58
	100.00	100.00

NATIONAL AMALGAMATED APPROVED SOCIETY

Turning now to another branch of the company's activities, I have to report that on behalf of the National Amalgamated Approved Society we administer the National Health Insurance of a membership of 847,000, an increase of 81,000 over the corresponding figure for 1941. During the year payments of benefit were made amounting to £927,931, including £76,488 in respect of maternity benefit. In addition, the further considerable sum of £40,832 was received by "Refuge" members by way of non-cash benefits. The number of new members of the Approved Society obtained during the year by "Refuge" representatives was 75,473.

The National Amalgamated Approved Society has over 3,000,000 state insurance members, and has performed its obligations towards them successfully and satisfactorily for over 30 years, its National Health Insurance benefits having been taken by its representatives—all industrial assurance agents—directly into the homes of the people during this long period. These men are performing a function which, for its successful discharge obviously calls for homely feeling and sympathy. Sir William Beveridge has suggested that the approved society system should be abolished, but I should be sorry indeed to see the friendly contact between the members of the National Amalgamated Approved Society and its present agent representatives disappear, and in its place to see National Health Insurance conducted in an atmosphere of impersonal officialdom. Sir William's justification for his proposal is the desirability of making benefits uniform for all state insured persons, but this objective could equally well be secured by suitable arrangements within the present approved society system.

It is insufficiently realised that the industrial assurance offices which are associated with an approved society act merely as agents for that society and exercise no control whatever over its finance, which, further, has always been subject to strict Government audit; whilst all approved societies have to conduct their affairs in

conformity with the National Insurance Acts and Government regulations. In fact, it is provided by Statute that an approved society shall not be conducted for profit, and that its constitution shall provide for its affairs being subject to the absolute control of its members. The approved societies fulfil a special function, and their retention would do nothing to hamper the general scheme for better social security, but would rather facilitate it. I need hardly add that this company is entirely in sympathy with, and will cordially support, any well-considered and soundly financed development of social security, and the benefit of our long experience would be freely offered in any discussions which might take place regarding how the desired objectives could best be achieved.

TRIBUTE TO STAFF

In conclusion I wish once more to acknowledge the services rendered by the company's staff in the field and at chief office during still another year of war, in which, in spite of greatly diminished numbers of experienced staff, the company has been able to carry on its work of providing life and National Health Insurance facilities in the homes of the millions of its policyholders. I am also pleased to say that the relations between the company and the Refuge Field Staff Association and the Chief Office Staff Council continue on an amicable footing.

Gentlemen, I have now much pleasure in moving the adoption of the annual report and accounts.

The report and accounts were adopted. Messrs J. Proctor-Pearson and John W. Moss were reappointed directors.

Messrs Walton Watts and Company were reappointed auditors.

The meeting closed with a vote of thanks to the chairman.

AUTOMATIC TELEPHONE
AND ELECTRIC COMPANY,
LIMITEDIMPORTANCE OF
TELECOMMUNICATION

The annual general meeting of the Automatic Telephone and Electric Company, Limited, was held on April 1st at Liverpool.

The following is an extract from the statement by the chairman, Sir Alexander Roger, K.C.I.E., circulated with the report and accounts: "The effort attained by your company during 1942 was easily the heaviest in its history, but, owing to the magnitude of taxation, the figures give little indication of our large increased turnover. Your directors recommend a dividend of 7 per cent. on the ordinary stock, making 10 per cent. for the year, plus a cash bonus of 2½ per cent. and a dividend of 10 per cent. on the deferred stock and shares, plus a cash bonus of 2½ per cent."

Some attention is being given to the question of telecommunications by Government and Parliament, but it is doubtful whether its full and vital importance has been grasped by the general public. Well in advance of other industrial countries it is less than a century since England adventured wealth, energy and ingenuity to circle the globe with the means of rapid and cheap communications. Our international trade would never have reached its pre-war proportions without these great systems.

The field is unlimited for all forms of communications and transportation, and the war will not settle international rivalry for the influence and trade which pertain thereto. On the contrary there is evidence of an increase of rivalry at this very time. Your company and the many concerns interested are in a stronger position than ever to deal with the demands likely to appear when the war is over.

SCOTTISH AMICABLE LIFE
ASSURANCE SOCIETYSATISFACTORY NEW BUSINESS
FIGURES

The 117th annual general meeting of the Scottish Amicable Life Assurance Society was held in the Merchants' House, Glasgow, on the 31st ultimo, the Right Hon J. Milne Barbour, D.L., M.P. (president of the society), presiding.

D. Bruce Warren, Esquire (Deputy Chairman of the ordinary directors), in moving the adoption of the report and accounts said: "I need hardly at this time emphasise the difficulties with which the society has had to contend during the past year. The increasing demands made on the country's manpower have led to a further reduction in the staff—70 per cent. of our pre-war male staff are now on active service—and to a further limitation of the sources from which our new business would normally be obtained. In these circumstances the net new business of £632,000—£86,000 more than in 1941—cannot be considered as other than satisfactory."

LIFE ASSURANCE A PRIME NECESSITY

A substantial proportion of this business has been obtained from existing members. Notwithstanding the many pre-occupations of war time they have realised that life assurance is still a prime necessity for the ordinary family man, and they have increased their life assurance cover to bring it into line with their domestic responsibilities and with present-day monetary conditions. I would strongly urge those of our members who have not yet considered their position to do so now.

As all the outdoor staff have either joined the Forces or have been transferred indoors the same contact cannot now be maintained with members and agents, and we must therefore rely on them to communicate with us whenever they wish to increase their assurances or introduce their friends.

The past year has seen further additions to our group pensions business, and the specialised service we can render is fully appreciated not only by employers but by their staffs.

The mortality experience has been exceptionally favourable. The claims by death, including war claims, are less by £95,000 than in 1941 and represent under 70 per cent. of the amount expected. This percentage is the lowest experienced since the new A 1924-29 tables were adopted in 1935. The interest revenue at £617,150 represents a return of £4 10s. 10d. per cent. or £3 6s. 8d. per cent. after deduction of income-tax.

FUND EXCEEDS £13,757,000

As the result of the year's operations the life assurance and annuity fund has increased by £375,521 and now stands at £13,757,042. There has been little change in the society's investments apart from the substantial increase of nearly £700,000 in British Government Securities. By investing all our new money and a large proportion of maturing securities in the new War Loans the society is taking its full share in financing the national War effort, and I would again remind you that every new life policy effected, and every premium paid to the society, enables us to give increased support to that effort.

A valuation of the investments as at December 31st last shows that the market values were in the aggregate in excess of the amount appearing in the balance sheet. The report and accounts were unanimously adopted.

BRITANNIC ASSURANCE COMPANY, LIMITED

LARGE SUMS INVESTED IN GOVERNMENT SECURITIES

£407,090 ALLOTTED TO POLICYHOLDERS FOR BONUSES

MR. J. A. JEFFERSON'S SPEECH

Mr J. A. Jefferson, F.I.A., chairman and general manager, presiding at the 77th ordinary general meeting of the stockholders held, on March 26, at the chief office, Broad Street Corner, Birmingham, said:

Despite war conditions and the resulting staff difficulties, the company had a very satisfactory year in 1942. The premiums collected increased by £542,000 to £6,444,000. The funds for the first time exceeded £40,000,000, an increase in the year of no less than £2,871,000.

On the outbreak of war our total male staff numbered 4,559, and no less than 1,818 members of the indoor and outdoor male staffs have been released for service in His Majesty's Forces or for other work of national importance.

During 1942 real unemployment virtually disappeared, and the total of wages earned showed a very considerable increase. With further limitation of the commodities available for the public, it was more necessary than ever for the Government to secure a greater volume of savings and at the same time to obtain revenue by means of taxation. The life assurance offices helped by attracting a considerable volume of savings in a form which served a triple purpose: Firstly, to supply a flow of new money to Government securities; secondly, to provide life assurance cover; and, thirdly, by preventing the money being spent in other directions to curb inflation.

The large increase in our premium income has been brought about not so much by new business as by the maintenance in force of existing business. Lapse rates, which were comparatively high during periods of mass unemployment, have shown a falling tendency for some years, and in 1942 were less than half the pre-war rate. Does not this prove that lapses are due to conditions of insecurity? When people have the money they do not lapse or surrender their policies, and we welcome the prospects of everyone attaining greater regularity of income after the war.

It might be as well to point out here that, especially after periods of industrial distress, an appreciable proportion of our "new business" consists of policies which have been re-entered at little or no cost to the policyholder after some temporary falling out of benefit.

THE KENNET COMMITTEE

The Kennet Committee was set up by the Government to report what practical measures could be taken to secure the greatest release of man-power in the sphere of banking and of insurance. Particulars quoted in the Report show that the total number of men employed at the outbreak of war was 88,726, and that this number had been reduced by June, 1942, to 51,172. The vacancies created had been filled by the employment of 31,253 women, and it may be pointed out that there was a reduction in the total number of men and women employed of 6,301, notwithstanding the fact that the volume of business had grown substantially since the outbreak of war. There is a practical limit to the size of the agency women with domestic responsibilities can be expected to control, and of the company's agency staff over half, or 1,670, are women—indeed, we have only 900 of our pre-war male agents still with us.

The report also showed that there were only 2,517 cases of deferment, or under 3 per cent. of the total, and recommended that we should reduce this number by 15 per cent. as soon as possible. As chair-

man of the Industrial Assurance National Service Advisory Committee dealing with deferments I am in a position to say that the industry has already gone beyond this suggestion, and the number of male deferments to-day is only about 2,000. I can say without fear of contradiction that the members of the Kennet Committee were favourably impressed with the efforts made by the Industrial Assurance Offices to release man-power.

THE BEVERIDGE REPORT

First of all I want to correct a very definite misunderstanding. It has been stated that we are out to wreck the Beveridge Plan, but so far from this being the case we have all along made it clear that we welcome any sound proposals for improving benefits and ironing out anomalies. The basic principles of the proposals aim at security and freedom from want; these are not new sentiments—they have been the goal of all the great institutions for thrift, including industrial assurance offices and friendly societies, for generations past, and less than justice has been done to the wonderful work of private enterprise in this field.

Improvements in benefits are, in our view, desirable, and can be made, but we do not agree with some of the methods suggested for giving practical effect to them. We certainly feel that there is no need to look beyond the existing organisations, which have proved their efficiency and are fully capable of administering the improved benefits. We have gained great experience and appreciation of the problems of the working classes from our long association with them, and anything to improve their lot is most welcome to us; but whatever scheme is adopted it is essential, if disappointment is to be avoided, that it should be based on sound financial principles. Sir William suggests that there is no need to wait for the coat before putting on the trousers he has designed. May I suggest that trousers usually need a pair of braces to support them, and we may find ourselves in a very peculiar situation, if sound finance in the shape of braces is not provided before the trousers are put on.

It is estimated that at the present moment 10,500,000 members, or practically one-half of the entire number insured under the National Health Scheme are being serviced by industrial assurance offices through their associated approved societies. Surpluses in these societies can only be used for the benefit of members, and the allowance for administration is exactly the same as for other approved societies, and the whole administration is under continuous scrutiny by the Government. No pecuniary advantage is, or can be, derived by the industrial offices, which simply act as paying agencies at cost price.

The future of approved societies is still in the balance, but with an intimate knowledge of the good work they have done I earnestly hope that a way may be found of using their machinery.

ORDINARY BRANCH

The premium income increased by £232,000 to £1,831,000. On the other hand, death claims fell by £27,000 to £211,000, and war claims fell by £15,000 to £26,000. The expense rate at 12.51 per cent. was very slightly in excess of the rate in the previous year. The net yield on the fund fell by 7d. per cent. to £3 8s. 7d. per cent. The ordinary branch

fund showed an increase of £905,000 and amounted to £14,327,000.

INDUSTRIAL BRANCH

The industrial branch fund increased during the year by £1,775,000 to £21,793,000 and the premium income by £310,000 to £4,605,000. The net rate of interest fell by 9d. per cent. to £3 14s. 8d. per cent. Death claims were £96,000 less than in 1941, the figure being £1,221,000, including £52,000 in respect of bonuses. War claims fell from £63,000 to £42,000. The mortality experienced was the lightest in the company's history.

The expense rate of 29.60 per cent. showed a reduction of .94 per cent. and was almost the lowest yet achieved.

VALUATION OF ASSETS

During the year our total assets increased by £2,947,000, whilst our holdings of British Government securities went up by £3,797,000 to the imposing total of £14,318,000.

At the outbreak of war our holdings of British Government securities were £6,436,000, representing 19 per cent. of our assets; to-day they represent 35 per cent., or 45 per cent. of our Stock Exchange investments.

At the moment the investment reserve funds are still intact, but I have no hesitation in asking you to approve further transfers of £150,000, which will bring these funds up to two and a half million pounds.

ANNUAL VALUATION OF LIABILITIES

The policy liabilities under all Britannic policies were valued by the net premium method on the assumption of only 2½ per cent. interest. Having regard to the strength of the valuation and the provisions made for possible contingencies, the directors feel fully justified in allocating a substantial amount of the surplus to policyholders.

In the ordinary branch the surplus disclosed is £522,824. An allocation of £207,090 to policyholders has enabled the directors to declare a bonus addition of £1 per £100 sum assured on all with-profit policies in force on December 31, 1942.

In the industrial branch the surplus disclosed is £900,632. The directors are pleased that the allocation of £200,000 to policyholders will enable them to repeat the present bonus scheme for a period of one year, commencing April 1, 1943.

The allocations from the life branches for policyholders' bonuses amount to £407,090, while the surpluses carried forward undivided in these branches amount to £590,868.

STAFF PENSION SCHEME

The transfers amount to £100,000. The scheme is non-contributory, and we are counting service with His Majesty's Forces for pension purposes.

The work of the company has been carried on most efficiently during the past year. The directors again desire to express their sincere appreciation of the willing service rendered both by the indoor and outdoor staffs.

HOOVER LIMITED

ORDINARY GENERAL MEETING

The sixth ordinary general meeting of Hoover, Limited, was held on March 31, 1943, at Perivale, Greenford, Middlesex. Mr C. B. Colston (chairman) presided, supported by Mr E. L. Colston and Mr J. A. Wykes.

The report and accounts were unanimously adopted and a final dividend of 11½ per cent. (less income tax) was declared.

The retiring director, Mr J. A. Wykes, was re-elected, and the auditors, Messrs Deloitte, Plender, Griffiths and Company and Messrs Williams Stoker and Company, were re-appointed.

The company's net profit for the year ended December 31, 1942, amounted to £322,601 (against £274,480 last year). The final dividend of 11½ per cent. made a total distribution of 15 per cent. for the year. (Last year same.)

LONDON BRICK COMPANY, LIMITED

BENEFITS OF PAST CONSERVATIVE POLICY

SIR P. MALCOLM STEWART ON POST-WAR BUILDING PLANS

The forty-third annual general meeting of the London Brick Company, Limited, was held, on the 29th ultimo, at the Connaught Rooms, Great Queen Street, London, W.C.

Sir P. Malcolm Stewart, Bart., O.B.E., Hon. LL.D., D.L., J.P., the chairman of the company, presided.

The chairman, in the course of his speech, said: The profit on trading at £233,522 is down by £132,043, but interest and income from investments at £29,009 are up by £8,574. The total revenue at £262,710 is less than that of the previous year by £123,500, a decline of close on 32 per cent. From the profits earned there has been deducted the dividend on the 8 per cent. cumulative preference stock, amounting to £32,000, and £25,000 has been allocated to general reserve, against £50,000 in the previous year.

The board recommends the payment of a dividend of 10 per cent., which will absorb £200,000, leaving an addition of £2,580 to the carry-forward. This recommendation could not have been made but for the fact that no provision has been made for depreciation from the profits of the year. This calls for explanation, as it is obviously a definite if temporary departure from long-established practice, to which I trust we shall duly be able to return.

DIVIDEND RECOMMENDATION WARRANTED

Lest any stockholders should think that our proposals unwarrantably deal with less favourable trading conditions or that we have hastily and unsoundly sought to maintain the rate of dividend, I intend to show that our recommendation is warranted and based on a policy, the possible application of which has been long foreseen. A sound policy is one the consequences of which can be calculated, and I trust you will agree that this applies to the case under review. To justify these statements I will give you some extracts from former addresses to the stockholders:—

In 1936, when the directors revalued the fixed assets by transferring £1,350,000 from general depreciation reserve and by reducing their total to £2,100,000, I said at the following annual meeting: "There is no absolute permanency of prosperity in any industry, however favourable its prospects. The advantages of present prosperity should be used to minimise the ill effects of possible future adversity. While I am not apprehensive of the immediate future, long experience of the industry convinces me of the prudence of the steps now being taken, and I trust our stockholders will be gratified at the way in which this section of the balance sheet has been cleared up."

INCREASED STABILITY

Then more recently, in 1939, I stated: "It will be readily appreciated that the effectiveness of present and future depreciation is much enhanced because of the exceptionally low figures to which our fixed assets have already been written down. Thus, from past prosperity have we provided for possible future adversity, a policy designed to give increased stability and security which can but prove advantageous to all interested in our undertaking in whatever capacity."

These statements were not based on guesswork, but prompted by hard experience of the last war and of the early years of the business, when for a period every penny of profit was ploughed back and dividends, which could have been paid, denied to increase efficiency and extend the business at a time when finance from other sources was not obtainable on reasonable terms. That was many years ago.

needed and appreciated when post-war building swings into its stride as they were eighteen months ago, when no restriction was allowed to hinder our fulfilling the then urgent requirements for the Government's programme of construction. With reference to the production side of the business, our efficiency has been diminished through the reduction of output. Higher costs have inevitably followed.

The bright side of the picture, however, is the substantial amount of war work being done at Peterborough under the supervision of Mr S. T. Baker and at Stewartby under Mr P. A. Hill. It is gratifying that our well-equipped foundry, engineering, and welding shops are all making a substantial contribution to the war effort.

NEAR AND DISTANT OUTLOOK

As to the prospects for the current year they are poor. It is impossible to anticipate other than a further shrinkage in the demand. The situation could only be changed for the better were the Government to embark on some substantial constructional programme. At present there is no evidence of this, nor do I think it is likely shortly to take place. Consequently, stockholders should expect a further reduction of the profits for the current year.

Meanwhile we can look forward to the future with confidence, since the Government is fully conscious of the necessity for getting the building industry into its stride at the earliest moment after the war, not merely to overtake the arrears of building but particularly on account of the high percentage of labour, direct and indirect, which thus will be absorbed. The building and civil engineering industries can provide a massive agency for the mitigation of unemployment. This was discovered after the last war, but, as there was a complete failure to plan adequately, the results were disastrous.

CONTROLLED PLANNING

To-day the good intention is to establish controlled planning on broad lines to embrace the many interests previously neglected, but above all to avoid ill-ordered construction. An admirable 10-year building programme has been issued jointly by the Ministers of Labour and Works. This indicates the labour force required to carry out a planned programme of building. Its magnitude, however, is such that it would appear that consideration should be given as to how far it is practicable to dovetail it into the general post-war economic picture. The scheme offers a grand target for building to be achieved over many years, and is a valuable piece of work.

Meanwhile in other directions sectional plans have been, and are being, worked out, but they remain sterile because the basic data on which they should be founded have not been determined. No effective progress can be made until the Government clearly lays down a few primary principles. The foremost of these is the urgent need to define what form the control of land is to take. Without this, planning remains ineffective; indeed, the farther it goes the greater the risk of producing plans to be scrapped.

FUTURE FULL OF PROMISE

To revert to our immediate prospects, I can only confirm that they are not encouraging. However, subject always to giving the first place to such contribution as we can make towards winning the war, you may rest assured that we shall, to the best of our ability, fulfil our responsibilities to all parties connected with our company. Present difficulties do not depress us, because we are preparing for the future, which is full of promise and offers increased opportunity for service.

The report and accounts were unanimously adopted and a dividend of 10 per cent. on the ordinary shares approved.

The auditors (Messrs Derbyshire and Co.) having been reappointed, the proceedings terminated with a vote of thanks to the chairman, directors and staff.

PROVISION FOR DEPRECIATION

Let us consider the depreciation provided since 1936, when the grand total of fixed assets was written down to £2,100,000. This figure embraced some 10,000 acres of valuable freehold clay lands reduced to their then agricultural value, our model village at Stewartby, partially built after the last war, when construction costs were high, cottages, social clubs, swimming baths, sports pavilions and canteens. These assets were all written down to a low figure, leaving our many freehold and few leasehold buildings, kilns, machinery and all fixed and loose plant, including our considerable transport equipment, at £1,750,000, or about £1 per 1,000 of annual productive capacity of bricks only.

But gratifying as the position was in 1936, we have in the five years from 1937 to 1941 inclusive written down the total of fixed assets plus additions by a further sum of £600,000, and in addition have made full provision for depreciation of motor vehicles. I think these figures speak for themselves. This heavy depreciation, provided under more favourable trading conditions, was essential if the company were to be maintained in a sound position. Clay lands economically situated steadily become exhausted, and any continued falling off in the demand for our products would make the brick kilns and plant affected virtually valueless, since there is no known effective alternative use for them.

PRUDENCE, COMMON SENSE AND EXPERIENCE

Once again hard times reign, but we have provided the means of mitigating their effect without unwisely impairing the sound financial structure of the company. The conservation of our strength in periods of prosperity enables us favourably to consider the stockholders when adversity threatens. The policy persistently practised in the past makes possible the present proposals. It has been a simple policy based on prudence, common sense, and experience, which cannot be bought ready made, but when gained should be applied.

The benefits of our policy, which it is now proposed to enjoy, have been secured through enterprise, the taking of considerable risks and a ceaseless endeavour to increase efficiency. Whatever changes we are going to witness in the industrial post-war world, progress and prosperity and efficient production cannot be secured if individual initiative, enterprise, and direct executive responsibility are cramped or damped down. Let us foster co-operation in every department of industrial life. The conception that the workers and their trade unions are in one camp and industrialists in another must be broken down. Only by the realisation of a common interest and the making of a common effort can true prosperity be achieved.

NEED FOR CO-OPERATION

Effective defence of our liberties, improved social services, freedom from want, and security for the future, all these can but be fully achieved through national prosperity. Prosperity is dependent on plentiful production, and to secure this with true efficiency the close co-operation of all parties to industry is essential.

Let us willingly accept the bonds of unity in both the industrial and political spheres, for through a united effort alone can we surmount the grave post-war difficulties which surely await us, but let us again become free individually to develop such gifts and qualities as nature has bestowed, and bountiful nature begets a vast variety of pattern.

COMPANY'S UNIQUE FACILITIES

Our unique facilities for large-scale operations will again be just as much

THE CLYDE VALLEY ELECTRICAL POWER COMPANY

STATE CONTROL AND PRIVATE ENTERPRISE

VALUE OF COMPETITION

MR R. ROBERTSON'S ADDRESS

Presiding at the annual general meeting of the Clyde Valley Electrical Power Co. in Glasgow, on Tuesday, March 30th, Mr R. Robertson, LL.D., the chairman, said: Ladies and Gentlemen,—The prohibitions imposed upon the company by the Government restricting the form of the report of the directors still apply, and I am again prevented from making the observations usual on this occasion regarding the operations of the company.

A short time ago we had the privilege of listening to the speech of the Prime Minister in which he put forward his suggestions for post-war development. I was glad to observe his tribute to private enterprise and his hopes for its continuance when he said: "... but it is all the more vital to revive at the earliest moment a widespread, healthy and vigorous private enterprise ..."

PRIVATE ENTERPRISE AND ELECTRICAL INDUSTRY

I feel that while the Government should always exercise a balancing influence between State control and private enterprise, there is no justification at present for any alteration in the control or management of the electrical industry. I am satisfied that without private enterprise the electrical industry would not have reached its present state of efficiency.

During the past few weeks the chairmen of other electricity undertakings, when addressing their shareholders, pointed out the error of transferring the industry to public boards and have in general terms shown the value of the incentive of private enterprise, with which in general I cordially agree. Without going into great detail, I should like to take this opportunity of touching upon this question in the light of the achievements of this company to which I made a general reference last year.

FALLACY OF NON-PROFIT-EARNING CONTROL

It is not disputed that power companies in general are well managed, and I have not seen any suggestion that a change in control would lead to more efficient management, but it is maintained that the primary object of companies such as ours is to exploit the consumer in order to pay high dividends to the stockholders, and that it is therefore desirable that the control of the industry be transferred to what is described as a "non-profit-earning" board. A view is sometimes held that if the stockholder had no interest in the business other than to receive a fixed rate of interest on his capital, the incentive to make profit would disappear to the benefit of all concerned, especially to the consumer of electricity. This view is quite erroneous.

One of the weaknesses of the non-profit-earning idea is that it makes no provision for losses. Revenue may fluctuate for many reasons and the surplus may be smaller than anticipated or even be non-existent, and there is always a prospect of the surplus being insufficient to meet interest. Business must therefore be conducted on cautious lines and profit must be visible in each expansion before it is commenced, otherwise more capital may require to be borrowed to pay interest, thereby endangering future stability.

BENEFIT OF COMPETITIVE FACTOR

On the other hand, the principle on which this company in common with other power companies is operated is that, being in constant competition with other sources of power, light and heat, we must sell at a

competitive price, and any surplus of the revenue remaining after meeting all the outgoings belongs to the ordinary stockholder and is available to pay a dividend or is ploughed back into the business. We are able to take business risks in the knowledge that we are not obliged to maintain the ordinary dividend. We can therefore afford to supply at prices which at first may not show any profit, and may even result in a loss, in the hope that in later years by a process of careful development the revenue may increase and a profit ultimately result which would never have been available if the initial risk had not been taken.

SOUNDNESS OF BOARD'S DIVIDEND POLICY

Some of you may know that up to 1916, that is for the first eleven years of the company's business career, no dividend was paid to the ordinary stockholder. In 1916, when the Government was borrowing at 5 per cent., the dividend paid was 2½ per cent. actual, and it was not until 1922 that the stockholders received 8 per cent. dividend. On other occasions the directors did not hesitate to reduce the dividend where the margin of profit did not warrant its maintenance at the previous rate. This policy has largely contributed to the success which the company has achieved, and has enabled it to afford supply at the present low rates. If the company had been under obligation to pay a fixed dividend in these early years, I, who have been connected with it since its inception, consider from my own knowledge that its present success could not have been achieved.

LOW UNIT PRICE

We have done our duty in the area of supply entrusted to us. That area covers almost 1,250 square miles. The density of population varies widely, being extremely sparse in many parts. The average density is moderate because we are precluded from supplying in most of the densely populated parts of the area. We supply approximately 78 per cent. of the premises in our area, which is one of the highest percentages in comparable areas throughout the country, and which would have been exceeded had it not been for the war. We have the same tariffs throughout the whole area. So long as statistics were available, our average selling price per unit was among the lowest in the country and was the lowest in Scotland.

During the 15 years up to 1939, with the exception of the year 1926, the year of the General Strike, the annual selling price per unit obtained by the company and its associate company, the Strathclyde Electricity Supply Company, Limited, for energy supplied for all purposes has been below 1d. Between 1925 and 1939 that average was reduced by over 20 per cent.

DOMESTIC CONSUMER

With regard to the domestic consumer, for a considerable number of years a consumer who made reasonable and normal use of the supply could obtain his requirements of energy at under 1d. per unit. The number of domestic consumers grew from 12,400 in 1925 to 153,000 in 1939, of whom no less than 91,000 occupy one, two or three apartment houses. Some of these houses include our best consumers, who take full advantage of our supply relative to the size of their houses. This progress would not have been achieved if the price had not been attractive and within their means.

Our domestic tariff has been steadily reduced over the last 20 years, the last reduction being in 1936. Although coal has doubled in price since that date, we have been able to continue our supply at the same low rate.

McGOWAN COMMITTEE REPORT

The McGowan Committee in 1936 made important recommendations regarding the reorganisation of the electrical industry with which your directors in the main agree. These recommendations were accepted by the Government with a promise of the introduction of legislation to give effect to them, but such legislation has not yet eventuated. To those who have a desire to obtain a knowledge of the industry I recommend a perusal of the report of that Committee. I quote a few salient paragraphs from the report bearing on the matters I have touched upon:

Paragraph 162:

"In the majority of cases it will no doubt be found that under an area scheme the power companies should be retained on a consolidated and improved basis, and if such consolidation is carried out on sound lines, substantial benefits to consumers should accrue in the area as a whole."

Paragraph 471:

"(iii) Adequate grounds do not exist for an immediate and complete reorganisation on a regional basis under public control by the setting up of regional boards which would buy out all existing undertakings. "(iv) Reorganisation should be based on the retention and utilisation, where possible, of the larger and more efficient of the existing undertakings and the absorption by such undertakings of the smaller or less efficient undertakings."

COOPER COMMITTEE

These recommendations still hold good, and nothing has arisen to justify departure from them. They were endorsed by the Committee, under the chairmanship of Lord Cooper, which last year dealt with the question of hydro-electric development in the Highlands. Dealing with the question of the transference of existing undertakings in that area to public boards, the Cooper Committee states:

"We should not have hesitated to advise even this drastic solution if we could have supported it by the prospect of resulting increased efficiency and cheaper supplies; but we have no grounds for holding out any such prospect."

We have anticipated the recommendations of the McGowan Committee regarding the inclusion of small isolated undertakings in larger undertakings. This company has from time to time taken over a number of undertakings with considerable benefit to the consumers. In one taken over in 1934 we modernised the undertaking at considerable expense and introduced our own tariffs. The result was that in five years the number of consumers which was 1,073 at time of taking over increased to 7,910.

These results have been achieved by the efforts of this company alone, and have not been caused or brought about by any extraneous means. Under the Act of 1926 we must purchase all our energy from the Central Electricity Board, and the price we have to pay is the same as it would have cost us to generate the like quantity of energy if the board had not been brought into existence.

EFFECT OF DIVIDEND ON CHARGES

It is sometimes said that the dividend paid by this company prejudicially affects the price we receive for energy, but this is not so. If the electrical industry were transferred to public boards, it would be necessary for the board to pay interest on the money borrowed from the public, and it should therefore be noted that the dividends and interest paid by the company represent less than 3½ per cent. on the capital expenditure of the company and its associate companies. A dividend of 1 per

cent. to our ordinary stockholders represents to our domestic consumers, on the average, 6½d. per annum. I have obtained figures relating to what may be described as an average power consumer. An ordinary dividend of 1 per cent. represents less than one-sixty-fourth of a penny per £ of the turnover of that consumer.

Incidentally, it is interesting to note that our contribution to local rating in 1939 was equal to a 4 per cent. dividend on the ordinary stock.

In light of the Prime Minister's observations I feel certain that before any drastic alteration is made in the management and control of a great and successful industry any such proposals will receive examination free from political or sectional bias and that the aspects of the matter to which I have drawn attention will be borne in mind. The future of the industry can best be served by development along the lines recommended by the McGowan Committee.

The board have made provision for taxation, contingency fund and war damage insurance.

TRIBUTE TO STAFF

I would again express on behalf of the board our appreciation of the very satisfactory manner in which the employees of the company have discharged their duties throughout the year. The high reputation for service enjoyed by the company among its consumers is due in large measure to the conscientious manner in which our employees discharge their duties.

I now have pleasure in moving that provision be made for the dividend on the 6 per cent. cumulative first preference stock for six months to April 30, 1943; that a final dividend of 5 per cent. on the ordinary stock be paid, which together with the interim dividend of 3 per cent. paid in September, 1942, makes a total of 8 per cent. for the year, and that the sum of £30,000 be appropriated for the credit of the staff benevolent fund.

The report and accounts were adopted.

MITCHELL COTTS AND COMPANY, LIMITED

IMPROVED FINANCIAL POSITION

The ordinary general meeting of Mitchell Cotts and Co., Limited, will be held on the 8th instant in London.

The following is an extract from the statement by the chairman (Mr Alexander Hamilton) circulated with the report and accounts:—The trading profit for the year amounts to £180,053, as compared with £176,236 for the previous year. After providing for income-tax and directors' fees, the net profit is £98,803, a small increase as compared with last year's figure of £95,366. We have already declared and paid the preference dividend for the year and a first and second interim ordinary dividend, aggregating 15 per cent. for the year—the same as previously. It was explained, when the second interim dividend was paid, that this again took the place of the usual final dividend.

The directors have transferred to general reserve £40,000, and to staff provident fund £5,000, and accordingly we are able to carry forward £52,355 to next year, which is an increase of £7,283 over the amount brought forward from the previous year. As regards the balance-sheet, the principal feature is the improvement in the company's financial position due to the repayment by subsidiary companies of sums which we had advanced to them and their depositing of funds with us.

It seems improbable that it will be practicable to produce and circulate to the members a consolidated balance-sheet during the war, but from the information available I am again happy to confirm that the margin between the net assets of our subsidiary companies and the cost of their shares to the parent company remains very satisfactory. Nine months of the company's current year have now passed and present indications are that our business is maintained.

E.N.V. ENGINEERING COMPANY, LIMITED

RECORD VOLUME OF WORK

INCIDENCE OF TAXATION

The annual general meeting of the E.N.V. Engineering Company, Limited, was held, on the 25th ultimo, at Winchester House, Old Broad Street, London, E.C.

Mr C. G. Twallin (chairman of the company), who presided, said: Ladies and gentlemen,—This is our fifteenth annual general meeting. Once again we meet under the conditions occasioned by the greatest war recorded in history.

The accounts have been in your hands for some days and I ask your permission to take them as read.

Since we met here last year I regret to say our colleague, Mr. Hugh Purdy, has passed away. He had been connected with this business as a director since 1919. On behalf of the board I desire to place on record our appreciation of his abilities. We mourn his passing, both as a business associate and as a personal friend whom we held in high regard.

The figures placed before you to-day speak for themselves. The volume of work represented exceeds any previous record, yet, in spite of this, owing to the incidence of taxation, both as regards income tax and excess profits tax, the amount available for distribution you are invited to allocate to-day is very little larger than the corresponding figure of last year. This remark is not made in the nature of a complaint; it is gratifying to be in a position to support the national effort in this way.

You will notice the amount reported on the assets side under investments is relatively rather high. This includes a portion in tax reserve certificates which will, in due course, be applied in payment of taxation; the balance is in War Bonds.

All expenditure incurred on air raid precautions and war damage contributions has been provided for and definitely written off, although some of these items are not allowable as a charge against profits by the taxing authorities.

ADEQUATE DEPRECIATION PROVIDED

You will observe that we are continuing to add to our plant, and, following our usual custom, providing adequate depreciation. I have pointed out on previous occasions the generous amount allocated to depreciation. Prevailing conditions are such that our foresight should stand us in good stead. Our machines are running long hours, and this, more than ever, calls for careful consideration when dealing with depreciation.

Our new canteen is completed and operating. This is appreciated by our workpeople, and we trust will prove beneficial to health.

We are continuing to add to our land and buildings account, and in this connection providing a reasonable sum for depreciation.

The remaining figures in the accounts I suggest require no further explanation.

The figure available for your allocation to-day is £95,570, made up as follows:—

Balance brought forward from the 1941 year	£30,533
Profit for 1942, as shown on accompanying profit and loss account	85,662
	116,195
Less redeemable preference share dividend from January 1st to September 30, 1942 ...	£1,875
Interim dividend of 7½ per cent. on the ordinary shares for 1942	18,750
	20,625
	£95,570

ALLOCATION OF PROFITS

The directors recommend this amount be allocated as follows:—

Reserve for proportion of dividend at the rate of 5 per cent. per annum, less tax, on the redeemable preference shares for the period from October 1 to December 31, 1942	£625
In payment of a final dividend of 10 per cent., less tax, on the ordinary shares for the year ended December 31, 1942	25,000
and a bonus of 8½ per cent., less tax, on the ordinary shares	21,875
In transferring to reserve account	15,000
Balance to be carried forward to following year's accounts	£95,570

You will observe there is a larger allocation to the reserve account, which, in our opinion, is a prudent measure. Our holding in Government securities has been augmented. There remains a slightly larger carry-forward to the current year's accounts. It should be noted that credit has not been taken for the rebate on E.P.T. promised by the Chancellor of the Exchequer to mature after the war. Presumably this will be taxed, so the net result is somewhat doubtful.

While our main energies are centred on helping to win the war in as short a time as possible, we are not unmindful of post-war development, every likely avenue of work receiving careful consideration.

Our thanks are due to our managing director, Mr Hukins, our works director, Mr Buskard, and the full-time working directors for their efforts in placing such a satisfactory report before you. I am sure you will also wish me to convey your thanks to our managers, foremen, charge hands and workpeople for their share in producing this result.

The report and accounts were unanimously adopted.

BRITISH ROPES, LIMITED

SATISFACTORY RESULTS

The twenty-first ordinary general meeting of British Ropes, Limited, was held, on the 30th ultimo, at 95 Gresham Street, London, Mr Herbert Smith (chairman and managing director) presiding.

The following is an extract from the chairman's statement circulated with the report:

The board have again transferred £25,000 to general reserve, bringing the reserve up to £100,000, and £5,000 has been transferred to War Damage Insurance Reserve. Your directors recommend a final payment of 7½ per cent. to the ordinary shareholders, which makes 12½ per cent. for the year. After giving effect to the above recommendations, the carry-forward is increased from £201,878 to £210,760. It must be realised that in thus adopting a prudent policy in the distribution of profits, the directors have to give consideration to the draining of cash resources by prevailing rates of taxation and other causes, and to preserve a reasonable liquidity of assets for the future.

Your subsidiary companies overseas have traded successfully throughout the year and, despite some temporary troubles due in part to world-wide shortages of raw materials, have continued to be of considerable value in enabling the execution of overseas orders, which could not be shipped from this country.

I believe that the end of the war will see the commencement of an era of industrial development in many countries which hitherto have been primarily producers of raw materials and importers of finished and consumer goods. In this connection you will agree that we have a valuable asset in our factories abroad.

The report was unanimously adopted.

SCOTTISH POWER COMPANY, LIMITED

DEVELOPMENTS IN SCOTLAND

The thirty-third ordinary general meeting of this company was held, on the 26th ultimo, in Edinburgh.

Mr William Shearer, chairman of the company, in the course of his speech, said: The Report of the Cooper Committee was published in December, and is a most interesting and in many ways an impressive document, distinguished, as it is, by a display of considerable knowledge of many aspects of the problems involved. I should like to remind you of the powerful vindication of the initiative and efficiency of private enterprise contained in the references in the report to this company and the Grampian Company, and inferentially of our foresight in endeavouring by the promotion of the Affric Scheme in 1941 to secure a substantial new source of power the provision of which, at the earliest possible date, is, in the view of the committee, essential to meet the local demand for general domestic and industrial supplies.

COOPER COMMITTEE'S RECOMMENDATIONS

While these references to the efficiency and success of the great work we have accomplished are very gratifying, it would not have been unreasonable to expect that the Committee's recommendations would have provided for the continuance without interruption of our development programme. But the main recommendation of the Report is that there should be created a new public service corporation called the "North Scotland Hydro Electric Board," which should be responsible for initiating and undertaking all further generation of electricity in the Northern area (which of course includes the greater part of our existing Grampian area and the area of the City of Aberdeen), for public supply and transmission in bulk to the existing undertakers and for generation, transmission and distribution in all areas outside the limits of existing undertakers.

The Bill on February 24th received its Second Reading. In the second reading debate the Secretary of State stated he had tried his best to meet all legitimate difficulties and apprehensions. I am convinced that there are quite a number of both to be solved and allayed before this measure should be placed on the Statute Book. We rely on the assurances which the Secretary of State gave as to improvements in the Bill to the extent that barriers to full co-operation might be removed.

We can assure the right hon. gentleman that, notwithstanding our being keen exponents of the value of private enterprise, we are no less interested than he is in the well-being of Northern Scotland, and in what he and the Cooper Committee refer to as "the regeneration of the Highlands."

Indeed, we are proud of what we have achieved in this direction during the last dozen years in bringing—without any cost to the taxpayer—the amenities afforded by electricity into so many northern counties.

PLEA FOR SQUARE DEAL

In the changed circumstances we can now only ask for a square deal in the settlement of amendments to the Bill, and this I feel confident the Secretary of State will give us and the other authorised undertakers. If that is done, he may rely upon our giving him all possible co-operation.

But influences are at work, with the avowed intention of eliminating all private enterprise supply, and it may be that of municipalities also, not, I fear, on grounds of improving efficiency or the cheapening of prices to consumers, but for the satisfaction of furthering political shibboleths. I trust that the Minister of Fuel and Power will not lend an ear to any such ill-considered proposals.

The report and accounts were adopted, and a final dividend of 5½ per cent., making 8 per cent. for the year, was declared on the ordinary stock.

BRITISH ALUMINIUM COMPANY, LIMITED

INCREASED PROFIT

MR. R. W. COOPER'S STATEMENT

In the statement presented at the annual general meeting of the British Aluminium Company, Limited, held on the 30th ultimo, the chairman, Mr R. W. Cooper, said:—

The total profit for the year amounted to £1,051,119, being an increase of £77,537 over the previous year.

As will be seen by reference to the balance sheet, the 4 per cent. mortgage debenture stock outstanding has been reduced to £3,352,419, and, to meet the sinking fund payment due on January 1st of this year, the sum of £40,903 was deposited with the trustees in cash, and has since been applied against further debenture stock redemption.

Sundry creditors have increased as against the previous year by £836,830 to £3,644,712. Reserves for taxation in one form or another account for a considerable proportion of this sum and include, in accordance with our usual practice, a reserve for income tax in respect of the year just ended, which, in fact, does not become payable until 1944.

The amount owing to subsidiary companies is increased by approximately £2,000 and stands at £67,079.

SUBSTANTIAL RESERVES

We have added £50,000 to the depreciation reserve, bringing the fund up to £1,600,000, and it will be observed that the debenture stock redemption account now stands at £147,581.

Following our settled policy of building up a strong reserve account, and as the profit of the year justifies an increased allocation, we have added £150,000, as against £100,000 in the previous year, to our reserve account, bringing it up to £3,200,000.

On the other side of the account, capital expenditure incurred during the year was £52,104, while for similar expenditure we have advanced considerable sums to our subsidiary companies. On the other hand, there has been a material reduction in their current accounts, with the result that our total investment in subsidiary companies is increased by only £17,754 to £6,367,128.

Investments in allied companies stand at £1,490,942, an increase of £6,052.

Government and other securities at £421,011 show an increase of £50,000, accounted for by the purchase of further Government stock.

Stocks have decreased by £150,041, and stand at £809,731, but there is an increase of £187,316 in debtors, which total £1,453,400.

Cash on deposit and in hand amounted to £1,433,261, a substantial increase of £504,741, and in addition we hold £400,000 tax reserve certificates acquired during the year.

Contributions and premiums under the War Damage Act have been provided out of the profits of the company, as have also losses of subsidiary companies. These latter are small in amount and arise mainly by reason of certain companies being on a more or less care and maintenance basis for the time being.

ALLOCATION OF PROFITS

The dividend on the 6 per cent. cumulative preference stock takes £90,000. We recommend a final dividend of 7 per cent. on the ordinary stock, making, with the 3 per cent. interim dividend already paid, 10 per cent. for the year—requiring £300,000. This leaves a balance of £29,869 to be added to the carry-forward, raising the amount at the credit of profit and loss account to £251,997.

The report and accounts were adopted.

LANCASHIRE ELECTRIC LIGHT AND POWER COMPANY, LIMITED

SUCCESS OF PRIVATE ENTERPRISE

The annual meeting of the Lancashire Electric Light and Power Company, Limited, was held, on the 30th ultimo, in London.

Sir Joseph Nall, D.S.O., D.L., M.P. (the chairman), said that their trading results for the year 1942 were practically the same as the previous year. This was reflected in the balance on profit and loss account in the company's accounts, amounting to £184,058 compared with £181,904 in the previous year and making a total available balance of £198,165 compared with £197,288 a year ago. They were accordingly proposing to maintain their dividends at the same rates as last year.

The electricity supply industry today provided a striking example of state enterprise and private enterprise cooperating and working harmoniously for the common good, the state in this case being represented by the Central Electricity Board and the private enterprise by the company and municipal undertakings. The function of municipal undertakings in electricity was more comparable to private enterprise than it was to nationalisation.

Within that structure the industry as a whole was fully alive to the onward march of progress, and the various associations representing the several types of undertakings were giving detailed consideration as to what was likely to be required of the industry when the war was over. He believed that general agreement should be possible in that matter over a wide field of problems affecting the future of electricity supply. The McGowan Report stood out as a monumental work of reference on that subject.

The report was adopted.

CONSOLIDATED AFRICAN SELECTION TRUST, LIMITED

DEMAND FOR INDUSTRIAL DIAMONDS

The adjourned annual general meeting of Consolidated African Selection Trust, Limited, will be held on the 13th instant at Selection Trust Buildings, Mason's Avenue, London, E.C.2.

The following is an extract from the report of the directors, which embodies the annual statement by Mr A. Chester Beatty, the chairman:—

The net profit for the year ended June 30, 1942, was £440,427, compared with £351,357 for the preceding year. An interim dividend of 3d. per 5s. unit of ordinary stock was paid in May, 1942, and a further dividend of 4½d. in February, 1943, both dividends being free of income tax. The last-mentioned dividend was in lieu of the usual final dividend. The distribution of a total of 7½d. free of tax compares with 6d. for the previous year. The balance sheet and the accompanying consolidated balance sheet show a strong financial position. The directors take this opportunity to make preliminary announcement of their intention to redeem on July 31, 1943, at 22s. a share, the outstanding 189,600 6½ per cent. redeemable shares of £1 each.

Notwithstanding war conditions, operations at the mines have proceeded satisfactorily. The aggregate diamond sales of this company and its subsidiary, Sierra Leone Selection Trust, Limited, for the financial year under review were substantially higher than for the preceding year. For the current year, ending June 30, 1943, the indications so far are that our sales will be maintained at this higher level.

The mines continue to make a valuable contribution to the war requirements of the United Nations. Under the impetus of war conditions, the consumption and uses of industrial diamonds are expanding.

(Continued from page 435.)

distribution provisions. Producers' prices for whole round fish will be reduced from 6s. 3d. per stone to 5s. 5d., and hake, which was 8s. 6d. per stone, is now included in the group. The course of producers' prices since April, 1940, is shown in the accompanying table. Prices were first con-

AVERAGE PRICES PAID TO FISH PRODUCERS

	(per stone)				
	Apr. 1940	Apr. 1941	Apr. 1942	Oct. 1942	Apr. 1943
	s. d.	s. d.	s. d.	s. d.	s. d.
Cod.....	5 4	13 5	6 6	6 3	5 5
Haddock.....	6 1	14 8			
Whiting.....	5 2	12 4			
Hake.....	8 5	24 11	9 0	8 6	

trolled in October, 1941. Cod and haddock landed headless will be 7s. 7d. per stone, and other headless round fish will be 7s. 1d. Dogfish and catfish prices are fixed at 5s. 5d. for whole or headless fish. Herrings, pilchards, sprats, mackerel and horse mackerel will be 3s. 3d. per stone instead of 3s. 6d. Prime fish and flat fish prices remain substantially as they were. It is proposed to raise producers' prices for the winter months, and the price for round fish will probably be 6s. 4d. per stone. Retail prices will not vary between summer and winter, and prices paid by wholesalers will be kept constant by varying the transport levy. For the next six months the levy on white fish will be 1s. per stone and 9d. for herrings, 3d. higher than

before in each case. Retail prices of round fish have been reduced by ½d. per lb, and hake prices by 2½d. Prices now range from 9½d. per lb for whole fish, to 1s. 4d. for fillets. All the price changes come into force on April 10th.

The Ministry of Food has been in consultation with the Fish Industry Joint Council, and for the summer months, in view of the larger supplies expected, it is proposed to relax certain provisions under the zoning scheme, from April 17th. The main change is in regard to wholesalers' customers' lists. Wholesalers will be required to offer to each of their registered customers (inland wholesalers) at least the quantity of fish they received during the four weeks ended March 27th last. The wholesaler may satisfy his customers' additional requirements, provided he maintains a reasonable proportion between them. Any surplus may then be disposed of, with the sole restriction that it must be within the zone. It will be necessary to revert to the old arrangement for the winter months. Certain alterations have been made in the boundaries of some zones. Some large towns have been transferred to other zones and some may draw from two parts. The Ministry admits that these measures will entail some sacrifice of transport economy, but they are considered necessary to even out supplies. An Order is to be made making it an offence to send certain "undesirable" varieties and forms of fish and fish offal as part of a merchants' entitlement.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash.

APART from a slight improvement in sentiment, the favourable course of events in Tunisia evoked little response from the markets. Thus, quotations in the gilt edged market remained virtually unchanged until midweek, when some light buying occasioned several advances of ½ for both short and long-dated loans. The foreign bond market saw some improvement in South American issues, in particular Brazilian bonds. Chinese loans were heavy throughout, falling two to three points on the week. In contrast, Japanese stocks were firm. A point rise for Transport "C" stock, and a few insignificant gains for the Southern junior and "Berwick" preference and preferred issues, were the only movements in a quiet home rail market. South American rail stocks were practically unchanged until midweek, when BA Western and Central Argentine prior charges improved. United of Havana 1906 debentures recovered some of the previous week's setback and, elsewhere, Canadian Pacific ordinary fluctuated narrowly.

The industrial market was quietly steady. Tobacco and brewery issues were generally inactive, although Guinness and Ind Coope, exceptionally, fell 1s. 3d. Apart from a loss of 1s. 6d. for De Havilland, aircraft issues were steadier this week. Motor shares were buoyant, Albion, Rover and Raleigh Holdings all advancing. Changes in the heavy industrial section were trendless and generally insignificant. Among shipping shares, Cunard and P & O deferred reflected the dull tone with losses of 6d. Textile issues continued to enjoy steady support, Bradford Dyers and British Celanese preference shares attracting attention, and among other issues to improve, Lister rose 1s. 3d. Activity in radio shares slackened off pending some official statement in connection with the proposed Cossor merger. Emmies, Cossor and E. K. Cole, however, were all higher on balance. Of the dollar stocks, Brazilian Traction and International Nickel jumped 1½ and ½ point respectively. Recent trading results drew some support to the stores group, John Barker rising 1s. 6d. on the annual report.

Profit taking in mid week followed on

the strong advance in kaffir issues, although losses were relatively small. Blyvoors was again outstanding with a net gain of 3s., and Western Reefs rose 2s. 6d., among other advances ranging from a few pence to ½. Of the diamond issues, De Beers deferred and preferred were both bought, the former rising a full point. Rubber shares were idle, although quotations remained steady. Several tea issues enjoyed gains of a few pence, but there was no great interest in the market. Oil shares were rather better than of late. Shell and Anglo-Iranian both gained 1½, but Ultramar was outstanding with a 3s. rise. VOC and Trinidad Leaseholds were both firmer in sympathy.

New York

THE encouraging war news, coupled with a steady investment demand, led to the largest turnover on Wall Street for over a year. Gains ranging up to four points were recorded for selected industrial leaders, in particular, rail and steel issues, while speculative stocks enjoyed considerable support. Despite almost continuous profit taking, many issues reached their highest levels in three years.

Shorter Comments

Royal Bank of Canada.—Mr C. H. Hunt has been appointed manager of the West End Branch, London, of Royal Bank of Canada in succession to Mr J. A. McKillop.

Brazilian Traction, Light and Power (U.S. \$000s).—Gross earnings February 1943, \$3,918 (\$3,523). Net earnings (before depreciation and amortization) \$2,135 (\$1,841). Gross earnings two months 1943, \$7,956 (\$7,248). Net earnings two months 1943 \$4,358 (\$3,824). Temporary rates for certain of the services continue pending determination of permanent rates. Gas rationing owing to fuel shortage is now in effect in Rio, Sao Paulo and Santos.

Finance

GOVERNMENT RETURNS

For the 11 days ended Mar. 31, 1943, total ordinary revenue was £100,838,000, against ordinary expenditure of £197,370,000, and issues to sinking funds of £301,457. Thus, including sinking fund allocations of £14,370,799, the deficit accrued since April 1st is £2,817,688,000 against £2,713,806,000 for the corresponding period a year ago.

Egyptian Cotton Yarns.—Considerable satisfaction has been expressed in Lancashire at the report that arrangements have been made for larger exports to the United States of cotton yarn made from Egyptian cotton, chiefly for women's hosiery. The authorities consider that it is more advisable for the yarns to be produced and sent from Great Britain rather than to export Egyptian cotton to the United States to be spun there. It is reported that the quantity to be shipped from April will be about 300,000 lbs. per month. Lancashire is in a position to supply this yarn, and the arrangement will relieve the strain on the spinning capacity of mills in America. During the last month or two, the fine spinning trade in Lancashire has improved, and the special contracts which are now being given out will be beneficial. So far as war work is concerned, most of the goods required are made from American cotton.

Coal Using Equipment.—The British Coal Utilisation Research Association has been asked by the Government to set up a committee to report on the equipment of British homes for cooking and heating with coal and coke after the war. Mr Stanleigh Turner, Vice-President of the Mining Association of Great Britain, is the chairman of the new committee, on which the various Government Departments concerned with housing and fuel are represented and which also includes the leading experts on modern domestic appliances. The task of the committee will be to find how convenience, ease of operation and attractive appearance can best be combined with low running costs.

Iron and Steel Control.—The Minister of Supply has issued the Control of Iron and Steel (No. 30) (Scrap) Order (S.R. and O., 1943, No. 435), which came into force on March 29, 1943, and supersedes all previous Scrap Iron and Steel Orders. The Order has been issued principally for the purpose of combining in one document the provisions of the Nos. 14, 21, 24, 25, 27 and 29 Scrap Orders, although the opportunity has been taken of effecting a number of alterations in wording for the sake of consistency in both the body of

COMMODITY AND INDUSTRY NEWS

the Order and the specifications set out in the Price Schedules.

Rubber Control.—The use of rubber in the manufacture of soles and heels is further restricted by a new Ministry of Supply Order which came into force on April 1st. Limits are imposed on the amount of crude rubber, reclaimed rubber and zinc oxide that may be used in the vulcanised compound, and for many types of sole and heel the use of crude rubber is forbidden. The use of rubber in the manufacture of full soles is prohibited, and half-soles, heels and heel tips may not exceed a prescribed thickness. The Order also fixes a maximum volume for heels and the types of sheeting which may be manufactured. The Control of Rubber (No. 11) Order which has hitherto governed this matter is repealed by the new Order, the Control of Rubber (No. 193) Order (S.R. and O., 1943, No. 478).

Confectionery Zoning.—A zoning scheme for chocolates and sweets will be introduced shortly, and it is expected that the date of operation will be June 27th. Under the scheme the country will be divided into four zones. In general, retailers and wholesalers in a particular zone will not be able to receive supplies manufactured outside that zone, although arrangements will be made to deal with bulk transfers from one zone to another if there are surpluses or deficiencies in production. The Cocoa and Chocolate (War Time) Association and the Sugar Confectionery (War Time) Association, through whom the scheme is being operated, are arranging for the largest manufacturers to exchange their accounts so that a retailer or wholesaler in a particular zone now receiving supplies from one or more of the manufacturers situated outside that zone will, after zoning, receive supplies from one or more of the manufacturers situated near at hand within the zone.

Control of Jute.—The Ministry of Supply has made the Control of Jute (No. 5) Order (S.R. and O., 1943, No. 499), which came into force on April 1, 1943, and makes certain amendments to the Control of Jute (No. 4) Order, which in-

roduced maximum prices for sales by producers of jute yarn (including twist). The amendments include provisions for the maximum prices for twist to be applicable only to producers who also make jute yarn; the addition of a new rove yarn; the fixing of twisting charges according to the weight of yarn instead of according to the type of yarn; and the introduction of a minimum weight limitation for rove yarn and maximum weight limitations for heavy and medium yarns.

The Meat Ration.—From April 4th butchers will receive one-seventh of their meat allocation in the form of canned corned meat. Consumers will be entitled to 1s. worth butcher's meat and 2d. worth canned corned meat per week. The arrangement is said to be a temporary measure taken to conserve stocks of meat. Last year it applied from December 29, 1941, to April 26, 1942.

"THE ECONOMIST" SENSITIVE PRICE INDEX (1935=100)

The Chancellor's Problems

NEXT week Sir Kingsley Wood will introduce his fourth Budget. He will be faced with a further increase in Government expenditure at a stage of the war when the physical resources of the country are already fully mobilised. The policy of cutting down civilian consumption and of drawing on the stock of assets at home and abroad has already been taken almost as far as possible; and there is a limit beyond which its extension must have a harmful effect on production, either by impairing the people's capacity to work or by allowing essential plant and buildings to fall into disrepair. In particular, the Chancellor will need to be on his guard against the facile method of securing additional financial resources by allowing the purchasing power of the £ to depreciate in terms of essential goods and services.

In view of the delicate nature of the Chancellor's task this year, the need for a close estimate of expenditure and available resources is more important than ever. The view expressed in *The Economist* of April 18, 1942, on the occasion of last year's Budget that there were "signs in its make-up of the old and familiar sin of under-estimation" has been justified. Ordinary revenue in 1942-43 was £193 millions above the estimate; not counting the Canadian contribution this is an excess of eight per cent. Expenditure was £337 millions, or six per cent, above the estimate. The percentages of error are admittedly not very large, but it should be possible to do better. Probably the main reason for perennial under-estimation is to be sought in the Treasury's ostrich-like refusal to admit that there is a measure of inflation. The estimate of the National Income for 1942 at factor cost, given in *The Economist* of January 9, 1943, showed an increase of some ten per cent over the figure for 1941. It was then stated that it would be surprising if the "real" national income had risen by even half as much. There may be reasons against explicitly admitting that the currency is being inflated, however slightly; but it is surely foolish of the Treasury to carry self-deception into its own estimates. The fact that the Government has not quite succeeded in appropriating the full proportion of the national income corresponding to the value, at current prices, of the resources it has transferred to its own use is no crime. On the whole, the compound of measures designed to restrain the increase in spendable incomes, on the one hand, and of rationing and price control, on the other, has worked well. It has succeeded in limiting the rate of inflation and in diverting it to comparatively unimportant sectors of the national economy. There is certainly no danger so far of a run-away inflation. But the Chancellor must recognise that the cause which was largely responsible for the excess over his estimates in 1942-43 will still be operative in 1943-44.

In framing his Budget, then, Sir Kingsley Wood has to take account on the expenditure side, not only of additional needs at current prices, but also of the likelihood of some further increase in costs. To ignore the latest increase in engineers' wage rates, for instance, and the list of other pending wage claims, would be unrealistic. During the first quarter of this calendar year the annual rate of ordinary expenditure was £650 millions ahead of that for the whole of the financial year 1942-43. It is true that expenditure in March, the final month of the financial year, is always abnormally heavy; but the Budget for 1943-44 should be based on the likelihood that expenditure will be higher than in 1942-43 by £600-£700 millions at least, and that existing taxes will bring in a further £250-£300 millions owing to the rise in incomes.

What are the possibilities of making up at least part of the difference between this rise in expenditure and the additional yield of existing taxes by higher or new taxes that will not have harmful consequences? Without

a reform of the present system, direct taxation offers very little scope. A general increase in income tax, that is in the standard rate, might do more harm by creating hard cases than good by bringing in revenue. Powers were taken by the Chancellor two years ago to apply the surtax to incomes from £1,500 instead of from £2,000; they might now be used, though this would involve additional administrative work for comparatively little extra revenue. The overwhelming proportion of the increased national income has gone into the low income categories with incomes below £500 a year. In any but the lowest income groups, an Excess Incomes Tax might with advantage have been introduced at a much earlier stage of the war. The arguments adduced against such a tax or, indeed, against paying overtime in post-war credits, have never been convincing. But any changes in these directions at this stage are, for administrative and political reasons, unlikely. Indirect taxation, however, still offers evident scope for mopping up excess purchasing power, as the striking buoyancy of customs and excise in 1942-43 demonstrated. Although supplies of unessential goods and services have been severely curtailed, there is much to be said for putting still higher duties on tobacco and entertainment and on alcohol and non-utility clothing. *The Economist's* old suggestion of a Purchase Tax on services has not lost its validity; and a tax on advertisements is still overdue. Carefully selected taxation on these lines might bridge a substantial part of the additional difference between revenue and expenditure.

Since the new Budget will involve careful adjustments in detail rather than major changes, Parliament will have an opportunity to discuss the much-needed reform of the income tax in the light of war and post-war needs. The present system was admirable when the tax was low; but it is quite inappropriate in present conditions. In particular the system should be put on a pay-as-you-go basis without delay. There are at least three good reasons for an immediate change and only the flimsiest of arguments against the principle. The present system will cause hardship to individuals when incomes are declining or cease, as many assuredly will after the war; it will harm the national economy during a decline in the national income by accelerating the downward trend in consumers' purchases; wholesale default would bring the income tax—the best and fairest instrument of taxation—into disrepute. Instead of attempting to fit a pay-as-you-go plan into the existing system of taxation—a solution of the second-best variety—it might be the occasion for a complete change of the system, possibly on the lines of a scheme described in *The Economist* on February 7, 1942. This scheme suggested a uniform but low flat rate of tax, supplemented by a system of family allowances in cash, with an additional progressive tax on all but the lowest incomes. There would be administrative difficulties during the period of transition, but these would not outweigh the benefits to be gained.

In fact, the time has come to talk about the contribution finance can make to reconstruction. The task of finance after the war is not simply the negative one of finding the money for reforms but of persuading people to act and work in the communal interest. There are two main problems. The one is to reconcile high taxation, from which there is no escape, with enterprise and initiative. The other is to ensure the speedy replacement and efficiency of the equipment of British industry. These are problems which require careful examination, preferably by a commission of enquiry, and on which a forward-looking Chancellor might have something to say next week. An early investigation of them by some expert and impartial body, officially appointed, would be invaluable.

Economic Equipoise

TWO plans for the international exchanges have been published this week. The succinct Keynes plan, published as a White Paper on Wednesday, proposes an International Clearing Union. The more elaborate White Plan, announced in the United States almost simultaneously, describes a World Stabilisation Fund. It is perhaps, significant that, in this war, the first essays in international government for the postwar period should be economic. Currency comes first; and food is next on the agenda. Last time, in 1917-18, it was the League of Nations and the Fourteen Points that took precedence. The current approach is practical. It is concerned with specific material problems that must be solved. But, however apt or ingenious, plans to establish an equilibrium in the economic transactions of the nations after the war will fail unless the underlying conditions of agreement in the political sphere already exist. Law-abidingness, as in Aristotle's dictum, is more important than law.

The British and American plans for stability of the exchanges after the war are two tentative solutions for the same international problem. They start from the same assumptions: that the purpose of an international monetary system is to provide the conditions for a large and regular transfer of goods, services and capital among the nations, and to make it possible for countries to pay their debts or expend their credits without needlessly harmful consequences to themselves or to other nations; and that the system must not be as autocratic in its effect upon national policies as the gold standard, or as anarchic in its effect upon world conditions as exchanges fluctuating freely. Each represents an attempt to find a middle way: to secure exchange rates that shall be known and stable in the short period, but movable as policies and conditions change; that variations in exchange rates shall be generally agreed; and that these variations when made shall be calculated to bring internal price movements and world trends into harmony. They are each dependent upon mutual trust and good judgment; and there is no evident reason why these counter proposals should not lead to the agreed programme which is essential for world economic stability and expansion.

Plainly, neither will work if policies and world conditions after the war are incompatible. There is no magic in either. In the world before the Great Depression, when sterling was deliberately overvalued, when the franc was deliberately undervalued, when this country lent long and borrowed short, and when the United States first invested regardless of the productivity of its investments, then withdrew into its shell, and finally drastically increased its tariff against the goods of its debtors, no system could have worked. The underlying postulate of both the Keynes and White plans is that equilibrium, a balance between the debts and credits of each individual nation in terms of commercial and other transactions, will be physically and politically possible; that nations, with surpluses in their total balance of payments will either accept the goods and services of their debtors in return or re-lend their balances in such a way as to produce the means of repayment. It cannot too strongly be argued that the mechanism of currency and exchange depends upon the wise and orderly conduct of commerce and manufacture and upon the continued flow of investment to countries whose economic development needs assistance from outside. As the British White Paper states:

If a country lacks the productive capacity to maintain its standard of life, then a reduction in this standard is not avoidable. If its wage and price levels in terms of money are out of line with those elsewhere, a change in the rate of its foreign exchange is inevitable.

The purpose of these plans is to give time and opportunity for adjustments to be made between national policies and world conditions. But it is essential that the adjustments should be made, not only by debtors, but by creditors as well.

It is the prime virtue of the British plan for an International Clearing Union that it lays the responsibility for adjustment upon creditors as well as debtors. "In recognising that the creditor as well as the debtor may be responsible for a want of balance, the proposed institution would be breaking new ground." This approach is not carried to its logical conclusion. As the White Paper states "The appropriate provision might be to require the eventual cancellation or compulsory investment of persistent credit balances." The basic problem is to secure that the surpluses which various countries achieve are devoted to the purchase of other countries' goods or to productive investment. What the White Paper proposes is no more than that persistent creditors in the balance of international payments should consult with the Board of the Clearing Union upon ways and means of restoring equilibrium of its balances, by the expansion of domestic credit and domestic demand, by the appreciation of its currency, by the encouragement of an increase in money rates and earnings, by the reduction of tariffs and other discouragements against imports or by international development loans. But it is no longer envisaged that the sole responsibility for restoring the international balance of payments should rest, harshly and damagingly, upon the debtor countries.

In fact, the Keynes Plan reduces the problem to its elements. What is proposed is not, as some people have supposed, a multilateral clearing system, handling all international exchange transactions. It is a clearing union that will deal only with the residue of unequal balances when normal commercial and capital transactions have been completed.

The idea underlying such a union is simple, namely, to generalise the essential principle of banking as it is accepted within any closed system. This principle is the necessary equality of credits and debits. If no credits can be removed outside the clearing system, but only transferred within it, the union can never be in any difficulty as regards the honouring of cheques drawn upon it.

The problem is to permit and persuade individual countries to bring their individual accounts into balance. The member states will agree among themselves the initial value of their own currencies in terms of a new international unit, the Bancor, the value of which in terms of gold will be fixed by the governing board of the Union. Each member state will have assigned to it a quota, which shall determine its right to enjoy the credit facilities provided; and the initial quotas will be based upon the sum of each country's total trade on the average of the three pre-war years, subject to post-war revision. Each member state will agree to accept the payment of currency balances due to it from other members by a transfer of Bancor to their credit in the books of the Union. The Union is set up, not for the transaction of daily business between individual traders and banks, but for the clearing and settlement of the ultimate balances between nations. It leaves the extent and nature of exchange control and the control of capital movements to the member states; the disturbing flights of fugitive and speculative capital, for no commercial reason, as before the war, cannot, of course, be permitted in any scheme for stabilisation. It leaves it to the discretion of the member nations to form currency blocs, such as the sterling area. It is merely concerned with two fundamental facts: the size and whereabouts of international debits and credits; and the need which must exist for particular countries to adopt measures to restore equilibrium in their particular balances of payments. As has been said, the need for creditors to make adjustments is recognised. But the chief onus is still placed upon member states to prevent the accumulation of excessive debit balances in relation to the quota of credit facilities provided. When a debit balance reaches half the assigned quota, the deposit of gold, currency or bonds will be called for. If it exceeds half the assigned quota, the Board may require a reduc-

tion in the value of the member's currency, the control of outward capital transactions if not in force or the outright surrender of gold or other liquid assets in reduction of its debit. Furthermore, the Board may recommend internal measures to restore the equilibrium of the member's international balance.

"The plan aims at the substitution of an expansionist, in place of a contractionist, pressure on world trade." Each country is allowed a margin of resources and an interval of time to effect a balance in its economic relations with the rest of the world. It is "in credit or debit with the clearing union as a whole." The accumulation of a credit balance with the Union does not involve the withdrawal of this purchasing power from circulation; "the command over resources which it does not choose to employ for the time being, is not withdrawn from use." In short,

the analogy with a national banking system is complete. No depositor in a local bank suffers because the balances which he leaves idle are employed to finance the business of someone else.

A country finding itself in a creditor position against the rest of the world as a whole will not allow its credit balance to exercise a contractionist pressure against world economy, including its own. Britain, for example, would by it be able to offset favourable balances arising out of trade with Europe against unfavourable balances due to the United States.

How does the American plan compare with these proposals? It has not yet been published in detail in this country; but it is evident that its principle of action is very different. It is, in terms of pre-war practice, the method of the equalisation fund in contrast to the method of the exchange clearing, of which the Keynes plan is a generalised form. The proposal is for a Stabilisation Fund of gold currencies and securities, amounting to no less than \$5 billion, subscribed by member nations in proportion to their foreign trade, gold holdings and national income and actively employed to stabilise the international value of national currencies. Unlike the Union, the Fund will take the initiative in the exchange markets. Gold, currencies, bills and securities will be bought, sold and held. Deposits will be accepted, and obligations issued. In this scheme, too, there will be an international currency, the Unitas, fixed at the value of ten gold dollars and, unlike the Bancor, freely convertible into gold. Currencies will be sold to meet the adverse balances of particular countries. International credits and debits will not be generalised. Measures will be recommended by the governing body to secure desired changes in national balances of payments; but the onus will rest, as in the past, upon debtors rather than creditors. There is mention of the

changes in monetary or economic policy that the Fund may regard as desirable, but there is no mention of tariffs. It is in essence a plan to assist all nations, debtors or creditors, by the existence of a large financial mass of manœuvre, without any attempt to apportion responsibility for disequilibrium between those who owe and those who are owed.

In the post-war period, the United States will hold the key to world economy. Its financial and physical stake in world arrangements will be predominant. These are plain practical reasons why any plan emanating from the United States should receive the closest and most careful consideration. It is not helpful to point to the specific American characteristics of the American plan; to the much larger reliance upon gold in a scheme that imposes upon every member state the obligation to make its contribution to the world fund in part in gold; to the absence of any specific reference to the level of tariffs; or to the constitutional arrangement which, by making a four-fifths majority necessary for any of the fund's decisions, gives the United States, with a maximum 25 per cent holding, in effect a veto. It will be far more useful to examine the suitability of the plan to meet the needs that it will have to serve. The fact that it lays a ban upon the control of normal commercial exchange transactions makes it inapplicable to the transitional period after the war, when disequilibrium in the trade and payments of the nations will inevitably be at its peak. The answer that a fund of \$5 billion should be sufficient to tide over the transition is unconvincing. In itself, the sum may not be large in relation to the immediate post-war problem. Moreover, in this plan, it is not the total fund, but the proportion of it in dollars that will count in a period when the crucial deficiency of every trading country will be a dollar shortage.

There are the foundations of agreement between these two sets of proposals. The Keynes plan is undoubtedly more realistic. It concentrates upon the core of the problem of unbalance in international payments. Outside this crucial sphere, the "least possible interference with internal national policies" is proposed. The plan is as modest as it is ambitious. It is capable of application to all countries whatever their forms of government or economic policy. It is "genuinely international without preponderant power of veto or enforcement." At this stage of the debate, it is undoubtedly to be preferred. But it is wholly welcome that there should be two plans to be debated. It is now for all the nations concerned, not only Britain and the United States, to work out from these starting-points an agreed system of currency and exchange by which they can live and trade together in peace, prosperity, fraternity and progress.

Russia's Trade—I

THE discussion of world reconstruction after the war has recently moved from general principles to concrete proposals. Currency and food problems are being tackled first; but the solution to these problems must obviously be sought within the wider framework of international trade. Russia's rôle in the world exchange of goods and services may become one of the crucial factors. A tentative analysis of the prospects and likely tendencies of Russian trade may therefore be of more than academic interest. It is necessary first to survey the main features of Russia's trade in the interwar period; these are the subject of this article. A second article will discuss the most likely effects of the war on Russia's trade after the war. A third one will approach the problem from the angle of currency and credits.

The first and most striking feature of Russia's trade during the interwar period was its abnormally low level. Before 1914, Russia's foreign trade was about 4 per cent of the world's traffic. After the revolution it went down to a fraction of 1 per cent. Towards the end of the "New Economic Policy" in the late 'twenties, it rose to about

1.5 per cent. In the period of the first Five Year Plan the proportion was 2-2.5 per cent, an increase accounted for partly by the larger volume of Russian imports and exports in the years 1930, 1931 and 1932, and partly by the contraction in the total of world trade. During the second and third Five Year Plans, however, there was a decline to about 1 per cent again. The Soviet "one sixth of the world's" share in the volume of world trade was no more than one hundredth. The share of the United Kingdom was 13-14 and that of Germany 8.5-9.5. The value of French trade was five times, and that of Belgium more than three times, as large as that of the Soviets. In the tables of world trade Russia's place was below Denmark, and in the neighbourhood of Norway, Poland, Finland or Rumania.

The rôle played by Russia in this war has shown how anomalous these proportions were. During the Great Depression and afterwards, Russia was the only country in the world with a rapidly expanding economy. During the late 'thirties, its volume of production was catching up with Germany's. But its participation in international

trade developed in inverse proportion to its output. The following table shows Soviet exports as a percentage of the gross value of Soviet output:*

1929	3.2 per cent	1933	2.2 per cent
1930	3.5	1934	1.8
1931	3.0	1935	1.3
1932	2.5	1936	0.8

The trend in part reflected Russia's deliberate withdrawal from world trade. Ideology dictated a policy of self-sufficiency; the experiment of socialism in one country was being tried. The other motive, and probably the decisive one, was defence. The memory of 1914-17, when Russia was defeated because its industries were unable to arm its soldiers and the industries of the Allies failed to fill the gap in time, was still fresh. The development of every variety of heavy and light arms industry within the shortest time was the guiding principle of policy. Only imports that served this purpose were considered desirable. Exports that were not essential for the defence effort were permitted.

Yet the Russian "withdrawal" cannot be wholly explained by these motives solely. In part it was also the result of the trends in world prices. The first Five Year Plan was first based on the assumption of a comparatively intensive exchange of goods with other countries. But it coincided with the Great Depression, in which the fall in the prices of primary products was much steeper than the fall in the prices of manufactures. Russia's position both as buyer and as seller was adversely affected; less was received for its exports and more had to be paid for its imports. During the first Five Year Plan, 84 per cent of Russian exports consisted of foodstuffs, raw materials and semi-manufactures; in imports a radical shift took place from consumers' to producers' goods, which increased from 69 per cent in 1924-25 to 95 per cent in 1931; and in the category of producers' goods the shift was from semi-manufactures to manufactures (the percentage of finished goods rose from 47 in 1929 to 74 per cent of all imports in 1931-32). From these figures it is easy to see how vulnerable Soviet trade was to the price movements of the world depression. The trend of world prices for a time threatened to upset the first Five Year Plan entirely and to deny to Russia the capital goods it needed. The following table shows what happened.

RUSSIAN TRADE DURING THE TWO FIVE-YEAR PLANS

Year	Exports		Imports	
	(in 000's of tons)	(in millions of roubles)	(in 000's of tons)	(in millions of roubles)
The First 5-year Plan:				
1927/28*	8,873	3,424	2,014	4,141
1929	14,145	4,045	1,936	3,857
1930	21,486	4,539	2,855	4,637
1931	21,778	3,553	3,564	4,839
1932	17,967	2,518	2,322	3,085
The Second 5-year Plan:				
1933	17,916	2,167	1,236	1,525
1934	17,340	1,832	1,025	1,018
1935	17,190	1,609	1,259	1,057
1936	14,204	1,359	1,155	1,352
1937	12,969	1,728	1,285	1,341

* 1927-28 was the last year of the N.E.P.

The peak years of Soviet trade, in export as well as import, were 1930-1931. But the volume of exports had had to be increased by roughly two and a-half times compared with 1927-8 in order to secure a more or less stationary monetary return (in roubles). The volume of imports rose by 75 per cent over the same period, while their value increased by only 17 per cent. These facts dispel the belief that Soviet economy has been immune from the fluctuating effects of the trade cycle. The world depression admittedly did not cause unemployment or interrupt production in Russia. But it did compel Russia to double and treble its exports of grain, timber and oil in order to purchase its needs abroad, and so to reduce domestic consumption correspondingly.

* The figures and tables contained in this series of articles have been taken from or calculated on the basis of official Soviet statistics. The main source has been the publication of the Research Institute of the Monopoly of Foreign Trade: *Vneshnaya Torgovlya S.S.S.R. za 20 let* (by Professor D. D. Mishustin and S. N. Bakulin—Moscow, 1939).

From 1932 onward trade shrank. The import surplus (in money terms) could not be borne indefinitely; and it was impossible to maintain the volume of exports, let alone to increase it. This was not only because of the restrictive policies of buyer countries; but also because the surpluses actually available for export were diminishing. The expanding planned economy was absorbing increasing quantities of export commodities. Thus, exports of oil were, with the progress of agricultural mechanisation, reduced from 6 million tons in 1932 to 2.5 millions in 1936; wheat exports, which were more than 2.5 million tons in 1930, fell to 58,000 tons in 1936; timber exports were cut from 4.6 to 3 million tons. On the other hand, many of the goods previously imported were now produced in Russia. The following table compares the percentages of Russian home consumption or of articles put in use covered by various imported goods in 1930 and 1936:

	1930	1936
Tractors	81	0.0
Motor cars	66.4	0.1
Roller iron	23 (in 1931)	2.0 (in 1935)
Tin	93	13.6 (in 1934)
Aluminium	100	2.4 (in 1935)
Machines	19	1.0 (in 1935)
Cotton	19.3	2.3
Rubber	100	44.1

The question whether Russia really achieved permanent or, as the Russians would say, structural self-sufficiency in this way will be discussed in the next article. The fact is that the policy of autarky allowed them to build and equip a mighty and modern war industry. But it is also a fact that the degree of defensive self-sufficiency they attained did not make the Lend-Lease deliveries by any means superfluous when war came. And it must remain a debatable question whether the building of defence industries might not have given even better results had they been based on more intensive foreign trade. The expansion of heavy industries was undertaken at the expense of the production of consumers' goods; and the under-consumption of the Soviet people caused periodic deteriorations in productivity. No one can say how much the Russian heavy industries have lost through waste, breakdowns and poor work. It is possible to argue that, by keeping a better balance between consumers' and producers' goods, the Russians might perhaps have secured equally good, if not better, results even in terms of war economy and defensive strength. But a better balance between consumers' and producers' goods (between section II and section I—in the language of Marxian economists) would probably have necessitated higher imports in one or the other category. After 1932 Russia could almost certainly have afforded larger imports without any appreciable increase in exports. After three years of an adverse trade balance (1930-1932) the Soviets enjoyed a continually favourable balance. In some years the export surplus on the trade balance (and Russia's trade balance is almost identical with its balance of payments) amounted to between one half and eight tenths of the total sums paid for imports. At the given level of exports, the imports could thus have been increased by about 40-50 per cent without causing any disturbances in the balance of payments and without any need for the Russians to draw on their considerable gold reserve.

After 1935-36, the prices of primary products were again moving upwards. But the opportunity to increase foreign trade was not used. The reason must probably be sought in the autarkical outlook which prevailed in the Commissariat of Foreign Trade. This is said not to recall mistakes which were made in all countries and in which the Russian share was not exceptionally high, but in order to make clear two points, both equally vital for the post-war prospects. First, there is a considerable "slack" to be taken up in the trade between Russia and the outside world. Secondly, there is a close interdependence between Russia's internal standard of living and its foreign trade. For Russia, as indeed for any other country, the international division of labour is a source of prosperity and wealth. This is the one principle that is common to Marxian and liberal economics.

BUDGET FIGURES

It has been the custom of The Economist for many years to collect together, shortly before the Budget is presented to Parliament, facts and figures relating to the national finances. At present paper rationing compels severe cuts in the explanatory matter. Where possible, however, the tables which have appeared in former years are given below, although some have had to be omitted because the sources of the figures are no longer published.

Revenue

TABLE 1.—REVENUE (EXCHEQUER RECEIPTS)

	(£ millions)

* £40,000.

† Including Road Fund revenue self-balancing until 1936-37 inclusive.

‡ Included in self-balancing until 1942-43.

TABLE 2. CUSTOMS AND EXCISE DUTIES—NET RECEIPTS.

Details of the yield of customs and excise duties in recent years are given in the following table. The biggest increases in 1940-41, compared with the previous year, are in the beer and tobacco duties, which were again increased in both the April and July Budgets of 1940. In the Budget for 1942-43, additions were made to the duties on spirits, wines, beer and tobacco, and to the entertainment tax, and the purchase tax on a large range of unessential goods was raised from one-third of their wholesale value to two-thirds.

	(£ thousands)					
	1913-14	1929-30	1938-39	1939-40	1940-41	1941-42

* Motor spirit duty, repealed 1921. † Including British wine, table waters, cider and perry, coffee and chicory, dried or preserved fruits, railway passenger duty, patent medicines, other licences, and miscellaneous. ‡ Safeguarding, abnormal importations, hops, and (1936-37) onwards beef and veal. || Included in duties under the Imports Duties Act.

TABLE 3.—DIRECT AND INDIRECT TAXES

The following table shows how the contribution of direct taxes (i.e., income tax, surtax, estate duties, National Defence Contribution, Excess Profits Tax, and other inland revenue) to total tax revenue has been rising steadily in the last few years at the expense of indirect taxes (i.e., customs and excise, stamps, and motor duties).

	Direct	% of Total	Indirect	% of Total
	£ millions		£ millions	
1913-14	78.0	47.8	85.0	52.2
1929-30	376.9	55.6	300.0	44.4

* In September, 1939, standard rate raised from 5s. 6d. to 7s. for 1939-40 and to 7s. 6d. for 1940-41. † In July, 1940, standard rate raised to 8s. 6d. for 1940-41. ‡ In September, 1939, the reduced rate of tax raised from one-third to one-half of standard rate for 1940-41; in July, 1940, the reduced rate raised to 5s.; in April, 1941, reduced rate raised to 6s. 6d.

TABLE 5.—MARRIED PERSONS' INCOME TAX.

In the 1942 Budget the only important change in the income tax was in respect of a married woman's earnings, the maximum allowance for which was raised from £45 to £80. This allowance is additional to the full married allowance of £140 given to every married couple. The following table, taken from the Taxation of Weekly Wage Earners (Cmd. 6348), shows the effect of this change on the income tax paid on specimen incomes by a married couple without children. It also compares the total tax they would pay if assessed as single persons with the amount they pay when assessed as a married couple.

Earnings for the Year		Total Tax Payable			
Husband	Wife	If Assessed as Two Single Persons	Assessed as Married with the Allowance at £45	Assessed as Married with the Allowance at £80

TABLE 7.—FINANCING EXPENDITURE

The following table summarises the Exchequer returns for the financial year and shows the respective shares of revenue and borrowing in meeting expenditure. It will be noted that the difference, amounting to £2,820 million, between ordinary revenue on the one hand, and total expenditure (including sinking funds and debt repayments) on the other, was met as to nearly £785 million by borrowing from the money market (i.e., by additions to the floating debt), compared with £500 million in 1940-41; nearly £318 million by small savings (3 per cent defence bonds and national savings certificates), compared with £410 million; £1,705 million by other borrowing, compared with £1,779 million; and £13 million by miscellaneous receipts, in which is included contributions received under the War Damage Act:—

£000	
Total ordinary expenditure.....	5,623,168
New Sinking Funds.....	14,371

Total.....	£5,640,487

The items shown as net are given after allowing for repayments and receipts.

TABLE 8.—THE COST OF SOCIAL SERVICES

The latest available figure for expenditure on public social services by central and local authorities appeared in *Hansard* of January 26, 1943, from which the following table has been compiled. The expenditure figures include payments out of taxes and rates, and also contributions by the persons benefiting in the case of the contributory schemes. Many persons shown in the last two columns as receiving benefits do so under two or more of the Acts mentioned in the first column, and are, therefore, accounted for more than once.

Service	Great Britain		Total Number of Persons directly benefiting from the Expenditure	
	1939-40	1940-41	1939-40	1940-41
Unemployment Insurance and Assistance Acts:—	£000	£000

* Numbers given are of insured persons. † Calendar years 1940 and 1941 respectively. ‡ Excluding supplementary pensioners, the number of which is not available. (a) Including agricultural scheme. (b) Including prevention and relief of distress. (c) Including Contributory Pensions Acts and in 1940-41 the Supplementary Pensions Act of 1940. (d) Including Personal Injuries (Emergency Provisions) Act, 1939. (e) Relating to hospitals and to treatment of diseases, and to maternity and child welfare work and midwives. (f) i.e., Physical Training and Recreation Act, Approved Schools Acts, and Lunacy and Mental Deficiency Acts.

TABLE 9.—CIVIL AND REVENUE DEPARTMENTS' NET EXPENDITURE† EXCLUDING CIVIL DEFENCE

This table gives estimates of purely civil expenditure for 1942-43 and 1943-44, compared with the amounts actually spent in the two previous years. The biggest change since the war is in unemployment assistance, which has naturally shown a big fall. The pensions items continue to increase, particularly the estimate for supplementary pensions, which are becoming a more and more important part of the pensions system. Details of the amounts actually spent in 1942-43 are not available.

NOTES OF THE WEEK

Tactical Second Thoughts

The "tull" between the battle of the Wadi Zigzaou and the break through on the Wadi Akarit lasted only a few days. General Montgomery used the time to mass his artillery and to prepare the difficult night attack which was to effect the break-through. On the Wadi Akarit the enemy enjoyed the most favourable conditions for defence. The front he held was little more than a small strip of land—12 miles in all. The attacker was deprived of any room for deployment. An analogy is provided by the experience of the Red Army during the Finnish war in 1939-40, when the initial failure of the Russians was partly due to the lack of room to deploy their forces. General Montgomery had to "tear a hole" in the centre of the enemy's line. This situation has caused the more "tank-minded" military experts to express anxiety about an alleged relapse into the obsolete tactics of the last war. The massing of guns instead of tanks does recall the technique of 1917 rather than that of 1939-40. But the difference between the use of artillery drum-fire now and in the last war is that it did effect a break through both at El Alamein and the Wadi Akarit, whereas then no such results were obtained in the west. Either weapon, tank or gun, has its particular *raison d'être*. But the anxiety of the tank expert may be justified in so far as the experience of the African campaign may have pointed to the need of some further technical improvements in the Allied tank. The obstacles of the wadis could not be mastered by General Montgomery's armoured vehicles. To what an extent are the Allied tank forces suited to fight in all the different conditions, for instance in mountain warfare, which are likely to be presented in future battles? This is not said in order to detract one iota from the brilliance of General Montgomery's victory. The daring and highly original method of night attack which he has developed can, in respect of tactical ingenuity, be compared only with the similar exploits of the Russian Command. And General Montgomery can answer the critics with the argument of victory. The Desert Army has at last linked up with the American forces; the enemy is in headlong retreat along the coast; and the Allied Forces in the north have begun a widespread attack.

Government Control

The use of emergency powers to secure efficiency and co-operation in the prosecution of the war is generally approved. Undoubtedly, as a note on page 468 shows, there is uneasiness among some investors and industrialists about the possible post-war implications of this wartime intervention when it takes the form of taking over ownership or appointing Government directors. Even the statement of Mr Churchill that no measures of nationalisation would be undertaken without the agreement of Parliament and the people did not set their minds at rest—though it is obviously as hard for the Prime Minister to say that there

will be no nationalisation as it would be for him to say the opposite. Most citizens, however, are content to accept as necessary the measures of control that are being increasingly imposed upon particular firms, provided they are fully explained and have been demonstrably introduced "in good faith." They wish more power to the elbow of every Minister whose aim is to multiply war output; and they are ready to recognise that drastic administrative action, without judicial review or proper Parliamentary consultation, though undoubtedly an evil—and one which must cease when the war ends—is probably necessary in the circumstances. But they are not disposed to give a blanket approval to all that Ministers do. They look for proof, and tend to regard each case on its merits.

An Unfortunate Precedent

One case of control in particular has aroused serious misgivings. A colliery in North Wales has been brought under Government control, though it is admittedly an efficient concern and one that has had no strike or lock-out for over sixteen years. On the face of it, it seemed that the intervention was quite unjustified. The later statement of the Minister of Fuel and Power, that because the members of the North Wales Miners' Association at this pit, representing some 50 per cent of the pit workers, were not treated on the same footing as the members of a local industrial union, strike action was threatened elsewhere in the coalfield, was an intelligible explanation, but hardly a satisfactory excuse. It is surely an entirely new principle that an efficient and reputedly peaceful firm should be subjected to control because of intimidation elsewhere. It is true that the resignation of the owners of this colliery from the North Wales Coalowners' Association, in order to avoid recognising the NWMA, suggests exceptional intransigence, and that both Major Lloyd George and the expert labour adviser he called in found much evidence of "both discourtesy and provocation" by them towards the members of the district union. Peace as well as production must undoubtedly be preserved. But sheer politics must not enter in. It is not a war aim to establish the "closed shop." And, however necessary, this precedent seems most unfortunate.

Intervention in Management

The prayer, supported by 128 Members of the House of Commons, to annul the Government's new Regulation empowering Supply Ministers to appoint nominees to boards of directors in war industries was withdrawn on Wednesday. The new order is an attempt to make Regulation 54CA more palatable to its critics, who feared the undue intervention of official representatives, without responsibility, into management. Until Wednesday's

debate, when Mr Lyttelton gave assurances and stated safeguards, the critics were not appeased. The Minister of Production defended the right of official representation on the board of companies in which the Government has "substantial investments." The £280 millions which the Government has spent, or proposes to expend, in capital grants or in the provision of capital assets to the engineering and allied industries is more than a quarter of their £1,000 millions capital; and is only a small part of the vast sums spent on agency factories, shadow factories and so on. Moreover, the Government, on behalf of the community, is, directly or indirectly, the sole customer of most engineering firms. The alternative powers to appoint directors, to introduce controllers or to purchase shares are regarded by the Government as essential for the discharge of its duty to secure the fullest and most efficient war output. It is their needless use, without guarantees for the future, that has disturbed the Conservative critics; and Mr Lyttelton, by promising to refer in every case to his Ministry's advisory committee on industrial efficiency and to consult the Treasury on the definition of "substantial investments" before appointing directors, stemmed their opposition. He made it plain that, in many cases, by appointing directors Ministers would be able to avoid introducing controllers. The drive for efficiency will go forward; and in so far as these protests have been a campaign against the firm policy of Sir Stafford Cripps in the aircraft industry they have been very properly and decisively rebuffed.

A Policy for Farming

The report of the sub-committee of the Conservative Party on Agricultural Reconstruction is the fullest and most forthright of recent plans for farming. It recommends two means of maintaining a fair and stable level of agricultural prices: by international agreements; and, at home, by import boards, levies on imported foodstuffs, direct subsidies and, in special cases, high tariffs. The point is strongly made that, before the war, the retail price of foodstuffs in Britain was twice the remuneration received by the primary producer at home and abroad; "a case exists for searching examination into existing distribution methods." The bulk of the report is concerned with ways and means of assisting the farmer to farm. A new form of County Committee is recommended, combining the features of both the County Council Committees and the War Agricultural Committees, with explicit authority to enforce good farming; and a land management department at the Ministry of Agriculture is recommended. The most sweeping claims are that estate duties on agricultural land should be wholly remitted, and that British agriculture, on every test of size and productivity, will stand comparison with agriculture in any other part of the world, not only in the production of milk, fruit and green vegetables for nutritional reasons, but also in corn growing and meat production. If this latter claim were true as it stands, it is hard to see why the drastic tax concessions and protective measures proposed by the sub-committee should be necessary. It surely amounts to a declaration that, given the stability of prices over a period that all primary producers require, and constantly stimulated by every means to the highest standard of technical efficiency, British agriculture can stand on its own feet without any special charge upon the nation. Actually, the measures proposed by the sub-committee do not bear out this encouraging inference. They recommend that "the post-war British quota should be fixed at something well in excess of 50 per cent of our total requirements"; that is to say, at about half as much again as before the war; and they admit that "a price must be paid." Agriculture is "a way of life," as well as "a bundle of industries"; "to those who measure the greatness of states not by statistics, but in terms of stability, well-being and quietness of mind, it may well appear as a necessary corrective to excessive industrialism"; and "the British agricultural producer has first claim upon his own home market." The fact that agriculture exists, in the first place, not to provide employment or profits, but to produce food—that, in short, food must come before farmers, in any rightly contrived programme for the national well-being—is not straightly faced. Nor is any real attempt made to compute the cost involved—which is the decisive point. When it is proposed that farmers should be given the right to sell at a guaranteed price a certain weight of cereals per annum, there is no calculation of the total quantities involved or of the total cost that would arise from the difference between the world price

and the guaranteed price. Nevertheless, the document is an encouraging one. Its claims are more muted than in the past. It pays more heed than formerly to the need which rests upon agriculture as upon every other industry to justify its use of resources by its productive efficiency in comparison with other industries. The size and kind of British farming after the war, in any right policy, must depend upon two factors: the size and nature of agriculture that will be able to stand on its own feet *plus* the supplement that the nation may be prepared to pay to maintain a somewhat larger agriculture than this for social and political reasons. There must obviously be a limit to the size of this supplement, if this country is not to waste its substance and to sacrifice the sole world economic advantage that remains to it—namely, the efficient manufacture of specialised industrial products on the basis of relatively cheap imports of food and raw materials. It seems reasonably certain that the maintenance of a farming industry with the protected right to provide something like 60 per cent of total food consumption would exceed this limit by an appreciable margin.

Grievance Redressed

Common sense, with the indefatigable aid of Mrs Tate, has triumphed. The Government has yielded on the question of compensation for personal injuries, and announced that in future this non-contributory scheme will apply on equal terms to all civilians, female or male. Mrs Tate's campaign to secure that men and women suffering similar injuries should be similarly compensated was powerfully reinforced by the recent report of a Commons' Select Committee. The Personal Injuries (Civilians) Scheme applies only to war injuries. The decision to equalise compensation will be extended to all war service injuries sustained by Civil Defence personnel, and to the basic disability pensions payable in the Women's Auxiliary Services and the Merchant Navy. Moreover, all non-occupied persons, of both sexes, will have their present rates of injury allowance and disablement pensions raised to those paid to gainfully-occupied men. Briefly, the effect of the scheme is a levelling-up of all injury allowances to 35s. a week, with an extra 8s. 9d. a week for gainfully occupied men if married. The increase for gainfully occupied women is 7s.; for non-gainfully occupied men 14s.; and for non-gainfully occupied women, mainly housewives, 18s. 8d. The largeness of these increases measures the inequity that is now, belatedly, to be removed.

Fire Damage caused by 1,000 fires a day hampers War Effort.

Half the fires in the country are caused by matches and cigarette ends.

MOST FIRES ARE CAUSED BY "CAREFUL" PEOPLE.

DON'T JUST BE CAREFUL—TAKE EXTRA CARE

Issued as part of the Fire Offices' Committee Campaign against fire wastage.

The Last Ditch

To the surprise of most Members and the consternation of some, Sir Douglas Hacking, the leader of the critics, opened the proceedings on the third day of the Committee stage of the Catering Bill by something like a surrender. He told the House that he and his friends, despairing of getting the Minister to see reason, had decided that it was so much waste of breath to move any more amendments. It was left to Sir Herbert Williams, Captain Peter Macdonald, Sir Leonard Lyle and a few other isolated pockets of resistance to carry on the struggle. But the remaining clauses of the Bill were carried through with comparatively little difficulty. In the only division of the two days, an amendment designed to limit the power of the Commission to the consideration of wages and working conditions, excluding matters relating to the efficiency and development of the industry, was defeated by 143 votes to 42. The principal alterations to the original draft were proposed by Mr Bevin himself. He moved an amendment excluding workers employed on ships from the scope of the Bill and a new clause empowering the Minister to establish a register of employers. Finally, he announced that he was prepared, in order to preserve the balance between the different sections, to appoint to the Commission technical assessors, who would be drawn from the different branches of the trade. This amendment was welcomed by the critics. Sir Douglas Hacking, who had held his peace for two whole days, warmly congratulated the Minister. The House adjourned in a very different atmosphere from that in which it had debated the second reading of the Bill. So, it is to be hoped, ends a chapter of Parliamentary history which bade fair at one stage to do very little to enhance the reputation of the present House of Commons.

Appointment Postponed

General de Gaulle's journey to French North Africa has been postponed at the explicit request of General Eisenhower. The motives behind this request seem fairly clear. Opposition to a close collaboration with Fighting France is still very pronounced in the ranks of the North African administration and among the officers of the French colonial army, and it is likely to remain so for some time to come. General Giraud's policy of conciliation has not yet fully succeeded in mollifying the diehard Vichy legitimists on the spot. While the battle of Tunisia is still in full swing General Eisenhower is understandably reluctant to allow the political controversy to weaken the all important war effort. "The British Government fully understand and sympathise with the reasons for General Eisenhower's request"; Mr Churchill emphasised this support for the Commander-in-Chief in a statement on Wednesday, in reply to a maladroit protest from General de Gaulle's National Committee. This view must no doubt be accepted. But it may perhaps be said that while the reasons for it cannot themselves be questioned, the straightforward form of General Eisenhower's intervention may be. The French are bound to ask how this intervention can be squared with the often repeated principle that internal political disputes ought to be settled by the French themselves. German propaganda inside Metropolitan France will surely not be slow to exploit French apprehensions. If political intervention in North Africa has become a military necessity, as it very well may be, then this political action must be taken with an unswerving eye to its repercussions in France itself.

Incommunicando

Both the Commons and the Lords have renewed the emergency powers of the Governors in the six out of eleven Indian provinces in which the Congress withdrawal suspended provincial self-rule. Both Houses took the opportunity to review the Indian situation. Their proceedings provide a remarkably accurate picture of the state of British opinion. There was no question of the desirability of renewing the emergency proclamations. Congress hardly found a spokesman, and Mr Amery and Mr Ammon were in substantial agreement. On the other hand, no speaker was able to provide a solution. There was fairly general condemnation of the tone of the White Paper on Congress responsibility for the recent disturbances, but little doubt that Congress was in fact responsible. In the Lords, the Viceroy's decision to forbid a meeting between Mr Gandhi and Mr Rajagopalachari was widely criticised. Many speakers in both

Houses, including Mr Amery, suggested that British democracy, designed for a homogeneous western state, might not be the proper solution for India, with its recalcitrant minority problems, and suggested scrutiny of other forms of representative and responsible government. Some speakers pointed to the Swiss federal solution—attractive, but, in all probability, out of its depth in the Indian Ocean. The main question for the present is whether Mr Gandhi should be held *incommunicando*. There can be no question of release or of the removal of emergency procedure until the civil disobedience campaign has been called off. On this question there must be faith in the Viceroy's judgment. There can be no appeasement of an opposition which, as Lord Samuel regretfully pointed out, has become totalitarian in philosophy, and violent in its methods. But how can the Indian politicians agree, the *sine qua non*, when they cannot meet?

Coal Conciliation

The acceptance by both sides of the coal-mining industry of Lord Greene's scheme for conciliation and arbitration has been rightly described as one of the most important events in the history of the industry—or, indeed, of industry as a whole. Comprehensive and permanent machinery for dealing with wages and conditions of employment is being applied in an industry where industrial unrest has been proverbial and is still rife—nearly half the total number of stoppages last year occurred in mining. The Greene scheme establishes a National Wages Board, comprising two parts, a Negotiating Committee consisting of eleven representatives of each side, with joint chairmen, and a National Tribunal of independent persons, appointed by the Master of the Rolls, in consultation with both sides. It sets up similar conciliation machinery in the districts—district conciliation boards and district referees—and provides for the transference to the National Board of problems which cannot be settled in the districts—though the North-umbrian miners have objected to the clause that district issues can only be referred to the Board on the joint resolution of both sides, on the ground that it invalidates the whole purpose of conciliation machinery and limits the tribunal's effective scope; no other arbitration scheme stipulates that there shall be agreement to disagree before a dispute is taken to arbitration. The parties commit themselves in advance to accept the settlements of the Negotiating Committee and the awards of the Tribunal as binding, and pledge themselves to endeavour to prevent the withdrawal of labour or the withholding of work. The Minister of Fuel has no voice on the Board, but he has the right to refer issues to it and to attend at the Tribunal—a provision without precedent. The Greene scheme represents an attempt at regulation within the industry, by the industry. It is the logical outcome of wartime developments—the increasing measure of uniformity and lessening of sectionalism and the establishment of a national minimum wage—and it may have far-reaching consequences. It should encourage the formation of a national miners' union and, though the Board is to deal only with wages and working conditions, it may pave the way for joint responsibility in wider fields of the industry. A joint statement issued by the Miners' Federation and the Mining Association, in welcoming the scheme, said:

It is the expressed intention of the two sides to collaborate in working out all the post-war problems of the industry.

Such a development obviously needs careful watching, and adequate provision must be made for safeguarding the interests of the consumer. The Greene scheme will depend for its success upon the spirit with which both sides approach it. If, as in the recent past, it is accompanied by the power to determine output and maintain prices in the producers' interests alone, and unaccompanied by a stringent obligation to raise the industry's efficiency by any means, the price paid by the nation for peace in the coal industry may well be too high.

New Weapons and Ideas

At the annual meeting of the Institution of Chemical Engineers last Friday, Mr Oliver Lyttelton gave an encouraging account of the growth of production. During the last quarter of 1942 the output of warlike stores for the Ministry of Supply was double that of the average for 1941; the structure weight of the production of aircraft was 75 per

cent higher. The trend of production is still upwards. Last February the output of all kinds of munitions was 40 per cent up on the year and that of heavy bombers up four times. But the end is not yet. Mr Lyttelton's claim that the A.22 or Churchill tank is one of the best machines possessed by either side can hardly mean that either he or the military tacticians are yet satisfied with tank production. As Sir Stafford Cripps's energetic intervention in the aircraft industry suggests, the Government is busy removing pockets of incompetence and inefficiency in industrial managements. Contrary to general belief, as Mr Lyttelton pointed out, the need for technical adaptation and adjustment is greater in munitions than in peacetime products. The demand for weapons is dominated by changes and improvements in strategy and tactics. The Minister said that a third of present production consists of weapons which did not exist at the outbreak of war except in the imagination of their inventors. He expressed the hope that reconstruction problems may be tackled as energetically as war production in order to ensure the rapid increase in output that will be necessary to provide the desired standards of life. Before the war technical progress raised productivity at the rate of about 1½ per cent per annum. "Let us see," added Mr Lyttelton, "if we cannot double that, or treble that, over the next twenty years."

Storm over Transit

In the summer of 1940, with the close of the Norwegian campaign, the Swedish Government gave Germany permission to send leave trains via Sweden to Norway. Ever since, this concession has been the subject of vigorous, and often somewhat embittered, controversy in the Swedish press. The claim that it is consistent with strict neutrality rests on two assumptions: that the fighting in Norway has definitely ceased and that the German side of the bargain is not abused. In fact, it has long been plain that Norwegian resistance has by no means come to an end, and it is increasingly certain that there is misuse of transit facilities by the enemy. The British Government has at no stage gone to the length of declaring the grant of transit facilities to be an "unfriendly act." It is recognised that, in a sense, in the summer of 1940 Sweden was yielding to *force majeure*. But there is a growing conviction in this country, and, it appears, in Sweden itself, that the time has now come to end an arrangement which has always been unsatisfactory and anomalous. The underlying controversy was brought to a head by the recent courier plane incident. The revelation that the German plane which force-landed in the course of a flight between Finland and Norway contained many military personnel and dismantled machine-guns has shocked public opinion. There was a storm in the Swedish Parliament. Incredible as it may seem, a Swedish officer apparently acceded to a German command that Swedish soldiers should be searched when the loss was discovered of a German revolver. There seems to be little doubt that Germany has in fact been using the courier route between Norway and Finland, to which the transit traffic agreement does not apply, for military transports. Swedish observers point out that the breach of neutrality, which is not denied, is a German breach. But has reasonable care been exercised? And does the performance of the Swedish military authorities who dealt with the aircraft give the impression of unceasing vigilance? After all, even invasion is still not out of the question. If these questions are being asked in Britain they are being asked even more searchingly in Sweden.

More Babies

The Registrar-General's latest return shows the highest total of births for any quarter ended in December since 1926 and a higher total for 1942 as a whole than for any year since 1928: 655,075 live births were registered, and the birth rate was 15.8 per 1,000, or 1.6 higher than in 1941. It is interesting to note that this is higher than the German rate (15.29 for 1942). The excess of live births over deaths was 175,168 compared with 52,048 in 1941, and the death rate of 11.6 per 1,000 is the lowest of the four war years. There was a further decline in the stillbirth rate, which was the lowest ever recorded.

These figures have been hailed in some quarters with undue optimism. As a correspondent in *The Times* has pointed out, the 1942 rate is still well below the lowest point reached during the last war, and the number of births registered during 1940-2 was 1,849,000 against 2,268,000 in 1915-17, to a smaller population of mothers. The recent rise in the number of births, though welcome in itself, has no direct or necessary bearing on long-term trends, since it is the net reproduction rate (the extent to which women of childbearing age are replacing themselves) that counts. In the years before the war, the net reproduction rate for England and Wales was 0.8; in 1940-2 it was slightly below 0.8. Mr. R. F. Harrod and others have stressed that an increase to unity in this rate within the next fifteen years is necessary if a great decline in population is to be averted. The problem of raising the net reproduction rate by 20 per cent from its present level remains as urgent as ever. National concern in this matter is reflected in an all-party motion calling upon the Government to "face up to the present downward trend in population" (sic). This problem is linked inseparably with the country's future social and economic policy. The mere granting of family allowances, especially if the Government only concedes the meagre amount of 5s. per child, may be of little avail in inducing couples to have larger families. Earlier marriages may help, though not necessarily, and economic barriers, especially in the professions, should be removed, while housing, health services, education, maternity and child welfare have an important part to play. But the key to the problem, in the material sphere at least, lies far more in the unrestricted development of productive forces and the attainment of economic security through the elimination of unemployment.

The Baltic Moral

The Germans have decided to summon immediately "national assemblies" in Estonia, Latvia and Lithuania. The move is part of Dr. Goebbels' anti-Bolshevik campaign, and there are some signs that it has not been altogether unsuccessful. According to *The Times*, the Baltic quislings

have found their task easy, and a large part—apparently even a majority—of the members of the committees is composed of real patriots who have many times courageously demonstrated their deep-rooted love of their native country and their faith in their country's right to a national destiny, independent not merely of Russia but, just as emphatically, of Germany.

For the first time since 1941, the Nazis have managed to rally the elements of the Baltic peoples that have hitherto been immune from their temptations. The moral ought not to be glossed over in Moscow. The raising of Russia's frontier claims at this particular juncture of the war has been worse than a grave psychological mistake; it has been a disservice to Russian interests in the war. The account of Polish-Soviet relations published on page 463 leads to the same conclusion. It would not be surprising if the convocation of "national assemblies" in the Baltic countries were followed by some similar Nazi attempt at "reconciliation" in Poland. There is little chance that Dr. Goebbels could score any success there like the success he seems to have scored in the Baltic states. The Poles have suffered too much to forget or forgive. But if as the result of Polish-Soviet friction, anti-Soviet feelings are exasperated in Poland, the Nazis are bound to be the beneficiaries.

AMERICAN SURVEY

The Acid Test

Before the present Congress assembled, it was argued that the two great tests of its intentions would be its action on Lend-Lease and, even more, its decision whether or not to extend the Reciprocal Trade Agreements. Lend-Lease has been triumphantly upheld. Hearings on the Reciprocal Trade Agreements Act—which is due to expire on June 12th unless it is extended—begin next week. Because a direct link to the war effort is lacking, the anti-Administration and high tariff groups in Congress will be able to let themselves go. It may prove a hard struggle. The thirty agreements which have been negotiated since the Act was passed in 1934 testify to Mr Hull's success in reversing the tide of ever higher American tariffs which characterised the years after the last war. The Secretary of State in February, in testimony only now made public, argued that the extension of the Act was essential for post-war reconstruction, to maintain full employment in the United States, and to open up new markets for American goods. Mr Welles, the Assistant Secretary of State, in an address last week to the New York Chamber of Commerce, re-emphasised the importance of this issue, which he felt was insufficiently appreciated by the public. He argued that no international organisation can succeed if the "economic underpinning" is unsound, and that an expansion of international trade is essential if the devastated countries are to be put on their feet as quickly as possible, in their own interests and those of the American taxpayer. He insisted that the action of Congress would provide the

first concrete test of whether the United States intended to co-operate with the rest of the world in a matter that is essential not only to the full solution of our domestic problems but to the construction of a durable peace.

Mr Welles went to some pains to defend the administration of the Act from charges that its approach was theoretical or doctrinaire. The experts employed, he said, do not spend their time discussing Adam Smith, but in detailed and selective examination of proposals for tariff reductions, industry by industry and product by product, varying concessions from the full 50 per cent allowed by the law to 5, 10 or 15 per cent, or, perhaps, no change at all. Mr Welles did not stand on the defensive, however. Towards the end of his address he pointed out that the Act is based on the theory of free enterprise in foreign trade and on the belief that the profit motive can create a foreign commerce from which the whole nation will benefit. But the ends served by the Act, both domestic and international, are of such overriding importance, he said, that if private interests succeed in preventing its extension, other means—perhaps even Government trading—will have to be undertaken to attain them.

Stemming the Tide ?

Two more hopeful notes were struck last week in the struggle to prevent inflation. One was the decision of the American Federation of Labour and the Congress of Industrial Organisations to throw their energies into an attempt to keep prices down rather than force wages up, thus dissociating themselves from Mr J. L. Lewis's drive for more pay. The other was the President's strongly worded veto of the Bankhead Farm Bill and the decision of its backers not to press for a vote overriding the veto at the moment. The Bill, which was passed by the Senate with only two dissenting votes, and by a House vote of 149 to 40, forbade the inclusion of any Government payment to farmers in the calculation of parity prices. Estimates of the price increases that would result from the Bill's passage vary. As the President pointed out, its effect was to deprive the Government of the power to avoid very substantial increases in the cost of food. The price of corn used as animal feeding-stuff might rise almost 10 per cent, with a consequent demand for higher prices for poultry, eggs, milk, and other dairy products. The President pointed out that if this happened, it would be impossible not to give way on the stabilisation of wages. The resulting spiral would have

devastating effects on the position of the farmers. Farm income at present, in terms of purchasing power, is at an all-time high. Inflation, said the President, would destroy farm income. Nor would higher prices produce the farm machinery and the manpower, the lack of which is the farmer's very real grievance. Senator Bankhead's failure to press for the two-thirds vote which could override the President is not necessarily a tribute to Mr Roosevelt's logic or eloquence. It is possible that such drastic action was never seriously contemplated. As things stand, Congress can take credit with the farm bloc without blackening its name too much with the rest of the country, or assuming responsibility for the race between wages and prices. The Bill remains in the background, too, as a potential threat. The welcome decision of Mr Murray and Mr Green to concentrate on lower prices and desist at least for the time being, from pressing for higher wages, has isolated, but has not deflected Mr Lewis from his demand for higher wages for his miners. There are ugly rumours in Washington of an alliance between Mr Lewis and the farm bloc frankly designed to speed the inflationary spiral. How long the leaders of the other great labour groups will be able to hold out depends upon the Administration's success in reversing the trend to higher food prices.

Government and Business

Among businessmen there is a growing and specific interest in one aspect of post-war economics—the relations that will prevail between business and Government. Some of this discussion has been provoked by the National Resources Planning Board's Report, with which, it seems fair to say, most businessmen are in deep disagreement. A majority of those, in answer to a recent poll of the Research Institute of America, plumped for the complete discontinuance of all Government controls, and were decidedly optimistic about the time it would take to get back to peacetime production. The magnitude of this task, however, has been indicated in two recent speeches. Mr William Batt, of the War Production Board, has estimated that Government investment—or scheduled investment—in wartime facilities amounts to \$14,000 millions; private investment he put at \$4,000 millions, making a total of \$18,000 millions. Mr Batt warned his audience that they must not rule out Government participation in the process of reconversion, or accept responsibility for the maintenance of employment in the post-war period. His own suggestion for plants that are not to be kept in the production of war materials, or in reserve, and are not suitable for conversion to consumers' goods, is that contracts should be renegotiated at the end of the war to provide a cushion against undue hardship—at the same time making profits unattractive enough to speed up the return to producing civilian goods. He insisted, however, that many of the controls developed in wartime will have to be retained. He urged that new forms of assistance and co-operative action between Government and business will have to be developed to meet the needs of peacetime production. Mr Batt was interested primarily in plant and materials. The other speech, by Mr Watkins, of the National Resources Production Board, dealt largely with the human problems of the transition. Estimating that, at the end of the war, about 35 million Americans will be engaged in war work or in the Forces, Mr Watkins stated his belief that, in the first two years of peace, about 15-20 million of these will be cut off from their wartime sources of income; and that it will take from six to twelve months at the best to return industrial facilities to peacetime use. The restoration of full peacetime employment would, he thought, take much longer, possibly two or three years, even allowing for a normal unemployment of about 2 million. In his own "pattern for to-morrow" Mr Watkins stressed the need for broader social security; the guaranteeing of markets for agricultural products and raw materials; a world economic organisation to direct the use of surpluses; and the recognition that where private enterprise is unable to maintain employment, the Government must fill the gap.

THE WORLD OVERSEAS

Polish-Soviet Relations

(By a Correspondent)

POLISH-SOVIET relations lately entered a rather critical phase. The Soviet and the Polish press engaged in sharp polemics about the frontier problem. With the publication of government statements on both sides, the polemics received official backing.

Formally, Polish-Soviet relations are, for the duration of the war, based on the agreement of July 24, 1941. Under that agreement, the two Governments resumed the diplomatic relations which had been broken off on September 17, 1939, when the Soviet armies under Timoshenko crossed the Polish frontiers and occupied eastern Poland. By the agreement of 1941, the Soviets declared the Soviet-German pacts of 1939, concerning territorial changes in Poland to be null and void. The agreement provided for mutual assistance during the war, and for the creation of a Polish army in Russia. In a special protocol, the Soviet Government agreed to free Polish nationals in Russia (prisoners of war and others) who had been deprived of their freedom.

From the very beginning, the political atmosphere in which this agreement had to be implemented was uneasy. The events of 1939 were still fresh in Polish as well as in Russian memories. The psychological barriers to understanding and co-operation were strong on both sides. Yet, in the initial phase energetic attempts were made by Premier Stalin and General Sikorski to overcome those obstacles. And in December, 1941, during his visit to Russia, General Sikorski saw some encouraging results. The first units of the Polish army in Russia were raised; quite a number of Poles were already at liberty, although the release of Polish nationals from prisons and camps was proceeding rather slowly in the face of many obstacles. The Russian authorities permitted the Polish Relief Fund (directed from London) to give material help to Polish deportees living in Russia, mainly in Siberia, in utter destitution. Towards the end of 1941, it could be hoped that time would cure mutual bitterness, and bring a notable improvement in relations.

This hope did not quite materialise. In 1942, political observers could see some new points of friction arising. One of them was the problem of the Polish-Czech Federation. Soviet sources criticised the scheme as an attempt to set up the old *cordon sanitaire* along Russia's western frontiers. Polish-Czech negotiations on that subject, which had gone forward fairly well in 1941, broke down under the pressure of Soviet objections. Further, a divergence of views on the guerilla problem developed, to some extent analogous to the split in Yugoslavia. Unofficial Soviet radio stations broadcast appeals in Polish calling the people in Poland to armed insurrection and guerilla warfare. Polish official circles advised caution, and warned against premature outbursts which would lead to sanguinary massacres. It was decided to transfer the Polish army to the Middle East. Yet all these points of friction might easily have been "localised." The existence of a foreign and politically alien army on Russian soil was, very understandably, a disturbing novelty to the Soviets; and the Poles, too, preferred to keep their army in a non-Soviet environment. The issue of the guerillas is bound to lose its acuteness, once the military situation and the internal position in Poland have developed to the point where more radical methods of resistance are in any case unavoidable. Yet, the cumulative effect of these frictions has been undeniable.

The tension has been further enhanced by the status of Polish nationals in Russia. The number of Polish nationals in Russia may be between six and seven hundred thousand. Many of them are still imprisoned or interned. In addition, the activities of the Polish Relief Fund in Russia have now been prohibited by the Soviet authorities.

This prohibition may well be explained, and perhaps justified, on the ground that the peculiar structure of the Soviet state makes the existence and functioning of extraneous organisations inside Russia very difficult, if not impossible. The prohibition of the Relief Fund activities, however, was accompanied by a political step, the importance of which seems to surpass the immediate issue. The Soviet Government officially notified the Polish Government that, from now on, all Polish subjects in Russia will be considered Soviet citizens. This applies to all Poles who were deported to Russia from Eastern Poland in 1939-41, even to such Poles who before the war had been domiciled in Western Poland, and whom the fortunes of the war brought within the Soviet occupation in 1939. The Poles drew only one conclusion from this measure, which was taken at the beginning of 1943—that Russia had, in fact, raised and to a point unilaterally settled the frontier question.

The Polish-Soviet agreement of July, 1941, provided only a negative solution to the frontier problem. Under it, Russia annulled the Molotov-Ribbentrop Pact of 1939, by which Russia got possession of Eastern Poland. The Poles interpreted this officially as meaning that Russia had recognised the *status quo* of 1939. Until recently, the

ARE YOU RETARDING EFFICIENCY

by
INCORRECT LIGHTING?

YOU couldn't read this paper in a poor light. Are you asking your workers to do efficient work under poor seeing conditions?

You must drive slowly in the blackout because you can't see far ahead. In the same way your workers may be slowed down because they cannot see well enough to work quickly.

LIGHT—THE VITAL FACTOR IN EFFICIENCY. Incorrect lighting impedes efficiency and retards individual output. When poor lighting is corrected, efficiency increases, accidents and "spoils" are reduced, strain is relieved, fatigue is lessened. Obviously total output gains in ratio.

CORRECT LIGHTING IS A SCIENCE. Correct lighting is not merely a matter of increasing the number and the power of your lights. High wattage is no criterion

of good lighting. Glare does not spell efficiency. Lighting is a science: it is a job for the expert.

AN ADVISORY SERVICE FOR INDUSTRY. The Mazda Industrial Lighting Advisory Service has been established to assist the owners and managements of factories to obtain expert advice about their lighting without obligation.

On request, a specialist will visit your works and report on your lighting. He may find it exactly as it should be, and you will be pleased to have his confirmation. He may make valuable suggestions which, if given effect, will aid production, and in many cases will definitely reduce current consumption and therefore save fuel. You are invited to write to-day for details.

BTH RESEARCH AIDS INDUSTRY

BTH Research Laboratories have made an intensive study of both the physical and psychological aspects of lighting in wartime industry, and their knowledge and experience are at the disposal of the principals of industrial undertakings through the

M.3972

Russian attitude was non-committal; it neither endorsed nor denied the Polish interpretation. It seemed, therefore, reasonable to assume that, whatever the legal niceties of the problem, Moscow envisaged a compromise solution in the form of a negotiated adjustment of frontiers. Recent developments have at least put a question mark on this assumption. The Soviet press waged a campaign against the Poles. The charge was made by the Ukrainian deputy to the Supreme Soviet, M. Korneichuk, that the Poles aim at extending their frontiers into the Soviet Ukraine, a charge which is, in fact, post-dated by more than twenty years. In support of the accusation, M. Korneichuk quoted some Polish papers published in this country, especially some oppositional weeklies, which had criticised General Sikorski for his failure to secure an explicit Soviet recognition of Poland's pre-war frontiers in the 1941 agreement. M. Korneichuk is perhaps the most popular army writer in Russia, and his words carry weight in military circles. In its turn, the Polish official reaction to M. Korneichuk's sally was unduly nervous. The Polish Government allowed itself to be dragged into an untimely frontier discussion in public, and made a strong statement of its unconditional adherence to the *status quo* of 1939.

This statement was unfortunately timed to coincide with the successful effort made by the British Ambassador to Moscow, Sir Archibald Clark-Kerr, to secure a personal conversation between Premier Stalin and M. Romer, the Polish Ambassador. The Polish statement was met by a strong official Soviet counter-statement. Soon afterwards, the appointment of M. Korneichuk to the post of Vice-Commissar of Foreign Affairs followed. This demonstrative gesture, for the time being, brought the crisis to a climax: the Soviet Government has made it clear that it sticks to the "Ribbentrop-Molotov frontier," which it apparently renounced in 1941. For the time, silence was plainly best for all concerned.

But later developments did not unfortunately tend to mitigate the controversy. The "uncompromising" chauvinist sections of the Polish colonies in London and New York attempted to exert pressure on General Sikorski's Government, and some of the Polish papers have thought it fit to make a display of hysterical Sovietophobia. In Moscow, on the other hand, an unrepresentative group of Polish Communists and Communist sympathisers has launched the so-called Society of Polish Patriots, and the polemical articles of their paper, *Free Poland*, were echoed by *Izvestia* and *Pravda*. At the same time, it was confirmed by M. Litvinov that two foremost Polish Jewish Socialist leaders, Henryk Erlich and Victor Adler (both well-known anti-Nazi politicians and members of the Executives of the Socialist and Trade-Union Internationals), have been executed in Russia on a charge of Fifth Column activities. On the Polish side, there is the natural but unbalanced anxiety of people who fought because they refused to cede Danzig to Hitler, and who are now in danger of losing more than half their pre-war territory to Russia. On both sides, extremist pressure groups have exerted a harmful influence. In this country, certain English papers, despite an official recommendation to desist, have continued to publicise only one side of the case—which makes it essential that both sides should be stated, even though total silence would be preferable. The question on which the future of Polish-Soviet relations may to some extent depend is whether the more moderate and co-operative tendencies among both, the Russians and the Poles, succeed in regaining the upper hand. Whatever the pros and cons of the Ukrainian problem, one in which neither the Russian nor the Polish record is by any means spotless, Poland's tragic rôle in this war deserves friendly consideration by its eastern neighbour and ally.

Decay of French Industries

[BY A CORRESPONDENT]

FROM March 1, 1943, the demarcation boundary between the two zones of the German occupation of France has been open for civilian traffic. No permits are now needed to cross from one zone into the other. Restrictions on traffic in the Nord and in the Pas de Calais have been relaxed, and the French-Belgian frontier has come under the control of the French police and of the French Customs

officials. Laval used the occasion to announce to the French yet one more triumph of his collaborationist policy. But the gift has been made to Vichy at a time when it can no longer make use of it, at least economically. Some time ago, the obliteration of the demarcation line might perhaps have served to eliminate some anomalies in the French economy. At present, however, the commercial traffic between the two zones can hardly be increased appreciably. The free distribution of goods throughout the country means very little when both the volume of goods and the transport available are grossly inadequate. In fact, the first weeks since the opening of the demarcation boundary have brought great congestion and confusion in passenger railway traffic. In appeals to the public to refrain from travelling, it was officially pointed out that the present rolling stock of the French railways is only half of what it used to be before the war, and of this half a very large proportion has to meet the needs of German military traffic. It is safe to assume that only one quarter of the pre-war rolling stock can now be used by the French themselves. Motor traffic has been completely paralysed. Only 10 per cent of the road garages are still open, and their customers are much more frequently German officers than French civilians. How the paralysis of transport should be dealt with is discussed in the press uninterruptedly. The switch-over to water transport is repeatedly recommended, apparently with no effect. The available stock of river vessels is very small, and it cannot be much increased. The traffic difficulties in the district of Paris have been strikingly illustrated by the suggestion recently made that underground trains should be used for the distribution of food in the capital.

The shortage of fuel is the basic factor which, together with the shortages of all essential raw materials, determines the industrial position. The Germans have now openly admitted the failure of their plan to increase the French coal output. A scheme, it now appears, was worked out at the beginning of 1941 which envisaged the stepping up of output to 65 million tons. France's pre-war production was about 45 million tons—the increase by 20 millions was intended to make good the cessation of British imports. The German press attributes the failure of the scheme to the shortage of pit props, to the inadequate number of miners and to the lower productivity of the individual miner. The present output is, therefore, certainly lower than it was before the war, although some German reports claim that it has been maintained at the pre-war level. Some time ago it was, with the customary advertisement, announced that new coal deposits had been discovered in central and southern France. There has, however, been no indication that the discovery has been followed up by effective exploitation, and the shortage of labour in the old mining districts in the north will not allow a transfer of miners to the south. The distribution of the current coal output has been entirely controlled by the occupation authorities and subordinated to the needs of the German war economy. The output of hydro-electrical energy has also been at a low level, as has been shown by the recurrent announcements about the closing down of electricity consuming establishments and by the progressive curtailment of the consumption of current.

The fuel crisis has led to intensive timber felling. The timber industry has lost 75 per cent of its trained labour; but the number of workers employed in it has been increased five times since the armistice. (It was 50,000 in 1940 and 250,000 in 1942.) Last year's output was 32 million cubic metres of wood, of which a very high percentage was firewood. The exploitation of the stock of wood has grown to an extent that creates a grave danger to French forestry. According to Radio Paris, 10 million hectares of French woodland are threatened with devastation, and last year's reafforestation covered not more than 10,000 hectares.

The Return of the Sabot

The famous French shoe industry has now become a very important consumer of wood. The programme of footwear production in 1943 consists of the following items: 8.5 million pairs of leather or rubber soled shoes, 16 million pairs of shoes with wooden soles, 7.5 million pairs of clogs and 1.5 million pairs of other wooden shoes. In the meantime, the use of rubber for footwear has been almost totally forbidden, and as the supply of leather has been very small after the drying up of North African imports, the number of wooden soles will probably become even higher.

The position is not much better in textiles. The stock

of raw materials available for 1943 is 120,000 tons, compared with a peacetime annual consumption of 470,000 tons. Cotton, of which France imported some 220,000 tons a year before the war, is no longer available; it is replaced by artificial silk and cellwool, of which 65,000 tons are available to meet this year's consumption. The factories which produce workers' overalls have been given priority in the allocation of raw materials. The first claim on the overalls goes to the workers of the Todt organisation as well as to those who are transferred to Germany under the *relève*. Vichy has, apparently, not only to supply slave labour to the conqueror; it has also to send the slaves in their working clothes. The concentration of the textile industry has resulted in a reduction in the number of textile factories from 12,000 to 8-9,000. The output of the Lyon silk industries is, according to some sources, about 10 per cent of the pre-war volume.

The Metal Tax

Until 1942, the iron and steel, motor car and aircraft industries still worked at full capacity for German orders. Nothing has been published about the present position in those branches of industry. There is, of course, no reason to assume that the Germans have given up the exploitation of the French armament factories. But the extent to which they use them seems to have diminished. The supply of iron seems to be not large enough to feed both the German and French industries. French iron production has recently been radically concentrated—only six foundries have been allowed to continue (the Lorraine industries are, of course, no longer officially considered as French). The stock of non-ferrous metals, too, has been exhausted; copper, tin and nickel have disappeared. An important exception is bauxite, in which France has been one of the world's principal producers. The shortage of all sorts of metals has been responsible for the imposition of the "metal tax," which will surely become a classic curiosity of modern taxation. Certain categories of taxpayers are compelled to pay fixed percentages of their taxes in one of the metals in short supply: iron, copper, bronze, tin, nickel, etc. The "taxation value" of the respective metals is assessed according to intricate tables composed along the lines of "marginal utility."

The reduction in the activities of the metal industries can also be deduced from the scope of the *relève*. According to a Swiss estimate, the number of French workers transferred to Germany, including the 1943 quotas, is 750,000, of whom at least 300,000 are skilled workers. The total is probably too high; the official figure given by Vichy is 500,000; yet the figure of skilled workers is not likely to be very much exaggerated. Until recently the *relève* was mainly applied to skilled metal workers, and it is clear that the transfer of so high a proportion of skilled labour from the French metallurgical plants would have been impracticable had not the employment of those plants been deliberately and drastically reduced.

THE BUSINESS WORLD

Fair Deal for Railways

LAST year, British railways earned nearly £40 millions more than the standard revenues to which they were entitled (if they could earn them) under the 1921 Act, and £46 million more than the fixed annual rental to which they are entitled under the revised wartime agreement of 1941. This is not an agreeable spectacle for the average railway equity stockholder. The grapes are there, and they are sweet; but they are out of reach. His spokesmen tell him to exert his influence in the constituencies since, it would appear, this issue of larger incomes for railway stockholders overrides the party truce; and railway chairmen have been bluntly told of his sense of grievance at having to bear "a special burden."

Even the spokesmen, however, appear to realise that the chances of basic revision of the 1941 agreement are extremely slender. They are content to record their protest in the expectation that the post-war railway settlement—and, in particular, the relations between rail and road transport—will show some recognition of the special wartime services of the railways and of the modest participation of stockholders in their fruits. This is at least a more respectable line of argument than could be found for the 1940 agreement, which drove railwaymen and railway stockholders into an unholy partnership to raise costs and revenues. Both sides have improved their lot during the war, though there is no fixed wage fund for railway workers like the fixed earnings fund for stockholders. Undoubtedly, some part of the stockholders' soreness is due to the fact that the rental agreement has radically changed the balance of bargaining power in wage negotiations in favour of the unions, and at the same time has deprived the marginal stockholder of any wartime equity.

The 1942 Pool estimates are indeed a stockholder's pipe-dream. The Pool net revenue amounts to £89,126,000; in 1940 it was £42,763,000, after provision for war damage. The following table gives the figures for the past three years—the 1940 figures are not strictly comparable:—

In £,000's			
	1940	1941	1942
Receipts—			
Passenger	104,785	132,106	163,544
Freight	140,498	158,826	176,658
Miscellaneous	2,709	2,903	3,285
Total	247,992	293,835	343,487
Expenditure	205,480*	226,636	251,715
Net Receipts	44,512	67,199	91,772
Net Pool Revenue	42,763	65,125	89,126

* Includes provision for war damage.

Two points are especially noticeable in these figures. The first is the spectacular growth in passenger receipts, which far outstrips the growth in freight receipts, great though that is. Last year, passenger takings accounted for about 48 per cent of traffic receipts, compared with 43 per cent in 1940, and 44 per cent in 1937. This is a rough comparison, which ignores the effect of London Transport's returns in the Pool estimate. Making all allowance for the large part which the transport of Service personnel plays in these results, they illustrate the old railway principle that higher passenger loadings are the most efficacious way of increasing net receipts.

The second point is the remarkable improvement in the operating ratio, that is, in the proportion of gross receipts that is absorbed by operating expenses. The average figure for the four main lines in 1937—a moderate pre-war year—was 80 per cent. It was 82 per cent for the 5 controlled undertakings in 1940, 77 per cent in 1941, and 73 per cent last year. But it would be most dangerous to suppose that this trend has become a permanent feature of railway operation. The maximum capacity at which the railways

can operate in wartime is well beyond the optimum capacity of peacetime. Passengers have been crowded on drastically reduced services, and cheap fares withdrawn—both conditions which the railways could not afford to impose in peacetime, even if they wished. Private traders, taking second place to essential wartime traffic, have tolerated the handling of their consignments on the basis of efficient waggon loading rather than speed of delivery, and exceptional rates for freight have been curtailed.

In short, the railways in wartime—and then only—operate as a virtual monopoly. Quite apart from the increase in passenger and freight working directly due to the war, they could almost certainly earn their standard revenues under peacetime working if the same apparatus of control were to exist. To regard the 1942 Pool results as having any relevance to the normal earning capacity of the railways, or as supporting any claim that stockholders have been unjustly treated, is to ignore the special conditions of wartime operation. The results are due to the sacrifices of railway users, and to the state, which is, after all, responsible for the creation of the wartime traffics. In these circumstances, it seems reasonable enough that the financial advantages should accrue to the state, and that the stockholders' equitable reward should remain based, very roughly, on a fixed rental related to normal earning expectations, plus a modest *douceur*.

What relevance, then, have the figures to a post-war railway settlement? Suggestions are sometimes heard that the wartime results should be used in computing the basis of compensation, if and when the railways are nationalised after the war. This begs the question whether the nationalisation of railways is desirable; it is, in fact, a dead issue, buried by Lord Keynes in 1926. It is most improbable that any improvement in railway efficiency would result from nationalisation, or that the purchase price would be limited to a strict capitalisation of the railways' normal expectation of earning power. Both as taxpayer and traveller, the citizen would almost certainly lose by nationalisation. There is probably quite sufficient control of the railways' "natural monopoly" in normal times to satisfy the public interest. Suggestions of nationalisation, therefore, must be suspect, whether they come from politicians or from stockholders who have lost faith in their equity and would prefer a gilt-edged holding instead.

Stockholders have been told that post-war transport problems are being actively considered by their boards, but there are, as yet, only a few hints of the direction which these discussions are taking. "Co-ordination" of rail and road transport is the keynote, and it means, in plain terms, agreement between the two sides of the industry to ensure that the railways enjoy better loading conditions, and get a bigger proportion of high-class freight traffic. It is a problem that was being slowly tackled before the war in road-rail discussions. Whether a mutually satisfactory "Square Deal" could have been worked out then is impossible to guess: It may be a good deal more difficult to work out after the war, so long as road transport services are free from restriction, and so long as traders are free to send goods by rail or road as they wish. Standardisation of road and rail rates would not be sufficient in itself, but standardisation of rates, coupled with control of users, could bind this country to a transport monopoly which might well choke the arteries of trade.

No transport agreement, whether voluntary or imposed by Statute, can be acceptable which fails to ensure cheap and efficient transport. No railway stockholder who holds other views should run the risk of retaining his holding. He should judge the present by the rental agreement, and refuse to contemplate the future through the rosy spectacles of the 1942 Pool results. As for the passenger and trader, let him bear with his present difficulties and watch the future. He was vociferous enough after the last war, and his turn to protest may come again.

Finance and Banking

The Foreign Exchange Market

The official publication of the proposals for an International Clearing Union has eased many anxieties in foreign exchange and banking circles. Earlier hints that the Keynes scheme involved a system of multilateral clearing—as in effect it does—had given rise to fears that it envisaged the establishment of a clearing office in each country through which all foreign payments would have to be canalised. A highly academic and unrealistic scheme proposing such a multilateral clearing system had recently received surprising attention in the City and there had been an altogether unfounded tendency to confuse this scheme with Keynes', because they both used the same terms to depict vastly different things. The Keynes scheme would, in fact, involve the least possible interference with the existing mechanism of the foreign exchange market or with the organisation and functions of international banking. Each national foreign exchange market would continue to function, with such degrees of control as its authorities thought fit, quite independently of the Clearing Union. It would only be the relatively small hard core of uncleared balances arising out of the operations of the open market which would be cleared through the Union by the central banks of the countries concerned. The Keynes plan even provides scope for free dealings in gold. Central banks would be entitled to retain their separate gold reserves and ship gold to one another, provided they did not pay a price above the parity indicated by the ratio of their currency to the *bancor*. The White Paper even suggests that gold might be put into circulation by any country desiring to do so, though such a step would inevitably restrict the scope for changes in exchange parities, provision for which is an essential part of the plan.

"The Practices of the Goldsmiths"

One false note in the White Paper on the Keynes scheme is the claim that this is the first real attempt to apply the "banking principle" to international payments, and the accompanying assertion that in the matter of payments between countries the world has never got away from the practices of the seventeenth century goldsmiths. This is perhaps an odd statement to come on such high authority, and from London, of all places. It is probable that nowhere has the banking principle been applied more effectively than it was in the mechanism of the pre-1914 gold standard, hinged on the operations of the London capital market. Every commercial country of importance kept funds in London, while in their turn London bankers and acceptance houses extended their facilities throughout the world. Britain was the main creditor nation; but by its free trade policy and willingness and ability to lend abroad on short and long term, it kept her net balances of payments very near to equilibrium. There was a highly integrated international foreign exchange market which allowed arbitrage to follow minute differences in interest rates and international security prices in such centres as London, Paris, Amsterdam, Brussels, Berlin and New York. The result was that the immobilisation of international credit through gold movements was kept down to a minimum. International shipments of bullion were, even in years of crisis, a minute fraction of the total international monetary turnover. It is true that the world fell sadly away from the achievements of this efficient mechanism. After 1920, America became the main creditor, and, for a variety of reasons, not all of its own choosing, decided to take its credits in gold, which became sterilised in its banking system with disastrous result to the balance of world economy. But this advent of the dark ages in monetary affairs should not obscure the fact that they had been preceded by a long period of comparatively high civilisation. What the Clearing Union may hope to achieve is to re-discover, centralise and systematise the application of the banking principle to international payments.

More Bills for Market

During the past week there has been a complete return to credit abundance after the exceptional spasm of

stringency experienced in the previous week. That interesting departure from the normal ease was to some extent an aftermath of the special measures taken to maintain the position exceptionally easy during London's Wings for Victory week; but it was also a result of the peculiar distribution of the Treasury bill issue. In the past few days the position, helped by the previous week's heavy special buying of bills, has again eased, though the market obtained the more normal allotment of 30 per cent of the £75 millions of bills that were tendered for on Friday of last week. This week the tender for Treasury bills is being raised to £80 millions, another indication of the desire of the authorities to restore to the Treasury bill issue some of the elasticity which it has for so long lost to the Treasury deposit receipt issue. This week's TDR payments amounted to £70 millions, against which there were nominal maturities of £50 millions, of which an appreciable amount had been pre-encashed. In spite of this net floating debt borrowing, the Bank return shows a small increase of £165,000 in bankers' deposits, maintaining them at the comfortable level of £144,510,000.

Dollar Devaluation

The question of the United States President's powers to change the gold value of the dollar is again attracting attention. This has led to all kinds of rumours of a further devaluation of the currency—rumours which have done good service to the speculative activity in gold shares. The monetary powers vested in the President have their roots in two laws, the Agricultural Adjustment Act of May, 1933, and the Gold Reserve Act of February, 1934. The first gave the President power to fix by proclamation the weight of the gold and silver dollar

at such amounts as he finds necessary . . . to stabilise domestic prices or to protect foreign commerce against the adverse effect of depreciated foreign currencies.

But this discretionary power was limited, as regards the gold dollar, to a devaluation of 50 per cent. The Gold Reserve Act put an upper limit to the powers of changing the value of the gold dollar, this ceiling being 60 per cent of the old gold contents of the dollar. These powers were extended from time to time, the last occasion being an Act approved in June, 1941, which put the expiry of the President's devaluation powers forward to June 30, 1943, unless the President shall sooner declare the existing emergency ended. The emergency is far from ended and the administration is again seeking for an extension of its monetary powers. The fact that this question is coming up for consideration at the present time has become mixed up with the discussion of the various international currency stabilisation plans now before the American and British publics. It should be noted that the "unitas" of the United States Treasury scheme is based not on the dollar, but on gold, the unit of account being equal to the weight of gold of ten present-day dollars, i.e., 137 1/7 grains of fine gold. Under this scheme, the United States would have to give greater statutory permanence to the possibility of changes in the gold content of the dollar than those provided by existing legislation. The scheme makes definite provisions for changes in the value of member currencies in terms of the unitas, i.e., of gold, given the required four-fifths majority of the Board of the proposed international authority.

Investment

Higher Equity Yields

The story sketched last week on the basis of the sensitive indices of *The Financial News* can now be filled in from the fuller figures of *The Actuaries' Investment Index*. This shows a renewed rise in all the main sections of industrial equities except miscellaneous, which has been brought down by the weakness of brewery shares. Further, last month's improvement more than offsets the February decline and all sections, including miscellaneous, are above the end-January level. The really interesting point is, however, that, this rise notwithstanding, the main sections, again excluding miscellaneous, show a rise in yields. This can only mean that dividend payments have been increasing, and that the rise in the general level of prices has failed to keep pace with this higher level of distributions. In detail, the improvements in prices on the month are not quite what was expected. Despite the recent setback, aircraft shares have risen further without the assistance of larger payments, while building materials, cotton shares and gas stocks also made important contributions to the net gain. Electrical distribution stocks were, however, down by some 4 per

cent on the talk of grouping and eventual nationalisation. Outside the industrial list, there was a further sharp fall of some 2 per cent in insurance shares, which now stand below the level of a year ago. If the month brought a widening of the yield margin between equities and fixed interest, it also witnessed a continuance of the narrowing of margins within that category. Gilt-edged were stable to firm on the month, but home corporations fell, while there was a further improvement in debentures in the productive industrial group and a rise in preference shares in both that and the distributive group. The rise in equity yields strengthens the view that prices existing two months ago fully discounted any improvement then in sight. There may well be some more results which are slightly better than their predecessors, and a further improvement in distributions on the scale of last month might start a fresh buying wave of modest importance.

The Vested Shares

The statements of the Prime Minister and the Chancellor of the Exchequer have not entirely relieved the anxiety of those who were perturbed by the Short Brothers vesting and other Government acquisitions. Mr Churchill's statement that he could not conceive that the Government would embark upon a policy of nationalising the aircraft industry without consulting, not only the House, but the country is reassuring. It indicates that no break with constitutional procedure is in contemplation. But the suggestion that a new and developing industry such as this may be nationalised has aroused concern. There was no answer to the particular question whether the Government, without proceeding to nationalisation, might elect to run individual companies. There would, of course, be nothing objectionable if this happened, provided that such companies should operate on an identical footing with those privately owned—which would not be easy to ensure. Very properly, it has now been stated that there is no intention to use wartime powers to prejudice unjustly any existing firm or their

shareholders. But the investor and the industrialist are naturally concerned less with the intention than with the effect. The fact that a host of anomalies and minor injustices, caused inevitably by a mass of hastily created laws and regulations, are borne with little complaint justifies those who bear them in asking for a full explanation. Sir Kingsley Wood's replies did not carry this particular matter much further. It is scarcely necessary to give holders of vested shares a receipt, since their holdings are in any case on record. The plain fact is that the Government has yet taken no decision as to post-war policy.

Valuation of Assets

The correct method of valuing assets in company balance-sheets has been for decades a matter of dispute among accountants and others. In the past, the problem has usually been approached purely from the standpoint of the shareholder, and the object has been to ensure that there should be no distribution of capital as profit. With the emergence of the idea that the state should take a hand in evening out the trade cycle, there has arisen a desire that industry should make its own contribution, and the old problem of valuation—in this particular case, valuation of inventories—is taken up from the standpoint of influencing the trade cycle by Mr K. Lacey in *The Accountant*. He maintains that, under existing systems of accounting, a rise in book values of stock-in-trade due to a rise in prices would be considered as profit of the period and distributed as such. This, of course, tends to raise prices higher than they would be if the distribution were cut to a figure at which the maintenance of the physical volume of stock were assured, other balance-sheet items being unchanged. Correspondingly, when prices are falling, there would be an under-distribution resulting in an acceleration of the deflationary process. It had been commonly assumed that, while the valuation process was as described, special provisions were made, not explicitly, but by additions to reserves. But if this is not so, or if the true facts of the case were not understood, the case for a revision of outlook is overwhelming. Mr Lacey goes on to make a specific suggestion as to the future. This is that industry should be required, after the post-war restocking, to set up a reserve, free of income tax and EPT, to cover the wartime rise in the cost of stocks at the level existing either before the war or after the restocking, whichever was lower. If prices fell, the relevant amount would be withdrawn from this fund, and, when they rose, the fund would be increased out of the company's resources to cover the increase. Evidently, such a practice would be a valuable stabilising factor, but it is not clear that the state can be expected to shoulder the bulk of the burden of replacing any capital of existing concerns which has been lost in this particular way during the war. The demand for replacement of fixed assets would be at least as difficult to resist. The whole problem needs detailed study, and all that can be said at this stage is that one must reconstruct first those concerns which are capable of making the largest contribution to reconstruction. It will also be necessary to make arrangements for new entrants into industry.

Doulton's Accounts

In presenting the accounts of Doulton and Company for the past year, the chairman, Mr L. J. E Hooper, draws attention to changes in the form of the accounts with results which, it is claimed, give the clearest possible picture of the company's affairs, within the necessary limitations of published accounts. These accounts have in many respects been above average for some years past and of late have been improved almost yearly. They go a long way towards itemisation of both assets and liabilities; the convenient modern practice of deducting current liabilities from working capital is followed, and the former include all appropriations, whether sanctioned or not, which should be placed under that category. Further, tax liability on January 1, 1943, is separately stated from future provisions and the latter are included under allocated reserves, which are separated from those available for general purposes. The former include depreciation, but it is a retrograde step that this is no longer split between depreciation on land and buildings and that on plant and

equipment. It is also a pity that the company does not state the amount of sales and additions, but merely the net figure of the two together, since this makes it impossible to keep track of the rate of depreciation provided. For the rest, all the information given is excellently arranged and very clearly presented. Unfortunately, the profit and loss account, at least, what was spent on materials, wages and power. This one does not even give details of whence the profit was derived, or of administrative charges. It is, in fact, only an appropriation account, with the addition of directors' fees and a non-recurring item. Even the occasional transfers to staff superannuation are not explained. The company, whose earned percentage dropped from over 30 for 1937 to 2 three years later, did much better last year. The profit was more than three times as large as in 1940. The ordinary dividend is maintained at 5 per cent, with a small margin to spare after providing £20,000 for deferred repairs and half that sum for staff superannuation, against nothing in either case last year. The board has decided to distribute, out of capital reserve, a scrip bonus of equal amount.

Mexican Bond Payments

The agreement between the Mexican Government and the International Committee of Bankers on Mexico for modified resumption of service on the direct external debt from the beginning of 1943 has now been put into effect. Funds adequate to meet the payments specified under the agreement were received in time to honour the April 1st coupons. This news was followed by a number of fractional rises in the market prices of the leading Mexican issues. The 5 per cent Consolidated External Gold Loan, 1899, now stands at around 18 and the 6 per cent ten-year Treasury Notes, 1913, Series "A," at around 20. The improvement in quotations is, of course, evidence of the earlier lack of market confidence that the specified payments would materialise. The low level of prices still reflects general dissatisfaction with the terms of the agreement under which the Mexican Government has eliminated all interest due in the years 1923-42 inclusive, by purchase at depressed prices of the interest obligations in those years at 1 per cent of face value. Under the present scheme, the secured debt is to be retired in the course of the next twenty years and interest payments in the meanwhile will be met by annuities. It appears that the total sum initially to be paid out in interest will amount to pesos 10 million, but this will, of course, decline as retirement is effected. In addition to the 5 per cent state loan of 1899 and the 6 per cent ten-year notes, British investors also have important interests in the 4 per cent External Gold Loan, 1910. Recent negotiations on the question of the external debt have not raised the investors' faith in Mexico's willingness to pay.

Capital Issues in 1943

In the first quarter of the year, capital issues calculated on the "New Basis," which includes issues by "permission to deal," were some £30 million lower than in the corresponding quarter of 1942. The customary capital issue tables printed in the next column show that the whole of the fall took place in Government issues, at £459,040,900 against £493,120,000. Compared with the total of £327,871,340 raised in the fourth quarter of last year, there is, however, a substantial recovery in Government issues amounting to some £132 million. In both years, these figures were, of course, swelled by the special influences of savings campaign boosts—warships and wings for victory weeks. It is, however, possible that the downward trend in Government borrowing, excluding floating debt and tax certificates, which became evident during the course of 1942, has now been decisively reversed and is in the process of moving to new high levels. Compared with the totals of a year ago, Savings Certificates have yielded more than £5,000,000 more, and all series of National War Bonds nearly £4,000,000 more. The decline in the sales of 3 per cent Defence Bonds continues. The first quarter total of these is only some £35 million, £17 million less than in 1942. There is also a considerable drop in sales of 3 per cent Savings Bonds, which brought in £167,415,115 against £193,194,506. The total of unofficial issues, although more than three times that of a year ago, is still only £6,585,000. The largest issue was that of ordinary capital to a nominal

total of £2,962,238 by Lancashire Steel, which represented only a transfer of ownership. United British Oilfields of Trinidad has increased its 5 per cent debentures by £750,000, and there have been numerous small issues in the miscellaneous section. Helped by the removal of the ban on conversions, the industrial total for the last three months amounted to £10,482,751 against £4,002,059.

Company Notes

John Summers' Expansion

The preliminary statement of John Summers & Sons, steel-sheet producers, reveals a further substantial improvement in trading profit for 1942 from £874,494 to £1,066,253, against only £553,590 in 1940. Taxation and war damage insurance together require £541,589 against

• Interest paid half-yearly
• Income Tax not deducted at source

3% SAVINGS BONDS
1960-70
POST OFFICE & TRUSTEE SAVINGS BANK ISSUE

Issued by the National Savings Committee

£480,588 in the previous year, when tax alone took £425,000. Since war damage assessments have been substantially reduced over the past year, the latest tax liability cannot fall far short of £500,000. The payments on the "A" and "B" ordinary shares are raised 2½ points each, to 8½ and 4½ per cent respectively, thereby restoring the 1939 distribution. Provided that no new charge has to be met, earnings should be adequate for the repatriation of the transfer of £140,000 made to general reserve in 1941. These results doubtless reflect the first full year's efficient operation of the new strip mill, the management having surmounted the initial difficulties of transition and new methods, which caused the sharp setback to earnings in 1940. Provided the economies derived are passed on to the consumer, there is no reason to doubt that the constant and considerable demand, required to enable the optimum output of the plant to be maintained, will be forthcoming. The experience of wartime production has helped the management of John Summers over the difficulties of the running-in period, and they should be able to cope the more easily with post-war problems. The £1 "A" ordinary shares at 27s. 6d. yield £6 7s. 8d. per cent, a reflection of past difficulties as much as doubts concerning the future.

United Glass Bottle

Trading profits of United Glass Bottle, struck after EPT and depreciation, were some £10,000 lower last year. Total profits are reduced in consequence from £415,530 to £406,267. A number of reductions in allocations have, however, more than saved the drop in revenue. Income tax liability is slightly lower, at £166,000 against £168,000, and there is no transfer for writing off ARP or for war damage insurance, which together required some £23,000 in 1941. Thus, equity earnings are increased from £102,136 to £116,251 and the 12 per cent ordinary dividend is even more generously covered by a rate of 20.7 against 18.3 per cent. The entire surplus is used to raise the transfer to contingencies from £25,000 to £50,000, at the cost of a small reduction in the carry forward from £65,922 to £65,152. From the shareholders' standpoint, these results are, of course, entirely satisfactory. Unfortunately, they shed little light on the industrial experience of the concern in 1942. It is quite possible that the rise in equity earnings is the reflection of higher gross profits, from which have been deducted EPT and higher depreciation, and not merely the result of lower deductions. Last year, the chairman, Sir Max J. Bonn, emphasised that profits still depended on increasing output and turnover with no rise in prices. In view of the notorious shortage of glass bottles, there must have been every attempt to expand production, but it remains probable that output was limited by a severe shortage of materials. The balance-sheet shows a slight reduction in debtors, but a striking rise in creditors from £372,570 to £647,635, and in net loans to subsidiaries from £10,052 to £52,746, so that some expansion does seem probable. There is little change in the comfortable margin of net liquid assets at £959,315 against £951,625. The £1 ordinary shares, at 60s. ex dividend, yield £4 per cent.

Plastics Profits

For the fifth successive year, the accounts of the British Xylonite Company, a holding company in the plastics industry, show a fall in gross income, profits for 1942

declining to £63,493 from £74,423. The return of £5,100 in respect of over provision in previous years, considerably reduces the actual tax payment to £18,648 against £30,865. After the preference payment, earnings for the ordinary dividend, maintained at 10 per cent, have risen from 11.5 to 12.2 per cent, some £3,400 being added to the carry forward, now totalling £57,162. The consolidated statement, however, provides a more accurate picture of the group's intensive operations. Unfortunately, the whole increase in trading profits from £826,753 to £981,245, is absorbed in taxation, requiring £786,741 last year against £627,449 in 1941. The parent balance-sheet shows subsidiaries at £1,032,972 and net liquid assets of £307,803. The feature of the consolidated statement is the holding of £930,000 of tax reserve certificates, against a tax provision of £1,203,200 compared with only £713,698 in 1941. All liquid assets other than the above-mentioned government stocks show insignificant declines, stocks to £673,068, debtors and cash to £555,109 and £134,128, respectively. Despite the increase in creditors, surplus liquid assets have risen some £62,000 to £985,134. Not only the accounts, but the chairman's statement, are well above the average for the times. Mr. C. F. Merriam gives an interesting commentary on the technical aspects of plastics production, in particular stressing this country's inferiority to both America and Germany. He considers that plastics will complement rather than supplant existing materials, a more realistic view than some on the future of this industry. At the current price of about £3 the £1 ordinary shares yield £3 6s. 8d. per cent.

United Serdang

The accounts of United Serdang for the year to August 31, 1942, present an opportunity for another sad *post mortem* on rubber and palm oil estates now wholly in enemy occupation. There was, of course, production and cultivation in Java and Sumatra for some five months of the year in question and, consequently, there is a small balance on trading account of £47,818 against £160,293. Income from dividends, which will form the sole revenue until the Japanese are evicted, is, however, no more than £5,762. After deducting administrative expenses, there is a surplus of £46,446, representing 6.5 against 20.7 per cent on the ordinary capital. The directors have decided to take the drastic, but salutary, step of writing off, out of profits and carry forward, all liquid assets in the Far East to a total of £256,237. This involves a draft on the carry forward of £209,791, reducing it to £35,096. In addition, the concern has a general reserve of £50,000. The balance-sheet and profit and loss account are shown in consolidated form, and, failing up-to-date information from the wholly-operated subsidiaries, the former includes no reference to inter-company items. The liquid items are all notably lower—evidence of the disappearance of trading business since February, 1942—with the exception of Government securities, which show a moderate absolute rise from £223,800 to £338,150. At their reduced level of £275,426, net liquid assets are not high, considering the calls which there must eventually be upon the companies' cash resources. The £35,096 carried forward is subject to adjustment of taxation, of which no close estimate can be made. The management has cut its losses to the full, and the picture presented by the balance-sheet is no doubt a conservative one. The 2s. ordinary shares now stand at 1s. 6d.

Steel Research

In his address to shareholders at the annual meeting of the Lancashire Steel Corporation, Mr John E. James, the chairman and managing director, rightly drew attention to the importance of research in the iron and steel industry. More research should be carried out not merely by individual companies, but also collectively by the industry as a whole. The rapid progress in metallurgy during the past few years has focused attention, not on the limits of technical development, but on the wide scope for further improvement. If the British steel industry cannot compete in size with the industry in the United States, for example, it can still remain in the forefront of technical development. Another aspect to which the industry is no doubt paying a good deal of attention is the utilisation of its capacity after the war. Here again the success of the industry in marketing its products will depend on its ability to produce the right kind of materials at competitive prices. It will not find salvation behind a tariff wall, but by keeping abreast of its competitors in the kind of materials it can produce best.

War Damage

Sir Malcolm Trustram Eve, chairman of the War Damage Commission set up under the original War Damage Act, reviewed the work of the Commission on Monday, on the occasion of its second anniversary. He pointed out that some three million properties had been damaged or destroyed by enemy action; that claims had been paid in respect of 1,200,000 buildings; and that, inclusive of payments to local authorities, the total amount expended had already passed the £100 million mark. In other words a large volume of first-aid and permanent repair work has been carried out during the past two years. It is doubtful, however, whether repair work can continue at the present rate; in particular, other needs may demand the slowing down of permanent repairs. The Commission has now begun the task of classifying claims and, especially, of distinguishing between properties ranking for a cost of works payment and a value payment. Classification has been appreciably facilitated by the War Damage (Amendment) Act, 1943, which prescribes the use of 1939 values, instead of the unknown postwar values, as a yardstick. Broadly, the effect of the Amendment is that if on 1939 figures of labour and material costs, any damaged building would have been worth repairing, it will be considered worth repairing after the war and its owner entitled to a cost of works payment. The record of the War Damage Commission is encouraging; after some initial difficulties it went about its task in businesslike fashion.

Suspension of Coal Rebates

By the Railway Freight Rebates Bill, which was given its first reading in the House of Lords last week, the statutory arrangement, by which the coal export trade has been virtually subsidised since the Derating Act of 1929 to the extent of an average amount of about £1.8 millions per annum through the Railway Rebate Fund, is to be suspended indefinitely. This decision is the latest phase of the new policy in the control of the finances of the coal mining industry which was inaugurated in June, 1942, by the Coal Charges Order. The effect of that Order has been to pool the current income of the industry. The first step was the taking over from the Central Council of Coal Owners the collection and distribution of the War Emergency Assistance and the Guaranteed Wage levies of 7d. per ton; the second, the diversion on July 3rd, into the Coal Charges Fund of the proceeds of the 3s. increase in the price of coal authorised by the Government to meet the cost of the Greene wage award and other accrued charges; and the third, the contribution by the colliery owners to this fund of the proceeds of a further increase of 1s. per ton in the price of coal from January 1, 1943, as well as of an additional 6d. to cover the cost of the output bonus, and, among other purposes of a scheme intended to maintain the credit balance of the industry at a level "necessary in the interests of efficient production." These operations were financed by a national levy of 5s. per ton on colliery disposals, and on current consumption this levy represents over £45 millions per annum. It is now to be increased by the transfer to the Coal Charges Account of that part of the net revenue of the Railway Freight Rebates Fund which would otherwise have been available for the rebates on

export coal. When the war broke out the rebate was 1½d., plus 20 per cent of the nominal conveyance charges, representing approximately 6½d. per ton on the coal exported. Owing to the war period contraction in the volume of the export trade, the rebate has been increased to 1½d., plus 75 per cent of the nominal charge, representing between 2s. and 2s. 6d. per ton; and for the nine months ended September last, the total amount allowed was estimated at about £700,000. In the recent negotiations with the Government the industry fought hard against any interference with the normal operation of the rebate fund and for the earmarking of current surpluses to meet post-war export trade contingencies. Since 1939, however, the position has been complicated by the raising of export prices in September that year to the level of inland prices; by the new scheme under which the districts are now severally guaranteed credit balances which compare favourably with pre-war pithead profits, but without taking into account the change in the price level; and by other factors. The Government, however, has made two or three material concessions to the industry. It has agreed, for instance, to compensate colliery owners—possibly in the form of price allowances on current exports—for the loss incurred by the suspension of rebates; this compensation is to be paid on all shipments and not merely on those to foreign countries; the Government has also agreed to keep in the rebate fund the net surplus at September 30, 1942 (estimated at over £500,000 after adjustments to cover railway repayments) for distribution when rebates are resumed.

* * *

Clothing Price Schedules

The President of the Board of Trade has made two new Orders, the Utility Apparel (Maximum Prices and Charges) Order, which revokes and replaces previous Utility Orders, and the General Cloth and Apparel (Maximum Prices and Charges) Order, which amends the previous Order. They come into force on April 12th. In the new Utility Order, tables of margins and ceiling prices are divided into eight sections, each dealing with a particular class of apparel, and published separately as a "related schedule" to the Order. The schedules relate to men's and boys' outerwear, underwear, women's outerwear and underwear, overalls, knitted apparel, infants' and girls' apparel and gloves. The layout is designed to simplify traders' problems in looking up relevant price schedules. Ceiling prices are specified for recently introduced utility garments, and others have been simplified. Distributive margins for utility nursing uniforms are set out in the Order, but ceiling prices have not yet been fixed. Some changes have been made affecting non-utility as well as utility clothing, concerning increased retail margins for shirts, and alteration charges. Where wholesalers' maximum prices exceed 3s., they may now be rounded to the nearest penny. In certain conditions, composite business (retailers who supply ten or more branches from a central warehouse) may add an extra margin of 5 per cent to the price paid to the manufacturer for most classes of made-up apparel. The general principle that no business may take more than one distributive margin remains in force. A revision of non-utility retail margins to a tax-exclusive basis is promised after a review by the Central Price Regulation Committee. Withdrawals of labour from the making-up trades have begun in areas for which concentration arrangements have been made.

* * *

Milk Prices and Distribution Costs

As a result of the Ministry of Food's plan for the distribution of milk, which began on October 1st last year, savings have been made in distribution costs at the rate of £2,250,000 per annum. The saving is being directed to reduce the subsidy (which was about £20 million last year, including the cost of the National Milk Scheme) rather than retail prices. Milk distributors are paid according to the function they perform, the services performed by the larger distributors themselves being more extensive than those of the smaller ones, whose supplies are delivered to them; and costing investigations are continually undertaken. The cost of certain services was reduced on April 1st. The depot allowance and the wholesale allowance, at 1½d. and 2d. per gallon respectively, remain unchanged. Retailers get ½d. per gallon less, under the new costs, making their remuneration 10½d. per gallon in London and 9 5/6d. in the provinces. The reduction will be made by increasing the maximum price to retailers from 2s. 1d. to 2s. 1½d. per gallon.

Industry and Trade

Coal Production

Coal production, frankly, remains disappointing. Not only was there a decline between February and March, compared with a substantial expansion a year ago, but actual output last month was appreciably below last year's corresponding figure and below the standard tonnage. It may be that the current rate of output is adequate for current needs, thanks to the recent mild weather and the economies achieved in consumption. But it would be a pity if a temporary easing of the position were to delay the promised reorganisation of the coal-mining industry. The need for an improvement in productivity is as great as ever.

WEEKLY OUTPUT OF SALEABLE COAL
(Weekly Standard Tonnage 4,161,800 tons)

Four Weeks ended*	1941 tons	1942 tons
September 5th	4,080,200	3,978,000
October 3rd	4,146,600	4,076,100
October 31st	4,131,400	4,124,500
November 28th	4,196,650	4,126,500
December 26th	3,853,400	3,880,100
	1942	1943
January 23rd	3,824,800	3,813,400
February 20th	4,028,000	4,016,400
March 20th	4,074,600	4,013,700

* The actual dates given relate to 1942 and 1943.

Retailers who do their own wholesaling get an additional allowance. This is reduced by 1d. It varies according to turnover. For a daily turnover of 750-999 gallons the remuneration is now 1d. per gallon; 1,000-1,249 gallons, 1d.; 1,250-1,499 gallons, 1d.; and for 1,500 gallons and over, 1d. per gallon. The average costs of retail firms which do their own wholesaling are approximately 1d. per gallon above other retailers, which justifies the extra allowance. The cost of the wholesale service, when carried out alone, is more expensive at 2d. per gallon. The changes in margins are based on costings made early in the winter. The reduced costs resulting from the rationalisation of retail delivery have not yet exerted their full influence, since few schemes were in operation before the beginning of this year. They will be reflected in the results of the next costs investigation, to be made during the summer. Any necessary change will be made from October 1st.

Flax Production Report

The Session's Fifth Report of the Select Committee on National Expenditure is concerned with the expansion of flax production in England and Scotland. Before the war, only about 3,500 acres were cultivated, and the steps to be taken to increase it in time of war were first considered in 1938. The Committee, in the course of its evidence, uncovered a history of lack of information, experiment, long-term planning, liaison and co-operation in almost all aspects of the industry. The main controversy centres on whether flax should be retted (or rotted in water) before scutching (separating the wood from the fibre), or scutched green. It is agreed that retted flax is better, but green scutching is adequate for a number of purposes. The former is a highly skilled craft, and was practically unknown in this country; it has other disadvantages, such as the problems raised in the disposal of the effluent. The decision in favour of green flax was, however, taken with insufficient data. There seems to have been a prejudice against retting and in favour of green flax, which is well illustrated by the following quotation from the Report:

The official insistence on the necessity of much experiment before embarking upon retting seems inconsistent when compared with the readiness to adopt the almost unknown and untried process of green scutching in 1939 and 1940.

Nevertheless, the Committee felt, after its investigations, that the decision to concentrate on green flax was justified in 1939. It is considered that when supplies of retted flax from Belgium were lost, efforts should then have been made to produce some in this country. Instead, it was decided to expand the production of green flax, and preliminary work for retting was begun very late in 1942, so that "in the result, over two years have been wasted." Criticism is directed against the organisation of the Home Flax Production Department, partly on the score that its technical knowledge is deficient, and that fullest advantage was not taken of expert advice. Throughout the hearing of evidence, "it was rare for any two witnesses to agree," and liaison between interested departments seems to have been weak. On many of the matters referred to an improvement has been observed of late, particularly in co-operation. The Committee makes four recommendations: that retting should be adopted without delay where it is possible; that fieldmen should not be called up; that all factories should be inspected, and a report made to the Minister of Supply; and that a reorganisation of the Home Flax Production Department of the Ministry of Supply should be carried out forthwith.

New Tea Agreement

On Monday of last week the International Tea Committee, which is administering the tea scheme, decided to maintain the export quotas for the year ending March 31, 1944, unchanged at 125 per cent of the standard export quantities. This decision means that exports will continue unrestricted, but as the Dutch East Indies, one of the three signatory countries of the scheme (the two others are British-India and Ceylon), is at present occupied by Japan, it is of no more than theoretical interest. In fact, tea supplies are short; last autumn the Combined Food Board had to introduce a tea pooling scheme (discussed in *The Economist* on September 26, 1942) to secure a fair distribution of supplies. Nevertheless, Monday's quota decision is not devoid of special interest. The last international tea agreement (the second of its kind since the introduction of

tea export control on April 1, 1933), which had been in force since April 1, 1938, expired on March 31st; the fixing of quotas for the next twelve months thus indicates that a new agreement has been concluded. The official text of the new agreement is not yet available, but it is understood that it will run for the duration of the war and two years thereafter, and that it does not embody any fundamental changes. The extension of the agreement had been regarded as certain for many months past, and its prolongation until two years after the termination of hostilities had been recommended by the International Tea Committee at the end of last year. The prolongation of the agreement without any significant changes has caused some surprise. Unlike the wheat, sugar, rubber and tin control agreements, the tea scheme has never been a Government scheme. The first two tea agreements (and now the third) had been concluded between the main tea planters' associations of British India, Ceylon and the Dutch East Indies. True, they required official sanction, and the Governments of the three chief tea exporting countries have supplemented them by Acts and Ordinances, and are appointing the members of the International Tea Committee. But as for four-fifths of these appointments the approval of the planters' associations is required, the scheme remains largely a producers' scheme. Have the negotiations designed to transform the tea agreement into a Government scheme been suspended or ended in failure?

Engineering Wages Award

It is unfortunate that the very involved award of the National Arbitration Tribunal in the engineering wages dispute should have been issued with such speed that the press had no time to predigest it, and the parties to the award no opportunity to explain it to their members. As a result a certain amount of confusion has arisen, leading to considerable dissatisfaction, and even, in some cases, to stoppages of work. Mr H. N. Harrison, in his presidential address to the Confederation of Shipbuilding and Engineering Unions this week, expressed his "disgust" at the award, which he said did less than justice to the workers' claim, and was no better than that which the employers had offered. But while it is easy to understand the disappointment of the engineering workers who are not affected by the award, it should be remembered that the unions had voluntarily taken the claim to arbitration, and had bound themselves to accept the Tribunal's decision, whether they liked it or not. It would indeed make a mockery of arbitration if the Tribunal felt itself obliged, in order to try and please everybody, to award more than the employers had offered and less than the workers had claimed. The engineers' claim, which was presented last November by the 40 unions of the joint engineering trades, was for an all-round increase of 11s. per week on base rates; an addition of 33½ per cent on base rates for all plain time workers; and a restoration of pre-1931 conditions in regard to overtime, night shift and Sunday work. The employers in January replied that they could not accept the demand for an all-round increase, since engineering workers were already the highest paid section of industry, nor would they concede the restoration of pre-1931 conditions, but they were prepared to iron out sectional differences and adjust anomalies. They offered to transfer 20s. of the existing national bonus from the bonus to the district base rate, and to increase the rates of plain time-workers by 6s.

The Tribunal in its award has substantially adopted the employers' proposals. It has transferred 20s. of the national bonus to the district base rate, and gives plain time-workers an extra 6s. per week. It is more generous than the employers, in that it sets the piece-worker's premium at 27½ per cent, an addition of 2½ per cent over the existing premium of 25 per cent laid down in the 1922 Agreement, as adjusted in 1931, against the unions' claim for 33½ per cent. This means that a piece-worker of average ability on a basic rate of 46s. should be able to earn 27½ per cent on the consolidated rate of 66s.; if he is already earning more than the 27½ per cent he will not receive any addition. The Tribunal's award provides that where time-workers are receiving lieu rates, compensatory or other bonuses or merit rates commonly applied (as opposed to individual merit rates), which bring their earnings above the district rates, the 6s. advance would be reduced *pro tanto*. The number of workers receiving such compensatory bonus schemes seems to be larger

THE PRUDENTIAL ASSURANCE COMPANY, LIMITED

HIGH STANDARD OF EFFICIENCY MAINTAINED

BEVERIDGE PROPOSALS ANALYSED

SIR GEORGE BARSTOW'S REVIEW

The ninety-fourth annual general meeting of the Prudential Assurance Company, Limited, was held on Thursday, the 1st instant, at 142, Holborn Bars, London, E.C.1. Sir George L. Barstow, K.C.B., chairman of the company, presided, and after the passing of a resolution expressing sympathy with the families of those members of the staff who have fallen in their country's cause, the chairman said: Ladies and Gentlemen,—The ninety-fourth annual report of the directors is already in your hands, and I propose, with your consent, to take it as read.

Owing to the need for economy in the use of paper, it was decided this year not to print and circulate the remarks which I am now about to make.

The company's operations during 1942 were beset with difficulties similar to those with which we had to contend in the previous war years. Aided, however, by the goodwill and co-operation of the public, our staff again succeeded in maintaining our services at a high standard of efficiency. This is a considerable achievement in view of the very large and increasing proportion of our permanent staff on National Service.

At the outbreak of war our permanent male staff in this country numbered 18,473, of whom over 60 per cent. are now absent on National Service, 3 per cent. are temporarily deferred and 2 per cent. awaiting call up. Those of the remainder who are still with us consist of men over age 41 or who are otherwise ineligible for National Service. The proportion of our overseas staff serving in the Forces is also considerable. I think we can claim that the Man-Power Committee set up under Lord Kennet was favourably impressed by our figures, and the company has established the Joint Committee which the Kennet Report recommended should be set up to make suggestions and to consider ways and means whereby even more staff might be released for National Service.

WAR CLAIMS PAID

Up to the end of 1942 the amount paid by the company due to war casualties, including civilians who lost their lives in air raids, exceeded two and a quarter million pounds. Over one million pounds of this amount represented payments under pre-war life assurance policies which contained a clause restricting the amount payable in the event of death from war service to the return of the premiums paid. As the shareholders are aware, the directors, at the beginning of the war, voluntarily suspended the operation of that clause until further notice, with the result that, apart from a few exceptional cases, the full sum assured and bonuses under such pre-war policies continue to be payable on death from war service.

As an illustration of the national character of the Prudential business, I may inform you that we have paid claims in respect of more than one in three of all the civilian air raid deaths which have occurred in this country.

THE BEVERIDGE REPORT

The Beveridge Committee was appointed in the summer of 1941 to conduct a comprehensive survey of existing national schemes of social insurance and allied services, and the terms of reference were extended in January, 1942, to enable the Committee to consider the inclusion of a death benefit. The Prudential was invited

to prepare a memorandum which was duly submitted and later supplemented by oral evidence given by our officials in regard to the activities both of the company and of the four Prudential Approved Societies. The company's memorandum was published with other memoranda in the Supplement to the Report.

The Report, which was issued in December, 1942, may be described briefly as a series of proposals directed to the abolition of want by raising the various allowances payable under existing State schemes during sickness, unemployment and old age to the full level of subsistence and by including allowances for children. The Report also recommends a complete medical, surgical, hospital and rehabilitation service, and certain grants such as marriage and funeral benefits, the whole scheme to be financed partly by compulsory contributions from employers and insured persons and partly by taxation.

It appears to be taken for granted by a number of people that insurance companies, particularly those which transact industrial assurance business, are opposed to the social ideals which inspired the Beveridge Report. I believe this to have no foundation in fact, and, speaking for the Prudential, I say most emphatically that it is far from being the case. We have the greater reason to be sympathetic with the declared object of the report in that so much of our work lies among the industrial classes. At the same time we recognise that the principles of financial prudence make it necessary to consider the Beveridge proposals in conjunction with other problems of the post-war situation. That proposals involving substantial benefits have to be paid for by large contributions is a self-evident proposition which is too often forgotten. Happily the economic and financial problems involved are outside our province.

But there are certain proposals in which we are directly concerned and which demand close scrutiny on our part, none of which, however, is vital to the scheme as a whole; in particular, the proposal to set up an Industrial Assurance Board with a statutory monopoly of the business of transacting Industrial Assurance through collectors; the inclusion of a funeral grant in the social insurance scheme; the proposal for the abolition of approved societies under the National Health Insurance Act; and the proposed removal of workmen's compensation business from the insurance companies and mutual organisations.

SET-BACK TO PRIVATE ENTERPRISE

Of these four proposals I must say that the first (which the author of the Report himself admits is non-essential) threatens our whole organisation both at home and overseas. If adopted it would, I believe, undermine confidence abroad in British insurance generally and result in a severe set-back to the cause of private enterprise as a whole. It amounts to a virtual nationalisation of industrial assurance and possibly of a very large proportion of ordinary life assurance. The second, the grant of funeral or death benefit, appears to us to be wholly redundant, as the bulk of the population to whom this benefit would apply is, as the Report admits, already insured. The third, i.e., the abolition of approved societies, seems to us unnecessary; whilst as to the fourth, the administration of workmen's compensation,

with all its difficulties and technicalities, is being well handled by the existing organisations.

Some of the remaining proposals would be certain to affect the company indirectly and in some instances prejudicially; nevertheless, the Prudential welcomes proposals designed to lead to a permanent betterment of the position of the industrial classes.

GOVERNMENT'S DECISIONS

In the debate in the House of Commons on February 16th to 18th, H.M. Government announced their provisional decisions on the Report. Those decisions, in so far as they relate to the four proposals directly affecting the Prudential, to which reference has been made, are as follows:—

Firstly the proposed Industrial Assurance Board is rejected, at least "for the time being" in Mr Morrison's words. Though I suppose nothing in politics is permanent, I trust this will not become a political issue and that it will be recognised that, like all other forms of voluntary insurance, industrial assurance is a business the development of which is best left to private enterprise.

Secondly the inclusion of a funeral benefit or death grant in the social insurance scheme is accepted in principle by the Government, but Sir John Anderson stated that "The amount of the benefit will require further consideration, as will also the transitional arrangements needed to overcome the many technical difficulties arising from the existing volume of voluntary insurance."

Thirdly, as regards approved societies, Mr Morrison stated that "it looks as though they will inevitably have to be superseded, but the door is open for the consideration of agency proposals."

Fourthly, the Government have reserved judgment on the matter of workmen's compensation and I do not propose to refer further to that aspect of the matter.

POLICYHOLDERS' INTERESTS

It was also stated by Mr Morrison that the Government, in the course of framing their recommendations to Parliament, would enter into consultation with all sorts of people, including "vested interests." In our case vested interests comprise millions of policyholders, holding between them some 30 million policies, as well as the shareholders and staff, and if and when we are consulted you may rely on our representing the case for the Prudential with due regard to the interests of all three parties. It should be borne in mind that our policyholders and staff are not restricted to this country, but are spread over the five continents.

I may also remind you that if we are a vested interest, it is because nearly a hundred years ago, and long before State Social Insurance was introduced, the original founders of this company undertook a particular branch of social activity. They were business men actuated largely by business motives, and their business has developed on such lines that I doubt whether even the State could succeed in providing at so low a rate of expense such efficient, sympathetic and flexible service.

That is as far as I can take the Beveridge Report in this address.

I will now deal with the results of the company's operations during 1942, which are given in the 94th annual report of the directors.

ORDINARY BRANCH

In the ordinary branch the premiums were £14,972,825, an increase of £374,434. The net new sums assured were £25,457,702, including £8,580,107 written by our overseas branches. The death claims were £2,797,125 and the claims under matured endowments amounted to £9,323,731.

INDUSTRIAL BRANCH

In the industrial branch the premiums were £26,275,143 as against £24,858,403 in the previous year. The death claims

were £8,000,068 and the claims by maturity of endowment were £7,006,431.

The expenses for 1942 amounted to 25.77 per cent. of the premiums, an increase of 39.

GENERAL BRANCH

In spite of a sharp decline in the premium income of the motor vehicle account, the net revenue premiums in the general branch amounted to £2,721,135, an increase of £100,484 as compared with 1941 figures. A substantial part of the increase was in respect of marine insurance. In consequence of the further restrictions imposed in July last on the use of petrol many private cars and motor-cycles have been laid up, and in view of the limited use permissible in other cases, premiums under all private car and most motor-cycle policies have been reduced by 20 per cent. In the circumstances a heavy reduction in income from motor vehicle insurance was inevitable.

Our accident business, which comprises personal accident and sickness, employer's liability, motor and some items of the miscellaneous section, shows a reduction in the loss ratio. Although in the fire section the ratio is slightly higher than that for the previous year, the claims' experience generally continues to be favourable.

The conditions overseas to which I referred last year have continued to be difficult, but again I am able to report satisfactory progress on the part of our branches, a feature which redounds to the credit of the staff concerned.

The company has continued to act as an agent to the Board of Trade in connection with the War Risks Insurance Act, 1939, and the War Damage Act, 1941.

With regard to our United States subsidiary (the Prudential Insurance Company of Great Britain located in New York), the business has again run on satisfactory lines.

VALUATION SURPLUS

The bases employed in calculating the liabilities of the company are set out in the valuation report of the joint actuaries.

ORDINARY BRANCH

In the ordinary branch the basis for the valuation of life assurance policies issued in the United Kingdom has been strengthened by the employment of a rate of interest of 2½ per cent. combined with the A. 1924-29 ultimate table of mortality, and an additional reserve of loading has been made in respect of these assurances.

The surplus in the ordinary branch, including £708,216 brought forward, is £2,085,885, of which £500,000 has been transferred to the investment reserve fund, an increase of £250,000 as compared with the amount transferred last year. A sum of £250,000 has been taken from the investment reserve fund and applied to writing down investments in this branch. The investment reserve fund has therefore been increased by a net amount of £250,000 and now stands at £3,500,000. £1,025,000 has again been transferred to the ordinary branch contingency fund. The surplus is £119,553 less than for 1941, but the valuation basis has been strengthened.

The board has decided to grant a bonus on claims on participating policies arising by death or maturity of endowment during 1943 at the rate of £1 per cent. for each December 31st on which such policies were in force subsequent to December 31, 1939.

INDUSTRIAL BRANCH

The surplus in the Industrial Branch, including £336,085 brought forward, is £4,584,273, as compared with £4,049,418 in 1941. £850,000 has been transferred to the investment reserve fund, an increase of £350,000 over the sum so transferred last year. A sum of £350,000 has been taken from the investment reserve fund and applied to writing down investments in this branch. The investment reserve fund has therefore been increased by a net amount of £500,000 and now stands at

£4,500,000. £2,500,000 has again been transferred to the industrial branch contingency fund.

We have decided to pay in the industrial branch a bonus on claims arising by death or maturity of endowment during 1943 at the rate of 10s. per £100 sum assured on the participating policies issued by the Prudential for each December 31st on which the policy was in force subsequent to December 31, 1939, provided that one full year's premiums have been paid.

GENERAL BRANCH

As stated in the directors' report the method of dealing with taxation in the various general branch accounts has been changed. The previous practice was to show in each revenue account the amount of tax deducted at source from interest and dividends and this has on occasion tended to produce anomalous results. The method now adopted charges the tax appropriate to the trading profit in each account.

Owing to a change in the basis of assessment to tax in connection with our American subsidiary involving an increase in liability for tax for the year 1941 it has been necessary to make a further provision of £51,250 as shown in the profit and loss account.

The amount provided for tax in the 1942 accounts is estimated to cover the full liability in respect of that year's profits and includes an appropriate sum for tax liability in respect of the American subsidiary on the new basis.

The surplus in the general branch, including £200,968 brought forward, is £340,971. If the change in the treatment of income tax in the accounts of this branch were applied to 1941 the comparable figure for that year would be £394,301. The sum of £40,000 has been transferred to the investment reserve fund to replace a similar amount which has been applied to writing down investments in this branch. £15,000 has been added to the additional reserve fund which now stands at £1,260,000.

Shareholders will no doubt expect me to comment on the reduction in the dividend on the "B" shares this year from 2s. to 1s. 6d. per share, both free of tax. In this connection it is necessary to remind shareholders of the increasing burden of taxation which we have been called upon to bear in recent years both in this country and overseas. Thus, although the gross profits continue to be maintained at a satisfactory level, the net profits available after providing for taxation have shown a decreasing tendency. This was aggravated in 1942 by the change to which I have just referred in the method of assessment to United Kingdom tax of the profits of our American subsidiary.

Your directors, after giving the matter their most careful consideration, came to the conclusion that in the prevailing conditions of taxation they were fully justified in asking the shareholders to accept a reduction in the dividend. The gross value of the reduced dividend is still greater than that of any dividend paid prior to 1939.

ALL BRANCHES, DETAILS OF DISPOSAL OF SURPLUS

Details of the disposal of the surplus of the three branches and of the bonus declarations for both the life branches are contained in the directors' report.

APPROVED SOCIETIES

The membership of our approved societies has increased during 1942, and at the end of that year exceeded 4,600,000.

During 1942 the sum of £5,198,387 was paid in cash benefits, including additional cash benefits provided out of surplus disclosed by the valuation of the societies. Of the above amount, £4,802,192 was in respect of sickness and disablement benefits and £396,195 was in respect of maternity benefits.

In addition to the above sum, £400,532 was expended on additional treatment benefits provided out of the valuation sur-

plus, of which £326,647 was paid for dental treatment benefit.

INVESTMENTS

The investment of our funds during 1942 proceeded on lines very similar to those to which I referred in my statement last year. In accordance with our practice of giving full support to the Government's programme of war finance, the whole of the increase in our funds in this country has been used in subscriptions to British Government securities. Our holdings of British Government securities now exceed £151 millions, an increase of more than £25 millions over the corresponding figure of last year. Our total assets have grown by £13 millions, from £375 millions to £388 millions, and the percentage of British Government securities has thus increased from 33 per cent. to nearly 39 per cent. From these figures it is apparent that not only has the growth in our funds been invested at the low rates now prevailing on British Government securities, but that the proceeds of requisitioning or repayment of some £12 millions of other assets during the year have been similarly applied, involving the acceptance of these low rates of interest for a considerable term of years.

I may add that, including the contributions already made this year to the "Wings for Victory" campaign, our total subscription to war loans from the beginning of hostilities to the present date exceeds £100 millions.

In addition to the Home issues, we have continued to support the War Loans issued by the Governments of India and the Dominions from our funds accumulating for investment in respect of our life and other insurance business in those countries. Our total subscriptions to such loans amount to £2,250,000.

INTEREST RATE ON FUNDS

In view of the foregoing remarks, shareholders may find it difficult to understand how it comes about that the net rates of interest on the life funds in both the industrial and ordinary branches show marked improvements over those of the previous year. In the industrial branch the net rate of interest has improved to £3 11s. 8d. per cent., a gain of 4s. 8d. per cent., and in the ordinary branch to £3 11s. 6d. per cent., a gain of 5s. per cent.

These improvements arise in the main from the basis of our assessment to income tax and from the conservative method of dealing with taxation in our accounts. We are assessed in the life branches on the basis of interest less expenses, and whereas we suffer tax on our interest receipts, largely by deduction, the rebates of tax which we are allowed, mainly in respect of expenses, are not received until the following year. When the standard rate of tax is increased, as in 1941, the higher rate has immediate effect on a large part of our interest income, whilst the tax rebates received that year are calculated at the lower rate of the previous year with the result that the rate of interest earned is temporarily reduced.

No alteration was made in the rate of tax in last year's budget so that in 1942 both tax payments and rebates were made at the same rate, and in consequence the net amount of tax borne was less than in 1941. The gross rate of interest on the combined life funds has in fact fallen slightly and, as already explained, this tendency must be expected to continue in view of the increasing proportion of our assets which is invested in British Government securities.

TREASURY BAN RELAXED

A further factor adversely influencing our interest income has been the relaxation by the Treasury of the restrictions on new issues which were primarily imposed to facilitate the war-time financial operations of the Government. The restrictions have

been relaxed to the extent of permitting public utility and industrial companies to convert their debentures to a lower interest basis, and in consequence those companies which are fortunate enough to have an option to repay their debentures at the present time are enabled to secure an advantage by making fresh debenture issues on terms which would in some cases be unobtainable but for the severe restrictions on the new issue market.

The market value of our British Stock Exchange securities has improved materially during the past year and I am happy to say that in our opinion the assets of the company taken as a whole are fully of the value stated in the balance-sheet. We have taken our properties and investments in enemy and enemy-occupied countries at what we consider to be a conservative value but it is impossible to determine their value accurately. In view of this and of the abnormal times we have decided not to change the certificate in the balance-sheet as to the value of the company's assets from the form in which it has been given during the war.

The distribution of our Stock Exchange securities between the various classes is:—

Government and municipal...	60 per cent.
Debentures and bonds	16 " "
Guaranteed and preference stocks	10 " "
Ordinary stocks	14 " "

The geographical analysis of our assets as a whole is now as follows:—

United Kingdom	87 per cent.
Dominion, Indian and Colonial	8 " "
Foreign	5 " "

ELECTION OF DIRECTOR

Mr Percy Crump, O.B.E., F.I.A., entered the service of the company in 1895, became a Fellow of the Institute of Actuaries in 1909, was made assistant secretary in 1925 and joint secretary in 1931. He has thus served the company for nearly 48 years.

On his retirement at December 31, 1942, he was given a seat on the board in order that the company should retain the benefit of his long experience of financial matters. He now offers himself for election.

RETIREMENT

Mr C. C. H. Drake, F.I.A., who was appointed joint actuary in 1935, after having been assistant actuary for some years, retired at the end of last month after 43 years with the company. We gratefully record the valuable service to the company which his qualifications and his long and varied experience of our business both at home and overseas enabled him to render.

APPOINTMENTS

The following managerial appointments have been made by the directors:—

Mr Leslie Brown, F.I.A., to be joint secretary.

Mr W. F. Gardner, F.I.A., to be joint actuary.

Mr W. E. Burge and Mr R. S. Thorp to be assistant managers.

STAFF

It is not an easy matter to find appropriate words adequately to express my thanks to all grades of our staff, both home and overseas, for the devotion and zeal which they have applied to their tasks during the past year.

Our warm appreciation is always extended to them in normal times, but in these war years of constantly increasing difficulties the manner in which the members of our staff have adapted themselves to continually changing conditions calls for the highest praise.

I am sure you will wholeheartedly endorse this expression of thanks to the whole of the permanent and temporary staff of the company, including nearly 14,000

women who have served with such loyalty and enthusiasm during 1942.

It is a matter of great pride to us all that a number of our men on national service have received awards for gallantry and devotion to duty.

To all members of the staff who are serving with the Forces, including those who are prisoners of war, we wish a safe and speedy return.

The report and accounts were adopted. Sir Joseph Burn, K.B.E., F.I.A., F.S.I., was reappointed president. Mr P. C. Crump, O.B.E., F.I.A., was elected a director, and the retiring directors, Mr Ernest Dewey, Lieut.-Colonel P. L. Reid, O.B.E., Mr H. H. Moseley, B.C.L., and Sir George Stuart Robertson, K.C., were re-elected. Major L. W. Bird, D.S.O., O.B.E., and Sir John S. P. Mellor, Bart, M.P., were reappointed auditors.

Mr Ernest Dewey, deputy chairman, paid tribute to the manner in which the management of the company and its indoor and outdoor staff at home and abroad had performed their duties in the trying conditions of the present emergency. Mr F. W. Morgan, M.C., general manager, suitably responded.

After a vote of thanks to the chairman and directors the meeting terminated.

ANGLO-FRENCH EXPLORATION COMPANY, LIMITED

The ordinary general meeting of the Anglo-French Exploration Company, Limited, was held, on the 7th instant, in London, Mr F. A. Robinson (the chairman) presiding.

The following is an extract from the chairman's statement circulated with the report and accounts: Our liquid position has still further improved, net cash assets at December 31, 1942, amounting to £141,900 against £92,331 in 1941. The profit and loss account shows a reduction of £12,766 in dividend earnings, of which all but £1,500 is accounted for by the loss of income from our tin and other interests, which have ceased production on account of Japanese invasion. We have been able to offset this loss in part by an increase in our profit from realisations, with the result that our net earnings amount to £41,753, compared with £47,452 last year. We are again able to recommend a dividend of 5 per cent. and to carry forward £22,451 against £21,146 brought in from 1941. The report was unanimously adopted.

WESLEYAN AND GENERAL ASSURANCE SOCIETY

The one hundred and second annual meeting of the Wesleyan and General Assurance Society was held, on the 6th instant, in Birmingham.

Mr Arthur L. Hunt, F.S.S., F.C.I.I. (the chairman), said that in 1942 in the ordinary department 8,401 policies had been issued assuring £1,317,000. In the industrial department 106,977 policies were issued assuring £2,837,000. The number of death claims had been remarkably light, being little over four-fifths of the number which would have been expected in pre-war years. The total claims and surrender values paid amounted to £1,430,000, making a total of over £34,000,000 paid since the establishment of the Society. Relatively few policies were lapsed and the amount paid out in surrender values was very small indeed.

With regard to bonuses, in the ordinary department additions would be made at the rate of £2 per cent. to with-profit policies becoming claims by death or maturity during 1943, being £1 in respect of each of the years 1941 and 1942. In the industrial department, additions would be made on the same scale as previously to the sums payable on claims by death or maturity on or before April 3, 1944.

The assets stood at £18,901,000, and the premium income totalled £2,439,000. The report was unanimously adopted.

THE MATADOR LAND AND CATTLE COMPANY, LIMITED

INCREASED PROFITS

The sixty-first annual general meeting of the company was held within the registered office, 93 Commercial Street, Dundee, on the 2nd instant, Mr W. D. Macdougall presiding.

The chairman said:—Gentlemen,—It is now my duty to submit the report and accounts for the year to December 31st last.

PROFIT AND LOSS ACCOUNT

One of the most ancient of our proverbs is that "Good wine needs no bush," and these accounts need little advocacy from me to commend them to your adoption. The course of our revenue in recent years has been one of steady progress. A profit of £19,770 for 1938 rose gradually to £89,873 for 1941, and for 1942 we now show £95,555. Perhaps the feature in our report which will interest you most is that on these figures we have felt justified in recommending an increase in the bonus for the year from 2½ per cent. to 5 per cent., making, with our basic dividend of 10 per cent., a total distribution of 15 per cent. In making this recommendation we are in no way departing from what I have said in past years as to our policy of dividend stability, but the board feel it their duty to hold the balance evenly between the interests of the shareholders of today and those of the future and, after careful consideration, have resolved without any doubt to come to the decision indicated.

BALANCE SHEET

Implicit in that decision, and supporting it, is of course the great and increasing strength of the company's balance-sheet. In the accounts before you, against a capital of £200,000, we show reserves (excluding taxation reserve) amounting to £280,584, an increase of £36,617 on the year, while on the assets side of the balance-sheet the low values at which our land and our herd are entered are more striking than ever when set against today's prices.

RANGE AND HERD

The branding of our calves this year has presented exceptional difficulties through the shortage of skilled labour. Mr Mackenzie cables that the tally has at last been completed at 14,874 head. However, branded or not, the calves are there and while the actual number may not reach the highest level of recent years, we have just received a letter from Mr Mackenzie in which he indicates that looking to the condition of the cows he is hopeful of a big calf crop for 1943. As regards the current year's operations generally, I have nothing unfavourable to report.

OIL PROSPECTS

The testing of our land for oil by a company of high standing proceeds. So far, no oil has been found, but we shall at least eventually have had both ranches thoroughly tested, and that free of all expense to ourselves.

AMERICAN DIRECTORS AND STAFF

In concluding I must not omit once more to present our acknowledgments to Mr Mackenzie and his staff. The report and accounts before you and the statement I have made present and in a measure explain the results, but it is impossible that they should do justice to the daily work and skill involved in producing these results.

I have also to make acknowledgment to our American colleague, Mr Drought, for the keen and helpful interest he takes in the company's affairs.

MOTION

The report and accounts were approved of and adopted, and the balance at the credit of profit and loss account applied in the manner recommended by the directors.

BANK OF SCOTLAND

VERY SATISFACTORY RESULTS

STRONG LIQUID POSITION

LORD ELPHINSTONE'S ADDRESS

The annual general meeting of the proprietors of the Bank of Scotland was held within the head office, Edinburgh, on the 6th instant. The Right Honourable Lord Elphinstone, K.T., Governor of the Bank, presided.

In submitting the directors' report, the chairman said: The directors much regret the loss by death during the year of The Master of Polwarth. He has given valuable services since he joined the board in 1939. They also regret the resignation, in July last, on account of the state of his health, of Mr H. A. Jamieson, who had been a member of the board since 1922, and I am sure the proprietors will join with the board in extending to him their good wishes.

To fill one of the vacancies on the board, the directors invited Mr W. G. C. Hanna, O.B.E., C.A., to be an ordinary director.

BANK'S BALANCE SHEET

Our balance-sheet figures continue to reflect war-time tendencies. Deposits have increased by £10,235,000 to £60,829,000. This very substantial increase must, however, be regarded as exceptional, as certain public accounts which carry considerable balances happen to be maintained with us this year in annual rotation. A further expansion of £1,476,000 has taken place in our note circulation, bringing it up to £7,415,000, or more than double the pre-war figure. The acceleration in Government expenditure for war purposes is no doubt largely responsible for the progressive increase in these figures.

When I referred last year to the mounting figures of our note circulation I urged that surplus notes in the hands of the public should be returned by the holders to their bank accounts so that they might be made available as deposits for lending to the Government. I would again make this appeal to those who may be inclined to keep by them a greater quantity of cash than is really necessary.

The fluctuations in the items drafts issued and acceptances, although considerable, have no special significance.

LIQUID ASSETS

The liquid position of the bank has been fully maintained throughout the year. Assets in cash, bank balances, cheques *in transitu*, and money at call and short notice amount to £19,847,000, or 27.4 per cent. of our liabilities to the public. Bills discounted (including £350,000 of Treasury bills) account for £550,000. Our holding of Treasury deposit receipts has increased to £7,500,000, while our investments total £36,765,000, bringing our liquid resources up to £64,663,000, which is equal to 89.4 per cent. of our public liabilities. These ratios are somewhat higher than those usually associated with banking practice in ordinary times, and they indicate the extent to which the normal lending business of the banks has been affected by prevailing circumstances.

It will be seen that we are in a favourable position to meet all reasonable requests from our customers for legitimate banking accommodation.

ADVANCES

Our advances show a further decline of over £600,000 to £8,430,000. This is regrettable but not surprising when one considers that the borrowing needs of the commercial community are so greatly reduced by reason of the restricted supply

of goods of all kinds. We continue to lend liberally for the production of war supplies, food, etc., but to an increasing extent the financing of war industry is being taken care of by the Government departments.

All known bad and doubtful debts have been fully provided for.

RESULTS FOR THE YEAR

The increase of £5,479 in our nett profits is modest in relation to the expansion that has taken place in our resources, but it will be appreciated that upon a large proportion of our funds a very low rate of interest has been earned. Operating costs, too, have increased owing to the release of more men to the Services. We continue to pay the salaries of all our staff in the Forces less the amount of Service pay received by them. Last December—in recognition of the extra burden so cheerfully borne by the staff remaining with us—we paid a bonus of 6 per cent. on salaries.

The nett profits are	£238,124
Add: The balance from last year	156,217
	394,341
This has been dealt with as follows:—	
Applied to reserve for contingencies	£75,000
Transferred to trustees for officers' pension fund	30,000
Dividend at 11 per cent. per annum, less income tax	132,000
	237,000

Leaving to be carried forward £157,341

I think you will agree that these results are very satisfactory.

CRITICISMS ANSWERED

Recently the banks have been the target of renewed criticism and I am pleased to note that the challenge has been taken up by bank chairmen. It is well to remind the public that besides providing essential services the banks perform a vital function in the nation's financial structure.

The demands made upon the banking system have greatly increased in war time. Much additional work is involved in the payment of wages in industry, and of the men and women in the Services and in those of our Allies at present in this country. The expansion in the note circulation is in itself a measure of the increase in the amount of cash that is being handled by bank tellers. Clothing coupon banking accounts—instituted at the request of the Board of Trade in May, 1942—placed an extra burden upon the banks, but the acceptance of this additional duty no doubt avoided a large increase in the staff of the Government department concerned.

The smooth mobilisation of the money resources of the people in the service of the nation has been and is being effected with the help of the banks, whose share in this important process is perhaps not as fully realised as it should be by the general public.

That these functions and services are carried through efficiently and expeditiously is surely a tribute to our highly organised banking institutions which have not only stood the test of time (in our own case for 248 years) but have also contributed in no small measure to our country's reputation for stability and integrity.

THE KENNET COMMITTEE

Last year the Government set up a committee under the chairmanship of Lord Kennet to ascertain what measures could be taken to secure the greatest possible release of man-power in banking and allied businesses. The banks, acting in concert, had already taken steps to meet the many problems involved in the release of staffs, and since the report was issued further adjustments have been and still are being made. Numerous branch offices have been closed, and many normal services restricted, but it is believed that the public will accept any resulting inconveniences in the right spirit.

BANK STAFF

Of our permanent staff of 1,261—657 have now been released for service with H.M. Forces, while our temporary female staff has also been depleted by withdrawals for the women's services or for industry. Subject to a time lag in the calling-up of released staff, the banks are now operating with 85 per cent. of their pre-war total of employees, and many of these are, of course, only partly trained. It will be readily understood, therefore, that the maintenance of essential banking services places a severe strain upon those who are left, but we are happy to think that, all things considered, the business of the bank continues to be carried on efficiently and to the satisfaction of our customers. On behalf of the court of directors I would again express our appreciation of the excellent services rendered during the past year—frequently under difficult circumstances—by the executive, managers, agents and staff alike. We are indebted to all of them, and not least to our temporary female staff, most of whom are proving to be adaptable and highly efficient.

It is with sincere regret that we record the death of a further five members of our staff on war service, and we extend our sympathy to their bereaved relatives and friends. Our thoughts also go out to those who have the misfortune to be prisoners of war.

To all members of our staff serving their country at home or abroad or on the high seas we send from this meeting cordial greetings and our good wishes for their early and safe return.

THE TREASURERSHIP

As stated in the report, Mr J. W. Macfarlane, who had been treasurer of the bank since October, 1938, and had given 48 years of most valuable service, retired at the end of May. The board accepted his resignation with sincere regret, and their good wishes go with Mr Macfarlane in his retirement.

To succeed Mr Macfarlane as treasurer the board appointed Mr J. B. Crawford, the secretary of the bank. Mr A. A. Gunn, formerly assistant secretary and superintendent of branches, has been appointed to succeed Mr Crawford as secretary.

DIVIDEND

I now have pleasure in moving that the report and balance-sheet as submitted be adopted, and that a dividend for the half-year at the rate of 12 per cent. per annum, less income tax, be now declared payable on April 15th, making with the dividend paid in October last 11 per cent. for the year, less income tax, the same as for the previous year.

The motion was agreed to.

Lord Elphinstone, K.T., and Lord Henry Scott were unanimously re-elected Governor and Deputy Governor respectively for the current year.

Mr S. Crawford Hogarth, Mr Robert McCosh and Mr W. G. C. Hanna were re-elected ordinary directors.

Mr H. L. Usher, C.A., and Mr R. Arthur Morrison, C.A., were reappointed to conduct the audit of the bank's books for the current year, and a vote of thanks to the chairman terminated the meeting.

RUGBY PORTLAND CEMENT COMPANY, LIMITED

A YEAR OF SUCCESSFUL SERVICE

PLANNING, PROFITS AND PLAIN THINKING

MR HALFORD REDDISH'S SPEECH

The annual general meeting of The Rugby Portland Cement Company, Limited, will be held on the 22nd instant.

The speech of the chairman, Mr Halford W. L. Reddish, will be as follows: As the report and accounts have been in your hands for the usual period I assume with your permission that we may take them as read.

There is nothing in the accounts on which in present circumstances I can usefully comment, but I think you will regard the balance-sheet which we have placed before you as satisfactory.

You will see that the trading profit for the year, after providing for taxation and contingencies, and for adjustments under the C.M.F. Pooling Scheme brought into being at the suggestion of the Ministry of Works to deal with certain exceptional circumstances due to the war, amounts to £123,432. The net profit of £69,196 compares with £68,283 for 1941.

We propose to repeat last year's dividend of 7½ per cent. on the ordinary shares, leaving £64,967 to be carried forward, against £60,992 brought in.

It would be idle for me to pretend that in many ways 1942 has not been a year of difficulty, and I should like to pay tribute to those of our staff and workpeople who, realising that the national interest should be paramount in all our lives, have laboured so faithfully and in many cases at no little personal sacrifice to overcome such difficulties as have from time to time arisen.

Although the clouds may appear to have lifted slightly since we met a year ago, we have yet to win the war, and all our efforts must still be directed to this end. Nevertheless, there is today much talk of the economic problems which will face the nation when victory is ours, and I therefore feel that both shareholders and employees may welcome some comment on matters which concern us all. Our shareholders are naturally interested in the conduct of the company on a sound financial basis and in the return which they receive on their capital in the form of dividends—a modest war-time return indeed when we remember that all our ordinary shares have been issued at a premium. Our employees, all of whom are embraced by profit-sharing schemes, are equally interested in the maintenance of the company's profits and the soundness of its finance.

NO FAIRY GODMOTHER

In considering some of the questions which have been in the public mind during recent months, we have first to remember that the state is not a sort of fairy godmother able to produce wealth by waving a magic wand, but merely a collection of individuals; that the national income is really the sum total of the incomes of the individuals making up the state; and that the sums required to be raised by taxation in one form or another for the benefit of all have to be found by those same individuals.

If one may judge by the utterances of some who should know better, there is in many minds no clear understanding of the difference between capital and income. I should like to see every child in every school in the land taught the difference between capital and income. Such knowledge is, in my judgment, necessary, not only for the sound financing of an industrial enterprise, but also for the proper conduct by each individual of his own life; and most certainly it is necessary if we are to consider intelligently the national finances and the economic implications of the various schemes envisaged

for the post-war period. And, in parenthesis, may I suggest that the Government might well set a good example by producing its accounts after the war on a more scientific basis instead of giving us what is little more than a simple summary of cash transactions.

FINANCIAL FACTS AND FICTIONS

To refer more specifically to what I have in mind, it is not uncommonly said that if we are spending fifteen millions a day during the war (that is, when our very survival is at stake) why cannot we spend fifteen millions a day in peace? Now we are meeting only a portion, perhaps half, of our current expenditure out of current income, and to do even that we are cheerfully shouldering a very heavy burden of direct and indirect taxation. What we are not paying for out of current income we are paying for either by realising capital or by borrowing capital sums on which interest has to be paid in the future, and for the repayment of which provision will also have to be made. Every holder of National Savings Certificates, every depositor in the Post Office Savings Bank, has lent his money to the country, and rightly expects to receive interest on it, and in due course to have the capital repaid to him. Secondly, we are not paying today as we should have to in normal times for all our imports. Food, raw materials, and munitions of war are pouring into the country under lease-lend arrangements. In the early days of the war, before those arrangements were made, we realised the capital of many of our foreign investments in order to pay for our necessary imports. That capital has gone. In addition to all this, we are largely living on capital internally, and are restricted, every one of us, in the amount we can spend on personal requirements of every kind. In other words, we have cheerfully given up much for the duration of the war in order that we may the better wage the fight for our own survival and the crusade against the forces of evil.

"YOUR RAILINGS CANNOT BE TAKEN TWICE"

To the man therefore who suggests that war-time expenditure can be maintained by the state in peace-time I would say:—

(a) Are you prepared to accept a continuance of both direct and indirect taxation indefinitely at their present levels?

(b) Are you prepared to continue to save money as at present and to accept the present restrictions on your personal expenditure on food, clothing, comforts, amusements and travel?

(c) Do you seriously suggest that other nations will send us food and raw materials in peace-time without our paying for them?

(d) Can you find any means of consuming capital more than once—for the railings round your front garden cannot be taken twice?

Elementary as these points are, I think it well to state them clearly today, for sound finance is an essential requisite of our rehabilitation after the war; and if we depart from the narrow path of sound finance the least of the many evils which will beset us will be the country's inability to honour its bargain to the millions who have lent it their savings in its hour of need.

You will remember the advice which Mr Micawber gave to David Copperfield:—"Annual income twenty pounds, annual expenditure nineteen nineteen six, result happiness. Annual income twenty pounds, annual expenditure twenty pounds ought and six, result misery."

That is equally true of an individual, of a few hundred individuals joined together to form what we know as a joint stock company, or of many millions of individuals embraced in a state.

Last year, in connection with the incidence of the excess profits tax, I pointed out that in the main the ordinary shareholders in our industrial companies were not, as is often implied, large and impersonal financial institutions, but the "small men"—the wage-earners who have saved and invested. It is equally true, but not perhaps sufficiently realised, that the majority of our national revenue comes directly or indirectly from the "small man," and that he, too, is the consumer providing the bulk of the nation's internal purchasing power. With this in mind I should like to refer to one aspect of the Beveridge Plan which has so far received comparatively little attention.

THE BASIS OF BEVERIDGE RE-EXAMINED

Apart from its proposed co-ordination of the administration of many of the social services, the Beveridge Plan seeks to do two main things. It seeks to abolish want, an aim which (if what it really means is the abolition of actual need) must meet with the whole-hearted approval of everyone and must clearly stand high among the claims on the national income after the war. Secondly, it seeks to provide by insurance to all members of the community, irrespective of need or desire, certain specific "benefits," the "premiums" for which are to be found partly by the individual concerned and partly by subsidies provided by employers and by the Exchequer.

In so far as the contributions which are levied from trading employers are concerned, clearly in a cumulative form they will ultimately be paid for by the consumer; and in so far as the subsidy found by the Exchequer is concerned, that will in turn be found by the general body of taxpayers, and, as Sir William Beveridge himself has been at great pains to point out, constitutes merely what he politely calls a redistribution of income. Now if it were possible for us to leave out of consideration the export trade—that is, if we as a country were entirely self-supporting in our production of food and raw materials—the position would be comparatively simple. Unfortunately, however, this country is not self-sufficient in food and raw materials, and if we are to exist at all must import large quantities of both from the outside world, and must pay for them, if not in gold, then by the export of goods and services.

STANDARDS OF LIVING

It is well therefore that we should realise that unless and until every country in the world and every type of population in the world has advanced sufficiently to desire a similar standard of living we must do one of two things. Either we must form an economic bloc with other countries having similar aspirations in the way of standards of living, so that together we are self-supporting, or by a state subsidy of some kind (which again means a levy on the general body of taxpayers), we must reduce the cost of our exportable goods sufficiently to enable us to compete in world markets, in order that we may be able to pay for our essential imports of food and of raw materials required both for the manufacture of goods for internal consumption and for re-export. The greatest hope for the future clearly lies in a strong lead being given by the English-speaking peoples—by the British Commonwealth of Nations, the greatest political influence for good which the world has ever seen, together with the United States of America. There, as I see it, lies the world's best hope both in the economic field and in the guarantee of world peace in the future. As other nations are prepared to raise their standards of living and to follow our example in the adoption of enlightened social services, and to accept their share of the obligations of maintaining world

peace, so they should be admitted to the economic bloc which I have described.

WORK THE ONLY WAY TO WEALTH

But let us mark well that the Beveridge Plan intends to effect nothing more than a redistribution of the national income. In itself it does nothing to *increase* the national income—to build up again the wealth accumulated by the work of our forefathers, which has made possible our increasing standards of life in this country and so much of which has been destroyed by two major wars.

And let us face this fact—that national wealth cannot be created nor the national income be increased except by the labour of man, by the work of men's minds, by the work of men's hands. The more a man labours, and receives, as he is fully entitled to do, the due rewards of his labour, the more he is contributing to the national wealth. I do not share the views of some pessimists who seem to think that we must face large-scale unemployment in the post-war years. Apart from many other considerations, the destruction of so much national wealth in the war will in itself make it absolutely necessary for everyone to work harder than ever for very many years to come, unless we are tamely going to accept very substantially reduced standards of living. That is an inescapable fact whether we like it or not. I do not believe that our fellow Britishers, who, in the fiery regeneration of the national character in the last three years, have shown such an example to the world, will fail to rise to the great opportunities which await them in the post-war years. I do not believe that it will be a case of finding work for anybody, but a case of encouraging everyone to realise the fundamental truth that only in good work, whether of brain or brawn, faithfully performed, lies any hope of real happiness in this life.

WHY INCOME TAX?

What then is the justification for any direct tax on income, and particularly on earned income? I venture to suggest that it is the comparative ease of collection which has led succeeding Chancellors to make direct taxes on income the mainstay

CITADEL OF HEALING

Last year at the Christie Hospital 4,864 new patients from all parts of England were examined, 45,223 investigations of patients were carried out and 17 Cancer Diagnostic Clinics maintained at Hospitals over a wide area. Funds are urgently needed for this work and for the extension of research into Cancer, still mankind's great scourge.

CHRISTIE CANCER HOSPITAL
AND
HOLT RADIUM INSTITUTE
WINCHESTER, ENGL.

of their Budgets. Much more logical, and much fairer in its incidence, would be a tax on expenditure, and no better time for the initiation of such a change could be imagined than in the immediate post-war period when the stocks of consumer goods in the country in proportion to the potential demand will be smaller than ever before. A tax paid on new consumer goods at the point where they pass into the hands of the ultimate consumer is surely a practical proposition. In the case of National Savings Certificates we give to every citizen the right to acquire the same limited amount of this very advantageous security. Could not the same principle be adopted in the case of an expenditure tax by freeing the simple necessities of life from all tax, even when necessary by subsidising them, thus placing everyone in the same position? From that point a tax on consumer goods graduated according to the degree of luxury or semi-luxury involved could well be imposed. By the small earned income allowance for income-tax purposes we affect to recognise that there is some virtue in earned income but at the same time we penalise thrift. I should like to see this differentiation disappear in the post-war years as part of a definite plan to abolish as quickly as possible all direct taxes on the income of an individual. Such a system would give encouragement and incentive to everyone to do what in the interest not only of himself but of the whole state is so essential in the post-war years—work hard and be thrifty. And labour would receive its due reward.

THE REMOVAL OF RESTRICTIONS

I am a profound believer in the dignity and worth of what is termed private enterprise—in the right of every man, whatever his station in life, to rise by the merit of his own endeavours. It was the spirit of rugged individualism, not in a selfish sense, but in the sense of adventurous individual enterprise, which made this country great and which will have contributed so largely to our ultimate victory. I do not for one moment believe that the great mass of the people in this country, who are fighting this war for the preservation of their liberty and who expect their centuries-old freedoms restored to them when the war is won, will submit to the widespread regimentation and bureaucratic control which some politicians may seek to impose on them. Some war-time restrictions can well be removed almost as soon as hostilities cease; others will have to remain for some time and perhaps be relaxed gradually over a period of three or four years. But let us be watchful lest any stay longer than is necessary. It would indeed be a tragedy if, after the traditions of centuries, in the days to come, we in England were submerged by a wave of bureaucratic control scarcely distinguishable in its reactions on the lives of everyone of us from a totalitarian regime.

THE FUTURE OF THE INDUSTRY

As far as our own industry is concerned, you will not expect me to attempt any forecast of the immediate future; but whatever the shape of the post-war world, it is clear from recent pronouncements that the Government is alive to the fact that an active and expanding building industry is the backbone of national prosperity, and that in consequence there will be a substantial demand for cement for many years to come. The cement industry, with its existing capacity, together with the increases already planned, will be ready, as it has always been in the past, to meet all demands made upon it; and as soon as it is freed from war-time controls will, I have no doubt, revert to its pre-war practice of increasing production, cheapening costs and selling-prices, improving the wages and conditions of its employees, and providing a reasonable return on the capital which has made its development possible.

But in the meantime let us concentrate all our efforts on the winning of victory; then, and then only, shall we have deserved the opportunities for joyous adventure and high achievement which will beckon to us in the days to come.

VICKERS LIMITED

A STRENUOUS YEAR

The seventy-sixth annual general meeting of Vickers Limited was held, on the 2nd instant, at Vickers House, Broadway, Westminster. Mr A. A. Jamieson (the chairman of the company) presided.

In his statement, which was circulated to the stockholders with the report and accounts, the chairman said:—

During 1942 Sir Charles Craven resumed his duties as chairman and managing director of Vickers-Armstrongs Limited, and of English Steel Corporation, Limited. Subsequently it was arranged that his services should be placed at the disposal of the Minister of Production on a part-time and advisory basis, but he will also carry on his work here.

It is a satisfaction to me that we have once more been able to place the report and accounts before stockholders punctually, but this has not been done without great effort and the gradual depletion of man-power in the administrative sections may render this impossible in future.

BALANCE-SHEET ITEMS

There are some features in the balance-sheet before stockholders which call for explanation. Vickers have sold certain quoted shares and the remaining holdings under this heading now stand at a nominal figure. The market value of these holdings at December 31st was approximately £143,176. In the balance-sheet of Vickers-Armstrongs under the sub-heading "Other companies—shares, at cost, less reserve" there is a reduction from £462,285 in 1941 to £238,647 in 1942. The reason for this is that Vickers-Armstrongs have taken over the assets and liabilities of three of their wholly owned subsidiary companies, viz.: The Whitehead Torpedo Company, Limited, The Thames Ammunition Works, Limited, and The Variable Speed Gear, Limited. The assets and liabilities taken over are now included in the Vickers-Armstrongs' balance-sheet under the appropriate headings. It was felt that no useful purpose was served by continuing to operate these wholly owned subsidiaries as separate companies.

The increase of £15,883,601 in the figures of stocks, work-in-progress and debtors of Vickers-Armstrongs reflects the expanding production of that company. The consequent drain upon our cash resources, after allowing for the increase in instalments on account of contracts of £8,491,294 is exemplified by the reduction in cash balances and the larger advances which we have been called upon to make to Vickers-Armstrongs, the indebtedness of that company amounting to £8,517,007 as against £6,395,155 in 1941.

All known taxation has been provided for and all taxation due has been paid.

YEAR OF EXPANDING PRODUCTION

The accounts indicate that 1942 was a year of expanding production and our energies were fully employed in producing all forms of material for the supply departments. Our shipyards have made deliveries of every class of warship and merchant ship required of us. Our aviation works have delivered an increasing number of Spitfires and Wellingtons. The constant development of these aircraft, in order that they might retain their position as the finest of their class, has occupied the attention of the technical departments concerned; in addition the development of new types has continued. Our engineering works have expanded their production of armaments of every description and have kept pace with the ever-changing requirements. The demands upon the capacity of the English Steel Corporation have been intensive. The Corporation has delivered an increased supply both of steel and of machined products. They have also given much technical information to other companies.

Support has been given to the war savings campaign and it may be of interest

to stockholders to know that the total amount subscribed through savings groups within this organisation from their inception till December 31, 1942, is £2,083,000.

It has been a strenuous year, and a tiring one for all employees in this organisation: but one and all they continue to give of their best and are ready for another year of heavy and continuous work.

The report and accounts were unanimously adopted and the final dividend of 6 per cent. approved.

JOHN BARKER AND COMPANY, LIMITED

The fiftieth ordinary general meeting of John Barker and Company, Limited, was held, on the 8th instant, at Kensington.

Mr Trevor A. Bowen, D.L., J.P., chairman and managing director, said that he was pleased to report a net profit of £345,056, an increase of £91,308 over last year. Their liquid assets totalled £1,958,429, an increase of £332,712. Notwithstanding the successful results of the year under review, they could not expect such good results in the current year; the adverse conditions under which they were trading today were having a cumulative effect upon trade and that would be felt increasingly.

He was no pessimist but, looking at the future and the rate at which red clothing coupons were being used, it appeared that in a very few months they would be exhausted. Other factors indicated that apart from that particular matter the outlook was not at all encouraging. Cash was plentiful at the moment, but coupons were largely the governing factor in trade, and he was of opinion that they would need all their carefully built-up reserves to pull through and re-establish their pre-war position. They proposed to pay a dividend of 10 per cent., less tax, on the ordinary shares.

The report was adopted.

LANCASHIRE STEEL CORPORATION, LIMITED

IMPORTANCE OF RESEARCH

The thirteenth ordinary general meeting of this company was held, on the 2nd instant, at Manchester.

Mr John E. James, chairman and managing director, said that he would like to take the opportunity of welcoming those members who had acquired their holdings since the last meeting through the liquidation of the Partington Steel and Iron Company.

The directors had decided to recommend the full dividend of 5½ per cent., less tax, on the second preference shares and 7 per cent., less tax, on the "A" and "B" ordinary shares. The directors also proposed to recommend the conversion of all classes of shares into corresponding classes of stock.

The war had revealed more and more the value of research and its effect upon the technical side of the industry, and greater provision for research would require to be made in post-war years than in the past. The investigations which would be necessary could, he considered, be done most effectively both by individual companies and by the industry acting collectively. Individual companies, for example, might develop those types of research in their laboratories which could be pursued and tested in their own works, transferring thereafter to collective research the results of those investigations. The Corporation itself had many avenues both in raw materials and in finished products which would provide great scope for such work, and in that way make some contribution towards at least one object of research, the standardisation of methods of manufacture. The whole question was one of great interest and very considerable attention would require to be paid to it.

The report was adopted and the proposed conversion of shares into stock was approved.

HADFIELDS LIMITED

FRESH RECORDS ACHIEVED

MR P. B. BROWN ON THE OUTLOOK

The fifty-fifth ordinary general meeting of Hadfields Limited was held, on the 2nd instant, at the Royal Victoria Hotel, Sheffield, Mr P. B. Brown, M.Inst.C.E., J.P., chairman and joint managing director, presiding.

The chairman, in the course of his speech, said: The enormous demand for steel of the highest quality has made it necessary to conserve the use of imported alloys. Valuable work in this direction has been done by the technical advisory committee of the special alloy steel committee of the Iron and Steel Control in which our company has of course participated. For over half a century our research workers have been in the vanguard of that great army of metallurgists who, following the example of our late chairman, Sir Robert Hadfield, devote their lives to the study of that indispensable and versatile metal steel.

Sir Robert's discovery and publication in the early eighties of the last century of the remarkable transformation in the physical properties of carbon steels brought about by the addition of 12 per cent. or 13 per cent. of manganese, has been acknowledged as the beginning of the "Alloy Steels Era."

TAYLOR-WHARTON'S 200TH ANNIVERSARY

An interesting reminder of this occurred last October, when I was invited to send to the Taylor-Wharton Iron and Steel Company, of High Bridge, New Jersey, U.S.A., a message on the 200th anniversary of its formation. In response the following telegram was sent:—

"Hadfields Limited send hearty congratulations to Taylor-Wharton Company on its 200th birthday and on the jubilee of our friendship. During the 50 years since you introduced to America the manufacture of Hadfield manganese steel our association has been mutually helpful and stimulating. Long may it continue."

In a publication issued by that company in celebration of its 200th anniversary they give an interesting account of the great forward step they took when they adopted the Hadfield systems for the manufacture of alloy steels, and describe how it brought to them a great wave of prosperity. We still maintain a close technical association with the Taylor-Wharton Company.

WIDESPREAD ACTIVITIES

You probably know that the operations of our company go far beyond the mere production of high-grade steel. A large proportion of the steel we produce is fabricated into machines of various types and other highly finished engineering products; in fact the number of workers engaged in our engineering departments is much greater than that employed in the melting, refining, forging, rolling, and other purely metallurgical processes.

The profit for the year amounts to £202,264 as against £198,904 for last year. It will, however, be noticed from the profit and loss account that the amount paid for war damage insurance is £10,569 less than for 1941; therefore, actually there is a reduction in the real profits of £7,209.

The total current assets exceed the current liabilities (excluding works development provisions) by £1,720,494 as against £1,703,758 a year ago. The reserve accounts and profit and loss balance amount to £1,330,516, which is equal to 123 per cent. of the issued ordinary capital. It will be seen that the policy of the board is to build up the financial resources of the company in order to meet the difficulties and uncertainties of the future, and I feel sure this will have your approval.

Unfortunately, I am not in a position to give details of the great variety of work upon which we are engaged or of the

alterations and extensions made to the plant. You will, however, be glad to know that all past records of the company have been exceeded in tonnage and in values.

THE FUTURE

Many schemes are being promulgated for the better regulation of industry, the control of banks, credit, exchanges, overseas trade, and the like, but we cannot get away from the hard fact that the world will be impoverished by the destruction and disorganisation brought about by the war, and it will be some considerable time before the industries of this country, on which so many of us depend, can recover. It is to be hoped that the international conferences now being proposed will give some index of the conditions under which trading may be possible between the nations in post-war years.

As Lord Riverdale said in a short article that appeared in the press on March 3rd, and which I would advise you all to read carefully, "It is to foreign trade we must look for our future well-being." Equality of opportunity, freer and fairer access to the markets of the world must be provided if international trade is to be built up and world-wide peace and prosperity secured.

BEVERIDGE SCHEME

You are no doubt all carefully studying the recommendations of the Beveridge scheme for killing the five giants—physical want, disease, idleness, squalor, and ignorance. The proposals Sir William puts forward must commend themselves to all who have the nation's interest at heart, but the extent to which his recommendations can be adopted must depend entirely on the capacity of the country to secure a fair share of international trade. While we may approve of most of them it would be unwise under present conditions to pledge the Government, the employers, and the employees to the great increase in expenditure required to carry out his recommendations.

There are many firms who, like ourselves, have made large and costly extensions at their own expense in order to meet the demands of the Service Departments of the Government. There is little doubt that at the end of the war many of these extensions and additions to plant will be surplus to our peace-time requirements. The Finance Acts state that any loss occurring under these circumstances shall be a charge against taxation, but such loss, unless previously realised by sale or otherwise, is to be taken "on such date as Parliament may hereafter determine." In order to enable us to give consideration to post-war developments we must urge the Government to make a more definite statement at an early date.

There are other matters upon which it is desirable that the Government's policy should be made known. The Federation of British Industries is taking up these points with the Treasury and should receive the active support of all firms likely to be affected.

The chairman concluded by moving the following resolution: "That the directors' report and balance-sheet now submitted be adopted and entered on the minutes. That the payment of the dividend on the £300,000 4½ per cent. cumulative preference stock (£10 per unit) for the year 1942 be confirmed; that in addition to the interim dividend on the ordinary stock of 9d. per unit (7½ per cent.), less tax, paid on August 31st, a final dividend be paid at the rate of 1s. 6d. per unit (15 per cent.), less tax, making the total ordinary dividend for the year 1942 2s. 3d. per unit (22½ per cent.), less tax."

The resolution was carried.

ASSOCIATED ELECTRICAL INDUSTRIES, LIMITED

RECORD WORKS OUTPUT

The forty-third annual general meeting of Associated Electrical Industries, Limited, was held, on the 2nd instant, in London. Sir Felix J. C. Pole (the chairman) said that the profit for the year was £686,527, an increase of £4,991, and the net profit was £452,820, an increase of £34,580. The directors recommended a dividend of 10 per cent., less tax. The Council of the Institute of Chartered Accountants had been expressing its views on certain aspects of the accounts of companies. That was all to the good because there were differences of practice which might well be assimilated. For example, stockholders would note that it was their company's practice to make complete provision for taxation on the profits of the year covered by the report and they showed the amount to be paid in dividends as a net figure after deduction of tax. That was not universal practice. In their case, if they showed the preference and ordinary dividend figures gross, that was including tax, then the profit for the year would be recorded as £984,925 instead of £686,527.

RECORD ORDERS

All previous records had been beaten by last year's orders received and the output of their works. They had responded wholeheartedly to the demands of the Government for increased production. Indeed they had been actively engaged for a good many years in assisting the country's defence programme, and today their works were entirely occupied on work for the furtherance of the war effort. Much of that represented their normal electrical products and in that connection the stockholders would be interested to know that the company had received substantial orders from the Ministry of Supply for electrical plant for our Russian allies.

(Continued from page 472)

than was originally thought, and a great many time-workers will in consequence not benefit by the full 6s. advance. The unions have emphasised that there will have to be an adjustment so that the pieceworker will not have to earn the 20s. transferred from the national bonus to the district rate. The award has no effect on the wages of women who are

The knowledge and skill of the company's engineers had been in constant demand in devising or improving specialised articles, and the company had been gratified to receive many commendations from Government departments. On the manufacturing side great skill had been displayed in expanding and improving factory accommodation, and in securing the highest degree of workshop efficiency and the most speedy flow of output.

POST-WAR PROBLEMS

With regard to post-war problems the important thing at the moment was to win the war, and he accepted wholeheartedly the Prime Minister's advice that they should "concentrate even more zealously upon the war effort and not take our eye off the ball for a moment." He might say, however, that—to quote another Minister, Major Lloyd George—"I believe that the country's future prosperity is intimately tied up with the electrical industry and that that industry is bound to play an extremely large part in post-war reconstruction."

When the war was over he felt satisfied that, no matter whether there was to be—as he hoped—a planned organisation of industry or whether they reverted to highly wasteful competitive conditions, nationally and internationally, the Associated Electrical Industries group of companies would not be found wanting. The war had shown that the manufacturing industry could produce to meet maximum demands. The great post-war problems related to distribution and consumption. If they could, by national and/or international action, find ways and means of preventing that kind of world suffering so aptly described as "production wealth and consumption poverty" all would be well. The problem was being discussed on both sides of the Atlantic, and, in his opinion, all suggested solutions should be most sympathetically studied.

The report was unanimously adopted.

B. MORRIS AND SONS, LIMITED

INCREASED TRADING PROFIT

The annual general meeting of B. Morris and Sons, Limited, was held, on the 7th instant, in London.

Mr Arthur J. May (chairman and managing director) said that the profit on trading, £26,761, showed an increase of £7,654. After meeting various items, there was a balance of profit of £17,042, which showed an increase of approximately £5,000. More than two-thirds of that profit was set off against the profit and loss account, reducing the adverse balance to £2,270. That arrangement improved the asset value of the ordinary shares very considerably, apart from the fact that they would receive a 5 per cent. dividend.

The company in 1942 had earned over 10 per cent. net on the ordinary capital, which reflected a great deal of credit on the staff and employees. Part of the profit was due to circumstances, that were not likely to operate in 1943, but their normal trading profit was larger than in 1941. If they had another successful effort this year, their taxes might be heavier, but they would be able to meet the increased taxation without affecting their capacity to pay dividends. That, of course, depended on the year's business. They were subject to various Government controls, the chief being the Tobacco Control, and there was no doubt that the price of raw material, owing to the efficient working of that control, had been kept within bounds.

Last year they had promised a very substantial reduction of the debit balance on the profit and loss account, and nothing gave him greater pleasure than the fact that they had been able to redeem that promise. He was not going to say anything with regard to 1943, except that their brands of cigars and cigarettes were very much in demand. The first three months of the year had been satisfactory.

The report was unanimously adopted.

employed as women under the recent Women's Wage Agreement, but it will affect those women who are employed as "men" under the Men's Wages Agreement. The table at the foot of this page shows how a skilled fitter is affected by the Tribunal's award, and how the new position compares with the old rate, the unions' claim, and the employers' offer. London rates are somewhat higher.

ENGINEERS' WAGES IN MAIN PROVINCIAL AREAS

Standard wages of a skilled fitter (the basis of the engineering wage structure) when employed on PLAIN TIME RATES per week of 47 hours; overtime is paid extra pro rata at premium rates; holiday credits worth about 1/10 a week are additional.

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

WHILE the war news has throughout served to maintain sentiment, *The Financial News* ordinary share index reaching a new high at 97.9 on Tuesday, actual turnover pending the Budget has failed to improve. Several minor improvements for some of the short and medium dated stocks in the gilt-edged market were recorded at the reopening, but irredeemable and long-dated issues were barely steady in the absence of any real business. Brazilian bonds were firm in the foreign bond market, but, apart from some marking-up of Japanese issues, there was little of note. The publication of the Government White Paper on the railway revenues occasioned some rather tentative and speculative support for home rail issues. GW improved 1 1/2 points and LMS ordinary 1/2, with smaller gains for most of the prior charges. By midweek, however, interest had slackened considerably. Argentine rail stocks failed to attract any interest, but, elsewhere in the foreign rail market, Antofagasta and San Paulo issues were firm.

Selective buying offset the occasionally irregular tendency of the industrial market. International stocks were outstanding, improving in sympathy with the trend in New York. Brazilian Traction, International Nickel, and Holdings were all higher on the week, while Canadian Pacific ordinary rose 1 1/2 points on steady support. Despite the imminence of the Budget, brewery shares were steadier than of late. Among tobacco issues, Imps were outstanding with an advance of 1/2. In the motor and aircraft section, aircraft shares were firmer on Mr Churchill's statement on the future of the industry, while Raleigh Cycle Holdings advanced 2s. 6d. The feature of an otherwise quiet heavy industrial section was the marking-up of John Summers "A" shares by 4s. 6d. on the increased distribution. South Durham, however, weakened on the slight increase in the dividend. British Celanese attracted buyers in the textile market, the ordinary

shares gaining 1s. 4 1/2d. Courtalds recovered last week's decline, advancing 1s. Shipping issues displayed no decided tendency, although Court Line rose 9d. Stores issues were easier after their recent strength, and among miscellaneous stocks, Metal Industries "B" shares rose 2s.

Further details of the allied post-war currency schemes with their proposals for gold, continued to encourage Cape buyers in the kafir market. Dealings were on a rather reduced scale this week, while interest was transferred to the dividend-payers from the developing mines of the Far West Rand. Diamond shares were well supported, Consolidated of South Africa rising 2s. 6d. among other issues. Rubber shares were devoid of any interest, although tea shares were in demand in midweek, gains ranging from 6d. to 1s. Activity in oil shares was never great, although leading issues were slightly better in midweek, recovering their earlier insignificant losses.

New York

WALL STREET responded strongly to the favourable reports of the Tunisian campaign. Trading on the opening day this week was the most active for over 15 months, investment and speculative buying resulting in widespread gains. Demand for rail and utility stocks was particularly marked, several issues achieving new peaks for the year, while steel, copper and industrial favourites advanced, despite intermittent but heavy profit-taking.

The Budget

BY far the largest Budget that this country has ever seen is also one of the least controversial. It is remarkable enough that the Chancellor of the Exchequer could propose to spend £5,756 million in a single year—more than the whole national income as recently as 1940. It is still more astonishing that he should intend to raise no less than £2,908 million in revenue. But that he should be able to do these things without stirring up more than a ripple of argument and objection is still more phenomenal, and a tribute alike to the management of the national finances and to the readiness of the people to take their fiscal punishment.

The mass of economic and financial information that is nowadays released with the Budget provides the material for extended comment and for most interesting analysis, with which a beginning is made on later pages. Sir Kingsley Wood, incidentally, promised a further extension of this new, but wholly admirable, principle when the return of peace makes it possible to release information on production and other matters now held secret. The journalist may shudder at the burden that this will lay on him in future Budget weeks if all the new details are also to be released on a single day; but the principle of basing the annual Budget on the widest possible survey of the national economy is the great

advance in public finance that will always be associated with Sir Kingsley Wood's tenure at the Treasury.

Alongside the manifold problems of the nation's economic life, the Budget itself becomes almost a routine performance, and the Chancellor devoted to it only a fraction of his speech. He estimated that both expenditure and revenue on the existing basis of taxation would be higher in 1943-44 than in 1942-43. There can, of course, be no question of covering the deficit, or even of substantially reducing it, by taxation; but Sir Kingsley properly set himself the goal of increasing revenue to such an extent that domestic drafts on capital this year would be no larger than last year. This involved raising about £100 million in additional taxation and, as was the general expectation, the burden has been placed on "optional expenditure" on tobacco, alcohol, entertainments and on the purchase of "luxury" goods.

This procedure is unexceptionable. It is, of course, necessary to record regret that the Chancellor did not take the opportunity of reforming a system of income taxation which, in these days of universal direct taxation, has become dangerously cumbrous—he would concede no more than a statement that this subject was "not excluded" from the deliberations of his advisers. It is possible once again to

the coming year have been underestimated. The year 1942-43 showed an increase of expenditure of £847 million, while the increase for which the Chancellor is now budgeting appears—after allowance has been made for the disappearance of expenditure on supplies from Canada, which are now to be lease-lent—to be only some £375 million. This might be partly explained by the fact that production is now at its peak; but the same argument hardly applies to revenue, where the estimated increase, on the existing basis of taxation, and after the necessary adjustments, is only £250 million, compared with a realised increase last year, in excess of the effects of last year's increases in taxation, of £582 million. It is safe to assume that, by the end of the year, revenue will be well over £3,000 million, and expenditure up to, if not over, £6,000 million.

These, however, are minor matters to set alongside the massive achievements of British war finance. In the coming year, on the Chancellor's estimate, revenue will provide 50.5 per cent of the total expenditure, and 56.4 per cent of the expenditure "requiring domestic finance." This latter is the more accurate comparison, and the fairest measure of the British taxpayer's burden. There is almost certainly no other nation in the world which is raising in taxes so high a proportion of its national income as Great Britain. It is a commonplace of the economic history of the last war that the financial policies pursued by Great Britain were far sounder, and far less productive of post-war misery, than those of any other country that fought all through the four years. But in the twelve months that ended on October 31, 1918, only 29 per cent of the total expenditure was raised in revenue, and the heavy proportion of borrowing was raised at rates of interest well over double the present. If this was a sound policy, how much more so is that now being pursued.

It cannot, of course, be maintained that there is no

element of inflation in the financing of the war. Indeed, there is no reason why it should be maintained. So long as there was a wide margin for higher taxes and more stringent restrictions, it was right to press for them, and to preach the perils of inflation. But there is a limit to what can be done in these ways, and that limit has just about been reached. It is enough, in the circumstances, to have kept the degree of inflation small—the national income rose by only 11½ per cent in 1942, of which some part was due to higher real output, and only the remainder to a fall in the value of money—and to have diverted it to the less important sectors of the national economy—the cost of living index is lower than a year ago. It is no secret where the inflation is to be found—in the greatly increased and increasing earnings of the wage-earners—but it happens to be in places where the tax-collector cannot get at it without great difficulty and the risk of injustice. If matters can be held in roughly their present condition the bog of inflation can be considered to be laid—until the Armistice.

The future historian of democratic institutions will find a place for sound methods of public finance among the explanations that he will give of the fact that representative government in Britain has achieved far greater stability and strength than in any other at least of the large European nations. The enormous expenditures and deficits of these wartime years would not fit into any pre-war definitions of soundness. But they are the unavoidable fruit of total war and "soundness" is now to be measured by the extent to which these enormous dislocations and crushing burdens are provided for without social disaster and political disruption. The end of the story is yet to be written. But we have come far enough to be confident that the genius for financial statecraft which has played its part in making the British people great has not deserted them in this greatest of all their trials.

United States?

THE United States is at present passing through a period of considerable political disturbance. It was obvious when last November's elections returned a Congress with a very narrow (and very unruly) Democratic majority, that the President would not have an easy time on the home front. These apprehensions have not been diminished by the behaviour of the new Congress since it convened in January, and Mr. Walter Lippmann declared roundly a few weeks ago that the President, after dominating five Congresses, had lost control of the sixth. On the surface, this would seem to be true. Congress is repealing Presidential directives, and the President vetoing Congressional acts; the farmers' organisations and some of the labour unions are, in their various ways, on the verge of open hostilities with the Federal Government. There is an admitted crisis in food production and a crisis even more severe, though not admitted, in manpower—although food and manpower were two of the contributions that America was to bring in abundance to the cause of the United Nations. But in America more than in most countries, the surface is deceptive. Dissension is the normal state of politics and crises are thick upon the ground. The question that the observer has to decide for himself is whether this is one of the times when the cries of alarm have to be taken seriously or whether by an elaborate process of checks and balances, false starts and sudden recoveries, over-zeal and under-planning and with a very large admixture of plain horse-sense applied on the spot by men who never go to Washington—whether by these familiar methods the right thing will be done in the end.

Mobilisation for war is still the dominant theme of all public activity and most of the matters which appear on the Washington scene as separate problems are in reality only the various aspects of a single gigantic pre-occupation. The production crisis came last autumn when it became apparent that the method of placing contracts

and of "needling" the contractor had reached its limit. Something much closer and more detailed in the way of preliminary planning of production was needed and the War Production Board has provided it under the name of "scheduling." Mr. Charles Wilson of the General Electric Company, is the chief author of the system of scheduling and he has gradually had conferred upon him most of the very considerable powers of the War Production Board. Obscure personal reverberations of the explosion in February, when Mr. Ferdinand Eberstadt was expelled in Mr. Wilson's favour, are still occurring. But the essential thing is that many of the bottlenecks have been broken and that production is rapidly mounting. By the autumn, it is said, America will be producing as many munitions as the rest of the world put together.

Productive capacity and raw materials, in fact, are no longer the limiting factors. Nowhere can the deficiencies of the American administrative structure be seen more clearly than in the manpower arrangements. There is confusion and overlapping at the centre and a great leakage of efficiency between Washington and the local centres of administration. Really serious trouble has not yet been caused, since there has until recently still been a margin of unemployment to draw upon. But grave embarrassments are being caused to a number of essential industries by the absence (at least until the President's order this week) of any really effective means of preventing the voluntary departure of their workers and by the preference of local draft boards for filling the Army with single and childless men from essential industries rather than with fathers of families from less essential trades. But, in any case, as British experience shows, the phase of freezing the labour that is already in the essential industries is only a preliminary to the far more difficult stage of the direction into those industries of fresh supplies of men and women. For direction, America is not yet

either politically ready or administratively equipped.

Part of the difficulty can be briefly expressed by saying that America has no Ernest Bevin. A labour policy as drastic as that in force in Great Britain can be carried through only by a man whom the rank and file of Labour—all of them—trust. But American Labour is divided into three factions, and while there is an uneasy truce between the American Federation of Labour and the Congress of Industrial Organisations, both of them are threatened with outflanking by the redoubtable Mr. John L. Lewis, whose campaign against the President is described by our Washington correspondent on page 493. This situation makes it very difficult for any of the Labour leaders to put himself in a position where he can be accused of abating any of Labour's demands.

Not only the wage earner but the politically much more powerful farmer also has demands which could only be granted at the expense of the general price-level. At the moment the dykes are holding and the stabilisation policy has just been re-affirmed. But the period of danger is not passed. Nor is it certain that the country will accept the considerable intensification of rationing that now impends. The Office of Price Administration, which is the responsible authority, has either through misfortune or mismanagement, contrived to give the country the impression that the rationing system is not efficiently run and the current cry of "Down with Bureaucracy" is hardly conducive to the growth of a system which, in a country like the United States, is necessarily complex. It cannot yet be said for certain whether or not the internal economy of the country will get out of control.

This is the unruly team that President Roosevelt has to drive—and he is driving them with great skill and moderate success. His sense of timing has never been

better shown than in recent weeks. He gave the farm bloc enough rope, and then proceeded to hang them with a veto which neither House of Congress would upset because of the pressure of public opinion. And since that public opinion included the Labour leaders, fearful of a rise in food costs, the President was able to improve on his victory by issuing a blanket prohibition on all rises of prices and wages and by freezing all essential workers in their jobs. It is the mark of an able general to win victories with weak forces by tempting the enemy to advance too far. So long as Mr. Roosevelt is in the White House there is good reason for hoping that the right thing will in the end, or just before the end, be done.

But how much longer will Mr. Roosevelt be in the White House? The election is only eighteen months, the nominating conventions only fifteen months ahead. The President is at present the object of a bitter and concerted attack by a coalition of Republicans and of those Democrats who, on this issue, dissent from the party leadership. Under the Constitution, it is very difficult for there to be anything in the nature of a party truce, and it is already clear that next year's election will be bitterly fought along party lines. The Republicans are out for blood; they will nominate the candidate who has the best chance of winning; and at the moment the odds are on their success. What that will mean it is at present quite impossible to foretell and there are few things more important for anyone who wishes to know the shape of the post-war world than to keep a close watch on Republican politics. It is tolerably sure that there will be no conscious—and certainly no deliberate—slackening in the war effort for at least two years to come. As to what will happen after that, there is nothing for outsiders to do but to watch and pray.

The National Finances

FOR the third year, Sir Kingsley Wood has provided with his Budget a mass of information on the national economy and on the Government finances which makes it possible to understand what is happening under the pressures of war far more clearly than ever before. The tables contained in this year's edition of the White Paper are printed, virtually in full and with a summary of the comment on pages 498-500. The White Paper concerns itself with the two main subjects of its title, with "the sources of war finance" and with "national income and expenditure." The two are, of course, closely related, and it is hardly possible to discuss either one intelligently without calling the other in aid. But they are, nevertheless, distinct subjects and since space is limited, it is proposed to deal in this article in the main with the first subject, the sources of war finance, and to leave the subject of national

income and expenditure for further treatment next week.

The distinction is, roughly, between the economic and the financial, and to begin with the financial is to place the smaller before the larger. This can, however, be remedied by first putting the Government's activities in their proper place in the framework of the national activities as a whole. In wartime, all expenditure—that is, all forms of consuming labour and materials—can be divided into the two heads of personal expenditure on consumption and Government expenditure. The latter, for very proper reasons, cannot be further sub-divided, but this year it is possible, for the first time, to sub-divide the total of expenditure on consumption. In summary form, the figures for the last three complete calendar years are as follows (they can be found in full in Table B on page 498):

EQUITY & LAW
LIFE ASSURANCE SOCIETY
Established 1844

PROTECTION IN WARTIME

● Civilian War Risk Cover without additional charge is normally granted under new Whole-Life and Endowment Assurances—whether With-Profit or Without-Profit.

● A Guaranteed Bonus each year until 1946 inclusive is provided under all new With-Profit Policies—thereafter Bonuses are dependent upon Profits.

Head Office: 163/4, STRAND, LONDON, W.C.2
(temporarily transferred from 20, Lincoln's Inn Fields)
Telephone: TEMple Bar 0381

(£ millions)	1940	1941	1942
Personal expenditure on consumption:			
Food, drink and tobacco.....	1,852	2,010	2,232
Rent, rates, water, fuel, light and household goods.....	985	995	1,003
Clothing.....	496	450	462
Travel.....	185	202	215
Other services.....	461	469	465
Other goods.....	303	383	423
Total.....	4,282	4,509	4,800
Government expenditure on goods and services.....	3,059	4,194	4,608
Total expenditure on goods and services.....	7,341	8,703	9,408

Where did these goods and services come from? The first and most obvious source is the production of the community. This can be measured by the sums of money paid out to the people in the course of producing the year's output; but to this has to be added the total of indirect taxes which, by going into prices, have inflated the figures in the above table. (For example, when a consumer buys a bottle of whisky, the value of the goods and services he is consuming is represented by only a fraction of the price, the remainder being taxation. If the full price of the bottle has been entered in the above table—as it must be—not only the distiller's receipts but also an item equal to the tax will have to be entered on the income side of the balance sheet if the two sides are to balance.) Whatever cannot be provided out of the current output of the British community has to be met by drafts on capital. These can take two forms—domestic or external. Domestic capital is drawn on when accumulated stocks of goods are consumed and not replaced, when machinery and other plant is run down but not maintained, and when actual capital goods—such as park railings—are consumed. External capital is drawn upon to the extent that goods are obtained from abroad on credit—that is, goods that have to be paid for sometime, but are not paid for by the export of British goods at present. The figures for these quantities are as follows:—

(£ millions)	1940	1941	1942
Rent, etc.....	389	385	384
Profits and interest.....	1,624	1,926	2,183
Salaries, etc.....	1,288	1,338	1,408
Wages, etc.....	2,425	2,970	3,409
Net national income at factor cost.....	5,726	6,619	7,384
Indirect taxes, etc., less subsidies.....	837	1,087	1,219
Net national income at market price.....	6,563	7,706	8,603
Drafts on capital—domestic.....	22	200	173
external.....	756	797	632
Total available resources at market price.....	7,341	8,703	9,408

In the two tables printed above, money figures have been used as *measures* of real magnitudes. They are, in fact, anticipations of the subject that is to be discussed in greater detail next week. The remainder of this article is concerned in the main (though not entirely) with the more financial aspects, that is, with the collection by the Government of the money counters that it requires to meet its expenditure, which, as the first table showed, is now very nearly half of the total real expenditure of the community. Expenditure in a financial sense, however, is necessarily larger than the money measure of real expenditure. The cost of old age pensions, for example, has not been included in Government expenditure above as it is a pure transfer of income from the Treasury to the pensioners without any goods or services being consumed in the process. (The pensioner proceeds to consume goods and services, but that is, of course, included in personal expenditure on consumption.) From the *financial* point of view, however, the cost of old age pensions has to be raised by taxation or borrowing just like the cost of any-

thing else. The financial chapter of the story thus begins with a different set of figures:—

(£ millions)	1940	1941	1942
Central Government Expenditure	3,339	4,616	5,103
How are these sums of money raised? The first answer is to give the channels through which they reach the Exchequer:			
Central Government revenue (nearly all taxation).....	1,259	1,828	2,343
Borrowing:—			
A.—From Government agencies—			
Unemployment, National Health and other similar funds.....	543	247	49
Canadian Government interest-free loan*.....	...	...	157
B.—From private sources—			
Small savers†.....	467	601	599
Large savers†.....	552	1,021	1,026
Banks and money market†.....	518	902	476
Tax reserve certificates (i.e., funds accruing to meet taxes).....	...	17	453
Total Borrowing.....	2,080	2,788	2,760
Total receipts.....	3,339	4,616	5,103

* Not to be confused with the Canadian Government contribution of £225 million, which was a free gift.

† These sub-divisions are somewhat arbitrary.

This table is a complete financial answer. But for further enlightenment, it is necessary to recross the frontier between the financial and the economic and to show the ways in which the public (meaning by that phrase, for the moment, all persons and institutions other than the Exchequer itself) obtained the funds which they lent to the Government. The figures are as follows:—

(£ millions)	1940	1941	1942
Personal savings—to meet accrued taxation.....	94	206	280
“free”.....	628	704	891
Business savings—to meet accrued taxation.....	183	233	148
“free”.....	175	180	190
Extra-budgetary funds and local authority surpluses (“Governmental Saving”).....	186	220	231
War risks and war damage claims paid and available for re-lending.....	36	248	215
Funds arising from disinvestment—			
Overseas.....	756	797	632
Home.....	22	200	173
Total (= Total Borrowing).....	2,080	2,788	2,760

Finally, it is possible from the Chancellor's speech to give a summary of the way in which he expects to finance the current year's expenditure. This is set out below, together with the figures for the calendar year, 1942:—

	Calendar Year 1942	%	Financial Year 1943-44	%
Total Expenditure.....	5,103	100	5,756	100
Revenue.....	2,343	46	2,908	51
Borrowing—				
Extra-budgetary funds, local authority surpluses and claims paid.....	446	9	425	7
Business savings.....	338	7	350	6
Personal savings.....	1,171	23	1,300	23
Disinvestment—domestic.....	173	3	173	3
overseas.....	632	12	600	10
Total Borrowing.....	2,760	54	2,848	49

These figures, if they are realised, will establish the soundness, within the new orthodoxy, of the Chancellor's management of the national finances. Although the total of expenditure is to increase, the proportion of it to be raised by taxation is also to increase, without causing any significant diminution in the proportion to be derived from savings. More than that even the purist could hardly demand.

NOTES OF THE WEEK

Lend-Lease and Reciprocal Aid

No better indication could be given of the way in which the war has transformed the picture of the national finances than Sir Kingsley Wood's abandonment of the traditional form of the Budget speech. Instead of beginning with the results of the past financial year, he began with the aid received by the United Kingdom from the United States and Canada, which finds no place in the Budget accounts, and then turned to the aid given by Britain to the United Nations, which is hidden in the Votes of Credit. Eighty per cent of the total goods supplied to the United Nations by the United States are on Lend-Lease terms. From Canada, the United Kingdom received last year the billion dollar gift. This year, Canada is sharing its production of essential war supplies with the United Nations on the basis of strategic needs. In addition, the Dominion is taking over the whole cost of the Royal Canadian Air Force squadrons overseas, as well as the pay and allowances of the RCAF personnel serving in the RAF, Sir Kingsley Wood then gave the other side of the picture—the aid given by the United Kingdom. He emphasised, what is often forgotten, that all the supplies received by this country from the United States have not been on Lend-Lease terms. In fact, since the outbreak of war, £1,500 millions has been spent in America by the British Exchequer on supplies, munitions and the provision of capital equipment a sum far greater than the value of Britain's imports in an average pre-war year. Against this, Britain's total commercial exports, by which foreign currency is earned, have fallen to “a small fraction” of the normal figure. All munitions and military supplies and services furnished by Britain to the United Nations are on Lend-Lease terms. The value of the munitions already given to Russia is estimated at £170 millions. Supplies to the American Forces in this country have meant that the total expenditure of the American army authorities over here (except for the pay of the troops) was only £250,000 in the last seven months of last year, which in its turn meant the saving of 1,200,000 tons of shipping. In addition, Britain is shouldering the general cost of the war from Tunisia to Burma, to meet which £400 million to £500 million a year is being borrowed from the countries concerned. Added to this are the net costs of purchases in South America and neutral countries and the chartering of ships from European Allies, which brought Britain's overseas disinvestment in 1942 to £630 million. In the face of these figures only the most wilfully prejudiced would deny that capitalist and imperialist Britain has stripped itself for the fight.

Spring Meeting

Since the turn of the year there have been many signs of uncertainty in the direction of German policy. Propaganda followed confused and contradictory lines. Political and military commentaries were unusually vague. The Axis Conference at Salzburg last week, which was obviously a full dress and lengthy occasion, seems to have put an end to the period of doubt and discussion. The main outline of the year's strategy has been decided. It is the fourth year of an exhausting war. The spectre of 1918 haunts the German mind and the resemblance is sufficiently exact. In 1918, the defeat of the Germans was determined not by lack of weapons and munitions—Ludendorff had enough for further campaigning. It was determined by lack of manpower. To-day the position is much the same. In spite of the losses in the winter battles, in spite of the muddle in economic organisation, German armament production is still sufficient for more large-scale military campaigns. The difficulty is the lack of new recruits. The 1925 class is already at the front and boys between 15 and 17 are used in the anti-aircraft defences at home. Everything is conditioned by this desperate shortage and it looks now as though the Germans have decided on a defensive war and a long delaying action inside the European fortress. As General Dittmar put it in his first commentary after the Axis conference: “In 1918 we were forced to attack for the purpose of forcing a decision, because we could not wait any longer. At present we have the freedom to wait

and it is the Russians who are forced to attack.” The two chief points in this defensive strategy are the “Atlantic Wall” which, it is claimed, now stretches its concrete fortifications from the North Cape to Iberia; and a stabilised front in Russia against which any Russian offensive will spend itself in suicidal destruction. Yet even for this defensive strategy, Germany's resources are stretched very thin. It is more than ever necessary to get the collaboration of the satellites, partly because Germany's power to police disaffected areas is decaying, partly because men are needed not only to work, but even to fight. This need explains the change in German propaganda to Europe. It is not a new line—the Bolshevik menace, the defence of Western Civilisation, are old gambits. But now this tune has drowned all the others, the notes of menace, the promise of economic stability. Now the refrain is the unity of Europe coming together “freely and voluntarily” in a system of “co-operative defence.” It would be unwise to dismiss completely this attempt to refurbish the “new order.” To meet the new turn in enemy strategy, there should be an energetic closing of the ranks and concerting of plans on the side of the United Nations.

The Washington Talks

In his report to the House of Commons on his visit to America, Mr Eden gave a general account of a series of explanatory talks and personal contacts in Washington and New York. The usefulness of such exchanges is obvious, and the proposed visit of Mr Cordell Hull to this country in the course of the summer will carry on the good work. The Washington talks covered immediate military questions—War Cabinet rather than Foreign Office work—the co-ordination of military and political action and some questions of post-war organisation. On the first point Mr Eden naturally had nothing to say; on the second and third he was rather disappointingly vague. It is true that the British and American Governments cannot come to decisions which commit other Governments, but is there not some danger that this may be used as an excuse for them not to make up their own minds—an essential preliminary to fruitful discussion with others? Discussions on the very important question of co-ordinating political and military policy, a vital need on which the early days in North Africa threw a revealing and uncomfortable light, ended, apparently, in complete agreement. But Mr Eden did not say whether this agreement covers the fundamental problem of deciding with whom the reconquer-

ing Allies will deal. Mr Sumner Welles' reply to the criticisms of American foreign policy submitted by the Chairman of American Defence, Harvard Group, goes a little further than Mr Eden's report. The American Government is ready to aid "any group fighting the common enemy" but not so "as to prejudice a people's basic right . . . to choose its own form of government." Yet is this formula strict enough to exclude the time-servers? Or to prevent such blunders as the giving of official backing to Otto of Habsburg? However, it is possible that the agreement reached between the two Governments was more concrete than Mr Eden suggested. The last matter of discussion between the two Governments—post-war arrangements—seems to have led to only alarmingly vague conclusions. Mr Eden mentioned only one point on the post-war agenda—the setting up of an authority backed by force to prevent the repetition of aggression by Germany, Italy and Japan. No one denies the importance of this aim nor the value of securing America's full collaboration in enduring it. It has been a matter of common agreement for over a year. Now the time has surely come to sketch in a fuller picture of the post-war order. British and American collaboration depends, as Mr Eden very justly pointed out, on doing a job of work together, the job of securing international peace. This infinitely complicated process cannot be elaborated speedily at the end of the war. Mr Eden is too modest when he speaks of the "certain preparations" which must be made so that the Allies will not be "completely unready when the time comes." This kind of minimum preparedness is comparable to a belated decision, on the eve of war, to have an army at all. By this time in the last war the Allies at least had the Fourteen Points. It would be folly to go into the next peace even more meagrely equipped.

A First Victory

Common Wealth obtained its first win at the Eddisbury by-election with a majority of 486 over the Liberal National. The new party's task was undoubtedly made easier by a split among the Liberals, some of whom contended that the official candidate was really a Conservative. But it is unlikely that all the votes—2,803—given to the Independent Liberal candidate would, in his absence, have been given to the Liberal National, and Eddisbury remains a Common Wealth triumph, which, coming on top of its near successes in four by-elections in February, is a further signal to the leaders of the big parties that it is a political force to be reckoned with—at least in present conditions. Unhindered by a political truce, a Common Wealth candidate has at present all the advantages of a well-organised party structure behind the electioneering programme of an Independent. Officially the party seeks to co-operate with Labour, and will, for the time being at least, not oppose a Labour candidate. But it can hardly be doubted that it is winning votes from many who, if there had been no party truce, would have voted Labour. How long it will continue to secure this benefit depends on whether the Coalition Government, and with it the party truce, continues throughout the reconstruction period, and on this the only official intimation, given last week by Mr Attlee to the Parliamentary Labour Party, is that neither Labour Ministers nor the Labour Party are committed to a peace-time coalition. With the Conservative Party, Common Wealth's position is more simple. It is a case of straight-forward opposition, which will continue after the war. So far no one has spoken for the Conservative Party as Mr Morrison has spoken for Labour. Its leader has spoken indeed, but as Prime Minister of the party coalition. Its chairman has also spoken, only to repudiate the younger progressives in the party by declaring that Conservatives must not attempt after the war to compete with Socialists in bribing the electors, even at the cost of taking a line unpopular in the country as a whole. If it is this Conservative attitude which is to prevail, Common Wealth's pin-pricks may not heal so quickly.

A House Divided

General Catroux returned from Algiers a week ago bearing with him General Giraud's proposals for the union of all right-thinking Frenchmen. The French National

Committee have in the meanwhile spent their time in almost ceaseless deliberation. Yet the essential points of difference have not been eliminated. It appears that the Fighting French in London are not prepared to support, as the interim and provisional organ of French Government, the "French Council of the Overseas Territories" suggested by General Giraud. Nor are they satisfied by the proposal that the interim Council, presumably in concert with the resurrected departmental *conseils généraux*, would remain the effective executive until the last French department was freed from enemy control. The Fighting French view is that the interim executive, however constructed, must be, in some manner representative of the known attitude of the underground resistance movement in France as well as of that of colonial governors and residents. Here, it appears, is a difference of principle that threatens to wreck the negotiations; though the outsider tends to interpret the difference to some extent in terms of prestige. There is genuine evidence that *Gaullisme* cuts more ice inside France than *Giraudisme*; and consequently that representation of the underground movement on the executive council would strengthen the Fighting French element in the merger. It must be admitted that the unwillingness of General Giraud to include such representation does support this interpretation. General Giraud's plan cannot be dissociated from the fact that he is obviously more acceptable to the inhabitants of North Africa and certain other overseas territories. There is a difference of principle on the score of how soon, and in what circumstances, metropolitan France is to regain influence over and control of its own destinies. This difference of principle is undoubtedly based in part on the varying personal interests of the two generals. Partisanship apart, it should be clear that from the first the executive council must be in touch with and must, in some measure, represent the underground movement. The future of France should not be compromised for a day longer than is necessary by the special political influences emanating from North Africa. Apologists of General Giraud ascribe many of his day to day decisions to his inability to escape from these influences. On the other hand, there can be no Fighting French claim to monopoly in contact with underground France, and the problem of choosing men who can truly represent the wishes of the silent people of France is not an easy one to solve. But it is the wishes of the French people, in and out of metropolitan France, which should decide. It would be a mistake for the American or British Governments by pressure, or for American or British public opinion by partisan advocacy, to prejudice the choice that has to be made.

Industrial Health

The growing interest in the nation's health generally and in workers' health in particular was reflected in a conference on industrial health organised by the Ministry of Labour in London last week-end. It was satisfactory to learn from the Minister of Health that his department is pressing on with its consultations with the medical profession and local authorities about the organisation of a comprehensive national medical service, and to note the emphasis laid by all the speakers on the importance of positive and preventive medicine. A very great deal has been done since the war in developing health and welfare services within the factories, and Mr Bevin is one of the few Ministers who can pride himself on having carried through aims which he dreamed of long before he became a Minister. The conference was primarily useful in focusing attention upon the urgent needs and problems to be faced, and in stimulating further efforts. In spite of what has already been done, there is little room for complacency. The death rate from tuberculosis has risen, dermatitis and other skin diseases are increasing, while absenteeism due to colds and influenza loses millions of man-hours of production each year. Fatal accidents in industry increased from 944 in 1938 to 1,345 in 1942, and non-fatal accidents from about 180,000 to 313,000 during the same period. The number of full-time works doctors—164—seems ridiculously small and 401 overburdened factory inspectors have to carry out the multifarious duties of inspection and enforcement of standards. Above all there is the vexed question of hours. There is abundant evidence to show that overlong hours of labour are taking their toll and reducing efficiency, especially among women and juveniles, and that the lessons of the last war, that excessive hours defeat their own object,

have not yet been fully learned. The recently formed Industrial Health Advisory Committee to the Minister of Labour might well start its career by a vigorous campaign against long hours of labour.

A Disappointing Campaign

The monsoon is again approaching. The campaigning season in Burma is coming to an end and, as an offensive operation, the advance into Arakan has failed. The facts are soon told. In the third week of December last, General Wavell's troops crossed the Burmese frontier and proceeded with little difficulty to occupy the towns of Maungdaw and Buthidaung. The Japanese retreated before them, and such fighting as took place amounted to no more than patrol clashes. There followed a slower and more arduous advance whose objective was generally believed to be the coastal air base of Akyab. By degrees, Allied forces occupied the mountainous jungle of Arakan and the Mayu peninsula as far south as the outskirts of Donbaik and Rathedaung. By the end of February, the advance had virtually petered out, although air attacks on enemy bases inland were maintained. The situation changed again in the middle of March, when the Japanese launched a considerable attack and Allied forces were forced to withdraw from the approaches to Rathedaung. The Japanese advance has not gone uncontested, but for the past month the Allied withdrawal has slowly continued, and the British force is back once more in the neighbourhood of Maungdaw and Buthidaung.

The Japanese claim to have won a major victory is precluded by the limited objective of the Arakan campaign. The coastal strip north of Akyab is separated from the heart of Burma by an impassable mountain range. Rightly or wrongly, the Wavell offensive did not aim at the recapture of Burma; nor has its recapture been prevented by the Japanese counter-offensive. Whether the British manoeuvre was purely defensive, the better to guard the Indian frontier, is less clear. It is more probable that the British force did fail to attain the limited objective of cleaning up the Mayu peninsula and securing the Akyab airfield. In which case, little is to be gained by concealing the fact. After all, the Arakan territory is a military *cul de sac*. Its loss is not catastrophic. No one, least of all the Chinese, can have imagined that an offensive taking north-western Burma as its starting point could free the mouth of the Burma Road.

Short Brothers

Much of the uneasiness caused in business circles by the decision of the Minister of Aircraft Production compulsorily to purchase the shares of Short Brothers under Defence Regulation 78, as a means of changing its board of directors, arose because the reasons for this drastic step were not sufficiently explained at the time. Last week the Prime Minister did much to kill rumours that it was "the thin end of the Socialist wedge," by saying that no measures of nationalisation would be undertaken without the agreement of Parliament and the people. Nevertheless, doubts remained about the need for a complete change of the company's executive, and for the acquisition of its shares without promise of return after the war. At this point the issue became a question, not of principle, but of fact, and only the Government could know all the facts. During a debate in the House of Lords on Tuesday enough was made known to suggest that, far from abusing his powers, Sir Stafford Cripps had done only what was necessary. Speaker after speaker, including the Earl of Listowel, Lord Brabazon (Minister of Aircraft Production after Lord Beaverbrook), and Lord Geddes, approved the Minister's action. Lord Listowel had information that "the state of affairs in this firm had been unsatisfactory for a very long time." Lord Brabazon said that, in spite of the assistance he was giving Short Brothers during his period of office, there was no improvement in production; if the Minister was compelled to take drastic action, "the blame rested entirely on the directors of Short Brothers." Lord Geddes, from personal observation, pointed out that "a tragedy of temperament as much as anything else" made Sir Stafford's action inevitable; at one time Short Brothers were taking

three times as many man-hours as another firm needed to produce a comparable aircraft. His only criticism was that the Government had not acted sooner. Lord Sherwood, on behalf of the Government, suggested that the attitude of the company's board of directors—"interference" in the "higher executive"—compelled the Minister to take up final steps of acquiring its shares. The debate has left the impression of an executive unequal to the task of expansion imposed upon it by the exigencies of the war. The removal of the executive will not necessarily destroy the individuality of the firm. Lord Teviot, who had initiated the debate, agreed at its end that "many of those who were perturbed about the situation will be reassured." On Wednesday, Sir Stafford Cripps informed the House of Commons that the results of a thorough inquiry carried out by Sir George Schuster and Mr Robert Barlow convinced him that action was necessary to safeguard production. If the Government had explained its case earlier, many doubts could have been avoided.

Agricultural Education

The report of the Departmental Committee under Lord Justice Luxmoore, which was appointed "to examine the present system of Agricultural Education . . . and to make recommendations for improving and developing it after the war," recommends an extension of the present system rather than any radical change in it. Agricultural education now exists in three tiers, the University departments at the top and the Farm Institutes, giving short courses of a practical nature, at the bottom, with the Agricultural Colleges midway. But, in addition to this, there is an extensive system of advisory specialists, who help the farmer on his farm to master his problems and improve his technique. These advisors are organised in 13 "provinces," the headquarters of which are located in every case at a university or college, and it is perhaps only for this reason of convenience that the advisory system is counted as part of education. But all these, as the Report very properly emphasises, rest on the basis of general elementary and secondary education, and the first recommendation must necessarily be for an extension and improvement of general schooling in country districts. On agricultural education proper, the Report's recommendations relate more fully to the organisation than to the content. They propose the creation of a National Council for Agricultural Education, responsible to the Minister, but not to the Ministry, of Agriculture. The Council should take over the farm institutes and increase their number, and it would also exercise a considerable degree of control over the colleges and university departments by grants of public money. This organisation would cut across the present powers of the County Councils, and there is a minority report by one of the members on this point. From the point of view of agricultural education by itself there can be little doubt that improvements in effectiveness would follow from a centralised system financed by the Exchequer. But is it right to divorce agricultural education so completely from the educational organisation as a whole? And if it is right for agricultural education, will it not also be right for many other special varieties of technical education? It is difficult to decide between the conflicting arguments, and the best solution would possibly be some form of dual control. Special varieties of technical education might perhaps be organised on a national basis, but made responsible not to the Ministry of Agriculture, the Board of Trade, the Ministry of Fuel and Power, and the other departments interested in their technical aspects, but to the Board of

Education, whose duty it would be to serve as the grand co-ordinator.

The agricultural advisory service, however, is something of a different nature, which must necessarily be organised nationally and under the Ministry of Agriculture. The Committee propose fewer, but larger, provinces, and they add a rather curious recommendation that the advisers should be stationed in university towns, some of them as large as Bristol, Birmingham and Leeds. The whole scheme would, it is estimated, cost a capital sum of £3,500,000, and an annual sum of £2,500,000, compared with the pre-war expenditure of £620,000. There can be no doubt that there is room for a very large improvement in the average standard of technical efficiency of British farmers, and if an extension of agricultural education on these lines would reduce by £2,500,000 a year the amount of subsidies that the state will be called upon to pay, it would be very cheap at the price. But before that can be hoped for, some steps will have to be taken to see that the average farmer benefits from what is offered to him. One of the chief weaknesses of agricultural education at present, at least in its higher branches, is that the farmers take far too little advantage of it. Wartime pressures and experiences may be changing this attitude; but the need for maximum efficiency is now so great that there may well be as good a case for the principles of universality and compulsion in agricultural education in the twentieth century as there was in elementary education in the nineteenth.

Science and the Future

Sir Stafford Cripps' appeal for more and better-trained scientists, and for the increased application of research in industry after the war, will be supported by scientists and industrialists alike. This country has tended to neglect its scientists in the recent past—according to a recent estimate, whereas the Soviet Union budget for science represented 1 per cent of the national income, Britain's is only 0.1 per cent and America's 0.3 per cent. The average Englishman receives little or no scientific education and the bulk of research has been financed by industry itself and carried on independently in industrial laboratories. The war has given a tremendous impetus to scientific research and to its application to practical problems, while a far better degree of co-ordination between the scientists of industry, the universities and the Government has been obtained. Sir Stafford gave an example of a wartime development, the brilliant work on radiolocation performed by wireless scientists, which has saved countless lives. These factors are bound to have permanent effects on post-war structure and organisation, and it is to be hoped that the same ingenuity and inventiveness will be shown in dealing with reconstruction problems as in making the weapons of war. The future commercial and industrial position of this country will depend upon the quality and standard of its products, rather than on their mass production, and if Britain does not maintain a high level of technical skill and adaptability to new methods, it may well be left behind. Scientists themselves have shown their desire to use their talents for the benefit of the nation as a whole and to assist in the full development of productive resources. As Sir Lawrence Bragg said at the recent meeting of the British Association:

Scientists are too often regarded as experts to call in when there are troubles, not as colleagues to call in when making plans.

If science is to play its full part in the future, more funds will have to be devoted to research, to education and to the modernisation of laboratory equipment and apparatus; closer relations will have to be established between the universities and industry and between the various research organisations; and above all, the basis of recruitment and training of scientific workers will have to be broadened and their status, when trained, improved.

Taxing Expenditure

The fact that the Chancellor of the Exchequer has thought fit, for two years in succession, to raise the whole of the additional revenue from indirect taxation may, imaginably, be the explanation of the re-emergence of suggestions for the switching of the emphasis of taxation

away from direct impost and towards taxes on commodities and services. The latest, and perhaps the most extreme exponent of these ideas is Mr Halford Reddish, chairman of Rugby Portland Cement. He would like to see in post-war years

a definite plan to abolish all direct taxes on the income of an individual. Such a system would (he says) give encouragement and incentive to do what is in the interest not only of himself but of the whole State is so essential in the post-war years—work hard and be thrifty. And labour would receive its due reward.

To do Mr Reddish justice, he is quite prepared to subsidise, when necessary, the simple necessities of life. For all else, he envisages a steeply graded series of luxury taxes and, very oddly, he regards this system as superior to direct taxation, because it bears less heavily on earned income. It is the lot of Chancellors to be misunderstood, but seldom can there have been so complete an inversion of anyone's motives as appears here. Sir Kingsley Wood—with complete justification—imposes heavy indirect taxes just because it does restrict demand, for all but the most essential goods and services, at a time when 100 per cent war effort is imperative. Mr Reddish hails it as a heaven-sent solution of our peacetime difficulties of unemployment and lack of demand, which, it seems, he regards as arising from under-saving. It is true that immediately after the war it will be highly desirable to limit expenditure so as to prevent acute competition for goods, most of which will continue in short supply. For this purpose, Mr Reddish's scheme would be a great success, but at the price of restricting luxury expenditure to the rich. Anything more regressive than such a plan it would be hard to imagine. It would mean that all taxation was designed to make the millionaire pay as little for each unit of goods subjected to tax as the family with a few shillings a week to spare after buying whatever might be considered "the simple necessities of life." It would wipe out all the advance in the practice of tax-raising of a century, and impose a tremendous brake on the demand for consumers' goods.

Shorter Notes

The following table gives the number of civilian casualties in air-raids since September, 1939:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940.	1,494	1,980	3,474
Sept.-Dec., 1940.....	22,282	28,522	50,804
Total, 1941.....	20,863	21,839	42,702
Total, 1942.....	3,221	4,149	7,370
1943:—			
January.....	328	507	835
February.....	252	347	599
March.....	293	439	732
Totals to date....	48,733	57,783	106,516

Of those killed in March, 116 were men, 136 were women, and 41 were children under 16. The March figure excludes the casualties in the London shelter disaster on March 3rd, when 33 men, 96 women, and 44 children lost their lives.

The Government has received the report on the London shelter disaster, but on security grounds has decided not to publish the conclusions. In announcing this in the House of Commons, last week, Mr Morrison stated that culpable negligence could not "properly" be included among the causes of the disaster. He added that rumours that it was caused by a Jewish panic, or induced by Fascists or criminals, were dismissed in the report as without foundation.

An Interdepartmental Committee on dentistry has been set up, under the chairmanship of Lord Terviot, to report on the progressive stages by which, having regard to the number of practising dentists, an adequate dental service can be made available to the whole population. Another of its terms of reference will be measures to be taken to secure an adequate number of entrants to the dental profession.

AMERICAN SURVEY

Hard Coal Smoke

(From Our Washington Correspondent)

THE current negotiations for a renewal of the anthracite contract that expires on April 30th between the mine operators and the United Mine Workers involve matters as various as Pennsylvania's political stand in the 1944 election, the balance of trade union leadership in the country, and the treatment of an important type of manpower problem.

Some time back, Mr John L. Lewis announced that he would fight for "substantial" wage increases; on March 6th the Tri-District convention at Scranton, representing 80,000 Pennsylvania hard coal miners, voted all but unanimously to present a list of demands, of which a \$2 a day raise over the present \$5.08 basic wage is the chief, but which also includes time-and-a-half for overtime over 35 hours, a one-year agreement instead of two, cancellable on 30 days' notice by either party, and the organisation of minor supervisory employees and foremen.

How does the situation look from a \$25-a-month shack in the neighbourhood of Wilkes-Barre? The hard coal industry has been on the down grade ever since the other war; 1917's peak production of 100 million tons shrank to 48 million in 1938 and rose only to 51 million in 1940 and about 56½ million in 1942. Oil burners effected the greater part of this shift; the pipe lines now under construction to the east coast promise more accessible supplies for them in the future than in the past. The companies have made little concerted effort to stay in the game as industrial patterns shift; the anthracite pay-roll dropped from \$230 million in 1917 to \$45 million in 1940. The resulting economic pressure on miners' families can be measured by the fact that during the decade 1933-42 \$169,238,000 was spent for WPA in the five anthracite counties and \$142,434,000 for other types of public assistance; in December 1941, 10.7 per cent of the population there was on relief as contrasted with 5.8 per cent elsewhere in Pennsylvania. The long-run view has for some years counselled the young people of the mine villages to get out whenever the going is good.

They have been getting out lately—one estimate puts the weekly exodus from Wyoming County at 1,000 men. The population is a mixture of Welsh-Scotch-Irish-Irish and Central European, with a Catholic tradition of large families. But the typical miner to-day is middle-aged or over. The youngsters are in the army or in war plants, not in the mines. (This fact may make the 48-hour week a paper plan as far as increasing production is concerned; what proportion of miners is physically fit to work it?) The earnings at the war plants bring home a striking contrast: in November, 1942, average weekly earnings in anthracite were

\$35.05; in aircraft \$46.44; in shipbuilding \$60.75. Some of the miners who have gone into a tank plant just down the line are making close to the shipbuilding average. So what's wrong with a \$2 a day increase if the country really needs coal as well as tanks to win the war?

It is on this economic pressure that Mr Lewis is counting. The union has been a central institution to the men in the mines. The Lewis machine has carefully absorbed local leadership wherever it has shown itself, and, on the evidence, it is entirely probable that the union members will stand firm behind the convention demands in the coming negotiations, even to the point of going out on strike if called. A strike call, if it takes place, will, however, set loyalty against loyalty. By and large, the miners politically are vigorously pro-Roosevelt. Mr Lewis's last-minute deal with Mr Willkie in 1940 was unpopular and is unforgotten. Patriotic fervour has given the Wilkes-Barre area an enlistment rate that is even within shooting distance of Texas. The miners are for the war effort. But suppose the President tells them that the war effort requires continued coal production at present rates? Mr Lewis's position as their economic champion might diminish Mr Roosevelt's political championship enough to make Mr Lewis really able to deliver the miners' vote in 1944.

Mr Lewis occupies the position of an outsider not only in respect to his political feud with the President; it also affects the trade union leaders who are taking a responsible part in war administration, and various parts of the machinery that they are attempting to operate.

The proposed \$2 a day wage increase exceeds the amount that might be provided under the "Little Steel formula." The War Labour Board, whose tripartite participating panel—industry-labour-public—includes AFL and CIO leaders, has just reaffirmed this formula by a seven-to-five decision in the Boeing aircraft case. In the Boeing case, the labour members, plus one of the representatives of the public, dissented from the decision; their grounds were that the increases proposed by the Board's investigator would not have been inflationary, and (more stressed) that the decision of the majority had been influenced by conversations with Mr Byrnes, the Director of Economic Stabilisation, which destroyed the War Labour Board's status as an independent tribunal.

Under such pressures, how long will the present wage formula stand? Moreover, manpower shortages are currently obvious, not at the end of the production line but at its beginning. For the occupations which depend on

low-paid male labour there are no replacements in sight; the young people are going into the army or on to the production line; women cannot be used; the men who are left at work are getting older. Farming, lumbering and mining are top operations in this category. Will special arrangements not have to be made to keep workers in these vital trades on the job?

Senatorial Initiative

[FROM OUR WASHINGTON CORRESPONDENT]

March 29th.

THE resolution introduced into the Senate on March 16th by Senators Ball-Hill-Burton-Hatch is a new development in the US foreign policymaking process.

The content of the resolution is in itself interesting. It provides:

Resolved, That the Senate advises that the United States take the initiative in calling meetings of representatives of the United Nations for the purpose of forming an organisation of the United Nations with specific and limited authority—

(1) To assist in co-ordinating and fully utilising the military and economic resources of all member nations in the prosecution of the war against the Axis.

(2) To establish temporary administrations for Axis-controlled areas of the world as these are occupied by United Nations forces, until such time as permanent governments can be established.

(3) To administer relief and assistance in economic rehabilitation in territories of member nations needing such aid and in Axis territory occupied by United Nations forces.

(4) To establish procedures and machinery for peaceful settlement of disputes and disagreements between nations.

(5) To provide for the assembly and maintenance of a United Nations military force and to suppress by immediate use of such force any future attempt at military aggression by any nation.

That the Senate further advises that any establishment of such United Nations organisation provide machinery for its modification, for the delegation of additional specific and limited functions to such organisation, and for admission of other nations to membership, and that member nations should commit themselves to seek no territorial aggrandisement.

The resolution, however, is important irrespective of its content. It is a first attempt to formulate a bipartisan American foreign policy. Senator Ball, who introduced it, is a Republican from Minnesota; Senator Hill is a Democrat from Alabama; Senator Burton a Republican from Ohio; and Senator Hatch a Democrat from New Mexico. It is presented, therefore, by men from both sides of the political fence, and by men representing states in the Middle West, the South and the South West remote from either seaboard.

From the early days of the country, foreign policy has been as much a subject of party politics as any other item of national agenda—indeed, there was a period when about the only way to tell the aims of the Democratic and Republican parties apart was to note their difference of views on the tariff. Those were the days—and they lasted until yesterday afternoon—when the United States still maintained an amateur status in the field of world policy, when the luxury of a here-today-and-gone-tomorrow fluctuation of purpose with the ins-and-outs of the two party system was still feasible because of geographic remoteness. The four-Senator resolution is the first formal attempt to translate the sound of airplane engines into political procedure; to put the United States into the class of professionals who make foreign policy as part of their regular business.

That is a crucial difference in status. The amateur mood of the past is the mood in which Americans counselled each other to stay away from green tables lest professionals operating there take their shirts; it is a mood of benevolent remoteness, of absence of vital interest in the outcome, of charity without responsibility. The professional mood is a mood in which marbles are played for keeps; it is a mood of less charity and more consistency.

One previous event has foreshadowed this kind of American procedure. The destroyer-bases arrangement of the summer of 1940 was undertaken at the height of a Presidential campaign; by all the rules of American politics it was incredible that such a move should be undertaken, that the making of a partisan issue should be invited so soon before a vote. But because both candidates felt that it was vitally necessary to the country's safety, the arrangement was effected by the President and endorsed by his opponent.

The "B.H." resolution is therefore an important straw in the wind, indicating the country's feeling that foreign policy of the future must be far more broadly based than in

COMMUNICATIONS

THE ELECTRIC TELEGRAPH

IN 1839 Paddington was a fashionable resort. The new electric telegraph was one of the sights of London, and the Duke of Wellington was among the visitors to Paddington Station. Posters "respectfully informed" the public that they might view "this most interesting and extraordinary apparatus" for a charge of one shilling.

A Famous Arrest

The new telegraph soon achieved fame in connection with the detection of a murderer. That famous telegraphic message describing the murderer's appearance as "a man in the garb of a *kwaker*" (so spelt because there was no Q in the telegraphic code) gave the clue that brought the criminal to justice.

Progress of Science

To-day messages of every kind flash over our telegraph wires. But progress has brought us greater wonders in the submarine cable and wireless. In their development of a vast overseas service, Cable and Wireless Ltd. have played a prominent part in the history of modern communications. Swift and inexpensive messages, 'via Imperial,' are exchanged between the farthest corners of the world. The strain of wartime traffic is very great. It is not always possible to give the same service as in peacetime, but the Company and its staff are doing all that circumstances permit.

CABLE AND WIRELESS LTD.

The only British owned and operated Overseas Telegraph Company in this country

the past. The resolution is also of interest as an exercise of Senatorial initiative. In this respect it has company. Some half-dozen resolutions have already been introduced into the Senate—by individual Senators from both parties—with the general purpose of insuring an effective system of collective security. Senator Gillette, of Iowa, has proposed turning the Atlantic Charter into a series of binding treaties. Senator Thomas, of Utah, has called for a United Nations conference to set up a comprehensive programme of international economic co-operation. Senator Wiley, of Wisconsin, has urged the formation, by the President and the Senate, of a Foreign Relations Advisory Council to include, in addition to a technical staff, the Secretary and Under-Secretary of State and the chairmen and leading minority members of the Senate and House Committees dealing with foreign affairs, and other Senators designated by the President. Senator George, of Georgia, recently proposed the establishment of a sub-committee of the Committee on Foreign Relations; this was established under his chairmanship on March 23rd as the Senate Committee on Post-war Economic Policy and Planning. All of these moves have importance as a rehabilitation of the Congressional arm of government, whose rôle for the last decade has been either a passive recipient of Administration measures or an active critic of the way they were executed, with, latterly, a growing tendency to say "must not" to "must" legislation. This particular group of resolutions, moreover, has specific importance in relation to policy for the peace because of the historical precedent of what the Senate did last time. If, this time, the proposal the President sends to the Senate has been negotiated under a general instruction from that body, a good many of the psychological handicaps of the American constitutional system have been removed.

Or, at any rate, they would have been transferred to an agency that cannot rest on a veto. In this connection, the development of the Executive attitude with regard to the B.H. resolution has been interesting to watch. The resolution originated in February, in the course of some conversations between Senators Ball and Hill. Early in March, it was shown to Under Secretary of State Welles; on March 14th the four sponsors discussed it at the White House with the President and Senators Connally (chairman of the Foreign Relations Committee) and Wagner. Two days later, the President's attitude was thought to be cool, and Senator Connally said that while he favoured the establishment by the United Nations of an international agency

to preserve peace, there were several resolutions that had this in view, and as to Senate Resolution 114, "neither the White House nor the State Department has indicated to me approval of the resolution in its present form." On March 19th, however, the President gave his press conference to understand that, on the contrary, he endorsed the broad principles of the measure; on March 22nd Secretary Hull said that a Senate declaration for a post-war collective security system would be helpful at home and abroad.

Most interesting of the endorsements, as further evidence of the tendency to broaden the base of legislative commitment to whatever policy is adopted for the peace, was the round robin supporting the Ball-Hill-Burton-Hatch resolution signed by 26 of the 55 Republican freshmen in the House of Representatives. It read in part: "There are some people who contend that these things should not be discussed or agreed upon until the war is won. We disagree. The American people are looking to their leaders in Congress of whatever party to exercise real statesmanship so that there may be no repetition of the present tragedy. Our nation alone cannot police the world. Our nation alone cannot prevent wars. The world can progress toward permanent stabilisation of peace only through the collaboration of its component peoples. To deny this is playing false with the thousands who are risking or losing their lives not alone to defend the nation, but to save the future from the same fate."

But from the chairman of that same committee, Congressman Bloom, of New York, came a different type of comment. Mr Bloom said that the resolution is "an example of the disjointed and scattered thinking that is going on both without and within Congress." At the same time, however, he subscribed to the broadening of the base of future foreign commitments by urging that the House take part in any legislative measures regarding post-war policy—such proposals to be jointly studied and framed as a concurrent resolution of both Houses.

The next stage of the Ball-Hill-Burton-Hatch resolution is submission to a sub-committee created on March 25th by Chairman Connally, and headed by him, to study all resolutions concerning the United Nations. Its members, besides himself, are: Senators Barkley, George, Gillette, LaFollette (who has called the B.H. proposal "an extreme manifestation of futility"), Thomas, of Utah (who has given public support to the measure), Vandenberg and White. Meanwhile, the country will also consider it.

THE WORLD OVERSEAS

Canadian Propaganda Policy

(From Our Ottawa Correspondent)

IN the war for men's minds, Canada has lagged behind. From recurring controversy over public information policy, one may judge that Canadians have become keenly aware of this defect in general war policy. Should not Canada's part in the war be better known? This question arises from time to time, in the press and in Parliament. Canadian opinion has become sensitive to misinformed or ignorant comment concerning Canada, and tends to regard it as malicious. When an American isolationist of pre-Pearl Harbour vintage remarked that Canada was exacting cash on the barrelhead for everything it was doing to help the cause of freedom, he provoked the first crisis in Canadian information policy.

Since the day in 1939 when the Bureau of Public Information was created as a war agency, information policy has undergone many changes. First under Mr Walter Thompson, veteran publicity director of Canadian National Railways, then under his assistant, Mr Herbert Lash, the Bureau was mainly a fact-issuing agency. There was sharp criticism of the volume and, in some instances, of the content of the hand-out material. Last year, Mr Charles Vining, chairman of the Canadian Newsprint Bureau, conducted a survey of information problems in Canada and the United States, and as a result the Wartime Information Board, with Mr Vining as chairman, was organised to replace the old Bureau. Now Mr John Grierson, com-

missioner of the National Film Board, has replaced Mr Vining. Throughout these changes, there has been no accepted propaganda policy, no prevailing concept of its function.

War information in Canada, in its initial phases, was merely a matter of issuing publicity releases, in the undistinguished manner followed in peacetime by most departments of government. Anything else would have been regarded with suspicion. Anything else would have been propaganda which, as everyone knew, was a bad thing.

In 1941, the Department of External Affairs appointed a press attaché to its Washington legation. In 1942, Canadian information centres were opened in Washington and New York. A similar centre was to be opened in London. The function of supplying facts and figures to fill an existing demand for information concerning Canada was accepted as a legitimate enterprise where the manufacture of synthetic propaganda would have been objectionable, both to Canadians and Americans. Canadians visiting the United States brought back conflicting reports regarding the success of British information activities in that country. Australia seemed to enjoy as good a press in the United States as any country, a fact related to the presence of American forces in the South-West Pacific.

The question of publicity in the United States over-

shadowed other considerations in the controversy on information policy. It is now apparent that the controversy was indecisive, and some of the reasons why it should be so are also apparent. The voice of Canada was muffled and uncertain abroad, because it was muffled and uncertain at home. "Each outburst of unjustified criticism," said Philippe Picard, M.P., "of the quality and extent of our participation is meat for the United States isolationists and their propagandists, and it works ultimately against the interests of the British cause."

Canada's New Status

But no one was ready to propose that freedom of criticism should be restricted, except where precise military considerations existed. There was no clear frame for Canadian thinking about Canada, and therefore no clear frame in which to present an exterior view of Canada. The old view was no longer valid. The slow change of twenty-five years had transformed this Dominion, but it was largely unnoticed abroad and often ignored at home. Instead of playing a rôle as adjunct to British policy and as supplier of a few divisions to the British Army, Canada came into a distinctive rôle of its own in this war, of which the visible symbols are a separate military alliance with the United States, an independent war economy immeasurably more productive than even Canadians suspected, and substantial land, sea and air forces which are steadily achieving independence in operational status. Canada has separate membership on nine international boards created in this war.

With this growth has come a surge of Canadian nationalism. It is something new to visitors from Britain. It is deplored by resident imperialists. It is a shock to visiting Americans. But it is inevitable. It countervails imperialism within the British Commonwealth, and it is one of the most substantial checks against American imperialism. It is a new international factor still largely unrecognised on a strange world landscape in which so many factors are new.

This is the new framework of Canadian thought, the basis of Canadian propaganda. Canada is an example of a free democracy with the British Commonwealth. It offers a propagandist example of free and full mobilisation, of full conversion from peace to war, of full response to the cause of freedom in a hemisphere distant from battlefronts and traditionally isolationist. A new positive pattern of thought has been crystallising in Canada, in a great flux that gave a surface reflexion of confusion and uncertainty.

One man who had realised that here was a new frame for positive information, or propaganda policy, was John Grierson. His career in making documentary films in Canada since he left England in 1938 has been, in the words of Hollywood, colossal. The National Film Board produced 200 films last year, all of them short, many of them specialised for armed forces or war plants. But it has 65 travelling theatres showing free films. It distributes through 30 central film libraries. Its series "Canada Carries On" plays in 700 Canadian theatres each month. Its series "World in Action" goes to 4,000 US cinemas. Its "Front in Action" films are shown in the United Kingdom, Australia, South Africa, New Zealand and South America. Its sound tracks carry seven languages besides English. Grierson's films represent a positive pattern of thought and feeling about Canada, and Canada's rôle in the world, that is new. They attempt to create the kind of atmosphere in which men and women will recognise their relation with the vast drama of affairs, and in recognising it put forth their best efforts, not by legalistic compulsion, but by knowledge of what is at stake in the present conflict and in the future. This is Grierson's philosophy of propaganda. It is the missing clue to a positive information policy which has hitherto been lacking.

Financial Occupation of Holland

[BY A CORRESPONDENT]

Cut off from its overseas resources, Holland was reduced to the level of Germany's war economy, and, since the beginning of 1942, the deterioration has been more marked than in Germany. At the beginning of the occupation, the German commissars were faced with a dilemma. After

they had taken stock of Holland's raw materials and industrial capacity, they declared a price stop, fixing the prices at the level of May 9, 1940, as the maximum. But effective economic incorporation made it necessary to increase Dutch prices to the level that obtained in Germany. Gradually, all prices were increased, and it may be estimated from very incomplete data that the main agricultural products, such as butter and eggs, had to be increased to roughly 80 per cent to reach the German level. In January, 1941, a price commissar was appointed, and the five price inspectors working under him were enabled to inflict fines or close down businesses if the price regulations were violated. Retail prices can be controlled comparatively easily if there is no breakdown in civil administration. The chief difficulty is price costing in industry, particularly if there is a change in materials and methods of manufacture. The price stop is a very unsatisfactory basis, and consequently the powers of the new price commissar were extended in October, 1942. All matters relating to prices, which had been dealt with by the different Ministries, have now been entrusted to the price commissar, and the general procedure is to fix arbitrarily the prices of manufactured goods according to the cost of production of the more efficient firms.

New Taxes

The alignment of Dutch and German economic conditions demanded a drastic change in taxation methods and finance. Step by step, the German financial system has been introduced. At first, a general increase in taxation was attempted, which was not very successful. Immediate results were necessary and, in quick succession, the wages tax, the corporation and property tax and the turnover tax were either introduced or modified after the German model. It is of interest that the reorganised turnover tax amounts to 2½ per cent, against only 2 per cent in Germany. The corporation and excess profits taxes are slightly smaller. But the combined effect of the corporation tax and the property tax makes it impossible for most of the companies to maintain their profits, and there are now hardly any companies which could pay dividends exceeding the stop fixed at 6 per cent. The financial result of the new taxes is impressive. Total revenue increased from Fl 925 millions in 1940 to Fl 1,219 in 1941 and Fl 1,450 in 1942.

As in Germany, the share market presented the most troublesome problem for the new economic administration. The changes in share quotations on the Amsterdam bourse were extraordinary. The share market was the only outlet for idle capital, and the fortunes of war, especially in the Far East, were the basis of many speculative movements. After the reopening of the bourse, there was a tremendous rise in German shares, but the announcement that all dealings in blocked Reichsmark investments, and the transfer of such capital through the clearing from Germany, would be subject to taxation brought all transactions in German securities to a standstill. Later in 1941, interest was concentrated on the shares of firms which were working on German orders. After the abolition of the exchange frontier and of the special tax on blocked Reichsmark accounts in the autumn of 1941, there was speculation in East Indian and American shares. This was countered by the announcement that East Indian shares could no longer be used as security for loans. But neither the dividend stop nor the introduction of all the methods used in Germany to curb speculation could retard the upward trend in share quotations. Finally, the registration of shares was decreed, and the most recent measure is the introduction of a quotation stop, which has restricted dealings to a minimum. Quotations must not exceed the share prices obtained on November 9, 1942.

The large German clearing debt, a reconstruction fund and, finally, a state fund used as a basis for financial assistance to closed-down firms, all required unprecedented public borrowing. Investment-seeking capital had therefore to be diverted to state loans and Treasury bills. This was not difficult, and the total debt increased from Fl 4,219 million at the end of 1939 to Fl 8,352 million at the end of 1942. The interest rate was successively reduced to the German standard, amounting to 3½ per cent. Three items in the reports of the central bank are of particular interest:

(In million Fl.)

	1940	End of 1941	1942
Dutch bills	253	3.1	159
Foreign bills	15	930	1,615
Notes in circulation	1,552	2,116	2,912

The increase in foreign bills shows that the German clearing debt has been taken over by the central bank. In this way Holland pays the costs of occupation.

It is hardly surprising that conditions in Holland led to the hoarding of banknotes. On April 1st this year, banknotes of Fl 500 and Fl 1,000 ceased to be legal tender. Holders can offer these notes to the Treasury as advance payment for taxes, a move which is designed to stop hoarding as well as tax evasion. Wage and salary earners, as well as small business men, did not respond to the appeal to deposit their money in savings banks. Total deposits in two-thirds of the savings banks which published regular statistics decreased from Fl 1,185 millions at the end of 1939 to Fl 915 millions at the end of 1941. During 1942, however, deposits exceeded withdrawals, and total deposits stood at Fl 1,007 millions at the end of the year. The increasing concentration of industries and the diminishing supplies on the black market are probably the reasons for this increase. During the decline in small savings, there was a considerable increase in new insurance policies from Fl 348 millions in 1940 to Fl 628 millions in 1941 and Fl 945 millions in 1942. The annual reports of the banks reflect these financial movements; during 1942, the greater strain on finances is shown by the fact that advances as well as deposits decreased. As a virtual province of Germany Holland has been ravaged beyond recognition, and the very doubtful participation in the promised exploitation of Russian provinces by the East Company must be a poor compensation even for ardent Dutch Nazis.

Rationing in Portugal?

[FROM OUR LISBON CORRESPONDENT]

March 27th

MAIN necessities may be rationed here, after an elaborate investigation by a consumers' enquiry board has been completed. This will take time. "A few weeks" is the official estimate, and a speaker in the National Assembly hoped that the weeks would not be long and that in the interval

distribution would not be criminally altered. Had the question of rationing been taken in hand a year ago, concluded the speaker, there would not have been the pitiful sight of queues of poor people waiting for hours on end.

Charcoal, soap and oil are the main items affected. In Lisbon people slept outside the oil shops to be on time for their purchase of 200 c.c. next morning. Oil is the most important item, providing as it does both food and light for the working classes, whose illuminant was mostly paraffin when that was obtainable. Rationing is welcomed, but promptitude in its application is of first importance, since it is a general and well-founded belief that present difficulties are due, not to shortage of stocks, but to hoarding at source, coupled to a small extent with transport difficulties. What makes popular opinion even more bitter is the knowledge that the scarcity and rising prices cannot be laid to foreign account, but could be cured by drastic official action, directed towards the instant control of stocks, which large holders find ways of selling at figures out of all relation to production costs.

Foreign Companies

The new measure calling for the nationalisation of certain types of foreign limited companies now carrying on business here has not been published for the second time in the official gazette; as a result, it has not yet the force of law. These are those who believe the publication may well be indefinitely delayed. Meanwhile, the National Assembly is discussing another measure of importance to the business world. It proposes that companies, other than those engaged in banking and insurance, both of which are already liable to official inspection, should be given state-appointed representatives, to ensure that their operations are conducted in such a way as may best contribute to the common good. It is not designed to use the proposed measure as a weapon of offence against commercial undertakings in general. Commercial opinion is not, however, entirely satisfied with this statement. For, however sound may be the basic intention, actual practice in other connections has shown a tendency to widen bureaucratic interference with everyday trade.

WHITE PAPER STATISTICS

The first pair of tables below present the salient figures of the Budget estimates of revenue and expenditure for the current financial year. They have been compiled from the "Financial Statement (1943-44)" (4d. net). The remaining tables include virtually all those contained in "An Analysis of the Sources of War Finance and an Estimate of the National Income and Expenditure in 1938, 1940, 1941 and 1942" (Cmd. 6438, 6d. net), though in some cases with a measure of compression. The text of the comment upon the tables, though derived from the White Paper, is by The Economist, except where placed in quotation marks.

The Budget

[REVENUE (£000)]				
	Budget Estimate 1942-43	Actual Receipts 1942-43	Estimate for 1943-44	
			On Basis of Existing Taxation	After Proposed Tax Changes
Inland Revenue:				
Income tax	913,000	1,006,828	1,175,000	1,175,000
Surtax	78,000	75,358	80,000	80,000
Estate duties	90,000	93,336	100,000	100,000
Stamps	15,000	15,280	17,000	17,000
Nat. Defence contribution	425,000	30,635	500,000	500,000
Excess profits tax		346,887		
Other inland revenue	1,000	950	1,000	1,000
	1,522,000	1,569,274	1,873,000	1,873,000
Customs and Excise:				
Customs	438,295	459,489	464,500	525,320
Excise	366,705	425,300	408,500	450,180
	805,000	884,789	873,000	975,500
Motor vehicle duties	34,000	28,537	25,000	25,000
Total Tax Receipts	2,361,000	2,482,600	2,771,000	2,873,500
Canadian Govt. contribution	225,000	224,719	400	400
Post Office net receipt	10,000	12,377	400	400
Wireless licences	4,300	4,560	4,700	4,700
Crown lands	800	1,000	800	800
Sundry loans	5,000	4,062	4,100	4,100
Miscellaneous	21,000	90,533	24,000	24,000
Total Ordinary Revenue	2,627,100	2,819,881	2,805,000	2,907,500

EXPENDITURE (£000)			
	Budget Estimate 1942-43*	Exchequer Issues 1942-43	Estimate 1943-44
Consolidated Fund Services:			
Interest and Management of National Debt	325,000	310,801	375,000
Payments to Northern Ireland	9,500	9,198	9,500
Other Consolidated Fund Services	7,800	7,389	7,500
Total	342,300	327,388	392,000
Supply Services (excluding Post Office):			
Defence Token Votes	4	4	4
Civil Votes	446,682	437,658	444,652
Revenue Departments	18,519	18,118	19,458
Votes of Credit	4,900,000	4,840,000	4,900,000
Total Supply Services	5,365,205	5,295,780	5,364,114
Total Ordinary Expenditure	5,707,505	5,623,168	5,756,114
Sinking Funds	...	14,199†	...
	5,707,505	5,637,367	5,756,114
Self-Balancing Revenue and Expenditure:			
Post Office	102,523	102,523	110,632

* Including Supplementaries.

† In addition, sinking fund payments amounting to £172,000 were made outside the Permanent Debt Charge.

In comparing the estimates for 1943-44 with those for the previous year, two changes in practice should be noticed. (1) The Canadian Government Contribution disappears from the accounts, as Canadian supplies are now to be provided on terms similar to Lend-Lease, without financial compensation. This change affects both

revenue and expenditure. (2) In order to save manpower, the Post Office is no longer to make any charge to Government Departments for inland telephone and telegraph services. This is estimated to reduce Post Office revenue by about £17 millions.

War Finance

A.—The Sources of War Finance

	(£ millions)		
	1940	1941	1942
Central government expenditure.....	3,339	4,616	5,103
Less Overseas disinvestment	756	797	632
Expenditure requiring domestic finance.....	2,583	3,819	4,471
Less Central government revenue	1,259	1,828	2,343
	1,324	1,991	2,128
Less Extra-budgetary funds and local authority surpluses	186	220	231
	1,138	1,771	1,897
Less Compensation received in respect of war risks and war damage claims	36	248	215
	1,102	1,523	1,682
Less Savings and undistributed profits, including reserves against taxation	1,080	1,323	1,509
Residue	22	200	173

The residue shown in this table is the amount of net domestic disinvestment, as shown in the National Income tables below. It is made up of (a) sales to public authorities of fixed capital assets previously owned privately; (b) sinking funds and depreciation funds of firms and institutions; (c) depletion of stocks and working capital; less (d) new investment out of private funds; (e) replacements and renewals charged on depreciation funds; and (f) replacements of war losses actually carried out.

The above figures incorporate important revisions from those in last year's White Paper. The figures for "savings and undistributed profits" have been put up from £823 millions to £1,080 millions in 1940, and from £1,028 millions to £1,323 millions in 1941. The effect is to reduce the "Residue" from £286 and £493 millions respectively to £22 and £200 millions. These changes, it is stated, arise from "more accurate estimates of certain items as a result of additional information that has become available since last year."

B.—Personal Expenditure at Constant Prices

	(£ millions)			
	1938	1940	1941	1942
(1) Food.....	1,198	1,235	1,260	1,320
(2) Drink and tobacco.....	452	617	750	912
(3) Rent, rates and water charges	500	524	521	520
(4) Fuel and light.....	194	210	233	242
(5) Other household goods	261	251	241	241
(6) Clothing.....	441	496	450	462
(7) Travel, including privately-owned vehicles and their running expenses	296	185	202	215
(8) Other services.....	468	461	469	465
(9) Other goods including the income issued in kind to H.M. Forces and Auxiliary Services	225	303	383	423
(10) Personal expenditure on consumption at market prices	4,035	4,282	4,509	4,800

This table is entirely new and the result of a comprehensive enquiry. It should be noted that it covers only personal expenditure on consumption; money spent on

consumers' goods and services by businesses and public authorities is excluded. The figures for 1938 are not widely different from private estimates made before the war. The changes between 1938 and 1942 show a number of divergent trends—such as the great rise in drink and tobacco and the fall in "other household goods" (the category perhaps most affected by raw material shortages). It is to be hoped that in future years it will be possible to subdivide the item of "other services."

C.—Consumption Expenditure at Constant Prices

	(£ millions)			
	1938	1940	1941	1942
Personal expenditure on consumption at market prices	4,035	4,282	4,509	4,800
Plus Subsidies.....	15	70	142	150
	4,050	4,352	4,651	4,950
Less Indirect taxes specifically on consumption	431	—578	—770	—931
Personal consumption thus adjusted.....	3,619	3,774	3,881	4,019

The above figures are merely variants of those in the previous table. Estimates have also been made of the average change in prices of the bulk of the goods involved—i.e. of all those except the income issued in kind to the Services. The method of calculation was "by taking the average of the change between 1938 and 1942 in the cost at market prices of buying the collections of goods and services bought in 1938 and 1942 respectively." The results are as follows:—

	1938	1940	1941	1942
Proportionate change in—				
(1) Personal expenditure on consumption at market prices, including indirect taxes and excluding subsidies	1.00	1.06	1.11	1.19
(2) Personal expenditure on consumption, excluding specific indirect taxes and increased by subsidies	1.00	1.04	1.07	1.11
(3) Personal expenditure on consumption in terms of constant prices	1.00	0.88	0.82	0.82
(4) Retail prices, excluding specific indirect taxes and increased by subsidies	1.00	1.18	1.30	1.36

These figures are subject to qualifications which are set out in detail in the White Paper. In particular, it should be noted that "retail prices" are usually defined as including specific indirect taxes and excluding subsidies. On this definition, the price rise would be line (1) divided by line (3), giving figures of 1.00, 1.20, 1.35 and 1.45 respectively. Neither set of figures, of course, must be confused with indices of "the cost of living" with the specialised meaning that has become customary.

D.—Private Savings

	(£ millions)			
	1938	1940	1941	1942
Personal Savings—				
Gross personal savings, inc. allowance for accrued taxation.....	241	807	1,004	1,271
Less Death duties, etc.	—90	—85	—94	—100
Net personal savings	151	722	910	1,171
Less increase in allowance to meet accrued taxation....	—17	—94	—206	—280
Net personal savings after allowance for accrued taxation.....	134	628	704	891
Impersonal Savings—				
Gross impersonal savings, including allowance for accrued taxation	182	358	413	338
Less increase in allowance to meet accrued taxation....	—12	—183	—233	—148
Net impersonal savings, after allowance for accrued taxation.....	170	175	180	190
Net Private Savings (Personal and Impersonal)—				
Aggregate net private savings after allowance for accrued taxation.....	304	803	884	1,081

The most interesting points in this table are (a) the great increase in aggregate savings—more than threefold; and (b) the stability of impersonal savings after allowance is made for taxation. Reference to Table II below shows that this is entirely due to the weight of EPT and other taxation. The totals show considerable increases over the previous estimates, owing to fuller information.

E.—Proportion of Private Income (Personal and Impersonal) Devoted to Taxation

	(£ millions)			
	1938	1940	1941	1942
(1) Private income	4,920	6,156	7,063	7,836
(2) Direct taxes, social insurance contributions of employees, War Damage Act contributions and premiums, etc., met out of private income	552	794	1,231	1,527
(3) Indirect taxes and rates specifically on consumption less subsidies	416	508	628	781
(4) Other indirect taxes, etc., met out of private income....	170	200	240	220
(5) Excess of tax liabilities over payments.....	29	277	439	428
(6) Total tax liabilities in respect of private income, i.e., (2) + (3) + (4) + (5).....	1,167	1,779	2,538	2,956
		(percentages)		
(7) Line (6) as a percentage of line (1)	24	29	36	38

The method followed in this table is somewhat different from that of the corresponding table of last year's White Paper, which compared the total of taxation with the whole National Income. This, however, involves some distortion, since a certain proportion of the sums raised by taxation is, in effect, met out of the expenditure of public authorities. The above method is, therefore, more correct, though it results in somewhat lower percentages (e.g., last year's percentage for 1941 was 40.)

National Income

I.—NET NATIONAL INCOME AND EXPENDITURE (£ millions)

	1938	1940	1941	1942		1938	1940	1941	1942
1. Rent of land and buildings	381	389	385	384	6. Personal expenditure on consumption at market prices	4,035	4,282	4,509	4,800
2. Profits and interest.....	1,241	1,624	1,926	2,183	7. Expenditure at home and abroad, by public authorities, on goods and services at market prices	845	3,059	4,194	4,608
3. Salaries, and the pay and allowances (in cash and kind) of officers in H.M. Forces and Auxiliary Services	1,081	1,288	1,338	1,408	8. Private net investment at home and war losses made good	287	(—22)	(—200)	(—173)
4. Wages, and the pay and allowances (in cash and kind) of other ranks in H.M. Forces and Auxiliary Services.....	1,787	2,425	2,970	3,409	9. Private and government net investment abroad.....	—55	—756	—797	—632
5. Net national income	4,490	5,726	6,619	7,384	10. Subsidies.....	15	70	142	150
					Less				
					11. Indirect taxes and rates specifically on consumption.....	—431	—578	—770	—931
					12. Other indirect taxes, rates, etc.....	—206	—205	—220	—239
					13. War risks insurance premiums	—	—124	—239	—199
					14. Net national expenditure	4,490	5,726	6,619	7,384

The figures for previous years have been revised. In last year's White Paper net national income was given as £4,595 million in 1938, £5,585 million in 1940, and £6,338 million in 1941. The increases in the war years are due to upward revisions of the estimates both of personal expenditure on consumption and of personal savings. This has the effect (though it does not show in the above table) of reducing the figure for domestic disinvestment, which is arrived at by subtracting net national income from total private-plus-Government expenditure at home.

There can be very little doubt that the new figures are closer to reality than the old. That there is some net domestic disinvestment is unquestionably true; but it was difficult, in previous years, to accept that its magnitude could be quite as large as the estimates showed.

The increases from year to year in net national income are now shown, on the revised figures, to have been 27.5% in the two years 1938-40, 15.6% between 1940 and 1941, and 11.6% between 1941 and 1942.

THE BUSINESS WORLD

Production Committees

[I]t is more than a year since agreements for setting up joint production committees in engineering factories and Royal Ordnance factories were signed between the engineering unions, the engineering employers and the Ministry of Supply, but until recently little has been heard about how these committees have actually been working. The Minister of Production stated on February 17th that 2,096 factories employing 150 or more workers each had set up production committees and that these had "on the whole been a success." The International Labour Office has recently published a useful survey of production committees in Britain, tracing their development and contrasting them with the older-established machinery of joint industrial consultation. The Amalgamated Engineering Union has now made an important contribution to the available store of knowledge on the subject. Its third Production Report, based on returns sent in from 1,000 establishments covering over a million workers, is a record of the operation, achievements and difficulties of joint production committees between April and September, 1942. The Report, which is in part statistical and in part descriptive, is admittedly a one-sided picture, being drawn entirely from the replies of shop stewards and trade unionists, but it is well documented and states that no points are included which cannot be substantiated.

The document is in some respects encouraging and in others depressing. It shows very definite improvements in output in a number of factories and reveals a greatly increased interest in production among the workers as a whole. But there is little room for complacency in learning that the same defects and drawbacks in the organisation are being met as in the union's earlier inquiries (described in *The Economist* of June 29, 1942). The most frequent complaint is of bad workshop organisation, but other criticisms, such as shortage of equipment, misuse of manpower, idle machines, shortage of raw material and even flow of orders are recurrent.

What is discouraging about the general picture of defects is its deadly similarity to the picture of six months ago, and even, in some respects, to that of over a year ago, comments the report. Most of the deficiencies, it is claimed, are due to lack of organisation and bad co-ordination at the top, and the efforts of individual managements and workshops cannot set them right; this leads to a sense of frustration. In spite of the system of capacity clearing exchanges, there have been persistent shortages of machine tools; the Ministry of Production has not succeeded in preventing a "priorities scramble"; the allocation of raw materials has been uneven; and far too little attention has been paid to the training and upgrading of female labour. The criticisms are serious, though they are by no means new. The Select Committee on National Expenditure has often drawn attention to exactly the same defects. But it is disquieting to hear the same stories told over and over again.

On the credit side, there have been distinct improvements in production at many factories. Nearly half the establishments sending in returns were able to report increases, in a few cases amounting to 300 or 400 per cent, and only 4 per cent of the total showed actual decreases. There has also been a satisfactory increase in the number of committees in existence—55 per cent of the firms covered had production committees, against only 21 per cent in March of last year—and it is creditable that only 2 per cent of the committees formed have broken down. In the AEU's view, the chief reason for improved production has been the establishment of better relations between management and workpeople, and in 67 per cent of the firms with production committees "improved co-operation" is given—by the union representatives—as the main reason for increased production. (It would be interesting to have the management's view.) Other reasons given are the adoption of workers' suggestions—this reason bulks larger in firms with committees than in those without—a reduction in absenteeism, better use of female labour, improvements in

welfare, and the introduction of guaranteed piece rates or output bonuses, though the paucity of references to financial factors is remarkable. Details of the enquiry's results are given in a note on page 507.

Production committees are exclusively concerned with matters directly relating to production. Such items as the use of machinery, machine tool capacity, the organisation of stores, the shift system, progress and inspection, figure most prominently on their agendas. A great deal of time is also devoted to welfare—canteens, transport, ventilation and lighting—and the relation between welfare and productivity is now widely recognised. Welfare matters are usually dealt with by sub-committees which report back to the main committee, and there is no doubt that their activities have been instrumental in bringing about substantial improvements in welfare arrangements. But in view of the large numbers of women now engaged in engineering and the importance of ensuring their welfare and their contentment, it seems a weakness that such a small proportion of women should be represented on the committees.

Good production committees—which are said to be in the majority—carry out their functions in a healthy atmosphere of co-operation, meeting at frequent intervals and providing opportunities for the interchange of information and views. But there are still many committees which encounter obstacles, both in their formation and in their operation. The few that broke down completely seem to have failed mainly as a result of lack of co-operation. The attitude "This is our works, and while I am manager it will not be done," and "Management resent intrusion of workers

taking an interest in the managerial side" still prevails in certain factories. Then, even if the management agree to set up a committee, it may become only a "façade" committee or may degenerate into a kind of absenteeism tribunal—a tendency which was very marked in the early days of pit production committees. Some managements are reluctant to take the workers' representatives into their confidence and will not submit items to the agenda on their own initiative. Not all the lack of co-operation is on the management side—far from it. There are many "short-sighted or mischievous elements" among the workers who are opposed to any form of industrial co-operation and who encourage the workers to look upon their representatives on the committees as management "stooges." This attitude is certainly not lessened by the way in which some worker members tend to look upon the committees as a kind of "secret society." Probably the best way of overcoming such difficulties is to have an efficient system of reporting back, either through factory meetings or by posting the minutes of committee meetings on the workshop notice boards. Another deterrent, to which some importance is attached, is the hostility shown by some foremen or charge-hands, who are said to be suspicious and resentful of the responsibilities undertaken by production committees.

What are the main conclusions to be drawn from the AEU survey? In the light of the evidence collected, the union's claim that

the committees have fully justified their existence and have proved themselves a factor of incalculable value in the war effort.

Finance and Banking

One Thousand Million

The £50 million increase in the fiduciary issue announced this week brings the total to the very round sum of £1,000 million. The passing of this glaringly self-assertive milestone demands a review of the stages by which the fiduciary issue has reached its present ten-figure eminence since the beginning of the war. The various increases are given below—all of them were of £50 million each, except for the initial jump of £280 million, which accompanied the transfer of gold from the Bank of England to the Exchange Equalisation Account on the outbreak of the war, and the £70 million on the last occasion but one:—

Date	From £ Million	To £ Million	Intervening Period Weeks
September 5, 1939	300	580	...
June 12, 1940	580	630	40
April 30, 1931	630	680	46
August 30, 1941	680	730	18
December 3, 1941	730	780	13
April 22, 1942	780	830	20
July 28, 1942	830	880	14
December 3, 1942	880	950	18
April 13, 1943	950	1,000	19

The pace of these increases has been gradually increasing. The active circulation just before the war was £529,499,000. Last Wednesday it had reached £943,494,000, a relatively much steeper jump than the accompanying rise in bank deposits, which since the war have risen by 58 per cent, against the 78 per cent rise in the circulation.

Lend-Lease Silver for Britain

It was made known from Washington this week that Great Britain had made a request for 3,250,000 ounces of silver from the United States under the special Lend-Lease facilities announced last December. At the same time, a similar request for 1,750,000 ounces of silver has been made to Canada, these deliveries to be financed under the existing arrangements for reciprocal aid. Of this total of 5 million ounces, one third is apparently required for coinage purposes and the balance for essential industrial needs. The loan from the United States is to be repaid in silver after the war. This special Lend-Lease operation is being considered by the Senate Silver Committee, and the silver senators have seized with verve and alacrity on such a promising occasion to push the interests of their metal. In the first place, the suggestion has been made by a member of the committee that the silver should be made available by additional domestic production, and it seems to have been a short step from this to plead that, on the

is probably not an exaggeration. But at the same time it is clear that there is still a long way to travel before the committees can exercise their full value. There needs to be more give and take between management and workers, and more mutual confidence. The workpeople are taking a new interest in the day-to-day problems affecting production, and it is reasonable to expect the managements to encourage them to feel that they can contribute something positive—especially in the matter of examining their suggestions. There needs to be more frankness and publicity about the production programme and needs. Some committees have sensibly arranged for the display of production targets and posters, and for factory meetings addressed by Service speakers. The committees should pay more attention to the needs of women, in particular to the question of improving their skill. Nationally, the chief need seems to be for a strengthening of the regional production machinery, for more pooling of information and capacity between firms.

The AEU alleges that the production authorities in this country ignored the criticisms made in its earlier enquiry—though keen interest was shown in the United States. It is impossible for the outsider to judge how far this complaint is justified. But, in any case, those responsible for the direction of the war effort cannot afford to overlook this third Report. The new aim and policy is to extract the maximum productivity and efficiency from the existing labour force, rather than to seek its expansion. The task is to eliminate the remaining bottlenecks, to fill the gaps, and to tighten the organisation all round. The AEU report provides a concrete starting-point.

available evidence of the shortage of silver, the restriction on the price of both imported and domestic silver should be lifted and the metal allowed to rise to its monetary price of \$1.29 per ounce, compared with present prices of 45c. for imported silver and 71.11c. for domestic silver. These familiar kites need not be taken too seriously.

The impending arrival of Lend-Lease silver in Great Britain raises some interesting questions. Will the silver required for industrial purposes be made available to industry through the bullion market? Up to now, all the silver so required and provided by the Treasury has been distributed through the recognised firms of silver brokers. To vary the procedure in respect of Lend-Lease silver would mean creating a new distributive machinery, though this process would not be necessary if the silver in question were exclusively used in ordnance and other Government-owned factories. If the silver is made available through the market, the next question to be decided will be that of the price. The present official price of 23½d. is below the American price for imported metal and not much more than half the price for domestic silver, which is the price the US Treasury would have to pay for the metal if this specific delivery were to be made available by increasing domestic production. Finally, there is the delicate question whether the authorities in this country should allow the London market to continue dealing without restriction in "free" silver at a time when urgent industrial requirements have to be satisfied by Lend-Lease metal. The amount involved in these free dealings may be extremely small, but the principle at stake is of some importance.

Bank Investment Record

The March clearing bank statements are inevitably dominated by changes set in motion by London's Wings for Victory week. This was completed before any of the clearing banks made up for their March statements, and the aggregate figures, therefore, provide a complete picture of the impact on the banking position of the exceptional stimulus to investment in Government securities during that week. In the first place, it is seen that investments have risen by £23,941,000 to a new record of £1,132,393,000. This indicates a smaller direct participation by the banks in London's Wings for Victory week than in the earlier Warships and War Weapons weeks, despite the larger amount raised in the latest of these affairs. In this respect, therefore, the position has improved somewhat. This increase in bank holdings of gilt-edged securities is more than offset by the decline in Treasury deposit receipts, this item having fallen by £49 million over the month. The

latest debt return had shown that £77,500,000 of TDR's had been pre-encashed during March to finance subscriptions to tap Government loans, and it is thus evident that substantial pre-encashments were made by the banks as a counterpart to their customers' subscriptions. The other main movements shown by the clearing bank returns for March are a rise of £24,493,000 in bills, partly offset by a fall of £14,341,000 in call loans and an increase of £15,121,000 in advances, which may be explained largely

in terms of seasonal accommodation extended for financing tax payments. There are now certain fiscal advantages in favour of the earliest payment of such taxes as EPT, and the banks are finding that the demand for loans in this connection has been increasing of late. The net effect of these various movements is to leave the structure of credit substantially unchanged. It is true that deposits show an increase of £17,031,000 on the month, but to the extent of £13,104,000 this is the illusory result of a larger volume of cheques and other items in course of collection last month.

UNION CORPORATION, LIMITED

(Incorporated in the Union of South Africa.)

ABRIDGED REPORT OF THE DIRECTORS FOR YEAR 1942.

The Accounts are drawn up in Union of South Africa currency, United Kingdom currency being taken at par. The profit is £810,132 5s. 6d., plus £127,531 7s. 9d. brought forward, making a total of £937,663 13s. 3d. A final dividend of 5s. 6d. U.K. currency per share was declared, absorbing at par £423,500, making, with the interim dividend of 2s. 6d. per share, a total distribution of 8s. 6d., or £816,000 for the year, and leaving £121,663 13s. 3d. to be carried forward. Holdings of Shares, Debentures and other securities have been taken into the Accounts at cost or under, but in no case above the market price of December 31st last, or where no market price exists, above the Directors' valuation. At present market prices, these holdings show a very substantial surplus over the amount at which they stand in the Balance Sheet. The Directors, as on other occasions, have thought it expedient to provide for contingencies by reducing the book cost of certain holdings both below cost and below market price.

The Directors have set aside £25,000 as an addition to the Reserve for Pension Contingencies for which the like amount was appropriated in 1935 when this Reserve was created. This Reserve is intended to meet contingencies relating to Management and Staff Pensions and cognate objects not covered by the Staff Pension Fund for which provision was made in 1933.

GOLD INTERESTS.

A summary of the operating results for the past year of the five gold mining companies operating in the Witwatersrand in which the Corporation is largely concerned is given below and is based on the market price for gold at 168s. 0d. per oz. fine:—

Year ended Dec. 31st, 1942.	East Geduld Mines	Geduld Proprietary Mines	The Grootvlei Proprietary Mines	Marievale Consolidated Mines	Van Dyk Consolidated Mines
Tons milled	1,923,000	1,393,000	1,845,000	597,000	1,187,200
Yield per ton	48s. 8d.	40s. 1d.	45s. 11d.	45s. 2d.	42s. 0d.
Working Costs per ton	16s. 7d.	19s. 8d.	20s. 4d.	30s. 1d.	28s. 10d.
Working Profit per ton	32s. 1d.	20s. 5d.	25s. 7d.	15s. 1d.	15s. 2d.
Total Working Profit	£3,089,000	£1,422,000	£2,180,000	£898,000	£1,888,000
Dividends (totals and per share)	£990,000 (11/0)	£894,775 (12/3)	£679,180 (4/9)	£225,000 (1/0)	£375,125 (1/4)

The Working Profit figures include the amounts due to the Union Government for taxation and under Government lease agreements, but exclude revenue from sources other than gold mining operations. Thus, East Geduld Mines 1942 dividend income on its shareholding in The Grootvlei Proprietary Mines was £31,900, and Geduld Proprietary Mines 1942 dividend income on its shareholdings in East Geduld Mines and The Grootvlei Proprietary Mines amounted to £385,200.

WESTERN HOLDINGS.—A contour survey of a portion of the area held by the Company under the Prospecting and Mining lease granted by the Government has been made.

WITBOK.—A borehole on the Company's northern boundary is being drilled and had reached a depth of 1,887 feet at the end of the year.

OTHER INTERESTS.

BAY HALL TRUST.—The dividend for 1942 was again unchanged at 6s. per cent. BRITISH ENKA.—Labour shortage and quota arrangements restricted the Company's activities. Nevertheless, a somewhat improved profit was earned.

SAN FRANCISCO MINES OF MEXICO.—For the year ended September 30th, 1942, the Net Profit before charging taxation was £423,334, compared with £121,342 for the previous year. A dividend of 2s. 6d. per share was paid, compared with 9d. per share for the previous year. During the year the mine established records in many directions.

SELECTION TRUST.—For the year ended March 31st, 1942, this Company paid a dividend of 9d. per Ordinary Stock unit. Its principal interests are in the American Metal Company (substantially concerned in copper in Northern Rhodesia through its interests in Roan Antelope Copper Mines and Rhodesian Selection Trust), Consolidated African Selection Trust and Ultramar Company.

SOUTH AFRICAN PULP AND PAPER INDUSTRIES.—During 1942 satisfactory progress continued to be made. The balance of the loan from the Corporation was repaid and a profit of £95,032, after provision for depreciation, was made, which compares with £91,023 for the previous year. A dividend of 5 pence, absorbing £37,500 has been declared.

ULTRAMAR COMPANY.—This Company's subsidiary, Caracas Petroleum S.A., is concerned with the development and exploitation of extensive oil concessions in Venezuela. Work is being carried out in joint account with Texas Company. Operations are proceeding and drilling has revealed promising oil-bearing formations.

RHODESIA AND WEST AFRICA.—Although again hampered by heavy taxation, both Mufulla Company and, in turn, Rhodesian Selection Trust, were able to resume dividend payments, the former with 2s. 3d. per share and the latter with 7½d. per share. Roan Antelope dividend was repeated at 6d. per Ordinary Stock unit. Consolidated African Selection Trust paid 7½d. per Ordinary Stock unit, against 6d.—free of tax in each case.

CHROME.—We have now established ourselves as a producer of Chrome Ore and material quantities of this strategic mineral were shipped during the year at a small profit.

COPIES OF THE FULL REPORT AND ACCOUNTS CAN BE OBTAINED ON APPLICATION AT THE LONDON OFFICE, PRINCES HOUSE, 25, GRESHAM STREET, E.C.2.

Investment

The Budget and the Market

Events always look larger in prospect to the stock market than when their actual dimensions are known and it is, therefore, not surprising that the most immediate effect of the budget was a modest recovery in tobacco and brewery shares, which had been out of favour for some weeks. The budget is a repetition of last year's prescription at two-thirds strength. Further, the investor can now build on the experience of the effects of last year's supplementary taxation and the general view is that taxes on beer, tobacco, entertainments and luxuries will have little effect on sales. Perhaps this rather over-simplifies the position. It is a matter of balancing the further contraction of the field in which alternative private expenditure is feasible against the possibility—one might almost say probability—that the expansion in Government outlays may be less this year than last. The market might, perhaps, more safely assume that, with the significant exception of tobacco, it will be lack of physical supplies rather than a fall in demand which will limit profits in these fields. The second set of considerations which may properly affect the market arises from the promised further adjustments of EPT assessments. Some of the points cannot be settled until after the war, but Sir Kingsley Wood was able to give certain assurances. In a general way, he has conceded that terminal losses, that is those involved in changing back from a war to a peacetime basis, shall be dealt with. All expenses of a revenue nature incurred in earning EPT are to be allowed as a deduction in computing liability for that tax, even if they are in fact incurred after the termination of the tax. It has also been agreed that relief for income tax and EPT, hitherto applied to scrapped equipment, is to be extended to any loss of value arising, even although the equipment continues in use. Sir Kingsley has also decided that the question of providing for stock depreciation may have to be considered, possibly on the lines laid down in the Finance Act, 1921, to deal with EPD. Further, the existing provisions with regard to special allowances for companies working wasting assets are to be extended to certain other minerals such as sand and gravel, while allowance is to be made for post-war increases in working costs arising out of departures from normal practice designed to accelerate production for the war effort. The last of these provisions has special reference to mining and oil companies and there was an immediate response in rises in Rhodesian copper and Nigerian tin mining shares. The earlier changes, as also the question of a detailed investigation of a number of further suggestions, affect a large number of industrial concerns, particularly, perhaps, those in the heavy and engineering industries which have been most fully converted to special war production. There is so far no sign that the market regards the budget as more than a very modest bull point.

Brokers' Charges

There is one aspect of the Budget which, while it does not affect investment values, is of crucial importance to brokers. This is the further rise in charges for telegrams and trunk calls. It is estimated to amount to about one-third increase, which would mean anything from £700 to £1,000 for a moderate-sized firm doing a fair business with country brokers. This may be only 5 per cent of total costs for a London broker, but, as most of these have been doing little better than cover expenses, it is obviously a matter which will call for careful consideration. The avowed object of the higher charge is to release manpower, not to produce revenue, but it is not easy to see how brokers can economise greatly on these charges, since service of this sort is one of the principal means of competition. Brokers have already faced one increase of about 15 per cent in these and similar charges, beside the two-thirds rise in postage. Their wage bills are inflated because they are forced to pay for experience in excess of their needs, while they have to put up with a lack of physical energy and adaptability in their staffs. Many of the broker's services to clients have been cut to the bone, and it will not be surprising if there is a demand for increased charges. Commission charges were felt to be high before the war, but there has been a rise of 36 per cent since 1938 in the general level of prices. For brokers, the increase has certainly been greater, when it is

remembered that "form-filling" replaces the cut in non-essential services. A rise in charges would kill some business, but the alternative appears to be discrimination, among clients against the small man, and among brokers in favour of the long purse. If an increase is to be made, it should, however, be related specifically to increased wartime costs.

Better Unit Trust Accounts

It may be recalled that the first accounts of any unit trust group, those of the trusts managed by Municipal and General Securities, were favourably commented upon in *The Economist* of February 20th, but that certain further improvements were suggested. This same group has now produced the accounts, in a substantially similar form, for each of its nine trusts during the year 1942. The figures, still in percentages, have, however, been regrouped so as to coincide very closely with the requirements then suggested. Further, the company has published its own profit and loss account, a statement to which the public has no special claim, but which, it was felt, would help greatly to reassure unit holders. *The Economist* asked for absolute figures for the trust accounts and for percentages only for the accounts of the managers. The latter have reversed this suggestion, and given absolute figures for their own profit and loss account, as well as percentages. In all the circumstances, and until other groups have been won over, this is as much as anyone is entitled to ask, and the Municipal and General deserve the thanks of all unit holders, and the support of all those of good will in the movement, for the lead they have given.

The various trust accounts are drawn up to show profits under three main heads: issue of sub-units, of which there were none under the Treasury ban; service and management of trust property, and maintaining a market in sub-units. Under the second head, the average profit was 0.107 per cent of the valuation of the trusts, with an extreme range of 0.391 for the Foreign Government Bond Trust to 0.069 for the First British Fixed Trust. In the third group, there are two sub-heads: gross profit on resale of sub-units; average profit being 2.806 per cent on proceeds of re-sale—with a range from 4.047 for the Limited Investment Fund to 1.978 for the First British—and 0.452 per cent on liquidation values with a range from 0.872 for the Fourth British to 0.092 for the Third. Finally, there was a profit of 0.466 on the total of all sub-units resold or liquidated from changes in prices of sub-units between dates of repurchase and resale or liquidation. A comparison of these percentages with those set out in the various advertising booklets of this and other groups is an adequate means of comparing promise with performance. In the absence of any earnings on creation of sub-units, the profit and loss account cannot be a matter for congratulation to the managers. The net profit is a mere £276, or 2.964 per cent of the gross figure of £9,314. Of the latter, 73.2 per cent was derived from service and management, 21.6 from maintaining a market, and 5.2 from holding the sub-units. The managers and proprietors took under 2 per cent in remuneration. Nearly 37 per cent went in rents and other overheads, almost 35 in other salaries, and the remainder, mainly, in legal, audit and accountancy charges. Nothing was spent on advertising or publicity. Copies of the accounts are obtainable from the managers.

Stock Exchange Report

The stock exchange has effected a further saving of 37½ per cent in the paper for its annual report, covering the year ended March 25th, without sacrificing any further information, but, in view of the fact that the area is now less than 10 per cent of that used in 1938-39, not much information can be expected. The total number of members has fallen slightly from 3,604 to 3,560, while the number of these in the forces has risen from 1,266 to 1,310, involving a drop in the effective membership of almost 5 per cent on the year to 2,250. The story with regard to clerks is similar and the gross number, on the house floor and in the settling room, is now 2,264, of whom all but 1,010 are in the forces. Four years ago, the comparable figures appear to have been 4,099 members and 2,790 clerks, of whom 223 members were not on the active list. From the

financial standpoint, the year's operations were an improvement on those of 1941-42. The concessions to members in the forces appear to have been reduced, economies have been effected and, although income rose by only some £10,000 to £244,054, net income increased by almost 50 per cent to £74,533. Taxation takes £39,500 against £20,000, buildings replacement receives £30,000 against £25,000, but nothing is provided for war damage contribution, compared with £22,873 last year. The net result is a deficit of £5,328 against one of £30,926. The carry forward, which is the only published free reserve, stands at £162,229 after this further draft on it.

Another Preference Scheme

It is understood that opposition has failed to defeat the scheme for a capital reconstruction of Fras. Hinde and Hardy, silk manufacturers, of Norwich. The company made a considerable profit in the year to June 30th last after a decade when, on balance, preference dividends were not covered. Dividends on these shares are in arrears since the end of 1937; there was a debit on profit and loss account at June last and there are intangibles to be written off. The proposal is to cut the ordinary shares from £1 to 5s. and to create almost as many new ordinary shares of 5s. to give to the preference shareholders at the rate of one 5s. ordinary for every £1 preference. The latter are asked to submit to the cancellation of arrears; to have their rate of dividend cut from 7½ cumulative to 6 per cent non-cumulative. As some compensation, in addition to the share in the equity, half the profits available after meeting preference dividends are to be placed to a reserve to equalise that dividend up to a maximum of £10,000. This appears to be the fourth scheme submitted by the company in little over a decade. The first, which sought to cut the preference capital by one-third, in return for 2s. per preference share in cash, was withdrawn. Later, it was agreed to fund the arrears of preference dividend, and it is part of the present scheme that the last of these funding certificates are to be redeemed in full. A year ago a third scheme was withdrawn by the company, because its properties were damaged. Shareholders have been very ill-advised to accept the scheme. The accumulated deficit and the intangible items do not enter into the picture. They can be written off by reducing the ordinary capital without altering the rights of holders of that capital one iota. The directors state that, when conditions become normal, the preference holders will receive at least as much under the new scheme as under their present rights. This means that it will be possible to pay a considerable dividend on the ordinary capital, which has received nothing for a decade or so. If this is a reasonable statement of the outlook, the arrears of preference dividend should be funded and the rights of holders left untouched. There is no reason why they should be asked to bear the risk that the directors will prove wrong, or accept types of investment other than that for which they subscribed.

Company Notes

ICI Higher Earnings

The rise in Imperial Chemical Industries' net profit figure for 1942, as disclosed by the preliminary statement, from £6,162,212 to £6,499,859 does not do full justice to the jump in revenue. In the latest period, net profits were struck after, instead of before, the customary charge of £180,106 for workers' pensions, and after a £500,000 rise in the transfer to central obsolescence and depreciation, increasing it to £2,500,000. Thus, net earnings in reality show a jump of more than £1,000,000 to £9,179,965, nearly half of which is absorbed by the increased depreciation charge. The remainder is passed on to equity earnings, which are up from £4,316,002 to £4,833,755, representing 11.0 against 9.1 per cent. The ordinary stockholders again receive 8 per cent less tax, at 9s. 4d. Of the surplus, £100,000 against nil is earmarked as a War Personnel Reserve; War Contingencies receive £601,595 against £300,720, and there is an increase of just over £100,000 in the carry forward to £965,499. The rise in the consolidated liability for NDC and EPT at £300,000, against £800,000 in the previous year, is less than might have been expected, but the absolute sum

now reaches the considerable total of £6,700,000. The table below analyses receipts and expenditure of the parent over the past three years. In the absence of the very full accounts and the chairman's statement, it is idle to attempt to explain last year's rise in profits. That there has been an increase in output is obvious, but it is less easy to suggest how the

	Years to December 31,		
	1940	1941	1942

* Except tax on dividends.			
† Including £100,000 to War Personnel Reserve.			

increase in gross earnings has been passed on to net revenue. The industrial activity of the group is now so vast and so completely identified with the war effort that its progress might almost serve as an index of the progress of war production as a whole. The £1 ordinary stock, at 39s. 3d., yield £4 2s. 4d. per cent, less tax, at 9s. 4d.

South Durham Improvement

The full accounts of *South Durham* and its subsidiary, *Cargo Fleet*, for the year to September 30th last show that the previous year's recovery has been continued. Profits of *South Durham*, after deferred repairs and contingencies, jumped from £281,134 to £409,672, the highest level of the past decade. Unfortunately for shareholders, tax liability has risen even more steeply from £41,000 to £180,000 while depreciation is maintained at £100,000. It is only the reduction in war damage from £25,933 to £10,003 which makes possible a rise in earnings for ordinary and "B" ordinary shares from £39,905 to £45,167. Thus the smallness of the rise in equity payments, which caused some market disappointment, is fully explained. Ordinary shares, which receive 8½ against 8 per cent, are covered by an earned rate of 8.6 against 8.0 per cent; "B" ordinary shares, which receive 2½ against 2 per cent, are also covered by a margin of 0.1 per cent. The small surplus goes to raise the carry forward from £122,865 to £123,586. It appears that strict control of expenditure has contributed to the ½ point increases in distribution. In the case of *Cargo Fleet*, the same factor, the jump in tax liability, which in this case is up from £25,000 to £70,000, has prevented any substantial rise in distributable earnings. The surplus, which amounts to £798 against £501, is added to the carry forward, raising it to £98,569. The

POST OFFICE & TRUSTEE SAVINGS BANK ISSUE

Issued by the National Savings Committee

balance sheets of both concerns suggest that the basis of the recovery has been a marked expansion in turnover—possibly due to fresh plant coming into production. For *South Durham* there is a jump in net loans to subsidiaries from £21,436 to £139,289. Debtors are nearly £400,000 higher at £880,384 and creditors have risen more than £400,000 to £834,037. Since stocks and cash are also substantially increased there is a moderate rise in net liquid assets from £603,021 to £668,973. The statement of *Cargo Fleet* shows similar, if less pronounced, movements. The chairman, Mr Benjamin Talbot, gives away no trading secrets. He suggests, however, that the rise in profits is arrived at after very adequate provision for deferred repairs. The jump in the gross figure is, no doubt, considerably more striking. The £1 ordinary shares of *South Durham*, at 32s. 3d. ex dividend, offer the sound yield of £5 5s. 5d. per cent.

Cunard Payments Resumed

A preliminary statement by Cunard Steam Ship shows a profit for the year of £343,723 compared with one of £229,701 for 1941. It may be recalled that out of the carry forward of £578,340 at the end of 1941, first preference arrears of £318,750 were met in March, 1942, while in November £330,000 was paid to bring the second preference dividend up to the end of June last year. These payments absorbed the whole of 1942 profit and reduced the carry forward to £220,813 after bringing the preference dividends up to date to December 30th. Earnings for 1942 amount to 9.9 per cent on the equity, after allowing for current preference dividends, against 5.7 per cent for 1941. No dividend is declared on 1942 profits, but the directors recommend an interim of 2½ per cent for 1943, calling for £69,628 net on the assumption, made throughout, that tax is reckoned at the full standard rate. The £1 ordinary stock units, which have been rather weak of late at about 21s., showed virtually no change on the announcement.

Higher Paint Earnings

The preliminary statements of two paint manufacturing concerns, *Pinchin Johnson* and *Indestructible Paint*, reveal that operations in 1942 were highly profitable. Disclosed earnings before tax of *Pinchin Johnson* jumped sharply from £310,859 to £453,121, at least £60,000 above the previous record for the past decade. Tax and EPT provisions, however, require only £90,000 more at £270,000. The ordinary dividend remains unchanged at 8½ per cent, although earnings have risen from 8.6 to some 16 per cent. Contingency reserve receives £60,000 compared with a transfer of £24,567 to reserve for investment depreciation and contingencies. Including this latter allocation, equity earnings for 1941 equalled 11.1 per cent. Nearly £18,000 is added to the carry forward now totalling £169,202. Earnings after tax of *Indestructible Paint* show a considerably smaller relative appreciation, from £37,400 to £45,266. Nevertheless, the ordinary payment is raised 5 points to 25 per cent, thereby restoring the pre-war distribution. These results reflect the official demand for the industry's products, which, despite the stringent control for civilian purposes, and a heavy fall in exports, is probably unsatisfied. The greater relative increase for *Pinchin Johnson* is partly accounted for by the uninterrupted operations of the past year, compared with the dislocation of output in an important plant in 1941. According to the chairman, Mr E. Robson, the plant installed is better suited to present requirements. A year ago, he was able to say that shortage of supplies was being met by employment of substitutes. Under present conditions current earnings appear assured, while the prospects of the industry in the post-war physical reconstruction are better than for many others. The 10s. ordinary shares of *Pinchin Johnson* at 32s. 6d. ex dividend yield £2 12s. 4d. per cent, while the £1 ordinary shares of *Indestructible Paint*, quoted at 111s. 9d., give a rather higher return of £4 11s. per cent.

Brazilian Traction Dividend

The rise in the 1943 interim payment of Brazilian Traction from 40 to 75 cents was considerably better than the market expected. There was an immediate jump of 2½ points in the price of the ordinary shares to 27½, and the general enthusiasm was responsible for a short-lived demand for Brazilian Government and rail stocks. In 1942, the

company paid a 40 Canadian cent interim and a final of 60 cents, making C\$1 for the year, against 40 cents in 1941, when earnings per share amounted to C\$1.87. The 1942 report has not yet been issued, but in the light of the latest payment it must be assumed that last year's dividends were no less generally covered. There is no doubt that entry into the war has stimulated economic activity and that Brazilian Traction has profited thereby. The size of the latest increase, however, probably owes most to the settlement of the tax dispute with the Brazilian Government at a liability of some US\$5,400,000 against US\$7,800,000. The management had apparently reserved the full amount in dispute. What dividend shareholders may expect in the full year 1943 remains a matter for speculation. Probably C\$1.50 should be regarded as the outside figure, but until the 1942 accounts are available no forecast can be attempted. At the current price of 27½, on last year's payment, the yield is no more than 4.2 per cent, less non-residents' tax of 15 per cent.

BSA Setback

For the third year in succession, total profits of *Birmingham Small Arms*, struck after EPT and contingencies, have declined. In the latest period to July 31, 1942, the drop from £1,208,079 to £1,159,735 is less steep than in the previous year, but, even with certain savings in expenditure, the 7½ per cent ordinary dividend is under-earned by a margin of 0.4 per cent. All adjustable charges are lower with the exception of total depreciation provision, which receives £439,977 against £430,815. As in the previous year, there is no transfer to free reserves, and the customary provision for debenture repayment involves a reduction in the carry forward from £278,249 to £238,310. The failure to reduce the ordinary dividend in step with the decline in surplus earnings is presumably due to the management's belief that the narrowing of the margin will be purely temporary. The company's balance-sheet shows an increase in net loans to subsidiaries from £741,715 to £768,603. The sharp fall in debtors of nearly £2,000,000 to £3,752,535 in the consolidated statement, and the smaller reduction in creditors from £7,884,426 to £7,714,605, may indicate some reduction in turnover, but it is more likely to be due to a change in the tempo of payment. Despite the rise in cash from £561,426 to £815,921, and the acquisition of £1,000,000 of tax reserve certificates, there is a decline in net liquid assets from £2,404,229 to £2,286,108. At the same time, fixed assets, after deduction of increased depreciation, are slightly higher. It appears more than likely that the energies of the concern last year were in some degree diverted from current output to reconstruction of plant. The £1 ordinary shares, at 23s. 9d., yield £6 8s. 4d. per cent.

Crosses and Winkworth

The management of *Crosses and Winkworth*, the Lancashire cotton spinners and doublers, are able to announce one more step on the path to full liquidation of debenture arrears. Under the 1931 scheme of amalgamation with Crosses and Heaton Associated Mills, £600,000 of "Crosses" debentures were issued to the Midland Bank as security for overdraft. It has now been found possible to cancel these debentures, together with the floating charge they carried. Bank overdraft was eliminated in the year 1940-41, and the next year's accounts showed a credit balance of £263,872. In the last three years, there has been a marked improvement in the company's liquid position. Excluding the liability on interest arrears of old Crosses and Heaton debentures assumed at the time of the merger, net liquid assets have risen from £124,359 in 1938-39 to £624,585 in 1941-42. Advances secured against cotton stocks have also been eliminated. It must be pointed out, however, that the size of accumulated arrears is still formidable. In addition to the remaining interest on old Crosses and Heaton debentures of £82,625—nearly half the outstanding total was paid off last year—there is £928,483 arrears of interest due on 6 per cent first mortgage "Heaton" debentures. Despite the improvement of recent years, which has to some extent been based upon exceptional war-time trading factors, the 6 per cent non-cumulative preference shares and the equity capital are almost as far as ever from sight of a dividend. When the remainder of the old debenture arrears have been paid—as should be the case in the year ending March 31, 1943—there will be a very strong case for a reconstruction. The cancellation of the bank debentures is an important step to that end. The 6 per cent "Heaton" debentures have been rising steadily during the past year. They now stand at 101½ against 89 some six months ago.

Industry and Trade

Higher Customs and Excise Duties

In imposing higher indirect taxes, Sir Kingsley Wood has rightly selected the main outlets for the increase in spendable incomes, that is to say alcohol, tobacco, entertainments and luxuries. Beer goes up in price by a penny a pint, the duty on spirits is up by 2s. 4d. a bottle; a packet of ten cigarettes hitherto costing 1s. is now retailed at 1s. 2d. Cinema and theatre seats, except those priced at 1s. or less will cost more from May 16th, and the purchase tax on goods hitherto taxed at the rate of 66½ per cent has been raised to 100 per cent. Telephone and telegram charges have also been raised; for example, the cost of a three-minute day trunk call, 35-50 miles from the caller's district, will be 1s. 10d. from May 1st, against 1s. 5d., and the price of an ordinary inland telegram of nine words or less will be raised from 9d. to 1s. The Chancellor's estimates of receipts show that he does not expect the increased duties on alcohol, tobacco and entertainments to have a deterrent effect on consumption. He expects to obtain a further £28.5 millions or 13 per cent from beer, £8.4 millions or 12½ per cent from spirits, £57 millions or 17 per cent from tobacco, and £7.8 millions or 25 per cent from entertainments. The increase in the purchase tax on luxuries from 66½ per cent to 100 per cent is estimated to bring in an additional £4 millions or 3.6 per cent, but this will be offset by an equivalent loss of revenue resulting from the decision to exempt from purchase tax utility cloth, domestic textile goods, soft furnishings, bedding and haberdashery.

The Purchase Tax

The Chancellor's decision to increase the purchase tax on luxuries to 100 per cent is to be welcomed; most of the articles included in this category are either articles such as clothing or household textiles, for which utility goods can be substituted, or articles, such as cameras, musical instruments, ornaments and jewellery which are not essential. It also includes conventional necessities, such as toilet requisites, but there is no reason why these should not be treated like beer and tobacco. Equally welcome is Sir Kingsley Wood's decision to exempt from purchase tax utility cloth and other utility textiles; he might have extended this concession to domestic pottery and other essential household articles in everyday use, such as pots and pans and brushes.

Miners' Bonus

The Miners' Federation of Great Britain is understood to have come round to the view that the output bonus should be changed from a district basis to a pit basis. When the scheme was originally under consideration, both sides of the industry opposed the idea of a pit basis, on the ground that it could not be operated fairly owing to the variations within each district. It may be argued, with more justification, that a district bonus does not provide a fair reward for good pits in bad districts, and that the introduction of a pit bonus would undoubtedly provide greater incentive for effort. The district basis, to judge by the output figures during recent months, has certainly not been a success. The scheme is being reviewed by the Greene Board, and no doubt the Board, which itself originally favoured a pit basis, will welcome the miners' change of heart.

AEU Production Enquiry

The third Production Report of the Amalgamated Engineering Union, covering the period from April to September, 1942, is based on returns collected from 1,000 establishments, representing 1,268,010 workers in 881 firms. The report analyses the factors contributing to improvements in production and those impeding production. The subject-matter of the report is discussed in an article on page 501. The first table shows the reasons given by the

workers for increased production in those establishments which claimed increases, that is 55 per cent of those with production committees and 42 per cent of those without.

REASONS FOR INCREASED PRODUCTION, APRIL-SEPTEMBER, 1942

Causes	Establishments with Production Committees	Establishments without Production Committees	Total
	%	%	%
Better co-operation between management and workers	67.7	37.6	52.6
Workers' suggestions adopted	58.1	30.0	44.0
Improved timekeeping and less avoidable absenteeism	53.1	38.8	45.9
Better workshop organisation	51.1	28.8	40.0
Better use of equipment	50.0	32.3	41.2
Improved production methods	48.5	37.6	43.0
Better use of female labour	47.4	42.3	44.8
Guaranteed piece rates or output bonus	41.8	25.3	33.5
Better use of production time	40.3	23.5	31.9
Better welfare conditions	31.5	15.2	23.3
Better use of skilled labour	30.7	20.0	25.3
Propaganda for more output	28.1	14.1	21.1
Better flow of contracts and deliveries	28.1	23.5	25.8
Less time limits and high finish	22.2	18.2	20.2
Improved canteen facilities	17.0	8.2	12.6
Increased standardisation of units	16.3	13.1	14.9
Improved transport facilities	13.0	7.0	10.0
Improved housing facilities	1.8	0.6	1.2

It is interesting to note that the two factors, improved co-operation and adoption of workers' suggestions, are given far less weight in establishments without committees than in those with committees.

The Report shows that many of the same factors that were found to be hindering production in the earlier enquiry were still operating six months later. These factors are shown for establishments with and without production committees and as compared with six months before.

FACTORS RETARDING PRODUCTION

Causes	Establishments with J.P.C.'s	Establishments without J.P.C.'s	Total	Previous Enquiry (Total)
	%	%	%	%
Bad workshop organisation	43.6	39.0	41.3	16.7
Shortage of, or obsolete, equipment	41.8	31.75	36.75	38.3
Lack or misuse of manpower	36.5	32.5	34.5	28.4
Idle machines	31.0	28.75	29.9	17.0
Raw material shortages	29.8	21.5	25.6	18.7
Uneven flow of orders	28.2	13.75	21.0	9.2
Component shortages	27.8	15.0	21.4	11.6
Obstructive management	19.2	27.25	23.25	26.6
Too fine limits and high finish	2.4	2.75	2.5	5.8
Shortage of work	32.6	16.75	24.75	15.8
Bad welfare conditions	12.0	14.5	13.2	4.6
Bad canteen facilities	9.8	5.5	7.6	3.2
Grievances about earnings	9.4	12.5	11.0	10.6
Bad transport facilities	7.0	3.0	5.0	4.6
Bad time-keeping and avoidable absenteeism	9.2	3.75	4.0	6.4

It should be noted, however, that these returns in the main reflect the subjective attitude of the workers, which cannot be measured with precision by statistics.

Cotton Trade Organisation

The first report of the Cotton Industry Conference, presented at the end of last week to Mr Hugh Dalton, the President of the Board of Trade, contains nothing revolutionary. Apparently it is concerned mainly with the future constitution of the Cotton Board. The present

INSTITUTE OF INDUSTRIAL ADMINISTRATION
Special Study Course on "ELEMENTS OF LEADERSHIP" by Major L. Urwick, O.B.E., M.C., M.A., will be held on Tuesdays, May 4th to June 1st, at 6.30 p.m., at the Polytechnic Extension, Little Tichfield Street, W.1.
The fee for the Course is 10s. 6d., which must be sent with application for enrolment to the Institute Offices, Artillery House, Artillery Row, S.W.1.

Cotton Board consists of 10 members and the chairman, Sir E. Raymond Streat; its members are nominated by the President of the Board of Trade. It has been urged in Lancashire for some time that a change should be made in favour of a Board consisting of representatives elected by the several trade organisations and the trade unions. The Conference has suggested a Board of 18 persons, exclusive of the chairman, the membership consisting of three persons each for cotton spinning, cotton weaving and merchandising, two raw cotton merchants, and one representative each for bleaching, piece dyeing, yarn bleaching and dyeing, and printing, and three representing the trade unions; its chairman would be appointed by the President of the Board of Trade from a panel of names submitted by the Cotton Board. There has been some difference of opinion about how the funds should be raised to meet the expenses of the Board. By a majority vote it has been agreed that the costs should be covered by a levy on raw cotton purchases, but objection has been taken to this course by the Master Spinners' Federation and the Manchester Cotton Association; in their opinion the necessary funds should be raised by a levy based on the amount of machinery in each section. The constitution of the Cotton Board is an important matter, but surely the industry's main problem is to think about producing the right sort of goods at the prices at which they will find customers after the war.

Fishing

Less than two weeks after making an Order reducing fish prices from April 10th, the Minister of Food postponed its operation until June 12th. Although the prices were in general accepted by the Fish Trades Joint Council, trawler owners were not happy about them, and fishermen still less. Fishermen's remuneration is made up of a basic wage and a poundage on the catch; in addition, there is danger money in wartime. The Third Schedule of the Fish (Maximum Prices) Order—the one in question—deals with prices on which the poundage settlement shall be based, and it was over this that trouble arose, although the prices laid down are minima, and there is nothing to prevent trawler owners from paying more. The fishermen struck, and the dispute was reported to the Minister of Labour, who called a meeting on April 9th, of the trade union, the owners, and the Ministry of Food. The result was the postponement of the price reductions, in order to give the trawler owners and the men time to adjust their relative positions. Negotiations had been proceeding for an increase in basic wages, before the new Order was made, and presumably these will be influenced by its operation. It is true to say that trawler owners' profits and fishermen's earnings have been good, but too little is known of the danger and discomfort incurred in their work. Many of the trawlers not taken over by the Admiralty would have been considered unseaworthy in peacetime, and maintenance costs are therefore vastly higher. Good will towards the settlement of internal problems is much in evidence and there is every hope that difficulties will be overcome.

Home Flax

In the course of a statement in the House of Lords on April 8th, Lord Portal added a footnote to the Fifth Report of the Select Committee on National Expenditure, on home flax production. He said that 47,000 acres were under flax in England alone. In Northern Ireland it is hoped that the acreage will reach 100,000 this year; in Southern Ireland the acreage is 18,000. The Admiralty is a large user of flax, and the occupation of Belgium by the enemy aggravated supply difficulties. Before the war four-fifths of flax requirements were obtained from countries now enemy-controlled. The prewar acreage in this country was as little as 3,500 acres, and Northern Ireland has more than trebled its acreage. According to the Select Com-

mittee's Report, there are now 17 factories, all Government owned, some having been specially built, and others purchased from the private owners, who continue to manage them on an agency basis. The cost of acquiring and building these factories amounted to £1,212,000, and further expenditure will be less than £50,000. The net cost of the 1942 yield in England and Scotland is estimated to be about £1,360,000; farmers received about £940,000, and the cost of processing the crop was about £900,000. Yields have improved since the beginning of the expansion. At first yields were over-estimated. From every ten acres 2 tons of flax fibre and one ton of tow were expected. In 1940-1941 the actual yield was half a ton of fibre and half a ton of tow from ten acres. According to Lord Portal, the yield in 1942 had about doubled to just over one ton of fibre to every ten acres.

Agricultural Improvement

The work of the Agricultural Improvement Council for England and Wales is complementary to that of the Agricultural Research Council; in a sense, if there were no Improvement Council, the work of the Research Council would be fruitless. For the Improvement Council has the dual task of seeing that the results of agricultural research are applied in practice, and of keeping the Research Council informed of farmers' problems which need scientific research and attention. Farmers, as a body, tend to be conservative, and the immense variety of types and sizes of farms, and the traditionally different methods in use in the same branches of agriculture in different parts of the country, make it difficult to apply scientific methods on a systematic basis. In its first report, covering the period June, 1941—June, 1942, the Improvement Council concludes that there is a fundamental need for the majority of farmers to get a better general and scientific education—in this connection, the report of the Luxmoore committee on agricultural education is discussed on p. 491. It believes that no progress will be made unless the industry is guaranteed a certain amount of economic stability in the future. The county war agricultural committees have done invaluable work in advising farmers about their problems, and some form of local advisory centres on these lines will probably have to be continued after the war. The Improvement Council has paid particular attention to the question of the use of agricultural machinery, its standardisation and improvement; it has also dealt with the urgent problems of re-seeding and ley farming, and has initiated committees to deal with both these matters. The Council has also taken up the question of sheep farming and measures for improving hill and upland grazings and systems of sheep stocking and management. It has arranged for investigations to be carried out into losses from dry rot in potatoes and the use of salt as a fertiliser in place of potash. Other matters to which attention has been paid include artificial insemination, cheese starters and mineral deficiencies in crops. The activities of the Improvement Council, like those of the Research Council, have been of immense value in contributing to agricultural efficiency during the war, and both bodies are equally important from a long term point of view.

The Co-operative Movement

The turnover of the Co-operative Wholesale Society has continued to expand. For the year ended January 9th its sales reached the record figure of £157,395,338, an increase of 9 per cent compared with 1941. To this, grocery and provisions contributed £117,239,855. From its own works the Society supplied goods to the value of £47,406,257, an increase of less than 1 per cent. The directors attribute the increased turnover to four factors: (1) The heavy duty on tobacco, (2) the advanced price of Government-controlled flour and increased releases of foodstuffs covered by the "points" scheme, (3) the improved distribution of clothing, and (4) the release of wholesalers' stocks of dry goods previously controlled under the Limitation of Supplies Orders. The deposits and withdrawals in the Banking Department (in which 869 co-operative societies, 10,269 trade unions and 823 clubs have current accounts) totalled £1,003,321,105, an increase of over £74 million or 8 per cent. There were substantial decreases in sales of boots and shoes, furnishings and

carpets. Supplies to the Ministry of Food were £3,494,379, a decrease of 11 per cent. A slight increase in the drapery trade brought its annual turnover to £5,553,398, to which the London branch contributed more than the Manchester headquarters, a reflection of progress in the south. Contracts and exports totalled £4,433,079 and shipments from the American, Australian and New Zealand depots were £3,010,911, the former being an increase of 11 per cent and the latter a decline of 8 per cent. Supplies from the society's farms of 18,807 acres reached £640,948, with a resultant profit of £154,533. After meeting taxation, expenses of production and distribution, interest on capital, depreciation, and internal reservations the net profit for the year was £5,185,683, from which dividend on purchases by society members is being allocated at the rate of 5d. in the £ with a special bonus of 2½d. in the £. An appropriation of £478,084 to the reserve fund will raise that to more than 4½ millions. The CWS has taken a referendum of its societies on the salaries of its 28 directors. These are now based on a commencing salary of £750 per annum, rising by five yearly increments of £50 to £1,000. A proposal to raise the commencing salary to £1,000 with the £50 annual advance has been rejected by 2,796 votes to 2,226. Recently the directors entered into negotiations with the Scottish Co-operative Wholesale Society with a view to the amalgamation of the two organisations into one British CWS, but a decision has been deferred pending the submission of the detailed proposals to the whole of the retail societies in Scotland. In addition to its wholesale business, the English CWS has a CWS Retail Co-operative Society, Limited, operating in Cardiff, Bangor, and Hastings, where the aggregate membership rose last year by 1,793 to 23,055 and sales advanced to £786,363. Other distributive societies that have met with difficulties are being supervised by the CWS with a view to ultimate absorption in the federal retail venture under the control of the directors of the CWS.

Pooling of Rice

Following the introduction of allocation systems for tea, oilseeds and meat, the Combined Food Board has recently prepared a pooling scheme for rice. Recently this scheme was formally accepted by the Government of the United States, which carries the main burden of meeting rice requirements outside the Pacific area. Normally only about 9 per cent of the world's rice production enters international trade, the remainder being consumed in the producing countries. Of world exports, which used to fluctuate around 8 million long tons per annum before the war, some 95 per cent came from countries now controlled by Japan, with Burma, Korea, Thailand and French-Indochina heading the list. Something like two-thirds of the world's rice exports were usually absorbed by Asiatic countries, including India, Ceylon, Malaya, China, the Dutch East Indies and the Philippines, while the bulk of the remainder went to Europe and Africa. Fortunately the United States harvested a record crop last year which, together with the carry-over from earlier seasons, has raised current supplies in the hands of the United States to 805,300 tons. By the Combined Food Board's scheme 276,800 tons of this total are to be allocated to Cuba, the Soviet Union, the United Kingdom, Canada and the neutral countries of Europe. In addition to the United States surplus there are small rice surpluses in Brazil, British Guiana, Mexico, the Dominican Republic, Ecuador, Chile, Egypt, and Madagascar. The total of these supplies, however, is not known, although the Combined Food Board's plan, according to an official United States Office of War Information announcement, will assure a supply in 1943 of 5 lb per head in the United States, about 3 lb in Canada and 2½ lb in the United Kingdom. It is probable that these allocations can be raised next year, as the Combined Food Board has recommended, that "every practical effort be made to increase rice production in all producing areas still accessible to the United Nations." While it is not possible to forecast the results of this recommendation, fairly extensive areas in Western Asia, Africa, and the two Americas are suitable for rice production. There is no likelihood that production of rice outside the Pacific region will ever reach a substantial percentage of world production; but as normally only a relatively small proportion of Eastern production enters international trade, the expansion of output for export elsewhere may become an important factor influencing the price of rice, and, indirectly and to a smaller extent, wheat prices on the world market.

Chairman's Copy

Special Meeting of the Directors

AGENDA

Co-operation by Company in the Battle for Fuel

1. Appointment of Fuel Watchers
Full time or part time?
Ministry of Fuel Badges.
2. Monthly Fuel Consumption in Works
3. Steam Raising
Consultation with Regional Officer of Ministry of Fuel & Power for technical advice.
Maintenance of Brick Work.
Improving pipe lagging.
X Check up on boiler - firing methods.
(Experiments with lower grade fuels.
Approach Boiler House foreman re Ministry of Fuel courses
4. Heating of Shops
Banking of boilers during after-noon.
Exclusion of draughts.
X Control of working temperature.
(Speak Welfare Committee
5. Fuel Consumption for Process work
Re-organization of production flow to keep fuel-using plant at full capacity—Write to Trade Association
6. Canteen
Maintenance of cooking equipment in good condition.
Planning menus for fuel economy.
7. Lighting
Lower powered lights in corridors, etc.
Use of localized lighting.
More frequent cleaning of reflectors.
Economy in use of overhead lights.
Write Ministry of Fuel
Total Savings to date
8. Any other business.
9. Date of next meeting. **FUEL ECONOMY?**

ROYAL BANK OF CANADA

DIVIDEND NO. 223.

NOTICE IS HEREBY GIVEN that a DIVIDEND of 1½ per cent., being at the rate of 6 per cent. per annum upon the paid-up capital stock of the bank, has been DECLARED for the three months ending 31st May, 1943, and will be payable at the bank and its branches on and after 1st June, 1943, to shareholders of record 30th April, 1943.

By Order of the Board.

E. B. MCINERNEY, London Manager.
6, Lothbury, London, E.C. 2. April 14th, 1943.

COMPANY MEETINGS

NATIONAL BANK OF EGYPT

FURTHER MARKED EXPANSION

DIVIDEND OF 15 PER CENT

ALY SHAMSY PASHA'S REVIEW

The forty-third ordinary general meeting of the shareholders of the National Bank of Egypt was held at the head office of the Bank in Cairo on the 24th ultimo.

Aly Shamsy Pasha (the President) was in the chair.

The report of the directors stated that the gross profit for the year after providing for depreciation on the Bank's buildings and furniture, for rebate of discount and for doubtful debts, amounted to L.E.1,08,549, and the directors recommended an additional dividend of 11 per cent. The total dividend for the year would thus be at the rate of 15 per cent., equivalent to £1 10s. per share.

BALANCE SHEET 31st DECEMBER, 1942

	L.E.	MM.	EST.	S.	D.
LIABILITIES					
Share Capital:					
300,000 fully paid	2,925,000	000	3,000,000	0	0
Statutory Reserve	1,462,500	000	1,500,000	0	0
Fund	1,462,500	000	1,500,000	0	0
Special Reserve	39,136,441	265	40,139,939	15	2

HALIFAX BUILDING SOCIETY

INCREASED FINANCIAL STRENGTH

BRIG.-GEN. SIR EDWARD N. WHITLEY'S ADDRESS

PRESIDENT'S ADDRESS

The following are extracts from the President's address:—

We have for many years been able to point to the undoubted strength of our country's finances and to the sound methods with which they have been administered by successive Governments. Egypt's credit built up by years of prudence, stands high; the inestimable benefits that are derived from the maintenance of her financial reputation at its present high level are apparent to all and need no further emphasis from me.

PRICE CONTROL AND COST OF LIVING

When addressing you a year ago I laid stress on certain defects in the system of price control. The continued rise in the cost of living during the past year bears out what was then said. A general rise of prices is one essential characteristic of inflation: I venture to remind you that no country that has experienced inflation has ever derived permanent benefit from it. It is enough to say that inflation creates inequities, since it lowers the standard of living of some classes of the population (those whose incomes are fixed) and confers prosperity on others without any regard to the merits and demerits of either class; it thereby creates disturbances in the social order as each economic group strives to readjust itself to new living conditions. The stabilisation of the cost of living must be the basis of a sound economy.

There can be no disagreement with the policy of successive Governments to improve social conditions, and it is with great interest that we have followed the reforms introduced during the past year.

BANK'S LIQUID POSITION

The balance-sheet which we present to you today shows further marked expansion, and reflects the favourable monetary conditions of the year. Our deposits from the general public have reached a new high level of over L.E.39,000,000, while bankers' balances are also substantially higher at over L.E.13,500,000, and we welcome this evidence of extreme liquidity. The Government balance again shows a notable increase, but it must be remembered that capital sums are included and that the increase does not necessarily signify a large surplus of Government revenue.

Trade demand for finance has been very restricted throughout the year, and there has been only limited scope for the employment of our funds. There has thus been a large increase in our investments, which I may mention include a considerable holding of three months' Treasury Bills and other short-term investments.

LARGER EARNINGS

The profit and loss account shows that earnings have risen by L.E.203,000 to L.E.1,08,549, but this increase is absorbed to a great extent by a sharp rise in our current expenses to L.E.636,406; this is due to heavy taxation payments, both here and in London, and also to a higher salary bill arising from increased cost of living allowances. The margin between increased revenue and increased expenditure though small will permit of a slightly higher distribution to shareholders, and your directors hope that the restoration of the dividend to the rate at which it stood for many years prior to the outbreak of war will give general satisfaction.

SOCIETY'S LARGE SUBSCRIPTION TO GOVERNMENT LOANS

It is the definite wish of the Government that we should do our utmost to direct the savings of our members into Government loans to pay for the enormous cost of the war, and we have therefore subscribed during the year £8,133,508 almost entirely in 2½ per cent. National War Bonds, and I am sure that all our members will approve of this substantial support.

At the same time we cannot overlook the fact that even in the present crisis some people must buy their homes, and we have advanced to borrowing members almost entirely for that purpose £2,202,463 on sound first mortgages, an amount considerable in itself but not more than a tenth of what we were lending in the years just before the war and what we may reasonably hope to lend when building by private enterprise begins again after the victory is won.

PROBLEM OF POST-WAR HOUSING

Sir Edward, in dealing with the question of post-war housing, said: The problems connected with the housing of our people are being attacked by many committees and from many angles. The Building Societies' Association, as I told you last year, appointed a committee under the presidency of Lord Sankey, to look into the question from a building society point of view. This committee, after careful consideration, has recommended to H.M. Government that when the new building begins four conditions should be fulfilled before any house is passed fit for occupation: first, that the site is in accordance with the plans prescribed by the Central Planning Authority; secondly, that the planning and design of the house is approved by the local authority; thirdly, that the by-laws, which are to be revised and brought up to date, have been complied with, and fourthly, that the materials and workmanship are certified after repeated inspection during building by some statutory body.

IMPORTANCE OF EARLY GOVERNMENT DECISION

Since our last meeting reports have been published by two Government Committees. These reports have already formed the subject of much discussion, and I do not propose to add to the volume of comment they have induced beyond urging on His Majesty's Government the vital importance of early decision, particularly on the problem of the location of industry and the right of developing undeveloped land so that those who are likely to be concerned will know how the future is to be shaped with regard to the questions with which the reports deal.

UNITED GLASS BOTTLE MANUFACTURERS, LIMITED

SATISFACTORY RESULTS

DISTRIBUTION OF 12 PER CENT

SIR WALROND SINCLAIR'S REVIEW

The thirtieth ordinary general meeting of the United Glass Bottle Manufacturers, Limited, was held, on the 15th instant, at the registered offices, 8 Leicester Street, London, W.C.2, Sir Walrond Sinclair, K.B.E., presiding.

The secretary, Mr. S. S. Kenyon, having read the notice convening the meeting and the auditors' report,

The chairman said: My Lord, Ladies and Gentlemen,—Before commencing the formal business of the meeting may I claim your indulgence for a few moments? I have been requested by my colleagues to preside today in the following sad circumstances.

THE LATE SIR MAX BONN

As mentioned in the directors' report, your board have to record with very deep regret the death on March 25th last of the chairman of the company, Sir Max Bonn. His sudden passing at a comparatively early age constitutes a very real loss to industry generally, to the other institutions with which he was intimately connected, and to your company in particular.

It was a profound shock to his colleagues, and no words are needed from me to remind you of his many sterling qualities, organising ability and outstanding kindness, coupled with a marked enthusiasm for everything he felt would improve in the slightest degree the best interests either of the company or any of its employees.

The premature passing of such a dynamic personality will, I am sure, be deplored by everyone connected with the company to the success of which he contributed so much. I would, therefore, ask you to join me in a formal mark of respect to his memory.

The meeting then stood in silence. Continuing, the directors' report and the accounts for the year 1942 have now been in your hands for some days and, with your permission, I propose to take them as read. There is little in the accounts which in present circumstances calls for particular comment, but I am confident that you will consider the various items to be both self-explanatory and satisfactory. You will notice from the assets side of the balance-sheet that investments in British Government securities at £149,983 show an increase of £30,000. During the year we also purchased £100,000 of tax reserve certificates which will in due course be set off against the amount due for taxation on January 1st next. Since the closing of the accounts the group has provided for a further investment of £100,000 in British Government securities.

SUPPORT FOR WAR SAVINGS

We welcome a sustained and in fact increasing effort throughout the respective factories in support of the war savings movement, to which your directors are always ready to give any reasonable facility and encouragement. Cash at bankers and in hand at £291,201 shows an increase of £85,202. On the liabilities side of the balance-sheet, sundry creditors' provisions at £1,059,603, show an increase of £154,381, made up of deposits by customers for returnable packages, to which I will refer again, less decrease in the amounts due for taxation and trade creditors.

The excess of floating assets over liabilities amounts to £1,055,366, and would seem to stultify the observations made last year as to the drain arising from E.P.T. being levied at the full 100 per cent. rate and the necessity for carrying as large a stock of raw materials as might be either per-

missible or feasible. The increase reflected under this heading partly arises from a change of trade practice, under which our customers are now called upon to make a substantial deposit, which is in due course returnable, in respect of each case invoiced to them. This new procedure was caused by the necessities of the timber position, and is in accordance with the wishes of the official Control.

PROFIT AND LOSS ACCOUNT

Trading profit shown at £349,033 compares with £359,049 in the preceding year. During 1942 your company has felt the full impact of increased operating costs, whilst there has been no compensating change in price or selling values. But for the regular outflow of production it would have been quite impossible to maintain the usual U.G.B. service, having particular regard to the much depleted staff and its consequent replacement by less experienced workers.

The net profits, including interest and dividends, less depreciation and full provision for taxation, amount to £194,752 (against £196,317 last year), to which is added the balance brought forward £65,922. After making appropriations to debenture redemption reserve £20,950, contingency reserve £50,000, and staff benevolent fund £12,500, there remains £177,224 available for distribution. The dividend for the year, less tax, on the 7½ per cent. preference shares, £45,050, and an interim dividend, less tax, on the ordinary shares, £19,547, have been paid, and it is proposed to pay a final dividend on the ordinary shares of 6 per cent., less tax, £33,510, making 9½ per cent. for the year (same as last year), and a cash bonus of 2½ per cent., less tax, £13,962 (same as last year), leaving a balance of £65,152 to be carried forward.

TRIBUTE TO MANAGEMENT AND STAFF

In spite of the considerable assistance afforded by the head office staff to all sections of the organisation, present-day conditions and regional controls throw a vastly increased responsibility and burden on individual factory managements. For obvious reasons I cannot dwell on the complexity of the many problems involved, but my colleagues and I take legitimate pride in the achievements of our managers, their associates and the workpeople, who have dealt so successfully with these difficulties.

Having regard to the uncertain conditions prevailing, the future outlook can only be described as somewhat obscure, and I can do no more than report to you that the first three months of 1943 have been satisfactory both as regards volume of orders and production results. Although the demands on the higher management are increasingly severe, the general condition of your company is such that it should be well able to surmount difficulties if and when they arise.

I feel I should be entirely lacking in my duty if I omitted to take advantage of this opportunity to express the thanks of your directors to Mr T. C. Moorshead and Mr H. J. Judd and through them to each and every employee of the company for their devoted and untiring work throughout a difficult year, and to extend our warmest greetings to those who have left us temporarily for service in H.M. Forces.

PAYMENT OF DIVIDEND

There has been a slight change in the procedure with regard to the payment of dividends. A large proportion of the share-

holders now have their dividends paid direct to their bankers and we have adopted the system whereby these are credited through the head offices of the respective banks. The dividend declared today will therefore be payable on April 29th.

DISTRIBUTION FOR THE YEAR

I now beg to move the adoption of the report and accounts and that a final dividend of 6 per cent. (making 9½ per cent. for the year), less income tax, and a cash bonus of 2½ per cent., less income tax, on the ordinary shares of the company for the year ended December 31, 1942, be paid, and I call upon Mr Cannington to second the resolution.

Mr. J. S. Cannington seconded the resolution and it was carried unanimously.

The retiring directors, Mr J. M. Connell, Mr C. G. G. Hayman and Mr W. Reid, were re-elected; the auditors, Messrs Cash, Stone and Company, were reappointed; and the proceedings terminated with a vote of thanks to the chairman, directors and staff.

LACRINOID PRODUCTS, LIMITED

MR T. L. HORABIN'S SPEECH

The sixth annual general meeting of Lacrinoid Products, Limited, was held, on the 12th instant, at the company's registered office.

Mr T. L. Horabin, M.P., the chairman of the company, presided and said:—

The net profit, after providing for taxation and writing down of freehold premises, is £6,523 compared with £6,207 for the previous financial year. From the profit, £1,000 was paid on the retirement of three directors during the year. Owing to the excess profits tax position of the company it is not possible to show a variation to any large extent in the profit from year to year.

Problems arising from war-time conditions continue. The labour situation in particular has not been easy. Today, 90 per cent. of our staff are women. Most of them have come to us without any knowledge of factory work, scarcely any with any initial appreciation of the skill and care which must be exercised in plastic processes. Yet they have quickly become adept at their work and have justifiably earned the title of craftsmen. The management has taken and is taking all possible steps to ensure that the factory workers are able to maintain the high quality of their work, and improvements are constantly being made so that the conditions of work are as pleasant as possible.

Practically the whole of the output has been directed to supplying Government requirements. The company's main product has always been buttons, and they are its principal product today. In our workshops we also manufacture other products for the Government. For obvious reasons I cannot go into detail. In this work we have received the fullest collaboration from the various Government departments with which we deal.

POST-WAR PLASTICS POLICY

Although buttons must always be an important part of our output, our greatest potential post-war development is in products which are at present in small demand, particularly household equipment. For some years after the war, vast housing schemes will have prior claim upon the productive capacity of this country. We must play our part in the re-housing of the people by preparing our plans now for the production of those articles which we are specially fitted to contribute towards better homes.

During the war, the use of plastics has been considerably developed. Plastics have invaded industries hitherto the monopoly of other raw materials, and there is little doubt our industry will continue to hold some of these gains when the war is over.

But we must not forget that the production of many of the older raw materials has also been considerably developed and, in some instances, a substantial surplus of productive capacity will be available when the war is over. Plastics must be ready to meet such competition. It is from this point of view that Lactinoid are considering their post-war policy.

In conclusion, Mr. Alexander Bernstein, the managing director, his colleagues and employees of the company, deserve the greatest credit for the way in which they have surmounted the difficulties which have faced them during the past twelve months. The report and accounts were adopted.

HALL TELEPHONE ACCESSORIES (1928) LIMITED

The fifteenth ordinary general meeting of Hall Telephone Accessories (1928), Limited, was held, on the 14th instant, in London.

Major The Hon. Oscar M. Guest, M.P. (chairman and managing director), presided.

His review, circulated with the report and accounts, stated: Once more the company shows an increased turnover. This is one indication of its contribution to the war effort and another is the increased size of the taxation reserve; for, as this company's

earnings exceed its excess profits tax standards, all profits above that limit belong to the Exchequer. Unfortunately it is not possible to get relief from taxation for the capital expenditure which few can avoid and therefore any such expenditure, however desirable, diminishes liquid assets. Although the company's increased activity does help the nation, yet it cannot increase the amount earned for the shareholders in present conditions.

The report was adopted.

TELEPHONE AND GENERAL TRUST, LIMITED

SPREAD OF CAPITALISM

The seventeenth ordinary general meeting of this company will be held on the 21st instant in London.

The following are extracts from the statement of the chairman and managing director, Sir Alexander Roger, K.C.I.E.: The profit amounts to £103,605, a decrease of £4,357, and it is proposed to pay a final dividend of 5 per cent. on the ordinary stock, making 8 per cent. for the year, for the thirteenth year in succession, together with a dividend of 8 per cent. on the "A" ordinary shares subject to tax.

There is an appreciation of 2.21 per cent. on the total of investments of £2,677,384, compared with a depreciation of £288 per cent. in December, 1941; 80 per cent. of the investments are in the British Empire.

A prodigious change has come over Great Britain since the war. The startling fact is that we have become a veritable democracy of capitalists. The population almost to a man, certainly to a family, either directly by investing in War Saving Certificates and National Defence Bonds or indirectly through friendly societies, trade unions, etc., have acquired a capitalist interest in Great Britain—the safest investment in the world.

The business of Great Britain, in which we are now all shareholders, is already far ahead of many industrial countries, with whom we have to compete for world trade, in the provision and relative cost of social services. If, as I believe, it is necessary for industry generally to export largely to maintain these services and our standard of living generally, we must consider whether industry is able to load the price of our goods with additional costs and still sell successfully and in sufficient quantity, or whether industry must reduce its export prices to be on a competitive basis with less advanced and less costly social services in other countries.

STOCK EXCHANGES London

Note: all dealings are for cash

SATISFACTION with the Budget was almost general throughout the markets, industrial issues improving slightly on the possibilities of post-war tax relief, while the lightness of the new indirect taxation favoured the affected shares. The gilt-edged market provided the notable exception to the general firmness. Short-dated stocks were steady, but irredeemable and long-dated issues fell away steadily. Old Consols losing $\frac{1}{2}$ and $\frac{3}{4}$ per cent. Conversion Loan $\frac{1}{2}$ among other falls. South American issues attracted attention in the foreign bond market, mainly on the belief that the Brazilian Traction dividend reflected a general improvement in the exchange position. Chilean and Brazilian issues improved a point and more. Junior and marginal preference stocks in the home rail market were firm throughout, the 4 per cent. LMS 1923 preference being prominent with a point rise, while GW ordinary improved the same amount. The prior charges were dull in sympathy with the Funds. There was little of interest in the foreign rail market apart from a rise of $\frac{1}{4}$ points for San Paulo ordinary on anticipation of the report. Argentine issues declined in mid-week, but elsewhere, Canadian Pacific ordinary improved $\frac{1}{8}$.

Apart from "Budget" shares, good features in the industrial market were few. Gains for brewery issues ranged from a few pence to 1s. 6d. and 2s. 9d. for Distillers and Guinness respectively, while of tobacco shares Imperial Tobacco and Carreras "A" rose $\frac{3}{4}$ and $\frac{1}{2}$ on the Budget statement. Textile shares were firm on the news that utility garments were exempt from purchase tax. Motor shares, however, were dull, Leyland and J. Lucas losing 1s., and Rolls-Royce $\frac{1}{4}$. Shipping shares were firm at the close of the previous week, but later lacked interest. In the heavy industrial market BSA eased on the year's results, but midweek witnessed some improvement, Sheepbridge and R. Thomas ordinary rising

1s. and 6d. respectively. Stores shares were featureless, but among the dollar stocks, Brazilian Traction rose $\frac{1}{4}$ on the increased dividend, although International Nickel lost $\frac{1}{2}$ point on balance.

In the kaffir market, demand continued to favour dividend-payers rather than the developing mines. Blyvoors fell over 3s., while Springs advanced the same amount. Gains ranged from $\frac{1}{4}$ to $\frac{1}{2}$, although profit-taking later reduced many of the early gains. Rhodesian copper shares were firm on the prospect of EPT relief; for similar reasons West African gold-mining issues hardened. Rubber issues were little more than steady, but among numerous widespread advances for tea shares, Doars and Jokai were prominent with gains of 1s. 6d. and 1s. respectively. Oil shares, although steadier than of late, failed to participate in the improvement common to most other sections. Ultramar and Pets, however, were firm on some speculative support.

New York

PRESIDENT ROOSEVELT's price and wage fixing order at the end of last week sharply reversed the upward trend of recent weeks on Wall Street. Losses ranging from one to three points were later only partially offset by some tentative buying. A further relapse was occasioned this week by the Interstate Commerce Commission's suspension of increased freight charges. Heavy selling of rail stocks was accompanied by a general decline in practically all sections.

COMMODITY AND INDUSTRY NEWS

"Utility."—The Board of Trade have made the Description of Price-Controlled Goods ("Utility") Order (S.R. and O., 1943, No. 423) restricting the use of the word "utility" in relation to any goods that are price-controlled under the Goods and Services (Price Control) Acts. The Order

provides that, except under the authority of a licence, no person may supply, offer to supply or advertise any such goods upon which, or in relation to which, the word "utility" (or any word resembling the word "utility") is used, without taking sufficient steps to prevent the use of the

word from implying a Board of Trade scheme, or suggesting the existence of such a scheme. The Order does not, of course, apply to "Utility" goods described as such in Board of Trade Orders. The Order came into force on April 5, 1943. (Continued on page 516)

GOVERNMENT RETURNS

For the 10 days ended Apr. 10, 1943, total ordinary revenue was £67,188,000, against ordinary expenditure of £187,459,000, and issues to sinking funds of £213,077. Thus, including sinking fund allocations, the deficit accrued since April 1st is £120,484,000 against £103,826,000 for the corresponding period a year ago.

April 17, 1943

(Continued from page 512)

Fat Cattle and Sheep Prices.—The present price schedules give the prices for fat cattle until June 27th, and for sheep until July 11, 1943, and for the year July, 1943, to June, 1944, will be on the same general levels as in 1942-43. Only a few minor changes will be made.

Straw Prices.—A further review of prices of straw for paper-making will be made in August. Meanwhile, prices remain unchanged till August 31st, and the Papermakers' Straw Trading Company will continue to buy baled wheat straw at £4 per ton f.o.r., or delivered to the mill, packed in compressed wire-tied bales.

Reduced Cheese Ration.—The Ministry of Food announces that the cheese ration for ordinary consumers will be reduced to 3 ozs. from May 2nd, and allowances to catering establishments will be correspondingly reduced. The ration for special classes of consumers will remain unchanged at 12 ozs., and the special allowances made to industrial canteens and certain other types of establishments will not be reduced.

Agricultural Machinery.—Since March 31st, home manufactured tractor ploughs, binders and threshing machines have only been obtainable by farmers with the approval of their County War Agricultural Executive Committee.

Soya Beans Control.—The Minister of Food has made the Soya Beans (Control) Order, which prohibits the use of soya

beans except for human food or in the manufacture of human food. It also stipulates that any person wishing to buy or sell soya beans, otherwise than by retail, must first obtain a licence from the Ministry of Food. The Order came into force on April 11, 1943.

Raw Cotton Distribution.—The Government scheme for the distribution and handling of raw cotton and the arrangement with the Liverpool and Manchester Cotton Associations have been renewed until March 31, 1944. The scheme has been in operation during the last twelve months and followed the liquidation of Cotton Importers and Distributors, Ltd. The Liverpool and Manchester Cotton Associations have decided to continue the care and maintenance scheme.

"THE ECONOMIST" SENSITIVE PRICE INDEX (1935=100)

Head Office: 38, BISHOPSGATE, LONDON, E.C.2

West End Branch:

28, CHARLES II STREET, HAYMARKET, S.W.1
Manchester Branch: 52, MOSLEY STREET
New York Agency: 65, BROADWAY, NEW YORK CITY

LLOYDS BANK LIMITED

EXECUTORS AND TRUSTEES

The appointment of individuals as Executors and Trustees imposes on them heavy burdens and duties which they are not always in a position to fulfil. Especially is this the case in wartime, when life is so uncertain and so many difficulties arise in the administration of estates.

When the Bank is appointed, continuity is assured and a Testator can rely on his estate having the benefit of skilled and experienced management in connection with his investments and with the many other matters incidental to its administration.

The services of the Bank's Executor and Trustee Department are available to customers and non-customers of the Bank. A pamphlet giving terms and particulars will be sent free of charge on application to any Branch.

Head Office: 71 Lombard Street, London, E.C. 3

ASHANTI GOLDFIELDS CORPORATION LIMITED

NOTICE IS HEREBY GIVEN that a Final Dividend (No. 99) of 35 per cent., less Income Tax at 10s. in the £, has this day been RECOMMENDED on the Issued Capital of the Corporation in respect of the year ended 30th September, 1942, and will be payable on and after the 6th May, 1943, to all Members on the Registers on the 8th April, 1943.

The Walls of Jericho

THE news that General Montgomery has launched a new offensive against the Axis positions at Enfidaville brings to an end a week of universal lull in the fighting. In Russia the spring thaw and in the Far East the approaching monsoon will continue to immobilise the fronts, and for the next weeks Tunisia may be the only centre of military activity.

The appearance of a lull is illusory. Everywhere the military machines are being toolled up for the coming offensives, and in Germany, at least, a major campaign of political warfare is preceding the expected clash of arms. There is a spate of writing and talking and a coming and going of diplomats such as Europe has not witnessed since the last desperate attempts to salvage peace in 1939. In all this activity, the Germans have a sort of tactical initiative even although the grand strategy of the war is no longer theirs to control. Their doings are by no means aimless. Behind them lies a military and political pattern, the pattern of a defensive war.

Hitler announced the opening of this phase at the end of 1942 and the winter defeats in Russia have made the plan more urgent. The pivots of it are, of course, a stabilised Russian front and the Atlantic Wall, but even for this defence line, more soldiers are needed. The Ger-

mans are caught in the dangerous spiral of an insufficient labour supply. So total is mobilisation, that a man cannot, practically speaking, be moved from anywhere to the front without a corresponding loss to war output. Hitler needs more men to replace the thousands lost before Stalingrad. There is a limit to the number he can squeeze out of occupied territory without the active co-operation of the authorities concerned, and the extra men who might be called in to supervise the call up and intimidate the recalcitrant are themselves needed at the front or in the war effort. The Germans must therefore try to increase the amount of voluntary co-operation hitherto received, but they must do it without using a show of force, which would only entail a further waste of manpower.

On the face of things, it seems fantastic that Hitler at this stage should reverse his earlier "new order" policy and seek to win the collaboration of peoples he has pilaged for over two years. But this is undoubtedly the underlying strategy. The first line is the offer of better conditions. Gayda published a summary of the new "new order" in the *Giornale d'Italia* of April 4. He grouped it under six headings: "recognition of the right of all national European states, great and small, to liberty,

independence and full sovereignty"; permanent collaboration between the European peoples on the basis of their common interests and civilisation; a just redivision of the earth's goods and raw materials; freedom of national and economic development for each nation; freedom of the seas and of trade; "justice and social peace within every state." This attractive programme is having little effect—the peoples of Europe have had to endure a lot of rhetoric in their time; but it gains a certain importance, partly because the Germans are at the same time exploiting, with some success, the Bolshevik bogey, partly because some of the concessions offered may be real. Germany's desperate need has given a little elbow-room to all the satellites, and in the case of Boris, Horthy, and Antonescu possibly, and of Mussolini and his advisers certainly, the recent meetings with the Fuehrer did not end with the issue of marching orders, but were genuine negotiations with concessions from both sides.

The picture the Germans are trying to build up is of a condition of impenetrable siege within the *Festung Europa*, protected on both east and west by two stabilised fronts. The German Press is full of accounts of the Atlantic Wall—"not a man without reinforced concrete covering" is said to be the Fuehrer's new slogan. However, the mere building of a picture is far too gradual and passive a method. The Nazis' chief concern is to use the background of feigned security for a vigorous political offensive against the West and against the "doubters" inside Europe. The damning of Russia as the beast from the pit continues, and new atrocities have been brought to light by the Germans just when Polish-Soviet relations have reached a rather delicate stage. The "defence of European civilisation" is plugged incessantly and, if Dittmar is to be believed, volunteering for the anti-Russian army has improved in Eastern Europe. In propaganda to Britain and America, peace offers accompany the anti-Soviet line. Count Jordana has obligingly come out with an offer to mediate; Gayda has openly spoken of the Axis' readiness for a patched-up peace with anyone except Russia; Weizsaecker, one of Germany's most experienced diplomats, has been sent to join Ciano at the Vatican to see, no doubt, what cross-currents can be picked up, and what rumours can best be set in motion.

Budget White Paper—II

The National Income

THE White Paper issued with the Budget professes to deal with the two subjects of "the sources of war finance" and "the national income." As was pointed out in the article in *The Economist* last week, which discussed the first of the two subjects, it is impossible to keep them apart, especially in wartime, when the activities of the state occupy so large a proportion of the total national economy. But at bottom the two questions are distinct. The first, and smaller, of the two can be phrased in ordinary language as "where does the Government get the money to pay for the war?" and it was to this that last week's article was chiefly addressed. The second, and more embracing, question is "How does the nation as a whole make a living, and what does it go on?" It is this that the present article, with the assistance of the White Paper, will attempt to elucidate. It should, however, be said at the outset that there are still gaps in our knowledge that the White Paper, improved as it is from year to year, does not fill. The official estimator must proceed cautiously; the private statistician can afford to take a few more risks if by so doing he can make the whole subject more intelligible. It is believed that the picture presented in this article is true in its major proportions; but it must not be held to precise accuracy.

What is the size of the national income? It has been

The picture has a certain consistency, but only because the darker colours have been left out. Europe may be a fortress, but bombs do not stop short at concrete emplacements on the sea shore. All travellers from Germany are agreed on the really devastating effect of the raids. The grandiose talk of "free economic development" covers an ugly reality, in which there is no slack to take in and no possibility of any added output. Above all, there are signs—of all things most dangerous to a dictator state—of a crisis of confidence in Germany. In his broadcast to the Germans on April 19, Goebbels had actually to apologise for the Fuehrer's absence, to explain away his depression and fatigue and remind his hearers that

If a people must shoulder a great risk to preserve its existence, it is better to ban the devil of doubt and discord . . . Confidence is the best moral weapon of all. If that begins to be found waning, it is the beginning of the end.

The Nazis are planning and manœuvring desperately to make the best of a very bad job, but the answer of the Allies should not be to rely on Germany's difficulties to bring the whole edifice tumbling down. There should be no confusion of Hitler's European fortress with the walls of Jericho. Marching round seven times, blowing trumpets, will not bring them down. The Allies have to be as resourceful and resolute in their offensive strategy as the Nazis are seeking to be in their defensive. First of all, against the prattle about mediation and negotiated peace the Allies must reiterate the unconditional surrender clause of Casablanca. Far more urgently, they must set about their fighting now. The Atlantic Wall may yet be the Germans' Maginot Line, but only on condition that it is attacked and turned. The time factor is crucial. Just as in Tunisia the loss of initiative in the first stages cost the Allies months, so any delay in Europe may cost them years. Hitler's greatest weapon against the Grand Coalition has always been their illusion that time is on their side. A year's successful defensive strategy will not weaken the Germans. They might gain a space in which to bind their wounds and make good their deficiencies. Hitler is obviously playing for time. It is the one thing the Allies *must* see he does not have.

pointed out at length in these columns in previous years that there are several possible definitions of what is loosely called "the national income." It is not proposed to repeat this discussion here; it must suffice to say that the official estimates are of "net national income at factor cost"—"net" because it is arrived at *after* (financial) provision has been made for the maintenance and replacement of existing capital, and "at factor cost" because it takes no account either of the inflation of money values caused when the state imposes indirect taxes which are added to the prices of articles of consumption or of the corresponding deflation of money values that occurs when the state grants a subsidy. But for many purposes both these missing elements are needed. When income is to be compared with expenditure, the comparison can best be done, not at "factor cost," but "at market price," for it is in terms of the latter that statistics of expenditure are kept. This adjustment is easy. And though for many purposes it is as well to know the size of the *net* national income, the layman will find it easier to understand a conception that embraces the whole flow of goods and services produced in a year, rather than one that concerns itself only with a part—though admittedly the larger part—of the total flow. Unfortunately, this adjustment from net to gross cannot be made accurately, since no figures

are available of allocations to depreciation accounts, sinking funds, etc. This is the most serious lacuna in present British statistics, but until it is remedied the statistician is compelled to resort to the most unsatisfactory device of adding a fixed sum of £475 million each year—this being the tentative estimate advanced in last year's White Paper.

With this preliminary explanation, the balance sheet of income and expenditure can be set out for 1938 and 1942.

INCOME		EXPENDITURE		
	1938 (£ mn.)	1942 (£ mn.)	1938 (£ mn.)	1942 (£ mn.)
Net national income at factor cost	4,490	7,384	Expenditure on:—	
Indirect taxes <i>less</i> subsidies	622	1,219	Consumption	4,035
			Government	845
Net national income at market price	5,112	8,603	Maintenance and increase of domestic capital	(762)
Depreciation, etc., funds	(475)	(475)		(302)
Gross national income at market price	5,587	9,078	Total	5,642
				9,710

The third item on the expenditure side—"expenditure on the maintenance and increase of domestic capital"—was, in 1942, insufficient to maintain the existing capital of the country. The difference between the totals of the two sides, amounting to £55 million in 1938, and £632 million in 1942, is the volume of overseas disinvestment (drafts on capital).

Direct comparison of the two years in the above table is prevented by the great change in the value of money. This year, for the first time, the White Paper includes estimates of the real volume of consumption; the money rise from £4,035 million to £4,800 million conceals a fall of 18 per cent in real terms. The White Paper explicitly states that these price ratios do not apply to Government expenditure. For obtaining a view of what has been happening to the national economy, it is most important to be able to translate the money figures into real terms, and it is, therefore, here proposed, despite the warning in the White Paper, to guess at the change since 1938 in the value of money when spent on the objects of Government expenditure. The rise in these prices will be considerably less than the 45 per cent increase in market prices of consumption goods. For one thing, the inflating effect of indirect taxes has been much smaller on the sort of goods that the Government purchases than on consumption goods. For another, while the efficiency of the consumers' goods industries has been declining, under the pressure of the call-up and other wartime difficulties, there has been a growth in the efficiency of the munition industries. It is proposed to assume a price rise of 30 per cent in 1942, of 25 per cent in 1941, and of 15 per cent in 1940. These figures are nothing but the merest guesses; but it is unlikely that their inaccuracy seriously affects the results. The same proportions are applied to capital expenditure. With these adjustments, the figures for later years can be translated into "1938 pounds"—that is, into pounds of the purchasing power they had in 1938:—

(millions of pounds of 1938 purchasing power)

	1938	1940	1941	1942
1. Consumption	4,035	3,551	3,408	3,408
2. Government expenditure	845	2,660	3,355	*3,545
3. Maintenance and increase of domestic capital	762	395	220	232
4. Overseas disinvestment	— 55	— 658	— 638	*— 485
5. Gross national income	5,587	5,948	6,345	6,700

* 1942 was the first complete year in which Lend-Lease was in operation; this has the effect of making both Government expenditure and overseas disinvestment less than they would otherwise be.

From these figures it is possible to show in simple and precise (and probably fairly accurate) terms from what sources the community has gathered together the formidable aggregation of men, materials and machines with which it is fighting the war. Government expenditure, in terms of 1938 pounds, has increased from £845 million to £3,545 million and the increase can reasonably be taken as the cost of the war in 1942. The sources from

which this increase has been met are shown in the following table:—

	Millions of 1938 pounds
Cost of the war in 1942 (increase in item 2)	2,700
Derived from:—	
Increased production (increase in 5)	1,113
Reduced consumption (fall in 1)	627
Reduced provision for domestic capital (fall in 3)	530
Overseas disinvestment (change in 4)	430
Total	2,700

This table is a statement, clearer than has ever been possible before the present war, of what happens to a national economy (or rather to the British national economy, for other nations are differently placed) when it is subjected to the strains of total war. The figures are unlikely to be precisely accurate; but it is the general picture they draw, rather than the precision of the estimates, that is important. They permit three significant generalisations to be drawn.

First, the cost of the war in 1942 was, in real terms, almost half the Gross National Income of 1938—that is to say, the community succeeded in 1942 in devoting to the purposes of war an aggregation of goods and services equal to half of its total gross output before the war.

Secondly, this total cost was met, as to rather more than two-fifths, by increased production; as to rather less than a quarter by reduced consumption; as to one-fifth by failing to maintain—still less to increase—the domestic capital of the country; and for the rest by drawing on the accumulations of overseas capital or by going into debt to foreign countries.

Thirdly, about two-thirds of the real economic burden of the war is being borne by the generation that is fighting it, by the means of working harder and consuming less.

But the final third is being met out of the accumulations of past generations, or left to be carried by posterity. The fraction of one-third is larger than was thought possible at the beginning of the war. This has been unavoidable. But it is the measure of the permanent economic effects that the war will leave behind. The productive equipment of the nation will not have been maintained; and its income from abroad will be both curtailed and mortgaged. These facts cannot be ignored. The magnitudes involved are not enormous; the sum of overseas disinvestment and domestic under-maintenance for all three war years is about £2,000 million at 1938 prices, or less than half of a year's *net* output. But neither are these sums negligible and they will affect the post-war standard of living. Before the war, the attainment of Full Employment would have raised the standard of living; after the war, it will be needed to keep the standard of living at the pre-war level. Before, the alternative was between more wealth and more leisure. The war has not yet had such costly permanent effects that we shall have to produce more and consume less; but we shall be faced with the choice of more production or less income. That, in the long run, will prove to be the economic cost of Hitler.

WHITE PAPER STATISTICS

By a most regrettable error, Table B from the White Paper was reprinted in *The Economist* of last week (April 17, page 498) under the heading "Personal Expenditure at Constant Prices." This should have read—

PERSONAL EXPENDITURE AT MARKET PRICES.

Readers preserving the tables for reference should make the correction in their copies.

Russia's Trade—II

THE question which follows from the survey of Russia's foreign trade in the inter-war period is: Under what circumstances will Russia be able or willing to switch over from self-sufficiency to international trade? What are likely to be the forces impelling her in that direction, and what are the foreseeable obstacles?

The factors which are likely to favour a re-orientation of Russian trade policy have frequently been described in the columns of *The Economist*. They are: the devastation of industry and agriculture throughout Russia's western fringe; the exceptionally extensive rate of unreplaced wear and tear in Russian industries at large, and in Russia's mechanised agriculture; the shift of the centres of gravity of Russian economic life to the Urals and to Asia; and the new relationship to the outside world in which Russia will find herself as a result of Lend-Lease and Reciprocal Aid. The ultimate scope and strength of each of these factors cannot be gauged while the war is still on; but it seems safe to assume that, on balance, they will tend to make Russia more dependent on foreign trade than she has hitherto been.

While all this is true, it would, nevertheless, be a fallacy to think that the changes brought about by the war will compel any abandonment of autarky by Russia. No automatic results can be taken for granted. It is true—at least on the face of things—that the rebuilding of Russia would be greatly helped by an ample supply of goods from abroad. The war has obviously interrupted, for a time, Russia's economic advance, and will have thrown the country back to a level substantially below that reached through the enormous effort of the three Five-Year-Plans. After this war, Russia may in some respects find herself confronted with difficulties similar to those she had to overcome after the civil war. But there will also be one decisive difference. In the early 'twenties Russia started the work of reconstruction from scratch. The level from which she will start this time will, of course, depend on the duration of the war; more than for any other country, the prolongation of hostilities spells for Russia the destruction of fixed capital and labour reserves. But it is almost certain that her productive capacity after the war will, in any case, be sufficient to allow for a tempo of reconstruction considerably quicker than that of the 'twenties. Russia cannot be thrown right back to the old starting point. The permanent achievements of industrialisation will be Russia's great assets after the war, as they have proved to be during the war, no matter which course—autarky or international trade—is set.

In theory, it should be possible for Russia to make one or two Five-Year-Plans of Reconstruction, based almost exclusively on the use and development of domestic resources. The volume of productive capacity with which the country emerges from the war would then constitute the initial material basis for new economic expansion. There is no reason why a totally state-owned industry and a state-controlled agriculture should not be able to cope with that task—within the framework of a closed national economy. The scope for achievement is given by Russia's vastness and by her immense natural wealth.

But the drawbacks of autarky are obvious. They would reproduce on a much wider scale and with greater force all the familiar features of the inter-war period: the lack of balance between producers' and consumers' goods; the chronic under-consumption of the people; the low productivity of labour; and so on. The domestic resources of a closed national economy at any given time are limited. The amount of resources that is allocated to producers' goods sets absolute limits to the proportions of fixed capital, raw materials and labour which can be spared for the production of consumers' goods. Any autarkic scheme for reconstruction would again be bound to give priority to heavy industries at the expense of consumers' goods,

probably over a period of many years. "Structural self-sufficiency" turns out to be a rather elusive phantom. True, the statistician may again prove—as he did in the past—that his country has been able to cover a hundred per cent of its needs of tractors by home output, instead of by import; but this will be so because 50 or 60 per cent of the domestic need for, say, textile machines will not be covered at all. The balance would be even more heavily turned against consumers' goods if soon after the war Russia had to draw on her shrunken domestic resources in order to make massive repayments for Lend-Lease, or in order to meet new and large defence expenditure—both of which are not impossible consequences of an all round relapse into autarky. The question whether, or for how long, Russia would be able to bear all these burdens, after three decades of more or less pronounced under-consumption, belong to the sphere of politics rather than to that of economics.

A conversion from autarky to international trade ought to provide easier solutions for most of the problems. But here the short term prospects are distinctly different from the long term ones. Immediately after the war, Russia's export capacity will be very considerably reduced (except perhaps in oil and timber); so that she will be able to benefit only to a limited extent from the sellers' markets which can be expected for a few months, or perhaps years. In this period of the sellers' market it will be her fate to appear mainly in the rôle of buyer. From the outset, therefore, the crucial question will be posed: the extent to which Russia will be able to resume full membership in the world trade system will depend on the extent to which that system is given a liberal character and is assisted by a liberal credit policy. This will, of course, be equally true for most of the European countries, but Russia is likely to provide the most extreme and striking illustration of the general rule, and the economic implications are bound to be more far-reaching and novel than in any other country.

In the somewhat longer run Russia will, of course, recover her full export capacity. Two phases can be foreseen. At first, Russia will remain predominantly an exporter of primary products. Two or three good harvests may make it possible to spare large surpluses in cereals, which together with oil and timber have formed the bulk of Russian exports in the past. Cotton, the cultivation of which has been greatly expanded in some Asiatic provinces, may become a new item in Russia's export trade. But it is hardly likely that in the long run Russia will put up with the rôle of an exporter of primary products. The doctrine of industrialisation has struck too deep roots in the minds of the Russian people. The present generation of Russia's economic leaders has been accustomed to think of trade between primary producing and manufacturing countries in terms of "colonial or semi-colonial exploitation." The experiences of the Great Depression, in which Russia was so severely handicapped by the disparity in the prices of primary products and manufactures, could only confirm this attitude. In the longer run, therefore, the tendency to industrialise exports is most likely to become the dominant feature of Russian trade policy. This tendency was already explicit in the inter-war period; and it was a point of national pride that in a number of articles Russia was able to change from an importer into an exporter. This was true of agricultural machines, motor-cars, tractors, textile machines, sewing machines, electrical bulbs, iron ore, coal and coke, asbestos, cement, fertilisers and tanned leather. The quantities exported were admittedly very low; and after the war it will certainly take a considerable time before Soviet exports can assume a predominantly industrial character. It may require even more time before Russia is able to compete successfully with other industrial exporters on European markets.

In this context, the geographical trends of Soviet trade are of some interest.

THE SHARE OF INDUSTRIAL COUNTRIES IN RUSSIA'S IMPORTS

(In percentages of the total)				
	1913	1926/27	1930	1937
United Kingdom	13	14	7	15
USA	6	21	25	19
Germany	48	23	24	16
France	4	3	3	2
Japan	0.3	0.5	2	4

The striking feature is the decrease in Germany's share and the increase in imports from the USA. The British percentage has on the whole remained stationary with intervening fluctuations. The recent rise in imports from Japan is explained by the needs of industrialisation and electrification in the Soviet Far East. On the export side the position is somewhat different.

THE SHARE OF INDUSTRIAL COUNTRIES IN RUSSIA'S EXPORTS

(In percentages of the total)				
	1913	1926/27	1930	1937
United Kingdom	18	26	27	33
USA	1	3	4	8
Germany	30	22	20	6
France	6	7	4	5
Japan	0.1	2	2	2

Among the great industrial countries, Great Britain was the main buyer of Russian goods. The United States' share was steadily growing, but not in proportion to the growth of Russia's imports from the USA. The German market was definitely losing its importance for Russia. The basic trends reflected by the two tables are almost certain to continue after the war.

An analysis of Russia's trade with her Asiatic and European neighbours also shows some interesting trends. For the purpose of the comparison the Asiatic countries—Afghanistan, India and Ceylon, Iran, China, Outer Mongolia and Turkey—have been grouped together under one heading, "the Asiatic Zone," and Scandinavia, the eastern and central European and the Balkan countries have been grouped under the heading of "the European Zone."

NOTES OF THE WEEK

On How Many Fronts?

The United Nations' bomber offensive against the Axis is still growing. The events of last week-end marked another stage in the crescendo, and suggest that it will not be very long before attacks come from all points of the compass at all times of the day and night. Round the clock bombing is now being systematically developed. On Saturday, April 17th, the raid which the USAAF made on Bremen by day was followed by RAF night attacks on Skoda and Mannheim. Over the same week-end, the Red Air Force attacked Königsberg and Danzig from the east. Meanwhile, Italy and Sicily are being bombed both from the north and from the south, by planes based on Britain and North Africa. This cross play is only in its earliest stage, and it will grow. The war on two fronts is outmoded. Since the third dimension has been called in, every enemy target is potentially threatened with attacks from every direction. The significance of this, from the standpoint of German industrial location, is that nothing is safe. Time, labour and materials spent in industrial evacuation are a waste of resources. No arsenal, however central and remote, dare fail to be equipped with the strongest defences. The force of men and material in the German AA and searchlight commands, not to speak of civilian ARP, which is contained by the bomber offensive is increasing. The size of the artillery bombardment which is blown into the air, daily and nightly, cannot be far below the scale of the artillery barrage before Alamein. British losses in the raids on Skoda and Mannheim were exceptionally heavy; 55 planes out of 600. But, even judged against the damage directly inflicted on the targets, the profit is worth the loss. Relatively, the American raid on Bremen, one of the first heavy United States raids on Germany, was also costly. The USAAF is

THE SHARE OF THE TWO ZONES IN RUSSIA'S TRADE				
	1913	1926/27	1930	1937
<i>In imports:</i>				
Asiatic zone	15	16	12	16
European zone	9	11	15	6
<i>In exports:</i>				
Asiatic zone	9	11	13	15
European zone	13	17	12	8

Russia's interest in the Asiatic market was growing steadily, whereas her interest in the European sphere to the north, east and south of Germany was on the whole declining. Russia could not hope to compete successfully with the other industrial countries in Europe; in Asia, however, she enjoyed the advantages of geographical proximity, advantages which will be even greater to the extent that it proves possible over the years to industrialise Russian exports. The transfer of industries to the east points in the same direction. It may, therefore, be guessed that the pre-war trends will continue. In a world market that permits of multilateral trade, Russia will tend to sell to Asia in order to cover her excess of purchases from the great industrial nations of the west.

But this long-run development will inevitably be affected by the fact that Russia will emerge from the war as a debtor nation. From the point of view of the Russian economy in the inter-war period this marks a decisive turning point. It was Lenin who used to repeat (after J. A. Hobson?) that the interdependence between creditor and debtor is, as a rule, much closer than that between buyer and seller. On the one hand, that "closer interdependence" may result from Lend-Lease. On the other hand, it is bound to be enhanced by Russia's peculiar position in relation to the world market, during the critical period immediately after the war. She will need very large imports; but she will also need a long breathing space, before she can pay for them by her own exports. Any hope of bringing Russia back into the western system of international trade will be shattered if she is not given the means of affording an adverse balance of payments during the first years after the war. The extent to which this change will affect the monopoly of foreign trade and the whole currency and credit system which was established in the inter-war period will form the subject matter of the last article of this series.

still only at the beginning of its offensive against the Reich, but the scale is mounting.

* * *

Tightening the Screws in Italy

According to travellers recently in Italy, there is at last a real sense of tension among the people. Hitherto, the war, though detested, was shrugged off. People felt that somehow they would manage and that it was all a long way off. Two years ago, Ansaldo made his "Woe-woe" speech, accusing the Italians of being more interested in football than Abyssinia. Until recently, that happy-go-lucky temper prevailed. It had its advantages. Revolts have never started among careless and indifferent people. There was at no time the slightest danger of the split in the regime

THE BRITISH LINEN BANK

so confidently expected in some quarters outside Italy. This year the temper has changed. The losses on the Russian front, the loss of the Empire, the bombing raids have introduced completely new factors into the experience of the Italian people. After months and months of "phoney war," the bitter reality is upon them, with worse to come. The problem facing the authorities is how the Italian people will react to the new severity? Will they stiffen, like the British after Dunkirk or the Germans after the first winter campaign in Russia? Or will they crack? The recent increase in supervision suggests that Mussolini is inclined to take no chances with his warrior nation. For some time past, the Fascist party officials have been called on to increase their activity and vigilance. It looks as though the former party secretary, Vidussoni, has not proved energetic enough for the new drive for total control. Scorza, who replaces him, is an Old Guard Fascist, a militia man with a reputation for toughness. It is no coincidence that the Chief of Police has been changed at the same time.

Coal Production

The exceptionally mild winter and early spring may tend to make the public forget that a serious coal position still faces this country, and Major Lloyd George gave a timely reminder last week-end that the coal crisis is by no means over. Production, which should normally be going up at this time of year, is each week 100,000 tons less than in the same week of last year—and this in spite of the fact that there are 5,000 more men in the industry than a year ago and in spite of the campaign for increased output and the publicity surrounding the "Battle for Fuel." Various reasons for the drop in productivity have been advanced, such as the growing age composition of the labour force, the fact that the best men are in the Forces, the failure of the district output bonus scheme and the miners' dissatisfaction with their working conditions; but none of them seem adequately to answer the question—what is wrong with the coal industry? It is to be hoped that there will soon be an opportunity for the Minister to throw some light upon the matter and to report upon what progress has been made with the scheme for reorganisation which was projected last June. The Government's White Paper indicated that output would be increased by concentration of men and machines on the most productive pits and seams, the introduction of more mechanisation, the grouping of pits and in general an extensive rationalisation of the industry. Such a programme should be beginning to bear fruit by now; instead, coal output is down and productivity per head is low. In view of the need to increase production this summer in preparation for the winter, every possible measure should be taken to increase the efficiency of the existing resources, since little fresh intake of labour can be expected. It is clear from another twelve months' experience that no plan of reorganisation, however far-reaching and drastic, can now be safely dismissed or deferred, if it would have the effect of increasing output—and similarly that no plan can be considered at all unless it would have that effect. Meanwhile, consumption will have to be further curtailed, and it is to be hoped that the plan for fuel rationing, which was turned down last summer, is being kept in cold storage and has not been relegated to a Whitehall shelf. A more immediate problem is the difficulty that has developed in connection with the Greene conciliation scheme which is due to come into operation on May 1st. The Northumberland and Cumberland miners object to the provision that makes reference of district disputes to the National Tribunal dependent upon the agreement of both sides.

The Laws of the Republic

The discussions of the French National Committee on General Giraud's memorandum closed on a more optimistic note than was generally believed possible. The full text of this memorandum has now been made public. General de Gaulle's reply, which General Catroux has conveyed to Algiers, is known to contain certain stipulations and amendments, but the sphere of agreement is considerable. The generals are apparently agreed that the aim of all resistance and military effort is to restore the laws of the Republic in force before June 22, 1940, and to arrange for the holding of free elections. Unanimity on this point is, of course, of tremendous, overriding importance. Before it, all differences

of method appear insignificant. But it still remains true that the form of provisional government and the relation in the meanwhile between the civil and military authorities will have a very marked and enduring influence on the type of freely elected government which eventually comes into being. These questions—the composition of the provisional executive, which General Giraud proposes to call the French Council for Overseas Territories, and the relation between civil and military authorities, from the time when the Council is set up until the time when France is wholly liberated—are still open. In theory at least, it is all plain sailing from the moment French soil is freed. The departmental *Conseils-Généraux* choose by secret ballot delegates to form a Government in accordance with the Law of February 15, 1872. This body arranges for normal elections to be held when the workers and prisoners are back from Germany. Then, the nightmare will be over, and July 14th will again be a national festival. But the agreed aims of both generals can only be realised if there is in the meanwhile an almost superhuman determination not to exploit the situation. It has often been claimed that the French collapse took place because the democratic constitution was rent by irreconcilable extremes. The point has never been proved, but it will be proved, one way or the other, by the interim negotiations. The provisional government must not be a party affair. Fear to represent in it all the shades of opinion that can be represented, and exaggerated suspicion of the civilian by the military, or of the military by the civilian, could still prevent the resurrection of French democracy.

Martinique Moves with the Times?

As things stand at present, agreement with Admiral Robert of Martinique and Guadeloupe remains out of the question. But his letter to the Associated Press certainly represents a move away from his former pro-Vichy intransigence. Apparently, there are terms on which the Admiral would consider joining the Allies; and the terms amount to being allowed to have a foot in both camps. Thus, Admiral Robert must be assured that he will not be forced into rebellion against the "French Government." In the circumstances, no absence of plain speaking can make this mean anything but Vichy. Yet, he stipulates that the Allies must vest French sovereignty in a unified Fighting French movement. This statement of his position puts Admiral Robert out of court. He cannot serve Vichy and the Republic. It also throws into relief the large measure of agreement between Generals Giraud and de Gaulle. There is between both of them and Admiral Robert a real difference of principle such as does not now exist between the aims of their own two movements. It would, of course, be absurd to insist too rigidly on the logical inconsistencies of the Admiral's attitude. After all, it is either an attempt to climb down gracefully, or an attempt to show bogus good will by imposing terms which he believes to be impossible. If the Admiral wishes, at the eleventh hour, to insure his personal future, he will have to try again.

Reinstatement in Employment

A recent case heard in the High Court revealed the extraordinary position that may arise from the operation of the Essential Work Order. A certain firm, Ultra Electric, Limited, applied successfully to the national service officer on May 18th last year for permission to dismiss seven employees on the ground that there was no work for them. One of these employees appealed, under the terms of the Order, to a local appeal board, which recommended to the national service officer that she should be reinstated in the firm's employment from August 10th. The firm was given a direction to this effect. But when the employee presented herself for work on that date, there was none available. She was told, however, that she would receive her wages, and she continued to receive them though she was never given any work to do. The national service officer thereupon preferred an information against the firm on the ground that it had not reinstated her in employment, but the magistrates dismissed it, and the High Court upheld their decision. In giving judgment, Mr Justice Charles said that reinstatement in the circumstances of the order connoted the putting back of a person, so far as was humanly possible, in the same position as he or she was when dismissed. He disagreed with the idea that the giving of work was not to have any consideration, for "work" and "wages" were closely linked up in the order. But it was

quite clear that the firm in question had done all they could to give their employee work when she appeared on August 10th; consequently, although there was no work for her to do, they had reinstated her. The immediate interest of this case is that it has shown the fallibility of the Ministry of Labour's local appeal boards. At a time when every pair of hands is wanted, one pair is allowed by the law to remain idle though its owner is receiving wages of £2 12s. 3d. a week. But Mr Justice Charles enunciated some principles which should have a wider application. Reinstatement, "so far as humanly possible, in the same position as he or she was when dismissed..." and the inseparability of work and wages—these, it is hoped, will eventually be the guiding principles of unemployment policy, disability benefits and workmen's compensation.

Local Government Reform

As the Government's reconstruction plans are gradually made known, it becomes more and more clear that the pre-war mistake of burdening local authorities with tasks for which they are unfitted still prevails. The health services, education, housing, town and country planning—in all these cases, it seems, the local authorities are to continue to be the agents of the central government, although before the war many of them had shown themselves unable to carry the load. Central government must, of course, be administered locally. The question is, should it be administered by local branches of the central government or by the popularly elected local authorities, and, if the latter, how can they be fitted to do so? The Labour Party's reconstruction committee has no doubt that it is the popularly elected local authority system which must be preserved. It forms, says a report to be submitted to the party conference, "an essential part of the framework of our democracy." But the report is equally sure that it must be radically reorganised. This reorganisation, it is proposed, should be based on the now familiar device of regionalism, but a distinction is drawn between wartime regionalism, which is central government writ small, and the Labour Party's own proposals, which would be local authority writ large. Briefly, the report suggests a regrouping of local government areas, mainly on the basis of the present county areas, but well-balanced with regard to industry, agriculture, commerce and residence. Within each region there should be area authorities to administer purely local services—as an example of the division of function, it is suggested that hospitals and health centres, ambulances and the school medical service should belong to the region, while maternity and child welfare should belong to the area authority. It is strange that the committee seeks to preserve the old rating system, though admittedly drastically revised, and did not even discuss other means of raising local revenue, such as a local income-tax. Indeed, the question of finance is crucial. No authority can have the virtues of independence unless it has independent sources of finance, which certainly cannot be derived from the rating system. But with the main idea underlying the administrative proposals, there will be general agreement, and it is worth noting that, in the only hint so far given of the Government's policy for local government reform, the Minister of Health spoke of the need for larger local authority areas. What is essential is that reform should come before reconstruction plans are formulated, not after.

The Health Services

The Labour party's reconstruction committee has followed up its proposals for local government reform with a scheme for a state medical service. Unlike the Government, it has at least put first things first, for a precondition of its scheme for the health services, and of any scheme to be administered by the local authorities, is the reform of local government. But the committee's report on the health services suffers from this sensible and logical procedure, because so much has been written and said about them in recent months that its recommendations read like clichés. A health service that is preventive as well as curative, comprehensive and open to all—such unexceptionable principles have been accepted by Government, doctors and public alike since the publication of the Beveridge report and even earlier. Nor is there anything really new in the proposals for making these principles effective. A central health authority, local health authorities, a co-ordinated hospital system, health centres and a specialist

and consultant service—these, too, have a very familiar ring. But on a point which is still at issue among many of the health reformers, the Labour party has taken its stand, and that is on the question of doctors' payments. It recommends that they should be full-time, salaried and pensionable state officials. They are, apparently, to be allocated where they are needed, and can be sent to Durham or the Rhondda Valley, rather than to Harley Street, if the authority so desires. How this squares with the freedom of choice of doctor—and of patient—is not clear. Possibly the Labour party considers it unimportant, though it regards good doctoring as "a very individual business," and states that patients should be able to change their doctors if dissatisfied. But it is just this question of how to square the socialisation of administration with extreme individualism in practice that makes it so difficult to plan the medical services. The one must be secured, the other must be preserved. But a complete answer to how it is to be done has not yet been given.

Debate in a Vacuum

The debate in the Lords on Lord Cecil's motion that the Government should outline more specifically its plans for the setting up of an international authority was an interesting review of the Government's earlier pronouncements, but it did not achieve the desired result. Lord Cecil and Lord Davies were undoubtedly led to raise the question by their concern over the lack of definition in almost all the official utterances on post-war co-operation. Lord Cranborne, save on one or two points, referred them back to the Prime Minister's broadcast and to Mr Eden's recent speeches—which is where they had started from. Several points were, however, underlined—the complete unanimity of all shades of political opinion on the need for international organisation; the Government's determination to accept full responsibility for the functioning of an international authority and not to enter it "lightheartedly" as it did after the last war; the necessity of putting overwhelming force behind the international authority; the disarmament of the aggressors. Another point implicit in the Lords' discussions was the difficulty of improving on

Puts vital information at your fingertips

Shannobic folders never slip under or ride up because they hang on a metal frame. The hangers carry the weight. They are easily removed and replaced. Large, angled, celluloid tabs, adjustable to one of five positions, allow flexibility of indexing and give immediate identification of folders. Shannobic Suspension Filing will fit YOUR filing cabinets and desk drawers. Let us send you details.

Or the Shannobic Desk Top Unit, a rigid all-metal frame with 20 Shannobic Suspension Folders, is ideal for use on war-time emergency desk tables or as an extra desk top filing drawer. Price complete, 37/7 quarto, 42/7 foolscap, including Purchase Tax. Post free in Great Britain only.

To comply with Paper Control Order 48, please send 1d. postage stamp for leaflet.

the League ideal, provided the Powers recognise, as they must, what Lord Cecil called "the strong desire" of the nationalities "to be independent and not under the control of any other nationality." A Confederation or League of Nations is the only conceivable form of international co-operation; but, as Lord Samuel pointed out, this Confederation could act through a great variety of international economic and social institutions—ILO, World Court, Clearing Union, Civil Aviation Corporation. This mixture of the political and the functional is undoubtedly the most promising and fruitful approach. It is all the greater pity that Lord Cranborne passed over it in his reply for the Government. The impression created by the debate was one of general but vague good will and a great deal of unsettled problems.

War Pensions Again

The Prime Minister's refusal to move the appointment of a Select Committee of the House of Commons to consider war pensions has led Sir Ian Fraser to table the motion on his own account. He has the support so far of over 60 Members. Whether a Select Committee would be the best body to consider war pensions is debatable, but there can be no doubt that an independent investigation of the principles on which they are granted or refused would do much to dispel the feeling that the Government always tries "to do a man out of his pension." Mr Churchill was hardly right when he said that the essential principles of the war pension system were not questioned. Over and over again the case has been raised in the House of the fighting man who was passed fit at his medical board, has served some months, and has then died, or been invalided out, without the grant of a pension to himself or his dependants because the disease was not held to be attributable to his war service. The principle of attributability is attacked almost as often as the amount of pension paid to those who do receive them, and it is attacked mainly from ignorance of the Government's motives in adopting it. If, as can be accepted, those motives are sound, the publicity given to them by the investigations of a committee should be welcome to the Ministry of Pensions, which is in the unenviable position of fulfilling a public duty well, and receiving from the public nothing but kicks. Cannot the public be told, for instance, that there is a certain number—it may well run to thousands—of pensioners from the last war who are treated—and treat themselves—as invalids for life, but who, if they had no pensions, might have rediscovered an active place in the community? Pensions are sometimes the cause of the infirmities they are intended to compensate.

Milk Distribution

As long ago as September, 1940, Lord Woolton invited the representatives of the milk distributive trade to see "what further reductions in distribution expenses can be made by the trade on a voluntary basis." A committee under Lord Perry was set up and reported that "the system of milk distribution employed in the greater part of the trade is unnecessarily costly and elaborate." The Committee recommended a distributor's allowance of 8d. per gallon, which would be adequate if distribution were rationalised, and cited the example of certain provincial co-operative societies which operated with as low a margin as 6½d. This proposal evoked an outcry from certain sections of the trade, and Lord Woolton, bowing before the storm, rejected the Perry recommendation. Instead, after a detailed investigation into the costs of distribution, a structure of margins, varying according to the services rendered by distributors, was introduced in place of the old flat level. The scheme came into operation last October, and (as reported in *The Economist* of April 10th) certain changes were introduced at the beginning of this month. Retailers now receive 10½d. in London and 9 5/6d. in the provinces; there are extra margins for wholesale retailers, increasing according to their size, on the grounds of increasing costs. There has been considerable criticism of the Government's distribution policy. Recently, the *Financial News* wrote that its "real weakness . . . is that it leaves the pre-war channels of distribution virtually intact without regard for efficiency." The producers resent the disappearance of the level rate and the increased control that has passed into the hands of the distributors. In the House of Lords debate on April 1st, Lord Beaverbrook complained of the discrimination against the 80,000 producer-retailers in favour of the combines and co-operative societies—the 1,000 "monsters"—and Lord Perry said that the small man would be "frozen out of business." The point of view of the "monster" was recently put by the chairman of the Express Dairy Company, which claims to operate the largest dairy business in the world. He pointed out that, whereas the producer's price has been increased by 10d. a gallon since the war, the distributor's margin has remained stationary, in spite of greatly increased costs, and showed that his firm had already effected savings of over 25 per cent in manpower and substantial reductions in transport costs. Rationalisation of deliveries over the whole country is inevitably a slow business. The really important thing is that the ordinary consumer, who cannot be expected to understand the complicated formulae of costs and margins, or to follow the milk distribution controversy, should reap the benefit of any savings which may be effected as a result of rationalisation.

Women in Conference

The important part played by women in the war effort gives exceptional interest to conferences such as those held last week-end by the TUC and the National Council of Women. Large numbers of women have entered industry, while the numbers occupying administrative posts in the civil service and engaged in the professions have increased enormously. At the end of 1941 there were 1.3 million women trade unionists; to-day there must be at least 2 million. The women trade unionists were mainly concerned with the position of women in industry and pressed for the maximum degree of mobilisation and the best possible standards and conditions for women workers. Such matters as recruitment for part-time work, day nurseries, communal feeding, shopping facilities, working hours and health and welfare in the factories bulked large in their discussion, but the most important topic was the question of remuneration. Agreements establishing the principle of "the rate for the job" have been concluded for some thirty trades, and the extension of the principle over the whole field of industry was called for, while the granting of equal compensation for civilian war injuries was welcomed as a step in the right direction. At the same time, the trade union women showed their readiness to accept the same responsibilities as men by emphatically rejecting a suggestion that working women with household duties should be exempted from fire-watching. Considerable attention was paid by both Conferences to the question of the post-war position of women. Mrs. Corbett Ashby warned the National Council that forces were being set in motion to "push women back to where they were before the war," and Sir Walter Citrine said that there must be no return to the position that a woman was employed merely because she was cheaper than a man. After the last war, women gained equal suffrage with men, but not economic equality. After this war, women will undoubtedly demand economic equality.

Keeping Abreast

Last November, Mr William McKinnell, chairman of the Building Societies' Association, emphasised the social

value of a widespread home-ownership movement after the war. In his view, home-ownership is "a stabiliser, an essential feature of our fabric and a feature which it is most important should be retained and extended in the days to come." In commenting on the speech, *The Economist* suggested that, from the standpoint of mobility, it might be dangerous to lay too much emphasis on this argument. In any case, large numbers of new houses will be needed to let in the years after the war if the poorer section of the community is to be provided with adequate housing accommodation. Mr McKinnell's latest speech, delivered at the annual meeting of the South-Eastern Counties' Association of Building Societies on April 14th, suggests that the movement has now realised that it will have to operate in a different market after the war if it is to take a large share in the financing of new dwelling-house construction.

We have accordingly informed the authorities that building societies will, in principle, be willing to assist considerably in the provision of mortgage facilities in respect of houses for letting, subject only to the satisfactory working out of details which are now under consideration.

There is, indeed, no reason why the machinery of the building societies should not be used to assist in financing the large number of houses to let that will be needed.

Shorter Note

General Sir Henry Maitland Wilson, Commander-in-Chief Middle East, spent the weekend in Ankara. It is known that he had talks with the Turkish General Staff which covered the supply of Allied war material promised at Adana. In wartime, official visits provide a perpetual guessing game for the other side. But when allowance is made for bluff and double bluff, little can be deduced, and intuition provides the only short cut to knowledge. General Maitland Wilson went to Turkey for the weekend; because he wanted a change; because the Turks wanted to see what a real Brass Hat looks like; and—of course—in order to drag them into the war.

AMERICAN SURVEY

Wages and Manpower

The interesting thing about the new powers of "freezing" labour conferred on Mr McNutt by last week's Executive Order is that they are designed primarily as an anti-inflation measure rather than as a method of improving the distribution of manpower. As such they are an indication of the relative importance attached at present to the two problems in the United States. The President's order reaffirmed the authority of the Manpower Commissioner to regulate hiring new workers at higher wages except where it would aid the prosecution of the war. New regulations now issued provide that while employers in essential industries may offer higher wages to attract workers from non-essential jobs, they may not take labour from other essential industries without government consent. Employers in non-essential industries are forbidden to tempt employees from essential work with offers of higher pay. From the viewpoint of manpower policy, it is an advance that wages in non-essential industries should be kept down as against those in war production, and that essential industries should cease pirating each other's labour. But the order is largely negative in its effect. It prevents things from getting worse rather than providing a sure and discriminating means of making them better. It will not, apparently, halt the flow of workers from poorly-paid essential works to non-essential industries where wage rates are already high. Non-essential industries may still prey upon each other, with no responsibility for making their labour contribution to the war effort, and there is no attempt to evaluate the claims of the essential industries to the workers they already control or to those they wish to attract from the reserve of labour. In some instances these claims are undoubtedly inflated

and could with advantage be pared down. Nor is it clear how the policing of the order is to be made effective without a general registration of the working population. Much more than this will be needed if the United States is to have the means of placing every worker in the job most useful to the war effort.

The Labour Crisis

While Mr McNutt has been interpreting the Presidential order, the labour organisations have been reconsidering it. Their second thoughts are distinctly less favourable than their first. When the President "froze" wages at their present level, the union leaders explain, they assumed that the same exception in favour of wage increases "to correct inequalities" would be made as has always been made to the so-called "Little Steel" formula, which proposed to tie wages to the cost of living. How large a breach this exception would make is shown by the fact that the War Labour Board, which interprets "freezing" to mean "freezing," has promptly thrown out no less than 10,000 petitions for wage increases. Both the AFL and the CIO are up in arms. In part their indignation is no doubt sincere; but in part it is also, as always, due to their necessity to keep an eye on Mr John L. Lewis. Mr Lewis's position is simple; he never had any truck with "Little Steel" or any other formula, he is not a member of the War Labour Board, and he is determined, come what may, to get an increase of \$2 a day for his miners. There is still more than a week to go before the zero hour of May 1st, and the compromise—if there is to be one—should not be

To every man and woman smoker

Will you help to reduce the appalling loss of vital material caused by fire damage?

THOUSANDS of tons of foodstuffs completely destroyed, a clothing factory in flames, destroying hundreds of thousands of garments—fires like these are costing the nation £12,500,000 a year! More important than the money are the labour, the raw material and the shipping space which must be diverted from the war effort to replace the loss.

And the facts are, undeniably, that most fires start from some little act of carelessness by a normally careful person. A match thrown away still smouldering,

a cigarette end left burning, an electric iron left switched on—simple acts of carelessness like these are slowing up production, as well as making tragic inroads into the nation's reserve of materials. Will you help to stop it?

Be more than careful with lighted matches and cigarette ends—be sure! Stub your cigarette ends till they're right out and never throw away a match or spill unless you know it's out. Your help, everybody's help is needed, to reduce the loss to the war effort by fire.

Most fires are caused by careful people

ISSUED AS PART OF THE FIRE OFFICES' COMMITTEE CAMPAIGN AGAINST FIRE WASTAGE

3 SAFETY FIRST RULES FOR SMOKERS

1. You know a match is out when you can do this.

2. Stub your cigarette end right out.

3. Look twice, when you're in any doubt.

expected before the eleventh hour. But its nature is already being suggested. Wage rates could remain unaltered and the Executive Order be obeyed, and still the miners could secure a considerable increase in income if they were guaranteed 52 full weeks of work every year. Such a solution might save faces all round; but it would increase the average cost per ton of coal raised and a corresponding increase in the price could hardly be desired. The cost of stability is a vigilance which is not merely eternal but also proof against face-saving compromises.

1,200 Economists

Twelve hundred leading economists can hardly be wrong, particularly when they agree, and when the subject of their agreement is the unimpeachable thesis that the reciprocal trade treaty programme is the "minimum basis of US post-war policy." But they may easily be ineffective, as when a similarly impressive manifesto failed to prevent the enactment of the Hawley-Smoot Tariff in 1930. It is not yet certain that the Republicans will muster sufficient strength to force the Administration to compromise on the Bill to extend the present treaty-making powers, and their determination to treat the issue as one of strict party politics may have the effect of rallying the majority, but already the possible details of compromise have been reported, and they are far from reassuring. It is said that to "avoid controversy" the State Department might be willing to accept a renewal of the act for two, rather than three, years, with Congress granted the power to nullify any agreement within 60 days of its negotiation. The *quid pro quo* would be the right to reduce tariffs by 75 per cent rather than (as at present) by not more than 50 per cent of existing duties. It is already being pointed out in the American press that this would be tantamount to Congress writing its own trade treaties with the interested lobbies just outside the door. The permission to reduce duties by 75 per cent would then be an empty gesture indeed. So much publicity has been given recently to the difficulties introduced into foreign policy by the need for Senatorial consent to treaties that it is hard to believe that the principle will be extended to trade negotiations. The value of the Trade Agreements programme has been much more as a symbol than in its actual success in drastically cutting tariffs. Disinterested critics are more concerned with the smallness of the concessions made than with the possibility that the State Department might embark on a brutal policy of selling American interests down the river. At the moment the symbolic nature of the programme is greater than ever. It seems to be agreed that a favourable decision by Congress will be viewed abroad as a vote of confidence in American internationalism after the war. This is an argument which cuts both ways, however, and is not likely to persuade the isolationists to abandon their opposition. It certainly is to be regretted if the decision is to be made on party lines; but it will be even more unfortunate if, as seems possible, it is used as just one more way of expressing the determination of Congress to be independent and to curtail the authority of the Executive.

Hot Water at Hot Springs

The decision to exclude the press—for all intents and purposes—from the food and refugee conferences has been understandably unpopular with that body. From the *Herald Tribune* to the less lofty *Mirror* there has been outraged protest that this constitutes an abridgment of the freedom of the press. Some slight modification of the President's order apparently has been secured, but it does not go very far. Bermuda technically is a war zone to which only war correspondents are admitted and where censorship is easy, and at Hot Springs news of the conference's discussions will be funnelled out to the newspapers through State Department handouts. The alarm of the press is due less to the arrangements for these particular conferences, at which, it is pointed out, the discussions will be largely technical, than to the fear that a precedent is being established which will apply to all other similar meetings and in particular to the peace conference. These suspicions are probably not altogether unfounded. For the Administration, it may be pointed out that, despite all his belief in "open covenants openly arrived at," President Wilson limited the press coverage at the last Peace Conference. If the presence

of newspapermen constitutes a real hindrance to the work of the governments, it can hardly be denied that there is a case for some abridgment of the very great press freedom enjoyed in the United States—a freedom which has not always been without its abuses. When this is said, however, there still seems to have been some lack of skill in dealing with the situation. An unnecessary resentment has been aroused, and the newspapers are now unlikely to rest until they have overthrown—or at least undermined—the policy of exclusion. Moreover, more redoubtable suspicions have been aroused: Senators have raised their voices in objection to the lack of any Congressional representation on the American delegations. Neither the Senate nor the press is very quick to draw a distinction between its own privileges and the general good, and an alliance of dudgeon between them might be very dangerous.

FSA Funeral

The demise of the Farm Security Administration is close at hand. The House has refused further appropriations, on the grounds that it stimulated "collectivist trends in Soviet style on the farm front." The action was taken by the House Appropriations Committee, but the voice is that of the Farm bloc, which has had its knife into the FSA for many months. The way the wind was blowing became clear with the resignation of Mr Parisius from the Department of Agriculture last January. He was in favour of extending the methods of Farm Security to increase production. These included, beside the provision of credit on very easy terms—"rehabilitation loans"—to small farmers who could otherwise not obtain funds, some interesting experiments in co-operative use of machinery, instruction in better techniques of farming, and close supervision by full-time experts of the methods of FSA borrowers. More recently, FSA began a programme of moving farmers from poor land, either to better farms of their own or to jobs where they could make a greater contribution to the food goals. The particular sphere of influence of the FSA was in the South, and inevitably it became entangled in anti-negro prejudice and in the confusion between co-operation and collectivism. With the end of the FSA there disappears one more of the New Deal's agencies for assisting the "under-privileged." Ostensibly, with so much farm prosperity, there is little need for government aid to the small farmer. Actually, there is still a great need for improving agricultural methods and moving farm families to land where they will be able to provide a decent standard of living for themselves.

Dollar Devaluation Powers

The fight on the President's monetary powers has been joined before the Senate Banking Committee. Mr Morgenthau, appearing before the Committee, pleaded for an extension of the President's powers as they stand, arguing that the authority to devalue the dollar could not be safely terminated until a satisfactory means was available for assuring the stabilisation of appropriate exchange relations and for avoiding competitive currency depreciation in the critical post-war period. He gave an assurance that the President had no intention of exercising his devaluation authority unless it became necessary from a competitive standpoint. The Senate Committee was unmoved by this reasoning and eliminated the relevant clause from the Bill before it. The significance of this action must be sought in its attack on Presidential powers in general and not for any implied revelation of currency ideas current in Senatorial circles. The Committee, on the other hand, gave unanimous approval to a clause providing for a two-year extension of the Currency Stabilisation Fund. Mr Morgenthau, in his evidence, stated experience had revealed no better means of settling international balances than the shipment of gold. He instanced that during the fiscal year 1941-42 the Stabilisation Fund had sold \$644 million of gold to foreign countries and bought \$162 million. In the present fiscal year to date the corresponding amounts had been \$401 million and \$27 million respectively. These figures illustrate the swing of gold away from the United States, which has also been reflected in the Federal Reserve statements. Mr Morgenthau stated that since its inception in 1934 the Stabilisation Fund had made a net profit of \$32 million.

THE WORLD OVERSEAS

Sweden: The Home Front

(By a Correspondent recently in Sweden)

NEUTRALITY can only be had, at a price, it is paid for by loss of control in many major matters of public policy and by a great deal of private uneasiness and frustration. However much it may be the obvious, the rational, the expedient policy, a nation in adopting it slips into a backwater of history in which the only disturbances are the reflection—sometimes violent—of great events in the world outside. Hitherto, the Swedes have not been too uncomfortably conscious of their isolation, because they have had to meet and overcome formidable difficulties in the economic field, and because they have maintained vigorously and against impressive odds their faith in and practice of the democratic way of life. Now, however, that the tide of war is turning towards an Allied victory, and nations are beginning to think about and prepare for the post-war world, many of the Swedes are unhappy about their position. They are justly proud of having safeguarded their pre-war stable economic standards and profoundly civilised political system, but they are doubtful whether safeguarding is enough. Sweden was a pioneer in democratic practice before the war. By missing the agonising but toughening experience of resistance, many fear that their nation may have lost its power to contribute to the further development of free society. They recognise that this risk is the price of their neutrality.

These misgivings are comparatively recent. In the tense days of 1940 and during the indeterminate fighting of 1941 and 1942, the Swedes were absorbed in the struggle to adapt themselves to shifting world conditions. The war and the blockade and Hitler's new order gave them extremely difficult economic problems to solve. For many of the most direct necessities of consumption—fodder, fertilisers, a wide range of foodstuffs, fuel, oil and coal—they were dependent on markets which were now cut off. The loss of fodder meant a wholesale slaughter of livestock. In 1938, Sweden exported over 13,000 tons of pork and bacon. Now there is virtually none even for consumption at home. Stringent rationing—more stringent than in this country—was introduced. Fats, cream, meat, eggs, cheese and tea, and a number of goods such as dried fruits, nuts and spices, some of which are on points in Britain, are all rationed. The flour and bread ration is small, and covers macaroni as well. Coffee and cocoa are rationed. Coupons have to be given up for meals in restaurants. The ration for soap and cleaning materials is exceedingly meagre. Tobacco is rationed. Fuel is rationed—in Stockholm this winter, private houses had two periods of hot water, four days at Christmas and again four days before Easter. There is no petrol at all.

The structure of rationing is built up in Sweden as in Britain on a firm foundation of guaranteed prices and subsidies to farmers. Some Swedes complain that although basic foodstuffs are well distributed, the pressure on the prices of all uncontrolled foodstuffs is so great that the poorer people have little chance of supplementing their rations. The price of some commodities bears this out. Rabbits were finally controlled at 10 sh. a rabbit. Fowls, fruit, fish are beyond the more slender pockets. The authorities have tried to even out this disparity by a system of rebate cards which enables people below a certain income to pay less—sometimes half price—for their rations. Supplementary cards have also been issued this year to guarantee extra supplies to people with small incomes. Heavy manual work also entitles the workers to extra food. On the whole, the rationing system works fairly and efficiently, and compares very favourably with conditions in other neutral countries. Successful rationing is in some ways a test of social and political maturity. The Swedish people have survived it well.

They have also turned with great energy and ingenuity to maintaining their industry and their agriculture in the teeth of the "new order." Apart from the small extra-European trade carried on until quite recently under guar-

antees from both belligerents—the Gothenburg safe-conduct traffic which the Germans have now refused to sanction—the greater part of Sweden's foreign trade (about 65 per cent) is with Europe. This does not, however, mean that Sweden's trade with non-European countries has been diverted to the Axis; it has ceased to be. Axis Europe cannot meet all Sweden's needs and other trade simply lapsed. Before the war, Sweden imported over 7 million tons of coal and coke and over 700 million litres of petrol. Germany is struggling to meet its coal obligations in return for Swedish ore, and deliveries are said to be better this year than last; but only a fraction of Sweden's need is covered.

The Swedish answer to this emergency is wood. The Swedes build in wood, warm themselves with wood, make motor spirit from wood, feed their cattle on wood, make their textiles of wood, their towels and table cloths and bandages and mattress covers from wood, their soap and vinegar and turpentine and tar from wood, and now even "meat" for human consumption from wood. Since the beginning of the war, the production of fuel has risen from 7 to 50 million cubic metres. Further cutting will injure the forests. The other limiting factor is manpower. They have drafted thousands of workers into the wood industry and most of the 10,000 Norwegian refugees who are waiting to get away and fight are working for the time being in lumber camps. But the Swedes have discovered with all the other experimenters in *ersatz* that manpower is in the long run the scarcest raw material.

Part of this new industrial activity will be maintained. Producer gas for cars is still dirty and a great nuisance and very unsightly too—cars travel about with a sort of witch's cauldron attached to the back—but experiments are improving the quality and it may be a competitive proposition before the end of the war. The developments in artificial textiles will certainly be carried on. Other experiments which may be lasting are coke from peat, rubber from dandelion seed, forbolin (a sort of linoleum) made from wood products. Swedish industry has also set about making all kinds of instruments and machines which were formerly imported. The Government has financed a large proportion of the new ventures and, in spite of shortages and gaps, Sweden to-day is a remarkably busy and relatively prosperous community. There is no doubt about the energy and foresight—both public and private—with which a functioning economy has been maintained against very difficult odds.

Political problems have so far been less troublesome than the economic changes imposed by the war. True, Sweden

has become entirely cut off from the free world; but the country has much solid democratic capital to live on, and even if, as many Swedes maintain, the period has been one of disinvestment, the democratic framework of society has been competently preserved. The coalition of Social Democrats, Liberals, Conservatives and Agrarians which was formed at the end of 1939 still commands the full support of the people, and, though with some restiveness, of its component parties. The Coalition Government, under Mr. Hansson, is unsensational and rather given to Baldwinism. It tends to be over-paternal in its treatment of Swedish public opinion, an attitude which people find galling. Popular discussion is discouraged on the lines of "If only you knew the full facts," and "My lips are sealed." This example from the *Sozial Demokraten* of April 7th gives exactly the tone—the matter under discussion here is the transit of German soldiers to Norway:

When the Government has taken a step, and has pursued its policy, it has had in mind Sweden's own vital interests, present and future. Under the weight of its immense responsibility, it has had to weigh different views and considerations against each other, before reaching a decision. This will be so in the future. Many important decisions will be taken by the Government during the next few months, decisions which may be of the greatest importance to the whole nation, but it cannot be thought wise to seek to influence or accelerate developments by a propaganda which if driven to its conclusion, can endanger the vital interests of the working class and the nation as a whole.

This solid, if uninspiring, government has at no time been in any danger of overthrow by parties outside the coalition. In spite of German pressure and the "triumph" of the new order, Nazism has been so insignificant in Sweden that it is hardly worth mentioning. It made a little headway perhaps among the farmers in the south of Sweden; and a few officers in the Army and a few officials in the police were influenced by Nazi ideas. But in comparison with the band wagon ride into fascism in other European countries, Sweden's record is remarkable. The Communist Party has slightly increased its vote in recent years—50,000 at the outbreak of war—100,000 in 1940, 170,000 in the municipal elections of 1942—but this is due to the fact that, given a Coalition Government, the Communists are the only party in opposition and pick up a lot of disgruntled votes in this way. The 1942 figure was largely due to a split in the Social Democrat ranks. The leader of the extreme Left Wing (or Socialist party) suddenly joined the Nazis. None of his followers went after him. His party, 50,000 strong, stayed homeless for a time, then joined the Communists. The incident is typical of Nazism's insignificant influence.

If the coalition is in any danger, it is only from within. Now, in the fourth year of the war, there are signs of real discontent. The Conservatives are worried lest, in co-operating with the Social Democrats, they find themselves involved in actions which compromise them with their own followers. The Communists are a case in point. The "transport ban" (which is virtually a complete ban on distribution) on two communist papers was raised this March. The Conservative members of the coalition were very perturbed. Some of them, under the leadership of Mr. Bagge, now advocate the end of the coalition and the formation of a parliamentary opposition. The Conservatives share with the Agrarians the feeling that the industrial

workers are being "pampered." The rebate system for poor families is denounced as an "inflationary measure." The farmers, who are the backbone of the Agrarian party, complain that the agricultural subsidies are too small and that the Social Democrats are sacrificing the land workers.

The Social Democrats themselves are divided. Since they have an absolute majority in the Riksdag, the dissolution of the Coalition would not put them out of office. Mr. Hansson, the Prime Minister, like some Labour leaders in Britain, would probably prefer a perpetual coalition; but younger members of the party are restive.

Finally, through all parties is working the ferment of frustration bred of Sweden's safe but not particularly noble position in the war. Some admit their dissatisfaction. Some do not. But all feel it. Right through all the Coalition parties runs a dividing line which really creates a Government party and an opposition party, both within the Coalition. The dividing line is foreign policy. Shall Sweden at this stage move from neutrality to non-belligerency, having first put its neutrality in order by stopping the most serious infringement of it—the transit traffic? This question divides every party. It will be the dominant issue throughout the coming months.

Canada's Budget

[FROM OUR OTTAWA CORRESPONDENT]

March 5th

CANADA'S Budget for 1943 contained the assumption that the practical limit has been reached in taxation, for though it provided for \$136,200,000 more revenue than in the previous year, the tax increases anticipated by Mr. Ilsley will be derived mainly from greater yields, without a change of rates, and from the technical advantages of the transfer to a complete pay-as-you-earn basis of income tax payments. Relatively modest increases on liquor, cigarettes, cigars and tobacco, and an increase in the postal rate for letters from three to four cents, will produce nearly \$50 million annually. These increases were modest only in terms of war budgets, not of peacetime taxation. Income tax changes will bring in \$90 million more, without any variation of rates, and the same factors will produce an added \$15 million in compulsory savings, or refundable income tax.

These estimates of increased revenue seemed even more modest when considered in the light of Budget requirements, which will be \$1,000 million more than in 1942-43. Mr. Ilsley's Budget speech dwelt at length on the necessity of curtailing civilian consumption in order to create public savings which the Treasury could borrow. Success of the borrowing programme, he said, would be in the hands of the people themselves. "The programme which I recommend," he said, "is briefly and simply this, that each man and woman in this country should limit personal and business expenditures so that provision can be made for \$5,500 million for the purposes of war and the ordinary conduct of government; that we should contribute \$2,752 million through the taxes now in force and the additional rates which I have recommended and that we should lend an additional \$2,748 million."

Actual war expenditures in the past year, including \$1,000 million under the United Kingdom Financing Act and \$200 million for the purchase of British interests in Canadian war plants, were \$3,803 million. Civil expenditures brought the total expenditure to \$4,470 million. The new Budget provided for the following expenditure:—

(\$ millions)	
War costs	3,890
Civil costs	610
Mutual Aid	1,000
	5,500

Revision of estimates of Canadian national income has not been completed. Mr. Ilsley said that the Budget expenditures proposed for 1943-44 would be more than half the gross national production. In earlier debates in Parliament, he noted, the Government had been confronted with suggestions that the Canadian people were being asked to contribute too much in proportion to the national income. The evidence, he replied, was pretty clear that the average Canadian had suffered only a moderate decline from the peak of wartime consumption, along with some inconveniences in shopping and travel.

Unprecedented Saving

Provision of half the budgetary expenditures through public borrowing would involve unprecedented savings on the part of the Canadian people, savings of about \$250 a person. It could probably be achieved only through the rapid extension of rationing as a means of curtailing civilian consumption. This may, of course, be the intention, though the Budget speech left the matter obscure. Instead, the tenor of Mr. Ilsley's argument was that chief reliance will be placed on redoubled efforts to mobilise savings by voluntary subscription drives. The difficulties of rationing have proved immense, in the cases where it has been imposed.

The experience of 1942 with regard to public borrowing was not encouraging. In a budget of approximately \$4.5 billion, the deficit was \$2,261 million. To meet this, borrowings from the public amounted to \$1,070 million. One factor was that a Victory Loan drive had been carried out just before the fiscal year started, providing the Treasury with funds in hand. Only one loan campaign was conducted during the fiscal year. In the coming year, two big loan campaigns will be conducted. But, to meet Budget requirements in 1942, the Canadian Government had resort to bank borrowings of \$893 million net, of which \$790 million were borrowed from the chartered banks. Since the public held considerable savings in cash, this was not entirely dangerous borrowing. But it was, as Mr. Ilsley said, borrowing that he would rather not have done. It was borrowing, moreover, that could be expected to be liquidated, in part at least, from the proceeds of future public borrowings. Still, the Budget speech went on:—

The purchasing power in the hands of the public is already excessive in relation to what there is available to buy and appears likely to grow more excessive. In short, we find that the forces making for inflation are present on a large scale. The pressure is held in check only by the rigour of our existing taxation, by the willingness of Canadians to save on an unprecedented scale, and by our price control and wage control.

Politically, the 1943 Budget encountered two viewpoints that tended to cancel each other out. On one side was the view that Canadians were already paying the limit in taxation, that taxation as an instrument was too blunt to

use more drastically, or even, as one French Canadian member had said, the country was going to run out of money. On the other side, it was inevitable that the Budget would be criticised for not adopting a greater measure of taxation and compulsory savings. The Government's attitude was that in Canada taxes are heavy in comparison with other countries at war, and that serious barriers exist, both in equity and administration, to substantial increases in income taxes.

As from April 1st, income taxes will be heavier, because existing rates allow for deductions made in 1942 for the national defence tax, abandoned in August. This deduction, combined with deductions at source of the income tax, started in September, mean that, except in higher brackets, about half the 1942 income tax has already been collected. The taxpayer will be compelled to pay only half the 1942 income, in the transition to full current basis of payment. The result is that deduction at full rate will start in April, rather than next September, and this will account for most of the increase.

To avoid a sharp widening of the inflationary gap created by bank borrowings, the voluntary mobilisation of public savings will have to be carried to extremes not hitherto contemplated. That is the Treasury's chief problem for 1943.

ORE RESERVE.—The fully developed ore reserve, as recalculated at December 31, 1942, amounted to 9,767,000 tons or an average value of 4.3 dwt. over 45 inches. (1941: 10,600,000 tons at 4.3 dwt. over 45 inches.)

Copies of the full Report and Accounts may be obtained from the London Secretary, 170, Winchester House, Old Broad Street, London, E.C.2.

NOTICE TO LIFE POLICYHOLDERS

The Directors of the COMMERCIAL UNION ASSURANCE COMPANY, LIMITED, announce that after making substantial provision out of the surplus disclosed by the quinquennial Valuation of the Life Fund as at 31st December 1942 to cover extra wartime mortality and other contingencies, Bonuses have been allotted to participating policies in respect of the five years ending on that date. The Bonuses, which are allotted in respect of the premiums paid during the five years, are

- For policies effected before 1st January 1940, at approximately four-sevenths of the rates declared for similar policies at the 1937 Distribution; and
- For policies effected 1st January 1940 and later, at the rate of £1 5s. per annum per £100 sum assured.

Policyholders will be notified as to their Bonuses on or before the next renewal date of their policies and in the meantime, on account of staff shortage and other difficulties, are most earnestly requested only to communicate with the Company on the subject for some exceptional reason.

Germany at War

The Agricultural Outlook

THERE is no acute crisis in Germany's agriculture this spring such as existed last year, when serious winter damage led to drastic reductions in food rations and called for an extraordinary effort by the peasants and farmers. Last autumn, the food rations were partly restored, but it was necessary to reduce the quality of the bread, which provides the largest part of the German diet, by the use of barley, that typical feeding stuff, as bread grain. It is said to-day that, in the spring of 1942, roughly 7½ million acres were successfully resown during an unusually short sowing period. The rye, wheat and oilseed harvest failed. Root crops, particularly potatoes, seem to have yielded a good average. Most of the food rations could only be maintained by diverting to human consumption, in addition to barley, considerable quantities of potatoes normally used for fattening pigs. It is estimated that the population consumed from 30 to 32 million tons of potatoes, compared with some 14 million tons in 1938. A similar increase was reported in the consumption of vegetables, whereas the available supplies of fats and meat decreased from the previous season. During 1941 and 1942, there were heavy reductions in the numbers of pigs and poultry, and at the end of 1942 inroads were made on the cattle stocks. This year, there will be a further slaughter of cattle, because of the failure of the oilseed crop. The food supply situation as a whole could only be saved by the so-called "battle of deliveries," which was enforced by a big cut in the rations allowed to the peasants. "Homestead Controllers" were appointed to inspect the peasant's stock of foodstuffs at regular intervals.

The main features of the cultivation and production plan for last autumn and this spring shows very clearly how Germany's agriculture has deteriorated. It aims at restoring the normal acreage under bread cereals; at maximum yields in root crops and vegetables; a record acreage for oilseeds; increased deliveries of milk; and the restoration of the pig population. For years now, these annual cultivation plans have shifted in emphasis from one crop to another. Even before the war, German agriculture had already reached the limit of intensification, in spite of a greater use of fertilisers and machinery. It was hoped to maintain output in general. Events showed that this is not possible and that unfavourable weather conditions create an acute crisis in cultivation as well as in the supply of foodstuffs.

Crop by crop, there has been a similar difficulty every season since the war began. The tremendous war stocks, and the requisitioning of foodstuffs in occupied countries, concealed the deterioration during the first two years of the war. Since the beginning of 1941, imports from the south-eastern countries have been disappointing, and the surpluses produced in Denmark and Holland, which depended largely on imported raw materials, dried up. In 1942, even the supplies from French North Africa were lost. The most important supply countries for Germany at present are the incorporated Polish provinces and the Protectorate of Bohemia and Moravia. There were great hopes that the Don and Kuban territories would close the so-called fat gap. But these territories have been lost again. Reports on agricultural activities in the Ukraine and other occupied Russian provinces are contradictory. It seems that Germany concentrated labour and machinery in certain favourable districts, where production has been restored for the purpose of supplying the troops. Even the most ruthless method of requisitioning foodstuffs in occupied countries cannot alter the fact that Germany must supply by far the greatest part of its food requirements from its own soil.

Last autumn, the German press made the startling statement that the labour situation had been solved and that the total labour force employed in agriculture actually exceeded by one million the labour available in the last year before the war. The number of foreign civilians was estimated at that time at 2½ millions. Prisoners of war and civilians may have numbered at least 4½ millions. During the winter months, part of this labour force was transferred to war industries, and, since the beginning of the spring season, the German press has been silent on the agricultural labour situation. It may be assumed that, under the rigid production plans, as well as in the peculiar conditions of German peasant farming, agriculture is actually saturated

with labour. At the same time, the productivity of the new labour force seems to be low. There are extremely few draught animals, for which milch cows have to be widely substituted. The ambitious plan of converting the tractors still available to the use of generator gas could not be carried out, and it can be assumed that the reduced petrol and diesel oil rations prohibit the full use of tractors. Deliveries of new agricultural machinery have been cut down, and for each new machine an old one must be given in return. The supply of fertilisers is smaller than during last year. Once again, the *Reichsnährstand* is conducting a campaign for the pooling of machinery and for neighbourly help.

The Spring Plan

The spring plan demands a more intensive preparation of the soil as a compensation for smaller supplies of fertilisers, and the general rule is to expand spring sowings. The main concern of the cultivation programme this spring is to provide for early harvests. This is particularly noticeable in the potato plan. The acreage under early potatoes is to be extended, which makes it necessary to reduce the acreage for later varieties. Current production is hardly sufficient to cover demand on the basis of the present rations. There are no longer sufficient stocks for the months before the new harvest, and the cultivation of early varieties must be expanded in order to guarantee supplies in the inter-harvest period. Last year's reduction in food rations during these months can hardly be repeated this year for political reasons. A similar policy has been introduced in the cultivation of early vegetables.

If German agriculture could concentrate on the supply of foodstuffs, the situation would perhaps still be manageable. Industrial and technical demands on the agricultural output are, however, growing out of all proportion to production. During the coming season, greater quantities of potatoes must be diverted to the production of alcohol for motor fuel. The strained supply situation in high-quality lubricating oils makes it necessary to use more vegetable oils. Flax and hemp cultivation must also be expanded to increase the supply of fibres for industrial uses. The attempt to expand industrial crops and all kinds of oilseeds is thus intended to serve two purposes—an increased supply of textile fibres as well as fats.

The crucial part of this year's agricultural plan is the restoration of the number of pigs. The success of the plan depends on a root crop harvest that has to be above average. By considerable price increases for older pigs and long-term fattening agreements, pig breeders are encouraged to maintain their stocks of sows and young pigs on the chance of greater supplies of feeding stuffs in the autumn. If the harvest of root crops is only an average one, the plan will have miscarried, but it is argued that, in that event, the young pigs can easily be slaughtered. The main part of the feeding stuffs is to be obtained from the sugar beet crop. Growers will again receive a premium on the crop, and the yield exceeding the delivery quota can be retained as feeding stuffs. Special machines will also be supplied for converting sugar-beet into feeding stuffs. The extraordinarily narrow margin that is left to German agriculture is again shown by the fact that an expansion in the cultivation of sugar beet may be accompanied by a reduction in the acreage under swedes, mangolds and similar feeding roots.

If there is no increase in the pig population, Germany's fat situation will become critical in the winter of 1943-44. At present, roughly 50 per cent of its fat supplies come from the milk production. Even before the war, pig fat constituted one-third of total supplies. The production of vegetable oils is limited, and imports from south-eastern countries or occupied Russian provinces are far behind expectations. The most sanguine hope is that the inevitable decline in the production of milk will be compensated by an increase in pig fat if the root crop is favourable. Planning and control of deliveries have reached the highest pitch. Almost all agricultural products now receive special premiums, and for a wide range of products premiums in kind are paid. Deliveries above the quota in sugar beets mean increased sugar rations for the grower, and flax surpluses entitle him to linen goods free of coupons. In short, the entire agricultural production is subsidised for the sake of maintaining the stop prices of 1936. Yet, the financial situation of the peasants has hardly improved, and the actual output is no longer sufficient for the official food rations.

THE BUSINESS WORLD

Investors and Break-Up Values

FOR various reasons, a good deal has been heard lately about the different methods of valuing businesses when their ownership changes hands. The ex-proprietors of Short Brothers, a public company, have had their shares vested in the Government, for a consideration which is to be based on the prices between a willing buyer and a willing seller on a given day. The London and Home Counties Joint Electricity Authority recently suggested that electricity companies in its area should pass into public ownership on the basis, broadly, of net tangible asset values. Accountants are familiar with the concept of valuing a business "on a going concern basis." And investors, who every day buy and sell fractions of businesses through the Stock Exchange, are not infrequently reminded by their professional advisers of a quantity known as the "break-up value" of a business, with which the market value of its shares is often contrasted.

This list by no means exhausts all possible variations on the theme of business valuation. There is the "capital expended" basis, the "issued capital-cum-debts" basis, and the "market capitalisation" figure, arrived at by multiplying the nominal value of the shares in issue by their market price. There is no agreement between pundits on which of all these methods is the right one, in absolute terms. Which basis is adopted in any particular case seems to depend on the circumstances and, particularly, on the relative strength of buyers and sellers. Where one of the parties is not a free agent—a condition which may obtain when the buyer is the State—delicate questions arise and it is fortunate, perhaps, that more or less forced sales of large company undertakings, lock, stock and barrel, have up to now been relatively infrequent events. But the problem of valuing a concern, in terms of its past record, present condition and future prospects, comes up every time an investor buys or sells a share on the Stock Exchange. It is highly important, therefore, that the principles underlying that species of valuation should be clearly understood. The "willing buyer and willing seller" idea does not really take us very far. The Stock Exchange is a free market, and in the absence of evidence to the contrary we may assume that if business was done in Imperial Chemical Industries £1 ordinary at 38s. 9d. on April 20, 1943, *force majeure* was absent when the two parties reached agreement on this figure. But each must have had some idea in his mind of the worth of what he was buying or selling, and how did he reach it?

The generally accepted reasoning, on which, consciously or unconsciously, thousands of investors act every day,

involves the breaking down of the price into two elements—interest and risk. By investing his money in long-dated Government stock, an investor could have obtained an "income yield" of, say, 3 per cent. Since the last dividend paid by ICI was 8 per cent, the prospective "income yield" on £1 of stock bought at 38s. 9d. is 4.13 per cent. The difference measures the margin demanded and accepted for the risk that the ICI dividend may not be paid at an unchanged 8 per cent for all time. Any change in the price of ICI ordinary stock, therefore, is bound to be the result of a change in pure interest rates, or in the dividend-paying prospects of ICI, or in both, or the estimate made of them by those who buy or sell the company's stock.

There are two points about this, the generally accepted line of argument, which deserve special note. It bases everything on the process of capitalising income, and it assumes the *continuance* of a company as an income-producing organism. Both conditions hold in the numerous variants of the idea, such as the "earnings yield" basis, which takes account of any difference between profits actually made and those distributed as dividends. This amounts, however, to no more than an attempt to evaluate a single one of the unknowns on the "risk" side of the equation—namely that the discrepancy between earnings and dividends may, directly or indirectly, cause a change in dividends at some future time. But investors are sometimes urged by their advisers, professional and otherwise, to adopt a radically different method of valuation, based on "break-up values." Here, income does not enter, avowedly, into the question at all. Surplus liquid assets—cash, marketable securities, debtors, and (generally) stock-in-trade, less creditors and near future liabilities such as taxation—are valued. To them is added the balance sheet total of fixed assets like land, buildings, plant, machinery, less depreciation and specific reserves—with goodwill as a doubtful and rather controversial item. From the resulting figure of "net worth," the amount of debenture and preference stocks is deducted (on the basis of value in a liquidation, which in the majority of cases is par). The difference, divided by the amount of ordinary stock in issue, gives the "break-up value" per £1 ordinary. If the market price is lower than the "break-up" price, that is regarded as evidence, in its way, that the stock is "cheap." The opposite should apply where the market value exceeds the break-up value, but that consideration, in practice, is much less often urged.

Company	Net Liquid Assets	Fixed Assets (less Liabilities and Specific Reserves)	Debentures (if any) and Preference	Book Value of Ordinary	Amount of Ordinary	Break-up Value per £1 Ordinary	Present Price of £1 Ord.	Div. Yield on Ord.

* Consolidated Balance Sheet.

† Including Preferred Stock.

How does the "break-up" method work out in actual experience? The table on page 531 applies the method to the figures of seven companies in a variety of industries, before the war and at the latest possible date.

The table shows that, contrary to widespread belief, the break-up value of the shares of these fairly representative companies has changed comparatively little since the war. On the whole, liquid assets are somewhat higher and fixed assets somewhat lower than in pre-war days, but, where these changes are at all well marked, there is usually a special reason, arising out of war conditions. The shipping companies have lost fixed assets through sinkings and increased their liquid assets by the receipt of insurance monies. Courtaulds, which formerly had fixed assets valued at 2½ times the amount of its liquid assets, now has liquid assets totalling more than four times the figure for fixed. But for the most part, the changes have been broadly compensatory, and the net result is, generally, an increase of a few pence only in the break-up value of each £1 ordinary share or stock. Market values, in the majority of instances, range well above break-up values—Bass, for example, stands at more than four times its break-up value. Exceptions to this rule are the two shipping concerns—Cunard and P. and O. The market value of the former's equity stock is slightly, and that of the latter's appreciably, below the break-up value. But the income yield figures show no really wide variation (except in the case of Cunard, where market hopes of resumption of ordinary dividends have recently been justified) from an average figure of 4.18 per cent, that is 1.13 per cent above the gilt-edged rate.

The market seems to have logic and reason on its side, in its evident determination to value shares on an income rather than a break-up basis. Investors buy a stake in a company because they expect that it will continue to trade, not on the assumption that it will be broken up. There are occasional exceptions, of course. When the market value of many rubber shares, after Japan's conquest of Malaya and the Dutch East Indies, was considerably lower than their break-up value, it was relevant to point out the anomaly, because at that time it seemed possible that some companies might choose to liquidate instead of waiting for the end of the war. But in the case of shipping companies, and others which have received, or may receive, compensation for physical assets destroyed during the war, a share purchase on a possible increase in break-up values (due, perhaps, to the fact that compensation has exceeded the

written-down value of destroyed assets) may be misguided to the point of danger. Cash is a non-earning asset and liquid resources generally are low-earning assets. Every thing depends on how far these resources can be re-invested in business to produce a higher return now or more probably, after the war. And here the investor is on largely uncharted territory. In other words, an increase in break-up values of that character is an argument for higher, not a lower, risk premium.

The reasons for caution in accepting break-up values as a criterion go even deeper. A break-up total of assets is a heterogeneous item. It is obtained by aggregating liquid assets valued at current prices and fixed assets whose book valuations are largely conventional. In most instances, fixed asset valuations are founded on capital expenditure at some past date or dates, written down by depreciation allowance and reserve; which may be narrow or liberal, and whose object, as a rule, is not so much the maintenance of earning power as the assurance that the original cost of the asset will have been written off by the end of its working life. When a break-up actually occurs, the amount for which the fixed assets can be sold may well be different again because it will be based on the prospective earning power of the machinery to a new purchaser. It is even possible that, in the circumstances which compel the great majority of liquidations, the break-up value of most specialised fixed assets like machinery may be their scrap iron value.

The investor, in short, is normally—and rightly—among those who adopt the "going concern" method of valuation. It may be important for investors, as a class, to learn, in due course, what basis is taken by the authorities for valuing the Short Brothers shares—or by the Lord Chief Justice if the matter goes to arbitration under Section 71 of the Defence Regulations. The Short Brothers case may conceivably become a precedent, if and when the question of the taking over of other companies by the State arises. A price (as between a willing buyer and a willing seller) may be one thing if both parties are presumed to have the equity in future profits in mind as something on which a value ought to be placed, and something quite different if they are concerned merely with the capital expended in the business. The investor's interests, *qua* investor, are bound up with the first interpretation rather than the second. And how often is the greatest capital asset of any business—that is, the skill and enterprise of those conducting it—valued in the balance sheet at all?

Finance and Banking

Floating Debt Policy

The increase to £90 million in this week's offer of Treasury bills by tender breaks new ground, the weekly offering never before having exceeded £85 million. The move, however, is in continuation of policy which has been apparent since last October when the authorities restored to the issue of Treasury bills by tender some of the seasonal elasticity which it had lost since the advent of Treasury deposit receipts. In the last months of 1942, the issue was increased in order to give the banks an opportunity of acquiring more Treasury bills maturing in the period of heavy tax collection, when such maturities would be particularly welcome. With the turn of the financial year, a period of considerable expansion in the floating debt normally opens. It is evidently the wish of the authorities to allow the Treasury bills issued by tender to partake in that movement and not to confine it, as has been the case in the past two years, to the TDR issue. The reasons for this change in floating debt policy are probably to be found in the convenience of the banking system. It is evident from recent clearing bank statements, and from the day-to-day experience of the discount market, that the clearing banks have found it difficult to satisfy their normal requirements of bills. From the point of view of the banks and the distribution of their assets, bills still play a rôle from which they have not been ousted by TDR's. They are a more elastic instrument than the TDR, whose pre-encashment is hedged with many conditions, and whose acquisition by the banks is a process in which the banks have less power of initiative and decision than they have in their purchases of bills from the market. The banks,

therefore, desire to maintain a certain minimum volume of bills which is certainly above the exiguous figures maintained in recent months. The banks' bill portfolios since the turn of the year have been slightly higher than those for a year ago—the March figure of £172 million being some £10 million higher than the corresponding total for 1942. But for a truer comparison one must go further back than 1942, when the bill famine was already in being. This bill famine has developed despite a greater issue of bills through the weekly tender than has ever been known in the past. To some extent, this higher Treasury bill issue has merely taken the important place that used to be filled by commercial bills. But more important has been the increasing competition for the available amount of discountable sterling paper. Although some Empire central banks continue to be fed with bills via the tap, there is still an important special demand for bills which is fed from the weekly tender—either by direct tendering or by purchases from the market. The amount of sterling funds competing for the tender issue of bills is still increasing, and it is in this fact that the main reason for the current increase in the bills so issued must be sought.

Distribution of Bank Deposits

Among the new material contained in this year's White Paper on War Finance and National Income and Expenditure is the first publication of the statistics on the distribution of bank deposits as between personal and business accounts. At the request of the Central Statistical Office, the clearing banks have been making periodic sample

investigations into the distribution of their deposits. The results are as follows:

	(£ Million)				
	30th June, 1940	30th June, 1941	31st Dec., 1941	30th June, 1942	31st Dec., 1942
Total deposits held by clearing banks	2,469	2,946	3,329	3,263	3,629
Less: Advances to customers and other accounts	962	859	807	800	773
Total deposits (net)	1,507	2,087	2,522	2,463	2,856
Personal deposits (net)	617	661	692	704	820
Other deposits (net)	890	1,426	1,830	1,759	2,036

The net deposit totals are arrived at after deducting loans and advances from the gross figures. No attempt has been made to adjust the figures for the amount of bank accommodation obtained by discounting bills. It is rather surprising that the gross deposit figures should not have been corrected for cheques in course of collection and items in transit. To the extent that these transit items have been abnormally swollen by the greater delays involved by the wartime clearing machinery, the growth in deposits shown in the above table has been overstated. The personal deposits exclude the accounts of businesses, financial institutions, public authorities, and also those of individual traders, farmers, shopkeepers and professional men where the accounts are known to be used for purposes of business. The outstanding feature brought out by the table is its revelation of the extent to which the growth in net deposits has been accounted for by business deposits. The comparatively small rise in personal deposits is much more than offset by the increased personal savings effected to meet accrued taxation. Another table in the White Paper shows this increase to have amounted to £280 million in 1942 and £206 million in 1941. The explanation of the comparatively small increase in personal deposits is probably to be found in the fact that it is the individual bank depositor who tends to place any surplus cash he may accumulate in Government loans. The type of individual who has both the means and the wish to exercise a preference for liquidity is the wage-earner who remains untouched by the banking habit and who is hoarding notes.

Strength of Argentine Peso

Following the persistent strength of the Argentine peso in the domestic free market, the Argentine authorities have this week raised the official exchange value of the peso for the payment of non-regular exports from 481.82 to 397.02 pesos per 100 US dollars. This change has automatically involved a revision of the corresponding sterling rate from 16.95½ to 15.96 pesos to the £. The strength of the Argentine currency derives both from the commercial balance of payments and from capital movements. Shipping difficulties have affected Argentine exports and imports alike; but whereas there has been a glut of exportable material from Argentina, there has been no comparable volume of import goods from the two main sources of imports, namely, the United States and the United Kingdom. The commercial balance of payments has thus been shifting steadily in favour of Argentina, and that country has been accumulating in sterling and dollars as a result. The accumulation of dollars has to some extent been kept down by imports of gold, and it is probable that an appreciable part of the \$401 million of gold which has been sold by the US Stabilisation Fund since June, 1942, has made its way to Argentina. As a neutral country evidently determined to go a long way in the defence of its neutrality, Argentina has also become a favourite place of refuge for foreign capital. This influx of foreign capital has played its part in driving up the exchange value of the peso in the free market. The favourable balance of payments for 1942 is officially estimated at 503 million pesos. It is interesting to note that hitherto the only official answer to the strength of the peso in the free market has been a widening of the margin between the rates quoted by the authorities to importers and exporters respectively. The official exchange market in Argentina remains as rigidly stratified as ever, and the improvement in the general position is not being allowed to benefit those who have to make remittances from Argentina. Argentine exporters must accept fewer pesos for the foreign exchange they hand over to the Central bank, but the authorities' selling rates for exchange remain unchanged. There are limits beyond which the playing of this game cannot proceed, but as long as the exchange market remains as rigorously controlled as it is in Argentina there must be abundant scope for this kind of manoeuvring.

Investment

Railway Politics

The boomlet in diamond shares and African gold mines, for the time being at any rate, appears to have passed its zenith. There have been several bursts of profit taking, but, so far, they have caused little real set-back in prices, and some of the diamond shares and developing mines are still rising. This movement is, and always has been, mainly based on buying from the Cape. The development which is promising to replace it, a renewed demand for railway stocks, has its origins nearer home. While prior charges tend to fall with the modest weakening of long-dated gilt-edged stocks, equities have been rising at the rate of a point a day, and are now at the highest for a period of years. The commonly accepted explanation of the rise is the activity of the official representatives of railway stockholders, who are organising opinion to exert pressure on the authorities, nominally for a revision of the existing agreement. In this matter, the railway executives, having accepted the terms offered under a threat of nationalisation, are powerless to act, but it may be assumed that they are not sorry to see others doing so. There would seem to be very little chance of securing any change in the agreement, but the real object is understood to be to obtain gages for the post-war period. These it would be most improper for the Government to give, and, unless they include buying out existing holders, it is difficult to see how there can be any adequate protection for the stockholder against the claims of labour in a protected industry. At present levels, the yield on railway equities is still in excess of the general level. The point is approaching, however, at which quotations will discount the long-term maintenance of profits at the level of the present rental payment.

Debentures into Preference

While a number of concerns are busy converting debentures to lower rates of interest, the Austin Motor Company is going one better, as did Joshua Hoyle, by substituting for the existing 5 per cent debenture stock a 4½ per cent cumulative redeemable preference issue. The former, to the extent of £944,280, is to be repaid on three months' notice at 103, while provisional arrangements have been made for the private placing of the latter on terms to yield its full nominal value net to the company. There appears to be an accumulative sinking fund of 1½ per cent per annum on the debentures, whose original amount was £1,100,000, and a similar fund is to be established for the preference shares, which are to rank in front of all existing capital. Owing to the differences in date, amount and rate of interest, the sinking fund will not extinguish the new shares until 1978, whereas the debentures would have been paid off by 1965. Against this, and an immediate cash payment of some £28,328, there appears to be a saving in yearly charges of some £11,500. In the circumstances, there appears to be no reason why shareholders should object to the change. Repayment of the new preference is to be effected by purchase at or under 21s. or by drawings at that figure, while there is power to anticipate repayment, in whole or in part, at 21s. 6d. per share. The 7 per cent preference capital, which ranks after the existing debentures, stands at about 33s., yielding some £4 5s. 6d. per cent, but it is irredeemable. There is likely to be some disappointment that the debenture holders are to be offered no conversion rights and that no class of shareholder is being invited to apply for the shares. They have been privately placed, presumably at the request of the Treasury, and will gradually come on to the market, but subject to a six-months bar on sales below par.

Canadian Railway Traffic

The simultaneous arrival in this country of the accounts for last year provides an opportunity for some investigation of the character of the recovery in these companies' fortunes. Excluding railway tax, the operating ratio of Canadian Pacific fell from 71.65 to 71.54 per cent last year. In the latest complete pre-war year, 1938, the figure was 82.3 per cent. The Canadian National secured a heavier reduction last year, from 78.12 to 76.93 per cent, but the actual rate is still well above that of its competitor. Unfortunately, such statistics as are produced by the two lines are not always comparable. The Pacific shows a rise on the year in total carload traffic of 7.3 per cent to a figure more than 50 per cent above the 1938 level. The corresponding rise in tonnage of manufactured and miscellaneous goods was 16.2 per cent on the year and almost 100 per cent on the quinquennium. This is a considerable achievement, but the passenger showing is even more striking. Revenue passengers carried rose 47.2 per cent on the year and 80.5 per cent on the five years, while revenue passenger miles rose by 60 per cent over 1941 and 175 per cent over 1938. The result of this was a rise in passenger revenue per train mile of 44.4 per cent to a figure more than double that of 1938. Against this, freight revenue per train mile, although 8.7 per cent up on the year, was only some 16.25 per cent above 1938. It is also worth noting that, despite the heavy fall against 1941, agricultural tonnage was 25 per cent up on the five-year comparison. Meanwhile, the National system secured a rise of almost 55 per cent in passenger miles on the year and one of 51 per cent in passenger revenue, the latter figure being three times that of 1938. For this group, ton miles of revenue freight increased 16.7 per cent on the year and 120 per cent on the five-year period. While the rise in freight traffic receipts is much larger than that in passenger takings, the very large percentage expansion shown in the latter suggests that this feature has played a very important part in raising total net receipts. In this rise the cancellation of cheap fares has played a considerable part. It is not easy to say how much of the increase in freight will remain after the war, but the passenger position is approaching that existing in this country, and it is quite evident that, even if no fall in passenger miles were to be anticipated, profit, under more or less competitive conditions, is bound to fall very sharply.

Investment Trust Conversion

With the offer made last week by the Sterling Trust, the process of debenture conversions enters a new field. There exists a number of investment trusts with debentures optionally redeemable, and there is every reason to suppose that early advantage will be taken of the permission to convert. The offer applies to £1,443,760 of 5 per cent "A" and "B" debentures, whose life has been extended so that they are now repayable at any time on six months' notice at 101. Holders are offered a new 3½ per cent stock, 1963-73, at 99, with the alternative of repayment at 101 on November 1, 1943. The announcement has been made public well in advance of the necessary date, May 1st, and the offer will remain open until well after the middle of that month, because the debentures are in bearer form and holders cannot be approached directly. The question of whether the holder who wishes to remain in the investment trust movement should accept the new stock will depend on his exact assessment of the status of the Sterling Trust. A shade over 3½ per cent for 30 years is not specially attractive. A substantial part of the maturing stock is, in all probability, held by money houses who will prefer cash to a long-dated security, unless they can see an early turn in the latter. It is, however, improbable that the new stock will be allowed to come rapidly on the market, if it is subscribed under a guarantee or the more normal underwriting contract. Interest on the new debentures and the existing 4 per cent stock of the Sterling Trust is covered rather more than two and a quarter times by net income for last year. It is difficult to say what will be the prospects for these concerns after the war, but it is reasonable to suppose that they will be able to make considerable profits, even in a partially controlled new-issue market. The average yield shown by *The Actuaries' Investment Index* at the end of March was 3.61. It had improved almost monthly to that figure from a maximum of 4.31 at the end of 1940. During that period the yield margin between investment trust debentures and general industrial debentures has increased from 0.13 to 0.27 points, the latter now being 3.89 per cent.

Company Notes

Canadian Pacific Report

The 1942 Canadian Pacific Railway report throws considerable light on the jump in profits discussed in *The Economist* of March 13th last. The 16 per cent rise in gross earnings to \$256,804,091 was, in fact, a record for all time, even surpassing the earnings of 1928. By far the biggest jump came in passenger receipts, which rose by 55.5 per cent, despite the withdrawal of cheap fares. The explanation is, of course, the curtailment of road traffic. Freight earnings were higher for every category except grain transport, which is prejudiced by the decline in exports and the lack of storage space at the docks. Of subsidiary sources of income, net profits of steamships were rather higher, but net profits of hotels decreased somewhat more steeply. The rise in expenses, which outstripped the jump in income, despite the improvement in loadings and the reduction in empty car miles, was accelerated by higher wage payments. The directors point out that efficiency was reduced last year by a marked rise in labour turnover, which reached more than twice the normal peace-time level. Satisfactory as the rise in gross, and even in net, profits undoubtedly is, the full accounts emphasise the extent to which the recovery is due to war-time conditions—in particular, to the industrial boom and the petrol shortage. In these circumstances, it is impossible to forecast any permanence for the present level of earnings. In view of the directors' statement of two months ago that payment of equity dividends is out of the question until the level of prior charges is reduced to that existing when dividends were last paid in 1931, around that existing when dividends were last paid in 1931, a reduction of \$1,273,195 to \$22,955,503, against \$22,050,364 in 1931, is important. On the other hand, fixed charges rose by \$2,890,499 between 1930 and 1931, and it is clear that the whole of this difference will not be eliminated in 1943. But if in the current period the funded debt is reduced to the 1931 level, there does seem to be a case for the distribution of some token payment on common shares, even if it is virtually certain that surplus earnings, despite the potential recovery in grain traffics, will fall away when the war is over. Capital expenditure of 1942 exceeded the \$13,970,890 sanctioned by \$1,562,489. The 1943 total is estimated at \$14,196,440. The \$25 common shares have improved lately, and now stand at \$17½.

Cunard Accounts

Despite the rise in net profits of *Cunard Steam Ship* for 1942 of some £114,000 to £343,723, discussed in *The Economist* of April 17th, the full accounts show that total income rose by less than £42,000 to £1,064,196. Taxation and general expenditure required £459,484 against £365,441, but there is a saving of £45,000 in the transfer to taxation reserve, which receives £100,000, and there is a big drop in debenture service, which absorbs only £15,849 against £184,181, thanks to the virtual disappearance of £3,760,000 of 5 per cent stock. Despite the fact that equity earnings, after charging one year's preference payments, amount to 9.9 per cent, Sir Percy Bates issues a warning that the 2½ per cent interim, recently declared on ordinary stock and the Government share for 1943, will not necessarily be followed by a final dividend. This is wise, for the earning capacity of the group as a whole, despite the elimination to arrears and some prior charges, depends essentially on the safety of its fleet—a matter on which no forecast can be valid. It is very regrettable that this year there are no accounts of Cunard White Star. Sir Percy states that this subsidiary, as well as Port Line and Thos. and Jno. Brocklebank, has large liquid resources. This is not the case with the parent. Cash holdings have declined from £416,369 to £205,721 and there is a rise from £3,281,770 to £3,640,889 in net borrowing from subsidiaries. Neglecting the secured loan, unchanged at £300,000, there is a jump in the excess of current liabilities over liquid assets from £59,116 to £173,832. As to the future of the company, Sir Percy Bates intends to carry on in a spirit of reasonable but cautious hope. At the same time his admonition that no one should hold more Cunard ordinary than he can afford to lose can scarcely be described as encouraging. Further, on the point of air transport, he is evidently disappointed that a further year has served only to stress the difficulties of securing any development on the lines he advocates. The £1 ordinary stock fell 1s. 3d. on the report to 19s. 3d. ex dividend.

J. & P. Coats Profits

The preliminary statement of J. & P. Coats shows that in 1942 part of the previous year's setback was recovered. Net profits amount to £1,706,816 against £1,631,816 in 1941 and £1,884,852 in 1940. In 1941, the ordinary dividend was reduced to 8½ per cent from the 10 per cent to which it was reduced in respect of 1935. The latest results show that equity cover has risen by 1 point to 9.9 per cent, but there is no increase in dividend, the surplus over the 8½ per cent payment being added to the carry forward, which is raised from £455,705 to £541,241. J. & P. Coats sell a virtually essential article, cotton thread, in a field in which competition is restricted and supplies and prices are fully regulated by Government control. In these circumstances, there is little opportunity in wartime of earning higher profits. It must be assumed that last year's increase is due to a rise in sales—stimulated no doubt by clothes rationing—and that in 1941 the concern was not liable for EPT. Presumably, it is close to the EPT level, for the chairman, Mr J. O. M. Clark, in last year's statement gave a definite warning that this factor would in any case preclude a restoration of the 10 per cent ordinary dividend for the duration. The results appear to be as good as could be expected. The £1 ordinary stock at 44s. 9d. yields £3 19s. 1d. per cent.

Crosse and Blackwell Results

The preliminary statement of Crosse and Blackwell for 1942 shows a rise in net profits only from £58,496 to £64,901. There can be little doubt, however, that total income must have risen to a new record for the past decade. The previous year's net earnings were themselves the product of record total profits of £814,076, of which income tax and EPT required £632,654. In the circumstances, it is surprising that any further increase in the net figure has been possible. The latest figure provides equity earnings of 8.0 against 7.7 per cent for the ordinary dividend, which is raised from 4 to 5 per cent, the highest payment on the reduced capital of the 1935 reconstruction. The improvement is almost certainly the result of expenditure on the new plant which came into production in the previous year. The chairman, Sir Frederick Eley, then pointed out that there had also been a considerable cost saving rationalisation of process which may find further reflection in pre-tax profits. The influence of the debenture

repayment, carried out at the end of September last, can hardly have had considerable influence in the 1942 results, but, for the current period, the saving in interest on the 6½ per cent debentures, of which more than £1,000,000 were still outstanding, will be important. The 1s. ordinary stock at 1s. 7½d. yields £3 1s. 8d. per cent, a level which shows that the market assumes a further recovery.

Union Corporation Report

Disclosed revenue of the Union Corporation for 1942 amounted to £629,589, after allocating £25,000 against nil to pensions contingencies reserve, and compares with the £644,661 revealed in 1941. The ordinary dividend, maintained for the fifth successive year at 64 per cent, is slightly underearned according to the accounts, and involves a draft of some £6,000 on the carry forward, reducing this item to £121,664. Of the five Rand mines in which the company is particularly interested, two were able to raise their distributions, one was unchanged, and the other two reduced their dividends. Since output appeared to be fully maintained, the special tax, raised last year from 16 to 20 per cent, probably accounted for the reduction in some distributions. For 1943, the rate is 22½ per cent. According to the directors' report, share holdings now shown at £3,035,044, a reduction of some £54,000, would, at present prices, show a very substantial surplus. As in preceding years, provision for contingencies has been made by writing down certain holdings. Cash is over £1,070,000 higher at £4,106,989, and together with the holding of British Government stocks and South African tax certificates, which have risen by some £600,000 to £5,109,875, constitutes virtually 75 per cent of the company's total assets. Apart from Rand interests, the company has, *inter alia*, Rhodesian and West African investments, while, during last year, it was responsible for the production of material quantities of chrome ore. There is no reason why the present distributions should not be maintained, although the accounts provide little indication as to actual earnings. Reserves must, however, be considerable. If restrictions on output and further taxation should enforce lower dividends, the shareholders can content themselves with the fact that the post-war rôle of gold has not been overlooked. Its future importance may be judged from the fact that of the 1942 output, the Empire provided 63 per cent, while of the world's total holding, the United States now possess some 64 per cent. In the circumstances, the yield of some £4 18s. 8d. per cent on the 12s. 6d. shares standing at 165s. is reasonable.

Industry and Trade

Future of Civil Aviation

The future of civil aviation has become a topic of widespread interest, and the persistent prodding of the Government inside and outside Parliament is the healthy expression of a general feeling that Great Britain should take to the air as readily as the country has taken to the sea. On Wednesday last week in the House of Commons, and on Thursday in the House of Lords, the Government's policy was criticised with special reference to the composition of the new board of directors of the British Overseas Airways Corporation. Lord Rothermere questioned the qualifications of Mr Simon Marks, the head of a firm of chain stores, and of Mr John Marchbank, the former general secretary of the National Union of Railwaymen. His attack was hardly justified, inasmuch as organising ability and vision on the part of some members of the board surely count for more than merely previous experience or a pilot's certificate. True, a great deal will depend on the selection of the future permanent chairman, who should combine energy with vision as well as youth, and the Government is to be commended for not making a hurried decision. The wider problem of the future organisation of international air transport was discussed by Major-General Sir Frederick Sykes, Controller-General of Civil Aviation from 1919 to 1922, at a meeting of the Institute of Export on Thursday last week. He urged the need for the adoption of a policy of freedom of the air and for healthy competition between nations. Given a measure

of goodwill, it should not be too difficult to reach agreement on the fundamental conditions for a healthy growth of international air transport after the war. These are: (a) freedom of the air and of landing, fuelling and repair facilities, (b) standards of safety and working conditions, and (c) avoidance of competition in subsidies. On March 11th, Sir Archibald Sinclair, Secretary of State for Air, stated, on behalf of the War Cabinet, that it will be the "duty" of this country to "play a prominent part in the production and operation of civil aircraft." It is now up to the Government to discharge its self-imposed task with speed, energy and foresight.

Progress of Road Haulage Scheme

The Ministry of War Transport's scheme for securing economies in long-distance road haulage by means of a regional organisation under its control is now being rapidly applied. It may be recalled that the scheme (it was described in *The Economist* of November 7, 1942) envisaged the transfer of as much long-distance traffic as possible from road to rail; the concentration of the remaining traffic on the fewest possible vehicles; and the maintenance in serviceable condition of laid-up vehicles. The regional organisation consists of twelve divisions; each division is being subdivided into suitable areas, and vehicles grouped into units of about 50 vehicles, each centred on a firm with

the requisite facilities. Unit controllers, drawn from the industry, are responsible for ensuring that no traffic is accepted which should be carried by some other means of transport; these officers are to collaborate with the regional transport commissioners who supervise the issue of fuel to the units. As the basis or nucleus of each unit of vehicles the Ministry, with the advice of the regional transport commissioners, selected suitable undertakings which are being taken over bodily against compensation based, broadly, on their net profits for the average of any two years within the period from January 1, 1935, to March 31, 1939, subject to appropriate adjustments for any change in the capital value of the assets employed by them. As was shown in a Note on page 338 in *The Economist* of March 13th, there was at first a good deal of organised opposition to the terms offered by the Ministry, but most of the individual concerns approached have accepted them; indeed, some 200 road haulage units are now in operation. The second step, that of strengthening the undertakings selected as units by the inclusion of vehicles hired from other firms, is now about to be taken. On April 17th the Ministry of War Transport and the Standing Joint Committee of Road Hauliers' National Organisations, in a joint communiqué, announced that agreement had been reached on the terms and conditions of hire; the SJC has recommended their acceptance to the industry. Broadly, payment is to be on a 52-week basis, subject to a reduction in respect of laid-up vehicles after one month's notice by the Ministry. Certain items of cost, such as wages, fuel (excluding lubricants), road fund tax, insurance of vehicles and goods in transit risks are excluded from the rates of hire, and are to be reimbursed or borne by the Ministry. The road haulage scheme is shortly expected to be in full operation.

The Rise in Prices

One of the most interesting additions to the White Paper on the National Income and Expenditure (Cmd 6438) is the estimate of the overall rise, since 1938, in the retail prices of the goods and services purchased by the public. In the accompanying table these figures are compared with the official indices of wholesale prices and of the cost of living. Column 3 is based on the prices the consumer has to pay; column 4 shows the increase after allowing for subsidies but exclusive of specific indirect taxes. That the overall rise in the market prices of consumers' goods and services has been appreciably more marked than the more limited range of items included in the cost-of-living index is not surprising. The cost-of-living index is based on the prices of necessities, many of which are rationed, price-controlled and subsidised, whereas the index for all consumers' goods and services includes quality goods and luxuries which are subject to heavy taxation and many items which are not price-controlled. If it had not been for the concentration of production on necessities, to

the disadvantage of quality goods and services and the virtual disappearance of luxuries, the rise in the general index would have been considerably greater. A comparison of the rise in the cost of living index with the more general

Year	ANNUAL PRICE INDICES (1938 = 100)			
	Wholesale Prices (Board of Trade)	Cost of Living (Ministry of Labour)	All Consumers Goods and Services At Market Prices	Including Subsidies but not specific indirect taxes
	(1)	(2)	(3)	(4)
1940	135	118	120	118
1941	151	128	135	130
1942	157	128	145	136

(a) Indices published in the White Paper. (b) Calculated from figures in White Paper.

indices shows that, on the whole, the rise in the prices of necessities has been moderate and that surplus purchasing power has been diverted mainly to unessentials and has partly found its way back to the Exchequer by means of higher indirect taxes.

Aircraft Production

In a war commentary at Guildhall on Tuesday Sir Stafford Cripps, Minister of Aircraft Production, gave some interesting facts about the aircraft industry. In the first quarter of this year the output of complete aircraft, in terms of structure weight, was 55 per cent up on that of the corresponding period last year; the output of bombers alone was nearly three and a half times as big. Sir Stafford drew attention to the importance of combining quality with quantity, which calls for continuous technical adjustments. In view of his drastic intervention in the affairs of Short Brothers and the appointment of controllers to other concerns, his tribute to the industry's personnel and, in particular, his statement that failures in management had been few and exceptional, were reassuring.

The general rule is of good management under great difficulties, courageously faced and overcome. We owe a debt of gratitude to those who have devoted themselves with great ability and perseverance over long hours year after year, and our designers have done a grand job.

One difficulty in the industry's expansion has been its shortage of highly skilled personnel, owing to the absence of adequate provision for training. Much has been done to overcome these difficulties (no less than 40 per cent of the industry's workers now consist of women); in terms of structure weight, the output per person employed in the industry rose by no less than 36 per cent between March, 1942, and March, 1943. Sir Stafford ended his speech with the plea that the aircraft industry should not be allowed to disintegrate after the war.

Mica Control

Last week-end the Ministry of Supply announced that in future mica will be controlled by a special section of the Non-Ferrous Metals Control under Mr G. F. A. Burgess as Controller. So far this product had been administered as one of the "Sundry Materials." Although no official explanation for this move has been published, it seems that the introduction of a special Mica Control is the direct result of the tighter supply position. Mica imports into this country have been subject to licensing since November, 1939, and since December, 1942, licences have been needed to acquire, dispose and process mica. The United States, too, has tightened its mica control by introducing control by allocation on December 10, 1942. Mica, owing to its non-conductivity and flexibility, is an essential material for the electrical industries and serves a very large number of war uses, in high-tension magneto condensers, radio transmitter and receiver condensers, sparking-plugs, radio tube parts, armature rings, washers and other mechanisms. The pro-

duction of all types of war equipment, from the aeroplane to the submarine, as well as the machines for making them, are dependent on adequate supplies of mica. Owing to the many varieties of mica, world production statistics have never been compiled, but the United Nations have access to almost all the sources of supply, including the United States and British India, the most important suppliers. The Allied mica supply problem is not one of a general shortage, but of meeting the large demand for high-grade sheet mica, which forms only a limited part of total supplies. To solve this problem, all supplies of high-grade mica available to the United Nations have since October last been acquired and allocated by the Anglo-American Mica Mission.

Retail Trade

February repeated the recent downward trend in the average daily value of retail sales reported to the Bank of England. In the retail trade report, published in the *Board of Trade Journal* for April 10th, the index (1937 = 100) for all departments is 96, compared with 103 for February, 1942, and the average of 108 for the year ending January, 1943. The departments most affected by the lower turnover were those selling apparel. The index was 70, compared with 93 a year before, and the average of 104 for the year. This fall was due to a lack of coupons. The March figures will probably show some improvement, since a new block of 20 coupons became valid in the middle of that month. The household goods index, at 67, was 14 per cent below the average for the preceding year, and was lower, with the exception of one month, than it had been since August, 1932. The fall in turnover in February is reflected in the higher value (at cost) of stocks at the end of the month; they were nearly 11 per cent higher than the year before.

Women's Land Army

There is one member of the Women's Land Army to every six farmers in this country. At the end of 1939 their numbers were 4,544; 1940, 8,305; 1941, 21,736; 1942, 52,955; and on March 31st of this year 58,221. Nearly 4,000 women are in the Women's Timber Corps, which was formed a year ago. County War Agricultural Executive Committees employ 16,366 WLA members on most types of farm work. Until now there was never a lack of recruits, and the present rate of intake is over a thousand a week. More could be absorbed, but the Ministry of Labour finds it necessary in some areas to draft potential recruits into munition work. The shortage of WLA members means that they are sent only to do such work as milking, general farm work, commercial market gardening, and timber production. It may be necessary to transfer some of them to this work from institution and private gardens. Wages and conditions in the WLA have steadily improved. In 1939 the

average wage was about 28s. for a 48-hour week. Now, a Land Army girl may expect not less than 38s. The Agricultural Wages Board recently proposed a minimum wage of 45s. a week for all women agricultural workers; it is generally believed that this minimum will be accepted by the agricultural wages committees. The existence of an organised body like the WLA has improved conditions of women agricultural workers outside it. Before the war their numbers were 40-50,000, and their earnings about 20s.-25s. a week. They were seldom paid a weekly wage, but were employed by the hour. These workers now number between 70,000 and 80,000, and wages are slightly higher than those of the WLA. The difference is probably accounted for by the fact that the WLA receive free uniforms. The measure of the success of the WLA is the demand from farmers for them. Early in the war it was often difficult to place recruits; now there are not enough to go round.

Attack on Uthwatt Report

The report submitted at the annual meeting of the Land Union on Wednesday draws an astonishing, though in view of its source hardly surprising, contrast between the Scott report on the Utilisation of Land in Rural Areas and the Uthwatt report on Compensation and Betterment. The one is said to be in all ways a constructive document, while the other is described as destructive of the rights of property and of freedom of enterprise. The fact is that the Uthwatt Committee, whose report was described in *The Economist* on September 19, 1942, succeeded in the difficult task of preparing the basis for practical legislation designed to remove the obstacles in the way of orderly reconstruction and development by the Government and private enterprise, and to transfer the unearned increment in land values from individual landowners to the community. Unfortunately, the Government is taking rather a long time in studying its implications. Quite recently Mr Churchill informed the House of Commons that examination had not yet been completed. The delay suggests that the recommendations of the report committee are the subject of acute differences of opinion between the parties. Meanwhile, the absence of a policy has created a state of uncertainty and is holding up the complex task of planning. The establishment, earlier this year, of a Ministry of Town and Country Planning under Mr W. S. Morrison and his introduction in the House of Commons this week of an interim development Bill, whose chief purpose is to bring under planning control land which is not subject to a scheme or resolution under the Town and Country Planning Act of 1932, hardly amounts to a policy. What is needed now is a speedy decision upon the Uthwatt Committee's three main recommendations: the purchase by the State of the development rights of rural areas; the introduction of a levy on betterment in built-up areas; and the acquisition of land by the State against fair compensation, if and when required for reconstruction and development.

BANK OF LONDON & SOUTH AMERICA LIMITED

Affords a complete international banking service
through its branches in

ARGENTINA, URUGUAY, PARAGUAY
CHILE, COLOMBIA, ECUADOR

THE CUNARD STEAM SHIP COMPANY, LIMITED

NOTICE IS HEREBY GIVEN that the Sixty-sixth Ordinary General Meeting of THE CUNARD STEAM SHIP COMPANY, LIMITED, will be held at Cunard Building, Liverpool, in the City of Liverpool, on Wednesday, the 28th April, 1943, at eleven o'clock a.m.

1. To receive and consider the Statement of Accounts and Balance Sheet to the 31st December, 1942, with the Reports of the Directors and Auditors.

2. To elect Directors and Auditors in place of those retiring, but who, being eligible, offer themselves for re-election.

By Order of the Board,

H. J. FLEWITT, Secretary.

Offices: Cunard Building, Liverpool. 19th April, 1943.

THE ALEXANDRIA WATER COMPANY, LIMITED

ALEXANDRIA, EGYPT

DIVIDEND

NOTICE IS HEREBY GIVEN that a dividend of ten shillings and sixpence per £5 Share will be paid without deduction of British Income Tax, but less Egyptian Government and Alexandria Municipal Taxes amounting to 1/4.1028, making 9/1.8972 net on Coupon 109 on and after the 15th day of April, 1943, at the National Bank of Egypt in Alexandria at Rue Toussourti or in London at 6 King William Street, E.C. 4.

Dated Alexandria, Egypt, the 12th April, 1943.

By Order of the Board,

T. D. KEY
ROBERT WALTON } Joint Managers.

COMPANY MEETINGS

CUNARD STEAM SHIP COMPANY,
LIMITED

SUCCESSFUL RESULTS

SIR PERCY E. BATES'S STATEMENT

Sir Percy E. Bates, Bart., G.B.E., chairman of the Cunard Steam Ship Company, Limited, has issued the following statement to stockholders of the company along with the report and accounts to be presented to the sixty-sixth annual meeting on the 28th instant:—

This year restrictions on the use of paper only permit me to touch on the more important features in the accounts, but we have been able to find room as usual for the comparative figures for 1941.

In the profit and loss account, the first of the debit items is higher, owing to income tax. Directors' fees are higher because of the increase in the number of directors. The amount reserved for taxation this year is lower, not because the E.P.T. situation is much clearer than it was, but because the balance of probability seems to justify the change.

INCREASED REVENUE

The revenue for the year is £42,000 higher in consequence of somewhat larger dividends from our subsidiary companies. The balance being profit for the year is £343,000, compared with £229,000 for 1941. In the balance-sheet, the 5 per cent. debenture stock, which no longer carries interest, has almost disappeared. The deposit by the superannuation fund has been again reduced by £50,000. There is nothing abnormal in the decrease in the item—creditors, open voyage accounts and reserves, nor in the £400,000 increase in loans from Port Line, Limited, and Thos. & Jno. Brocklebank, Limited, two wholly-owned subsidiaries. We needed some more cash and so naturally arranged to borrow what was in effect our own money, and without unduly depleting their cash resources in relation to their commitments.

Adding the year's balance of profit, £343,000 to the carry forward from 1941 of £578,000, the directors have had at their disposal in stages, though never at one time, the amount of £922,000, out of which just over £700,000 has been paid to the preference stockholders for arrears and current dividend, leaving £220,000 which it is proposed to carry forward.

On the credit side, the figures tell their own story; there is nothing abnormal in any of them.

It is impossible under present conditions to circulate the accounts of the subsidiary companies, or a combined balance-sheet. The main subsidiaries, Cunard White Star, Port Line and Thos. & Jno. Brocklebank, all have large and liquid resources.

As regards the air, since last year all that has happened has laid greater emphasis on the difficulties involved in dealing with this element. So far, no national policy has been evolved, and while my ideas remain unchanged no progress in dealing with them has been possible.

DIVIDEND POLICY

The year has justified the hopes I expressed last April. The arrears and current dividends on both issues of preference stocks have been covered by the combined figures of the carry forward from the previous year and the profit earned during the year. But the strain has been a heavy one, involving cash payments of more than double the year's profit. In these circumstances the directors did not feel justified in recommending further payments in respect of the year. On the other hand, we have some reasonable confidence as to the future, and nearly one-third of 1943 is already behind us. It was to give an expression of their present views that

the directors decided to declare the interim dividend on the ordinary stock in respect of 1943. That these views may change with events is of course true, and it should not be assumed that because there is to be an interim dividend on the ordinary stock there is of necessity to be a proposal of a final one a year hence. We must let the year unfold itself. The current business of the company and its associates I cannot discuss, for obvious reasons.

TRIBUTE TO STAFF

I cannot write about the staff with the freedom that I would like, but if I could the stockholders could share with the directors the appreciation and indeed admiration for their work, skill and devotion, which we all feel so strongly, especially with regard to the staff afloat. Staff matters have always held a very special importance in our minds. Since the end of the year the boards of the Cunard Company and Cunard White Star decided to take measures to buttress the superannuation fund, in order to mitigate the effect of the general reduction in the rate of interest obtainable on the gilt-edged securities, in which the fund invests its money. This action has received direct appreciation from every department in both companies.

THE FUTURE

To conclude with a general word on the future. Cunard ordinary stock is a speculative affair; it has emerged from a period of 13 years during which no ordinary dividend was paid. The basic reasons for this absence of return lie mainly in a period of a good deal earlier still, and of course some lie outside the company altogether. On March 19th there were 13,480 stockholders' accounts on the register of ordinary stock; of these 10,168 did not exceed £300; 8,642 stood at £200 or less, and 5,542 showed figures of £100 or less. If I thought it were any use advising that no one should hold more ordinary stock than he could afford to lose, I would give that advice. But by nature man is a gambling animal, as was shown by the popularity of greyhound racing and more recently in the demand for death benefits. Robert Louis Stevenson developed this argument more than 60 years ago in his essay, *The Day After Tomorrow*. The future may contain anything, but for myself I carry on in a spirit of reasonable but cautious hope.

ASSAM RAILWAYS AND
TRADING COMPANY,
LIMITED

The adjourned sixty-second ordinary general meeting of the Assam Railways and Trading Company, Limited, was held, on the 21st instant, in London.

Mr E. A. A. Joseph, the chairman, said that the railway revenue showed a large increase, which was no doubt partly attributable to the carriage of military traffic. There was no reason, however, to suppose that the normal steady progress which had now continued for four years had not been fully maintained. It was particularly gratifying that increased earnings had been accompanied by decreased working expenses, so that the percentage of expenditure on gross takings had fallen from over 61 to under 52. The Government had taken over control of the railway from April 1st, 1942. The board were at present negotiating the terms of the arrangement with the Government of India.

The report was adopted.

CLERICAL, MEDICAL AND
GENERAL ASSURANCE
SOCIETYSIR FRANCIS E. J. SMITH'S
ADDRESS

The annual meeting of this Society was held, on the 21st instant, in London.

The following address was submitted by the chairman, Sir Francis E. J. Smith:—

Judged by war-time standards, the results of the Society's transactions during 1942 are, in the opinion of the directors, satisfactory.

RESULTS OF THE YEAR

Our net new life business rose to the record war-time figure of £1,110,564. New business is important; so, equally, is the avoidance of loss of existing business by the process of surrender. In 1942 surrender values of life policies amounted to only £46,000, which is considerably less than one-half of the corresponding 1939 figure.

The total of normal claims by death was nearly £100,000 lower than in the previous year, and their character was favourable. On the other hand, claims arising directly or indirectly from the war were heavier than in 1941.

The Society continued, as in previous recent years, to support new issues of War Loans to an extent which materially exceeded the current growth in funds, a policy which must, by itself, impart a downward trend to the average rate of interest earned upon the assurance funds.

Actually, during 1942, a substantial recovery took place in the income produced by our property investments and, mainly on this account, the average gross yield earned upon our assurance funds rose by 4s. 10d. per cent. to 4s. 5s. 3d. per cent., and the net yield by 2s. 6d. per cent. to 3s. 3s. 6d. per cent. These welcome recoveries in yield were foreshadowed a year ago when I stated that the interest rates then published did less than justice to the earning powers of the Society.

THE SOCIETY'S ASSETS

Our holdings of British Government securities rose, by £500,000, to just over £3,000,000, whilst mortgages and loans decreased by nearly £400,000. In other respects, the distribution of the total assets of £16,500,000 showed little change. A valuation of the Stock Exchange securities at the end of the year disclosed a satisfactory rise in capital values, which further increased the margin by which market prices exceeded book values.

TREATMENT OF WAR RISKS

In regard to the treatment of war risks, the directors have decided to continue, so far as reasonable prudence permits in time of war, the Society's traditional practice of issuing new life assurance contracts with the minimum of restrictive conditions. Even today, our new life policies, with few exceptions, provide unrestricted cover, at the tabular rates of premium, against all the risks of death incurred by civilians and by members of His Majesty's Army serving in this country. Should death occur as the direct result of service in the Army overseas, or in any other branch of His Majesty's Forces, the degree of cover provided is restricted. The amount payable may vary, according to the nature of the war risk and the form of policy, from a return of the premiums paid to as much as one-third of the full sum assured. In the case of deferred assurances, issued on the lives of children under ten years of age, no restricted war clauses are inserted at all.

The transaction of new life assurance business, under existing conditions, is clearly of two-fold importance. Each new policy provides added security for dependants, and each new premium paid constitutes a contribution to national savings.

THE MIDLAND EMPLOYERS'
MUTUAL ASSURANCE,
LIMITED

CHAIRMAN'S REVIEW

RECORD PREMIUM INCOME

ASSETS EXCEED £4,000,000

Presiding at the forty-fourth annual general meeting of the Midland Employers' Mutual Assurance, Limited, in Birmingham, on the 20th instant, the chairman, Lieut.-Colonel J. Beaumont Neilson, C.M.G., D.S.O., C.A., gave the following review of the company's activities during 1942:—

BALANCE SHEET AND ACCOUNTS

You will see from the revenue account that the premium income, less reinsurances for the year 1942, amounted to £2,664,272, an increase of £314,112. This is another record in the history of the company. The increase is due again not only to more employment and higher wages, but also to a substantial increase in the number of policyholders.

LOW EXPENSE RATIO

The expenses of management at £214,150 shows the very low ratio of 8.04 per cent. This is substantially in the same ratio as the previous year, notwithstanding the fact that during the year under review the company has continued to make allowances to all members of the staff who are on active service, has continued the "Grant in aid" scheme initiated two years ago to the remaining members of the staff, and has found it necessary to employ a larger number who are over military age or unfit for military service to take the place of those called up. In spite of this the increased business of the company has been handled with the promptitude and efficiency for which we have earned a reputation. Commission at £135,880, i.e., 5.1 per cent., is in the same ratio as the previous year.

INCREASED NUMBER OF ACCIDENTS

Cash expenditure in connection with claims amounted to £1,584,388, which is an increase of £239,917 over 1941. It will be noted that the insurance fund at the end of the year amounted to £3,414,595, against £2,741,704 a year ago. Of this amount, £1,198,923 is reserved in respect of unexpired risks as against £1,057,572 in the previous account, whilst the claims reserve at £2,215,672 is £531,540 in excess of the figure for 1941.

During the year under review the number of accidents reported again shows a substantial increase. This is due to new entrants into industry and the large number now employed therein, in addition to which fatigue and overstrain play a large part in the cause of such accidents.

ASSETS

The assets of the company as at December, 1942, show that there is an increase in investments of £281,709, in cash £415,035 and debtors £52,093. The assets now total £4,080,621, as compared with £3,331,784 a year ago.

The war savings scheme referred to in my previous reviews is continuing to work well.

BEVERIDGE REPORT

Considerable interest has naturally been aroused by the proposal in the Beveridge Report to include compensation for industrial accidents in the Social Insurance Scheme (subject to additional assessment of employers in the more hazardous industries). The experience of the past forty-five years has shown that there are many advantages in the existing system when administered on such an economic basis

as that of your company, and this fact will doubtless be taken into full consideration by the Government in formulating any legislation they decide to introduce. Improvement in the scales of compensation, which is probably overdue, can be as readily and undoubtedly more economically operated under the present system of mutual insurance than under any other.

The company's general manager prepared and issued a memorandum of observations on the Report in so far as it dealt with workmen's compensation. These observations I consider excellent and they should be of great help to all who have to study this part of the Report.

STAFF

As I have mentioned in previous reviews, the company has suffered by reason of the call-up of members of the staff to the Forces. Over 72 per cent. of our male staff are now engaged in various branches of the Services, in addition to which a large number of the female staff are either serving in the auxiliary units or have been released for other forms of national service.

The increasing premium income and the increased number of accidents referred to above have thrown a large amount of additional work on those members of the staff who remain. In dealing promptly and efficiently with the injured man-power we are, I feel, carrying out work of the utmost national importance and it is to be hoped that further calls will not be made on our much reduced staff.

Once again I have to commend to you the excellent work done by the whole of the company's staff, and special thanks are due to the general manager for his great work on behalf of the company.

The accounts were unanimously adopted and a vote of thanks to the chairman brought the meeting to a close.

BIRMINGHAM SMALL ARMS
COMPANY, LIMITED

CONTRIBUTION TO WAR EFFORT

The adjourned ordinary general meeting of the Birmingham Small Arms Company, Limited, was held, on the 20th instant, in Birmingham.

Sir Bernard D. F. Docker, K.B.E. (the chairman), said that the profit on trading and income from investments, after providing for E.P.T., N.D.C. and contingencies, was £719,758, compared with £777,264 in the previous year. Unfortunately the resources remaining available after payment of taxation of such severe and varied kinds related little to the magnitude of the productive effort made for the prosecution of the war. It was no exaggeration to say that without what was known as private enterprise the provision of munitions upon the present scale would have been utterly impossible.

Their tool group of companies was continuing its efforts in an ever-increasing degree. In previous addresses he had pointed out the necessity for H.M. Government to show an interest in the stability of this "key" industry.

It might well be that it was necessary for controls to be kept on after the war for a time, but it must be clear that the period must be strictly limited by absolute necessity. They had fought the war and they would win the war to achieve freedom; they must see that they did not escape that danger only to become the prey to the sapping efforts of bureaucratic control. Let them be free to go about their business; let planning be done when it must be done by industry and not by the state, and finally they were told monopolies were bad; let them not conjure up the greatest of all monopolies, state monopoly.

Finally, he would like to express sincere thanks to the chief executives and their staffs and to all the staffs and workpeople throughout their widely dispersed organisation.

The report was unanimously adopted.

TELEGRAPH CONSTRUCTION

COMPANY, LIMITED

LARGER PROFIT

The seventy-ninth ordinary general meeting of this company was held, on the 20th instant, in London.

Mr Colin F. Campbell, the chairman, in the course of his statement, previously circulated, said: The trading account shows an amount of £320,708 compared with £148,066 last year, and after putting aside £270,000 to meet taxation, there is a balance remaining on profit and loss account of £49,365. The directors have decided to transfer a sum of £23,675 to "reserve for contingencies," which leaves a balance of £25,689, to which must be added the sum of £40,571 carried forward from the previous year's account. The board recommend a final dividend of 5 per cent., making a total for the year of 10 per cent., the same as for 1941.

The works have been occupied during the year beyond their normal capacity and the output has exceeded all expectations. The board has taken every precaution to maintain the efficiency of plant and machinery, but we shall, in time, be faced with heavy commitments for renewals. Provision for these should be made now, but the excessive demands for taxation preclude us from doing all that is required. We do, however, look forward to the repayment of 20 per cent. of the excess profits tax after the war in view of the assurances of Government in this respect; this will help us to effect the necessary replacements.

The company's standard rate of profit is not a good one, so that the heavy provision for taxation is a severe drain upon our liquid resources. The Selborne Estate is in a particularly unfavourable position in regard to its standard rate of profit. Unfortunately it has now passed into enemy hands.

The report was adopted.

BRITISH TYRE AND RUBBER
COMPANY, LIMITED

BUSINESS WELL MAINTAINED

The annual general meeting of the British Tyre and Rubber Company, Limited, was held, on the 20th instant, in London, Sir Walrod Sinclair, K.B.E. (the chairman), presiding.

The following is an extract from the statement by the chairman circulated with the report and accounts: The net profit has this year been struck after providing for National Defence Contribution and Excess Profits Tax. The figure of £204,115, therefore, has this in common with our pre-war accounts, that it is subject to income tax only, which, in so far as profits are distributed, is passed on to shareholders. The amounts allocated to contingencies and general reserve are £25,000 respectively as last year. The total distribution to ordinary shareholders is likewise maintained at 11 per cent. The provision for taxation—£95,000—in conjunction with the contingencies reserve is sufficient to cover income tax on all profits to September 30, 1942, at present rates. The amount carried forward—£72,438—is £1,773 less than that brought in.

Despite the restriction of essential raw materials, in addition to the many other difficulties with which we have had to contend, your company's business has been well maintained during the year under review, with results which your directors consider to be satisfactory.

The course of business so far for the current year is reasonably encouraging, although the long view remains obscure. Rubber is now accorded its rightful place in the short list of essential materials, and the strictest economy in consumption is practised in all the factories of the B.T.R. group. This, of course, is a national duty, and I should like to take this opportunity to appeal most strongly for the practical co-operation of every user.

The report was unanimously adopted.

Finance

GOVERNMENT RETURNS

For the week ended April 17, 1943, total ordinary revenue was £40,063,000, against ordinary expenditure of £122,022,000, and issues to sinking funds of £140,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £202,584,000 against £167,501,000 for the corresponding period a year ago.

 1943. January 23, Reichsbank; April 3, Australia, New Zealand and South Africa; April 10, Portugal; April 17, Argentina, Canada, India, International Settlements, Turkey and U.S. Federal Reserve Banks.

their ability to stave off a German invasion developed into the conviction that the Germans were beaten, and that it was only a matter of time before the collapse would come. That is the Swedish state of mind to-day.

Thus the Swedes feel that, in a measurable space of time, their isolation will be broken, and they will be called upon to define their attitude towards other nations and to adjust their policy to the post-war world. There is intense interest in and speculation about the shape of things to come, and since Swedish policy must inevitably depend on the kind of settlement achieved by the Great Powers, Sweden is waiting anxiously for some indication of their intentions. Most Swedes realise that a satisfactory international system turns on the continuing friendship of Britain, the United States and Russia, and they are anxious lest disagreement over the future of Europe's eastern frontiers should be a barrier to post-war co-operation. The future of Finland naturally touches them very closely, and there is no disguising the undercurrent of apprehension which runs right through Swedish society where Russia's future policy is concerned. The feeling is historical rather than ideological. Most of Sweden's now very distant wars were fought against Russia. It can be easily dispelled by the adoption in Russia of that kind of "good neighbour policy" which has transformed the United States from a menace to the small states of Central America into their best friend. This, the Swedes maintain, is more likely to occur in Russia if there is a larger framework of friendship among all the Great Powers. They realise, too, how crucial to this is the question of greater Allied aid to Russia. The Swedes, from their neutral perch, are keen Second Frontiers.

Their apprehensions are not confined to Russia. If they fear too much intervention from the East, they fear too little from the West. Every indication that Britain and America intend to play a positive role in the post-war period is gratefully seized on. Few statements have aroused such discussion as Mr. Churchill's recent broadcast.

One can imagine that under a world organisation embodying or representing the United Nations, and some day all nations, there should come into being a Council of Europe and a Council of Asia . . . It would seem worthy of patient study that side by side with the Great Powers there should be a number of groupings of States and Confederations . . . the whole making a Council of great States or groups of States.

This is the first positive indication the Swedes have had of the direction in which official policy is developing in Britain. To some extent it fits in with their own way of thinking. In the last year interest in the possibility of forming a Scandinavian bloc or Nordic union of Sweden, Norway, Finland and Denmark has steadily increased. The newspapers have taken it up. Leading politicians such as Hr Undén support the idea. The Norden Society

has been expanded and the TUC, the Co-operative Union, the Employers' Federation and about twenty youth organisations are affiliated to it. As one newspaper put it, the desire for Nordic union has grown from the opinion of a limited intellectual group to a national feeling.

The form of union is still vague. Most people would define the union as meaning the amount of political, economic and diplomatic co-operation necessary to achieve military security. However, those who support it approach the policy from very different points of view. At one extreme are the isolationists. They argue that Sweden has nothing to hope from a wicked world of Great Powers. Whether it is bolshevik imperialism from Russia or capitalist imperialism from the Anglo-Saxon world, there will always be trouble so long as the Scandinavian countries insist on maintaining close relations with the outside world. Sweden's ability to remain neutral points the way, they maintain, for the future Nordic bloc. It must cut loose from all entanglements to east or west and set itself up as an independent neutral bloc, strongly armed and formidable enough to prevent any Great Power making "use" of its territory. There was at least a hint of this attitude behind the recent unofficial speech of Hr Sköld, the Minister for War.

It is not the majority view. Most Swedes regard their neutrality as a lucky chance, which may not be repeated. They want a Nordic Union, not in any isolationist sense, but as one of the integrated groups or regions out of which world order will be built up. They welcomed Mr Churchill's reference to regional Councils and hope with him that the Great Powers will build the larger framework within which the different blocs can work. Even if this framework is not fully achieved, they would still prefer close relations with the Western Powers to isolationism. On one point, however, they are in radical disagreement with British thinking. They will hear nothing of a European Council as an intermediary between their Nordic grouping and world order. The Swedes have little sense of Europe, and no sense at all of belonging to any kind of community, economic, political or cultural, with Eastern Europe or the Balkan States. They prefer the League of Nations organisation, supplemented by regional blocs where common interests exist, but not divided up into European or Asiatic Councils. The truth is that the Swedes are loth to take part in any grouping in which the Germans or the Russians might predominate. A world system would include the counterbalancing power of the British Empire and the United States. As for economics, they are more interested in South American than in Balkan markets.

To these projects of union and joint action there is, however, one very serious drawback. It is not certain that the other Scandinavian nations are as anxious as Sweden to link their fortunes together. Norway is emphatically against it, if it entails any weakening of its connections

with the Atlantic world and, in any case, is not prepared, after three years of suffering and struggle, to accept Swedish leadership, which it suspects to be part of the plan. An embitterment of the relations between Sweden and Norway is the price the Swedes are paying for neutrality and for the infringement of neutrality by the transit traffic. It is above all the realisation that Norway is hurt and estranged by the help Sweden is giving to Germany's occupying forces that lies behind the popular opposition in Sweden to the continuance of the transit traffic. It is the main issue today in public debate there. Extremists would like to make scapegoats of Hr Günther, the Foreign Minister, responsible for the transit arrangements, and Hr Westman, the Minister of Justice, responsible for press censorship on the subject. Moderate opinion maintains that, since the Government is collectively responsible, scapegoats are unnecessary. All that is needed is the rescinding of the concession to Germany. There is little doubt that the transit traffic will be stopped in the course of the next months.

This step will restore Sweden to full neutrality; but, in considering the post-war world, many Swedes are asking whether neutrality is enough. This does not mean armed intervention. Practically nobody in Sweden is ready for that. It should mean a very generous Swedish effort in the period of reconstruction. Some business circles are, it is true, reckoning on the immunity conferred by

neutrality to exploit a big competitive advantage in the shattered post-war world. Their plants are intact and expanded, their labour force disciplined and well fed, their contacts in enemy and allied territory excellent, their financial stability beyond dispute. More responsible citizens see, however, that if one thing were needed to crown Norway's bitterness and complete Nordic disunion, it would be the sight of Sweden using its million odd tons of merchant shipping and all its other economic advantages to put a rapid end to its wartime shortages and get ahead in a scramble for post-war markets. There are already proposals abroad in Sweden for the extension of lend-lease aid to the stricken nations of Europe, particularly to Norway and Finland. The weight of Allied opinion should, of course, do everything to encourage this trend of thought.

For the Swedes, this is a time of waiting. The shape of the future world is still too vague for them to fit their country into it with any degree of certainty. Their first task is to repair the damage done by their policy in Scandinavia itself. This is within their power, and can be accomplished speedily. For the rest, they are ready and anxious to be good citizens of the world, provided always the world is a place in which there can be good citizens. They will not shirk their duties and responsibilities, given a reasonable hope that other more powerful nations will not shirk theirs.

Budget White Paper—III

A Comparison with America

THE preceding article in this series showed how the economic cost of the war to the United Kingdom had been borne. The cost of the war in 1942, reckoned in pounds of 1938 purchasing power, was £2,700 million. Of this, £1,113 million was provided by increased total production, £627 million by reduced consumption, and £960 million out of capital—either by reduced provision for the maintenance and increase of domestic capital or by overseas disinvestment.

How does this experience compare with that of the United States? Figures are available for a fairly direct comparison—though it must be remembered that estimates of this sort are subject to a wide margin of error within each country, and to an even wider margin when international comparisons are made. The results, however, are interesting enough to justify a certain amount of statistical hazard. The British figures are derived from a comparison of 1942 with 1938. But, unfortunately, 1938 would be a very poor base year for an American comparison, for it was a year of sharp recession in trade. The year 1939 has therefore been taken as the peacetime base for America; it was about as "normal" as 1938 was for Britain. It should be remembered in consequence that the British comparison covers four years and the American only three.

The figures* are first given in terms of "pre-war" money—that is, 1938 pounds and 1939 dollars:—

	(£ mn.)		(\$ billion)	
	United Kingdom	United States	United Kingdom	United States
	1938	1942	1939	1942
Consumption.....	4,035	3,408	62.0	69.7
Government expenditure on goods and services	845	3,545	15.1	56.0
Maintenance and increase of capital.....	707	-253	11.0	7.5
Gross National Income at market prices.....	5,587	6,700	88.1	133.2

In this form, however, comparison is obstructed by the different size of the two countries and the different value of their currencies. Accordingly, in the next table, the figures are converted to percentages of each country's

pre-war Gross National Income—that is, the British figures are re-calculated as percentages of £5,587 million and the American as percentages of \$88.1 billion:—

	(Pre-War Gross National Income=100)			
	United Kingdom	United States	United Kingdom	United States
	1938	1942	1939	1942
Consumption.....	72.2	61.0	70.4	79.1
Government.....	15.1	63.5	17.1	63.6
Capital.....	12.7	-4.5	12.5	8.5

Gross National Income... 100.0 120.0 100.0 151.2

These figures, though expressed in percentages, are measures of real magnitudes. Thus the figure of 63.5 entered against Government expenditure in the United Kingdom in 1942 means that the British Government exercised command in that year over a quantum of goods and services equal to 63.5 per cent of the total output of the British community before the war. The conversion to pre-war prices of all the British estimates other than consumption rests on no more than a guess of the change in prices. It is possible that the British figures both for Government expenditure and for Gross National Income in 1942 should be higher.

From these figures, the cost of the war in each country, and the sources from which it has been derived, can be directly read off, still in terms of each country's pre-war output:—

	(Pre-War Gross National Income=100)			
	United Kingdom	United States	United Kingdom	United States
Cost of the war (increase in Government expenditure).....	48.4	46.5		
Derived from:—				
Increased production (increase in Gross National Income).....	20.0	51.2		
Reduced consumption.....	11.2	-8.7		
Reduced provision for capital or disinvestment.....	17.2	4.0		

Both the similarities and the differences between the experience of the two countries are interesting. Much the most striking comparison is the similarity between the cost of the war, relative to their pre-war output, in the two countries. The figures must not be driven too far, since the statistical framework on which they have been built up is rickety. But when all necessary allowances have been made on this account, it is still probable that each country has been able to mobilise for war a quantum

of physical resources equal to almost half its total pre-war output. This result may be surprising to many people in this country, where the impression prevails that the American war effort, though gigantic and rapidly increasing, is still substantially less, relatively to the country's resources, than that of Britain.

The origin of this impression emerges from the later figures. For there is a very natural tendency to judge the dimensions of a country's war effort, not by the magnitude of resources mobilised, but by the intensity of the sacrifices imposed. The British people, in the process of mobilisation, have reduced their consumption by an amount equal to 11½ per cent of the total pre-war output. The consumption of the American people in 1942 was actually larger than in 1939 though slightly less than in 1941. Britain has been compelled to under-maintain her domestic capital and to draw heavily on her overseas accumulations; America is still making a net addition—though a reduced one—to her capital.

The explanation lies in the very large and very remarkable growth in the output of the American economy—an increase of over 51 per cent in three years against the British increase of perhaps 20 per cent in four years. Part of the contrast is no doubt explained by America's freedom from the effects of blockade, black-out and bombardment—indeed, when these are borne in mind, it is the fact that there is any increase in British output, not that the increase falls short of America's, that is surprising. Nevertheless, the increased output of which the American economy has proved capable is astonishing. The unemployed margin of resources that existed in 1939—whether the unemployment was voluntary or compulsory—was evidently far larger than anybody suspected. It is not so many years since President Roosevelt's goal of a national income of \$100 billion seemed remote and visionary. In 1943, the Department of Commerce estimates that net national income at factor cost (assuming no further rise in prices) will be \$140 billion and gross national income at market price will be between \$175 and \$180 billion.

Spotlight on Poverty

TOWARDS the end of the fourth year of war it is difficult to remember that in the early months almost the whole war news, for this country, consisted of the trials and problems of evacuation. Yet, when the social history of the war comes to be written, it is probable that this great migration will form the most important subject, not so much because it is what the idealists call a social experiment—the mingling of rich and poor and town and country—but because it revealed to the whole people the black spots in its social life. Secrets, hitherto known only to a few doctors, health visitors and local authority officials, were without warning given the limelight of publicity when, in the early days of September, 1939, children and mothers from the poorest quarters of our towns descended upon the countryside. They came, they were seen—and they horrified.

The secrets cannot be covered up again—in spite of the events that have shaken the British public since then, in spite of the blitz which showed how the same quarters of the same towns could stand up to bombing, and in spite of the gradual straightening out of the evacuation difficulties themselves. It is written in the record that a section of the British people is degraded; and the only way to clear the record is to cure the degradation.

What were the chief charges brought against these evacuees? It was said of the children that they were completely lacking in any form of self-control—that they lied, swore and pilfered, that they were verminous, that they wetted and soiled their beds and even their clothes. It was said of the mothers that they explained the children—that they were indescribably dirty and had not even the most elementary idea of managing their homes and families.

These were grave charges to bring against even a small

These figures are, of course, inflated by the price rise that has already occurred. Reduced to terms of 1939 dollars, the figures would be about \$118 billion for the net and \$150 billion for the gross. The full meaning of these tremendous figures is very difficult to grasp. Indeed, it will not be fully apparent until after the war. If it is true that the war has led, in Britain, to a new conception of potential national productivity, then it is many times truer in America. The vision of material prosperity is the brighter—and the penalty falling on any political leader who fails to attain it will be the sharper.

* * *

A footnote is needed, by way of correction, to last week's article. It was there overlooked that the figures of domestic disinvestment given in the White Paper refer only to the operations of private finance. Any net investment or disinvestment at home by the Government is wrapped up in the figure of Government expenditure. (The figure for overseas disinvestment, however, includes both public and private operations.) This has considerable importance for the discussion in the last paragraph of last week's article on the capital impoverishment of the British community that will result from the war.

It is impossible to make any quantitative allowance for public domestic investment or disinvestment. There are entries on both sides; but it is reasonably certain that the net effect of Government activities is a net positive investment, or increase in capital, which may be large. This means that the net social disinvestment of the whole community during the war will be smaller than appears on the face of the figures quoted last week.

There is, of course, one intangible factor which cannot be measured. The capital that has been privately disinvested has all, or almost all, been useful capital adapted to the peace-time needs of the nation. It remains to be seen what permanent value can be derived from the capital that has been publicly invested during the war years.

section of the evacuees, and it is not surprising that for some time they were disbelieved or at least regarded as exaggerations. But if there are still some who refuse to accept them as true, a book has now been published* which must convince all except the stupidly prejudiced. It is the fruits of an investigation by a body of professional women, which was undertaken as a result of a resolution from the National Federation of Women's Institutes deploring the conditions disclosed by evacuation and asking for remedies. In this book the accusations brought against the evacuees have been carefully examined, and against a minority large enough not to be dismissed as negligible they have been found proven.

But the authors of *Our Towns* were not content to establish the facts. They also sought to find out why they have come about, why, in spite of the vast array of social services that exist in Great Britain, children are still able to be lousy, dirty, ill-fed and ill-clad. There is no single answer to their questions. But by their careful study of all the relevant factors the authors have collected enough material to provide a fairly complete picture of the family life of these evacuees.

In the great majority of cases, the father is an unskilled labourer whose wages, in peacetime, were probably not more than £3 a week. The mother has left school at 14 to become the poorest type of factory worker. By the time she marries, the little she learned in her elementary school of needlework and cooking has been forgotten. How to spend her money economically and how to bring up children she has not forgotten, because she has never known. These two parents, the unskilled father and the

* The American figures are mainly derived from an article entitled "National Income and National Product in 1942," by Milton Gilbert and George Joaz, in "Survey of Current Business," March, 1943.

* "Our Towns: A Close-up." By the Hygiene Committee of the Women's Group on Public Welfare. Oxford University Press. 143 pages. 5s. net.

feckless mother, then proceed to produce and rear a family. In most cases the father's wages are stationary, even if they do not fall or cease through unemployment. Each new child, consequently, depresses the family's standard of living further. They are unable, through poverty, to move into a bigger house, so child after child is born into an ever-increasing squalor. There are laws against overcrowding in this country. There are also laws about sanitation. Yet it was still possible in 1936 for an East End family to sleep five in a bed, for another to sleep seven in a room, and for another family of five to share one bedroom with six cats. The lavatory accommodation is as bad, if not worse. "Hundreds of thousands of families in all parts of the country," say the authors, "have not a private closet, and there are areas where it is the exception for a family to have one." In Clerkenwell, there are sometimes eight or more tenancies to one w.c.

There are still privy middens in towns, houses with cesspool sanitation, and others with closets across waste ground which women are afraid to cross alone at night.

The food and clothing of these families are on a par with their housing conditions.

The typical slum diet of our pre-war days, consisting largely of white bread, strong tea with plenty of sugar, pastry, bready pastes and sausages, cheap jam and margarine . . . may well be among the worst ever devised by mankind, so grossly lacking is it in protective elements.

But bad food is not always the result of poverty. Too frequently it merely reflects parental ignorance or indifference. One evacuee hostess received two children from a home where "a regular and substantial income" came in. The children

breakfasted on bread and butter and tea, got themselves fish and chips at mid-day . . . and had a third meal of bread with meat paste, cake and tea . . . which was the last in the day.

In the case of clothing, poverty is often exploited by the worst kinds of clothing clubs, which, in effect, become money-lenders of the poor, their sole object being, in the words of a caretaker of a block of working-class flats, "to get people into debt and then keep them in it. . ." The goods these "check-selling" firms provide are, according to the same source,

"tripe"—by this I mean shoes with compressed cardboard soles, cotton blankets, kiddies' blazer suits of very inferior flannel—in fact most "Tally" goods are very conspicuous by their poor quality.

Yet when, last year, the Board of Trade prohibited check traders from charging poundage on their checks, there were Members of Parliament who protested.

Badly fed, inadequately clothed and suffering from a persistent shortage of sleep, the children of these families can hardly help catching any illness that is going around. A comparison made in Newcastle-on-Tyne ten years ago disclosed that, among 124 children, under five, from the professional classes, there had been 2 cases of pneumonia, 1 of pleurisy, 2 of chronic and recurrent cough, and 6 of measles. Among 125 children of the same age from the poorest city streets, there had been 17 cases of pneumonia, 32 of chronic or recurrent bronchitis, 46 of measles, 6 of chronic diarrhoea, and frequent cases of abscesses, skin infections and otitis media.

But what most struck the hostesses of the children was their lousiness. *Our Towns* quotes a paper by Dr Mellanby on *The Incidence of Head Lice in England*, which shows that the preannounced inspections of school children reveals nothing of the true degree of infestation. His sample from hospital admissions in ten industrial cities showed an infestation rate of 30 per cent among boys of school age and 50 per cent among girls—the figures being three times as high as those given in the relevant school medical officers' reports. For both sexes under five the infestation rate was approaching 50 per cent. It is thus quite useless cleansing school children, who go home, nurse the baby and become infested again, unless measures are taken to cleanse the whole family at the same time.

It cannot be too strongly emphasised that the families of whom a close-up has thus been given are not representative of the British working classes. Others with meagre incomes manage to keep themselves and their children clean and comparatively well-fed and clothed. *Our Towns* quotes a moving account of her home life given by a Bermondsey housewife to *The New Survey of London Life and Labour*, which shows how life in a three-roomed flat with a family of three children can be run on £2 3s. a week. "I have been married 21 years," she says, "and I would not change with anyone . . ."

Poverty, in fact, is not always the determining factor whether a family falls below the standard, though in the great majority of cases the families examined were poor. Parental incompetence and indifference in the matter of food and clothing, and family upbringing as a whole, is not confined to the poor, though these better-off families generally lack the worst faults. Nor would the removal of poverty necessarily improve the homes of the "submerged tenth," within which are the problem families

always on the edge of pauperism and crime, riddled with mental and physical defects, in and out of the Courts for child neglect, a menace to the community, of which the gravity is out of all proportion to their numbers.

Give these families children's allowances, remove them to a new environment, the result will still be disheartening. Enuresis, for instance, is authoritatively held to be not a problem of bad housing, in spite of the bad sanitary accommodation that still exists. Except in psychological and medical cases, it is the product of a low social standard—the parents have simply not bothered to train their children.

Is there any solution to the problem of these problem families? And to the whole question of parental incompetence? The authors of *Our Towns* have no hesitation—it is education. The great drawback now is that the school medical services and the educational system as a whole get the child too late. But take the child at the age of two and, until the age of six, educate it in a nursery school, where the co-operation of the parents is wanted and encouraged, and you have "the best hope of influencing three generations—the child, its parents and its offspring." Many parents will be uneducable, and in these cases the authors state clearly that the doctrine of parental responsibility should never be upheld at the expense of the child. They deplore, rightly, the system that imprisons parents for child neglect and then hands the children back to them immediately on their release.

But nursery schools are not the only solution. The thorough reform of the whole of the educational system is urged. The authors remark pointedly that if there were a single system of primary education, to which the children of all social classes were equally sent, the conditions still allowed in many of the elementary schools would not be tolerated for a moment. Nothing short of the best for both buildings and staff should be the standard aimed at for the primary schools, but it will not be secured until it is compulsory for children of all classes to attend them. No less important is a change in curriculum. No longer should a girl leave school "the ignorant offspring of ignorant parents, with a child's mind in a woman's body, fit neither to be wife nor mother." And training in domestic subjects should form an important part of the curriculum of day continuation schools which should be made compulsory.

A great deal is being talked at present about reconstruction priorities. Housing, the health services, full employment, children's allowances—all these have a part to play, and a large part, in eradicating the black spots from British towns. But though they may remove the symptoms for a time, they will not finally cure the disease. Only education can do that. It will certainly take money; but there is no single object, bar none whatever, on which the State can better, or must more urgently, spend money. It will certainly take time; and it will not always succeed. But the attitude to adopt is not that it is only a chance; it is rather the only chance.

NOTES OF THE WEEK

Strained Alliance

The Polish-Soviet breach is obviously a triumph for Goebbels. The weakest spot in the Allied alliance has been probed and a breach created in the United Nations' front. Obviously, the Germans alone profit by the suspension of relations between the Polish and the Soviet Governments. The Polish Government has gained nothing by its incredibly foolish reaction to the German atrocity tales. In demanding a Red Cross inquiry on German-occupied territory, it gave the Soviet Government the handle it needed to raise in an acute form its differences with the Sikorski Government. Nor, on their long-term interests, have the Russians gained anything by precipitating the crisis and weakening the United Nations' front while the issue of the war is still in doubt. Yet it would put the crisis in a false perspective to suggest that it is primarily caused by German propaganda. Goebbels has exploited a weak and dangerous situation, but the weakness and the danger were there already. The immediate issue is not, of course, the Polish officers' graves at Katyn; it is the frontiers of Poland. The Russians claim the 1941 frontier now. The Poles maintain that, according to the agreement concluded between the Polish and Soviet Governments in 1941, the Russians renounced the settlement they had reached with the Germans—which gave them their 1941 frontier—and it was understood that the consideration of frontiers would be postponed until after the war. This ought not to be an absolutely irreconcilable conflict at this stage, for the Poles do not deny that frontier readjustments may be necessary. It is not unreasonable to ask the Soviet Government, in the interests of solidarity, to postpone a question which if brought up in its most acute form can only aggravate the dangerous situation which it has already caused. But here the United Nations must face the second and far more serious issue, a crisis of confidence between the Great Powers themselves. The course of the war so far has not removed the old deep-rooted almost pathological suspicion entertained by the Soviet Government of the outside world. This suspicion—that "capitalist, imperialist" Britain and the United States may still sell Russia down the river—lies behind Russia's disregard of the courtesies of alliance by its unyielding insistence on getting recognition for the 1941 frontiers now.

What can be done about this sombre situation? Clearly, it must not be allowed to develop. The Germans are pouring out over Europe the story that this breach means the betrayal of Europe by Britain to Russia. Can the Allied Government be absolutely certain that there will be no rallying to Germany in Eastern Europe as a result? Suppose the Russians were now to set up a Polish Government on Soviet soil—there is already talk of a separate Polish Army. It might then be possible for Hitler to find at long last some Poles ready to co-operate with him. Then Poland would be in the unhappy plight of possessing three Governments backed by different Powers—and it is hard to imagine anything more calculated than this to prise open the Grand Alliance. The Germans are already prating about a rift between "pro-Polish Washington" and "pro-Soviet London." It is no use burking these possibilities. They show the urgency of repairing the Allied line. There are two chief necessities. The first is, in the interests of solidarity; to persuade the Russians not indeed to abandon their claims, but to postpone their consideration until the war is won. The explanatory Polish Note may help here. But a bigger issue remains—the Second Front. The Russians are most likely to make concessions in the interests of solidarity if they believe that solidarity to exist. It is the task of Britain and the United States to convince them.

Slings and Arrows

Trouble still simmers in India. There seems no end to the incidents that a malign fate can produce to exacerbate the persistent unease. The Federal Court has declared Rule 26 of the Defence of India Rules invalid. It is under this Rule that Mr Gandhi and some 9,000 other disturbers of the peace are imprisoned. President Roosevelt's per-

sonal representative in India, Mr Phillips, has been forbidden to visit Mr Gandhi in prison. The Moslem League has met and repeated in the strongest terms its demand for partition, for the setting up of separate and independent Moslem states with self-rule. Nor have the incidents been confined to India. Across the Indian Ocean, both Houses of the South African Parliament have passed measures discriminating further against Indian property holding in Natal and Indian trading in the Transvaal, measures which have caused "profound regret and concern" to the Government of India, and widespread "offence and apprehension" among the Indian population. None of these incidents makes the existing unhappy situation definitely or unexpectedly worse. But, taken together, they render the prospects of an improvement, already remote, remoter. The action of the Federal Court in invalidating Rule 26 is, in a sense, cause for congratulation. It is a sign, albeit largely a formal one, that the present abnormal and unfortunate situation in India, with both the Central Government and the Provincial Governors in possession of large emergency powers of administration and justice, is still hedged by a rule of law. Already, it is true, an Ordinance has been promulgated to legalise the imprisonments. None will be released. This was inevitable. But the action of the Federal Court is a reminder to the makers of Defence Regulations, not only in India, but also in all British countries where the exigencies of war and emergency have required extraordinary powers, that equally extraordinary care is imperative to ensure that these powers are only used within the limits set by legislation. Powers of this kind are necessary. But, within the context of British principles of law, they are necessary evils at the best; and, within the framework of British political ideas, it is a truism that the abuse of such powers is inevitably corrupting. The punishments which have been inflicted under the emergency powers in India are hardly less unpleasant than the breaches of the peace that made them necessary.

The fact that Indian intransigence and dissension must bear the main responsibility for the present impasse only strengthens the responsibility of British administrators in India to do nothing to embitter relations still more and everything to prove that, under an even-handed justice, India's destiny is now in Indian hands. This is why the action of the Viceroy in refusing Mr Phillips' access to Mr Gandhi was almost certainly impolitic. Mr Phillips is returning to the United States with a much clearer idea of the difficulties of the situation in India than is common in that country: and an interview with Mr Gandhi might well have done good, in this respect at least. As a prisoner,

THE WESTMINSTER BANK

is represented by an extensive system of branch offices in England and Wales with agents elsewhere, and is amply equipped to conduct your private and commercial banking business. The Manager of any branch will gladly give an interview to discuss or explain any point which will help a client, or prospective client, to a full use of the services available to the Bank's customers.

WESTMINSTER BANK LIMITED

Head Office: 41 Lothbury, London, E.C.2

Mr Gandhi has doubtless no claim to visitors; but Mr Phillips was a very special case. And it remains a fact that, while Mr Gandhi is cut off from the outside world, even the very minute chance of Indian accord that remains is totally blocked. At the meeting of the Moslem League, Mr Jinnah made a formal appeal to Mr Gandhi to unite and drive the British out. But the burden of his fighting speech was that agreement between Hindus and Moslems is not possible; and he made no attempt to capitalise the disrepute by which Congress has fallen for its recent violence, by offering terms to the British. Nowhere in the main sectors of Indian politics are there any signs of a change of heart. The Viceroy is faced with the need to fill four vacancies on his Executive Council, three of them caused by resignations during Mr Gandhi's fast in prison. This seems a suitable moment to make plain the British position: to announce that both the present administration and the future constitution of India are the responsibility, not of the Britons, but of a completely Indian Council to which the adherence of all the Indian parties is still invited; while at the same time making it plain that neither the peace nor the war effort of India will be permitted to be upset by violence, intimidation or political blackmail.

The Machinery of Planning

The old confusion about what planning means persists. Members of Parliament are especially prone to it. In a debate on the adjournment on the eve of Easter, several speakers professed themselves puzzled as to the distinction between the Minister without Portfolio, who is concerned with the co-ordination of planning projects, and the new Minister of Town and Country Planning who is, of course, concerned solely with the planning of land use. Sir William Jowitt's answer was important, not only because it cleared up yet again this wearisome confusion, but also because it outlined the procedure by which reconstruction policy is discussed and made in the War Cabinet. At the base of the pyramid are the departments—the Ministry of Town and Country Planning concerned with land use; the Ministry of Labour concerned with unemployment insurance and, to a point, with demobilisation; the Ministry of Health concerned with sickness insurance and the medical services; the Home Office concerned with workmen's compensation; the Ministry of Pensions concerned with war pensions and the rehabilitation of war casualties; and so on. At the next highest level, there are two sub-committees of the War Cabinet. One is Sir William Jowitt's Committee of Ministers to which the plans and projects of the departments come for co-ordination. The other is a special Ministerial Committee set up, with the expert assistance of a specially selected staff, to consider and co-ordinate departmental plans for the implementation of various details of the Beveridge Report. Higher still, there is the Cabinet Committee which sits under the Lord President of the Council, and is concerned with major matters of home policy. This is the key body at the Cabinet level. To it, presumably, progress reports and final proposals come from the Jowitt and "Beveridge" Committees. The pyramid is not, of course, complete. There are some topics, like civil aviation and children's allowances, which have no particular departmental habitation; there are others, like demobilisation, which concern too many departments for a single Minister to be their first parent. In these cases, it seems, the Minister without Portfolio has a special responsibility. Otherwise, he is, as one member put it, merely a "filter," a subordinate officer whose functions are largely secretarial and, on occasion, advisory, rather than the Minister of Planning that he is sometimes taken to be. If there is a Minister of Planning, in the sense of one with a final responsibility for the reconstruction projects upon which the Cabinet must pass, he is the Lord President of the Council, Sir John Anderson.

Proof of Preparedness

So far, it would seem, so good. The scenery is in place. The stage is set for the drama of reconstruction. But Parliament and the public are far more concerned with the piece to be played than with its apparatus. They look for results, for proof of work in progress and decisions made. It seems probable now that the novel central principle of the Beveridge Report, the abolition of want by the securing of a minimum subsistence income to all individuals and families in whatever contingencies may arise,

has been rejected by the Government. This does not mean that the Report has been wholly frustrated. In general terms, the Government has accepted many of the detailed items proposed in the Report—the reform of health insurance and of workmen's compensation, the institution of children's allowances and the effective socialisation of the country's resources of medical skill. The need for none of these reforms was first stated by the Beveridge Report, and to accept them is not to accept the Report. But they are vastly important. The necessity for the reform of health insurance, medical treatment, burial benefit and workmen's compensation has been common knowledge for at least a generation; it has been stated by a long series of expert and official bodies and emphasised by unofficial experts. A great danger is that concentration on the larger aims of the Beveridge Report—which it will be, admittedly, a grievous failure to set aside—should cause incidentally a further delay in the redress of these familiar grievances. What is needed to re-assure public opinion, whose uneasiness in these matters was registered at Easter by resolutions in favour of the Beveridge Report from a multitude of conferring bodies, is progress reports and specific proposals, not simply within the hierarchy of departmental and Cabinet organisation, but to Parliament, in the shape of definite legislation. The excuse that the Beveridge Report came out only last December is disingenuous and invalid. The needs and the facts were known, in most of these instances, decades before Sir William Beveridge set to work. Moreover, there are other topics still, so far as is known, not definitely allocated to departments or committees—the crucial question of full employment, for instance, which requires a Royal Commission, and the pressing need for a new kind of Civil Service, skilled and experienced in matters of industry and trade. Sir William Jowitt described the preparations that are being made. Now it is proofs of preparedness that are looked for.

Scene Shifting

Under the new Bill presented by the Minister of Town and Country Planning, the half of the nation's land that is not already covered by plans or resolutions under the existing Town and Country Planning Acts will be deemed to be so subject. The measure is designed to implement the recommendation of the Uthwatt Committee that no building or development should be permitted which is likely to be prejudicial to the programme of reconstruction that has still to be worked out. It is a minor measure. Of the other half of the nation's land which is already covered by plans or planning resolutions, only a minute fraction—about 3 per cent of the total land area—is under effective planning control. The reason is that the procedure under the existing Planning Acts is all but prohibitive, administratively and financially. The purpose of the final Uthwatt Report was to break this deadlock by providing a solution to the problem of compensation for values disturbed by planning. Until its recommendations, or others designed to achieve the same result, are adopted as official policy, the planning of land use will remain a paper aspiration. The plea that the Uthwatt proposals are too technical and too controversial to be adopted is irrelevant. The obstacle presented by the difficulty of compensation is a fact that cannot be set aside or shelved. Either these proposals or some substitute must be adopted or else all the talk about a better-built and better-developed Britain will signify practically nothing at all.

The Tunisian Scene

Progress in Tunisia since the capture of Enfidaville has been painfully slow, but sure. During the past fortnight, the centres of fighting have shifted from the coastal hills north of Enfidaville, where the Eighth Army was temporarily halted, to the western and southern sectors of the front; and the battle for the outer defences of the Axis bridgeheads seems to be nearing a favourable conclusion. The Americans in the north have made some advance towards Mateur. The First Army has forced the obstacles of Djebel Tanngouche, "Long Stop Hill" and Heidous; it now faces the communication centre of Tebourba, the more or less imminent capture of which should open the road to Tunis, across open country. The French, too, have gained some ground in front of Pont du Fahs. If the reports about an early resumption of the

offensive by the Eighth Army are true, Tunis should find itself threatened by a series of concerted blows from several directions. So far, however, there seems to be little reason for exaggerated hopes about the tempo of the campaign as a whole. The enemy has been using every opportunity afforded him by the lie of the land with the utmost skill; and the Allies have so far not been able to prevent him

from delaying the advance from behind successive defence points. Of the two bridgeheads, which von Arnim has to defend, Tunis is the weaker and the less vital. Bizerta will be a much harder nut to crack, though the fighting for it may serve the Allied forces well as valuable training in the technique of reducing fortresses that will be needed at a later stage of the war.

Seeking a Formula

More than four months after the death of Admiral Darlan, the Giraud-de Gaulle negotiations drag on. General Carroux and General Giraud are now at work in Algiers on the latest memorandum of the French National Committee. But time, events and French sentiment are running ahead of the negotiations. The three *conseils-généraux* of Algeria are said to have acclaimed both Generals when they met a few days ago. As the hope of victory draws nearer, the outstanding differences between Algiers and London seem ever less important. The joint approach to the League of Nations, which General de Gaulle and General Giraud made on April 16th, repudiating the Vichy withdrawal, was a statesmanlike move in tune with the mood of the moment. But for all the popular impatience, there is nothing to be gained by burking the difficult points at issue. When, as the Fighting French Note makes plain, so much is common territory, the grounds for disagreement are better thrashed out than smothered. Reunion, when it takes place, must be enduring. The Fighting French Note selects six specific points for further discussion. None of these is negligible; some indeed are crucial. Briefly, they amount to the request that elimination of the Vichy régime, including the continued existence of the *Légion des Combattants*, shall be complete; that, in the phase of liberation, the authority of the police and departments shall devolve from the civil and not the military authority; that the provisional central authority must represent the entire nation and not the local administrative officers which it should control; that the military high command must be subordinate to the provisional civil authority; that there should be a legal council with power to declare acts of the executive *ultra vires*, and lastly and sixthly that the provisional central authority should comprise the normal and essential ministerial offices. General de Gaulle wishes the new provisional Government to have the status of an Allied Power. These counter-proposals of the French National Committee are still under discussion. There has been an attempt to represent them as an effort to bar the upsurge of Napoleonic militarism. It is more reasonable to regard them as an idealistic, though not by any means disinterested, counterpart to General Giraud's excessively realist memorandum. The assimilation of the two views will require an appreciation both of the limits

of practical policy in London and the value of the separation of functions in Algiers. But this should not be impossible; Montesquieu was a Frenchman.

Falling Between Two Stools

According to all the reports, Finland has lost the last chance, if there was a chance, of concluding a separate peace with Moscow. It is commonly believed that, in the last few weeks, peace feelers between Helsinki and Washington were put out. It may be no more than a coincidence that almost the entire staff of the American legation at Helsinki moved to Stockholm just after the Finnish Foreign Minister, M. Ramsay, had paid a somewhat secretive visit to Ribbentrop. But in Finland at least there is more than a tendency to take the gloomy view: to conclude that long-suffering sympathy in Washington is, to put it mildly, on the wane. Certainly, so far, diplomatic relations have not been broken off. Nor has President Roosevelt listened to the suggestion of the National Committee of Finnish-American trade unionists that war should be declared. But there is an impression abroad that Finnish-American relations are less cordial; there is also a certainty that Finland's Foreign Minister has received a dressing-down from Ribbentrop—so receiving the worst of both worlds. As Finnish diplomatic writers constantly point out, foreign policy in Helsinki is determined by two factors: enmity to Russia and friendship for the United States. Of the two, the former is the more potent influence, but the latter weighs heavily, representing the sole hope of reinsurance, of special treatment and ultimate preservation. To-day, the Germans play with special insistence upon the "Red terror" theme and they appear to have prevented Finnish defection. If so, the failure of Finnish policy will be complete; the nation will lack good will whichever side wins. It will have forfeited the comradeship in arms with Nazi Germany without gaining the benefits of American advocacy.

Back from the Wars

Mr Quintin Hogg entered a plea last week in the Commons for the early demobilisation after the war of the troops who are on active service in distant regions. He spoke specifically on behalf of the Eighth Army. In reply, Sir William Jowitt revealed the principle upon which the Government proposes to arrange demobilisation. Men will be released according to their age and length of service; but special provision will be made for the release of skilled workers whose services will be urgently needed in the immediate post-war period. Rightly, the Minister without Portfolio said that the scheme, to work, must be one

ORDINARY FIRE DAMAGE ONE-THIRD GREATER THAN PRE-WAR

Serious Handicap to War Effort

SINCE the war, loss to the nation through ordinary fires has gone up by one-third. Last year, well over 1,000 fires broke out in Britain every day.

This figure represents a serious handicap to the war effort. More serious still is the diversion of manpower, of raw material and of shipping required to repair the loss.

Who is responsible for this needless destruction, and why cannot precautions be taken, in the national interest, to stop it? Here is the answer:

Most fires are caused by some simple act of carelessness by a normal person who thinks that he (or she) is careful.

It is estimated that nearly 50% of the fires are caused by matches and cigarette ends.

Every reader of this paper is asked to help to reduce this terrible national loss from fire. Smokers are

specially appealed to. Remember, that it's "careful" people who start fires—and that means you! Be more than careful, be sure. Be absolutely certain that your match is quite out before you throw it away. Never leave a cigarette end burning even in an ashtray. Stub it out.

Most fires are caused by 'careful' people
Don't just be careful—take EXTRA care

which "the men themselves think fair." There is an almost insoluble dilemma in this matter. Scientifically and economically, it would be correct to release first the key workers who, in many instances, were called up last. Socially and humanely, this would be gross injustice. Up to a point, it was attempted at the end of the last war, and broke down because of the rooted and very natural conviction of the troops that those who had served longest and had the greatest responsibilities at home should be released first. This time, it seems, the attempt is to be made to hold the balance even between justice and expediency. There will be special difficulties. When the war with Germany is over, war in the East may continue. There will probably be a need for large occupying forces in foreign countries, and equally, there will be a need for larger standing forces than were maintained in the inter-war period. All these considerations suggest that, even after the war is finished, which is still a very long time distant, many men will be faced with a further extended period of service. It is enormously important that these issues should be frankly discussed and plainly decided, and that every one of the men concerned should be made fully aware, before the moment comes, of the national and international needs which may require, perhaps against the ordinary dictates of fair play, either the release of this or that man sooner than may seem just or the retention of this or that man longer than seems equitable.

Payment of Fire Guards

The Select Committee on National Expenditure, in its sixth report of the session, has revealed the extraordinary position that exists with regard to the payment of fire guards. Briefly, what has happened is this. An Order of September, 1940, made it compulsory for employers to protect their premises from fire, but placed no obligation on employees to do turns of duty. Employers were consequently compelled to employ voluntary fire watchers and to offer them varying rates of pay to do so. Then came the Order of January, 1941, which made it obligatory on employees to do fire prevention duty, but stated that no person should be entitled to any remuneration for such duty. Difficulties thereupon arose about the payment of subsistence allowances, and employers were later told by the Ministry of Home Security that they should supply their fire guards with food or with allowances in lieu. Negotiations were then started with employers and trade unions to put the Order on a proper footing, and it became clear that the Government would have to authorise subsistence allowances and also to bear the cost. These were proposed at the standard rate for all part-time civil defence duties—beginning at 3s. for a period not exceeding 12 hours. The trade unions, however, said that this was inadequate and also pointed out that it conflicted with the arrangements already in force. It was finally agreed that arrangements made before September 12, 1941, should stand, but in other cases the new rate should be accepted and the Exchequer would bear the cost. The employers are also allowed to rank their payments made under the old arrangements as deductible expenses for tax purposes. Thus, not only is there considerable unrest because excess rates are paid for the same duties in some premises and not in others and sometimes in the same premises—with a considerable detraction from the efficiency of the Fire Guard as a result—but the Exchequer has, indirectly, to bear the whole cost of the excess rates where the firm concerned is liable to EPT, and half where it is liable to income tax only. Nor is that all. The Select Committee has found no estimate of the cost involved for the Exchequer by the universal payment of the standard rate or of the additional indirect cost of the excess payments.

No record of cost is kept by the Departments who are responsible for approving the various schemes. No statistics are available even at the Board of Inland Revenue.

War Pensions Tribunals

The Minister of Pensions announced in the House of Commons last week that legislation will be introduced at an early date for the establishment of tribunals to hear war pensions appeals. To begin with, there will be nine to cover the whole country, but more will be set up as personnel becomes available. In order that their indepen-

dence of the Ministry of Pensions may be assured, the members of the tribunals in England and Wales will be appointed by the Lord Chancellor, in Scotland by the Lord President of the Court of Sessions and in Northern Ireland by the Home Secretary. Each tribunal will consist of a lawyer as chairman and a doctor. The third member will be co-opted in accordance with the case to be heard. If it is a soldier, the third member will be an ex-soldier; if it is a WAAF case, the third member will be a WAAF; if it is a civil defence volunteer, he or she will be a member of the civil defence services; and so on. The tribunals will have a full history of each case, with copies of the medical reports, and a statement by the Ministry of Pensions on why the claim has been disallowed. It will be interesting to see in how many cases the Ministry's decision will be reversed. The tribunals will not be able to alter the terms of the Royal Warrant which lays down that a pension is granted if the disability is attributable to military service and defines attributable disability as being:—

- (a) directly attributable to military service . . . or
- (b) due to a wound, injury, or disease which
 - (i) arose during war service or existed before such service, and
 - (ii) was aggravated by war service to a material extent and remains aggravated thereby.

All they can do is to decide whether the history of the case provides evidence "good and sufficient that the disability was in fact attributable to war service." Since, in the cases of disease—which will probably form a large part of the appeals—the Ministry has already had the benefit of specialist advice in coming to its decision, the tribunals, whose medical members will not necessarily be specialists, will hardly be better qualified to judge. Question time for Sir Walter Womersley is not likely to be shortened by the new procedure, though his responsibility will be lessened.

Labour and the Communists

One of the most controversial and bitterly debated topics at Labour's Whitsun Conference will be the question of Communist affiliation. The Communists have worked tirelessly and have enlisted considerable support. According to their latest report, 2,631 Labour organisations have voted for affiliation, including 10 national trade unions, 156 trade union district committees, over 2,000 individual branches and 178 labour party organisations. Their trump cards are the Amalgamated Engineering Union and the Miners' Federation, who together cast a powerful vote at the Labour Conference; they have also got the backing of the Locomotive Engineers and Firemen's Union, and, judged by the Easter voting, of the Shop Assistants and Clerks. But so far, it seems, the balance is against them. The two big general workers' unions—Transport and General, and General and Municipal—the National Union of Railwaymen and the distributive workers are among those who will oppose affiliation. The Communists argue the need for a united labour movement in order to win the war and prepare for the peace. They say that it is illogical that Labour should co-operate with Conservatives and with Russian Communists, though not with British Communists; and that their members, though small in number compared with the Labour party, are increasing—they claim an increase from 12,500 in 1937 to 64,000 to-day—and are zealous workers who would strengthen the Labour party, whose constitution they would be pledged to observe. Against them, the Labour party invokes the past record of the Communist Party, its disruptive activities and tortuous line, and holds that allegiance to the Comintern would militate against loyalty to the Labour party. At Whitsun, the Labour party itself will decide the issue. If the demand is quashed, the Communists will have to try again; if it is carried, which at the moment seems even more unlikely than the abrogation of the electoral truce, itself improbable by present signs, the Labour leaders will have to take consolation in the thought that they can always threaten disaffiliation.

Economy

Mr Greenwood's description of pounds, shillings and pence as meaningless symbols has been made famous by Mr Churchill's broadcast dissent. There are others who disagree with Mr Greenwood. Mr Francis Hirst, Chairman

of the Public Economy League, has published an appeal which he addressed to the Chancellor of the Exchequer on the eve of the Budget. His plea is for the reduction of "public waste." It is true that what matters in wartime is not money but men and machines and materials, and it is the waste of these, by public departments or by private citizens, which is directly harmful to the war economy. Nevertheless, Mr Hirst is right, psychologically and economically, when he contends that it would be anomalous to press taxation and voluntary savings to the limit while at the same time leaving the public spending of moneys so raised under less responsible control. Public economy, writes Mr Hirst, is "a means of arresting the growth of inflation and reducing the dangerous gap between tax revenue plus real savings and expenditure." The problem of inflation arises in wartime from the co-existence of increased purchasing power and a limited stock of goods and services for sale. The chief creator of these incomes in wartime is the state by its purchases of the materials and the equipment of war. The direct restraint of private incomes by any means other than taxation, as Mr Hirst points out, is peculiarly difficult in a democracy. It is all the more important, therefore, as the Chancellor of the Exchequer himself said in his Budget speech, "to see that all this tremendous sum is well spent by the state." Mr Hirst's plea is timely. The tendency to ignore the virtues of public economy in money terms when the necessary total of public expenditure is so vast as it now is should be resisted. Money is no more than an instrument, in peace or war. No nation lost a war for lack of money or won it by its abundance. But prodigal expenditure can be as damaging socially as inefficient production can be militarily. Mr Hirst and his friends over-estimate the extent to which the tremendous expenditure entailed in total war is due to wasteful spending. In magnitude, it is

a minor contributor. But in so far as it does contribute to the disparity between spending power and consumable goods, it is to be deprecated and destroyed.

Clear the Air

Hitherto the Lords have been the more active in giving the question of civil aviation a Parliamentary hearing. Now a motion has been tabled in the Commons, in the names of sixty Members, mostly Conservative, asking that civil aviation, "in view of its paramount importance for post-war trade and empire communications," should be divorced from Air Ministry control, and transferred to a separate, civil Ministry. Neither the creation of an Air Transport Command, nor the assurance that the Government is alive to the importance of civil aviation after the war, is sufficient evidence that a bold and constructive policy is in fact being matured. The position of the British Overseas Airways Corporation has still to be cleared up, and the confusion has been aggravated by recent correspondence in *The Times*. A letter from the late members of the Corporation, complaining of the unsatisfactory status and procedure under which they had worked, and would continue to work in the new arrangement, seemed to confirm the suspicion that more lay behind their resignations than met the eye. At least the gist of the story should be made known. In the meantime, the Government could do much towards a solution by appointing a permanent chairman. It may be difficult to find someone who is universally acceptable, but civil aviation, more than anything else, offers scope to men of energy and vision. The issue is too pressing for it to be allowed to drift, and too big for decisions to be impeded by sectional interests and intrigue. Until the domestic skies are cleared, it will be difficult to tackle the problem on the international basis that is essential for any long-term solution.

AMERICAN SURVEY

Prospects for Trade Agreements

(From Our Washington Correspondent)

April 6th

ON June 12, 1943, the authority of the President of the United States to enter into reciprocal trade agreements with foreign countries will terminate unless extended by Congress. The decision will be regarded by peoples throughout the world as an acid test of America's future intentions. If the Act is not renewed, this will be discouraging evidence that the people of the United States, by their actions though not by intention, "will once more turn back to that road of isolation which leads to inevitable disaster." If the Act is renewed without being amended importantly, this will be a heartening but far from conclusive indication that they "have determined upon a policy of international co-operation for the future." Amendments as to time or as to the President's discretion would make renewal less heartening and more inconclusive.

The most probable outcome is renewal for three years. The next probable is renewal for one year. The least probable is failure to renew. The least desirable, it can be argued, is renewal "for the duration of the war against Germany, plus six months." The history, economics and politics of the matter conspire to make this, not a clash of real immediate interests, not a partisan affair, but an almost pure issue of attitude.

Introduction of the reciprocal trade programme was the most significant effort of the United States in the 1930's to adapt itself to its role as the ranking economic, industrial and financial nation in the world. When it was first adopted, in June, 1934, it had two meanings which are still valid today. It was an attempt to reverse American leadership from trade war to commercial peace. It was the aspect of the New Deal which looked toward a world economy, in contradiction to other aspects, such as the AAA and the NRA, which tended toward economic nationalism.

In 1937 the Act was renewed (to quote Representative Doughton) "squarely on the basis of its achievements and

the clear necessity of continuing a procedure which had demonstrated its ability to reach the problem." The achievements and necessity were interpreted almost entirely in immediate domestic terms. By 1940, when the Act was renewed for another three-year period, the situation had changed. President Roosevelt at that time argued that the Act served the interests of the United States even during war, and concluded, "But what is more important (it) should be extended as an indispensable part of the foundation of a stable and durable peace."

It is probably correct to say that, if at the present time no reciprocal trade pacts existed, the exports and imports of the United States would be substantially the same as they are now, and for the same reasons—this despite the fact that since Pearl Harbour the United States has negotiated four pacts, and is in the process of negotiating three others. This means that the real or apparent conflicts of interests with foreign producers, which in the past have led some groups—particularly farm groups—to oppose the reciprocal trade programme, have been lifted by the war.

Indeed, the whole situation has completely reversed itself. In 1934, 1937, and even in 1940, commodities were plentiful. Now things are scarce, and the United States wants more of them. Take one specific example. Canada has several million bushels of feed which it cannot use in its economy this year; the United States needs more feed. The very section of the country which is usually high tariff-minded would like to find transportation to bring in more Canadian supplies. As shortages grow, Americans should increasingly sense the absurdity of denying themselves what other peoples have. What opposition to reciprocal trade pacts is left in the United States is based on attitude and not on interest. It is like the grin remaining after the fading of the Cheshire cat.

Against this fantasy stands one gigantic immediate reality—the coalition war. Can the American people evaluate the importance of assuring the United Nations that they

intend to use their economic power for the good of the whole? The problem can be put like this: in our common war the pooling of effort and materials is multilateral, but the obligations are bilateral between the United States and each of the others. How is reckoning to be made and used? Article VII of the Lend-Lease master agreement provides that the conditions of the settlement "shall be such as not to burden commerce between the two countries, but to promote mutually advantageous economic relations between them, and the betterment of world-wide economic relations." Clearly, the implementation to Article VII will require both negative and positive actions—to remove obstacles to freer trade, and to co-ordinate national economic policies. If the Reciprocal Trade Act is renewed, this will not by any means signify that the American people have thought through the problems of harmonising various national policies, and perhaps directing them by international machinery. But if the Act is not renewed, this will be inescapable evidence that so far they do not even recognise the necessity of removing obstacles to freer trade.

An Index of Policy

The reciprocal trade programme has tended to be a partisan issue. It was the sharpest break by a Democratic administration with the Republican trade policies of the 1920's and early 30's. Only two Republicans in the House and only five in the Senate voted for the Act in its original passage. On one renewal the Republicans in the House, and on another renewal the Republicans in the Senate, were unanimously opposed. Now for the first time the Republicans are near enough to a majority to make their position controlling.

At first, there were signs that the Republicans would set about to repudiate the reciprocal trade programme. But two things are happening. In the first place, those who are trying to lead the party in the direction of world co-operation are lining solidly behind the programme. Wendell Willkie, Governor Stassen and Senator Ball, of Minnesota, are only the most prominent. In the second place, many congressional leaders who were isolationists, or opposed to the reciprocal trade programme, have revealed that either they are shifting ground or they are unsure of the wisdom of voting against the programme. Because of this shift, a counting of noses on who voted what in the past probably is not dependable. Many southern Democrats who ally themselves with Republicans against the Administration on some issues, will stand staunch on this because of the south's traditional approval of international trade, and because of the character of Secretary Hull. Behind Congress, some influential private groups are giving approval to the programme—for example, the United States Chamber of Commerce, the National Association of Manufacturers, the League of Women Voters, and the Farmers' Union. The automobile manufacturers' association is the most active. No important social group has come out against renewal. However, an academic air surrounds the matter. Labour groups ignore it; and the most powerful agricultural organisation, the American Farm Bureau Federation, which approved renewal in 1940, might drive a hard bargain with the administration, balancing approval of the pacts against concessions on agricultural prices.

The whole current is towards making the issue non-partisan, and a clear index of American policy in the post-war period. It is expected that the President, who has retreated on a number of issues recently, and who is proceeding cautiously in announcing plans for the peace, will, if he feels it necessary, appeal to the people on this basic one. The opponents of the measure are likely to base their objections, not on the merits of freer trade, but on the propriety of delegating this authority to the president. Such an issue was unimportant in 1934, more important in 1937, grave in 1940 (when President Roosevelt carefully defended the constitutionality of the delegation), and crucial in 1943. As in most instances in American politics, the issue in this case is a smokescreen. The President's authority has good precedent; it is carefully hedged in; and it has been used with extraordinary skill. The conduct of trade relations in the future is certain to require more, not less, expertness and executive direction. The alternative is a throwback to the log-rolling procedure of building tariffs.

American Notes

Reciprocal Trade

The Bill renewing the Reciprocal Trade Treaties Act has successfully passed its first hurdle. The House Ways and Means Committee has, by a vote of 14 to 11, agreed to recommend extension without any material changes. Presumably, when the Bill reaches the floor of the House next week, the Republicans will make another attempt to write into it the series of amendments which were all turned down by the Committee. These include a veto power for Congress over all agreements; the establishment of an American cost of production below which foreign goods could not enter the American market; the limitation of the extension of the Act to two years instead of three; and a provision giving American producers the right to test provisions of agreements in the courts. The Republicans cannot be accused of a lack of imagination or ingenuity in devising a series of methods by which all meaning could be sucked from the reciprocal trade treaty programme while still giving lip-service to its intentions. The Committee vote was close, as had been expected, and the vote in the House and Senate will probably be close, too. But it looks as though that "clear-cut continuance" for which the Administration is fighting may just scrape through.

The Lewis Challenge

The labour outlook has grown very critical. Hopes for the successful conciliation of the coal strike have had to be abandoned; the case was then certified to the War Labour Board; now it has been passed to the President for action. Mr John L. Lewis has adopted a policy of defiance. He failed to nominate a labour representative to the Board's fact-finding panel which was to hold hearings on the dispute. Last week, when he and other mine leaders were due to confer with the Board, they ostentatiously remained in New York, refusing to recognise the Board's jurisdiction, and stimulating the drift of workers

from the mines by statements that the Northern operators had discontinued negotiations. Mr Lewis decided to call nearly half a million miners out on strike which would compel the country's steel mills to close in a few weeks. The Administration cannot find much comfort in the attitude of the other union groups. The American Federation of Labour has denounced the "job-freeze" as likely to impair morale and lower efficiency. Mr Murray, of the Congress of Industrial Organisations, has made much in recent weeks of what he calls the "overproduction" of munitions in relation to available shipping capacity. The crux of the labour crisis is, however, the Lewis revolt, which has now become a major threat to the war effort. A member of the War Labour Board said recently that, if its jurisdiction was ever successfully defied, either by a union or an employer, its usefulness would be over. Mr Lewis has the wrecking of one Labour Board behind him; it is obvious that he has determined to do his utmost to destroy the present Board and its "little steel" formula for wage stabilisation. The issue is more than one of coal production or coal wages, important though they are. It is more than a question of price and wage stability. If the Administration is unable to show Congress that it is able to master the Lewis threat, the sheaf of anti-labour and anti-union Bills on Congressional desks will find new life. Meanwhile, war production has suddenly been put in danger. The last court of appeal remains. The President has a heavy responsibility before him.

The Monetary Bill

The House of Representatives has improved on the rebuff to the Presidential monetary powers administered when the Monetary Bill was before the Senate. Not only was the Senate's refusal to continue the powers of currency devaluation upheld by the House of Representatives, but the latter body inserted a special amendment in the Bill forbidding the use of gold in the Stabilisation Fund as a US contribution to the establishment of any international bank. Subject to this amendment, which was returned to the Senate for its approval, the \$2,000 million Stabilisation Fund has been extended for a further period of two years. The chairman of the Coinage Committee of the House went out of his way to assert that the amendment in ques-

tion was not to be regarded as a criticism of the proposal for US participation in international currency schemes, but that any such proposal would require separate legislation. The move is, therefore, another piece of evidence of the jealousy with which Congress is safeguarding its powers against those of the executive. Meanwhile the Washington conversations on the US Treasury's international currency plans have begun. They are to be a series of bilateral meetings between the representatives of the US and of each of the United Nations, designed, according to Mr. Morgenthau's letter of invitation, "to find a sufficient area of agreement to warrant proceeding on a more formal basis." The US Treasury plan has now been printed by the Stationery Office in this country under the title "United States Proposals for a United and Associated Nations' Stabilisation Fund."

Seeing Stars

The world may chuckle, but Colonel McCormick is said to take his brand of Federal Union grimly. His modest proposal to incorporate Canada, Australia, New Zealand, England, Scotland and Wales in the United States was not a one-edition squib. It is apparently a comic strip that is going to run as interminably as little Annie Rooney in the pages of the *Chicago Tribune*. But Colonel McCormick is not a conscious American humorist in the Artemus Ward tradition. He has a religious reverence for his own stunts, and indeed this latest caper has its serious side. It arises from the Colonel's uneasiness at the progress which ideas of international collaboration are making in the United States. On this account it is cause for rejoicing. And there is a grain of truth in the *Tribune's* argument that, given the American Constitution, effective participation in world affairs is only possible if other countries join the United States. Colonel McCormick would hardly have proposed adding five more stars to Old Glory if he were not agitated by the headway made by such diverse champions of world organisation as Mr Willkie, Governor Stassen and Senator Ball—not to mention the President and Mr Hull. Hypocrisy may be the tribute which vice pays to virtue, but it is only exacted when virtue looks like being triumphant. Back in 1920, the Colonel only wanted to swallow Canada. We are getting on.

THE WORLD OVERSEAS

Canada in the Air

(From Our Ottawa Correspondent)

March 29th

THE global extension of air transport is followed with intense interest in Canada, where the value of possessing feasible and economic air routes in inter-continental transport is widely recognised. The discussions on "freedom of the air" reported in the United States and in Britain attract attention in Ottawa, for, in the coming era of world air transport, it is obvious that companies enjoying operating rights on Canadian routes will possess prizes of strategic value. Canada's position is rivalled only by that of Russia.

A recent statement by H. J. Symington, K.C., president of Trans-Canada Air Lines, that the company is considering oceanic and international flying and has assigned three flight crews to British Overseas Airways Corporation for trans-Atlantic experience, disclosed that an all-Canadian Atlantic air service is planned. An agreement in 1935 between the United Kingdom, Canada, Ireland and Newfoundland provided for a joint Atlantic service by a company in which Imperial Airways would hold 51 per cent of the stock and Canada and Ireland 24 per cent each. This company was not set up, and it is now obvious that Canada will seek something broader in North Atlantic flying rights.

The inter-locking of civil aviation in Canada and the United States has developed steadily, though further development remains at a standstill until the end of the

war. An agreement in force on August 18, 1939, reached by an exchange of notes, concluded a reciprocal agreement between Canada and the United States. The agreement established procedure by which permits would be issued to air transport companies to operate across the boundaries of the two countries, including the Canada-Alaska boundary. The chief clause read:

Each of the parties agrees, subject to compliance with its laws and regulations, to grant to air carrier enterprises of the other party permits for non-stop services through the air space over its territory between two points within the territory of the other party; provided however that inland non-stop services between the United States and Alaska shall be the subject of a separate understanding. Each party further agrees . . . to grant operating rights to the air carrier enterprises of the other party for the operation of international services between a place in the territory of one party and a place in the territory of the other party.

Details of any applications were made subject to amicable adjustment by competent aeronautical authorities of each country.

There are ten operating permits in existence for air services between Canadian and American points, only one of which is taken out by a Canadian company, the Toronto-New York run of Trans-Canada. The others are short connecting links along the sprawling boundary between the two countries. An exchange of notes on March 4, 1943, provided that the air transport agreement could remain in

force until the end of the war, instead of lapsing on December 31, 1942, when a conference will be held to consider recommendations relating to the allocation of routes.

In Canada, there are two air transport companies, TCA and CPA, the publicly owned Trans-Canada Air Lines, and the privately owned Canadian Pacific Air Lines. CPA, a subsidiary of Canadian Pacific Railway, represents a merger of a number of small bush lines and other air transport services. It has been Government policy to assign transcontinental main line services to TCA, a subsidiary of Canadian National Railways. TCA operates a service from Halifax to Vancouver, and will shortly extend to Victoria on the Pacific coast end. CPA, on the other hand, operates feeder lines and dominates the north country traffic, especially in the rapidly developing north-west. Both are anxious to enter the trans-ocean business as soon as conditions permit.

During the war, special arrangements exist to permit companies contracted with Air Transport Command of the US War Department to carry military traffic through Canada. The traffic is carried chiefly by Pan-American Airways and Northwest Airlines, the latter having a civilian permit to operate between Minneapolis and Winnipeg.

TCA's Ambitions

A recent report to Parliament by Trans-Canada disclosed the national air line's ambitions in clearer detail than had been given previously. Trans-Canada expects in future to straighten its transcontinental route between Toronto and Winnipeg to fly directly across the Great Lakes. Then it will operate west from Winnipeg directly to Edmonton and, it expects, to "points of exit in Western Canada and the Yukon Territory." With its present link between New York and Toronto, TCA therefore plans to operate what will undoubtedly be one of the main trunk lines from New York across the continent north-westward directly to Alaska, the point of exit to Asia.

For trans-Atlantic flying, TCA already operates to Newfoundland, where it has provided a daily service since May, 1942. Its plans looking to Europe and Asia will, it is expected, be pressed as soon as possible. The president of TCA, H. J. Symington, said in his report: -

Canada occupies an important position in the future of the air world. The shortest routes between North America and Europe and Asia cross the Dominion, and weather conditions are stable. Canada's national air line is destined to play an important part in world aviation.

Both in the transcontinental service inside Canada and in the inland route to Alaska, the ownership of key landing fields lies with the Department of Transport. It has also developed an extensive meteorological service in all parts of Canadian territory. These things will become, it is felt, important bargaining rights held by Canada in the postwar competition for world air traffic.

Belgium Under the Wehrmacht

[BY A CORRESPONDENT]

April 27th.

As in other occupied countries, Germany first tried to make use of Belgium's industrial capacity by a system of economic collaboration. For this purpose, the economic departments of the Military Commander, working as branches of the Wehrwirtschaft Department of the Wehrmacht, introduced compulsory "syndicates" for industrialists, "central offices" for the control and allocation of requisitioned raw materials, and the "Order Bourse" in Brussels for direct contact between German and Belgian manufacturers. In agriculture, the new organisation, superimposed on the old, is mainly marked by a great number of controllers trying to enforce regular deliveries of agricultural produce. A prices and wages stop, compulsory marketing and central control of labour were put into force from the first day of the completed occupation. This experiment in running an entire economy by special departments of an army of occupation is now at the end of its third year. Its results are that industrial activity has been reduced to a fraction of its pre-war volume; and all repairs to damaged buildings and the reconstruction of destroyed buildings have been stopped since last summer.

Two outstanding facts characterise the present state of affairs. Roughly one-seventh of the total number of persons gainfully employed before the war have left Belgium for Germany and France. There are still more than 70,000 Belgian soldiers in German prison camps. The number of Belgian civilians voluntarily and forcibly employed in Germany is reported to be 436,000 and several tens of thousands are working in France. At the same time, the number of Belgians forced to work on fortifications by the coast is steadily increasing. The second fact is that, on the average, the food rations for normal consumers are only two-thirds of the rations in Germany. The weekly fat ration amounts to 35 per cent of the German ration, and no cheese or eggs are distributed. Frequently, shops are unable to supply the official rations.

The Food Shortage

It makes no difference how agriculture is changed from season to season. Total output still cannot cover more than 50 per cent of normal food requirements. During the three years of occupation, the pig population has decreased to roughly 40 per cent of the pre-war numbers. The poultry stocks have almost disappeared because of the lack of feeding stuffs formerly imported from overseas. For some time, the cattle population, particularly dairy herds, were maintained. But the new agricultural season will bring about a further drastic reduction in pasture, and wholesale slaughter of cattle will be the result.

Semi-official estimates show some of the changes in agricultural activity: -

(Percentage of total agricultural land, forests included)

	Cultivated Area	Forests	Pastures	Orchards
1938	34.2	40.0	23.4	2.4
1941	54.8	17.0	23.6	1.5

According to this estimate, the forests have been ravaged. The immediate purpose was, it can be assumed, the supply of pit-props for the coalmining industry, for imports ceased with the occupation. Some time ago, the military commander decreed that owners of forests must supply more timber for the mines or else special committees would fell and transport the necessary timber for them. The fact that pasture remained almost unchanged suggests that the arable land was mainly increased by bringing fallow land

and the soil of cleared forests under the plough. During 1942 and 1943, the changes are mainly in the direction of ploughing-up at least 20 per cent of grassland, which is to be devoted to cereals, root crops and particularly oilseeds, i.e., flax and rape.

Peasants and farmers seem to have opposed these plans by some kind of passive resistance, the only useful weapon peasants can employ. Cultivation of certain crops has therefore been made compulsory. Infrequent estimates indicate that at least 50 per cent of the total arable land is now under enforced cultivation. But the system of compulsory delivery of the crops, and numerous premiums in cash and in kind for special crops, especially oilseeds, have not prevented a considerable part of the output reaching the black market in foodstuffs, which seems to be flourishing mainly by the simple device of forged food cards. Last year, some cereal supplies were imported from France and other countries under German domination. The standard bread now sold in Belgium seems to be a mixture of cereals, beet-pulp and pulse.

Apart from coal, Belgium's industry is almost completely dependent on imported raw materials. Before the war, there was even an import surplus in coal and coke. The military commander made great efforts to restore the coal mining industry, even to the point of granting special food supplies to miners and employing Russian prisoners of war. Yet, the pre-war output has not been reached again. The iron and steel output has also remained below the pre-war level of production. In combination with the Speer plan for ensuring current supplies of steel last autumn, the German Iron and Steel Organisation actually succeeded in bringing more blast furnaces back into production. It is, however, doubtful whether the increased production can be maintained. The greatest obstacles, insufficient coal output and the condition of the railways, prevent any lasting improvement. The result is that the monthly quota of steel for internal purposes fell to roughly 20,000 tons at the end of last year. The leading steel concerns report, for the year 1941/42, that production was again smaller compared with the previous year.

Decline in Textile Production

Belgium's greatest single industry, the textile industry, entirely dependent on imported raw materials, was at once restricted to 30 per cent of its capacity. After the German model, a co-operative concern, the "Fabelta" (Union des Fabriques Belges des Textiles Artificielles) was founded for the manufacture of cellwool. The output of artificial fibre, which was very small at the beginning of the war, is said to have been trebled. Meanwhile, a second concern, the "BEFI" (Société Belge de Fibre) has begun operations, and it is also reported that the manufacture of cellwool from casein will soon begin. But total output is still only a fraction of former imports of cotton and wool, and it appears that at present the military commander is engaged in concentrating the entire textile industry for the purpose of releasing workers for Germany. Last year, the commander dissolved several industrial associations in the textile industry and replaced them by a new compulsory marketing organisation after the German model.

The concentration of industries and recently of the retail trade has gone much further than in Germany. The engineering industry is almost confined to the construction of locomotives and railway trucks. The manufacture of non-essential glass is prohibited, and the chemical industry is more or less confined to the manufacture of fertilisers. Since last year, however, the production of pharmaceutical articles and of artificial vitamins seems to have been increased. The printing industry is compelled to declare all stocks of paper exceeding 100 kilogrammes, and all orders need the permission of the military commander. The general concentration has resulted in numerous amalgamations of independent firms in the textile, glass, chemical and margarine industry, whereas a number of German concerns, particularly in the electrical industry, have established branch firms in Belgium. The only fully employed section is the cement industry, and the whole output is used for military purposes.

Last autumn, the military commander introduced compulsory labour and fixed the minimum working hours per week at 48. Men from 18 to 50 years of age and unmarried women between 21 and 35 years are liable to compulsory work in Belgium and in Germany. Work-books after the German model are compulsory and make control easy. The result is shown in the fact that from October last year to this spring more than 130,000 workers were sent to Germany.

Chairman's Copy
Special Meeting of the Directors

MINUTES
Co-operation by Company in
the Battle for Fuel.

- 1. Appointment of Fuel Watchers**
Fuel Watchers to be appointed for each shift in each shop. Secretary to write to Ministry of Fuel's Regional Office for badges. Records to be kept of all economy suggestions.
- 2. Monthly Fuel & Lub. Oil Consumption in Works**
Detailed records to be kept.
- 3. Steam Raising**
Engineer from Ministry of Fuel to be invited to report on efficiency. Boilers to be surveyed and air-leaks in brickwork made good. Lagging of all steam-pipes to be inspected. Boiler foreman's and stokers' request to attend Ministry of Fuel's local training courses approved.
- 4. Heating of Shops**
Thermostatic Control of heating to be investigated. Central heating Plant to be banked to avoid overheating during afternoons. Doors to be kept shut and draughts excluded. Temperature of shops to be restricted to the limits required by the Factory Acts. (Welfare Officer to report later on results).
- 5. Fuel Consumption for Process Work**
Production Manager to consult Trade Association on economy in process plant; also to revise production flow to use plant to full capacity. Engineer to discuss Lub. Oil economy with suppliers.
- 6. Canteen**
Menus already planned for fuel economy.
- 7. Lighting**
'Switch off' notices to be put up. Bulbs, reflectors, and windows to be cleaned regularly.
- 8. Any other business**
(a) **Posters and Bulletins.** Fuel & Lub. Oil economy posters and bulletins to be obtained from Ministry of Fuel.
(b) **Record of Fuel & Lub. Oil Savings.** Record to be forwarded periodically to the Ministry of Fuel's Regional Office.
- 9. Date of next meeting - Fortnight hence to report progress.**

Issued by the Ministry of Fuel and Power

THE BUSINESS WORLD

The Currency Plans

THE circumstances in which the separate proposals of the British and American Governments for the post-war regulation of international currency exchanges were released to the world have turned out to be singularly unfortunate. It was, it is believed, not wholly the Governments' fault; but to produce two plans on the same day, with neither one acknowledging the existence of the other, was inevitably to produce an appearance of rivalry, however sincere the denials of the authorities in both countries. And this, calamitously, is just what has happened. In America, to judge by the available reports, something in the nature of a witch hunt is going on, with Lord Keynes most unjustly in the rôle of victim, and the whole discussion is being translated on to a plane of power politics and national rivalries, which cannot fail to bring it to disaster. In England, the full text of the American document was not, for the first two weeks, readily available to individual members of the public, and the summaries of an inevitably complicated matter, on several issues, misled British opinion. Thus in both countries a far wider breach is being driven between the plans than is justified either by the details of the plans or by the nature of the intentions that inspired them. (It is only fair to add that each Government has now officially published the other's plan; this reciprocal publicity is a recent, but a wholly admirable, practice.*) There are, of course, as is wholly proper and natural, differences between the two plans, and it is the main purpose of this article to submit these differences to a careful analysis. But perhaps it is salutary to begin with a list of the similarities:

1. Both plans have been devised to deal with exactly the same problem—namely, the problem of how the nations after the war are to settle any outstanding balances arising from their trade and intercourse with each other. Both plans recognise that this problem, though very important, is technical in nature and limited in scope. Both deliberately exclude, at least from the main body of the discussion, such wider matters as relief and reconstruction, long term international investment, commercial policy and commodity controls.

2. Both plans have, by implication, a virtually identical definition of the problem to be solved. They envisage a world in which many countries would naturally have, in some years at least, net "unfavourable" balances of payments, but in which they will have difficulty, in default of special provision, in possessing themselves of means of international payment acceptable to those with "favourable" balances. If some such means are not provided, the only alternative for deficit countries† will be either default or the imposition of restrictions on their purchases in the hope of arriving at an exact balance—thus re-starting the familiar vicious spiral of restriction.

3. Both plans are based on the realisation that it is not enough merely to provide means for relieving the necessities of deficit countries. There must be some mechanism by which equilibrium can be restored. The facilities of either plan would be useful (in the words of the British memorandum) "just as the possession of any kind of reserve is useful, to allow time and method for necessary

adjustments and a comfortable safeguard behind which the unforeseen and the unexpected can be faced with equanimity."

4. Both plans acknowledge that it is impossible to have any form of international system without laying some obligations and, on occasions, some disciplinary constraints on the member nations. Both, however, have the object of reducing to a minimum the extent of interference with the freedom of each nation's economic policy.

5. Both plans are based on the assumption that, with provision for surmounting critical periods and with an acceptable degree of international discipline, currency equilibrium will be possible in the post-war world. "We are too ready to-day," says the British memorandum, "to assume the inevitability of unbalanced trade positions, thus making the opposite error to those who assumed the tendency of exports and imports to equality."

6. Both plans aim at the removal of existing restrictions on, and obstructions to, international trade and financial transactions arising out of current trade or genuine long-term investment. Both, however, envisage the necessity of restrictions upon the movement of liquid capital.

7. Both plans are put forward in tentative form for further discussion.

This is a formidable list of similarities. If it does not go quite far enough to establish an identity in the technical principles of the solution proposed, it is at least sufficient to provide an answer to those who, sometimes not without malice, seek to find some diametrical opposition of the authors' intentions or of the nature of the solutions they suggest. This very considerable basis of agreement should be borne in mind in considering the chief technical differences.

Before these differences are considered, however, it is as well to be entirely candid—more so than either official document could be—about the specific nature of the conditions which any scheme will have to meet in the post-war world. To talk of "surplus countries" and "deficit countries," of currencies of which there is a shortage and those of which there is a superfluity, is all very well; but it is better to name names. The one country which, above all, was a surplus country before the war and is certain to be still more strongly so after the war, is the United States. The central currency difficulty of the post-war years will be to find means by which the rest of the world can meet its obligations to the United States and buy the American goods it needs. The "rest of the world" is not, of course, a homogeneous expression and among the countries other than the United States there will be some that have more difficulty than others, and some that have less, in balancing their books. One country which, to judge by the present indications, will have rather more than the average difficulty in paying its international way is the United Kingdom.

The chief technical differences between the British and American plans are summarised below under the appropriate headings.

1. General Technical Nature

Here there is a clear difference. The central idea of the American plan is that a large fund should be collected at the outset, from which deficit countries could acquire the supplies of foreign currency they require to meet their obligations. All member countries would be called upon to contribute to this fund, but—except to the admittedly considerable extent that it was held in gold—it would not be a single homogeneous fund, but an aggregation of separate funds held in different countries. The only source—other than sales of gold—from which the fund could derive dollars to sell to deficit countries would be from the contributions of dollars and dollar securities made by the United States. And to the extent that the fund acquired dollars by selling

to the United States gold originally deposited by other countries, the method of payment would, of course, be merely that of the gold standard, with the difference that the deficit country would have to give up its gold at an earlier stage. The American plan is thus a generalisation of the technique of exchange equalisation funds, which can only help a deficit country to the extent that the fund already possesses or can borrow the currencies it needs.

The British plan, by contrast, applies the banking principle to international transactions. It presupposes a willingness on the part of nations (as of individuals within a nation) to accept payment of sums due to them, not in cash, but in entries on the books of a credit institution. This willingness makes it possible for the Clearing Union to "create" international purchasing power, just as a bank "creates" money. But, to follow the analogy still further, the Clearing Union would, in so doing, only be an agent between the surplus and deficit countries; it can only lend to the extent that those who come into possession of the created funds are willing to leave them on deposit. Any attempt to draw them out in "cash" (i.e., gold or scarce foreign currencies) would immediately deflate the structure of credit.

In some respects, the difference between these two methods might seem to be largely technical. In either case, the surplus countries are to accept payment in something other than gold or foreign exchange acquired in the normal way by deficit countries. The choice before the surplus countries is between (a) themselves providing the gold or currency with which they are to be paid the net balances owing to them and (b) taking payment for these net balances in entries on the books of an international bank—which may not seem to be very much of a choice. Overdrafts must be matched by credits in somebody's hands; and funds raised by a levy on contributors must be re-invested somewhere.

But there is one major difference in principle. Under the American plan, the first act of every member nation would be to pay out its contribution to the fund, part of which, even in the poorest cases, would have to be in gold. These contributions—even where, taking the form of local currency, they were promptly re-deposited with the contributing nation—would pass out of its ownership. Under the British plan, no nation has to make any specific act of contribution; it is asked only to leave on deposit any net credit balances that may accrue to it after the inception of the scheme. The American plan would seem to require from every country specific appropriations of public funds. The British plan would require no such appropriations, at least in most countries; since any balances remaining on deposit with the Clearing Union would be genuinely available for meeting deficits in subsequent years, they could quite properly be carried on the books of the surplus country's Central Bank, just as a commercial bank carries its deposits at the Central Bank.

The British plan, in short, is deliberately and confessedly expansionist in object; it would put funds at the disposal of deficit countries without abstracting from surplus countries any funds except those that they have chosen not to spend in international commerce. It would be wrong to say that the American plan is deliberately contractionist; but since it asks all countries to make their contributions to the fund before any of them receive anything back, it might well be contractionist in effect. Judgment, on this issue, between the plans must depend on the view taken of the circumstances of the post-war world.

2. Participation and Control

Both plans provide for each member nation to be given a quota, which is at once the basis of its voting power and of its ability to draw upon the international institution. Under the British plan, the quota would be based on the total of imports and exports—apparently visible trade only is intended. The basis would, at the start, be the average of the three pre-war years, but would later be adjusted to a more recent basis. The sum of visible British imports and exports in 1936-7-8 was, on the average, about £1,375 million per annum. The corresponding figure for the United States was about \$5,455 million. Which of the two countries had the larger quota would depend upon the exchange values of the two currencies to be decided after the war; but with any probable exchange rate, there would be approximate equality. Under the American plan, the quota would be based on "a country's holdings of gold and foreign exchange, the magnitude of the fluctuations in its balance of international payments, and its national income." No method of calculation is given, but under each of the three suggested headings (it should be noted that it is the size of the fluctuations in the international balance of pay-

ments, not the size of the balance itself), the United States would be entitled to a larger quota, and under two out of the three, a very much larger quota, than any other nation.

Under the American plan, "the distribution of voting power shall be closely related to the quotas of member countries, although not in precise proportion to the quotas." No country, however, would be entitled to cast more than a quarter of the total votes. For nearly all important decisions, a four-fifths majority is required; this would mean that the United States certainly, and the United Kingdom possibly, would have a veto on all important actions. The British plan provides that each nation's quota "shall determine the measure of its responsibility in the management of the Union"; it does not specify whether anything more than a single majority would be required for decisions.

3. Unitas and Bancor

Both plans invent a new unit. Under the American plan, one Unitas would be equivalent to 137 1/7 grains of fine gold—that is, to ten U.S. dollars of the present gold value. (Since the plan was released, Congress has removed the President's power to alter the present gold value of the dollar.) Unitas, however, would be simply a unit of account. The books of the Fund would be kept in it; but the Fund itself would consist of gold, currencies (i.e., bank deposits held in the various member countries) and Government securities. Surplus countries would receive payment of what was due to them either in gold or in their own currency. In these circumstances, it is difficult to see why Unitas was invented.

Bancor, on the other hand, is intended to be a real international currency. Not only is its value variable in terms of gold; but it is the essence of the British plan that bancor should be legal tender between nations. "Member states shall agree to accept payment of currency balances, due to them from other members, by a transfer of bancor to their credit in the books of the Clearing Union."

4. The Role of Gold

Both plans accept gold as the ultimate substance of international value—as, so to speak, the "cash" in the international banking system. Under both plans, nations can get "international credit" by paying in gold; both plans provide that the international body may, at its option, pay out in gold in reduction of surplus nations' credit balances.

But the connection with gold is much more direct and rigid in the American plan than in the British. Part of the original contributions to the Fund have, under the American plan, to be made in gold (12½ per cent of quota for every country possessing more than \$300 million of gold; 7½ per cent for countries possessing between \$100 and \$300 million; and 5 per cent for those with less than \$100 million). In addition, various continuing payments which have to be made to the Fund (e.g., by deficit countries on the amounts of gold or exchange they have acquired through the Fund) have to be made in gold. Unitas is fixed rigidly in terms of gold.

In the British plan, the point is made with some emphasis that what is wanted is a new quantum of international currency "which is neither determined in an unpredictable and irrelevant manner, as, for example, by the technical progress of the gold industry, nor subject to large variations depending upon the gold reserve policies of individual countries." It is also provided that the value of bancor in terms of gold would be subject to variation.

5. Exchange Rates

Both plans provide that, at the outset, the value of each national currency shall be fixed in terms of Unitas or Bancor. Both plans also provide that these values shall not be varied without the consent of the international body. The American plan provides that "changes in these rates shall be considered only when essential to correction of a fundamental disequilibrium and be permitted only with the approval of four-fifths of member votes."

The British plan, on the other hand, contemplates more

*The British plan is entitled "Proposals of an International Clearing Union," Cmd. 6437, price 4d. net. The American plan is entitled "United States Proposal for a United and Associated Nations Stabilisation Fund," price 3d. net. Both are published, in the United Kingdom, by H.M. Stationery Office.

†There is a possibility of serious misunderstanding in using the phrase "debtor country" (i.e., one which, on capital account, has more debts owing to foreigners than investments in foreign countries) when what is meant is "deficit country" (i.e., one which, in the year in question, has incurred more debts than credits in international trading). There is a similar confusion between "creditor countries" and "surplus countries." In most recent years, the United Kingdom has been a creditor but deficit country. India is an example of a debtor but surplus country.

frequent changes in exchange rates. When a country has had a debit balance on the books of the Clearing Union exceeding "a quarter of its quota on the average of at least two years," it shall be entitled to reduce the value of its currency by as much as 5 per cent without permission and by a larger proportion with permission. Moreover, if a country's debit balance exceeds half its quota, the Clearing Union may, as a condition of any further overdrafts, call upon it to reduce the value of its currency. And conversely, if a country has a credit balance exceeding half its quota, the Union may recommend (though not compel) it to permit an appreciation of its currency.

6. Equilibrating Adjustments

Both plans provide for steps to be taken by the international body to restore equilibrium if countries are incurring either excessive deficits or excessive surpluses. The British plan is the more specific. The Clearing Union may recommend to (or, in certain circumstances mentioned in 7 below, enforce upon) deficit countries (i) currency devaluation; (ii) control of capital exports; (iii) surrender of gold or other liquid balances, and (iv) "any internal measures affecting its domestic economy which may appear to be appropriate to restore the equilibrium of its international balance." To a surplus country the Clearing Union may recommend (i) "measures for the expansion of domestic credit and domestic demand"; (ii) currency appreciation "or, alternatively, the encouragement of an increase in money rates of earnings"; (iii) reduction of tariffs and other import restrictions; (iv) international development loans.

Under the American plan, a deficit country is to agree, in certain circumstances, "to adopt and carry out measures recommended by the Fund designed to correct the disequilibrium in the country's balance of payments." Similarly, the American plan does not specify the nature of the recommendations that are to be made to countries with excessive surpluses.

7. Deficits and Surpluses

In the supporting argumentation, the British plan lays considerable emphasis upon the equal responsibility of deficit and surplus countries for international exchange disequilibrium. "We need a system possessed of an internal stabilising mechanism, by which pressure is exercised on any country whose balance of payments with the rest of the world is departing from equilibrium in either direction, so as to prevent movements which must create for its neighbours an equal but opposite want of balance" (italics in the original). The American plan contains no arguments of this tenor.

In actual substance, however, the two plans are—with one exception—very similar in their treatment of the deficit and surplus country. The exception is that the British plan would levy a charge of 1 per cent on all *bancor* balances, whether credit or debit, this provision being "a significant indication that the system looks on excessive credit balances with as critical an eye as on excessive debit balances, each being, indeed, the inevitable concomitant of the other." The American plan levies charges only on deficit countries and provides that they are payable in gold.

In its main provisions, each plan provides that a deficit country can be required, as a condition of being able to draw beyond a specified point upon the assistance of the international body, to make the necessary equilibrating adjustments. As for the surplus country, the British plan provides that it "shall discuss with the Governing Board (but shall retain the ultimate decision in its own hands) what measures would be appropriate." The American plan is even more cautious. The Fund "has the authority and the duty to render to the (surplus) country a report embodying an analysis of the causes (of the surplus) . . . , a forecast of the prospective balance of payments in the absence of special measures, and finally, recommendations." The board member of the country in question has to be a member of the drafting committee, and the country agrees to give "immediate and careful attention" to the recommendations. The authors of the American plan apparently have some lack of confidence that this will be enough to correct the situation, for the plan also includes some rather curious suggestions for the "apportionment" of any currency that becomes scarce. What deficit countries are to do if their apportionment falls short of their requirements and they are forbidden to impose exchange control or devalue their currencies, is not stated.

8. Exchange Control

On this subject, the American plan is explicit. Member countries are "to abandon, as soon as the member country decides that conditions permit, all restrictions and controls over foreign exchange transactions (other than those involving capital transfers) with other member countries, and not to impose any additional restrictions without the approval of the Fund." They are, however, to "co-operate effectively" with other countries which desire to regulate international movements of capital.

The attitude of the British plan is less clear. The general intention is said to be to make "blocked balances and bilateral clearings" unnecessary, and it is stated that "it should be laid down that members of the Union would not allow or suffer among themselves any restrictions on the disposal of receipts arising out of current trade, or invisible income." On the other hand, the control of capital transactions is not merely allowed, but to be encouraged and, in some cases, urged upon deficit countries (see 6 above). It is explicitly stated that the plan is "consistent alike with the type of Exchange Control now established in the United Kingdom or with the system now operating in the United States." Further, the plan urges the "further extension" of arrangements for centralising in Central Banks, or Exchange Controls "the supply and demand of all foreign exchange, thus dispensing with an outside exchange market, though continuing to accommodate individuals through the existing banks and not directly."

9. Sterling Area

The British plan makes specific reservation for arrangements such as the existing sterling area. "For arrangements such as the existing sterling area, there is no reason," it says, "why such countries should not be allowed a double position." But countries which do not belong to such a political or geographical group would be expected to keep their reserve balances with the Clearing Union and not with each other.

The American plan makes no specific references to groupings, but it is clear that they would be frowned upon. Each member country agrees not to "engage in multiple currency practices" and it also agrees to offer for sale to the Fund "all foreign exchange . . . it acquires in sale to of the amount it possessed immediately after joining excess fund." Whether or not the first quoted phrase is intended to refer to the sterling area, the second would clearly make its working impossible.

10. Abnormal Wartime Balances

Both plans mention the problem that will exist at the end of the war through the existence of large liquid balances held by some of the United Nations in others. For all practical purposes, this is a problem of the very large balances held in London by (i.e., owed by the UK to) Canada, India, and many South American and other neutral countries. Their origin is, of course, in the very heavy purchases that the United Kingdom has made in wartime without any possibility of shipping goods in payment.

The British plan says that the problem is one of "special difficulty." The creditors will want to draw on their balances, but the debtor can hardly stand the strain of redeeming them in *bancor*. It is hinted that the solution might be some special arrangement by which these balances could be convertible into *bancor* by the creditor, "whilst there would be no corresponding strain on the *bancor* resources of the debtor country, or, at any rate, the resulting strain would be spread over a period." If this means—as it appears to—that the country owing these abnormal balances would be given an additional quota of *bancor* on which its creditors could draw, then the immediate economic effect would be to enable the creditor to turn these balances into goods at the expense of those countries which, while he is doing so, actually incurred surpluses. If this additional quota had to be liquidated over a period by the original debtor, it could do so only by piling up surpluses—that is, by paying its debts in goods.

The American plan outlines a complicated scheme whereby the abnormal balances would, at the start, be taken over by the Fund, the creditor being reimbursed in its local currency. Thereafter, creditor and debtor would each repurchase, for gold, 40 per cent of the original balances over a period of 20 years, the first 20 per cent being cancelled by levies on creditor and debtor. The economic effect would be that the debtor would wipe off 90 per cent of the debt in goods—50 per cent out of its general trade, 40 per cent by exports specifically to the creditor—while the remaining 10 per cent would be forgiven by the creditor.

Finance and Banking

Credit Contrasts

There have been sharply contrasting conditions in the money market this week. Exceptional stringency in the early part of the week made way for equally exceptional ease on Thursday. The reasons for the initial period of credit scarcity were many. The Easter week-end expansion in the circulation had encroached on bank cash and notes have shown some sluggishness in returning from circulation this week. The Bank return shows the notes in circulation last Wednesday to be still £5,560,000 in excess of those circulating a week previously. In the second place, most of the clearing banks have been making up this week and have, therefore, proved more sensitive than usual to a shortage of cash. The discount market, for its part, has had a bumper amount of Treasury bills to take up. Not only did it obtain the generous allotment of 43 per cent at last week's tender for Treasury bills, but the aggregate amount for which it applied had been duly stepped up in accordance with the increase to £90 million in the amount of bills on offer. If the total amount tendered for by the market syndicate was slightly in excess of the £90 million on offer, the bills which it had to take up this week must have been in the neighbourhood of £40 million. The £90 million of Treasury bills to be paid for this week were offset by maturities of £75 million only. Treasury deposit receipt payments by the banks amounted to £40 million. Though nominal maturities were £10 million in excess of this figure, it is probable that, owing to pre-encashments of the week's maturities, the banks were in effect called upon to find a small amount of fresh TDR money. This combination of circumstances caused exceptional stringency on Tuesday and relief was given by substantial official purchases of bills. This official help was given very late in the day and the market was kept in suspense to the last and had drawn on every possible source of accommodation, including privilege money, when the special buyer appeared. The position had been appreciably eased by the close of business on Wednesday and the Bank return shows bankers' deposits at the comfortable level of £170,109,000, or £28,724,000 higher on the week. A rise of £32,709,000 in Government securities was the main instrument in offsetting the effect of the higher circulation and in swelling the volume of bank cash.

Large Bank Notes to Go

The Chancellor of the Exchequer announced in Parliament last week that, with his concurrence, the Bank of England proposed to cease forthwith to issue bank notes of the denomination of £10 and upwards and would withdraw those already issued as opportunity offered. It is impossible to say what sum is likely to be involved by the ultimate disappearance of all bank notes of £10 and over. The denomination of notes in circulation was published, as yearly averages, until the outbreak of the war, but it is probable that the distribution has undergone substantial alterations since 1938, the last year for which statistics are available. In that year, out of an average circulation of £485,600,000, notes of 10s., £1 and £5 accounted for £372,900,000, or 76.8 per cent. The balance consisted of notes of £10, £20, £50, £100, £200 (whose issue was discontinued in 1928), £500 and £1,000. The ratio of notes of larger denomination to the total circulation had been increasing in the preceding seven years, no doubt as a result of the increased hoarding of sterling notes on the continent of Europe in that period of troubled currencies. Whereas in 1938 the notes of £10 and over represented 23.2 per cent of the circulation, the corresponding figure for 1931 was only 15.8 per cent. Most of the largest notes, that is of £100 and over, were, before the war, used in bankers' reserves and as cover for Scottish and Irish note issues. In explaining the reasons for discontinuing the issue of the larger notes, Sir Kingsley Wood opened, rather typically, with the least important of them. The change, he said, was intended "to simplify the production and handling of the note issue." Some time may admittedly be saved in the labour of sorting the various denominations. But this will be more than offset by the additional labour and material involved in issuing the larger acreage of notes required under the new ordinance.

The Chancellor got nearer the heart of the problem when he added that the change "will provide an additional

handicap to those who may contemplate breaches of exchange control or other regulations." The existence of notes of large denomination has certainly aided the work of the note smuggler, and has to some extent contributed to the breaching of the exchange control regulations. Even more nefarious work has probably been done by bank notes in helping the operations of black markets, principally in foodstuffs, and in conducing to income tax evasion. Most black market transactions are effected in cash because cash payments leave no tell-tale traces. As for tax evasion, it is probable that by far the greatest amount of such evasion is attributable to the class of traders and professional men who, by transacting the greater part of their business on a cash basis and by appropriate adjustments of their books, are able, with a varying measure of impunity, to file false income tax returns. It would be asking too much of the decision not to issue more large bank notes to expect it to check these evils of illegal market operations and tax evasion. The two problems must be tackled more directly. But, in so far as the task of the evildoers can be made in any way more difficult by the withholding of notes of larger denominations, the action of the Bank of England can only be welcomed.

Floating Debt in April

The national debt return issued this week covers the period April 1st to 24th. It reveals some exceptionally large transactions. The most important of them is the issue during this period of a 3 per cent terminable annuity for £120 million to the National Debt Commissioners. This

A Complete Banking Service

was issued as an investment for the balances held by the Commissioners on behalf of the funds of the savings banks. The main counterpart to this is a reduction of £78,650,000 in ways and means advances from public departments. Pending the more permanent investment of these savings banks funds, the National Debt Commissioners had probably employed the bulk of them in ways and means advances. The floating debt statement is also notable for its revelation of the absence on April 24th of any ways and means borrowing from the Bank of England. The latest debt statement is the first since that for the end of last August to show no such indebtedness owing to the Bank. On the evidence of these monthly returns, it is clear that the Treasury now relies on direct borrowing from the Bank to a far greater extent than at any previous period. This recourse to central bank credit is of no great importance if judged by the amounts involved, but it provides a means of adjusting day to day disparities between anticipated income and expenditure and enables the Exchequer to keep its balances at the Bank down to exceptionally small figures. The net amount raised from the banks in TDR's in the first 24 days of the financial year was £74,500,000. During this period, pre-encashments of TDR's to cover subscriptions to new Government issues amounted to £47 million. The Treasury bill issue rose by £18,240,000 between April 1st and 24th. To get an exact comparison of the distribution of tap and tender bills one has to go back two months, i.e., to February 27th. Since then the tender bills have risen from £980 million to £990 million, and the tap bills from £1,829,735,000 to £1,867,160,000. The increase in the latter provides a partial reflection of the continued rise in Empire balances held in London.

Financing Expenditure

The following table summarises the Exchequer returns to date (April 24th) and shows the respective shares of revenue and borrowing in meeting expenditure:—

£,000			
Total ordinary expenditure...	399,630	Total ordinary revenue	151,278
New Sinking Funds	463	Loans raised:—	
Loans repaid:—		3% Def. Bonds (net)	9,262
"Other debt"	374	3% Savings Bonds 1960-70	33,120
Bank of England Adv.	6,500	2½% Nat. War Bds. 1951-53	47,600
Public Dept. Adv.	78,650	3% Terminable Annuity	120,000
Miscellaneous issues	1,815	Nat. Savings Certs. (net)	18,450
		Tax Reserve Certs. (net)	14,303
		Floating debt (net):—	
		Treasury Bills	18,627
		Treasury Deposits	74,500

Bombay Bullion Boom

The prices for gold and silver in the Bombay market have risen to new records this week. At Rs. 94 per tola, gold has touched the equivalent of £18 16s. per ounce and at Rs. 128 per 100 tolas, silver has reached the equivalent of 56½d. per standard ounce. The latest advance in the rupee price of silver has completely broken the barrier which, for some months, was offered by the minting price of the old rupee coinage, namely, Rs. 109 per 100 tolas. This was never more than a psychological obstacle, since the coinage

now going into circulation is of 500/1,000 fineness and, therefore, gives a minting price of Rs. 200 per 100 tolas. With the market price for silver so considerably over the old minting parity, a certain amount of hoarded old coins are probably coming into the market, but the volume of such dishoarding must be small, as all the portents seem to favour the continued buying of the two precious metals. The basic factor in the position of both gold and silver in India is to be found in the fact that, owing to the financial impact of the war on India and to the inevitable restrictions on imports into the country, a considerable measure of inflation is under way. The money liberally disbursed by Allied purchases from India and by preparations for the defence of India is neither being mopped up by increased taxation and domestic loans nor counter-balanced by increased supplies of imported commodities. Indians are merely following the precedents of centuries when they invest their surplus in precious metals. Superimposed on this underlying factor in the situation is the speculative activity of Bombay market operators. This has been stimulated by several factors recently. In the case of gold, imperfect appreciation of the Keynes and White schemes, and of the US Congress discussions of the Presidential monetary powers, has tended to increase bidding for the metal. In the case of silver a similar result has followed the news that Great Britain was applying for Lend-Lease silver from the United States. Another factor which has stirred speculation in both markets has been the disappointing course of the Burmese campaign with its faint revival of fears of Japanese invasion. The position in both gold and silver markets is highly artificial, as may be seen from the sharp break which occurred in both quotations towards the end of the week.

Alexandria Gold Market

Conditions resembling those experienced in India are also to be found in Egypt. In that country, too, there are basic inflationary forces at work, deriving most of their strength from the expenditure in Egypt of the considerable Allied forces stationed in that country. Moreover, there is in Alexandria a bullion market in which free dealings in gold is allowed. The turnover of this market is probably even smaller than that handled in Bombay and for the most part it consists of transactions for the local jewelry trade. Of recent months, however, there has been a considerable hoarding demand for gold to be satisfied, and this, coming on a poorly supplied market, has lifted the price to 188 piastres per dirhem. The dirhem is equal to 3.12 grammes, or 0.11 ounces, and the latest quotation gives a sterling equivalent of £17 10s. 6d. per fine ounce. It is interesting to note that although there is no link whatsoever between the Bombay and Alexandria markets, each of them quotes roughly comparable prices for gold. The supplies of gold reaching the Alexandria market are for the most part derived from hoards. It must not be forgotten that during the last war the Arab countries were liberally irrigated with this metal, and that to this day the gold coins distributed by Lawrence and others are an essential part of the currency of these countries. There is also a small trickle of gold production in the Middle East which by devious ways probably makes its way to the Alexandria market to realise the substantial premium which it offers over the official sterling and dollar prices for the metal.

Investment

Narrowing Yield Margins

Behind the sharp rise in home railway equities and the excitement in gold and diamond mining shares, a further modest rise in industrial equities has been proceeding steadily throughout the month just ended. It was suggested three weeks ago that a continuance of rather better industrial results might produce a modest buying movement. It is just possible to discern signs of such a development, but they are very slight. None the less, the index of *The Financial News* has climbed up over half a point on the month. This, combined with a renewed sagging tendency in gilt-edged prices, has been sufficient to reduce the margin between the two indices, as recalculated to the base of July 1, 1935, to 0.6 points on the average for last week, and to virtually nothing as at April 30th. There is

no particular significance to be attached to their crossing. If a different base date were chosen, it would occur earlier or later. It is, however, suggestive. The figures are, of course, price indices. According to the classical formula, the lines should cross in anticipation of the time when industrial profits will be on the up-grade. The argument presupposed that there was a necessary connection between profits and the value of equity shares. Now, it is quite possible to imagine circumstances in which only a small part of the improvement will pass to the proprietors. It is not, however, easy to imagine that the increased benefit of better times will be reduced to vanishing point, for that would mean, not only a great injustice to shareholders, but a definite discouragement to risk-taking among savers and a resultant reduction in the incentive to save.

The whole question for the investor is whether the point has already been reached at which the permitted rise in profits has been discounted or not. That is a political question and one which involves foreign as well as domestic politics. Some assistance in forming a decision may be derived from a study of the yield figures. Unfortunately, *The Actuaries' Investment Index* does not provide exactly the data required, nor has it a composite fixed interest figure. As between June 25, 1935, and

FIXED INTEREST AND EQUITY SECURITY
MOVEMENTS (July 1, 1935=100)
Financial News indices of 20 fixed-interest securities
(converted to new base) and 30 ordinary shares

March 30, 1943, there was a net fall in the price index for 2½ per cent Consols of 3.7 per cent to 96.3 and a rise in the yield from 2.94 to 3.05 per cent. For a slightly different selection of equities at the two dates, the price fall was 3.4 per cent, while the yield rose from 3.80 to 4.40 per cent. This means that for every point in the rate of interest an additional 0.443 points is demanded on a mixed collection of industrial equities against only 0.291 rather less than eight years ago. On a three or five years view at least, this difference can only be due to the "political" risk.

Valuation of Assets

As is usually the case, industry is already questioning the value of concessions promised by the Chancellor in his Budget speech. The general line of criticism is that, however fair they look, they will be shot to pieces by the Treasury when it comes down to actual figures. The dispute raises once again the whole compensation question, both as to the field which ought to be covered and the basis on which compensation should be granted. Without either entering into the intentions of the authorities, which are far from clear and can scarcely be given final form at this stage, or attempting to assert what ought to be done, a little preliminary clearing of the ground will do no harm. As was pointed out in a note in *The Economist* of April 10th, there is a substantial divergence of opinion among accountants and auditors as to the proper basis of valuing assets—quite apart from the technical difficulties of securing a just valuation when the principle is settled. It is now quite apparent that a considerable number believe that the sole essential is to maintain, not the manufacturing power of a concern, but its financial capital. Most directorates will wish to expand their enterprise, but it is still commonly the case that expansion is counted from the basic money capital, and that there is, in these cases, no recognition of the fact that, when prices are rising, it is necessary to retain profits sufficient to ensure a corresponding rise in the balance-sheet total if real capital is not to be depleted. That is to say one must retain enough not merely to replace stock-in-trade and fixed assets at the higher values, but also to permit of a corresponding increase in net liquid assets.

All these items may, of course, be affected by factors other than the price advance. Improved machinery may cost less per unit of output than the old, despite the price rise. New and cheaper substitutes may be found for old materials. Changes may occur in the practice of debt payments, which will reduce, or increase, the amount of liquid resources

required. In the absence of clear evidence of these changes, there should, however, be full allowance for the price rise over the whole of assets when deciding what can properly be paid out of the concern. There is a great deal of evidence that there is little scientific assessment of these needs, and that the rather haphazard guesses based on past experience may be leading to unduly generous dividend payments, if what the management has in mind is in fact the maintenance of physical potential and not merely financial profit. The new Budget White Paper shows net impersonal savings, after providing for taxes due but unpaid, of only £190 million last year against £170 million in 1938, and this figure refers not only to company profits retained, but to all savings in connection with industry, agriculture, commerce and retail distribution. Unless the earlier allocation allowed a great deal for expansion, the latter is, surely, far too low.

De Beers Muddle

It is a matter which cannot be too widely advertised that, while the full accounts of De Beers were available in Johannesburg on March 29th, no information as to their contents were obtained in this country for publication before April 22nd. Even then, nothing but a summary, cabled by a news agency, could be obtained. That the agencies should, perhaps, have acted sooner does not enter into the case. It is the clear duty of the company, knowing as it does that there are large holdings in this country, to see to it that all information is simultaneously available in both countries. Between Friday, March 26th, and Wednesday, April 21st, the price of De Beers rose from 16½ to 19½, an improvement of almost 15 per cent during a period when the ordinary holder in this country was without important information already in the possession of holders in South Africa and of those in this country who were able to obtain special facilities. It may be worth recalling that last year there was a muddle, owing to the fact that accounts posted *en bloc* were held up by the authorities here, whereas those sent to individual shareholders, passed through to the addressees. That resulted, as was pointed out by *The Economist* on May 16, 1942, in selective disclosure. This year's performance is even worse. There can be no question but that the company should take the matter seriously in hand.

Such figures as are now available present a more encouraging picture than the raising of the deferred dividend from 20 to 40 per cent. The diamond account is up from £1,767,967 to £2,615,000 and investment income, largely from diamond interests, from £896,172 to £1,314,000. Tax provisions are £752,000 against £503,000 and net earnings amount to approximately 80 per cent on the deferred capital against 17.3 per cent for 1941. After setting on one side £129,000 for authorised expenditure on machinery and plant it is possible to add £554,000 to the carry forward. The summary indicates that holdings in diamond interests are up by some 50 per cent to almost £5,500,000 and holdings in the Diamond Trading Company have been increased by 740,000 shares since the end of the year. The liquid position of the company also shows improvement. The report indicates that sales for the current year to date are satisfactory and output appears promising. The explanation of the improvement is not far to seek. After a considerable gap, skilled cutters have been trained in South Africa, this country, and America. There

Sixty - Second Annual Report of the Directors of Canadian Pacific Railway Company
Year ended December 31, 1942

The accounts of the Company for the year ended December 31, 1942, show the following results:—

Net Income for the year amounted to \$40,354,267, being \$5,992,835 greater than in 1941.

The comparative results of railway operations were as follows :—

GROSS EARNINGS increased by \$35,418,038, or 16.0 per cent., and were greater than in any previous year in the history of your Company, exceeding those of 1928 by \$14,885,630, or 6.2 per cent.

FREIGHT EARNINGS increased by \$18,496,666, or 10.4 per cent. Increases were reported in all commodities except grain. The

movement of manufactured goods increased principally as a result of the greatly expanded output of munitions of war. Developments such as the Alaska Highway, the enlarged shipbuilding programme, and the construction of naval depots and airfields at various points also contributed to the growth of freight traffic. The curtailment of ocean and coastal transport owing to the shortage of shipping increased the rail movement of such staples as coal and oil, and restrictions on highway transport contributed to an increase in short haul traffic.

Earnings from grain and grain products decreased \$6,041,016, or 15.5 per cent., in spite of the fact that the largest Prairie wheat crop on record—565 million bushels—was harvested this year. The lack of adequate shipping, as well as the closing of important export markets, created serious storage problems at the Lakehead and at other terminal points, thus restricting the movement of grain. Grain handlings on your Company's lines dropped to 181 million bushels as compared with 215 million in 1941 and were somewhat less than the average of 183 million bushels for the fifteen years, 1927-41. At the end of the year, only 10 per cent. of the wheat available for movement in the Prairie Provinces had been transported, and there remained to be shipped approximately 570 million bushels, or 80 per cent. more than at the close of 1941.

Revenue freight traffic totalled 22,600 million ton miles, 225 million greater than in 1941 and 4,177 million greater than in 1928. The average revenue per ton mile was 0·86 cents as compared with 0·79 cents in 1941 and 0·96 cents in 1928.

PASSENGER EARNINGS increased by \$14,041,105, or 55.5 per cent., and were the highest since 1921. Travel, with the exception of long distance holiday traffic, showed heavy increases over practically all sections of your Company's lines. Civilian travel was exceptionally heavy in spite of the elimination of many classes of reduced fares. The growth in passenger traffic resulted partly from the restriction of automobile travel through the rationing of gasoline and the shortage of rubber for tyres. The average passenger journey was 156 miles, compared with 144 miles in 1941, the longest previously recorded. The heavy movement of the armed forces, both on duty and on leave, and the low rates applicable to such traffic contributed to the reduction in the average revenue per passenger mile which was 1.87 cents, the lowest since 1910.

OTHER EARNINGS increased by \$2,880,267, or 15.4 per cent. Substantial increases occurred in revenues from news services and from dining, sleeping and parlour cars. Net payments for hire of equipment increased \$930,104 as a result of a greater movement of

commodities in tank cars, gondolas and covered hopper cars owned by private operators and by United States railways.

Exclusive of taxes the increase was \$33,187,885, or 18·9 per cent. of the increase in gross earnings. The war-time cost-of-living bonus paid to employees amounted to approximately \$12,000,000, an increase of about \$7,500,000 over the previous year. The bonus at rate of \$3·65 per week which went into effect November 16, 1941, effective August 15, 1942. In spite of the increased wage and material costs the ratio of working expenses (excluding taxes) to gross earnings was reduced from 71·65 per cent. in 1941 to 71·54 per cent. in 1942.

MAINTENANCE OF WAY AND STRUCTURES EXPENSES increased by \$8,461,192. The continuing heavy traffic brought about a considerable rise in current maintenance requirements, but shortage of labour and materials compelled the restriction of the work undertaken to those repairs and replacements essential for safe operation.

Locomotive repairs involved an expenditure of \$11,074,361 and included the shopping of 821 engines for heavy repairs. Maintenance of passenger train cars cost \$6,505,893 and included the general overhauling of 1,272 units. The maintenance of freight train cars cost \$10,685,545 and included heavy repairs to 26,272 cars. Arch bar trucks were replaced by cast steel truck side frames on 3,519 cars to make them available for interchange traffic. At the end of the year, 93.2 per cent. of locomotives and 97.7 per cent. of freight cars were in serviceable condition, as compared with 92.3 per cent. and 98.0 per cent. respectively, in 1941. Charges for depreciation of rolling stock amounted to \$12,777,310, as compared with \$12,700,602 in 1941.

TRANSPORTATION EXPENSES increased by \$10,653,857. The ratio to gross earnings was reduced to 32.27 per cent., the lowest on record. There was a substantial improvement in passenger service performance. The average number of passengers per train mile was 110, an increase of 47.9 per cent., while the average train consisted of 8.4 cars, an increase of 7.7 per cent. Another favourable factor was the heavy loading and better utilization of freight cars. In spite of a substantial decrease in the movement of grain, a commodity which loads heavily, the average freight car load showed a slight improvement, being 31.93 tons compared with 31.86 in 1941. Although loaded car miles increased 0.9 per cent., empty car miles were reduced by 13.5 per cent. As against these favourable factors, the movement of trains on many sections of the line was rendered more difficult owing to the increased density of traffic.

OTHER WORKING EXPENSES increased by \$10,234,135, of which \$8,087,822 was attributable to heavier taxes. Railway tax accruals, including \$21,300,000 for Dominion Income and Excess Profits taxes, were \$24,920,980. Expenses of dining and buffet service were higher by \$828,785 and news service by \$473,956.

Other income amounted to \$15,861,034, an increase of \$2,478,975, or 18.5 per cent.

Dividend income decreased by \$1,671. Dividends of \$2.50 per share—the same rate as in 1941—were received from The Consolidated Mining and Smelting Company of Canada, Limited. Net income from interest, exchange, and

ties and miscellaneous sources increased by \$2,523,799. A marked improvement took place in the operating results of the Northern Alberta Railways Company, which enjoyed a very large volume of traffic from special war projects and related activities in North-western Canada. As a result of additions to sinking and other reserve funds there was an increase in the income from this source, and the amount of your Company's management fees under its contracts with the Government was larger owing to the growth of production of munitions in the shops.

Net earnings of ocean and coastal steamships were \$2,888,278, an increase of \$99,981. All units of your ocean and coastal fleets were actively employed throughout the year.

Net earnings of hotel, communication and miscellaneous properties decreased by \$143,134. The reduction in hotel earnings amounted to \$354,228.

Dividends amounting to \$5,042,782, being at the rate of 4 per cent. on the non-cumulative Preference Stock, were declared out of the Net Income for the year.

It is the decision of your Directors that no dividend on Ordinary Stock should be declared from the earnings of the year 1942. During the past three years the Board of Directors has

has been substantially reduced, the Funded Debt of your Company is less than they were when dividends were last paid. It is felt that these charges are still higher than they were when dividends were last paid. It is felt that these should be brought down to something like the former level before distribution to shareholders is renewed.

Your Directors have in mind that after the war there will probably be a period of readjustment with unpredictable reactions on the earnings and expenses of transportation companies. After careful consideration of all factors, they have come to the conclusion that it is in the best interests of the shareholders to conserve your

exists an excellent demand for their output, both as gem stones and as industrial diamonds. The former constitute a partial inflation hedge, as well as an outlet for surplus cash, while it is believed that technological improvements have helped to increase the industrial uses of diamonds, the demand for which would, in any case, have been stimulated by industrial expansion under war conditions. The boom in diamond shares shows signs of faltering, and De Beers deferred now stand at 19½ against a recent high of 20½, the best for some eight years.

Last year, General Accident increased the amount paid up on its 2,000,000 ordinary shares of £1 nominal from 5s. to 10s. per share by a transfer of £500,000 from the balance of profit and loss account. This year it is proposed to make a further payment of 2s. 6d. per share, at a cost of £250,000 from the same source. The operation will bring the total paid-up capital, including £250,000 of cumulative preference shares, to £1,500,000, and reduce the carry forward, after providing for cash dividends and the proposed scrip bonus, by £214,324 to £242,285. This is apparently not to be the end of the matter, for the chairman, Sir Francis Norie-Miller, expresses the hope that it will be possible in the future to make the shares fully paid. The advantage to the shareholder of such an event is at least equal to the actual amount paid up on the shares, despite the fact that actual distributions are not necessarily increased. The company has a general reserve of £2,000,000, and an investment reserve, the greater part of which has been liberated by the recent rise in quotations, of £988,000. The company is, of course, suffering from the fall in premium income on motor insurance, in which it is deeply interested; but it is a fair inference from the increase in dividend that the outlook is considered favourable. The example set a year ago has now been followed by the London and Lancashire Insurance, which is proposing to pay up £1 per share of £5 nominal value, now £2 paid. This involves a transfer of some

Net charges to profit and loss amounted to \$4,446,938, as compared with \$2,978,009 for 1941. One of the principal items was the retirement of track and other facilities at Transcona Yard, near Winnipeg.

NOTE.—Particulars of securities held for account of the Company, of obligations of the Company in respect of the principal of securities of other companies owning railway lines operated under lease, and of contingent liabilities of the Company are set out in the accompanying schedules.

TO THE SHAREHOLDERS, CANADIAN PACIFIC RAILWAY COMPANY.

We have examined the Books and Records of the Canadian Pacific Railway Company for the year ended December 31, 1942, and the related schedules therewith, we certify that in our opinion it is properly accounted for in accordance with the provisions of the Income Tax Act, and the Income and Profit and Loss Accounts correctly set forth the result of the year's operations.

The records of the securities owned by the Company at December 31, 1942, have been examined and found to be correct.

Montreal, March 5, 1943.

£2,727,000, which will reduce the carry forward to some £2,695,000. This company experienced a bad year in the marine market, and has apparently not yet seen the end of the losses occasioned by the entry of Japan into the war. The yields on these two shares are some 3½ per cent for General Accident and £3 15s. 6d. per cent. for London and Lancashire.

John Summers' Report

The full accounts of *John Summers* for 1942 disclose a rise in total profits of the company after depreciation from £880,366 to £1,075,504, while those of the group, after providing depreciation totalling £340,320 against £341,222, rose correspondingly from £942,002 to £1,165,281. Tax provision of the group increased from £401,029 to £575,545 and that of the company by only £85,000 to £510,000. As stated in the discussion of the preliminary statement in *The Economist* of April 10th, ordinary dividends on the "A" and "B" stock were each raised 2½ points to 8½ and 4½ per cent respectively, covered by earnings of £426,602 against £297,304. The cover for the "A" ordinary dividend has risen from 10.6 to 13.8 per cent, and that for the "B" shares by 8.7 points to 15.1 per cent. General reserve receives £10,000 more at £150,000 than in 1941, while a new War Contingencies reserve of £50,000 is created. The carry forward is increased some £11,000 to £185,183. No statement has been made by the chairman, Mr R. F. Summers, but the balance-sheet confirms the impression that the group has considerably expanded its activities, primarily through the operation of the new strip mill. The consolidated balance-sheet shows a reduction by some £545,000 to £1,189,494 in stocks, probably a reflection of the current shortage of materials, coupled with an expanding output of finished products. Cash holdings are higher at £918,116 against £704,928, and

which have been rendered unnecessary by present operating methods and traffic conditions. A branch line from Lardeau to Gerrard in the Province of British Columbia, 33.1 miles in length, was abandoned during the year and the investment written off. Various miscellaneous properties and portions of facilities no longer required in operation were also written off.

The profit and loss balance at the close of the year was higher \$30,864,547 than at the end of 1941.

PRICE, WATERHOUSE & CO.,
Chartered Accountants.

the latter figure including £150,000 tax certificates. It is clear from a rise of £550,000 to £4,200,000 in fleet replacement account that there have been further losses, but it is impossible to gauge their amount. Owing to payments for new ships, there is an improvement of only £52,000 to £1,950,641 in net liquid assets, while the *King Line* statement shows a jump of nearly £293,000 to £930,987 in the same item. The £1 ordinary stock of *Royal Mail* at the current price of 23s. ex dividend yields £5 4s. 4d., while at 35s., the £1 ordinary shares of *King Line* yield some £7 2s. 10d. per cent.

The Selfridge Experience

The full accounts of the Selfridge companies and the statement of the chairman, Mr H. A. Holmes, on results for the year to January 31 last, make relatively encouraging reading. It was already clear from the preliminary statement, discussed in *The Economist* of April 3rd last, that there had been a substantial recovery in gross profits of *Selfridge and Co.*, the operating concern. Mr Holmes considers that this company realised its full share of the general improvement in retail trading which took place in central London last year. Despite the fact that the dividend paid to *Selfridge (Holdings)*, which was raised from 6 to 12½ per cent, was almost wholly absorbed in prior charges, the chairman points out that significant headway is being made in paying off these liabilities. The "A" Secured Income Redemption Stock, which has just received £17,708, is now reduced to £82,292. Its elimination will mark an important step forward. The most serious implication for the future of equity capital is the fact that the total reservation of £280,000 for taxation does not fully meet tax liability on current income of the operating concern. Ranking as a new company, it will for some years find taxation a heavy burden. The management is more than justified in its conservative allocation of resources, and not least in its provision for deferred repairs. Without deducting inter-company transactions, the balance sheet of the operating company shows a rise in net liquid assets which amount to £917,120 against £715,650. The *Selfridge (Holdings)* statement still contains much dead wood in the shape of accumulated losses not yet written off, but the improvement in earning power provides hope of ultimate recovery. The 1, 6 per cent, cumulative preference stock now stands at 16s. 9d.

Alliance Trust

Despite the falling off in income from the Far East, the decline from £649,599 to £641,668 in gross revenues of Alliance Trust for the year to January 31 last is very slight. Interest on borrowed money, at £106,108, is just below the 1941-42 level, while taxation requires some £2,000 more at £252,780. Thus, there is a modest reduction in equity earnings from £211,796 to £199,454, representing 36.2 against 39.4 per cent on the ordinary stock, which receives 25 per cent as usual. The management is able to transfer £60,000 to contingencies, against £75,000, and to raise the carry forward from £63,358 to £64,999. In the previous year, the full effect of the loss of income from investments in the Far East and Malaya had not made itself felt, but the chairman, Mr. J. Prain, pointed out that revenue from those interests amounted to less than 2½ per cent on the ordinary stock. In fact, equity earnings have declined by 3.2 per cent, without any marked rise in total charges, so that there may also have been some reduction in income from investments nearer home. The directors state that there has been a small improvement in mortgage business, but, as yet, no striking recovery in the demand for land. Investments stand in the balance-sheet at cost at £11,231,756, against £11,353,345. There is a reduction in secured loan and bank advances from £133,563 to £124,910. Despite this, and a greater decline in creditors than in debtors, cash items are up from £13,456 to £49,819. The directors are confident that the market value of investments exceeds the balance-sheet figure. The £100 ordinary stock at 560 ex dividend yields £4 9s. 3d. per cent.

DIVIDEND NOTICE

Toronto,
April 16, 1943.

Crosse and Blackwell Accounts

The full Crosse and Blackwell accounts for 1942 show a rather different picture than was suggested in the note on the preliminary statement in *The Economist* of April 24.

1943. Gross revenue is reduced from £825,180 to £741,186, but a sharp fall in tax provision from £632,654 to £504,319, and in debenture interest from £79,000 to £57,000, leaves the net amount well up. It is thus possible to transfer £62,138 against nil for deferred repairs before arriving at equity earnings of 8.0 against 7.7 per cent for 1941. After raising the ordinary payment from 4 to 5 per cent, £13,948 against £15,043 is placed to general reserve, and enough remains to raise the carry-forward from £17,458 to £18,632. The £1,179,564 of 6½ per cent first mortgage debentures were replaced at September 30th by a secured bank loan of £600,000 bearing interest at 4½ per cent. The gross annual interest charge will thus amount to some £27,000 against an average payment on debentures of some £85,000. The directors attribute the high level of gross profits to the benefits derived from the new plant, but there has apparently been a marked rise in costs which has prevented the realisation of record earnings. The company's balance sheet shows an interesting shift in net borrowing from subsidiaries and associates of £11,950 to net loans to these concerns of £99,387. The consolidated statement shows, despite the net repayment of £500,000 of longer-term debt, a decline in net liquid assets from £628,220 to £279,584 only, for which a rise in creditors from £1,338,035 to £1,559,358 is partly responsible. Stocks are somewhat lower, but the maintenance of output will depend primarily on rationing policy. The group is working solely on Government contract, and there is every prospect that it will be able to maintain the increased dividend in the immediate future unless supplies are restricted. The 1s. ordinary stock at 1s. 7½d. yields £3 1s. 6d. per cent.

Sudan Plantations

Both *Sudan Plantations* and the main cotton producing subsidiary *Kassala Cotton* earned less in the year to June 30, 1942. Profits of the former dropped by nearly £50,000 to £678,523; those of the latter by nearly £22,000 to £126,058. Despite this, both concerns raised their dividends by 2 points to 10 per cent. The increased distribution is to some extent justified by the rise in equity earnings of *Sudan Plantations* from 14.5 to 16.4 per cent and in those of the subsidiary from 12.8 to 15.8 per cent. Yet, this improvement is in each case due solely to the reduced provision for income tax—£150,000 against £250,000 in the case of *Sudan* and £30,000 against £60,000 in the case of *Kassala*. The reduction cannot be fully explained by the decline in disclosed profits and is presumably due in part to over-provision in the previous year. In the circumstances, the decision to raise the ordinary payment appears a little over-optimistic, despite the fact that adequate transfers have been made to general and Gezira reserves. It remains highly probable that the 10 per cent level, last paid in both cases in 1937/38, will not be maintained. The concerns have suffered from difficulty in obtaining an adequate supply of fertilisers and from a labour shortage. There is, of course, no limit to the demand for the cotton and salt output of the group, but there are exceptional transportation hazards as well as generally rising costs.

Recovery of Waste Material

The urgency of the shipping situation necessitates the utmost economy in the use of materials and in the reclamation of all recoverable products. A special drive for the reduction of scrap has been set on foot, and Sir Stafford Cripps recently called for the co-operation of managements and workpeople throughout the country. He stressed the rôle which joint production committees could play, and the recent AEU inquiry showed that the elimination of scrap was an item which frequently appeared on the committees' agendas. While the committees can be instrumental in ensuring that care is exercised in the factory, the best plan is probably to appoint a special officer to look after scrap. The committees can also help in seeing that finished and partly processed materials are used with the strictest economy and do not lie idle. The collection and reclamation of scrap nationally is organised by the Ministry of Supply, the Iron and Steel Control being responsible for all ferrous metals, the Non-Ferrous Metals Control for all non-ferrous metals, except for aluminium, magnesium and

The balance sheet of *Sudan* shows an improvement in net liquid assets from £2,990,514 to £3,234,068 and that of *Kassala* a reduction from £202,631 to £127,792. These movements are, however, less significant than the fall in cotton stocks common to both concerns. That of the parent is down from £2,907,797 to £1,309,284; that of the subsidiary from £644,485 to £344,508. For *Sudan Plantations*, there is a corresponding increase in holdings of cash items—tax reserve certificates amounting to £450,000 having been acquired—for *Kassala Cotton*, the rise in cash items is smaller, but the loan from the parent is reduced from £112,817 to £711. The directors say little about the future of the group, or about the situation which will arise when the agreement with the Sudan Government is terminated, at the latest in 1950. There are substantial reserves; those of *Sudan Plantations*, including the carry-forward, amount to £2,773,586 and exceed the total of fixed assets less specific reserves by £759,779. The £1 ordinary shares of this company, at 41s. 3d., yield £4 17s. per cent less UK income tax at 8s. 5d. and Sudan Business Profits tax at 1s. 7d. The net liquid assets, at balance-sheet valuation, give the shares a value of 26s. 1½d.

“Chartered” Accounts

The full accounts of the *British South Africa Company* show that the year ending September 30, 1942, was the most successful for several seasons. Total revenue, to which estate profits contributed, rose from £705,089 to £807,914. There is a welcome increase in income from dividends and interest, at £477,429 against £443,205, despite a marked decline in payments from the company's important Rhodesian copper interests. In the current period, there will, of course, be a dividend from *Mufulira*, whose payment of 11½ per cent against nil was received after the close of the financial year. The factor mainly responsible for the 1941-42 jump in income from investments is the increased dividend of 16 against 12 per cent paid last August by *Rhodesia Railways Trust*, which is controlled by "Chartered." The accounts of the latter show an increase in net profits of the sub-subsidiary, *Rhodesia Railways, Limited*, over the same period from £2,525,897 to £2,656,660. The replacement of a loss on citrus estates by a profit of £23,124 is apparently due to an improvement in local sales which more than offset the contraction in the export market. Despite a rise in tax provision from £275,288 to £327,198, there is an increase in the rate of equity earnings from 8.8 to 10.4 per cent. The shareholders receive 8½ per cent as usual and the surplus goes to raise the carry-forward from £638,763 to £718,404. The balance-sheet position is satisfactory. Investments stand at £8,109,320, of which quoted securities, included at £7,332,652, have a market value in excess of that figure. A year ago £7,166,588 of quoted securities, out of a total of £7,943,235, showed a depreciation of £475,509. Cash holdings are slightly lower and debtors and creditors higher, movements which reflect the more active trading which appears to have marked the past year. The 15s. stock, at 27s. 6d. ex dividend, yields £4 10s. 11d. per cent less tax at 8s. 5d.

Industry and Trade

metallic silicon, which are dealt with by the Light Metals Control of the Ministry of Aircraft Production. Directions have been given to firms about how to segregate scrap and to avoid mixing different grades, and advice is given about the best means of handling and disposing of scrap and marking the different types of metal. The same considerations apply to the recovery of waste oil; oil distributors throughout the country have been asked to find out what facilities their large consumers have for dealing with waste, how the reclaimed oil is disposed of, or, if not reclaimed, to inform the Oil Lubricating Pool. The recovery of scrap and oil may not seem to amount to much in the individual plant, but on a national scale the cumulative effects of economies are bound to be considerable.

Voluntary Labour

A great deal has been heard about the use of volunteer labour on the farms, but the possibilities of developing sparetime voluntary work in the factories are perhaps not

generally realised. The April issue of the *Production and Engineering Bulletin* gives an interesting account of the scheme for utilising voluntary labour which was adopted in one area. The various associations and unions catering for civil servants, teachers, bank officers, clerical workers, journalists and the like, were invited to co-operate by the local labour exchange, and volunteers from among their members were enrolled for week-end work. Such workers have been used for the production of cartridge cases, aircraft radiators and petrol tanks, among other things. Their standard of work cannot, of course, compete with that of ordinary full-time employees, and their net addition to the national output of munitions is probably small. But the fact that they are volunteers means that their enthusiasm for work is likely to be great, and it may also happen that a particular bottleneck is broken as a result of their employment, which has saved regular employees from working Sunday time or overtime. In one factory, the fact that volunteers passed through preliminary pressing over 4,000 shell cases on a Sunday enabled the regulars to complete 16,000 cartridge cases on the Monday, thus exceeding any previous Monday's production. Such schemes, like those for homework described in *The Economist* of February 27th, are also valuable from a psychological point of view. They should be given every encouragement, as well as the schemes for recruiting women for regular part-time work. There are now approximately 600,000 part-time women in industry and further increases are hoped for.

Planning Britain's Roads

In its recent report on the Post-War Development of Highways, the Institution of Highway Engineers emphasised the need for a bold improvement in Great Britain's road system. The result of the policy of improving and adopting existing roads has been "a totally inadequate system of traffic-congested roads." There is need for the re-planning of the highway system, which should provide "a means of safe, speedy, cheap and comfortable transportation of people and goods between the main centres of population and industry, wherever they now exist or where they will ultimately exist." The road system envisaged by the IHE would consist of

- (1) A skeleton network of high-speed roads to accommodate long-distance mechanical transport.
- (2) A secondary system of mixed traffic roads connecting neighbouring industrial areas and serving as feeder roads to the main high-speed routes, and as link roads connecting such routes and existing trunk roads on the outer ring of centres of industry and population.
- (3) Local pathways accommodating all classes of road users from industrial areas to recreational centres.
- (4) Minor roads to serve mainly local requirements.

The high-speed roads, or motorways, would be reserved for motor traffic only. The system need not consist in its entirety of new roads; there are many miles of existing trunk roads which, in the opinion of the Institution, could very cheaply and simply be adapted to form two-carriage-way high-speed routes and be fitted into the network. It is rightly emphasised that the planning of motorways should be undertaken by a national planning authority, and that its construction and maintenance should be financed from a central fund. The secondary system of mixed-traffic roads should be designed on the model of existing trunk roads; link roads connecting motorways with existing trunk routes should be sited and designed for the heavy loads which will be carried by the roads they connect. The Institution stresses the need for adequate safety provisions on all roads. There can be no doubt that the adaptation of Britain's highway system to modern traffic requirements should be an important item on the agenda for physical reconstruction. Except for local and minor roads, it must be planned nationally with reference to needs and means and to other forms of transport.

THE ALEXANDRIA WATER COMPANY, LIMITED

ALEXANDRIA, EGYPT
DIVIDEND

NOTICE IS HEREBY GIVEN that a dividend of ten shillings and sixpence per £5 Share will be paid without deduction of British Income Tax, but less Egyptian Government and Alexandria Municipal Taxes amounting to 1/4.1028, making 9/1.8972 net on Coupon 108 on and after the 15th day of April, 1943, at the National Bank of Egypt in Alexandria at Rue Toussouri or in London at 6 King William Street, E.C. 4.

Dated Alexandria, Egypt, the 12th April, 1943.

By Order of the Board,

T. D. KEY
ROBERT WALTON } Joint Managers.

Electrical Development

Although the electrification of Great Britain made rapid headway during the pre-war decade, the scope for further development remains very large. The British Electrical Development Association has prepared a programme designed to enable it to give the electrical industry full assistance in increasing the efficiency of its service to the public after the war. The association envisages improvements, such as the speeding up of the standardisation of voltages; the provision of increased facilities for the hire purchase and maintenance of apparatus, and for advice and guidance to the public; and the provision of a technical service designed to assist industrial consumers with their problems. The rate of progress in electrification after the war will depend very largely on the ability of the industry to make its services available cheaply and conveniently compared with other sources of heat, light and power.

World Wheat Supplies

The broad picture of world wheat supplies, as sketched in the January issue of *Wheat Studies*, is one of abundance, but of abundance mainly in the major exporting countries, accompanied by scarcity in other regions cut off from the granaries by the war, or having only limited access to them by reason of transport difficulties. Continental Europe's total supplies for the season 1942-43 seem to be smaller than in either of the two preceding years. In Russia the breadgrain position is stated to be uncomfortable, but not desperate. Last year's wheat crop in the British Isles is estimated at about 125 million bushels (against 90 millions in 1941 and

(a) July-June for the United States; August-July for other countries. (b) Average.

72 millions in 1938), "the largest harvest in more than 75 years," but has nevertheless to be supplemented by substantial imports. As the accompanying table shows, the combined supplies in 1942-43 of the four major exporting countries—United States, Canada, Argentina, Australia—are enormous, compared with pre-war averages. They represent "the combination of the largest carry-over in history with the second largest crop in history, smaller only than that of 1928," and would provide for a year's domestic use, a normal carry-over, and exports more than four times the annual average exports of the five pre-war years. The existence of such vast supplies will greatly assist in the speedy relief of starving peoples after the war.

Towels or Stockings

In putting towels on the clothing ration, Mr Dalton has caused friction in the home. The housewife with a grown-up family finds it almost impossible to keep the household supplied with towels, since it can only be done by the sacrifice, by an unwilling daughter, of new stockings, gloves or scarf. The Board of Trade says the family should pool its coupons; the housewife (represented by the women delegates to the Co-operative Party conference last week-end) declares that "it is usually the housewife who has to provide the coupons." In theory the Board of Trade is right—in practice the housewife. The issue of special coupons for household linens, as suggested by the Co-operative Party conference, would not equate supply and demand, but if it were practically possible to ration household goods, other than furniture, on a points system like the clothing ration, every member of the family would then be on an equal footing, and replacements of other scarce household equipment would be easier. If necessary, the clothes ration could be slightly reduced; probably one coupon less per head would be more than sufficient to provide all the household linens required.

COMPANY MEETINGS

ROYAL EXCHANGE ASSURANCE

223rd ANNUAL REPORT

SUCCESS IN ALL DEPARTMENTS

INCREASED TOTAL PROFIT

DIVIDEND OF 30 PER CENT.

LORD BICESTER'S SURVEY

The two hundred and twenty-third annual general court of the Royal Exchange Assurance was held, on the 28th ultimo, at the Royal Exchange, London, E.C.

The Rt. Hon. Lord Bicester (the Governor) was in the chair.

The general manager and secretary (Mr Alexander MacDonald) having read the notice convening the meeting and the report of the auditor,

The Governor said:—

Gentlemen.—It is now two years since I have personally given a review of our work in the form of an address at the annual general court. In the meantime the address has each year been sent in printed form to the stockholders with the annual report and accounts. Now it seems we should be interpreting better the wishes of the authorities if we reverted to our customary practice, and I should add that for the same reason we have this year also considerably curtailed both the form and size of our annual report.

With your permission I will take the report and accounts of the Royal Exchange Assurance for the year ended December 31, 1942, as read.

No changes have taken place either on our court of directors or among the executive staff during the year under review.

LIFE DEPARTMENT

In referring first to the work of the life department, the premium income at £1,405,000 is some £20,000 in excess of the amount received in 1941. After allowing for re-assurances, the new business for 1942 amounted to £2,215,000. I am particularly gratified that this year still fewer policyholders have found it necessary to surrender their policies, the amount in this connection being only £53,000, which is nearly £45,000 less than in 1941 and £75,000 less than in 1940. In a desire to help any of its assured who are meeting with exceptional difficulties in these unusual times, the Corporation has always been ready to give most sympathetic consideration to every case, believing as it does that the sound principles of adequate life insurance were never more potently demonstrated than in such circumstances as those through which we are all now passing.

The amount paid in claims by death shows an increase of £42,000. As in 1941 the amount paid is somewhat heavier than would be the case in peace time, but if allowance is made for the premature claims arising from war causes, the experience in comparison with the most modern standard table for assured lives is satisfactory. Of the amount of mortality loss in 1942 which can be attributed to direct war causes, 97 per cent. arose from casualties to members of the fighting Services.

RATE OF INTEREST ON LIFE FUND

With regard to interest income arising from our life fund, the gross rate of interest earned during the year 1942 was £4 4s. 8d. per cent. per annum, or 2s. per cent. per annum less than the corresponding figure for 1941. The Corporation has supported the issues of the various war loans to its fullest powers, but it is self-evident that with the rate upon new moneys so invested being lower than the average rate earned upon the fund's invested portfolio to date,

there must be a gradual decrease in the overall yield. Nevertheless at whatever temporary cost to the Corporation there remains the merit of being a potent factor in helping to shoulder the gigantic financial burdens that the war has laid upon the whole country. While this situation must be accepted during the period of intense strain, it is essential that in the years following peace more scope should be exercisable in the choice of investments, in order that institutions such as our own may again be able to play their part in contributing to the financial requirements of business and industry.

ANNUITY DEPARTMENT

The business of the annuity department is somewhat larger than last year, but the capital redemption account again shows a reduction. As mentioned in my last address, it is the considered policy of your directors not to seek for any increase in either of these fields, at any rate for the time being.

The year's work of our trustee and executor department has been satisfactory. This is a business which calls for an immense amount of detailed supervision and, in consequence, the continued depletion of staff owing to war necessities has greatly added to the burden falling on those responsible for this branch of our activities.

FIRE ACCOUNT

I am happy to be able to present to you this year an excellent fire account.

Our total net premium income on the combined sections of home, general foreign and the United States amounted to £1,645,000 as against £1,636,000 for the year 1941. While this increase is attributable to the home section, it is somewhat surprising to see that our income in the general foreign field practically held its own with the previous year. In the first half of last year conditions in the home fire business were not promising, resulting from a heavy loss experience throughout Great Britain for that period, and although later conditions improved, the total home losses for the year were very heavy. Meanwhile a campaign to bring before the public the extreme importance of fire prevention, as a very tangible means of helping the country's war efforts, was inaugurated under the auspices of the fire offices committee. It is as yet too early to say whether the improvement in losses by fire recently experienced will be maintained, but it is to be hoped that every success will accompany the efforts to impress on the public the importance of fire prevention now being made.

Turning to the foreign field, we have reason to be satisfied with the results. It was only in the early part of last year that the effect on our business of the entry of Japan into the war began to be felt, and you will remember that we had important interests in the Far East, particularly in the Netherlands Indies and China. In this connection I should like to extend our sympathies to Messrs Butterfield and Swire, our esteemed agents of so many years' standing in China, and to our other connections in those parts of the world who are now undergoing so many trials. It is our hope that the good will which we have for so long enjoyed in the Far East will not experience any prolonged severance.

The United States figures show some improvement on those of twelve months ago.

Taking our fire business as a whole, and including interest, there is this year available a sum of £182,000 which we propose transferring to profit and loss account, a result which is most satisfactory.

MARINE DEPARTMENT

You may remember that in my opening remarks when reporting to you on the work of our marine department last year, I emphasised that the entry of Japan into the war would most surely increase the difficulties that would have to be faced by those undertaking marine insurance business. This proved to be so. Further, at the beginning of the year the American market in which the Corporation has for many years been interested, found itself faced with heavy and exceptional losses for which no previous provision had been made in respect of the terms under which the insurance business was undertaken. As a result, in common with all other British offices operating in the United States, the business received through our agents there has been, for the year in question, adversely affected.

Nevertheless, conditions in the market here have continued to develop not unfavourably. In particular, I would like to mention the recent setting up of a joint cargo committee. As you know, for many years there has been a joint hull committee, the influence of which has greatly facilitated the satisfactory transaction of hull business, and tended to prevent hull rates from fluctuating too widely, a benefit which I know is regarded by shipowners as desirable.

By the work so far completed the newly established joint cargo committee has already shown its usefulness, especially in the agreement reached, which became effective on the fifteenth of this month, for putting into force combined marine surcharges. We welcome the setting up of this committee and trust that the useful work it has already done will be but the forerunner of benefits which it will bring to the conduct of cargo business in the London market.

It is just five years since the Corporation undertook the reorganisation of its marine department, and I am happy to say that we can again make a transfer in this year's accounts to profit and loss. The amount we propose transferring is £50,000. The marine fund thereafter will stand at £1,079,000, or 132 per cent. of the premium income. Your Court is pleased to feel that this fund contains a surplus larger than a year ago, but it should be realised that heavy calls for deferred repairs may be made on us in the future.

ACCIDENT DEPARTMENT

In reviewing the year's work of the accident department, I am glad to be able to tell you that very satisfactory results have been obtained in the face of increasing difficulties. You will appreciate that there has been an inevitable reduction in private motor car insurances, but it is gratifying to know that we have succeeded in retaining our quota of the commercial vehicles which are still on the roads, and we also have a fair share of the insurance of Government vehicles used by the National Fire Service and the Civil Defence Organisation.

Quite apart from our motor insurance business, our accident income is well spread, and on the whole of the home account the premiums have been maintained within 8 per cent. of the previous year's figure. It is perhaps not fitting to comment now upon the possible future of workmen's compensation business seeing that this and many other insurance problems are having the earnest consideration of His Majesty's Government, but I do feel entitled to say that the established insurance companies have provided the maximum service which their organisations are capable of giving.

in handling workmen's compensation insurance, and that in this respect, as in very many others, private enterprise has stood the test of time.

The year's experience in our overseas accident business shows the maintenance of a well-balanced portfolio notwithstanding the loss of premiums from enemy-occupied countries. Where there is a reduction in volume compared with the 1941 account, this is principally due to deliberate policy on the part of the Corporation. This policy has had a considerable influence on the aggregate figures I am now submitting to you, and contributes to a substantial surplus from overseas as well as from our operations at home. The combined account has produced a profit of £185,000 which I feel sure you will agree is a matter for congratulation.

PROFIT AND LOSS ACCOUNT

It will perhaps be more convenient if at this point I deal with the general profit and loss account of the Corporation. It will be of particular gratification to you to see that in this year's account the results of the departments of our business have disclosed the value of a powerful team all pulling their weight. In years past, one or other of our three departments of fire, accident and marine have shown excellent results individually, but rarely have they all had such a uniformly successful year.

This year has brought excellent results from all three, so that with the inclusion of the profit from the trustee department, an amount of £428,000 has been brought into profit and loss as against £283,000 from the same sources in 1941 and £212,000 in 1940.

Our nett receipts in respect of general interest show a higher figure than last year, and I shall have a word to say on this point in a moment. The items on the expenditure side do not, I think, call for any special comment except perhaps to refer once again to the heavy amount necessitated for provision for taxation. Altogether the balance on general profit and loss account, which as you are aware constitutes also our general reserve, is now £1,204,000, which amount has been carried to the balance-sheet.

It may seem strange to you that at a time when interest rates are at such low levels and when institutional investors such as ourselves are not only accumulating large sums in Government securities but are also having substantial amounts of securities hitherto held converted into others bearing in their turn a lower rate of interest, that the income from our investments should not have shown a larger decrease on pre-war figures.

LARGER DIVIDENDS FROM ASSOCIATED COMPANIES

But one of the contributing causes lies in the receipt of larger dividends this year from two of our associated companies, the Car and General Insurance Corporation and the Motor Union Insurance Company, Limited. Both these companies have now experienced a long period of successful trading, but it has required that time to establish them in their present strong financial position, and this could only have been done by the old-fashioned, but none the less eminently sound, policy of ploughing the profits back into the business. The attainment of financial strength seldom permits of being in a hurry, and while both these companies could have made a larger contribution to our income at an earlier date, your directors have deemed it prudent to exercise patience over a fairly long period.

DIVIDEND

You have already been informed of your directors' recommendation to pay a final dividend of 19 per cent. for the year 1942, and I shall presently ask for your confirmation of this proposal. This dividend, together with an interim dividend of 11 per

cent., paid in November last, will make a total dividend of 30 per cent., less tax, on the capital stock of the Corporation for the year 1942.

You will have gathered from what I have already said that the "Car and General" and the "Motor Union" have again experienced a successful year's business. The "Car and General" has reported a nett premium income for the year of £1,818,000, and an underwriting profit of £167,000. Their total assets now amount to £3,027,000.

Likewise the "Motor Union" shows a nett premium income of £1,311,000 for 1942, resulting in an underwriting profit of £139,000, while the assets of that company have now reached £3,439,000.

The "State" has also had a reasonably good year, but the National Provincial Insurance Company is still very naturally feeling the effect of war conditions prevailing in the particular sphere of business in which it is principally engaged, and this year it has not been considered prudent for them to pay their usual dividend.

TRIBUTE TO STAFF

This brings me to the end of my annual review of the actual results and figures in connection with the year's work of the Corporation, but there are a few further points on which I should like to touch. We are now in the fourth year of war. Many things that four years ago we should have thought abnormal are now being accepted as the accompaniment of everyday existence, but it would not be right to accept the results of the year's work of the Corporation without reflecting what has gone to their making, in extra strain and exertion on the part of all those who remain with us and have contributed to them. Like everyone else, we are working now with a very depleted staff, and this applies not only to the head office but to our branch offices both here at home and abroad. As a Corporation we are, as you know, with other companies acting as agents for the Government in operating both the War Risks Commodity Insurance scheme and the War Damage Act, Part II. The work on both these tasks grows no less, but we are further represented on local technical (fire prevention) committees, and on committees to assist the Ministry of Food in the salvage of food and feeding stuffs, while acting also on Board of Trade committees in the settling of claims under the War Risks Insurance Act, and helping in the war effort in many other directions.

In pre-war days our staff in the United Kingdom alone numbered 1,185, of which 839 were men. Of this latter number, 465 have been released for war services, which amounts to 55 per cent. of the pre-war number. From our foreign branches no less than 135 men are now serving in various capacities connected with the war. Many of our female staff have also joined the Services, and we recognise that those remaining with us are now undertaking many forms of work in civil defence in addition to their duties at the office.

These figures reflect the serious gap that now exists in our pre-war personnel and gives a vivid picture of the extra burden placed upon those remaining. I am grieved to say that up to the present we have received news that 20 have already given their lives for their country on active service, and in paying tribute to their memory we send our deepest sympathy to their relatives and friends. Four civilians among our number have died through enemy action and we equally mourn their loss. We remember also those who are posted as "missing," and those who, as prisoners of war, are undergoing the hardship and loneliness of captivity in enemy countries.

That is the price of war, but, bitter as it is, no hazard must stand in the path of victory.

I think we can all feel that the Royal Exchange and those who carry on its work are playing a direct part in helping on the country's cause, and while the role may be unspectacular, the general economic life

of the nation must be kept going, whether it be in business or elsewhere, and the call on those of us serving the Corporation at home is no less than it is to those who are upholding our cause abroad. But I should like to take this occasion, on your behalf, to express our great appreciation of the efforts that have been made this year by our general manager, the executive and staff, our local boards and agents both here and overseas, to the end that the affairs of the Corporation may prosper. I have no fear that if it is humanly possible to do so this record of service will be maintained, and provided no unforeseen misfortune overtakes us, that the future welfare of the Corporation and the safekeeping of its traditions, built up over 223 years, may be left safely in the hands of those who have produced the excellent results I have had the gratification of presenting to you today.

The Governor then invited questions from stockholders and, none being asked, moved: "That the printed report and accounts of the Corporation for the year 1942 be adopted."

Mr Charles L. Dalziel (the sub-Governor) seconded the resolution, and it was carried unanimously.

The proposed further dividend of 19 per cent., making 30 per cent., less tax, for the year, was approved.

The auditor, Sir Nicholas E. Waterhouse, K.B.E., was reappointed, and the proceedings then terminated.

NORTH BRITISH AND MERCANTILE INSURANCE COMPANY, LIMITED

DIVIDEND MAINTAINED

The one hundred and thirty-third annual general meeting of this company was held, on the 6th instant, in Edinburgh.

The following is an extract from the statement to the shareholders by the Hon. Arthur O. Crichton, the deputy-chairman of the general court of directors.

Life Department.—The net new business for 1942 amounted to £2,394,670, as compared with £1,945,348 for the previous year. Claims by death or maturity amounted to £2,317,640 after deducting re-assurances. Of this sum, £206,128 represents claims directly due to the war. The consideration for annuities granted amounted to £152,379 by single payment and £51,441 by annual premium.

Fire Department.—The premium income showed practically no change, while the loss ratio at 43.02 per cent. was higher by .37 per cent. Loss experience was again satisfactory both at home and from all main fields abroad. The underwriting profit of 8.19 per cent. compared with 7.66 per cent. for the preceding year. Net interest on investments increased by £6,260.

Casualty Department.—Our casualty business is transacted by the Railway Passengers' Assurance Company. The premium income was £63,966 less than in 1941, and the loss ratio at 46.37 per cent. was higher by 1.51 per cent. The underwriting profit was 13.07 per cent., compared with 12.67 per cent. in the previous year. Net interest was slightly down at £72,641.

Marine Department.—Premiums of the Ocean Marine Insurance Company, Limited, increased by £389,210 over the figure for 1941. Claims and expenses together were heavier in percentage. Net interest was £43,447, against £41,611. £100,000 has been transferred to profit and loss account from profits of past years now closed.

The combined underwriting profit, fire, casualty and marine, was £623,004 against £556,348 in the previous year, which under the continuing difficult conditions the directors feel the shareholders will consider satisfactory. We are recommending the same rate of dividend as last year.

LONDON ASSURANCE

SATISFACTORY YEAR'S OPERATIONS

The annual general court of the London Assurance will be held, on the 5th instant, in London.

The following is an extract from the statement by the Governor, Mr R. Olaf Hambro, on the report of directors and balance-sheet.

The life department new business for 1942 totalled £1,710,734, which represents a relatively substantial increase over that of the previous year. The premium income amounted to £863,078, and the fund as at the close of the year was £11,708,027, being an increase of £389,540 over that of the previous year.

The fire department premium income at £2,513,057 represents an increase of £67,128 over the previous year. Claims paid and outstanding show a ratio of 43.4 per cent. compared with 45.8 per cent., and commission and expenses of management are 48.9 per cent. compared with 49.5 per cent. The amount transferred to profit and loss account, after providing for the increase in the reserves of £26,851 for unexpired risks, is £164,226, or 6.5 per cent. of the premium income; a very substantial improvement over that of the previous year.

The accident department premium income at £1,362,661 shows a slight decrease of £23,751, which is remarkably small. The amount transferred to profit and loss account is £253,752, or 18.6 per cent. of the premium income, compared with 15.5 per cent. in the previous year.

The premium income in the marine department shows an increase of £1,163,547, the figure for 1942 being £2,627,400. After transferring £250,000 to profit and loss account, the marine fund stands at £2,421,874 compared with £2,087,179 brought in at the commencement of the year.

AGRICULTURAL MORTGAGE CORPORATION LIMITED

INCREASED FOOD PRODUCTION

The fourteenth ordinary general meeting of the Agricultural Mortgage Corporation, Limited, was held on the 29th ultimo in London.

Sir Harry Goschen, Bart., K.B.E. (the chairman) said that during the year just ended they had completed further long-term advances of £395,556, bringing their grand total of loans up to £14,293,083 secured on first mortgage of 962,560 acres.

He was glad to be able to report a further reduction of over 30 per cent. in the arrears of interest and capital repayments. More than 95 per cent. of the amounts which fell due during the year had been paid by March 31st, and the total of all arrears represented only slightly more than one-quarter of 1 per cent. of the aggregate of loans outstanding.

The farming year of 1942 was another year of triumph in the effort for increased food production. The total amount of human food produced from our land had been increased by more than 70 per cent. since 1939. Whilst harvest conditions were difficult in the west and north west, elsewhere what was probably the country's greatest harvest of all time was gathered with little loss.

As to the balance-sheet, cash and free investments now totalled over £3 millions, all of which was available for employment in long-term loans when the demand arose. They hoped that in the near future there might be many opportunities for the corporation to be of further assistance to the farming industry and that in the post-war planning of agriculture they might be enabled to fill to the full their main function of providing long-term credit to agriculture on the most favourable terms.

The report was unanimously adopted.

THE ALLIANCE TRUST COMPANY, LIMITED

APPRECIATION OF INVESTMENTS

STATEMENT BY THE CHAIRMAN MR JAMES PRAIN

The annual ordinary general meeting of the Alliance Trust Company, Limited, was held, on the 30th ultimo, at the company's office, Dundee.

The following is the statement of Mr James PRAIN (the chairman), which was issued with the report:—

It has been decided to discontinue for the time being the practice of issuing separately a report of the proceedings of the annual meeting: my customary review of the position of the company will not be addressed, therefore, to that meeting, but is submitted herewith along with the directors' report and statement of accounts. The proceedings of the annual meeting will be confined to the formal resolutions and to the transaction of any other competent business which may arise.

SATISFACTORY RESULTS

The results of the past year, as shown in the revenue account, do not call for much comment on this occasion. At our meeting a year ago I informed you of the extent of our interests in those areas in the Far East which were in enemy occupation. The figure I gave you at that time of the income we expected to lose in a full year was an amount equivalent to rather less than 2½ per cent. on the ordinary stock. The actual result shows that we have collected revenue during the year of £641,668, which falls short of that of the previous year by some £8,000, a reduction of less than 1 per cent. on the ordinary stock. It follows, therefore, our experience from our investments generally has been reasonably satisfactory, and this, together with a small improvement in the collections from the mortgage business, has served to mitigate the immediate effects on our finances of the military reverses in the Far East.

THE DIVIDEND

On the expenses side of the account the charge for income tax is somewhat heavier this year owing to the fact that in the early months of the previous year interest and dividends were still paid to us under deduction of tax at 8s. 6d. in the £, while in the period under review the standard rate of 10s. was deducted from us throughout. The result then is that there is available for distribution, after discharging our obligations to the holders of debenture and preference stocks, an amount equivalent to 36 per cent. on the ordinary stock. From this we have set aside £60,000 to the general contingent fund and we propose, for the sixth year in succession, to pay a dividend of 25 per cent. and leave a modest amount to increase the carry forward.

IMPROVEMENT IN STOCK EXCHANGE VALUES

A review of the conditions which have prevailed during the past year would not be complete without some reference to the very considerable improvement in Stock Exchange values which has taken place. The upward movement has been most marked in the last six months of 1942; in that short space of time a list of some of our representative industrial ordinary shares shows on the average a rise in market value of from 20 per cent. to 25 per cent. This movement has not been confined to ordinary shares; under a strong demand for stocks of any reasonable investment quality, debenture and preference stocks have also moved upwards but to a lesser extent. The scope for appreciation here is limited by the nature of the stocks and by the fact that in many cases adjustment to conform to the existing low rates of interest had already taken place to some extent. The effect of this general rise in values as applied to a varied list of securities, such as we hold

in this company, would show a very substantial improvement indeed overall, and therefore a considerable surplus over book cost. The precise figure is not of any great moment, for, as is being increasingly recognised, these Stock Exchange valuations, which are here today and gone tomorrow, are not of any permanent import. The true criterion of an investment company's position is its ability to earn and to maintain income at a reasonable level.

FACTORS AFFECTING THE SITUATION

I am not suggesting, of course, that nothing can ever be learned from Stock Exchange movements. In more normal times a major movement such as this would indicate confidence in a trade revival bringing in its train prosperity and increasing returns. A good example of this was in the year 1933, when after a long period of depression signs of trade revival were at last discerned and there followed a sharp and sustained upward movement on the Stock Exchanges comparable in extent to what has taken place in 1942. The appreciation which took place then in our investments was to us a matter of some significance, opening up as it did a prospect of a period of more satisfactory revenue collections, an expectation which was subsequently fulfilled. No such promise accompanies the buoyant markets of 1942. It is well known that the present situation has arisen from a combination of factors—the officially controlled rate of interest, the avenues for investment abroad not only closed but the traffic reversed by repatriation of large sums invested overseas—resulting in an investment demand of considerable volume.

THE OUTLOOK

The outlook—the immediate outlook—for our business remains little changed. Nothing comparable with the loss of our possessions in the Far East has occurred to affect us adversely in the current year. Some loss of revenue is bound to result from the redemption or conversion of debenture stocks by companies which can take advantage of the present low interest rates to arrange their borrowings on terms more advantageous to themselves. The effect of dwindling supplies in certain trades and the outcome of the policy of concentration which is now being applied to industry must also give rise to some uncertainties. But, broadly, the process of adjustment to wartime conditions is well on the way. The effect of the Excess Profits Tax is now known; the operation of this duty effectively prevents higher returns to the investor. I am hopeful, however, that our earnings in the current financial year will not be greatly dissimilar to those we now submit for your approval.

GENERAL CEYLON RUBBER AND TEA ESTATES, LIMITED

The forty-fifth annual ordinary general meeting of this company was held, on the 22nd ultimo, in London.

The following are extracts from the statement of the chairman, Mr J. Gilroy Annan, circulated with the report and accounts:—

It is satisfactory that the financial position is a strong one. All export coupon issues and operations necessitated under the Ceylon tea and rubber ordinances were eliminated as from June 1st last and the 1942 crops amount to: Tea 2,566,950 lb. and rubber 1,893,281 lb. The entire output of Ceylon tea and rubber is purchased at the basic rates on behalf of the Ministry of Food and the Ministry of Supply respectively. There will, therefore, be no further public auctions locally.

The estates generally are in good order, but the cost of production continues to rise, and it is impossible to make any accurate forecast of what costs over a given period will be, and estimates these days can only be considered as guides.

The report was adopted.

SELFRIDGE (HOLDINGS) LIMITED

CONSIDERABLY IMPROVED RESULTS

HEAVY TAXATION PROVISION

MR H. A. HOLMES'S STATEMENT

The annual general meeting of Selfridge (Holdings) Limited was held, on the 30th ultimo, at 400 Oxford Street, London, W. 1.

The following is quoted from the statement of the chairman, Mr H. A. Holmes, circulated with the report and accounts:—

Before attempting to review the figures, I would again emphasise that Selfridge (Holdings) Limited owns the share capital of Selfridges Limited, the separate company which was formed two years ago to operate the business.

SELFRIDGES LIMITED

The balance of trading profit of Selfridges Limited, after making full provision for depreciation of leaseholds, fixtures and plant and all other expenses, and after reserving £25,000 for deferred repairs, is £441,324 against £296,758. In this time of emergency it is not possible for us to undertake to the normal extent the outlays necessary under this heading, and in transferring £25,000 last year and a similar sum in the present accounts to reserve for deferred maintenance, we are only creating a fund which will eventually be required to undertake the arrears which, meantime, must be cumulative.

After deducting interest on debenture stocks, £55,802, and setting aside under the terms of the trust deeds £32,011 for the redemption of debenture stocks, the net profit for the year is £353,511, an increase of £150,541 over the figure a year ago.

RESERVE FOR TAXATION

The matter of taxation is one which has had to be very carefully considered by your board, as we recognise that the best qualified opinion has accepted the principle of making full reserve for all taxation liabilities arising from profits earned to date, although some considerable portion of such liability may not become payable for a year or so ahead. Owing to the method of computing income tax payable by new companies during their earlier years, and for this purpose Selfridges Limited is so regarded, it is, under prevailing rates of taxation, only possible to create a full reserve over a period. Therefore, after providing the sum of £180,000 for the estimated balance of taxation applicable to the year ended January 31, 1943, the directors have, in addition, set aside a further £100,000 to start a reserve for future taxation. This figure will not fully meet the estimated liability due on January 1, 1944, but it is a big contribution towards it and we hope to make up the full reserve as soon as practicable.

The making of these heavy and exceptional taxation appropriations has had the effect of reducing drastically the balance of profit available for distribution, which, after bringing in £24,970 from last year, amounts to £98,481. After declaring a dividend of 12½ per cent., less tax, requiring £62,500, which has been paid to Selfridge (Holdings) Limited, and transferring £10,000 to staff benevolent account, there remains a balance of £25,981 to be carried forward to next year.

PRUDENT FINANCE

It will be observed that the capital reserve of £1,074,639, which was created against the book value of freehold and leasehold properties, remains the same and that the further reserves consisting of sinking funds for redemption of debenture stocks, reserves for future taxation and

deferred repairs together with unappropriated balance of profit and loss account have increased during the year by £158,021 to £2,766. The prudent financial treatment of the profits to which I have referred, will, I feel sure, commend itself to you. I need not stress that a conservative policy is calculated to build up a position of strength which will when the war is over enable the business to face with confidence any conditions which may arise. The growing strength of our financial position is indicated by the large increase in the current assets which have risen from £1,092,297 to £1,422,606 against current liabilities of £505,586, which have only increased by £128,839. Current assets include stock in trade, which is again higher at £747,810 as compared with £523,812, and cash and investments which have risen from £447,336 to £588,899.

It is fortunate that my prognostications a year ago regarding the curtailment of supplies proved to be premature, but it is very evident now that this factor will become more serious for the remainder of the war period. It would not be wise, therefore, for us to anticipate anything but leaner times in the immediate future, but I have the greatest confidence in the post-war outlook, when not only current requirements, but much in the way of arrears of consumer goods, will have to be met over a period.

SELFRIDGE (HOLDINGS) LIMITED

Having dealt with the figures of the operating company and the special appropriations to the reserves of that company, the effect of the transfers has necessarily restricted the dividend paid to Selfridge (Holdings) Limited, although the net income from this source is more than doubled at £62,500 as against the corresponding figure of £30,000 a year ago. Inclusive of this dividend, the total income for the year is £79,975. After meeting the outgoings for ground rents, interest and other expenses as shown in the profit and loss account, amounting to £30,221, there is a net surplus for the year of £49,754 as against a comparable figure of £11,339. After adding the balance brought in from last year, £15,365, the sum to be dealt with is £65,119.

In accordance with the terms of the scheme of arrangement approved two years ago, 70 per cent. of the distributable balance (up to a maximum of £63,307 per annum) must be applied to reducing the amounts owing to the secured creditors. Accordingly £17,708 is allocated towards the redemption of the "A" secured income redemption stock, £5,312 towards redemption stock and £10,968 in reduction of mortgages, leaving a balance of £31,131, which the directors recommend be carried forward to the next account. I might remind you that when the balance of the "A" secured income redemption stock, which is about to be reduced to £82,292, is cleared off, the amount of income to be applied to repay secured creditors will drop, so that the maximum repayments in any one year will not exceed £29,974, against the present maximum of £63,307.

SHARES IN OPERATING COMPANY

The shares in the operating company appear at the nominal value of £1,000,000, but the real value will depend on future earnings, and even on the returns made during the last two years it would not be difficult to justify a much higher valuation. There is no change in the figure of £1,204,305, representing the properties forming the northern site, which must be regarded as a frozen asset during the war emergency period.

My references to the reserves in the operating company and the repayment of indebtedness by the parent company make it clear to stockholders that their capital position and future prospects have considerably improved during the year.

INTERNATIONAL NICKEL COMPANY OF CANADA, LIMITED

UNPRECEDENTED DEMAND FOR NICKEL

The annual general meeting of the International Nickel Company of Canada, Limited, was held, on the 28th ultimo, at Toronto.

Mr Robert C. Stanley (chairman and president), in the course of his address, said: At the last annual meeting I discussed at some length the expansion project which had been undertaken at an estimated cost of \$35,000,000 to increase our output of nickel in all forms by 50,000,000 pounds per annum over the 1940 production rate. I am pleased to report that this work is being promptly and satisfactorily completed and we are already producing nickel at the rate which was forecast last year. It is, moreover, gratifying to say that no financial aid from Government or from banks has been needed for this programme.

Distribution of nickel, now restricted to essential war uses, remains entirely under the direction of Governmental agencies. Heavy demand continues, and at times seems to be insatiable. The impression held by the public may be that an acute shortage of nickel has existed and still exists. The facts are that, while we have strained our production facilities to the utmost, essential deliveries of nickel have been made promptly, and no shut-downs of essential war production are known to have occurred due to failure of nickel supply. The situation in recent months has progressively improved, due to our increased output, to the accelerated return of nickel-bearing scrap to steel mills and to the constructive conservation measures which have been adopted by Governments and industry.

We continue to be the largest producer of copper in the British Empire and the world's largest producer of the platinum metals.

TAXATION AND PROFITS

Net profit after provision for taxes is \$33,301,829, comparable with \$34,356,401 in 1941. While the dollar volume of business in 1942 was only slightly less than the previous high figure of 1941, costs increased to an amount greater than could be offset by gains from operating efficiencies. The great increase in taxes is exemplified by a comparison with 1937, the most profitable year in the company's history. In 1937, when our average selling prices were higher and production costs lower, profit was \$60,650,514 before tax provision of \$10,350,890, whereas in 1942 profit was \$57,781,114 before tax provision of \$25,079,285. A comparison of dividends and taxes per share of common stock for the same years is even more striking. In the year 1937 shareholders received \$2.25 per share and tax provision amounted to 71 cents per share, while in 1942 shareholders received \$2.00 per share and taxes were \$1.72 per share.

POST-WAR POLICY AND PLANNING

At this time, with ultimate victory certain, we must further intensify rather than slacken our efforts to end the war. It is, moreover, the duty of industrial management to prepare now for the return of peace. This your company is doing, and I believe that our accomplishments during the war, coupled with intelligent planning at this time, foreshadow equally satisfactory accomplishments in the post-war period. One needs only to visualise the endless procession of trucks, tanks, planes and ships moving to the fighting front in order to realise the diversified usage of nickel in war material. The principal reason for this great demand for nickel is its intrinsic value as an alloying metal. More manufacturers are now using nickel than ever before and are becoming familiar with its qualities. It is quite probable that many war-time uses of today will become peace-time uses of tomorrow.

(Continued from page 566)

Silver and Platinum as War Materials

The British Government's request to the United States and Canada for lend-lease supplies of silver, discussed on page 502 in *The Economist*, on April 17th, suggests that the use of silver for industrial purposes is making progress in this country. So far the United States apparently continues to be the pioneer in this latest field of silver utilisation. The great bulk of the US Treasury's free silver stock has been assigned to the State-owned Defence Plant Corporation, which is using it for "non-consuming purposes" in war plant. This means mainly employment as "bus bars" and other concentrated electrical wiring in magnesium, aluminium, graphite, synthetic phenol, and similar works which are dependent on a regular and large supply of electricity. The silver thus employed frees large quantities of copper for munitions production, although the silver itself is not "consumed," and—being lend-leased only—will have to be returned to the Treasury after the war. In addition, the United States war industries have large supplies of silver available for "consuming purposes," i.e., for machine parts and alloys such as solder and bearing metals. Virtually the whole of the current United States silver imports are now being utilised for these purposes. In future imports are likely to be supplemented by a substantial part of the supplies of "domestic silver." Until last autumn all supplies of US domestic silver (which costs 71.11 cents per ounce, against 45 cents for foreign silver), had been absorbed by the United States Mint, but after the introduction of restrictions on the use of foreign silver in November, 1942, civilian users, despite the high price, absorbed the whole of the current output. Under a conservation order, introduced at the end of

February, the use of domestic silver for non-war purposes has been cut to one-half of the use in either 1941 or 1942. This measure, together with a further tightening in the restrictions for foreign silver, will, according to the War Production Board, allow the conservation of 25,000,000 ounces of silver per annum. These additional supplies will almost certainly be utilised for essential industrial purposes.

*

Besides silver, platinum has recently become an important war metal. As was pointed out on page 343 in *The Economist* on September 12, 1942, the United States Government last year imposed a strict control over platinum stocks and sales in order to prevent any supplies from falling into the hands of the Axis. This preventive measure has since the beginning of this year been supplemented by a general prohibition to use platinum, platinum-bearing metals, or compounds for jewellery purposes. Announcing that prohibition, the War Production Board stated that platinum is needed for many vital war purposes for which substitutes are not available, and that accessible supplies of platinum are "only just about equal to essential needs." As the jewellery trade has until late last year been the chief platinum-consuming trade, and accounted for over two-fifths of total consumption, the new order at once released substantial supplies of the metal for war needs. Moreover, current production of platinum is increasing with the growing Canadian copper and nickel output, which provides over one-half of the world's platinum supplies as by-product. (The main war uses of platinum were described in *The Economist* on September 12, 1942. In its announcement of the new conservation order, the US War Production Board referred to another vital war use, as wire in radio valves, and other communications equipment.)

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

BOTH before and after the holiday, turnover in the markets tended to contract, although there was a fair amount of speculative activity in home rail shares and diamond issues. Nevertheless, demand for stock was sufficient to raise *The Financial News* ordinary share index to a new peak at 98.5. The gilt-edged market was dull throughout, some selling after the holiday

of long-dated and irredeemable stocks reducing quotations, while short-dated issues were hardly steady. Almost the only feature of the foreign rail market was a general advance of around one point for Japanese bonds. San Paulo 7 per cent stock was prominent among Brazilian loans, and there was some support for Greek and Portuguese stocks. Speculative demand in the home rail market reached its peak before the holiday, but several advances were recorded later. On balance, GWR and LMS ordinary issues were outstanding, with advances of 2½ and 2½ points, respectively, while among the marginal preference issues Southern preferred rose 3½ points.

Argentine rail stocks responded on hopes of a revision of the exchange rate, debenture stocks rising a point and more, with smaller gains for the junior issues.

The industrial market was quiet, but not without interest. Brewery shares were firm, Meux and Ind Coope rising 1s. 3d., although Guinness lost 1s. Tobacco shares were virtually unchanged. Movements in the motor and aircraft section were irregular, Leyland, Albion and Bristol Aeroplane weakening, while De Havilland rose 1s. 6d. among several smaller gains. In the heavy industrial section, Whitehead Iron and Allied Ironfounders were prominent, but gains nowhere exceeded a few

COMPANY MEETINGS—continued

THE ROYAL LONDON MUTUAL INSURANCE SOCIETY, LIMITED

TOTAL INCOME EXCEEDS £10,000,000

The eighty-second annual general meeting of the Royal London Mutual Insurance Society, Limited, was held, on the 27th ultimo, at Winchester House, London.

Mr J. K. Wiseman, joint managing director, in presenting the directors' report and statement of accounts for 1942, said:— During the past year we have given every assistance in our capacity to the war effort, both as regards manpower and financially.

Our financial assistance to the war effort is represented by a subscription of £4,364,000 to War Loans. Our total subscription since the outbreak of war amounts to £12,000,000.

The total income for the year amounted to £10,150,000, an increase of £506,000. This is the first time our income has exceeded £10,000,000, and is another milestone in our history.

The combined premium income amounted to £8,179,000, an increase of £429,000 over the previous year.

The total claims and surrenders paid

during the year amounted to £3,646,000, and the amount added to the funds as provision for future payments was £3,853,000, these two items together totalling £7,499,000. War claims paid during the year amounted to £140,000, including £41,000 on the lives of civilians killed by enemy action. This brings the total war claims paid to £525,000.

The total claims already paid by the Society since its foundation now amount to £65,148,000. The total funds, which are required as part of the provision for future payments to policyholders, amount to £55,473,000.

The premium income in the ORDINARY BRANCH for the year (including consideration for annuities granted) amounted to £2,133,000, an increase of £105,000 over the previous year. The new sums assured amounted to £3,324,000. The amount paid in respect of claims and surrenders amounted to £1,253,000. The amount disbursed in surrenders showed a further reduction, a satisfactory feature reflecting present-day conditions.

In the INDUSTRIAL BRANCH the premium income for the year amounted to £6,045,000, showing the handsome increase of £356,000 over the previous year. Claims and surrenders amounted to £2,389,000.

The BALANCE-SHEET shows that the assets total £55,754,000, an increase of £3,848,000 over the previous year. Stock Exchange securities represent 78.2 per cent.

of the total, the remainder consisting mainly of mortgages, loans on public rates, freehold and leasehold properties and ground rents. The report and accounts were unanimously adopted.

GENERAL ACCIDENT FIRE AND LIFE ASSURANCE CORPORATION, LIMITED

The annual general meeting of the General Accident Fire and Life Assurance Corporation, Limited, was held, on the 28th ultimo, at Perth.

Sir Francis Norie-Miller, Bt., presided, and the following are extracts from his statement circulated with the report and accounts:—

The satisfactory results demonstrate the strength of the foundations upon which our great company is built. We propose adding another 2s. 6d. per share to the paid-up ordinary capital, making the total share capital £1,500,000, and I hope it will be possible to make the shares fully paid in the future. We have a general reserve of £2,000,000. We have also an investment reserve of £988,000. We have a staff pension fund of almost £600,000, £100,000 provided for war contingency reserve, and specific reserves in the departments of over £17,000,000.

The report was adopted.

New York

pence. Among textile stocks, Courtaulds and Patons & Baldwins advanced 1s. 3d. and 2s., respectively. Apart from a fall of 1s. 7½d. for Cunard ordinary on the chairman's statement, shipping shares lacked interest. Elsewhere, Cable & Wireless ordinary advanced strongly on hopes of an increased distribution and despite later profit-taking rose 5 points on balance. London Brick and United Glass Bottle were also prominent with gains of 1s.

Speculative interest at the Cape was transferred from *kaffirs* to *diamond* shares. Recent results occasioned a strong demand for De Beers, the ordinary rising 1½, and for Consolidated Diamonds, which rose 5s. 6d. Apart from some buying of Blyvoors, interest in gold shares declined, many of the Rand dividend-paying issues weakening on doubts regarding the coming payments. Rubber shares were steady, and there were several gains for leading Indian and Ceylon tea shares. Oil shares were neglected, but quotations for leading issues were virtually unchanged on balance. A minor feature was a gain of 10½d. for Canadian Eagle.

COMMODITY AND INDUSTRY NEWS

Machinery, Plant & Appliances.—Under the Machinery, Plant and Appliances (Control) (No. 4) Order (S.R. and O., 1943, No. 536), which came into force on April 19, 1943, a new class embracing certain apparatus for the projection of still pictures is added to those already listed in the previous Order (S.R. and O., 1942, No. 2487) and certain of the classes already listed are amended. In particular, the range of electrical machinery and plant previously licensable has been changed, mainly by restriction. Much of the matter thus decontrolled by the Board of Trade is licensable by the Minister of Supply under the Control of Industrial Electrical Equipment (No. 1) Order, 1943 (S.R. and O., 1943, No. 533), in force on the same date.

Retail Furnishing Wage Increase.—The National Joint Industrial Council for the Retail Furnishing and Allied Trades has decided to increase minimum weekly rates of wages, as a result of an application by the workers' side. For branch managers and manageresses the increase is 4s. a week where the weekly trade is under £150. Where trade is between £150 and £200 the increase is 5s. weekly. All other male employees are to receive an extra 2s. to 4s. a week, according to age, and the corresponding rise for women will be 1s. 6d. to 3s. a week. The increases begin on the first pay-day after April 26th.

Toilet Preparations.—A general licence (S.R. and O., 1943, No. 575) dealing with the use of petroleum products in the manufacture of controlled goods has been issued by the Board of Trade under the Toilet Preparations Order, 1942. Hairdressers who made toilet preparations before October 1, 1941, and are not registered in Part I of the Toilet Preparations Register may now make up for use in their saloons only small quantities of liquid petroleum products which were purchased before January 1, 1942. This concession refers only to stocks of liquid petroleum products not exceeding five gallons. Individual

DESPIITE occasional speculative support, quotations and, particularly, turnover fell away steadily on Wall Street, prior to the Easter holiday. Immediately after, however, on the belief that the recent decline had completed the readjustment of quotations, the market rallied strongly. The war news provided an additional stimulus, speculative and investment support resulting in numerous advances, many of which were later reduced by intermittent profit-taking.

ISSUES TO SHAREHOLDERS ONLY

Brown (E. G.) and Co., Ltd.—Subject to sanction at an extraordinary general meeting on May 7th, the directors have decided to issue 1,000,000 ordinary 2s. shares at 4s. 6d. per share, to rank *pari passu* with existing shares, payable in full on application. These new shares will not be entitled to participate in the interim dividend of 10 per cent, payable May 4, 1943.

F. Francis and Sons.—Issue of 50,000 5½ per cent cumulative preference shares £1 at par to rank for dividend as from April 30th, and *pari passu* in all other respects with the existing preference shares.

and maintenance was £7,000 per year for a 100,000 spindle mill. The demand for more favourable terms resulted in the sum being raised to £10,000. The owners of the closed mills are still dissatisfied, and recently they discussed with the Master Spinners' Federation the making of an application to the Board of Trade for an increase to £12,500 a year. The owners of many mills agreed to support the claim, although not unanimously. Recently the financial position of some nucleus concerns has been adversely affected by increased expenses due to higher wages and costs; some cases have been reported of yarn production being affected by the labour situation. It is widely recognised that the chief difficulty for stopped mills will be re-starting at the end of the war.

THE UNITED MOLASSES COMPANY, LIMITED

NOTICE TO STOCKHOLDERS.

Owing to circumstances beyond the directors' control,
 publication of the accounts of the company for the year
 ending 31st December, 1942, will be delayed, and the seventeenth
 annual meeting of the company will therefore be postponed to
 such time as the accounts are available.

In the circumstances the directors, at a meeting held to
 declare a Second Interim Dividend of 12½ per cent (actual)
 income tax, together with a Cash Distribution of 2½ per
 cent (not subject to income tax) out of Capital Reserve payable
 on the 14th June, 1943, to the holders of the £1,954,500 Ordinary
 Stock in the capital of the company entitled to participate
 therein registered in the books of the company as at 7th 3
 1943.

It is not the intention of the directors at the annual gen-
 eral meeting to recommend a further dividend for 1942.

The Registers of the Ordinary Stock will be closed from
 7th May, 1943, to the 21st May, 1943, both dates inclusive.
 Dated this 27th day of April, 1943.

By Order of the Board.

A Hungry World

THE conference on food problems which is to assemble
 in the mountains of Virginia in a few days' time
 said to be a meeting of experts, not of plenipotentiaries.
 is not, moreover, to deal with actual and impending
 problems, with wartime food supply or with post-
 war relief, but to confine itself to matters of the
 longer term. For both these reasons, it would perhaps be
 wrong to expect too much by way of precise and im-
 mediate results. The conference will be provisional and
 exploratory—and for all the natural impatience in all
 countries, it could hardly be otherwise. But in another
 sense it is right to have the highest expectations from
 the first of the post-war conferences. Material abundance,
 and especially material abundance of food, takes its place
 with liberty of the spirit as the two great boons that the
 United Nations can offer to suffering humanity. There is
 democratic monopoly of order and security—indeed,
 the totalitarians have hitherto been more successful than
 the free nations in providing at least the illusion of these.
 at none of the totalitarians can safely offer to make
 men's minds free or their stomachs full. The conference
 at Hot Springs is the first shot in the counter-offensive
 against the hunger of the world; if it does not record some advance,
 it will prejudice the whole of the larger cause.

It is, of course, impossible to keep the present entirely
 out of discussions about the future. The food situation
 of the world is not such that, as soon as the fighting
 stops and transport is available, it can snap back to
 normal. The war has increased the production of some
 kinds of food (usually the wrong kinds) in some places
 (usually the wrong places) and reduced production else-
 where. If the war were to stop to-day, there would be
 plenty of cereals, but grave world-wide shortages of live-
 stock and dairy products, oils and fats. The effects of
 these disturbances will last long after the war, and even
 beyond the relief period.

It is not very easy to cleave through the thicket of
 expedients to which Governments have been forced and
 to reach the first principles of the matter. But when they
 are reached, they are clear enough. This is still a very
 hungry world; the globe does not yet produce enough
 food of the right kinds to provide a sound diet for more
 than a fraction of its human inhabitants. Yet, on the
 other hand, agricultural producers the world over are
 in need of protection against conditions of glut. There
 is nothing new about the existence of this paradox;
 Shakespeare knew of a farmer who hanged himself in the
 expectation of plenty. It is the familiar paradox of bound-

matter has not yet drifted as far as this, but there can be no doubt that this may be its dangerous direction.

What can be done? It is a shared responsibility. It is the duty of Britain and America, as counsellors at once detached and vitally concerned, to put forcibly before the Soviet and the Polish Governments the fundamental implications of their dispute. Mr Eden has given the welcome news that the British and American Governments are working in complete unison in this matter. They must be prepared to rival the patience of Job and the persistence of the importunate widow. To the Russians they have to bring home the fact that the decisive contribution can only be made by the Soviet Union. It is a question of leading from strength. Everyone knows—including the Russians—that, after the victory has been won, they will have the physical power to impose any solution they choose in Eastern Europe. They could choose certain forms of action—for example, the creation of a Soviet Poland—which would irrevocably break up the promising partnership which the war has brought. But there is no reason to suppose that Russia would be immune from the otherwise universal rule that the incorporation of dissident minorities is a source of weakness not of strength. In the long run, Russia's security in the west will be better assured by a Good Neighbour policy than by any "realist" devices. It is a question not of power but of confidence and of the value the Soviets set on enjoying the trust of the world.

It will not be very difficult for the Soviet Government to begin the reconstruction of confidence. Stalin has taken the first step in his letter to the *Times* Correspondent in which he unequivocally repeats his earlier guarantee—that Russia wants to see a strong independent Poland established, and to enjoy neighbourly relations with it. The next step would be to restore diplomatic relations with Poland, another to agree to a postponement of all frontier adjustments until the war is won, another to invite General Sikorski or some leading Pole to a discussion in Moscow on all questions touching the relief or evacuation of Polish citizens in Russia. The Soviet Government could do this without loss of prestige because prestige is a question for the weak, not for the strong. It could not be imputed as weakness to a country with the defence of Stalingrad and Sevastopol to its credit that it treated generously a powerless and persecuted neighbour.

It would be the task of Polish statesmanship, backed by British and American diplomacy, to see that generosity on Russia's part met with an immediate and sincere response. So long as any doubt remains about the Soviet Union's ultimate intentions, it is difficult to ask the Poles to abate their fears and drop the intransigence the fears have bred. If Russia's intentions are clear,

then there can be absolutely no excuse for imperilling the free future of the Polish nation by persisting in grandiose schemes for dominating non-Polish peoples. The Poles' securest hope for future freedom is an internally harmonious Poland enjoying complete sovereignty and independence and linked to the Soviet Union by the kind of special friendship which after this war should unite Britain to the Low Countries or America to the Caribbean States. Such a Poland could be a pillar of a durable European order. A Poland weakened by dissident minorities and hostile to both its Russian and its German neighbours would be a menace both to Europe and to itself. Britain and America have the same responsibility here to make their position clear. Many Polish extremists are relying on the hope of Anglo-American support in pressing for an aggrandised Poland; yet if Poland's independence were threatened in the future, the Western Democracies' military problem in going to Poland's defence would be formidable enough. It would be impossible to persuade either the British or the American people to try to solve it, if Poland's frontiers were not fixed on a mutually agreed basis.

General Sikorski, in his broadcast commemorating Poland's National Day, repeated the assurance that

It has always been and will continue to be one of the main guiding principles of the Polish Government and the whole Polish nation to secure friendly relations with Soviet Russia; therefore, the facts which are separating us must be removed as soon as possible.

This is the statesmanlike approach and, provided always that Russia makes its contribution, the honesty of Poland's desire for good relations could be usefully demonstrated by changes in the Polish Cabinet designed to strengthen the conciliatory tendency—for example, those responsible for the appeal to the Red Cross should go at once; by a vigorous drive to put an end to tendentious pamphleteering; and by an official statement which agreed to postpone the discussion of frontier questions and stressed the Polish Government's desire for a friendly and moderate solution of all matters in dispute.

Only in an atmosphere of restored confidence will it be possible first to postpone the consideration of the very involved question of the Russo-Polish frontier and later to settle it along lines agreed to by both Governments. Restored confidence must therefore be the first aim of Anglo-American diplomacy. But they can contribute more than their good offices. The increasing weight of their attack on Germany's European citadel has already earned the warm appreciation of Stalin. As the attack broadens and intensifies, growing confidence will be created at the highest level. From there it must seep down through the whole structure of the Grand Alliance.

Trade Union Turning-Point

MR BEVIN'S warning to trade unionists, at the Scottish TUC last week, that they should not demand a complete restoration of their pre-war rights and privileges after the war, if they are to retain the benefits they have gained during the war, is a signal for the trade union movement to take stock of its present position and future perspectives. The unions have grown enormously in strength and in influence since the war. Their present membership is already approaching the peak of eight millions reached in 1920. Their association in the conduct of the war has been developed at every level of production, and the Prime Minister recently set a precedent by conferring directly with the representatives of mining and shipbuilding workers. The difference in the attitude of the workers as a whole towards the present and the last war is seen in the fact that five times as many working days were lost through strikes in 1918 as in 1942.

It is worth stressing this difference between the two wars, if only for the reason that it might otherwise be taken for granted. It is sometimes assumed

that because labour has co-operated to the full in wartime, co-operation will automatically be carried over into the post-war period. The 120 industrialists in their plan for future policy expressed the hope that the employer-trade union partnership would develop after the war, though they relegated labour to the position of a very junior partner. Many of the union leaders are also thinking in terms of co-operation, though there is, of course, a difference of emphasis. Mr Bevin himself has admitted that the unions "have now become an integral part of the state," and that this participation in government must be expanded. Obviously, the spirit of co-operation is welcome. Equally obviously any tendency in this direction that led to the abuse of any advantageous position, or to the restriction of productive forces by sectional interests must be guarded against, in the interests of the consumer.

Most of the schemes for joint consultation evolved during the war are designed to terminate at the end of hostilities, when their immediate object of maximum production for winning the war will have been achieved.

Will there be the same incentive for co-operation after the war? Will there be the same unity of purpose? Will not the employers tend to drift back into their natural habit of maximising profits, and the unions to their old, sectional attitude—neither regarding the interests of the community? Already a Tory offensive against the progressive features of the Government's labour policy, in particular against Mr Bevin and Sir Stafford Cripps, is gathering momentum; and, at the other end, labour is using its strong bargaining power and the absence of any Government policy to secure advances in wages.

There is, however, general agreement that, whatever the future may hold, there can be no return to the *status quo*, and that new problems and new situations will arise which may profoundly affect, not only the mutual relations of the two sides, but their internal policies. The TUC publicity officer, Mr Herbert Tracey, wrote in an article on "Trade Unions and the Future" (*Left News*, January, 1943):

The unions will probably find it necessary to adapt themselves to circumstances in which their traditional methods and aims will have become partially outmoded.

Collective bargaining, protection of their members' rights and standards, the organisation of friendly society activities—these have necessarily been the main preoccupations of trade unions in the past. Mr Tracey even fears that a comprehensive system of state insurance, such as the Beveridge scheme, "may conceivably weaken the incentives to trade union organisation." This view, which is surely an admission of the defensive rôle of the unions, is not borne out by the experience of the war, when an increase in trade union organisation has coincided with a great decline in the importance of the unions' friendly society side. Immediately after the war, the country will be faced with problems of demobilisation, reinstatement and the transition from a war to a peace economy. If the transition is to be smooth and if the aim of post-war society is to be full employment, it is clear that the unions should adopt a positive and co-operative, rather than a negative and defensive attitude.

Sir William Beveridge has given as one of the essential pre-requisites of the fulfilment of his assumption C—the maintenance of employment—the "mobility of labour"; the adoption of any form of national planning would necessitate flexibility of all productive resources, not least of labour. This means mobility between industry and industry as well as purely physical mobility. Even geographical mobility of labour may create difficulties: the schemes for settling unemployed men on the land during the 'thirties were far less successful than those for bringing new industries to depressed areas. But the early stages of the war showed that labour was highly sensitive to expanding employment opportunities—indeed, it became necessary to impose the Essential Work Order to prevent excessive mobility. The development of new techniques and materials, the changing boundaries of industry, the fluctuations in demand among consumers whose purchasing power is rising and who have margins to spend on non-essentials: these factors will necessitate a greater interchangeability of workmanship. Will the trade unions resist or assist this process? Will the old craft traditions impede flexibility? This is indeed no new question. The Luddites who smashed machinery were only acting in self-preservation. But if a genuine level of full employment is attained, the displaced worker need have no fear of the Damocles sword of unemployment over his head; he will know that his labour can be swiftly absorbed elsewhere. What he will want to know is what wage his labour will command. The trade unions have assisted flexibility and mobility during the war by agreeing to dilution and the introduction of women; if they are to assist flexibility after the war, they will want some safeguards. At the same time, as Mr Bevin pointed out, labour has won many advantages since the war and if these are to be retained, the unions should not insist upon an "ad lib restoration" of their pre-war position. It is in any case unlikely that they would get it: the experience of the last war showed that the complete restora-

tion of pre-war practices could not be expected, in spite of statutory enactments. The question is, what will the unions demand as a *quid pro quo*? They will probably seek some form of guaranteed working week and from the point of view of their own organisation, they might well demand the repeal of the Trade Disputes Act, 1927—the Post Office workers, at their annual conference, have set the pace by asking for affiliation to the TUC, in defiance of the Act—and legal recognition, such as is afforded to United States trade unionists by the Labour Relations Act.

Many plans are being worked out for extending training facilities after the war. The White Paper on recruitment and training for building provides an example which could be followed by other industries. The Tomlinson report on rehabilitation, though it deals only with disabled persons, suggests an extension of training and resettlement facilities which might be applied in a broader field. The TUC has always attached great importance to training and rehabilitation schemes, but no indication has been given of their attitude towards such schemes in relation to the unemployed. Hitherto training camps for the unemployed have been regarded with nearly as much hatred as the means test. Sir William Beveridge abolishes the means test, but he imposes a training condition upon the receipt of unemployment benefit—one of the few proposals of the report which the Government has unreservedly accepted. This is a matter on which it is vital to know trade union opinion.

The trade union movement is of uneven and piecemeal growth and, as a result, its structure is extremely diversified. Over two-thirds of the unions in 1941 consisted of less than 1,000 members, while over half the total membership was concentrated in fourteen large unions, dominated by the Big Five—the two general workers' unions, the engineers', railwaymen and miners' unions. There is a great deal of overlapping and competition, and charges of "poaching" members are frequently heard. No fewer than 52 separate affiliated unions cater for cotton workers, while the building, woodworking and furnishing group comprises 20 different unions. A motion by the National Union of Railwaymen at the 1942 Trade Union Congress, calling for a review of the structure of affiliated unions, in order to eliminate overlapping, sectionalism and diverse policies within an industry, was opposed by Sir Walter Citrine on the ground that it would interfere with trade union autonomy—it would, incidentally, also deprive a great many officials of their jobs. But, in spite of their defeat, the desire of some unions for more unification and rationalisation has not been appeased, and has recently been given concrete expression. The three unions representing the railway workers have taken a practical step in this direction by formulating a collective wage claim, and have formed a joint committee to promote closer co-operation; the engineers' wage claim was presented collectively by forty unions; and support for the idea of a national miners' union is growing. Another recent development which may be significant for the future is the growth of trade unionism among professional workers, such as technicians, scientists and managerial staffs. The danger that amalgamation or federation might lead to an increase of bureaucratic control or lessen the democratic basis of individual unions could probably be averted by a strengthening of the local or workshop units. The Amalgamated Engineering Union provides an example of a union which, though large, is thoroughly democratic in its constitution and practice.

These trends in the trade union movement are undoubtedly healthy, and it is essential that the new spirit should not be frustrated, either by the Government making promises which it cannot fulfil, as in the last war, or by the union leaders failing to give a constructive lead. At the same time the unions must use their strength and vitality to contribute to the best advantage of the nation in peace, as they have done in war. The path which organised labour will choose will, to a large extent, be determined this year, at the Labour Party's Whitsun conference and at the TUC in September.

Russia's Trade—III

THE crucial factor in all trade agreements made with Russia is the state monopoly of foreign trade which gives Russia in many respects an altogether exceptional position. All commercial relations with foreign countries are to all intents and purposes concentrated in one authority; and they are centrally and directly co-ordinated with the state's monetary policy. The familiar conflict between the interests of exporters or importers and those of the national currency is ruled out. As long as foreign trade in other countries was regulated by the automatic gold mechanism, the Russian system appeared to business men and economists in other countries as a challenge to all accepted methods of trading. But the contrast is not now so marked. Changes have taken place in other countries as well as in Russia. After the Great Depression foreign trade was everywhere more and more subjected to national control. True, differences in the degree, form and method of control, which varied from country to country, remained very substantial. But there was no great basic contradiction between the Soviet pattern and the various methods of restriction adopted elsewhere in Europe based on quotas, licences or bilateral agreements. After this war the debtor nations will of necessity have to keep a close hold on the movements of their foreign trade. State intervention in foreign trade will be widespread. What will matter most will be the policy underlying this intervention, whether it is expansionist or restrictive. The Soviet monopoly of foreign trade, similarly, is only an instrument of policy. In the past it has served autarky; there is no reason why it should not be used differently in the future.

The monopoly of foreign trade in Russia is now based on the state's management of industrial production. This was not so when the monopoly was introduced. During the period of the New Economic Policy, the Russian economy was split into two rival sectors: one was private, the other one state owned. The Government's trade policy had to counter the danger that the private sector might by trading with the outside world become the stronger. The state monopoly of foreign trade was thus a weapon in an internal economic struggle. But after the liquidation of the NEP—and of the private sector—that function disappeared. The monopoly is no longer a political device to defend a heterogeneous and incoherent structure against the "disintegrating influence of a hostile environment." State trading is simply the instrument of a state economy.

The topical question of how far this monopoly of trade could be fitted in with either of the two Allied currency plans now under discussion cannot be definitely answered. On the face of it the British scheme for an international Clearing Union makes no controversial demands on the Soviet trade system. The advantages of a multilateral settlement of balances are the same for Russia as for any other country; and they require no drastic adjustments by Russia. The principles of the British plan are:

There should be the least possible interference with internal national policies, and the plan should not wander from the international terrain.

The technique of the plan must be capable of application, irrespective of the type and principle of government and economic policy existing in the prospective member States.

The management of the Institution must be genuinely international without preponderant power of veto or enforcement to any country or group.

The feature of the British plan which is to some of the critics objectionable—the scope which it leaves for the regulative functions of the member states—makes it the more acceptable for Russia. In contrast, the American plan for a World Stabilisation Fund would require radical alterations in the Russian organization of foreign trade; and the "preponderant power of veto," invested in the holder of 20 per cent of the shares of the Stabilisation Fund,

inevitably invites strong Russian opposition. In other respects, however, which have no bearing on the monopoly of foreign trade or on the Russian currency system, the American plan might appear more attractive to the Russians. Among the debtor countries Russia is at present the only country with a considerable gold reserve. Russian gold production in 1938 amounted, according to League of Nations estimates, to about 12-13 per cent of the world's output. It has almost certainly increased since; and it has probably not been cut down in wartime. The importance attached in Russia to the accumulation of gold was, of course, not due to any gold orthodoxy. The metal was kept as a prospective war chest; but as Russia entered the war when Lend-Lease was already in operation it has not all been spent. The gold reserve may therefore help Russia to tide over the first period of disequilibrium in the balance of payments after the war; and it may very well influence the Soviet approach to currency problems. The important technical point, in which the British plan would need a modification from the Russian point of view, is the calculation of the quotas assigned to member states. If a country's share in total trade is accepted as the basis for that quota, then the credit facilities open to Russia would be very small indeed. The provision in the American plan, by which the quotas assigned would be related to gold holdings and national income as well as to foreign trade, is obviously better suited to the Russian interests.

But for Russia, perhaps more than for any other country, the main and the most complicated issue is not the currency problems associated with the short-term balance of payments, but the problem of long-term credit. Russian reconstruction after the war cannot be based on a conversion from autarky to large-scale international trading without the export of long-term capital to Russia, a feature which was almost entirely absent in the post-revolutionary era. The export of capital can, in theory, assume the form of industrial investment in Russia along the lines of the famous plan of "concessions" suggested by the Soviets more than twenty years ago. At that time the plan failed, mainly for political reasons. After this war, the return to some such conception would present undoubted advantages—from a financial point of view. The import of plant and machinery working for foreign concessionaires might help to speed up reconstruction and economic development without adding any substantial burden to the Russian balance of payments in the years immediately after the war. But the economic and political difficulties of this arrangement seem to overshadow its financial convenience. In the conditions of NEP, the foreign concessionaire could still find some elbow-room for business in a relatively free market. Within the framework of a planned economy that elbow-room is, to say the least, extremely limited. The foreign investor would have to adapt himself to the difficult atmosphere of total state control. On the Russian side, ideological considerations and national pride are certain to militate very strongly against this form of economic co-operation. Whatever may be said about the desirability of the international movement of capital, the fact remains that Russia is, by the force of its internal economic system, most likely to remain more or less closed to foreign industrial investment.

Thus, practically the only form of capital export to Russia which seems feasible is that of long-term loans granted to the Government in order to enable it to even out the incidence of massive relief and reconstruction imports over a period. It is clear that this form of capital exports depends primarily upon the creditor's trust in the debtor. The issue is therefore essentially a political one. It depends entirely on the degree of political confidence between the principal partners of the Alliance; and to the building up of that confidence all the interested sides have still to make their decisive contributions.

NOTES OF THE WEEK

The Citadel of Monopoly

Sir Percy Harris, in a speech at Manchester last week, called for a committee to investigate the growth of "combines, trusts, cartels and other organisations in restraint of trade." The case is certainly made out. The growth in all these forms of monopoly since 1932, and especially since 1939, has been menacingly large, and there is all too much reason to fear that the return of peace will be a signal for a further enormous advance against the freedom of British enterprise. It is in the nature of the case that the facts should be hard to come by in the first place, and that any private attempt to collate them should be beset by the perils of libel. An official committee, or even a Royal Commission, which can call for evidence on oath, is very badly needed, if only to let the public know what is happening. There is, however, one danger that should be guarded against. Combines, trusts and formal cartels may be the foundations upon which the existing state of affairs has been built. But the central stronghold of monopoly, and the most insidious danger, lie in the trade association. As the result of a decade during which it was possible to secure a closed market by Government intervention, the spirit of enterprise has been so discouraged that it is more profitable to combine to the disadvantage of the consumer than to compete in efficiency in his service. If there remain in a trade men of energy and good will who are not open to persuasion, it is usually not difficult to compel their co-operation in the conspiracy. This is not a fancy picture. It is—and if nothing is done, will be—the normal state of all British trades and industries. A restrictive trade association is far more noxious than an outright monopoly. In the first place, the monopoly has at least the chance of securing technical efficiency, while the restrictive trade association is, almost by definition, a conspiracy of the inefficient. And, secondly, while the monopoly is obviously suspect, the new feudalism of the trade association can be dressed up in such specious phrases as the "self-government of industry" (the old feudalism might as well have been called the "self-government of the landlords"). This is not to say that straight-run monopoly may not be dangerous. But if there is to be an inquiry, and if there is to be an attempt by the state to protect the community's rights—and there should be both—let them not forget the trade association.

Design for Gilds

The trade associations are busy bodies. Nowhere is planning for reconstruction being more actively pursued. One after another they produce, usually in the relative seclusion of the trade press, their projects for post-war trading; and in every case the pattern is the same—the old-style gild in modern dress. The latest example is the programme of the leather goods trade. Before the war, it seems, according to a memorandum submitted to the Council of the National Leather Goods and Saddlery Manufacturers' Association, the consumers of leather goods were too powerful: "big buyers dictated the price at which goods should be produced and the terms on which they should be supplied"; there was "a lack of unity on the part of manufacturers"; and there was "price cutting." In the war, the balance of power has apparently altered. Manufacturers of leather goods have banded together "in a manner never known before." The post-war aim of the trade is to preserve this united front; to "persuade" the entire industry to join the trade association; to prohibit entry into the trade except by licence; to enforce "a common code of trading"; and to "reach an agreement" with the main retail associations. Here are the outlines of a tight little monopoly by which the prices and conditions of sale will be determined by the producers' organisation. The usual appeal is made to employees. Only the non-competitive organisation of manufacturers, it is argued, can guarantee proper wages. The whole paraphernalia of gild organisation is envisaged, with compulsory apprenticeship side by side with "just prices" and "just wages." The frightening thing is that every trade is quietly making plans of this kind; and the consumer's only hope, against this restrictive wave, is that the Government may, by anti-trust and anti-monopoly legislation, put all these plans out of court at a single stroke.

Power to Bind

The Report of the Comptroller and Auditor-General for the financial year 1941-42 on the Appropriation Account of the Ministry of Supply for that year is uncommonly illuminating on the fixing of steel prices. In 1932 a policy of price regulation was instituted

aimed at maintaining a stable level of prices under fluctuating conditions of trade and so framed as to give a reasonable return on capital at a normal average rate of production somewhat below the full capacity of the industry.

Prices were, in effect, fixed by the industry's own Federation and approved by the Import Duties Advisory Committee; and the fact that British steel prices, just before the war, were something like 50 per cent above prices elsewhere speaks for itself. In September, 1939, the steel industry came under statutory control, and the Ministry of Supply made orders fixing maximum prices. There was no break, however, in the continuity of personnel or of practice, for the Ministry's Control was drawn from the industry and the Iron and Steel Federation. It would be wrong to suggest that control prices have been pushed up by this arrangement. Indeed, they are at present stabilised as at November 1, 1940, in face of rising costs. Plainly, too, the exigencies of war put an end straightway to the pre-war policy of restriction, and output rose to record levels. What has happened is that the pre-war technique of price maintenance has been perfected. In wartime, it is necessary to maintain in production firms whose costs are higher than those of the more efficient firms—the precise objective sought by the Federation (and indeed by all such trade associations) in peacetime, for other reasons. High-cost producers are maintained by grants from a fund levied on all producers by the British Iron and Steel Company, the trading body of the Federation, and these levies are included in the control prices. It is, of course, the Government who, as the chief consumer, pays these prices.

As a result of these control prices [the Comptroller and Auditor-General says] the industry as a whole appears to have obtained a higher rate of profit than that normally allowed under the Ministry's costed contracts.

All this bodes badly for the future. Consumers of steel would do well to study this report. Nothing could be more crippling to the establishment of high domestic activity and the restoration of overseas trade after the war than the continuation into the peace period of this, *imperium in imperio* which, born under State auspices in a period of depression, has grown to maturity in a period of war.

The Nation's Shelter

There were two remarkable debates in Parliament on Tuesday. Both the Commons and the Lords discussed housing; and, as the Minister of Health said in the Lower House, "the most intense feeling" was shown. In a single

day, housing took an equal place beside social security in the schedule of parliamentary priorities. Two demands were made: one that more accommodation should be provided now, despite shortages of labour and timber, especially of labour; and the other that this time the right decisions should be taken before the war is over about the finance, design and lay-out of post-war houses. The present wartime priorities were strongly attacked. Lord Beaverbrook in the House of Lords asked for 30,000 instead of the promised 3,000 agricultural cottages. The charge that the Service departments consume an undue proportion of labour and materials was made in the Commons as well; it was even suggested that war workers should be huddled like troops. During the war there is overcrowding because of evacuation, the transfer of workers, bombing and the cessation of building. When the war ends, there will be more overcrowding when the population moves back home. The task of the Government is to ease the present strain and make ready for the post-war rush. It is probable that, in view of crucial war needs at this climacteric of the conflict, the Government could not devote appreciably more labour or materials to building and repairs; but it is very doubtful whether what can be done is being done with sufficient determination and expedition. It is unfortunate for the solution of both present and future problems, that housing should be the concern, in one way or another, of some six Ministries. The tri-partite division of functions between the Ministry of Health, responsible for housing, the Ministry of Works, responsible for building, and the Ministry of Town and Country Planning, responsible for the control of land use, is evidently not conducive to speed or decision. While the war is on, every effort should be made to make use of every inch of available accommodation without delay or debate; and there is a point at which the running down of capital assets represented by the restriction of repairs and maintenance is directly and immediately injurious to the war effort itself. Overcrowding will tell on the health and morale of the population as well as upon its productive efficiency. After the war the proposed programme to build millions of houses will be largely abortive as a solution to the basic problem of squalor if decisions are not taken now to ensure that the houses built will be of the right kind, at the right price and in the right place. The feeling shown by the Commons and the Lords on Tuesday may spur the Cabinet and the Departments to set about these tasks somewhat more manfully and more effectively than has so far been the case.

Defence and Attack

In the last three weeks there has been a succession of Allied offensives on various sectors of the Tunisian front. The period started with an offensive by the Eighth Army which lasted from April 19 to April 23; this secured local successes, but was halted north of Enfidaville. Then the centre of gravity moved to the sector held by the First Army in the region of Medjez el Bab and Goubellat. The British advance there was halted in front of Tebourba, and was followed by strong Axis counter-attacks which failed to regain much of the lost ground. In the latest phase the initiative has passed to the Americans further north, who have captured Mateur, the important road junction, 18 miles from Bizerta. Each of the successive Allied attacks has obtained limited objectives, without achieving the decisive break-through. The question has been asked whether the advance might not have shown more momentum had the attacks been carried out, not as a series of disconnected blows, but as one co-ordinated operation. But the area of the fighting has steadily contracted, the enemy has been able to cover the terrain, by its nature terribly difficult for the attackers, with minefields and anti-tank guns more densely than ever before. Mobility has inevitably diminished; and the advance of armoured forces has as a rule become possible only after the infantry has cleared the mine-fields. It would be mistaken to say, because of this, that the defence has generally regained its old strength against the attack or that mobile warfare now belongs to the past. On European battlefields conditions similar to those in Tunisia will be the exception and not the rule. Similarly, the fact that the enemy's rear positions are "protected" by the sea from the Allied armoured forces gives the defenders only a temporary and exceptional advantage. Under such conditions the Allied advance—slow as it has been—can still be regarded as a proof of the ascendancy of attack over defence.

The Battle of the Narrows

Interest in Tunisia naturally centres on the land fighting; but the operation is, after all, a combined operation, and one of the most important advantages secured by the advance of recent weeks is a new freedom of action for the Allies' supporting Navy and Air Force. The problem is one of airfields. The first Allied rush to Tunisia failed largely because of the lack of air cover for the advancing land forces, and during those crucial weeks control of the central Mediterranean was firmly held by the *Luftwaffe*. All the Allied airfields were well back in Algeria and Tripoli, and the ships bringing up the vitally needed supplies had to run the gauntlet of fierce air attack, with only the fighter protection that could be provided by aircraft carriers. The Germans controlled not only airfields in Italy and Sicily, but also at least six large airfields situated inside their Tunisian bridgehead. To-day the position is reversed. First came the feat of organisation whereby Allied airfields were built up in eastern Algeria and in the south of Tunisia; then followed the advance on all fronts which has brought most of the Axis airfields either under Allied control or within range of Allied artillery. This new situation has made possible the division of the Allied air force into a tactical and a strategic air force. The tactical air force has the specific task of supporting the land forces on the field of battle. It is still a new force and has not yet come into its full stride, but it will be crucial in the final stages of the Tunisian fighting, particularly in the bombardment which must silence the artillery posts of Bizerta before it can be successfully stormed. The activities of the strategic air force include, of course, closest co-operation with the Navy, and the task in which both the Allied air and sea forces are engaged now is to close the "Sicilian Narrows." Both ends of the Mediterranean are now controlled by Admiral Cunningham's forces. Even in the Narrows the Axis is probably in no position to offer a surface challenge. The really bitter fight is between the Axis air force and U-boats and the Allied strategic air force and the Navy, with which, incidentally, a large number of American submarines are now operating. It is a very bitter fight and the losses on both sides, although they cannot be accurately estimated, are known to be very heavy—the January claim of the *Luftwaffe*, undoubtedly with the usual exaggerations, was 114,000 tons of merchant shipping and two destroyers in the Mediterranean alone. But there is no doubt about the outcome of this struggle. The Allied air and naval forces are pushing forward to win their battle—the Battle of the Narrows—as surely as the land forces are moving on to theirs. Indeed, the one reflects the other, for one of the chief factors in the German retreat is the impossibility of getting reinforcements to von Arnim, and this is due to the tireless work of the airmen and sailors operating in the rear of the Axis bridgehead.

Mobilisation: The Last Lap

It has been known for some time that Mr Bevin was going to take steps to direct women into part-time work, and the Control of Employment (Directed Persons) Order now confers the necessary powers upon him. In future, women between 18 and 45 may be directed to part-time work, up to a maximum of 30 hours a week, upon the recommendation of the Women's Advisory Panels. Women with children under 14 living with them will be exempt, and no woman will be expected to take up work outside reasonable travelling distance of her home. The Order in effect applies the Essential Work Order to part-time work which has hitherto not been covered, even in scheduled undertakings; it provides that workers may appeal to local tribunals if they are dissatisfied with the National Service Officer's ruling. The Order also provides that people may be directed to full-time work in unscheduled undertakings. This has already been done on a small scale, but an extension is necessary, in order to supply substitutes for workers who are needed for work of greater importance. The object of the Order, which represents the last lap in total mobilisation, is to tap the final reserve of manpower—it should provide the Minister with a greater flexibility of control, while the workers directed should have security of employment and protected conditions. Recruitment for part-time work on a voluntary basis has not been adequate, though the increase from 250,000 to 600,000 in the last six months is considerable. Many employers have been reluctant to take on part-time workers, but the experience of a number of firms shows the advantages of part-time schemes, where these are planned with a view to ensuring continuity of

production. The example of an aircraft factory (described in the latest PEP broadsheet) showed that, on certain operations, the hourly output of part-time workers was nearly a third higher than that of full-time workers, while their absenteeism rate was, understandably, far lower. It also suggested, as a result of personal interviews with the women, that more part-time workers would be available if there were more nurseries, more school dinners and more places where the children could play between 4 and 6 p.m. This is a conclusion which the employment, health and education authorities should note.

The Aircraft Industry

Sir Stafford Cripps has taken a further step in his overhaul of the aircraft industry by appointing to General Aircraft, Ltd., three new directors—Mr R. C. Rootes and two officials of Rootes Securities, Ltd.—in place of Mr Gordon England and Captain H. M. Schofield. All the facts are not available to the public, which knows Mr Gordon England as an aviation enthusiast and Captain Schofield as a Schneider Trophy pilot; but it seems likely that the Minister's intervention has been as necessary in this case as in that of the other firms to which directors have been appointed in the interests of productive efficiency. It is a small episode in a large and crucial campaign. The industry's problems were described at a recent press conference. Though the peak of aircraft production has not yet been reached, there are not likely now to be any spectacular increases; the task is to achieve and maintain the maximum qualitative and quantitative production. Output has to be matched with the operational requirements of the Royal Air Force and constant modifications have to be introduced to fit in with flying needs and new techniques. As the dispersal of the RAF on its world-wide mission increases, more and more stress must be laid on the production of spares—in one type, the proportion of spares to the finished plane is as high as 60 per cent. The steps that are being taken to pursue the policy of maximising productive efficiency are now known in outline at least. The Production Efficiency Board advises managements on the most efficient utilisation of machine-tools, among other things, while increasing importance is attached to personnel management, as a factor in reducing labour wastage and absenteeism. Arrangements are being made to improve the planning of sub-contracts and for the co-ordination of all groups of firms working on the same type of aircraft. Efforts are being made to reduce the amount of scrap

created in the manufacture, and it is estimated that even a saving of 1 or 2 per cent would make a considerable difference. It is clear that some of the mistakes of the past, which were undoubtedly due to lack of planning and of forward thinking, are being rectified. Sir Stafford deserves all support and co-operation. But there is still some disquiet about the control of the industry itself and about the operations of the so-called "ring." There is still room for improvement in the pooling of ideas and resources, in central scientific direction and in the utilisation of scientists and technicians on the job. Meanwhile, the crop of unofficial and sporadic strikes that have recently broken out, mainly in connection with wage and bonus grievances, though they may not amount to much individually, as a whole have serious effects on the production programme and call for firm action.

The Coal Position

It is disappointing that, far from showing any improvement, the latest figures for coal production (given in detail on page 599) record a further decline. Only four districts out of the twenty-five have qualified for the output bonus. Major Lloyd George stated confidently in February that the gap between production and consumption had been closed, and in the House on Tuesday, he attributed one-third of this to production and two-thirds to consumption. But even if the deficit has been met, there must be no relaxation of efforts to bring home the gravity of the situation to miners, owners, managements, and industrial and domestic consumers this summer, since next winter will be the testing-point. The Minister has said, in reply to some kite-flying by certain newspapers, that he has no present intention of rationing coal, and a Ministry analysis shows that more coal would have been needed for a rationing scheme than was actually sold to domestic consumers since June, 1942. But last winter's exceptionally mild weather may not be repeated this year and it is to be hoped that the Minister will not make a final decision before it is too late to introduce an effective scheme. The miners themselves are pressing for rationing and the President of the South Wales Miners' Federation did some plain speaking last week-end. He censured the small minority of absentees in the industry and referred to the obstacles created by some managements which prevented pit production committees from functioning as the Government's Coal Plan intended they should. A production enquiry, on the lines of the Amalgamated Engineering Union's investiga-

To every man and woman smoker

Will you help to reduce the appalling loss of vital material caused by fire damage?

THOUSANDS of tons of foodstuffs completely destroyed, a clothing factory in flames, destroying hundreds of thousands of garments—fires like these are costing the nation £12,500,000 a year! More important than the money are the labour, the raw material and the shipping space which must be diverted from the war effort to replace the loss.

And the facts are, undeniably, that most fires start from some little act of carelessness by a normally careful person. A match thrown away still smouldering,

a cigarette end left burning, an electric iron left switched on—simple acts of carelessness like these are slowing up production, as well as making tragic inroads into the nation's reserve of materials. Will you help to stop it?

Be more than careful with lighted matches and cigarette ends—be sure! Stub your cigarette ends till they're right out and never throw away a match or spill unless you *know* it's out. Your help, everybody's help is needed, to reduce the loss to the war effort by fire.

Most fires are caused by careful people

3 SAFETY FIRST
RULES FOR SMOKERS

1. You know a match is out when you can do this.

2. Stub your cigarette end right out.

3. Look twice, when you're in any doubt.

tions, might yield some interesting results. The Coal Plan also advocated—in a somewhat Pickwickian sense it seems from subsequent events—the concentration of production and the Minister's action in closing a pit in the Sheffield district—the Norwood pit—and transferring the men to another, more productive pit, is a sign, albeit a small one, of some slight activity in this direction.

A Pioneer Passes

Almost every European Socialist of middle age began his political researches by studying two books, as well as the works of Marx—"The History of British Trade Unionism" by Sidney and Beatrice Webb, and "The History of European Socialism" by Max Beer. In the last few days, both Beatrice Webb and Max Beer have died. The Webbs can claim to have shaped the outlook and philosophy of the British Labour movement, and to have been mainly instrumental in differentiating its policy and programme from the Marxism which won almost everywhere on the continent. In the choice between the method of reform and the method of revolution, the conclusions which the Webbs wrested from their massive researches into social conditions, and brilliantly expounded, helped decisively to carry the day in this country in favour of gradual change. Their philosophy of "gradualism" inspired a political creed which united the various branches of the British labour movement on principles much nearer to Herbert Spencer, Beatrice Potter's first famous friend, than to Karl Marx. Yet, at the end of their days, the Webbs tried to study the Marxist experiment in Soviet Russia with the same analytical labour that they had devoted for over two generations to the problems of social reform in their own country. This does not mean that, in the end, the Webbs capitulated to the revolutionary doctrine; the title of their last great work first carried a question-mark—"Soviet Communism: a New Civilisation?" It is rather another proof of their fairness of mind and integrity of purpose that they should have recognised, in such breadth and detail, the achievements of the Socialism that they themselves had been unable to accept; and it was, perhaps, with the hope that their own humane philosophy would triumph that they paid this honest and characteristic tribute.

The Making of a Creed

The morphology of British Socialism, in all its stages, was reflected in the life and work of Beatrice Webb. After an early youth spent restlessly on the fringes of late Victorian Society in London's West End, she turned to study the "physical misery and moral debasement" of East End life. First, she decided that the evils of low wages, long hours and insanitary conditions could be "mitigated and, perhaps, removed" by a combination of statutory regulations and trade union action. Then she came to doubt whether there was really, in the framework of private finance, manufacture and trading, a way out of over-work, poverty and unemployment or a possible approach to the national minimum of civilised existence for every citizen. She came to agree with Matthew Arnold that "Our inequality materialises our upper class, vulgarises our middle class, brutalises our lower"; but she could still see "no alternative to the authority of the profit-making employer." Then, in the co-operative movement, with "its production for use and its elimination of the profit-maker," she found an alternative—"the government of industry by the community of consumers for their common benefit as consumers" and "the complementary organisation of democracy and workers by hand and by brain, organised in trade unions or in professional societies." Beatrice Webb was no doctrinaire or ideologue. She knew precisely what she wanted from this Socialist democracy: the removal of "the psychological evils of a community permanently divided into a nation of the rich and a nation of the poor, into a minority always giving orders and a vast majority always obeying orders"; security of livelihood and equal opportunity for self-development for the whole people; personal dignity and individual freedom; and participation for all workers "in the administration of their service" to the community. Socialists may quarrel about the Webbs' Socialism. No democrat can deny their Democracy, or the many lessons that at least the ends they sought, if not the means, have for the strange muddled state into which the vast and complicated system of British democracy has drifted.

The Ulster Government

Changes in the Northern Ireland Government were foreshadowed in *The Economist* of April 3, 1943, page 420. It was there pointed out that there has been very little change in the personnel of the Unionist Government since the partition of 1921, and the recent pressure for change has come, not from the country as a whole, but from within the Unionist party itself. Sir Basil Brooke, who has succeeded Mr J. M. Andrews as Prime Minister, has the advantage of being comparatively young—he is 54, against his predecessor's 72—and the reputation of being a successful Minister, particularly as Minister of Agriculture. At the time of going to press, he had still not formed his Cabinet, but it seems likely that it will continue to be a purely Unionist Administration. There are only three Labour members in the Ulster Parliament, though Labour's influence is probably growing in the country as a whole, as witnessed by the Labour victory in two recent by-elections—one to the Ulster Parliament and one to the Imperial Parliament—at Unionist expense. But one of these members, Mr Beattie, made a bitter attack on Sir Basil Brooke this week, and the possibility of Labour representation in the new Government seems remote. Nor, even if the new Prime Minister is able to form a more energetic Cabinet from his own party, is there much that it can do at present, since vital issues, such as conscription, are outside its province and belong to the Imperial Government. The chief interest in the new Ulster Cabinet, to this country at least, is more theoretical. It shows how fatally apathetic to politics the people can become in the absence of any vigorous two-party system.

Non-Belligerent Turkey

Mr Sarajoglu's announcement to the reassembled Turkish parliament that Turkey, as Britain's ally, was not neutral, but non-belligerent, is a good summary of the change of atmosphere that has come over Turkey in recent months. Everyone assumes that at the end of fighting in Tunisia the signal will be given for new fighting elsewhere, in which Turkey may be involved. The Turks expect to play a more active part in this war. Are they ready to do so? They have been struggling under the most adverse economic conditions for many months now. The cost of living has increased fabulously: some foodstuffs on the Istanbul markets have risen 1,000 per cent in price. All efforts to fight hoarding and black marketing have proved ineffective and there has undoubtedly been a good deal of what the Turks call "economic sabotage." Another heavy cost has been the expense of maintaining an army practically fully mobilised for three years. Defence expenditure for this year—an extra credit of £120 million has been set aside for national defence—will be equivalent to one-third of the national budget. This mobilisation of manpower in the army, coupled with the need to increase all kinds of production to counter the falling-off of foreign supplies, has crowned the general economic difficulties with a severe labour shortage. However, the Capital Levy Bill passed in November is designed to meet this situation. By fixing the levy at a sum which all too often exceeds the resources of those who have to pay, and making hard labour the penalty for non-payment, the Turkish Government is securing a steady stream of new labourers from among formerly salaried people; the tax is, in fact, a conscription of labour. So far it has fallen more heavily on non-Turks, who, the Government maintained, have been unscrupulously manipulating the black markets. On the assessments already made, the capital levy will bring in about 450 million lire. There may be more to follow from some still unassessed vilayets. This large sum will be used to cover the costs of mobilisation and to carry on energetically Turkey's development programme for roads, railways and ports. It is significant that strategic development dominates the picture now. Here Turkey is being greatly helped by Britain. The United Kingdom Commercial Corporation is responsible for bringing in locomotives, goods wagons, all kinds of shipping, as well as wool, hides, steel, rubber, machinery and generous supplies of wheat and barley. British engineering firms are busy on the vital harbours of Alexandretta and Mersin; and Turkey is getting help in the development of its railway communications eastwards. Here, undoubtedly, the groundwork of military collaboration is being built with all speed. The military sphere itself has not been neglected. Two Turkish military missions have visited the Eighth Army and a series of British and American commissions have visited Ankara. Deliveries of

tanks, Hurricanes, submarines and destroyers have been reported. Whether Turkey's task is to protect the Middle Eastern flank, while the Ninth and Tenth Armies are used elsewhere, or to take an active part in the war, there is no doubt about the speed and care with which the necessary preparations are being made.

Germany's "Lost Youth"

Dr. Goebbels has now admitted that there were student riots in Germany in February, and that some of the young people were shot. These disturbances throw a rather unexpected light on the state of opinion inside Germany. So much is being said and written about the need for re-education, about the "lost youth" of Germany, its radical corruption, and so forth, that it is worth recording that the student Scholl and his friends died for some of the things it will presumably be the job of future educators to teach the young people of Germany. The circumstances of the student riot are not very clearly known, but most reports agree that the leader Scholl had served on the Russian front, and returned in a bitter state of mind to protest against the sufferings of the soldiers compared with the snug life of the Party and S.S. officials—many of them young men—at home. With the help of his sisters, Scholl duplicated leaflets of passionate protest against the war and the party, and these were distributed among the students at Munich; some found their way to other universities. Scholl was arrested, and after the Army had made a vain attempt to have him tried by court martial, he was condemned by the *Volksgericht* and shot. On the next day, the rioting broke out in Munich, and a number of other young people were executed. The leaflets continue to circulate. They are very simple and unsophisticated. There is no ideology, almost no politics, just a cry from the heart for peace and freedom. It is the old cry of *Nie wieder Krieg*, and it has a peculiar bitterness against the Party bosses, many of whom may well be the elder brothers of the students that were shot. If the Scholl incident is any indication of the mysterious movement of ideas in totalitarian Germany, it suggests two things—that there are already "Haves" and "Have Nots" among the under-thirties, the bureaucrats and officials for whom the state itself is private property, and the still younger men who are cannon fodder. It suggests, too, that the sheer horror of total dictatorship and total war is bringing with it its own antidote. The Scholl leaflets show that it will not be necessary to teach all the younger Germans to hate Nazism. The problem will be to give them something to love.

Further Education

Details have now been issued of the Government's scheme for the "further education or training" of men and women now on national service. It has, on the whole, been generously conceived. The primary condition of eligibility will be full-time service in work of national importance; thus, although the scheme is chiefly intended for members of the armed forces, the merchant navy, the civil defence services, police auxiliaries and the civil nursing reserve, persons employed in work of national importance will not be excluded. The second condition is that, because of his, or her, national service, a person was unable to start, or complete, his training for a career, is unable to resume or continue his career or requires a refresher course to enable him to follow his previous profession. The third condition, which follows from the second, is "an adequate educational background." But, wisely, the Government is not insisting on previous attendance at a secondary school or its equivalent.

The criterion will be whether a candidate is capable of profitably undertaking the course desired . . . which means, presumably, that persons who have left school at 14 and then continued their education on their own will be considered eligible. The financial grants will vary according to the private means of an applicant or his parents and to the course to be taken. For university courses they may amount to £180 or £250 a year for maintenance, plus fees. Married men will receive maintenance allowances for their wives and children. Generally speaking, a candidate will be allowed to choose the profession he wants to adopt, but the absorptive capacity of the profession will have to be taken into account, and a committee under Lord Hankey will advise on the numbers who should be encouraged to undertake the various kinds of further education or training. But, provided that the Government's reconstruction plans for

education, the health services and industry are as bold as they should be—a provision which, unfortunately, is far from sure—the shortage will not be felt in the openings for candidates, but in the numbers of candidates themselves.

The Tuberculosis Scheme

Six months ago, the Medical Research Council's committee on tuberculosis recommended three main measures for combating the wartime increase in the disease and for reducing its incidence in peacetime as well. The Minister of Health announced at the time that the first two of their recommendations had been accepted, and details are now available. Mass miniature radiography sets, to assist early diagnosis, are being provided as soon as possible for the populous areas. Lancashire County Council has already received one, and other districts will receive them at the rate of about one a month. Secondly, the allowances to persons undergoing treatment will be administered by the tuberculosis authorities of the local health services, and will consist of three parts: maintenance allowances, based on a standard scale without any means test; discretionary allowances, on proof of need, towards meeting standing charges—rent in excess of 15s., rates, hire purchase, school fees, etc.—which will not normally exceed 10s. a week; and special payments to meet special circumstances, such as the provision of domestic help in cases where the patient is a housewife. Compared with other forms of benefit, the allowances are fairly generous—as, indeed, they should be, since TB demands a high standard of living for its effective cure. The maintenance allowances are 39s. a week for a male applicant, undergoing treatment at home, and wife or for a female applicant with dependent husband; there are children's allowances, ranging from 5s. a week for those under 10 to 12s. for those over 16 years of age. For a single person without dependants, undergoing treatment at home, the rate will be 27s. a week, or 25s. where the applicant is living as a non-dependent member of a relative's household. The scale rates will be increased by a rent payment up to 15s. a week and by a fuel allowance of 3s. 6d. in winter and decreased by national health benefits and payments from employers. Thus, a married couple with three children, aged 14, 12 and 9, would receive £3 13s. 6d. a week without means test, where their rent amounted to 15s., compared with the standard benefit proposed by Sir William Beveridge of £3 4s., which assumed an average allowance of 8s. a child. How soon the allowances will come into force depends on how soon the tuberculosis authorities can set up the necessary machinery—in particular, the machinery for assessing need in the administration of the discretionary allowances. There is a serious shortage of personnel for tasks of this kind. There are two other gaps in the campaign against TB. One is the absence of any decision on the question of subsidising wages for the rehabilitation stage of treatment. The other is the absence of any measure to combat bovine tuberculosis, which, said the Medical Research Council, could be stamped out if all milk were adequately pasteurised.

Reunion Now

For the moment, the dispute between the French National Committee and General Giraud revolves round the how and when of effecting a meeting face to face. The latest document in the case, General Giraud's reply of April 25th, has not eliminated the differences of principle—notably the question of the form and composition of the provisional Government—and it has now become plain that long-range negotiation has exhausted its usefulness. General Giraud has invited General de Gaulle to a meeting in North Africa any time after May 5th. General de Gaulle is anxious to accept, but has announced that he prefers public discussions in Algiers to "a tête-à-tête in the country." Obviously, neither general wishes to be stamped into an unsatisfactory agreement. This niggling disagreement over the place of the conference suggests that neither party is sure of himself. Does General Giraud fear Gaulliste demonstrations in Algiers? Does General de Gaulle fear that undue pressure will be exerted on him at a private session? Time is now working against the generals. Interested parties are using the delay to depict them, however incorrectly, as the symbols of opposing ideologies. No one could be more embarrassed than General de Gaulle when his name was coupled with the singing of the Internationale except, possibly, General Giraud when he is accused of sharing his politics with Laval. All this is retrograde and unhelpful. It can only be prevented by reunion without delay.

THE WORLD OVERSEAS

Eire's Supply Position

(From Our Dublin Correspondent)

April 24th

THE position in regard to supplies was fully explained by the Minister for Supplies in moving the estimate for his department. Although many articles are necessarily scarce, the position is better than might have been expected at this time last year. This fairly satisfactory result is due partly to good management of the limited Irish shipping facilities and comparatively good fortune in their operation, partly to the expansion of home production of foodstuffs and some raw materials, and partly to the efficiency of the rationing schemes and price controls. The outlook for the future is neither uniformly bright nor uniformly sombre. Supplies of some commodities promise to be well maintained, while others threaten to become increasingly scarce.

Food presents on the whole the least serious problem in Ireland owing to the natural fertility of the country and its production of an agricultural export surplus. In spite of the high price offered for wheat and the very large acreage grown, there still appears to be an inexplicable deficiency in the quantity supplied for flour milling. The country would need another hundred thousand acres to be ploughed to become independent of imports. It is most regrettable that part of the precious shipping space available should still have to be devoted to importing wheat. The increase in the area under beet has eased the sugar situation, and the present ration can be maintained and may be increased. The supply of butter is not equal to the demand, but it is intended to accumulate larger stores this summer, so that the position next winter will be easier. Tea continues to be imported on the basis of one quarter of the consumption in the last pre-war years. It is hoped that the present small ration may be increased next winter.

The worst shortages in Ireland have been in respect of fuel for heating and transport. Here the shipping problem is central. Very few foreign ships have entered Irish ports since the war. Apart from a few British tankers carrying petrol, the country has had to rely upon its own shipping, which has been depleted by losses at sea. During the present year, shipping space must be devoted to wheat, sugar, rock phosphates, tobacco, newsprint and small quantities of industrial raw materials. Internal transport has been almost paralysed by the great reduction in the supply of coal and petrol. A complete stoppage of public road transport services was threatened earlier in the year, and may materialise unless supplies improve. The Government is making plans to meet this situation by equipping vehicles with producer-gas plants. Paraffin is in such short supply as to leave a very meagre quantity for domestic lighting purposes. Gas has been most stringently reduced, and there is a shortage of candles. For domestic heating purposes,

resort has been had to timber and turf. The limiting factor on the distribution of turf is transport, but sufficient reserves will be accumulated during the summer to maintain the minimum needs of the country for twelve months. Widespread dissatisfaction is expressed, however, at the price of turf. In the principal cities, the retail price has risen severely in the last two years in spite of the payment of a subsidy at the rate of 23s. 6d. a ton. The net cost to the community is as high as 87s. 6d. a ton. Turf at this price is a very expensive fuel compared with imported coal.

Imports of essential industrial raw materials have been greatly reduced. The supply of textiles of all kinds in the present year will be 22 per cent of normal needs. Savings in the use of materials for clothing have been enforced, and clothes are subject to a rigid points rationing scheme. Supplies of rubber have been better maintained than was expected, but the situation is still very serious. It is hoped to maintain enough new and remoulded tyres to meet the needs of vehicles for essential work and for public transport services for the present year. Three hundred thousand cycle tyres will, it is hoped, be available. Steel is being made at Haulbowline for agricultural machinery, horse shoes, nails and other purposes. It is uncertain whether the furnaces for smelting scrap steel can be completed. Imports of newsprint are only 16 per cent of normal supplies. Newspapers have been reduced to very slender dimensions, but some improvement has recently been experienced.

Severe Rationing

The Minister for Supplies stated that, owing to causes completely outside the control of anyone in Eire, the country is now getting only 25 per cent of its normal requirements of tea, 20 per cent of petrol, less than 15 per cent of paraffin, 16 per cent of normal gas coal consumption, no domestic coal, 10 per cent of normal cotton yarn needs and a total supply of textiles amounting to only 22 per cent of normal requirements. The situation would be a great deal worse than it is if it were not for the severity with which these restricted supplies are rationed. A large range of commodities are subject to maximum price orders, which are to be extended to many more articles in the near future. The success of these rationing and price control schemes depends upon the co-operation of traders or, in default of such co-operation, the ruthless administration of the law. Offences against these orders, and crimes of the black-market variety, are heavily punished, if necessary by the special military court. In some cases, retailers' licences have been withdrawn and sentences of imprisonment are frequent. In spite of this rigid control of prices, the cost of living has risen by 58 per cent since the beginning of the war. The increases for the various groups in the cost of living index are as follows: Food, 54 per cent; clothing, 75 per cent; fuel and light, 84 per cent; and sundries, 59 per cent.

Towards Inflation in Belgium

[BY A CORRESPONDENT]

By the end of 1942, Germany's clearing debt to Belgium had increased to Frs. 24,700 million. This tremendous debt had been incurred over two and a half years of occupation. Nominally, it is almost equivalent to the value of Belgium's total exports in 1937, and represents, according to a German estimate, roughly 50 per cent of last year's national income. At the end of 1940, the clearing debt was small, amounting to Frs. 940 million. Twelve months later, it had increased to Frs. 7,850 million. Though substantial, this

rise did not mean that during 1940-41 trade between Belgium and Germany was entirely one-way. In fact, an official Belgian source estimated that Germany's share in Belgium's imports amounted in 1941 to 66 per cent of their total value, against 11 per cent in 1938. In the same year, Germany received 72 per cent of Belgium's total exports, compared with 12 per cent in 1938. The big increase in the clearing debt in 1942, amounting to Frs. 16,850 million, shows that Germany must have virtually stopped exporting to Belgium. Recent reports show that there is still some trade with other European countries, mainly with Holland, Denmark, Norway, Spain and Italy. So far as figures have been published, it is evident that this trade balance is slightly in favour of Belgium. But the total values are small even compared with Germany's clearing debt.

Germany's clearing debt, together with the costs of occupation and the steady decline in industrial activity, are the determining factors in Belgium's extremely precarious financial situation. A considerable part of Belgium's current industrial output is sold without any equivalent in imports or even in payment, which means that the Belgian Government must make payments to the exporters. For this purpose, the Banque d'Emission has been established, whose main assets are credits granted by the central bank. At the end of 1942, credits granted to the Banque d'Emission amounted to Frs. 26,497 million, against Frs. 10,680 million at the end of 1941, and Frs. 1,881 million at the end of 1940. The central bank provided the necessary currency by printing banknotes, thus creating one of the most important conditions for a currency inflation such as was experienced in Central Europe after the last war.

The accompanying reports of the central bank (shown in the next column), which are now published in detail only at the end of the year, illustrate this. The gold holdings are naturally purely fictitious. The outstanding fact is the increase in the notes in circulation. Its full meaning becomes clear when it is added that payments for German requisitioning, and all payments by the state exceeding Frs. 75,000 are made in part in specially created Treasury bonds which are redeemable

	(In million Frs.)			
	June 25, 1940	Dec. 25, 1940	Dec. 25, 1941	Dec. 25, 1942

after five years and can be used at once for the payment of taxes. Without the fictitious gold holdings and the financial camouflage, the report of the central bank would look very different. The inflationary liquidity of private industry is indicated by the steady decline of central bank credits to industry. Hoarding of banknotes seems to be widespread, and the German Military Commander has repeatedly threatened heavy punishments against hoarding.

Budgeting in Belgium has become an exceedingly complex affair. Revenue and ordinary expenditure have been balanced since 1940. Yet the actual total expenditure created tremendous deficits which had to be covered mainly by short-term borrowing. Revenue was as follows:—

	(In million Frs.)
1940.....	8,172
1941.....	12,283
1942.....	14,607 (estimate)

This rise was effected by increases in all existing taxes. No reform of the revenue system has been attempted. Actual total expenditure, including reconstruction funds, the costs of occupation, amounting to Frs. 5,500 million, and so on, exceeded revenue to such an extent that the deficit in 1940 was estimated at Frs. 13,800 million and Frs. 21,100 million in 1941. In 1942, the deficit will probably have been nearly Frs. 30,000 million. The total national debt rose accordingly from Frs. 59,000 million at the end of 1939 to roughly Frs. 115,000 million at the end of 1942.

These conditions are reflected in the status of the commercial banks. The combined report of the commercial

Issued by the National Savings Committee, London

banks shows that total deposits increased from Frs. 15,709 million at the end of 1940 to Frs. 20,786 million at the end of 1941 and Frs. 27,465 million at the end of 1942. The increase in 1942 amounted to 32 per cent compared with 1941. The deposits of the leading German banks rose during the same period by only 14.6 per cent. Advances made by the Belgian banks declined considerably during 1941, but in 1942 there was a slight increase. As in other countries, the greater part of investments went into Treasury bonds and state loans, which rose from 18 per cent of total investments in 1939 to roughly two-thirds of the total in 1942. Commercial banks have thus become instruments of public financing, and the financial liquidity of a much reduced private industry makes bank credit almost superfluous.

Distrust in general financial conditions is shown by the course of deposits in savings banks. During 1940 and 1941, withdrawals exceeded new deposits considerably. In 1942, however, the trend was reversed. It may be assumed that this was due to the closing down of retail shops and small businesses. Total deposits in savings banks remained almost unchanged, showing a slight increase from Frs. 11,543 million at the end of 1940 to Frs. 12,791 million at the end of 1942.

Worthless Price Stop

It is obvious that under these conditions the price stop decreed by the military commander in June, 1940, is worthless. Indeed, price increases have been sanctioned by the economic administration because of the changeover to more expensive war materials and the rising costs of production and transport. As in Germany, the concentration of industries resulted in considerable financial discrimination, which was counteracted by a co-operative system of financial help after the German model. There is, however, no indication whether sufficient funds have been accumulated by levies on the industries which are still working. Price control is at the same time jeopardised by the black market.

Activities on the Bourse, especially in share dealings, are completely divorced from the actual industrial situation. The outstanding feature is that, in spite of the general decline in declared profits during the business year 1941/42, share prices continued to rise. Over the whole period from the occupation to the end of 1942, the share price index of the Banque de Bruxelles increased by 293 per cent; but since the beginning of 1943 the rise in prices has been slowed down. The organisation of the Bourse has been changed in the same way as the German Bourses, but no registration or requisitioning of shares has been attempted. General speculation ended in 1941; since then, interest has been concentrated on shares of international holding companies, e.g., "Sofina," and particularly on the shares of Belgian colonial companies. It seems that the Belgian public regards these shares as so-called real values, and there is also an indication that German capital is interested in a relatively unrestricted Bourse for the purpose of acquiring shares of international and colonial companies. This may also explain why German leading banks, almost without exception, have established branch banks in Belgium. The first full reports of these banks show substantial profits. Taught by their own inflation of 1919-23, German businesses are actively making the general sell-out in Belgium as profitable to themselves as possible.

Chilean Copper Supplies

[BY A CORRESPONDENT]

April 6th.

THE severance of diplomatic relations between Chile and the Axis last January laid the foundations for still closer collaboration between the Republic and the United Nations. Towards the end of March, Mr Henry Wallace, Vice-Presi-

dent of the United States, visited Santiago, with the object, presumably, of discussing ways and means by which this collaboration can be made effective. There has been no information on the political discussions, which must have taken place during the visit, but Mr Wallace told a press conference at Santiago that he had visited Chile chiefly "to help intensify her production of strategic war materials, and thus help to lessen the length of the war." Reports from the United States have supplemented this statement by saying that "during his stay in Santiago Mr Wallace would try to reach an agreement whereby water-power schemes in Chile would increase exports to the Allies in the vital war needs of nitrate and copper."

The supply of strategic materials certainly forms the main practical help that Chile can give the United Nations. The country has, indeed, supplied the United Nations to the utmost of its ability ever since the United States entered the war, and, in the case of copper, even before that event. But after a big increase in production and exports up to the spring of last year, a period of stagnation in Chile's mineral production set in early last summer. In the case of nitrate, there is no difficulty in raising current production to any quantity for which shipping space can be made available. Early this year, the Chilean Nitrate and Iodine Sales Corporation appointed, in fact, a special representative for the development of new markets in Argentina, Brazil and Uruguay as the United States and the other United Nations are not able to absorb Chile's current nitrate production, owing to the shipping shortage. But the position with regard to copper, the most important Chilean export, and a vital strategic material, is very different. In this case, Chile increased its production from the pre-war maximum of just over 410,000 metric tons, reached in 1937, to 453,600 tons in 1941. By the end of 1941, Chile's production was already running on an annual basis of over 520,000 tons, and, until early last summer, there was a further improvement. But although recent production figures are not available, it is known that, despite a 10 per cent increase in the United States buying price for Chilean copper in August, 1942, which raised the price to 12.375 cents per lb, or 0.375 cents above the United States domestic selling price, supplies from Chile since last summer have not fulfilled expectations. The limit to Chile's copper production is not set by the existing ore reserves. The country's known copper deposits, at 35,500,000 metric tons, contain about one-third of the known copper reserves of the world. The most extensive copper mines of Chile are, moreover, worked by open-cast method, and can thus be developed and exploited with a minimum loss of time. In addition to the three large Chilean copper deposits, to which reference was made in detail in *The Economist* of July 11, 1942 (page 46) the country has, in the words of a special report prepared by the United States Bureau of Mines in 1940, hundreds of properties, once important producers, which are now idle.

Many of these were abandoned when the richer, easily mined oxide-ores had been exhausted and the harder rock with sulphide-ores encountered in depth could not be concentrated without crushing plants and water. Lack of capital or initiative to spend money on mine and mill equipment, on pipe-lines for water, or on roads to facilitate transport and thus put the properties in a position to mine the lower grade ores, are the main reasons for their abandonment.

The Bureau of Mines report added:

Chile's future in mining is a question of reopening a number of old mines, and diamond-drilling on known low-grade deposits to develop sufficient reserves of minable ore to warrant further expenditures on plants that will permit profitable production. Had this procedure not been followed in the past and the adverse conditions for transport, water and power supply at high altitudes been overcome through technical skill and the expenditure of capital by experienced mining companies, the large copper mines of Chuquicamata, Braden and Potrerillos would never have been developed.

Copper requirements of the United States, and of the United Nations as a whole, today far exceed all maximum requirements in the past. As copper has become one of the acutest war shortages of the United Nations, this is certainly the time for taking up the plans foreshadowed by the US Bureau of Mines in 1940. The execution of such plans, however, raises not only the problem of the supply of materials and equipment for the development programme, but also the political question of Chile's participation in the scheme. For some years past, Chile has expressed the natural desire to have a larger financial share in its mining industry, and especially in its copper industry, 95 per cent of which is controlled by the United States. This question probably accounted for an important part of Mr Wallace's discussions with the Chilean Government.

THE BUSINESS WORLD

Finance and Banking

Big Bill Turnover

The ease of credit promised by last week's Bank return duly materialised, and conditions in the money market this week have been exceptionally comfortable. The market has had to take up another heavy allocation of Treasury bills, having obtained a 40 per cent allotment at last week's tenders for £90 million of bills. The outlet for bills, however, has been correspondingly large. The banks have been keen buyers of June bills, but the market has sold as many of these maturities as it wishes to dispose of at present. The parcels offered to clearing banks have, therefore, come to include an increasing admixture of July maturities. There has been an order for "hot" bills in the market this week—a sufficiently unusual occurrence to deserve notice—and this also helped the market to take up its heavy allocation of fresh bills with ease. The banks were called upon to pay £65 million in Treasury Deposits this week, a figure which compares with nominal maturities of £50 million, and effective maturities well below this figure, as pre-encashments of the current maturities were fairly heavy. On floating debt account, therefore, there has been considerable pressure on the volume of bank cash. On the other hand, Government expenditure, swollen by the May 1st dividend disbursements, has also been heavy, and the credit position has not been unduly strained. This is shown by the latest Bank return, which reveals bankers' deposits still at the comparatively high level of £162,092,000, though this is £8,017,000 lower than a week previously. Some help to the credit position has been given by allowing public deposits to run down by £4,610,000 to the exceptionally low figure of £3,733,000. The combined reduction in banker and public deposits is approximately balanced by a fall of £11,245,000 in Government securities. Notes are not returning from circulation after the holiday expansion, and the total issue increased by a further £526,000 during the week to last Wednesday.

Lend-Lease Silver

The Lend-Lease Administrator's statement on US silver deliveries to Britain, made last week to the Senate Silver Committee, added considerably to the information previously available on this operation. Mr Stettinius announced that Great Britain was faced with an acute shortage of silver for industrial and coinage purposes and that existing stocks would be completely exhausted by the end of this month. He added that British supplies from India had dried up because of the heavily increased industrial and coinage demands for silver in that country. On this point Mr Stettinius may have been slightly misinformed, since political considerations are mainly responsible for depriving the British Government of any further part of the large unutilised silver stocks of the Government of India, while, even if the silver were free to move, there would be considerable shipping difficulties to be faced. The amount of 5,000,000 ounces of silver which Great Britain is obtaining from the United States and Canada is required to meet the needs for the first half of 1943, that is, for a month, since existing stocks will last until June 1st. Of these 5,000,000 ounces, one-third is required for industrial purposes and two-thirds for domestic and overseas coinage. Of this total, Canada has undertaken to supply 1,925,000 ounces, and the balance of 3,075,000 ounces will come from the United States on lend-lease terms. Mr Stettinius gave some figures of US silver stocks which give perspective to the lend-lease delivery. As compared with its 3,000,000 ounces, there are more than 500 million ounces of Treasury free silver stored at West Point and elsewhere. This is after 700 million ounces have been withdrawn by the Defence Plant Corporation for non-consumptive use, that is, for industrial installations from which the silver

can be recovered after the emergency. These huge totals do not take into account the silver held to back silver certificates, which amounts to more than 1 billion ounces. These constitute a reserve which, given sufficient pressure, could always be mobilised by the simple process of replacing silver certificates by Federal Reserve Notes. In the light of these figures, Mr Stettinius could hardly be accused of overstatement when he asserted that "the withdrawal of the amount proposed would cause no strain on our national resources." But it is evident from the facts he gave about the existing and prospective silver position in this country that this lend-lease delivery will be but the first of a series of such operations.

Marketing the Silver

It is both hoped and believed in the bullion market that the distribution of the lend-lease silver to industry will be left to the market. The immediate amount involved, one-third of 5 million ounces, would certainly not justify the erection of new official distributive machinery. Nor is it believed in market quarters that the silver in question will be sold at a higher price than the figure of 23½d., at which official sales have been effected in this market virtually since the beginning of the war. The position would no doubt be different if the British silver stocks had to be replenished from India, since, in accordance with the assertion recently made by the Government of India, such silver would have to be bought at a price at least equal to the US import price, which is about 1d. above the present London quotation. Since the lend-lease silver will have to be repaid in kind to the United States after the war, the distribution of that silver to British industry at 23½d. per ounce would imply a confident belief by the British authorities that the post-war price of the metal will not be higher than this figure. It can also be argued that since the silver in question will go to war industry and will ultimately be consumed by the British Government, the price at which it is made available to industry is really immaterial. If it were raised, this would merely increase the prices which the Government would have to pay for the goods manufactured with the silver in question. There have been no indications yet that the exhaustion of British silver stocks and their replenishment with lend-lease metal will affect the nominal ability of the London market to deal in "free" silver. Although operations in such metal as reaches the market from other than official quarters are termed "free," it by no means follows that they have been made without any supervision. The few firms which constitute the market have operated their own unofficial control of the demand for "free" silver, and it is more than doubtful if any undesirable demand for the metal, such as hoarding or speculative buying, has been satisfied through the market. The authorities have their own ways of checking the efficacy of this unofficial control of the "free" market, and they appear to be satisfied that it accomplishes all that comprehensive official control would achieve. Given the exceptional shortage of silver in this country, the market firms may be expected to scrutinise the demand for "free" silver more closely than ever and to ensure that all such silver is, in fact, canalised to essential industrial requirements.

STAPLES PRESS LIMITED

are bringing out a series of Digests on Reconstruction, of which three have already appeared. They will be glad to receive, at 203, Regent Street, W.1, reports from bodies and associations who have discussed any aspect of Reconstruction. They are immediately concerned with Transport, Monetary Reconstruction, Town and Country Planning, Education, Foreign Trade and Agriculture.

Bank Loan Rates

The decline in the banks' loan and overdraft rates is still making progress. The latest evidence of this movement is the virtually unanimous decision of the clearing banks (with one exception, not the usual one) to reduce to a uniform 3½ per cent the rate charged on all church advances. These have, for the most part, been made for building purposes and in many cases have the support of diocesan guarantees. Even so, the security behind them hardly appears to entitle them to rank on a par with advances to industry having effective Government guarantees, which now command the same rate of 3½ per cent. Whether special consideration has been given to the ethical element in the security behind these loans, or whether this is the banks' answer to the Archbishop's recent homilies against usury, is not clear. The concession, however, can hardly do other than give impetus to a further decline in the average rate charged on bank loans. The old 5 per cent minimum is now a dead letter except for borrowers who have no means of bargaining with their banks and must accept the terms set before them. But a large number of advances with security at least equal to that backing church loans are still paying between 4 and 5 per cent, and the concession just made to the latter may well be found to spread ultimately to a much wider circle of borrowers than the banks intended to propitiate by their gesture.

Financing Far Eastern Exports

The chairman's commentary on the latest balance sheet of the Mercantile Bank of India gives an interesting explanation of the wartime revolution which has occurred in the financing of export trade from the Far East. The feature of the balance sheet changes over the year 1942 is a decrease in bills, loans and advances, balanced by an increase in cash and Government securities. To some extent, this redistribution of assets is due to the fact that the bank's branches in Burma and the Far East are out of action, and to the consequent reduction in the commercial banking business transacted by the Mercantile Bank.

Investment

Compensatory Equity Movements

The March experience of industrial equities, when yields rose despite a modest advance in prices, has not been repeated in April. According to *The Actuaries' Investment Index*, the figure for all classes of industrial equities just achieves a new record for recent years of 75.1, and there is a compensatory fall in the corresponding yield to 4.38,

ACTUARIES' INVESTMENT INDEX

Industrial— (All Classes) (159)	59.4	74.7	74.9	75.1	5.10	4.40

which is, however, well short of constituting a new low. The two main movements of the month are a rise of almost 10 per cent in home railways and a further fall of 2.2 points to 113.4 in electric light and power. This follows on a much sharper fall in March, and it reduces the aggregate index for the productive section to within 0.1 of that for

But it also follows the changed methods of financing the trade with those countries to which the bank's operations are now confined—India, Ceylon and Mauritius. The volume of that trade has, in any case, been considerably restricted by shipping difficulties, and now mainly consists of the staple exports, tea, jute, seeds, hides, rubber and sugar. Before the war, those exports were mainly financed by bills of exchange. These bills were bought by the exchange banks, and in normal times a large proportion of the funds of these institutions were always "on the water," that is, invested in bills drawn against goods in transit by sea. These crops are now bought in bulk by the supply departments of the Government and are paid for in rupees in the country of export. Thus the commercial bill of exchange has become scarce, and exporters have less need for advances from their banks to finance the purchase, preparation and storage of produce for export. It is not only the exchange banks which have been adversely affected by this development. It has also greatly influenced the London discount market and the London produce exchanges.

Scottish Bank Notes

The Scottish banks are following the lead of the Bank of England in discontinuing the issue of bank notes of £10 and over. The notes hitherto issued by these institutions are of the denominations of £1, £5, £10, £20 and £100. In certain cases, their note issue has expanded at an even more rapid pace than that of the Bank of England, and their general experience seems to suggest that, as in the case of the Bank of England, the notes of larger denominations now represent a somewhat greater proportion of the total issue than they did before the war. There is no question of recalling the notes of £10 and over, but as they return to the banks they will be cancelled and no further notes of larger denominations will be printed. It is not yet known whether a similar move will be made by Irish banks having a Northern Ireland note circulation. There is, of course, no question of Eire following the Bank of England's lead.

January, a temporary peak. On the three months' comparison, a net fall of 4.5 points in electric light and power, and much smaller declines in motor and oil shares, almost suffice to offset considerable rises in a number of sections, particularly building materials and gas stocks. It is rather difficult to justify the fall in electric power shares. At the end of last month, the yield on them was 4.12 against 4.38 for the whole industrial list. In view of the upward secular trend in the industry, this yield appears to make some concession to the idea that holders may be expropriated on terms which make insufficient allowance for probable future earnings. The very slight appreciation in the equity index has been accompanied by a rise of twice as much in that for industrial preferences, but the corresponding debentures have fallen, while the home corporations index is down by 0.5 and that for 2½ per cent Consols by three times as much. As the nearest approximation to the pure rate of interest at long term, the yield on this index has a special importance and the fact that, at 3.08, it is now at the highest since August, 1941, tends to support those who believe that the authorities will have difficulty in maintaining, in its integrity, the wartime structure of rates once there is any relaxation of control. Thus, the month has produced a further relative appreciation in equities, but mainly by a fall in fixed interest securities.

A Brewery Fusion

Firms are commonly supposed to amalgamate in times of difficulty, and some were rather surprised to learn some time back that Hodgsons' Kingston Brewery was considering an offer to take over its properties. The full particulars of the scheme have now been made public, and they present some points of interest. Courage and Company are offering to buy the Hodgsons' shares outright for cash at 85s., against a market quotation of 81s. 3d., and a considerably lower one prior to the original announcement of

negotiations. Shareholders are, however, offered the alternative of accepting £14 8s. in cash, and two Courage shares for every five Hodgsons' ordinary. This gives the Courage share a value of 68s. 6d., which was the market quotation when negotiations commenced. As the current quotation is 74s. 3d., the offer is very attractive. Further, Hodgsons' shareholders are given the right to apply for additional Courage shares at 68s. 6d. up to the total of their present holdings. This is equally attractive, if only the market price is considered, and applications are likely to be substantial. The total issue is, however, limited to 150,000 shares, and allotments will be *pro rata*. The terms are made even more attractive by the fact that in the past Courage have paid higher dividends than Hodgsons', although for the latest complete year each distributed 15 per cent. Hodgsons' appear to have achieved a record earnings percentage of 28.3 for the year to September 30th last, while the Courage figure was 27 per cent for the calendar year. The latter, which has attained its present size by a policy of absorptions, has recently accumulated a considerable surplus of liquid assets, while the

former, judged purely on its balance-sheet figures, appears to have been rather short of cash. On a ten-year run, the average equity earnings of Courage are some 27 per cent, against 20.9 per cent for Hodgsons'. There seems every reason why shareholders should accept the option to take up Courage shares, even after a fall in price to 72s.

Gaumont Reorganisation

The financial reorganisation of the Gaumont-British group is carried a step further by an offer to holders of the 7½ per cent cumulative participating preferred ordinary capital of Provincial Cinematograph Theatres. These shares, to a total of £2,000,000, rank after £700,000 of preference capital for a cumulative preferential 7½ per cent and for half the remaining profit—up to a total dividend of 15 per cent—after £75,000 has been provided for ordinary dividends. It is now proposed that holders should abandon the

participating right and receive in future a 10 per cent cumulative preferential dividend. Over the past decade, there have only twice been participating distributions on the preferred ordinary, namely 1½ per cent in respect of each of the two years ended January 31, 1938 and 1939. Profits, before reserve, have been slightly below the level of £250,000, but there is every reason to suppose that, for a period at least, they will be better. With distributable profits at or below £300,000, the proposed change would be beneficial to the preferred ordinary. Above that figure, they would lose a gradually increasing amount until, at £525,000, they would receive only £200,000, against £300,000, under the present arrangement. Obviously, for the semi-speculative holder, who should make up the majority of those who are interested in such a stock, the main question is the future course of the concern's profits. This is a matter upon which it is very difficult to reach a decision, although popular opinion evidently favours a material improvement. For those who prefer security, a rise in the cumulative payment to 10 per cent will doubtless be attractive, and this explains the acceptance of the scheme by the Association of Investment Trusts. Since the scheme is put forward by a board of directors which is essentially the same as that of Gaumont-British, the controlling company, it may reasonably be assumed that the plan is not considered to be disadvantageous to Gaumont-British. The directors have, however, also a duty to the preferred ordinary shareholders of PCT. This conflict of loyalties serves to accentuate the need for a clear statement as to the structure of the whole group and for its simplification with a view to eliminating such conflicts.

Sir Percy Bates Explains

In the report of Cunard Steam Ship, dealt with a fortnight ago, the chairman, Sir Percy Bates, stated that it was to give expression to a reasonable confidence as to the future that the directors had recommended an interim dividend in respect of 1943, but that it must not be taken for granted there would be a final dividend in a year's time. Later, he made the now famous statement:

If I thought it were any use advising that no one should hold more ordinary stock than he could afford to lose, I would give that advice. But by nature man is a gambling animal. . . . The future may contain anything, but for myself I carry on in a spirit of reasonable but cautious hope.

This was read by *The Economist* as scarcely encouraging, and the public's reaction may be gauged by a fall from 20s. 9d. to 19s. 3d. in the quotation for the ordinary stock almost within hours of the publication of the statement. It appears that this effect came as a complete surprise to Sir Percy. In any case, he took advantage of the annual meeting to explain, or at least to expand, it. As reported, he said:

During the whole of its sixty years and upwards as a public company, the board has never felt itself in a position to declare an interim dividend. I must allow that fact to speak for itself. If you understand what it means to break a tradition of sixty years, I think you will understand the statement of the accounts a good deal better. There are too many uncertainties in the future to give any figures of dividends. This company has had thirteen years without a dividend. A great many important things have happened and I think the board and company can look back with satisfaction and pride. I think the corner has been turned now and, subject to our wartime uncertainties, I think we can be confident of the future.

On this statement, the shares recovered to 20s. 4½d. Doubtless, Sir Percy finds himself hampered by the injunction against disclosures that might assist the enemy—a doctrine which ignores at least half the problem. But it is extremely difficult to reconcile a statement that it is the act of a gambler to hold Cunard ordinary with the concluding sentence of the latter quotation. Is this really the best that can be done for the shareholders and the employees, ashore and afloat, of one of the principal units in an industry which is held to be the pride of the country and a mainstay of our fortunes. Rightly or wrongly, the public at large looks to people who occupy positions at the head of such an enterprise to give guidance and a just assessment of the position as they see it. Prophecy cannot be expected, but a clear statement is. Even if these two statements can be reconciled, neither conforms to that definition.

Synthetic or Natural

There has been no dearth of discussion of late as to the relative merits of synthetic and natural rubber, including even the question of their relative prices. It was only natural that Mr Harold Copeman, chairman of the Rubber Growers' Association, should raise this point in his annual address. He dealt with it shortly, only to reach the conclusion that research in rubber and plastics might lead to the discovery of new uses for the former and that this, coupled with the expansion of the demand for tyres by Asia, and the peacetime extension of new wartime uses for rubber might well repay investigation. There was not a word in all this of the part to be played by the RGA. It may be that at last that body is energetically engaged upon research into the fields where plantation rubber is supreme and upon investigations which will lead to its production at a lower cost. If so, Mr Copeman said nothing of it. He is more concerned with whether synthetic rubber falls within the definition of raw materials under the Atlantic Charter. There seems to lie behind this a hope that, whatever advantages the American manufacturer is to extract from the huge American synthetic industry, his British counterpart may be left to rely upon the natural product. It is earnestly to be hoped that no such argument will prevent the British Government from encouraging the erection of plant in this country for the fullest exploitation of the chemical advances in which the war has been rich. It is equally to be hoped that the existence of an international scheme for the regulation of rubber output will no longer be allowed to postpone the drastic overhaul of the cost structure and the elimination of the producer whose costs are unduly high.

Company Notes

Yorkshire Amalgamated Collieries

The preliminary statement of Yorkshire Amalgamated for the year to March 31st last shows a marked improvement in net profits from £85,126 to £127,950. In the previous year, the net figure included £581 refund of income tax, but there is no indication as to whether there is a similar item in 1942-43. Assuming that no refund has been received, equity earnings will have risen from £77,046 to £120,450, a level which is, however, still rather over £9,000 lower than the total for 1940-41. There is still no payment on deferred capital, but the dividend on ordinary is restored from 5 per cent to the 6½ per cent paid in 1940-41. This would make it possible for the directors to add a few hundred pounds to the carry forward and to transfer £25,000 to general reserve, which received a similar amount two years ago, but nothing in 1941-42. The allocation of the surplus is not, however, revealed by the preliminary statement. No explanation of the recovery is provided, but it is probable that it results from the absence of certain special charges made a year ago. These included income tax provision in respect of the increase in the standard rate to 10s. in the pound and a generous allocation for EPT. The first of these is non-recurrent, and the scale of the second will, probably, be reduced. Further, war-damage contributions will also have been lower. Whether there has been a parallel improvement in earnings would not be apparent from the accounts, owing to the failure to disclose EPT. The figures are more favourable than was expected, in view of the fall in global production, and the £1 ordinary shares recovered to 18s. 9d. ex dividend, at which they yield some £6 18s. 8d. per cent.

William Beardmore Report

Less and less can be deduced from the profit and loss statements of the leading heavy industrial concerns. The important marine engineering concern, William Beardmore, again shows profits after depreciation and tax, amounting to £213,965, against £211,671, for the year to December 31, 1941. In its way this is satisfactory. Part of the rise is passed on to equity earnings, which amount to £157,584 against £156,770, representing 33.1 against 33.0 per cent. The 10 per cent dividend remains generously covered, and a repetition of the transfer of £100,000 to war contingencies, against

INDUSTRIAL LIGHTING

You provide the raw material—you have provided the equipment with which to turn that material into finished goods—but can your workers see well enough to use the equipment and the raw material to the best advantage?

Benjamin Lighting is designed to suit every operation so that all the workers in your plant can see well to handle their machines efficiently, to prevent the waste of goods wrongly finished, to reduce fatigue due to eye strain and to avoid accidents either at their machines or benches or when they are moving about.

The correct planning of a lighting installation to ensure the best seeing conditions requires considerable knowledge and skill. Not only must the lighting unit itself be suitable and the reflector direct the light in a suitable

manner, but they must be placed in such a manner that adequate light reaches the parts of machines where it is particularly needed to enable details to be seen, distances to be judged or finished to be examined. The handicap of obstructions likely to throw shadows must be overcome and the danger of causing glare, direct or reflected, in the eyes of any worker must be avoided.

That is what Benjamin have been doing for many years in all kinds of factories. To-day Benjamin are ready and equipped to deal with your works. Resident lighting engineers in all parts of the country are available to deal with lighting at the works and they are backed up by a staff of expert illuminating and research engineers.

'Grams': "Benjaleot, Southtot, London." 'Phone: Tottenham 5282 (5 lines)

double that amount two years ago, permits a rise of some £10,000 to £234,499 in the carry forward. Clearly, such accounts provide no indication of the industrial experience of the past year, a state of affairs perhaps inevitable during the war, but hardly enlightening to shareholders. The balance-sheet provides the obvious conclusion that turnover has in fact expanded considerably—an encouraging development at the present stage of hostilities. The statement shows that net work in progress is up from £1,583,580 to £1,907,901, a level still slightly below that of 1940. This rise and that in cash from the low level of £4,017 to £292,243 is financed by a fall of some £500,000 in debtors to £712,773 and smaller reduction in stocks from £831,193 to £668,021. On the liabilities side, the bank loan of £260,441 is eliminated at the cost of a rise in creditors from £1,533,545 to £1,700,388. The net change is a small reduction in surplus liquid assets from £1,873,570 to £1,847,300. The £1 ordinary stock at 32s. 3d. ex dividend yields some £6 4s.

Johnson and Phillips Improvement

Total profits of Johnson and Phillips in 1942 rose from £543,019 to £568,552. The total transfer to depreciation and maintenance is up from £72,394 to £102,706, but tax provision, adjusted to include in both years tax on dividends, is reduced from £320,000 to £310,000. There are no other significant rises in expenditure, so that equity earnings are up from £91,452 to £94,245, representing 23.5 against 22.8 per cent on the ordinary capital, which receives the customary 15 per cent. As before, £30,000 is transferred to contingencies and £5,000 to research and development account, occasioning a further small reduction in the carry forward from £102,478 to £101,724. This improvement is in line with the general run of electrical equipment manufacturing concerns. As with accounts already published, the rise in profits appears to be based on a very substantial jump in turnover. Total profits disclosed for 1942 are the highest so far achieved, and the increase in equity earnings suggests that some increase in capital employed may have been responsible for a modification of EPT liability. The balance sheet shows a striking rise in stocks and work in progress from £647,904 to £826,912, accompanied by an increase of £50,000 in bank overdraft to £300,000. Debtors and creditors are both higher, while cash is reduced from £67,871 to £55,193 and net loans to subsidiaries from £181,825 to £138,510. The draft on research and development account at £6,886 is nearly double that of a year ago, and the latest transfer brings the total to only £10,483 against £12,370. There is actually a rise in net liquid assets from £145,081 to £163,400. The position is encouraging, although ordinary shareholders are unlikely to derive direct benefit from any expansion, since the management has a long-standing policy of dividend equalisation. The £1 ordinary shares, at 70s., yield £4 6s. 8d. per cent.

Brush Electrical Progress

Trading profits of Brush Electrical Engineering in 1942 rose from £184,484 to £214,336. Total charges are increased, largely by new issue expenses and premiums on debentures converted, but compensation of £8,000 has been paid to a director. Taxes call for £25,000, against nil, but last year £16,500 was written off patents, while equity earnings are £54,794 against £57,362. Owing to the increase

in ordinary stock, which this year receives 8 against 6 per cent, the actual earnings rate has fallen from 29.1 to 16.8. The expansion of ordinary stock from £393,318 to £594,717 during the past year has been effected, in part, by the conversion of the outstanding debenture stocks, in part by exercising options totalling £58,229. The transfer to general reserve is halved at £25,000, while the carry forward is raised by £3,670 to £10,271. In common with other concerns in the industry, the balance sheet indicates some expansion in output. The consolidated statement shows stocks at £1,303,949, almost £200,000 higher on the year, while debtors have increased nearly £100,000 to £549,310. New bank loans total £143,189, and there is an expansion of approximately £50,000 in creditors to £979,155. As a result, the group's surplus of liquid assets is some £37,000 higher at £680,259, although the reverse is true of the parent, the surplus falling from £631,666 to £575,146. This is explained by a credit balance with subsidiaries of £35,039 against a debit of £58,926. The group's plant and machinery stand at £309,078 against £237,241, and there is an addition of nearly £30,000 to land and buildings at £195,113. The company's past record is not encouraging, but with the elimination of the debenture stocks and expansion of capacity, further improvement can be expected in the coming year. It remains to be seen, however, whether the present expansion of capital is warranted in the post war period. The current price of 8s. 6d. ex dividend for the 5s. ordinary stock yielding £4 14s. reflects some optimism regarding the future.

Central Mining-Rand Mines

The annual reports of the Central Mining-Rand Mines companies making up their accounts to December 31st last do not make cheerful reading. Almost all the mines concerned have suffered during the year from restriction of output, following official advice to conserve steel and other war material. There has also in many cases been an acute shortage of native labour which, toward the end of the year, restricted the use of mining plants. Thus, as the table below makes plain, the general trend is for declines in tonnage milled and in revenue per ton. Working costs are mostly lower, but working profits are almost all down and dividends are, on the whole, lower. There was no exception to the reduction in available ore reserves, and in most cases there was no improvement in payability. The exceptions to this rule are few. *Durban Deep* had a favourable year, and the strength of its normal expansion is sufficient to offset the influence of war conditions, even including the rise in the Union "special contribution" from 16 to 20 per cent. Working profits rose from £1,225,000 to £1,251,000; the dividend is raised from 35 to 40 per cent and there is an improvement of 0.1 dwt. in payability. On the other hand, the decline of the poorer mines within the group has been hastened. *Geldenhuis Deep* is now virtually at the end of its life. There has been considerable caving as the result of earth tremors from which *Rose Deep* also suffered, and it is doubtful whether the current programme can be continued for the whole of 1943. In view of the very small ore reserves, amounting to no more than 162,000, the 17s. 6d. shares, now standing at 12s. 6d., can be considered only in relation to their break-up value. The remaining mines should survive the war crisis without disaster. The rise in gross income of *Crown Mines* and of payability of *City Deep* are both encouraging, and, in the case of the former, development on the Main Reef Leader yielded unusually satisfactory results.

* Available ore reserve in all cases.

West African Gold Mines

The reports of *Ashanti* and *Bibiani*, the leading West African gold producers, show a parallel experience for the year to September 30th last. Disclosed total profits dropped from £2,291,426 to £2,044,019 and from £752,433 to £648,616 respectively. There was, however, in both cases a reduction in local gold taxes, administrative expenses and general mining charges, while tax liability declined from £300,000 to £100,000 and from £180,000 to £100,000. In the case of *Ashanti*, the drop may be due in part to earlier overprovision, but it is very possible that disclosed profits of £1,900,000 represent something near the level at which EPT begins to be payable. There is a slight increase in depreciation from £111,728 to £115,382, but this does not prevent a rise in equity earnings of some £40,000 to £1,046,537, representing 87.6 against 82.8 per cent. The 80 per cent dividend, which was also paid in the two previous years, is less tax at 10s. and the whole surplus goes to raise the carry-forward from £322,502 to £370,193. In the case of *Bibiani*, the rise in equity earnings is less

marked—from 24.1 to 25.1 per cent—and even now only just suffices to cover the 25 per cent ordinary dividend distributed for the fourth year in succession. The carry-forward is up from £94,932 to £95,188. It is evident from the balance sheets that output fell off last year. Virtually all current items in both statements are moderately lower, though the sharper falls in cash are explained by the acquisition of tax certificates and war bonds. This decline in activity is borne out by the directors' statement which reveals a decline in ore treated by *Ashanti* of 18,300 tons and by *Bibiani* of 41,900 tons. Ore reserves are somewhat lower in both cases, though for *Ashanti* there is a rise in average grade of 0.3 to 21.9 dwts. It seems improbable that the lower output is due to the impact, or prospect, of the official schemes for concentrating gold production in West Africa and how far these schemes will affect the operation of *Ashanti* and *Bibiani* is not yet clear. At current prices, the shares of the two concerns are fully valued. The 4s. shares of *Bibiani*, at 22s., yield £4 10s. 11d. per cent less tax at 9s.; the 4s. ordinary shares of *Ashanti* at 56s. 10½d. yield £5 12s. 6d. per cent less tax at 10s.

Industry and Trade

Coal Output

There has been a further slight drop in coal production. During the four weeks ended April 17th, output averaged 4,005,200 tons, compared with 4,013,700 tons during the previous four-weekly period. Both figures are well below the national target of 4,173,200 tons. The district percentages of standard tonnage are as follows:—

	Per Cent.		Per Cent.
Northumberland.....	97.0	S. Staffordshire & Worcestershire	91.6
Cumberland.....	94.2	Shropshire.....	100.9
Durham.....	97.5	Warwickshire.....	93.4
South Yorkshire.....	95.3	South Wales & Monmouthshire.....	95.1
West Yorkshire.....	92.4	Forest of Dean.....	97.5
North Derbyshire.....	100.3	Bristol.....	96.5
Nottinghamshire.....	96.9	Somerset.....	102.8
South Derbyshire.....	101.5	Fife & Clackmannan.....	95.1
Leicestershire.....	107.0	Lothians.....	98.8
Lancashire & Cheshire.....	98.3	Lanarkshire.....	95.6
North Wales.....	95.3	Ayrshire.....	95.6
North Staffordshire.....	101.2	Kent.....	99.8
Cannock Chase.....	94.6		

* The standard tonnage of this district is under review by the Local Reviewing Authority, in accordance with Paragraph 2 of the rules governing the operation of the Scheme.

Only four districts qualify for the bonus—Leicestershire, Somerset, South Derbyshire and North Staffordshire. The first three have consistently good production records, but some of the districts, including Yorkshire and South Wales, have failed to qualify for a bonus in any period since the scheme was introduced. In contrast to this unsatisfactory picture, it is encouraging to learn that output per manshift over the industry as a whole (in the most recent four weeks for which figures are available) was 1,056 tons, compared with 1,048 tons before the acceptance of the Government's White Paper.

Tobacco Off Lend-Lease

Lord Kindersley's speech in opening the Tunbridge Wells Wings for Victory Week seven days ago was of general interest in that it disclosed the news that tobacco no longer comes into this country as a lend-lease item (except for the Forces), and that it came off the list three months ago. No official reasons for this have been vouchsafed. A possibility is that the earlier view that tobacco was a necessity on a par with food has been altered. Lend-

lease supplies have high shipping space priority, and it is more than likely that it is now considered that such priority should not be accorded to a semi-luxury. Indeed, strong disapproval has been expressed that tobacco was ever included in lend-lease, and its removal is to be welcomed. Officials of the Tobacco Control hastened to assure the smoking public that supplies would not consequently be cut down, and declared that stocks were ample for the remainder of the year. It is also known that the Controller, Mr. Maxwell, is at present in America. The rising consumption of tobacco has been accentuated by the war in the absence of restriction. Imports of unmanufactured tobacco were 182,392,000 lbs. in 1937. If the rise in consumption during the war has been correctly estimated at 20 per cent, more than 100,000 tons a year is required to be shipped.

The Ministry of Food and "The Trade"

The general principles on which control has been exercised over the food trades were laid down by the Food (Defence Plans) Department. Schemes for particular foods were drawn up in consultation with experts and representatives of the trade. The Report of the Department for 1937 says:—

Control will be exercised through machinery operated, so far as practicable, by food traders themselves, and before each plan is completed care will be taken to see that it is understood and regarded as workable by the trades concerned.

The machinery which has been set up consists, in the main, of associations of importers, producers and distributors, some of them voluntary and some compulsory. A few of the associations began their operations on September 1, 1939, and others have come into being as the need for them has arisen. The most important of the older associations are the Meat Importers' National Defence Association, Limited, and the Bacon Importers' National Defence Association, Limited. They unload stores, and distribute supplies to wholesalers. Marcom, Limited (formed in July, 1940), arranges for the manufacture, sale and distribution of margarine and edible fats. There are associations for the cocoa and chocolate and sugar confectionery trades, whose

avowed policy is to combine control in the interests of consumers with the maximum freedom for individual firms. The Ministry fixed price schedules, which were worked out by the Associations, which also negotiate with the Ministry on questions of supply and allocation of raw materials. Membership is compulsory for producers of 25 tons or more annually. The National Egg Distributors' Association, Limited, was set up at the time of egg rationing to act as the Ministry's agents. There is another association to sell and distribute milk powder. The Ministry has no control over Bemast, Limited, and unlike most of the other associations and companies, has no representative on its board. On the other hand, Bemast depends on the Ministry's orders in performing its functions of buying fish from Newfoundland and Nova Scotia. War-time alliances of manufacturers of cake and biscuits, soft drinks and cereal breakfast foods were formed for the primary purpose of concentrating the production of these foods.

The characteristics of each section of the trade have been taken into account in the functions assigned to each association, and in the differences to be found in the constitutions. In general it is true that the Ministry's relations with the trade have been made easier by the wartime associations. Fish provides an outstanding example of what may happen without such a link. The danger that the trade association may shape the policy of the Ministry rather than the Ministry that of the trade has not been avoided, however, in the case of strong trade associations. The delay in the introduction of the National loaf is a case in point. In the same way, it is possible that another factor making for the Ministry's success in dealing with the trade despite the many potential dangers and disadvantages of the practice, has been the appointment of controllers from the trade. (Fish, again, is one of the few commodities controlled by an outsider.) The story might otherwise have been different.

Coastal Tramp Shipping

Owners of coasting tramp ships, the only class of shipping not requisitioned by the Government, have put into operation a "Mutual Compensation Scheme." The financial control over these ships is almost as complete as in the case of requisitioned vessels. It is exercised by the Ministry of War Transport by means of schedules of freight rates covering the various trades, the rates for different voyages being based on a scale of "daily hire rates" made up of averaging operating costs and allowances of 5 per cent for depreciation and interest on average ship values respectively, these percentages being the same as under the requisition agreements. In operation, however, the experience of individual owners, usually small units, may be very different from the average results of the fleets as a whole—owing to higher depreciation charges on new, costly vessels, lengthy periods out of service undergoing repairs or substantial overtime payments in port. The purpose of the new scheme is to compensate owners suffering in these ways, or through other exceptional circumstances not taken into account in determining the rate, compensation will be paid out of a fund made up by proportional contributions from all owners participating (very few have remained outside). The scheme has been under discussion for about two years. It was referred to in *The Economist* on June 14, 1941, and May 2, 1942. The delay in bringing it into operation is presumably due partly to the difficulties of obtaining adequate support from the large number of small firms engaged in the trade, which has little experience in co-operative action, and partly to the slowness of negotiations with the Ministry of War Transport. It appears that, in effect the scale of contributions under the scheme will be a matter for agreement with the Ministry and will correspond with increases in the "daily hire rates," so that the latter may represent the true cost of operating the tonnage.

Poultry Rations

The increase in the ration of balancer meal for domestic poultry from 4 lbs. to 5 lbs. per month for each shell egg registration surrendered is welcomed by those who keep hens. Balancer meal is the stuff which makes the eggs, and any other food eaten by the hens is in the nature, mainly, of bulk. Since there are about four million people who keep

a hen or hens instead of obtaining their egg ration through the normal channels, nearly 2,000 extra tons of balancer meal will be distributed monthly. Doubtless this amount is easily available; but the reason unofficially given for allowing it to domestic poultry keepers is, to say the least, questionable. It has been suggested that the new ration has been granted to prevent the feeding to hens of bread and other foodstuffs fit for human consumption. This is, of course, illegal. It is a good principle of law that laws should be easy to keep, but it is not a good principle to ease the law because it is being broken. Commercial poultry keepers are to have some share of the larger stocks of cereal feeding-stuffs which have accumulated owing to exceptional weather conditions, but these will not be obtainable as of right. Keepers who are prepared to take delivery of the whole of their summer ration before June 30th will be entitled to an extra month's ration.

Cotton Stabilisation

Two Governments last week introduced measures to stabilise raw cotton prices. In the United States the Office of Price Administration stabilised the price for 15/16 in. middling at 21.38 cents per lb; and in India an Order was introduced prohibiting all persons from entering into forward transactions for new crop cotton or cotton options. While the Indian move is only the first step towards the solution of a difficult position arising from the country's general inflationary development, and a 26 per cent reduction in the last Indian cotton crop, the United States stabilisation order has a more final character. It is the direct consequence of the new "hold-the-line anti-inflation order," and is one of the steps towards the stabilisation of clothing prices to which President Roosevelt referred in his broadcast speech last Sunday. As international trade in cotton has been completely dislocated by the war, the two stabilisation moves are of purely national importance. They will not affect cotton prices in this country, which have for the past two years been fixed, and not directly influenced by price developments in the main overseas trading centres. The United States move, however, deserves special attention, as it covers a decisive part of today's world cotton consumption. In the last pre-war season (year ended July 31, 1939) world consumption of raw cotton, according to the New York Cotton Exchange Service, amounted to 28,507,000 bales, of which 6,858,000 bales were consumed in the United States. In 1941-42 world consumption had fallen to 25,806,000 bales; in the same season the United States absorbed no less than 11,300,000 bales. There are no reliable consumption estimates for the current season, but the general trend of rising production in the United States, and a further reaction in most other countries (except certain small consuming areas, especially Latin-American) has been maintained.

Prices of Non-Food Goods

The Oxford Institute of Statistics conducted a miniature survey into the rise in retail prices since the war of various goods other than food, drink and tobacco. The results are given by Mr G. D. N. Worswick in the Institute's *Bulletin*, Vol. 5, No. 4, dated March 13th. Information was obtained from three shops in Oxford; one gave an estimate of the average rise in price, from which indices were obtained. The base is vaguely defined as pre-war = 100, and the following rounded figures to this shop's prices at the beginning of this year: Furniture, 250; household textiles, 265; hardware and china, 185; fancy goods, 185; leather and travel goods, 185; drugs and toilet goods, 150. From a second shop, the following indices, based on 40 items, were obtained: Hardware and china, 176; fancy goods, 195; leather and travel goods, 234; drugs and toilet goods, 155. The third shop gave an index of 166 for 60 hardware and household items, of which gardening equipment was 154, and other items 169. It is unfortunate that the Ministry of Labour's cost of living index cannot be used as a guide to changes in the price of these goods; it only deals with a few of them, in a group which includes tobacco, fares and newspapers, and which has a small significance in the total index (the weight allotted to it is 1 in a total of 12½). The Institute's researches are an attempt to define the considerable rise which is apparent in prices of household and similar goods. In view of the smallness of the sample the value of the conclusions of the article must be warily estimated. An outstanding example of the range of the price changes is given by the difference in the indices for leather and travel goods; in the first

shop it is 185, and in the second 234. Mr Worswick finally concludes that prices of non-food merchandise have risen by 75-100 per cent since the war. The average housewife would probably consider this to be an underestimate. Consumers' problems in regard to durable and semi-durable goods, as much as being concerned with the great rise in prices, are aggravated by scarcity. There are complaints of maldistribution of some of the necessarily small supplies, and there is no guarantee that they go to consumers who need them most. This is a problem for the Board of Trade.

The Sources of Sulphur

Sulphur is the most valuable non-metallic mineral after common salt—sodium chloride. As an element its most important application is in the vulcanisation of rubber, natural and synthetic. It is used in insecticides, paper, paint pigments, explosives and textiles. The rayon industry consumes carbon bisulphide as a solvent. Sulphur is the major raw material for manufacturing sulphuric acid—easily the leading heavy chemical and a vital solvent employed by a score or more key chemical and metallurgical industries. In recent years the United States has been producing nearly 75 per cent of the world's sulphur, Italy 10 per cent, Japan 4 per cent, and Spain, Chile and the Dutch East Indies 2 per cent each. The United States is thus in a position fully to satisfy the sulphur needs of the United Nations. Axis Europe depends largely on Italian native sulphur, supplemented by elemental sulphur extracted from Norwegian pyrites and by-product sulphur from industrial and waste gases. Japan is virtually self-sufficient. Nearly all America's ample sulphur comes from the salt domes of the Gulf Coast region in Texas and Louisiana, and was developed during the last war, when pyrite imports from Spain were curtailed at a time when the demand for sulphuric acid rose steeply. Output of the acid rose from 4,047,000 short tons in 1914 to 6,726,000 in 1917. The consumption of domestic sulphur rose from 267,000 in 1914 to 969,000 in 1917. By 1941 production of sulphur totalled 3,150,000 tons and consumption for all purposes nearly two million tons. Output last year exceeded 3,500,000 tons and stocks at the Gulf Coast mines alone were above 4,000,000 tons. From 1896 to the end of 1940 the United States produced in all 49 million tons of elemental sulphur. The country's consumption of sulphur and sulphuric acid by principal industries is divided as follows:—

Sulphur Consumption in 1941 in Long Tons		Sulphuric Acid Consumption in 1941 in Short Tons	
Chemicals*	1,060,000	Fertilisers*	2,500,000
Fertilisers and Insecticides	450,000	Chemicals	1,790,000
Pulp and Paper	360,000	Iron and Steel	1,450,000
Explosives*	83,000	Oil Refining	1,400,000
Paint and Varnish	65,000	Coal Products	940,000
Dyes and Coal-tar Products	65,000	Non-ferrous Metals	800,000
Rubber	55,000	Paints and Pigments	700,000
Food Products	6,000	Rayon and Cellulose Film	555,000
Miscellaneous	95,000	Textiles	190,000
		Explosives*	165,000
		Miscellaneous	550,000
Total	2,239,000	Total	11,040,000

* Including substantial tonnages absorbed by war industries.
Source:—Estimates by Chemical & Metallurgical Engineering.

America is an important exporter and the British Empire countries, largely lacking in natural sulphur, are the principal importers of the commodity. Canada has no native sulphur but elemental sulphur, sulphuric acid and ammonium sulphate are obtained from smelter gases and pyrites. The amount thus obtained in 1939 had a sulphur content of 96,000 tons. Great Britain extracts sulphur from industrial gases. Australia has taken steps to do so. India has native sulphur in Baluchistan to satisfy her vital needs. Palestine produced 1,400 metric tons of the commodity and exported 1,045 tons in 1940. The importance of American sulphur to the Empire countries is illustrated by the following table:—

To	US SULPHUR EXPORTS					
	Crude Sulphur (in Long Tons)			Sulphur Crushed, Ground, etc. (in 1,000th)		
	1938	1939	1940	1938	1939	1940
United Kingdom	99,135	112,810	245,469	4,935	5,001	3,987
Canada	82,651	142,437	197,746	5,237	6,687	5,983
Australia	108,465	109,341	78,766	3,806	1,143	708
New Zealand	43,167	49,753	64,776	300	282	211
South Africa	11,298	19,911	29,460	1,251	1,823	2,580
Total, incl. other destinations	579,107	627,819	746,468	28,463	56,102	44,229

From the table it can be seen that exports of crude sulphur have, in all cases except Australia, risen considerably.

NOTICES

THE STERLING TRUST, LIMITED

(Formerly The Alabama, New Orleans, Texas and Pacific Junction Railways Company, Limited)

REDEMPTION OF FIVE PER CENT. "A" AND "B" DEBENTURES

NOTICE IS HEREBY GIVEN that in accordance with the Conditions endorsed on the above Debentures, as modified by Supplemental Trust Deed of 18th October, 1940, the Company will repay at 101 per cent, on 1st November, 1943, the whole of the £438,120 outstanding "A" Debentures and £1,005,640 outstanding "B" Debentures with interest at the rate of 5 per cent. per annum (less tax) to the date of repayment.

Holders of "A" and "B" Debentures are given the right, exercisable up to the 22nd May, 1943, to exchange all or any of their "A" or "B" Debentures for an equal nominal amount of 3½ per Cent. Debenture Stock, 1963/73, which has been created by the Company for the purpose of the above redemption. Holders exercising such right will be paid in the ordinary way a half-year's interest to 1st May, 1943, at the rate of 5 per cent. per annum (less tax) on the "A" or "B" Debentures exchanged and not later than 1st June, 1943, will receive a cash payment at the rate of £2 per cent. on the nominal amount of the Debentures exchanged representing the difference between the redemption price of 101 per cent. and the price of 99 per cent. at which the new Debenture Stock is offered in exchange. A full half-year's interest (less tax) will be paid on the new Debenture Stock on 1st November, 1943.

Holders of "A" or "B" Debentures desiring to accept the above offer should immediately apply for particulars of the new 3½ per Cent. Debenture Stock and the necessary Exchange Acceptance Form, which can be obtained on application at the Company's Registered Office, 310 Gresham House, Old Broad Street, London, E.C. 2, or at the Company's Bankers, Messrs Glyn, Mills and Co., 67 Lombard Street, London, E.C. 3.

The Trustee of the 3½ per Cent. Debenture Stock, 1963/73, will be Share and General Investment Trust, Limited. Consent of the Treasury has been obtained to this issue under Regulation 6 of the Defence (Finance) Regulations, 1939. It must be distinctly understood that in giving this consent the Treasury does not take any responsibility for the financial soundness of any schemes or for the correctness of any of the statements made or opinions expressed with regard to them.

By Order of the Board,

A. J. BEEDELL, Joint Secretary.

310 Gresham House, Old Broad Street, London, E.C. 2.
1st May, 1943.

CITY OF REGINA

FIVE PER CENT. CONSOLIDATED REGISTERED STOCK, 1943-63

For the purpose of preparing the Interest Warrants due 1st July, 1943, the BALANCES will be STRUCK on the evening of the 1st June, 1943, after which date the Stock will be transferred ex-dividend.

For BANK of MONTREAL,
EDWARD POPE, Manager.

47 Threadneedle Street, E.C. 2. 1st May, 1943.

PROVINCE OF ONTARIO

THREE AND A HALF PER CENT. REGISTERED STOCK, 1946, AND FOUR AND A HALF PER CENT. REGISTERED STOCK, 1945-65

For the purpose of preparing the Interest Warrants due 1st July, 1943, the BALANCES will be STRUCK on the evening of the 1st June, 1943, after which date the Stock will be transferred ex-dividend.

For BANK of MONTREAL,
EDWARD POPE, Manager.

47 Threadneedle Street, E.C. 2. 1st May, 1943.

DOMINION OF CANADA

THREE AND A QUARTER PER CENT. REGISTERED STOCK, 1958-63

For the purpose of preparing the Interest Warrants due 1st July, 1943, the BALANCES will be STRUCK on the evening of the 1st June, 1943, after which date the Stock will be transferred ex-dividend.

For BANK of MONTREAL, Financial Agents of the Dominion of Canada in London,

EDWARD POPE, Manager.

47 Threadneedle Street, E.C. 2. 1st May, 1943.

PROVINCE OF NEW BRUNSWICK

FOUR PER CENT. REGISTERED STOCK, 1949

For the purpose of preparing the Interest Warrants due 1st July, 1943, the BALANCES will be STRUCK on the evening of the 1st June, 1943, after which date the Stock will be transferred ex-dividend.

For BANK of MONTREAL,
EDWARD POPE, Manager.

47 Threadneedle Street, E.C. 2. 1st May, 1943.

PROVINCE OF QUEBEC

FOUR AND A HALF PER CENT. REGISTERED STOCK, 1954

For the purpose of preparing the Interest Warrants due 1st July, 1943, the BALANCES will be STRUCK on the evening of the 1st June, 1943, after which date the Stock will be transferred ex-dividend.

For BANK of MONTREAL,
EDWARD POPE, Manager.

47 Threadneedle Street, E.C. 2. 1st May, 1943.

COMPANY MEETINGS

MERCANTILE BANK OF INDIA, LIMITED

EFFECT OF WAR-TIME CONDITIONS

SIR CHARLES INNES'S STATEMENT

The fiftieth annual general meeting of the Mercantile Bank of India, Limited, will be held in London on the 18th instant.

The following is an extract from the statement by the chairman, Sir Charles A. Innes, K.C.S.I., C.I.E., circulated with the report and accounts:—

The salient features of the balance-sheet are considerable increases in our cash and Government securities coupled with decreases in bills and loans and advances. These features are partly due to the fact that all our branches in Burma and the Far East are out of action owing to the Japanese invasion, and that the field of our operations is now confined to India, Ceylon and Mauritius. Partly they reflect the changes brought about by war conditions in the trade which before the war the Eastern Exchange Banks used to finance.

DIMINISHED VOLUME OF TRADE

The volume of that trade has been greatly diminished by the restrictions on imports and exports which shipping difficulties have necessitated, and the character and machinery of the trade have also changed. Before the war it was merchant trade and it was financed for the most part by bills of exchange. These bills were bought by the Exchange Banks, and in normal times a large proportion of our funds is always on the water, that is invested in bills against goods in transit by sea. Now there is little shipping space except for goods required for the war effort, among which must especially be mentioned the great staple exports of India, Ceylon and Mauritius, tea, jute, seeds, hides, rubber and sugar.

All these are now purchased in bulk by the supply departments of His Majesty's Government, and they are paid for in rupees in the country of export. Thus the commercial bill of exchange has become scarce, and moreover in present conditions exporters have less need for advances from the banks to finance the purchase, preparation and storage of produce for export. I am making these remarks not in any spirit of complaint but purely by way of explanation. The development I have mentioned is just one of the incidents of the war. But we may at least hope that it is merely a temporary phase. It is not only the Exchange Banks that have been affected. We may well hope that one of the objects of the Government's reconstruction policy will be to restore the City of London to its former position of pre-eminence in the finance of international trade.

CASH AND SECURITIES

There is also another reason for the increase in our cash and securities. The monthly statistics published by the Reserve Bank of India show that in August, 1939, just before the outbreak of war, current deposits with the scheduled banks averaged 123 crores and that the proportion of advances to all deposits was 47 per cent. In August, 1942, current deposits had risen to 295 crores, and the proportion of advances to all deposits had dropped to 21 per cent. By the end of January, 1943, there had been a further increase of current deposits to 351 crores. The fact is that for reasons which must be plain to all who know India, the Government of India have not found it possible to exercise the same control over prices and profits as has been applied in this country.

Large profits are being made and the level of taxation though high is not as high

as in this country. Thus savings are accumulating at a rapid rate. The implications of this fact for the future are obvious. Industrial development has made rapid strides in India during the war and, provided that the savings are not now dissipated in unsound ventures, there should be ample capital resources for further advance after the war. In the meantime, for lack of suitable commercial or industrial outlet, the money is placed in current account with the banks.

RESULTS OF YEAR'S OPERATIONS

In the light of these remarks it is not a matter for surprise that the profit shown in the profit and loss account, namely £131,916, is less than in the previous year. Indeed, it is satisfactory that in all the circumstances the decline was not greater, especially as our working expenses in the East have been increased, not only by the allowances we are making to our interned officers, but also by cost of living allowances to the local staff in branches that are still working. The effect of this latter factor will be even more apparent in the accounts of the current year. The figure of profit has been struck after making provision for all bad and doubtful debts other than those relating to branches in territories occupied by the Japanese.

This is the fiftieth annual meeting of this bank. Before the war we had planned to celebrate the anniversary in a manner worthy of the occasion, but you will agree that in present circumstances the policy we are adopting is the wise policy. We are maintaining the reduction of dividend which was first made in the second half of last year, and we are husbanding our resources against the day when we shall reopen our branches in the Far East. I hope and believe that that day is not far distant, and when it comes I am confident that another era of prosperity and useful service will open up for the bank.

MOSS' EMPIRES, LIMITED

INCREASED DIVIDEND

The forty-fourth ordinary general meeting of Moss' Empires, Limited, was held, on the 5th instant, in London.

Mr R. H. Gillespie (the chairman) presided, and commented on the balance-sheet and profit and loss account for the year 1942, which showed a reduction in debenture stocks by a further £4,800. There was an increase in investments by a further £3,000 in War Bonds, making a total of £78,000 in War Bonds, which excluded £50,000 subscribed to the "Wings for Victory" Week and £100,000 tax reserve certificates. Freehold and leasehold properties had been increased by £25,252 by purchase of a leasehold property. Provision for Imperial taxation amounted to nearly £203,000, representing an increase of £98,000 over the previous year. Trading profits had increased from £237,740 to £334,958. After making all provisions the profit and loss account balance was £111,108 as compared with £104,699 in 1941. The proposed ordinary dividend for the past year was 12½ per cent., against 10 per cent. for 1941, and they carried forward to the current year's account £45,325. Over £300,000 had been paid in entertainments tax, making £4,300,000 since inception of the tax.

The Chairman said that in these exceptional times it was difficult to attempt to forecast the future of any business, but trading results had been satisfactory since the beginning of the year, and the standard of attractions had been maintained. It was believed that the Ministry of Labour was satisfied that a very material contribution was being made in the provision of additional entertainment for the benefit of the Services and workers in munition factories.

The report was unanimously adopted.

ARMY AND NAVY STORES, LIMITED

ANOTHER SUCCESSFUL YEAR

STRONG FINANCIAL POSITION

The annual general meeting of the Army and Navy Stores, Limited, was held, on the 5th instant, at the company's premises, Howick Place, Westminster, S.W.

Brig.-General Sir Frederick Gascoigne, K.C.V.O., C.M.G., D.S.O., the chairman, in the course of his speech, said: I would like to remind you that this is the fourth occasion during the war on which I have addressed you, and that the balance-sheet before you is the third one, under war conditions, that has been submitted to you. During these three years we have managed to pay a dividend of 7½ per cent.—that is if you agree to our recommendation on the present occasion—and, what is equally, if not more, important, to strengthen our financial position generally.

I do not know what the feelings of our shareholders were at the beginning of, say, 1940, but your directors certainly did not anticipate that after three and a half years of war they would be able to present a balance-sheet as satisfactory as I hope you will consider the one we are presenting today to be. This has been brought about by reductions of expenses at home and by the very satisfactory results of our Indian branches.

FINANCIAL STRENGTH MAINTAINED

The result of our reduced expenses and our increased trading profit is a net profit of £186,043, or almost exactly £74,000 more than last year, which I hope you will consider satisfactory.

It has not been easy to adapt our organisation built up over the course of years to the new conditions, and we are fully alive to the many inconveniences the restricted services and supplies have caused our customers.

It can be no secret to those of you who do your shopping personally that much of our selling space has been requisitioned by the Government. Other space, previously occupied, as stock rooms, has also been taken over. Although it has meant considerable dislocation and rearrangement, we have, of course, willingly co-operated with the Authorities, who, on their side, have shown us every consideration.

The uppermost aim of your directors during the past three years has been to preserve the sound financial position of your company and to maintain its goodwill until we return to normal times and can continue the development of the Stores, to which the war temporarily put a stop. Your financial position has been preserved and your goodwill has not been impaired.

GOOD BUSINESS IN INDIA

Business in India remains good, and stocks are sufficient to see us through the financial year, which ends there in August. It is true that the greater part of the profit made there has to be handed back in the way of Excess Profits Tax, but the balance makes a nice addition to our general profit.

As regards the prospect of your business as a whole during this year, the volume of trade at home for the first three months has not been unsatisfactory; expenses are likely to be on a lower level even than last year; and the trade in India continues to be good. There is no reason to think the results there will not be as good as last year. The unknown factor is to what extent we shall be able to replace our stocks in this country as they are sold. Everything depends on that. You know how much we had to start the year with; we have been fairly successful up to the present in acquiring new stocks; and you can rely on us doing our best in this respect in the future.

The report was adopted.

E. POLLARD AND COMPANY, LIMITED

RECORD TURNOVER

The thirty-first annual general meeting of E. Pollard and Company, Limited, was held, on the 5th instant, at 159, St. John's Street, Clerkenwell, London, E.C.

Mr H. Edward Pollard, the chairman and managing director, who presided, said: This is the thirty-first annual report of the company, though actually it is nearly half a century since the beginning of the business of shop fitting, which has developed into the present organisation, covering, as you are aware, many ancillary trades and manufactures. To some extent it is also the end of the first period of our war trading, because many outstanding matters have been concluded and extended contracts completed, while certain taxation matters, the subject of an appeal, have been agreed in a satisfactory manner with the authorities.

The turnover of the year under review was easily a record for the company. All our factories were fully extended, and in spite of the continued difficulties all manufacturers are experiencing, a record output was reached. Great credit is due to the staff and management for their unceasing efforts, and also to the factories, both the permanent employees and the newcomers, for their co-operation.

PROFIT AND DIVIDEND

The profit for the year ended December 31, 1942, is controlled by the Excess Profits Tax, and, after providing for this, was £86,172. From this is deducted the items in the profit and loss account and also the War Damage Insurance, redemption of debentures and income-tax, leaving £31,880 available. Out of this the 7 per cent. dividend on the preference shares has been paid and £10,000 placed to reserve, and so with the amount brought forward from the previous year there is left £46,270. The directors recommend a dividend of 7½ per cent. on the ordinary shares, leaving a balance of £34,783 to be carried forward to 1943.

Comparing balance-sheet items at the end of 1942 with the corresponding figures at the end of 1941, you will notice the greater liabilities in the bank overdraft and in creditors, both due to increased trading. Taxation also shows a large increase, and in this connection reserve has been made to cover the estimated liability for Excess Profits Tax on the 1942 profits and a part—about £10,000—of the income-tax on these profits. The latter is in the nature of a deferred liability, since the actual payment does not become due until 1944.

The reserve, including the debenture reserve, now stands at £27,200, as against £15,487 in the 1941 accounts. On the asset side of the balance-sheet there is an increase in the amount due from subsidiary companies accounted for by advances made to them during the year for the liquidation of certain charges on two of their buildings. Still their buildings are now fully let and are showing a profit.

WORK IN PROGRESS

You will notice that there is a decrease in the amount of stock, which we are unable to replace owing to present restrictions. Work in progress now stands at £430,992 net, as against £267,472 in 1941, and the sundry debtors are now £436,287, as against £290,118. It will be seen that the total of these main trading assets is £936,173, as against £659,231 in 1941.

In regard to the future I can only say that at the present time we are very busy indeed, our order books are full, and there is no indication that our factories will be otherwise than fully employed in the current year.

With a view to strengthening the technical side of the board a seat has been offered to, and accepted, by Mr A. C. Marsh, who has been in active management of the company's factories for a

number of years. The members will be asked to approve his appointment by re-electing him at this meeting.

The report and accounts were unanimously adopted, and the dividend of 7½ per cent. on the ordinary shares for the year was approved.

Mr A. C. Marsh and the director retiring by rotation, Mr A. C. Caldicott, were re-elected to the board, and the auditors, Messrs A. R. Welchman and Company, were re-appointed for the ensuing year.

ASHANTI GOLDFIELDS CORPORATION LIMITED

MR JAMES H. BATTY'S REVIEW

The annual general meeting of this company was held, on the 5th instant, in London.

Mr James H. Batty, chairman of the corporation, in the course of his speech, after paying a tribute to the late Lord Luke, said that it was proposed to convert the issued shares into stock, and the necessary resolution to give effect to this would be submitted to the meeting.

The profit for the year amounted to £1,156,537. As mentioned in the directors' report, it was recommended that a final dividend of 35 per cent., less tax at 10s. in the £, should be paid on May 6, 1943. This, with the interim dividend of 45 per cent. paid on August 27, 1942, made a total of 80 per cent. for the year under review. The sum of £100,000 had been appropriated for excess profits tax, and it was proposed to transfer the sum of £10,000 to the staff pension fund. The amount carried forward at September 30, 1942, was £370,193.

Some reduction in output had been inevitable and the figures for the year were 210,000 tons treated for 235,527 ounces of gold. Costs, excluding development, rose by some 1s. 8d. per ton, partly as a result of the lower tonnage but chiefly on account of the rising cost of stores and spare parts.

Development at 7,304 feet was only one third of the previous year's figure. The work was for the most part confined to the lower levels of the main shaft section. It was not possible to do much development on the lower grade Obuasi South Reef.

The reserve showed a fall of 40,505 tons, due to less development, and an increase of 0.3 dwt., owing to most of the productive development having been on the richer levels adjacent to the main shaft at the bottom of the mine. This condition of things was likely to persist until development could be extended to the less accessible and lower grade Obuasi South Section. The reserve represented over nine years' supply of ore on the present basis.

With regard to current operations, he hoped they would maintain their present scale of output.

The following resolutions were passed by the meeting:—

Approval of the report and accounts.

Declaration of dividends.

Re-election of three directors.

Re-appointment of auditors.

Conversion of 6,242,787 ordinary shares in the capital of the company which had been issued and fully paid up, into ordinary stock.

BIBIANI (1927) LIMITED

MR JAMES H. BATTY'S ADDRESS

The annual general meeting of this company was held, on the 5th instant, in London.

The chairman, Mr James H. Batty, in the course of his speech, after paying a tribute to the late Lord Luke, said that it was proposed to convert the issued shares into stock, and the necessary resolution to give effect to this would be submitted to the meeting. A considerable amount of clerical work would be saved, and the change would in no respect affect the present rights of shareholders.

The profit for the year at £230,256 had been arrived at after allowing £70,259 for depreciation on plant, machinery and buildings and main shafts.

As mentioned in the directors' report, it was recommended that a final dividend of 17½ per cent., less tax at 9s. in the £, should be paid on May 6, 1943. This, with the interim dividend of 7½ per cent. paid on August 27, 1942, made a total of 25 per cent. for the year under review. The sum of £100,000 had been appropriated for excess profits tax, and it was proposed to transfer the sum of £5,000 to the staff bonus fund. The amount carried forward at £95,188 would be practically the same as the previous year.

Difficulties connected with staff and stores had compelled them to somewhat reduce their throughput. 252,000 tons had been treated for a return of 76,711 fine ounces of gold.

Very little development had been possible in the mine. The greater part of the 6,033 feet driven was for stope preparation, and in connection with ventilation and filling arrangements.

On the metallurgical side extraction had improved to just over 90 per cent. A satisfactory feature had been the success of the research department in finding methods to reduce consumption of imported chemical reagents.

With regard to current operations, the company hoped at least to maintain its present scale of output.

In conclusion, the Chairman said that much attention had been devoted during the past year to making the company as independent as possible of overseas supplies.

The following resolutions were passed by the meeting:—

Approving the report and accounts.

Declaration of dividends.

Re-election of two directors.

Re-appointment of auditors.

Conversion of 2,500,000 ordinary shares in the capital of the company which had been issued and fully paid up, into ordinary stock.

PINCHIN JOHNSON AND COMPANY, LIMITED

RECORD TURNOVER

MR EDWARD ROBSON'S REVIEW

The annual general meeting of Pinchin Johnson and Company, Limited, was held, on the 5th instant, at Tigbourne Court, Witley, Surrey.

Mr Edward Robson (the chairman) presided.

The directors' report stated that trading during the year had been extremely complicated owing to the extended control of essential materials and labour, but in spite of such difficulties the company's turnover established a record. All foreign and overseas units, with the exception of those in enemy-occupied territories, had continued to operate successfully.

The continued high level of stocks and outstanding debts, together with the slight diminution of available cash resources, must still dictate a conservative policy in regard to dividend distributions. Prospects for the immediate future continued to be dependent upon the requirements of the Government Services, industrial activity and export trade.

The chairman's statement circulated with the annual report and accounts was as follows:—

"Following the practice of the past two years, the proceedings at the annual general meeting will again be formal, and my statement to the shareholders is therefore circulated with the report and accounts. Recent restrictions imposed on the use of paper for this purpose make it imperative that I be as brief as possible.

Post-war planning of the company's interests is continuing to receive the earnest attention of your directors, and I would again emphasise that the technical activity in the company's laboratories has

(Continued at foot of next page)

RECORDS and STATISTICS

STOCK EXCHANGES

London

Note: all dealings are for cash

ALTHOUGH there has been little expansion in turnover during the past week, demand has been sufficient to raise *The Financial News* ordinary share index to a new high of 99.1. In contrast, the *gilt-edged* market was dull until midweek, with small persistent losses for the irredeemable and long-dated stocks. In a quiet *foreign bond* market, both Japanese and Chinese bonds weakened. Demand for *home rail* issues, in particular equities, was strong. GWR and LMS ordinary stocks rose 1 and ½ points respectively, while among the marginal issues LMS 4 per cent 1923 preference was particularly strong. Argentine rail issues rallied in mid-week, several senior stocks advancing. Elsewhere, Canadian Pacific ordinary jumped ½ point.

Demand in the industrial market was selective, although midweek saw a slight broadening of interest. Brewery shares were firm. Courage exceptionally lost 2s. on the Hodgsons' Kingston offer, but gains up to 1s. were plentiful. Tobacco issues, however, were virtually unchanged. Motor shares were steady to firm, but changes nowhere exceeded a few pence. Allied Iron was prominent in a strong heavy industrial group with a rise of 3s. Dorman Long, Hadfields, Sheepbridge and Powell Duffryn all advanced between 9d. to 1s. 6d. Textile issues were rather irregular, although gains generally outweighed losses. Stores issues were firm, while among the dollar issues, Brazilian Traction, International Holdings and Hydro Electric all forged ahead, the first mentioned rising 2½ points.

In the absence of Cape support, *kaffir* issues were marked down slightly, generally ½. A mild revival of buying in midweek from the Cape for *diamond* issues raised De Beers deferred ½ and Consolidated Diamonds 4s. 6d., while Anglo American Investment advanced 4s. Rubber shares were dull, and *tea* issues fluctuated without trend. In the *oil* market, Ultramar jumped 3s. 6d. in anticipation of a new issue, while leading stocks closed slightly higher on the week.

FAVOURABLE war reports and encouraging earnings statements induced widespread buying on Wall Street throughout the week. Steel, and other affected issues, rallied on the coalmine labour truce, while Tuesday witnessed one of the most active sessions since 1940, many leading issues achieving new high levels for the past three years.

Total share dealings: April 29, 1,341,000; April 30, 1,359,000; May 1, 844,000; May 3, 2,349,000; May 4, 2,805,000; May 5, 2,470,000.

* Two-hour session only.

COMMODITY AND INDUSTRY NEWS

Spices Allocation.—The Minister of Food has accepted the recommendations of the Combined Food Board on the allocation of cinnamon, mace, nutmeg and pimento available from British Empire sources. Supplies of cinnamon, mace and nutmeg are far below normal requirements of the United Nations and friendly countries, and allocations of all four spices have been deemed necessary to assure equitable distribution in the interest of all countries concerned. The current allocation divides supplies among six areas: Canada, the United States, other Western Hemisphere countries, Russia, the United Kingdom and other Eastern Hemisphere countries. This

COMPANY MEETINGS—continued

continued at a high level and is now playing a great part in furnishing the varied and new products required by the Government for essential war and national purposes.

A point worthy of note in the directors' report is that the proposed addition of £60,000 to the reserve for contingencies will raise that fund to a total of £200,000, while the carry-forward is increased to £169,202.

I again take the opportunity of paying tribute to my co-directors and the staff for the hard work which has been accomplished during the past year under exceedingly trying conditions.

The chairman then formally moved:—"That the directors' report and balance-sheet at December 31, 1942, as submitted, be received and adopted, and that a final dividend of 6 per cent., less income-tax, be declared and paid to the holders of the ordinary shares on the register of the company at April 13, 1943."

The resolution was carried unanimously. The retiring directors were re-elected and the auditors reappointed.

procedure has been adopted by the countries concerned. In addition to the quantities allocated, the Board has set up an unallocated reserve for use in adjusting possible inequities in its allocations. The pre-war consumption of cinnamon and cassia, which are used interchangeably in the United Nations, totalled about 25 million pounds annually and came largely from South China, French Indo-China, Netherlands Indies and Ceylon. Supplies of cinnamon are restricted to those available from Ceylon, and supplies of nutmegs and mace to those available from the British West Indies.

Corn Merchants' Association.—Corn and agricultural merchants are among the distributive trades which are required by the Government to release a further proportion of their staff and to effect further economies in transport. These merchants are engaged in the collection of home-grown grain from farmers in the distribution of animal feeding stuffs, fertilisers and seeds. Corn and agricultural merchants are forming a war-time association to be known as "Camco" (the Corn and Agricultural Merchants' War-Time Company). This company will be administered by a central board working through divisional committees. Meetings of traders are now being held to elect members to the divisional committees. It will be the function of these committees to co-operate in the arrangements for economy of transport and man-power so as to ensure that efficient services are still maintained.

Cotton Utility Allocations.—Greater freedom between the weaver and the converter was introduced in the method of operating the converters' allocations for rayon Utility fabrics some weeks ago; and it was stated at the time that if results were satisfactory, endeavours would be made to apply a somewhat similar procedure to

GOVERNMENT RETURNS

For the week ended May 1, 1943, total ordinary revenue was £50,673,000, against ordinary expenditure of £121,206,000. There were no issues to sinking funds. Thus, including sinking fund allocations of £463,077, the deficit accrued since April 1st is £319,348,000 against £278,551,000 for the corresponding period a year ago.

Out of Africa

AFRICA is free. German Europe is in sudden danger. The next assault on Hitler's outworks was already looming before Tunisia fell; the furious bombing of Italian ports on the mainland, in Sicily and in Pantellaria was a warning. It may well have been the shadow of a new threat that hastened the decision of the German High Command to write off a hopeless struggle. Faced by overwhelming forces, outmanoeuvred in hard and bitter defensive fighting, outmanoeuvred in what Mr Churchill has called a "model of the military art," and unable to bring in supplies by sea or air, the last Axis army in Africa collapsed almost overnight. The delaying action that had lasted for six precious months, and gained some time for Germany to mobilise the remnants of its reserves for this year's decisive battles, ended in total loss; all that is left of a proud and experienced force is 150,000 helpless captives. British casualties, nearly 11,000 since mid-April, were small by contrast, and fewer than many had feared. Three years after the Italians strutted into Egypt for a formal kill, less than one year after the Germans were in sight of the Nile, the Allied victory was complete.

This is the real turning of the tide, the transformation signalled by the triumph of Alamein and the Allied landings six months ago and made possible by the prodigious resistance of the Russians. In Washington the Prime Minister and the President are scanning a vast

panorama of opportunity. This spring it is in Italy and the Balkans that fevered preparations against invasion are being made. What England faced in 1940 Axis-controlled Europe faces in 1943. The Mediterranean danger to Italy and the Balkans, to the islands and the mainland that front Hitler's southern borders, is only the beginning of the story. In France, the Lowlands and Scandinavia, there is the same stirring. Allied armies now stand poised for the spring on every side, in this island, in Russia, on the Mediterranean shores, in the Levant and Asia Minor. Mr Churchill's "ring of steel," which was an article of faith three years ago, has become a fact. The superior economic strength of the free peoples, which was only a straw to clutch in 1940, is now reality, translated into men and guns. The problem of deployment, of bringing the strength of industrial democracy to bear against the totalitarian aggressor in battle, is near solution. The issue may be long drawn-out. In the Far East there is a great war to be fought. But it is, perhaps, worth remembering that a bare two months before the German collapse in November, 1918, the War Cabinet was debating between 1919 and 1920 as the most propitious date for the final offensive.

The knife-edge escapes have been many. There have been perilous times in the desert. The achievement is vast: the tenacity that held Britain and the Middle East against

the enemy horde; the resilience that forged an instrument of victory out of the sand and grit of Libya; the pride and courage and organisation that defied logistics to hold apart disastrous tides of battle in the West and East; the master-plan that fused the armies of three nations in the final advance on von Arnim; the leadership, engineering and ingenuity that gave air, artillery and mechanical warfare its greatest triumph in Tunisia. Alamain to Cape Bon is an historic progress. El Agheila to Alamain was its foundation; American troops, French troops and British troops, of the First Army as well as the Eighth, vied in the finale. For all the power of the machine it was a soldier's victory.

"The pattern for the ultimate defeat of the Axis," as the President called it, has been established: the unity of free nations in battle; the unity in combat of all arms, hour by hour; the murderous, decisive use of air bombardment, on a scale and with an efficacy unknown to Goering. The Allies have at last the chance to match their power with their deeds, to overcome space and distance and to marry the efforts of Britain and the United States with the brave and bloody labours of Russia. Upon the taking of this chance depends the duration of the tragic conflict that has already slain, maimed, starved, impoverished or desolated so many millions. Physically and psychologically, the enemy is stretched almost to the limit. Italy is naked to a hostile world. The effect of massive bombing on German output, morale and transport is now heavy. New bases have been won for bombers to assail Axis warmaking night and day from every point of the compass. The might of sea-power has once more been vindicated. The Mediterranean is all but open; and every Axis coast is in peril.

Germany is not down and out. Great contingents are mustering on the Russian front, and troops and supplies are moving into the Balkans. Many divisions are assembled in France, and the submarine offensive is still in spate. The *Luftwaffe* is still in being. The Nazis can no longer strike to kill; but they can strike to wound and delay. They may plunge yet again into hard-hit Russia. They may thrust desperately and dangerously against the very source of their ruin—the island fortress of Britain. Assuredly, they will play, in their worst hour, upon the frustrations and divisions that still mar the unity and strength of the Allies: the short-sighted opportunisms that bring forth a Darlan in freed French Africa, that thrust Russians and Poles into polemical conflict and blur the prospect of a free, peaceful, prosperous and friendly world—the old antagonisms of class, custom, creed and

nationalism. The dictators can rely no longer on their own strength. They look instead to the weaknesses of their foes.

This is the challenge. The victory in Africa will be known by its fruits, by the speed with which the harvest is reaped and by the combined action of the reapers, in the Mediterranean, in Russia and elsewhere—by common action in wide-flung battles and by honest, able and agreed peacemaking. Tunisia is a symbol of hope, as well as of strength and unity. *The Times* Correspondent in Tunis has written: "In this triumphant hour, it is worth remembering that the real honour belongs . . . to the dogged infantry who went in on Good Friday and sweated and climbed and fought, the men of Longstop Hill and the Bou, of Banana Ridge and Peters Corner, the gallant and uncommemorated men who hammered the stubborn German defence into brittleness, so that it broke under the final blow." Behind the clangour of the victory bells there is the mournful rolling of the muffled drum; it will swell as the advance goes on. The debt of Dunkirk, as the King has said, has been paid; but there are other and deeper debts. The young men who died or were crippled on those harsh Tunisian hillsides ask for no fine words or memorials, no vicarious play with their sufferings and sacrifice, no wordy pledges. With their comrades of Norway, Belgium, France, Greece, Crete, Malaya and Burma, with the few of the Battle of Britain, with the many of Russia's resistance, with the sufferers of subjugated Europe and the stricken Far East, with all those lost by sea, on land and in the air, they want what they went out to fight for—a sure end to the war. They have expiated the sloth and blindness of other men. They have given their lives and their vigour that others, more fortunate, may finish the job.

The men who die or are crippled in freedom's armies follow neither Fuehrers nor demagogues. They serve neither the "hard-faced business men" nor the bigoted doctrinaires. They are ordinary men with ordinary homes and families and ordinary aspirations—with sober hopes of peace and security and opportunity. They hate war; they fight to get it over, and to keep it so. *Il faut en finir* became a counsel of despair in bedevilled France. But it remains the creed of the many millions who press forward, now with high hope and renewed confidence, to the unconditional surrender of the aggressors. Something new must surely come this time out of Africa, something new and strong and resolute and full of hope, that will enable the world at last to ensue the peace it seeks.

Ritorneremo?

ON May 5th, when opening the seventh annual celebrations of the founding of the Italian Empire, the Duce struck a note of intransigent optimism. "We must and will return to Africa," he said; and again:

The great enterprise is not ended; it has only been interrupted. I know that millions and millions of Italians are suffering from an indefinable ill called "African nostalgia." There is only one way to cure it: to return to Africa. And we will return.

In raising the question of the future of his erstwhile empire at the close of a year which has seen the loss of the last of the African possessions, it is unlikely that Mussolini was speaking wholly for home consumption. His speech and those of a number of lesser fascist officials are to be regarded as putting forward a claim to continued ownership despite the vicissitudes of war and a warning that ultimate recovery would be in the forefront of Italy's post-war aims. Thus, the Senate rapporteur on the Estimates for Italian Africa observed that Italy would certainly return to those lands which were hers by historical right, by right of conquest and of the sacrifices of blood and wealth sustained to bring them civilisation. Primarily intended to put heart into the Italian people, these pronouncements appear also to have been destined

for the ears of Allied statesmen. For, with the exception of Abyssinia, the future of the Italian imperial possessions is still undecided, and the Duce no doubt hopes to extract a statement of policy from the spokesmen of the United Nations.

The problem posed by the conquest of the Italian empire is, indeed, an important one since it raises, as the defeat of Germany will not, major questions of colonial settlement. It is axiomatic that Allied victory will restore the national independence of sovereign states overrun by Axis aggression. Many difficult frontier and minority problems will remain to be worked out, but the principle is clear, and its first application has already been the return of Haile Selassie to the throne of his ancestors. On December 17, 1942, Mr. Eden stated that the British Government is anxious to secure the future independence of Albania. Its liberation will form part of the general European settlement rather than of the liquidation of the Duce's colonial possessions. In disposing of these, there is no rule of thumb which can be applied ready made. There is a strong case for ceding to Greece the Dodecanese, with their overwhelmingly Greek population, with perhaps the proviso that in the interests of world peace the United Nations should keep and maintain naval

and air bases. Early in 1942, Mr Eden gave a guarantee to the Sayd Idris el Senussi, head of the Senussi Fraternity, the Arab sect which forms more than ninety per cent of the population of Cyrenaica, that his community should never again come under Italian rule. For the rest, the ground is uncharted. Broadly speaking, there are four possible solutions: that the former Italian colonies should be given self-government; that they should be ruled by an international civil service under the auspices of some future international body; that they should be ruled by members of the United Nations as mandated territories; and that they should revert to Italy. There are already signs of the onset of an Italian campaign to win back by diplomacy the empire from which Mussolini has been beaten by force of arms.

The campaign has been launched in Italy by the Fascist Party leaders to the accompaniment of threats and demands. It will seek to influence Allied and neutral opinion by subtler and more persuasive arguments which it is well to recognise and assess from the outset. There is first of all the familiar "have-not" case: that Italy, if deprived of colonial possessions in which to "expand," will be driven into perpetual opposition to the peace settlement. To this it must be objected that, shorn of Abyssinia and Cyrenaica, Italy will in any case dislike the peace treaty and that Italian good-will cannot be bought by the return of Tripolitania, Eritrea and Somaliland.

All three colonies are poor, infertile and almost devoid of mineral resources. An important part of the Italian case for retention is likely to be based on economic and pseudo-humanitarian grounds. Attention will be drawn to the Italian record, and it will be claimed that, apart from the regrettable but inevitable periods of pacification associated with the name of Marshal Graziani, the neo-Roman rule was enlightened and enterprising. It is true that in the coastal districts of Libya the Arabs have been given a modified Italian citizenship; that good roads have been built; that town planning is impressive; that modern medical services have been introduced; and that agriculture and the local industries have been fostered. There are many advocates of Italian rule in Libya who have been struck by the air of efficient management and modern construction. It is no doubt less true, as an Italian radio commentator claimed on April 5th last, that "the natives lament our departure without troubling to hide their grief from the invader." But there will certainly be a drive to present Italian colonial rule as desirable in the interests of the governed. Finally, there is the claim on demographic grounds that Italy, unlike Germany, genuinely has something of a population problem, which can only be eased by emigration to suitable colonial territory; and that Marshal Balbo's feat in planting Libya in 1938 with some 20,000 Italians of peasant stock in specially constructed modern townships implies a moral right to reap the fruits of the investment.

It may be admitted at once that, especially since Mussolini began to take his empire seriously after the conquest of Abyssinia, there has been considerable achievement. Roads have been built, the desert has been reclaimed and production raised. But there has been no recognition of any principle except Italian self-interest, which cannot in these days justify the maintenance of an imperial system. After the empire was inaugurated in June, 1936, Italy devoted considerable resources to imperial development, and put into its possessions very much more than they yielded. There was a staggering increase in colonial expenditure. The official figures show a rise of total ordinary and extraordinary expenditure from L.456,213,000 in 1933-34 to L.5,774,802,000 in 1937-38. In terms of commerce, the expansion is even more striking. Exports from Italy to the empire rose from an average of L.348,500,000 for the quinquennium 1931-35 to L.2,448,900,000 in 1938. Imports from the empire over the same period rose from L.85,600,000 to only L.209,100,000. The essence of the scheme was, of course, the long-term development of a militarist autarky. Private enterprise continued to find the field unattractive. A census of joint stock companies in Italian East Africa—which included Ethiopia—and in Libya estimated that there were, in 1938, 246 concerns with a total nominal capital of only L.328,496,000. Total investments, including those by the state, were put at some L.900,000,000. It is possible that Italy's peasant settlers in Libya would have made their farms a paying proposition within the twenty-five years agreed for the termination of their *métayage*, but the result of Balbo's experiment was still very much in the balance at the date of Italy's entry into the war.

The material improvements in Libya and Eritrea, by which some observers have been dazzled, are impressive enough in themselves; but physical development alone constitutes no claim to continued ownership. Italy in the past has been concerned with the efficient long-term exploitation of some exceptionally unrewarding strips of African desert. The fact that the economic reward, even in the very long run, promised to be so slight turned the Italian empire into a menace to world peace. Unable to convert it into an economic asset, Mussolini determined to exploit its strategic possibilities. Intensively developed on totalitarian lines, Libya, Eritrea, and later Abyssinia provided a convenient jumping-off ground for the conquest of richer provinces, Egypt and the Sudan. Their conquest would have made the imperial façade a going concern. If the African possessions were returned to a liberal and democratic Italian Government, completely purged of Fascist and aggressive elements, there would be three possible lines of policy which it could adopt. It could cut development to a minimum and allow the territories in question to stagnate; it could develop them at considerable expense, with slight and distant hope of material reward, in the interests of the local

inhabitants; or it could develop their military and strategic potentialities with a view to expansion. The return of the former possessions, as such, could not possibly convert Italy into a satisfied power; and in the long run there is almost a certainty that an enterprising Government would return to the third line of policy. There is, then, an overwhelming case against returning any of the African possessions to Italian government.

So far, alternative methods of disposing of the imperial white elephant have been little discussed in public. Indeed, the liquidation of the Italian possessions can hardly be considered apart from the question of the development of backward territories as a whole. For the greatest problem they present is economic and not political. Obviously, there is no question of adding them to the colonial possessions of any of the United Nations. This war is not being fought for territorial aggrandisement, as Mr Eden has often pointed out. But the fact that so much unrewarding capital investment is required before the former Italian colonies can be turned into an attractive habitat for any members of the human race does suggest that the self-government solution is inappropriate. Not all the native peoples concerned are ripe for

the exercise of even political independence. They are far too impoverished to pursue a constructive economic policy. The mandate solution is also fraught with complications. It is very possible that there would be no great enthusiasm among the powers directly concerned, Great Britain and France, or even the United States, over the prospect of extending or taking on commitments in Africa. Progressive administration of any of the three colonies is onerous and costly. If this is regarded, as it should be regarded, in the light of a charge on world resources, there is a strong case for claiming that administration should be international. In an international colonial service, there is no reason why suitable Italians—and perhaps Egyptians and Abyssinians—should not exercise their imperial talents alongside the young men of the United Nations. The cost of development, in so far as it is not self-balancing, must be met from the resources of those powers which control the richer colonial territories of the world—as a contribution to world peace and prosperity. If the contribution is not made in this form, it will be made in the form of payment for future wars. For possession of an imperial liability by a poor nation places a great strain on its will to avoid aggression.

A Policy Against Monopoly

IT is becoming difficult to keep up with the series of admirable speeches in which Mr Herbert Morrison, alone of his War Cabinet colleagues, is working out the practical policies of the post-war years. Of the three speeches delivered on successive days at the end of last week and at the week-end, the first and third receive some comment elsewhere in this issue of *The Economist*. The second of the series, delivered to a Labour Party meeting at Birmingham on Saturday, was in many ways the most important of the three. It had two main themes, neither of them new in Mr Morrison's mouth, but both of them gaining rather than losing from repetition. The first theme was the necessity for the Labour Party to grow up to its responsibilities and to regard itself as something more positive than the permanent Opposition. On this, Mr Morrison had much that was wise to say. But it was necessarily addressed in the main to his immediate audience, and it is his second theme that deserves the widest national echo. This was "the real post-war issue . . . the great issue of the relations between the state and industry." The substance of Mr Morrison's remarks is worth quoting at length:

It is the fundamental question of home policy in our age, it is the question which, by our failure to solve it, dragged Britain down before the war into slow decline and nearly into utter defeat. We have to keep rubbing in the fact that between the wars Britain was drifting towards a form of organisation that was thoroughly bad. More and more of its major industries were running their own affairs in their own way on a basis of effectual monopoly without real positive control by the State, and without any true regard for the wider interests of the nation. It must be the duty of the Labour Party to drive these facts home to the whole population so that every time anyone mentions the word "Federation" or "Association," the public gets on its guard and begins to ask itself, "Should those words be translated Monopoly, Price Ring, Restriction Group?"

For some time to come after the war—and I don't mean only the so-called transition period when we are still in a state of economic emergency, but a period longer than that—the real practical issue in Britain will not be the maintenance of private enterprise. Over a very considerable part of the economic field there won't be genuine private enterprise in the old sense—or any prospect of it. The real issue will be whether centrally organised industries shall be allowed to run their own affairs in their own separate way on a basis of restriction, monopoly and safety first, or whether the State will find means, by public ownership or some form of public control, to ensure that they are operated in the interests of expanding national wealth and a policy of full employment.

You will remember that the Beveridge Report is based on three assumptions. Children's allowances which we shall I believe get, a comprehensive health scheme which I also believe we shall get, and a policy of full employment which we may get. But if we don't get it, Beveridge and a whole lot of other things will in the end go down the drain. The only way we shall get it is by turning our backs on the philosophy of restriction, of high prices, of so-called self-government in industry which really means the freedom of industrial monopolies from public control. That's a big job. There will be some very powerful interests and some very plausible arguments in the way. Here, then, is the real job of work for us who believe in social security. Here is the big crusade of public education on which we of the labour movement ought now to be setting out. I solemnly warn the movement that it will neglect, subordinate or turn its back on this issue at its peril. If we don't face it squarely, and get the country on to the right line, so as to ensure that the public interest be first in fact, as well as in words, we are heading towards the end of working-class progress, and towards our country's decline into a miserable, complacent "Little Englandism."

It is possible to quarrel with some of the undertones of this speech. Not everyone, for example, will accept the implication that this issue is an exclusive concern of the Labour Party—as Mr Morrison said, with perhaps explicable understatement, in another connection in the same speech, "it would be churlish to deny the Liberals some share of the credit." Nor would it be right to encourage the growth of any belief that the choice for general industrial policy lies only between "public ownership" and "public control"—though to apply this choice to "centrally organised industries," as Mr Morrison did, is fair enough. But these are small points compared with the main substance of Mr Morrison's argument, and on that main substance the only appropriate comment is one of deep satisfaction that at last, at long last, a leading member of the Government is consistently taking up, as a major issue of public policy, the cancerous growth of monopoly and restrictionism.

It is not enough, however, as Mr Morrison himself would be the first to insist, merely to inveigh against the course of the disease. What is wanted now is a practical policy of treatment. The ardent defenders of monopoly are still comparatively few; but they are supported by a much larger body of acquiescent opinion which, while not very happy about the economic history of the past dozen years, is yet disposed to think that there is little to be done about it, to say that "you can't put the clock back," or that "you can't unscramble eggs." This is the opinion that must be convinced and converted and brought to believe that it is fully possible to move—not back, but

forward—to a position in which genuine private enterprise in some industries acts as partner to enterprising public management in others.

The first step is to learn the facts. There has been no authoritative enquiry into the structure of British industry since the Balfour Committee in the middle twenties. Since then a whole new undergrowth of associations and combinations has grown up. From time to time the strands are parted, and a glimpse is given of what goes on in the depths of the jungle. The private investigator sometimes ventures in, but his resources are small, and he has to beware the dragon of libel. In general, the public has no idea of what is going on, and, though one may fear and suspect, it is difficult either to prove or to disprove the suspicions without the facts. The first necessary step, then, is a commission of enquiry—a Royal Commission, with its power to call witnesses *sub pœna*. As a result of wartime experience, there are plenty of public servants in the Ministry of Supply, the Board of Trade, the Ministry of Food and elsewhere who could quickly lead such a Commission to the truth. It would, however, be fatal to await the final report of such a Commission before proceeding to policy. The main outlines of the problem are known, and the detailed facts are needed to drive home the necessary reforms, not to determine their shape.

What lines should reform take? The discussion inevitably starts from American experience in the deliberate control of monopoly over the past fifty years. There is a mountain of misconception in this country about the anti-trust laws. For one example, many people have read in their student days accounts of the trust-busting adventures of Theodore Roosevelt, and imagine that American anti-trust practice is still in that stage. But trust-busting—the forcible dissolution of monopolistic corporations—has long ago been abandoned. For many years the enemy of the Anti-Trust Division of the Department of Justice has not been the fact of monopoly, but the act of restriction; and it is now recognised in America that greater danger comes from the restrictive acts of trade associations than from the outright monopoly of trusts. Secondly, there is a general belief in this country that the American anti-trust laws have not succeeded in their purpose. Nothing could be more untrue. It may be that one or two manifestations of monopoly or restrictionism escape from the net, and the very vigilance of the American public in hunting them down gives the impression that such practices are the general rule rather than the rare exception. It is true that the Government finds anti-trust litigation slow and complicated, and not always successful. But even if it were the case (as it is not) that the Government lost every suit that it brought, the anti-trust laws would still be an outstanding success for their deterrent effect. Anyone who is sceptical of this effect can be recommended to study closely the practice of business in the United States and the United Kingdom. Two examples will suffice to prove the point. The American trade association of a certain industry, which in this country is riddled with monopoly, has the standing rule that if at any of its meetings any member so much as mentions the price of the industry's products, the chairman must immediately suspend the meeting. A New York newspaper recently raised its advertisement rates. The department stores of the city, acting in concert, withheld their advertisements. Within a few weeks they had been indicted by the Federal Government, convicted and heavily fined. These examples do not sound like ineffective enforcement.

Nevertheless, no one would recommend that American practice should be copied in this country. The American procedure is too legal; in this country the existence of a more smoothly operating administrative machine makes possible less drastic solutions. Moreover, the American doctrine is too sweeping for this time and place. All but a handful of the stoutest die-hards would admit that there may, on occasion, be a case for restraint, control and organisation. The problem is to find a means of distinguishing when these things are in the general interest rather than of banning them completely.

It should not be difficult to discover effective means. One method would be to pass a declaratory Act formally

reviving the old common law doctrine against combinations in restraint of trade. The Act should specify and define the four main varieties of harmful combination. These are the fixing of minimum prices; the fixing of maximum quotas of production; restrictions on entry to a trade; and combinations to reduce or limit the productive capacity of an industry by scrapping existing plant or restricting the building of new plant. These activities (possibly with some minor variants) should be declared to be *prima facie* harmful to the public interest, and any firm or association of firms believing it had a case to be allowed to practise them would be required to prove that case and obtain a dispensation, either from a Government department or, preferably, from a standing Industrial Commission. The Commission could attach to its permit such conditions as it thought appropriate. In this solution everything, of course, would depend on the policy of the Commission. If it proved to be like the Import Duties Advisory Committee it would be a very poor watchdog. But IDAC was a reflection of the Brummagem policies of the thirties, and the hope of resisting the growth of monopoly and restriction rests on the belief that the policies of the post-war Parliament and Government will be inspired with a very different spirit. If Britain reverts to Chamberlainism, then indeed its days are numbered.

An Act of this character would not, in itself, be sufficient. It would not, for example, solve the problem posed by the trust proper—that is, the single firm in a monopoly position. Such firms have at least the opportunity to achieve maximum technical efficiency and pass on the benefits to the public, and it would be wrong to destroy this opportunity either by trust-busting or by too negative and restrictive a control. The remedy for this particular difficulty might be found along the lines of prescribing for such firms a much greater obligation of publicity in accounts than the Companies Acts impose on industry generally. It might also be found possible to require that a number of publicly appointed directors should be admitted to the boards of such companies.

Patent law is another aspect of the same general problem. The law long ago formulated the general proposition that a patentee had no right to prevent his patent from being used, provided appropriate royalties are paid. The duty of the state is now to revive and enforce this view of a privilege which the state itself confers.

Nor should the effect of tariff protection be forgotten. This is not the place (or the time) to revive the general controversy between Free Trade and Protection. But even if the main case for protection be, as a hypothesis, conceded, it is still true that the particular machinery created by the Import Duties Act placed a large premium on the monopolistic organisation of British industry. It ought to be unnecessary to insist that a protective tariff can be justified only if it serves the general interest of the community at large—but after the experience of the past eleven years such insistence, so far from being unnecessary, has become an urgent matter of public policy.

Finally, there is the labour aspect of the matter. It would be wholly wrong to think of the growth of restrictive practices entirely in terms of black Capital and white Labour. The American laws have been seriously weakened by the exemption of labour unions from their purview, and it should be very clearly understood in this country that restrictive practices are bad, whoever commits them. Mr Morrison himself has no illusions on this score.

Certainly the philosophy of monopoly may offer to a limited number of workpeople some relative stability of employment at a relatively satisfactory wage. But at what cost? At the cost of unemployment for the rest, of insecurity for the rest, of keeping down the national income as a whole by producing less than we could produce, at prices higher than we need; at the cost of installing in the seat of power and action a philosophy which, whatever attractive baits it may hold out to some fraction of the working class, is bound to mean in the end the defeat and destruction of the whole Labour Movement and everything for which it stands. A people's movement which became the hireling ally of a restrictive monopoly capitalism would end as the tool of economic fascism.

NOTES OF THE WEEK

A Famous Victory

The end of the African campaign came abruptly, to the surprise of the military experts who had forecast a stubborn and difficult fight for the Tunisian tip. Bizerta and Tunis fell to the Allies like over-ripe fruit. The process of "ripening" had been intensive since the Eighth Army wheeled northward from the Mareth line. During recent weeks the enemy had been losing men, material and elbow-room at a rate which proved too big a drain on his reserves and supply services. The tactical *coup de grace* was delivered when the First Army, strengthened by units of the Eighth Army, advanced from the Medjez el Bab sector and the Americans took Mateur. Overwhelming Allied superiority in the air left von Arnim with little or no chance to hold out in Bizerta for any length of time. The *Luftwaffe* had abandoned the battle and withdrawn. The enemy was probably confronted with the choice between entangling himself in further fighting in Africa, to the detriment of his strength in Europe, and disengaging from Tunisia in order to cut further losses. He chose the second course. He might have been expected to attempt the evacuation of his forces. This must have been the motive of the withdrawal to the Cape Bon peninsula. But the girdle around Cape Bon was slung with speed and determination; caught within it von Arnim had no choice but to surrender. More even than the quantity, the quality of the captured forces is important. The Africa Korps was the pride of the *Wehrmacht*. It included veteran units and Panzer divisions whose irresistibility once inspired fear on many battlefields. The fact that some of them have now surrendered to the French has the eloquence of a historic symbol. The effect of the Allied victory on morale inside the European fortress can hardly be overrated. The Allies' task is now to exploit their triumph to the full. It is idle at this stage to speculate about the next moves, but one thing seems to be clear. The mounting air offensive on Axis bases in the Mediterranean has now assumed a new character, and the enemy's inner defences are being softened.

Unconditional Surrender

The problem of Italy is now at the centre of Allied strategy. Presumably it will be one of the chief topics of discussion during Mr Churchill's visit to Washington. There is little doubt that some sections of the Italian Government would like to see Italy out of the war at this stage; the people of Italy would be behind the withdrawal almost to a man. Peace feelers have been put out; and there is some sort of a case for arguing that Allied interests would be served by the exit of Italy from the war. The Allies would have the unencumbered use of Italian bases, to complete the encirclement of the Balkans and to mount an offensive against southern France. Control of the Mediterranean would be secure. A great part of the British Navy would be freed for operations elsewhere. These are arguments, however, not for doing a deal with Italy, but for putting a rapid and violent end to Italian resistance. To negotiate with the Duce or with Badoglio or with any other hurriedly produced substitute would be like bribing a way through a door which stands half open. Negotiations would saddle the Allies with commitments—commitments to persons, commitments to economic support. There could be no *quid pro quo* which the "unconditional surrender" of Italy would not give. There are even signs that the Nazis do not rule out the possibility of a negotiated peace between the Allies and Italy. They have not reinforced the Italian mainland. They may perhaps not mean to make a stand south of the river Po. They may conceivably be quite willing to hand over their useless and deflated Ally to the care of others—although it should never be forgotten that the Italian navy, by virtue of its evasive action so far, is still in being. To all these schemes and manoeuvres, the Allies have one answer, the answer of Casablanca. There must be no more Darlans; there must be fighting, not parleying; occupation, and not co-operation.

After the War

The Home Secretary's virtues as a facer of facts and a stater of truths are again recognised in a leading article on page 612. At West Bromwich last weekend, Mr Morrison set out to show why, when the war ends, the familiar controls and restraints of wartime will have to be continued "for some time." The shibboleth he was attacking was the belief that the end of the war will mean, or that it should mean, an instant return to "normal." The fact is that the control and allocation of the nation's resources are a function, not of war, but of the physical scarcity that war brings; and that scarcity will inevitably persist after the fighting has ended. Moreover, there is one other respect in which postwar economy must resemble war economy. The principle of "first things first" is applied in wartime to serve the obvious and unquestionable demands of the battlefronts. After the war, there will be demands, no less obvious and no more questionable, for rebuilding and re-equipment, to say nothing of the higher social and economic values that are loosely comprehended in the term reconstruction. Mr Morrison is perfectly right when he says that the post-war situation will be one of physical shortages, on the one hand, and pent-up demand for goods and materials of all kinds, on the other. He is no less right when he says that, if the controls were removed when the fighting stops, the result could only be the "mad scramble," the rising prices, the false boom and following collapse that would have marked the war itself, if the controls had been absent, and which did, in fact, characterise the period after the last war. The Home Secretary was vague about the duration of this interim period before public and private enterprise will be able to settle, unfettered by scarcity, into their proper and separate spheres. It is impossible for any man to forecast the number of months or years that must elapse before new conditions of peacetime enterprise will be established. Nevertheless, it would be an error to suppose that, because of wartime experience, the nation must be wedded indefinitely to a total control by public agencies of its economic activities. It would be wholly wrong, both in expediency and in fairness, to use wartime experience as an argument for the perpetuation of Civil Service economy. What is needed is a statement, with the authority of the War Cabinet itself, that it is intended to maintain the system of controls and allocation only so long as the requirements of scarcity and urgent priorities make it necessary; that the controls, of resources, finance and labour, will be devised in such a way as to wither away as the need for them diminishes; and that, as the transition period ends, public and private enterprise will settle down side by side with the utmost possible inducement to initiative, adaptability and expansion.

The Currency Plans

The debate in the House of Commons on the British and American currency plans produced a responsible and interesting discussion which will have advanced the prospects of international agreement. There was not the slightest tendency to adopt an attitude of "my country's plan, right or wrong." The Chancellor of the Exchequer went out of his way to declare that though the plan was a British one, the Government were not "putting the flag on it," nor would they regard any criticism of it as derogatory to national prestige; and private members were equally quick to recognise that any scheme finally adopted will have to emerge from genuinely international discussion. Members of all parties, nevertheless, made it clear that they preferred the British plan to the American. The reason given, however expressed, was virtually the same in every speech; the British plan is "more flexible," "more elastic," "more simple." The nearest to a cheer was produced, both by Sir Kingsley Wood and by Mr Pethick-Lawrence, by declarations against a return to any rigid form of the gold standard. It is evident that, on this point, British public opinion has made up its mind—though there was no dissent from the Chancellor's view that gold should have some place in the new system. This is not a distinction without

a difference. Gold should be retained as the substance of ultimate international value; but there should be freedom for reasonable flexibility in the gold value of currencies. Several speakers emphasised the necessity of avoiding competitive depreciation, of securing "reasonable stability" of exchange rates and of permitting changes in them only by agreement. But there was also agreement that it would be fatal to attempt to prevent changes when they were required. The Chancellor confirmed that the two plans had already been the subject of many inter-Governmental discussions, and that the ultimate decision would lie with a conference of Ministers of Finance. Behind the whole discussion there lies what the Chancellor called the "economic philosophy" of the plan, and if the mistake of the 1920's is not to be repeated, this somewhat cloudy area will have to be clarified before final decisions are taken on financial technique.

Taxation of Industry

A most important issue of taxation policy is to be raised in the House of Commons during the Finance Bill debates by an all-party group of Members, who include Mr Benson, Mr Spencer Summers, Sir George Schuster and Mr Graham White. The issue is that of the taxation of industry, and particularly the effect of taxation on the replacement of industrial equipment. A larger and a smaller question are equally involved. The larger question is whether it is really in the interests of public policy to continue the assumption on which the British income tax has hitherto been based—namely, that all income, however arising, whether corporate or individual, should equally be subject to income tax. In the days when a standard rate of 1s. in the £ was normal, the argument of administrative convenience was dominant. Between the wars, with the standard rate fluctuating between 4s. and 5s., the principle was much more questionable, but the needs of the revenue permitted no relaxation. But now that the standard rate is 10s. in the £ and that the prospects of reducing it below 7s. 6d. seem slight, it has become very necessary and urgent to ask what are likely to be the ultimate economic effects of putting such high fiscal obstacles in the way of industrial development. The soundest of all forms of business growth is through the "ploughing back" of profits; is it really wise to make the process so very difficult? This is not an argument that individuals who derive their personal incomes from corporate enterprise should have those personal incomes taxed any less heavily than other personal incomes. Nor, of course, is it a plea that the barriers against tax evasion should be lowered. But it is a suggestion that the common interest would be served if profits genuinely re-invested in fruitful enterprise were more leniently treated.

Whether Mr. Benson and his colleagues will venture on to this wider field remains to be seen. They may content themselves with the more restricted, but still very important, topic of the fiscal treatment of depreciation and obsolescence. The Income Tax Acts permit specified rates of depreciation of machinery and fixed plant to be deducted from profits before tax is assessed. The allowances are small, and in virtually every case considerably less than the most progressive firms actually provide for depreciation—which means that they have to pay tax on a part of what they actually provide for depreciation. Clearly, with any rate of tax, and more particularly with a standard rate of 10s., this acts to slow down the speed with which the productive equipment of British industry is replaced. The case for changing this practice and positively encouraging the modernisation of British industry, especially in the years immediately after the war, is quite overwhelming, and the reconstruction of the public finances which will in any event be necessary after the war should provide means by which the immediate loss to the revenue can be offset. Even if the Inland Revenue cannot go so far as to exempt from taxation all expenditure that is genuinely devoted to replacement and modernisation, they should be prepared to levy on such expenditure a rate of taxation below the normal, and the ability to raise and lower this rate of taxation in accordance with the state of general trade would provide a most effective weapon of trade cycle control. These are not matters that can be settled in a couple of paragraphs or in a single Parliamentary debate. But they well deserve the closest examination.

Bricklaying

Mr. W. S. Morrison made his debut as Minister of Town and Country Planning on Tuesday. He began well. His exposition of the new Town and Country Planning (Interim Development) Bill was clear and able. By it, all land in England and Wales is brought, potentially, within the ambit of planning; and power is taken, during the interim period before actual plans are drawn up for particular areas, to prevent development that might prejudice the final plans. The criticism that has been levelled against this Bill is not that it is unnecessary or wrong, but that it represents only a small and obvious first step which might well have been taken a year ago—immediately after Mr Greenwood, then concerned as Minister Without Portfolio for planning matters, promised that the necessary legislation to give effect to the recommendations of the Barlow Commission would be introduced "at an early date." Three things are needed if the industrial, agricultural and residential development of the land of this country is to be guided in the interests of national welfare and amenity, as the Town and Country Planning Acts, of which this new Bill is the latest, have so far failed entirely to guide it. The first is the necessary machinery, of which the new Ministry of Town and Country Planning—the embryo of a central authority for land-use—is part. The second is the necessary technique, which has so far been completely lacking; the main obstacle in every attempt to plan hitherto has been the problem of compensation, which the recommendations of the Uthwatt Committee are designed to solve. The third, and by far the most important, is a policy. Machinery and technique are useless without a task to perform. The planning of land-use in the past has not only been ineffective; it has also been completely negative. The questions which really want answering before any progress can be made are not questions either of machinery or procedure. They are questions of intention. Does the Government intend to control, effectively, the use of land for industrial, agricultural, residential and transport purposes? If so, what are to be the aims of this control? Control without an objective is meaningless. When Lord Reith took his turn in the procession of Ministers who have been responsible for these questions, he committed the Government, in even more specific terms than Mr Greenwood, to the recommendations of the Barlow Commission, which advised control over the location of industry in order to prevent, on the one hand, the growth of congested cities and, on the other hand, the development of derelict areas. If the Government will state a definite and positive policy, it should not be hard to work out the necessary means to implement it.

The State Within the State

The concluding sentence of Lord McGowan's remarks to the shareholders of Imperial Chemical Industries must be read as a footnote to "A National Policy for Industry," published in November last and signed by the 120 industrialists, on which it sheds a rather questionable light. The sentence is as follows:

It will therefore be our purpose to preserve your long-term interest by the maintenance of efficiency and contentment among our people, by a rising standard of education and knowledge in all our ranks, by the prosecution of our research in an ever-widening field, by our boldness in the development of the new services and products which are emerging from the industrial chemist's brain and by the wise conservation of your company's financial resources, all governed—not by any selfish interest dictated solely by the profit motive—

but by our policy of service to the innumerable people who, directly or indirectly, are our customers at home and abroad.

This is a noble conception of the duty of industry, but it rests clearly on the suggestion of setting up a state within the state; and it is difficult to attach any other meaning to the passage which has been placed in italics but that ICI is to be removed from the sphere of competition. How else are they to substitute for profitability any other criteria for assessing the value of any action they may take, and who is to say that their criteria will be valid? It is the function of Parliament to lay down at least minimum conditions for workpeople and to see to it that the legal framework within which industry operates is such that all forms of initiative can reap their reward. If, under these conditions, one firm can provide better conditions, or increased service, by its higher efficiency, all honour to it. But there must not be special enclaves, produced and kept in being by the grant of special privileges and protections, within which the employer can guarantee withdrawal from the hurly burly of life at the expense of the rest of the community.

* * *

Trials of a Neutral

In a recent speech at Eskilstuna, the Swedish Foreign Minister, Hr. Günther, defended his country against the charge of violating its neutrality. He admitted that the permission given in 1941 to transfer the Germans' Engelbrecht Division from Norway to Finland was not compatible with strict neutrality. But the transit traffic arrangements whereby German soldiers come and go between Germany and Norway on Swedish railways was not, he maintained, unneutral, since no more soldiers were allowed into Norway than came out. He concluded his defence by saying that any neutrality policy must keep in touch with reality, and must be modified according to changing circumstances. This is, of course, an understandable, if unheroic, point of view. It is not one that appeals to the Norwegians, and the Swedes themselves are finding it less and less attractive as Allied victory draws nearer and the inevitable balance-sheet—their answer to the query, "What did you do in the Great War?"—is being drawn up. There was, therefore, a general welcome for Hr. Günther's assurance that, since no time limit had been attached to the transit agreement, it could be revoked at once. It is generally assumed that the revocation will not be long delayed. British policy towards Sweden continues to be tolerant and friendly. The matter of the safe conduct traffic from the port at Gothenburg has been cleared up. Until the beginning of 1943, the Swedes were able, by dint of long and hard negotiation, to secure safe conducts from both belligerents for a dozen ships engaged in trans-Atlantic trading, especially with South America. Early this year, the Germans stopped the traffic. Their excuse was the last two Norwegian ships lying in Gothenburg harbour which had still to attempt to run the German blockade and make for England. The others had taken the risk, with varying success, in the last year. As long as the British and Norwegian Governments were trying to take these ships out, the Germans refused to guarantee safe conduct to any ship leaving Gothenburg. Now, however, the safe conduct traffic has been resumed. Presumably the British have given a guarantee not to move the ships for the time being. As the length of daylight and the clearness of the weather for the next three months would make any such attempt impossible, the interests of both the Swedes and the British have probably been served. It is nevertheless another striking example of the good will constantly shown to the Swedish people by the British Government.

United Nations Unity

One of the urgent problems awaiting Mr Churchill in Washington is the establishment of political co-operation between the United Nations on a firmer basis. The Russo-Polish dispute has come as a salutary surprise to many optimists who assumed that the Grand Alliance was an established fact, with most of its internal difficulties regulated. This increase in realism has not, however, checked the widespread and growing desire for United Nations unity. No survey of recent trends in American public opinion would be complete without some comment on the eagerness with which people are considering post-war collaboration. Mr Willkie's anti-isolationist book, *One World*, is a best seller. It is estimated that well over 200 organisations are working on peace and reconstruction, and

numberless plans are appearing, most of them stressing the need for world government. The isolationists are not beaten and they are fighting back. Their technique very much resembles that of Goebbels—to concentrate their invective on the weak points in the internationalist argument and to confuse and bedevil the issue by appealing to fears and phobias which can be set against the rational appeal for post-war collaboration. Inevitably, Russia has been singled out for virulent attention. First is the question whether or not Stalin is playing a lone hand. "Why should America co-operate," screams the Patterson-Hearst-McCormick press, "if Russia does not? Russian policy is strictly nationalist. It is about time the United States gave up its 'globaloney' and followed the same line of strict self-interest." When Mr Eden was in Washington, there was a good deal of unfriendly press discussion on the lines of Britain "selling out" to Russia and trying to persuade America to follow suit. Then there are Russia's possible aims in Europe. All the national groups in America—especially the Slavs and the Scandinavians—are being bombarded with propaganda telling them that the small nations of Europe are exchanging Hitlerite for Bolshevik domination. The Polish frontier incident has been as much a godsend to the isolationists as to Goebbels, Labour circles have been deeply stirred and upset by the execution in Russia of the Jewish Polish trade union leaders, Alter and Ehrlich. Catholics are traditionally hostile and the Polish question is increasing their intransigence. This is the background of fear and distrust which the isolationists can exploit.

*

The friends of international collaboration are not taking the isolationist onslaught passively. The "internationalists" are attempting two things—to break down the traditional fear of Russia by interpreting the Soviet system to the Americans; and to get support for international co-operation on the grounds of sheer realism. Mr Willkie, who was obviously deeply impressed by Russia—"a darned effective country"—has explained and lauded what he saw of the Russian regime. Mr Davies' best seller *Mission to Moscow* has now been made into a film in which all the political protagonists appear and which puts across the idea that Russia alone followed a consistent foreign policy in the Munich period. *Life* recently produced a complete number devoted to things Russian in which the modern, industrial outlook of the Russian people and the practical common-sense of their leaders were stressed. On the side of realism is the comment of such journalists as Eugene Lyons, who, speaking the more effectively as a noted anti-Communist, nevertheless argues that lasting peace without the collaboration of Russia is unthinkable. The statesmen are playing a hand. There are Mr Wallace's warnings about the risk of World War III unless some United Nations understanding is reached, and Mr Adolf Berle's reasoned speech at Reading, Pa., in which he stressed the historical importance to America of a strong and friendly Russia. It is difficult to be categorical about the balance of power in the pro and anti-Russian war of words. It is part of the wider struggle to secure effective American participation in the post-war world. Nothing is more important here than that Anglo-American diplomacy should end the Polish-Soviet rift. President Roosevelt is sending Mr Davies to Russia with a personal letter to Marshal Stalin. If Mr Davies' new mission to Moscow can lay the foundations for renewed understanding between Poland and Russia, he will have helped to mend the most dangerous gap in the United Nations' line.

"Cash, Kind and Care"

The authors of *Our Towns*, reviewed in *The Economist* of May 1st (page 545), laid primary stress on the need for more nursery schools. The Nursery School Association of Great Britain, which has organised an exhibition now on view at Harrods Stores, urged in its report on *The First Stage in Education* that the nursery school stage in the national educational system should be recognised, and that it should be made obligatory on local education authorities to provide nursery school education for all children from the age of two, whose parents desire it. These recommendations have now received Ministerial approval. Opening the nursery school exhibition, Mr Herbert Morrison said that plans had already been made to endow the family in cash and kind.

We shall have to turn that pair into a trio—cash, kind and care. That means the nursery school or something very like it.

It is important to realise that what is wanted are nursery schools, and not day or residential nurseries—such as have been greatly increased during the war by the Ministry of Health—or infant schools, or even nursery classes at primary schools. There should be no attempt, that is, to graft provision for children under the age of compulsory school attendance on to the present system of primary education. The nursery school has very definite purposes of its own. It aims at the organised observation of children in their most formative years, by trained staff, and carried out in properly equipped open-air buildings with provision for meals and rest. Moreover, it is part of the policy of the nursery school to work in close co-operation with the parents. Evidence of the advantages of the nursery school over the nursery class is provided in the 1937 report of the school medical officer of the London County Council, quoted in the appendix to *Our Towns*. A comparison carried out over a year showed that the children of the nursery school, all of whom had unsuitable home conditions, had a far better health record than those in the nursery class. A further advantage of the nursery school is that it enables dull and backward children, mental defectives, and problem children to be singled out at an early age for special treatment and education. The advantages were, in fact, recognised as long ago as 1918, in the Fisher Education Act of the last war, which provided that the school age could be raised to six in any area where there was adequate provision for nursery schools. They have, however, been regarded as an extra, an unnecessary liability for the ratepayers, and the provision of the Fisher Act has largely gone by the board. But "we cannot afford not to have the nursery school," say the authors of *Our Towns*.

Wanted—a Coup d'Etat

The State Department has broken off diplomatic relations with Admiral Robert of Martinique, repudiated all former understandings and recalled the US Consul General. The nature of these understandings remains something of a mystery. Negotiations for a stable settlement of the status and the supply difficulties of the French Antilles have been going on ever since the collapse of France in 1940. In the spring of 1942, after the United States had entered the war, there was a renewed attempt to secure agreement. Had he been willing, Admiral Robert could probably have secured economic guarantees in return for the immobilisation of the French warships and little more than benevolent neutrality. But, after the German occupation of Vichy France last autumn, public opinion in the United States demanded active adherence to General Giraud. The delaying tactics had gone on too long; and Admiral Robert had missed the opportunity of concluding an agreement at all congenial to himself. By the spring of this year, the main bargaining counters on both sides had been used. Martinique was being deprived of food, and the French ships had long since been immobilised. The diplomatic game had already been played to a standstill and, in the almost forgotten language of the past decade, economic sanctions were being imposed. The formal break comes *post hoc*. It is overdue; it creates no new situation and it decides nothing. For it would be uneconomic and inhumane to allow the population of Martinique to starve, the more so since it is widely believed to contain a majority of patriotic Frenchmen who deplore the local fascist Government. Faced with a similar problem, French Guiana staged a *coup d'état*. Madagascar, St. Pierre and Miquelon provide the models for other solutions. Now that Admiral Robert has been driven off the fence, he has passed unmistakably into the enemy camp. His anomalous rule should be terminated.

* * *

Setback in Burma

It would be wrong to take the loss of Buthidaung, the British bridgehead on the Arakan peninsula, too seriously. It is, admittedly, very unsatisfactory that the Japanese should continue to demonstrate their superiority in jungle tactics; that the failure of the ill-conceived Arakan campaign should be thus underlined; and that the Chinese and the Indians should be further discouraged. But the Japanese threat to India through the reoccupation of Buthidaung is no greater than last December when Field-Marshal Wavell's offensive started. When it was plain that the British force would be unable to take

the airfields at Akyab, and would be forced to retreat from the outskirts of Donbaik, it was already clear that the campaign had failed to achieve its limited objective. It was never more than a side show; and the abandonment of a few more miles of a malarial and mountainous *cul de sac* during the rainy season is in no way a catastrophe. Inevitably, the Chinese see the setback against the background of the stagnation of the Allied Far Eastern offensive—in New Guinea as well as at the back door of China—and the possibility of a fresh Japanese offensive. Obviously, there is the danger in the Casablanca plan for beating Hitler first that Japan may effectively consolidate or even extend its conquests in the meantime. Yet, if any development could justify the "one thing at a time" strategy, it is the conquest of Tunis and Bizerta and the reopening of the Mediterranean to Allied shipping. The Mediterranean is not only the water-jump to southern Europe, it is also the route *par excellence* to the East. A large scale Allied offensive in the Far East, which dissipated resources more appropriately used in clearing the shortest route, would have been wasteful and ineffective. The capture of Tunisia is a curtain raiser to the reconquest of Burma via Rangoon and the great river valleys, as certainly as it is to the storming of Europe. The presence in Washington of the chiefs of staff of the Indian theatre guarantees that there will be no neglect of the Eastern offensive. Against this, the withdrawal at Buthidaung—although not the superiority of the Japanese troops—is a small matter.

Food from North Africa

It was somewhat embarrassing, to say the least, to be told by Lord Woolton, almost before the victory was won, that an immediate effect of military success in North Africa will be to improve the food position in this country. It is no doubt the duty of the Ministry of Food to weigh up at once what benefits for British diet could be obtained from the tapping of new sources and the possibility of easier shipping facilities. But the people of this country, at this crucial stage of the war, are already adequately fed, and the demand for shipping and supplies for military purposes, which must have absolute priority, will surely be enormous in the near future. On the other hand, ships returning from North Africa in any case should not come back in ballast simply for the sake of austerity; and there are some surpluses in North Africa which must be disposed of somehow. Military considerations must prevail without reservation. The British people do not need more food, though the peoples of Russia and Europe do. But if food can be shipped without even the slightest impediment to the military effort, it will, no doubt, be welcome. Perhaps the specific promise of more sardines in the future appears somewhat superfluous in view of the fact that the points value of tinned fish has been reduced in order to dispose of it; and dried fruits, which are also promised, cannot be rated as much more than a luxury in present conditions. The fats ration too, which is also promised additions from North Africa, has been adequate up to now, though the margin is now slender. It would certainly be well to improve the food situation in North Africa itself and in the Middle East, both areas of actual and induced shortages in several respects, before organising any appreciable increase in Britain's own supplies. North Africa needs textiles to replace the sacking which is all that many Arabs, at any rate, have to wear. It will, in any case, be necessary to reorganise local production to serve local and not overseas needs. Nevertheless, these exportable surpluses already exist, notably of dried fruits and sardines; and other surpluses will arise in time. It may be both expedient and wise to take advantage of them, and to use these nearer sources of supply in place of more distant ones. But it should still be considered whether the ultimate benefit of North African surpluses, in whatever part of the world they may be accumulated, should not be kept for the relief of the occupied countries, and of France in particular.

Industry in West Africa

The biggest problem to be solved in the development of the British colonies in Africa is how progress can be reconciled with the African's own tradition and culture. Politically, the problem is how indirect rule can grow into real self-government; socially, how tribal life and customs can give way to nationalism; economically, how their

wealth can be increased without the creation of a discontented African proletariat. The establishment of an Institute of West African Arts, Industries and Social Sciences near Achimota College in the Gold Coast does not, at first sight, seem a big step in finding a solution to this problem. Actually, however, its influence should be far-reaching. To begin with, it will be mainly engaged in the development of local industries, such as brick and tile making, pottery and the spinning and weaving of cotton. But the long-term policy of the Institute, which has been under discussion for some years now, goes further than this. It aims, not at merely reviving local crafts—pottery, for instance, used to be an old native craft—but at transforming them into small, but modern and economic, industries. Thus, it is attempting to bridge the gulf between the old African village economy and modern industry. The craft of the native used to produce beautiful things. That craft is now disappearing under the impact of cheap imports from Europe and Japan, and the native has begun to lose his craft or debase it in an effort to copy the European. The new Institute aims at saving the old aesthetic values and directing them to the production of things which are really wanted by Africans, not by tourists for curios, and which can be made economically. It will also train Africans to manage the industries, thereby giving wider opportunities for employment to the intelligent and skilled African, who, hitherto, has often found himself thwarted, though means must first be found to provide him with the necessary capital. This extension of opportunity, in its turn, will help to solve the political and social problem. A grant of £127,000 has been made, under the Colonial Development and Welfare Act, to establish the Institute—the largest individual grant made for an educational project. It will be money well invested.

* * *

New Pensions Bill

The promise in the King's Speech at the opening of this parliamentary session that

Renewed consideration will be given to the position of Old Age and Widowed Pensioners and further measures will be laid before you

has been fulfilled in the Pensions and Determination of Needs Bill which was introduced in the House of Commons this week. Broadly speaking, the new Bill provides a great number of very small improvements in the position of different classes of pensioners, but for the great majority of those in receipt of old-age pensions, who number 3½-4 million, there is hardly any improvement at all. The main change is in respect of widows under 60 with dependent children. Hitherto, supplementary pensions have only been payable to persons in receipt of old age pensions, or to widows in receipt of a widow's pension under the Contributory Pensions Act, if they are over 60 years of age. Since it is highly unlikely that a widow over 60 should have children of school age, this stipulation has automatically excluded all widows with children from applying for supplementary pensions, and their only means of supplementing their pensions of 10s. a week, plus 5s. for the first and 3s. for every subsequent child, apart from finding employment, has been public assistance. The new Bill allows them to apply for supplementary pensions instead. Another clause raises from £300 to £400 the maximum sum to be regarded as capital assets, and therefore not immediately available to meet his needs, possessed by a person undergoing a needs test for unemployment assistance, supplementary pensions or financial assistance for the blind. The Bill also reduces the national weekly income per £25 of this capital from 1s. to 6d. The third principal change is the application of the principle of the Determination of Needs Act—the substitution of an individual needs test for a household means test—to the grant of outdoor relief under the poor law and the provision of financial assistance to the blind. Thus, once again, Britain's social services have had to be patched up by an *ad hoc* measure. If proof were still needed of the case for a unified scheme, such as was proposed by Sir William Beveridge, this hotch-potch Bill provides it.

* * *

The Peers at Home

It is normally the practice of the House of Lords, or at least of that proportion of its members who have come recently from the Commons or the Services, to concern itself, as Lord Balfour of Burleigh claimed on Wednesday of last week, with "questions of broad national interest."

The deliberations of Britain at war have been much enriched by their proceedings. Twice recently, however, the Lords have become rather more introspective. Last week, an entire debate was devoted to the status of question-time in the Upper House. On Tuesday, this week, Lord Hemmingford called for the removal of the last traces of religious discrimination in civil office. Both these topics concerned the House's own chairman, the Lord Chancellor, who sits on the Woolsack, outside the actual confines of the House, but speaks, like any other peer, from the ordinary benches. The Lord Chancellor is in no sense a Speaker. He has no control over the practice and deportment of the House. It was argued last week that, if starred questions—that is, those which are designed simply to elicit information and not to provoke debate—were limited to a restricted period on a specific day, there would be no officer of the House competent to hold members within the dictates of the regulation. It was the general feeling of those who spoke that to abandon the present flexible procedure, by which questions of both sorts are taken as they come, would be to sacrifice the peculiar freedom and self discipline of the Lords' proceedings. The purpose of the proposal, which came from a Select Committee of the House—the Committee's own members, in the debate, were oddly different about their own proposals—was strictly practical. The reason for suggesting a set time for questions, on Tuesdays, was that responsible members of the Government could then know when to attend and reply. But the balance of opinion was that the material advantage to be gained would be outweighed by the appearance of an attempt to translate the procedure of the House of Commons, a ruling body, into the House of Lords, whose functions are deliberative. Question time in the House of Commons is a pivot of the constitutional and political system. It is the method whereby the people's representatives keep watch and ward over the doings of the Executive. The position of the Lords is quite different. They seek information, presumably, as distinguished and dutiful individuals. That they should continue to deliberate with as little formality as possible is probably wise—though the intentions of those peers who would like to see their proceedings somewhat more efficient and somewhat less wasteful of time are doubtless of the best.

* * *

The Lord Chancellor

The peers were not inclined to act upon Lord Hemmingford's proposal that the Lord Chancellorship should be made definitely available, by statute, to Roman Catholics. The position is obscure. The Roman Catholic Relief Act, of 1829, which absolved holders of civil office from religious tests, specifically excluded the Lord Chancellor. On the other hand, there is a belief among several experts that the Victorian statutes, of 1863, 1867, and 1871, which made it no longer necessary for any office-holders to swear an oath of their religious beliefs, in fact rectified this omission. At any rate, as Lord Simon pointed out, the Lord Chancellor does not at present make any declaration of religious faith or swear any oath except those of allegiance and faithful service. It would be fantastic if any person of any belief or unbelief were to be excluded, in these days, from any office; and it is a pity that this was not made plainer on Tuesday. It is gratifying to have the definite statement from the Lord Chancellor that Jews are not excluded from the highest legal office. It should surely be made equally plain, by statute if need be, that Roman Catholics are similarly free and equal. To suggest that this would produce a massive and indignant outcry is to do a disservice to British democracy and vastly to overvalue the brazen lungs of a recalcitrant and anomalous minority.

Shorter Notes

A good deal of wishful thinking went to General Franco's recent plea for a negotiated peace. "We have arrived," he said, "at a dead end. None of the belligerents has strength to destroy the other." The Caudillo is in error. If he will only wait, he will see just how completely the power of the Anti-Comintern states—of which he is the non-belligerent associate—will be destroyed.

*

Sir Basil Brooke, the new Prime Minister of Northern Ireland, has formed his Cabinet. He has at least proved himself able to sweep very clean indeed, for with the exception of Mr Grant, Minister of Labour, not one member of the former Cabinet has been retained.

AMERICAN SURVEY

Hours in Akron

(From an Industrial Correspondent)

Cleveland, April 10th

IN what used to be less than an hour's automobile drive from Cleveland's Terminal Tower lies Akron, the centre of the American rubber industry and currently a whirlpool of labour and a confusion of counsel on working hours. The swirl of labour and housing problems was brought about by the immigration of nearly 100,000 persons to join a 1940 population of 349,700 in the metropolitan district. Subtracting 25,000 who have joined the armed forces, about 450,000 are trying to live in a city built for 350,000. Most of the strangers have been accommodated as lodgers with families of older residence; about 1,000 houses have been built or are building; 200 automobile trailers have been brought in; and 500 "demountable" pre-fabricated houses are being assembled.

The current confusion is mainly over the order to the city to adopt the 48-hour working week. This was issued by the War Manpower Commission last September, and recently a "deadline" was placed at March 31st. But today several hundred stores, service establishments and other employers are still running on shorter schedules.

The Akron community presents a somewhat extreme example of the difficulty of standardising anything American, particularly a custom like working hours, over which so much emotion was aroused in the turbulent 1930s. The city has the largest plants of three of America's four leading rubber companies, Goodyear, Goodrich and Firestone; the district is also the home of three middle-sized ones, General, Mohawk and Seiberling; and it still has a few of the small rubber companies like those from which the industry sprang. The city's selection as the home of the rubber business was largely accidental; in 1870 Dr B. F. Goodrich answered a Board of Trade advertisement of the city's advantages, moved his plant there and the rest grew up about it.

Shares in the big three companies are owned all over the world, with a considerable interest in Britain, and four have a string of factories in other countries. Before Pearl Harbour, Goodyear owned 94,000 acres of rubber plantations in Sumatra. Firestone still operates upwards of 35,000 matured acres in Liberia. All three of the leaders are now heavily interested in synthetic rubber. The Dunlop-trained president of Goodrich, John L. Collyer, took his company into synthetic production ahead of any other in the industry.

Exit Tyres

Until the 1930s, the city made the bulk of the nation's automobile tyres. But, following an epidemic of "sit-down" strikes and other labour troubles, beginning in 1935, it rapidly decentralised by the building of a number of specialised tyre plants elsewhere. The withdrawal of tyre work left a good deal of vacant space in the old and large rubber factories, and this was available for the Government orders commencing in 1940. By 1942, all this room had been taken up; the chronic surplus of living quarters had given way to a shortage; and new industrial works were being erected. In addition to tyres, the city is manufacturing quantities of other rubber and fabric goods and metal products. For the first time in its history it has become widely diversified.

Akron entered the war period with a working week in the tyre industries of 36 hours, and in the rest of the city of about 40 hours. Rubber workers were averaging well over \$1 an hour in wages, the second highest pay schedule in America. The short week, shorter in Akron than in any other city, had been installed at the demand of the United Rubber Workers, a union which arose in 1933 and 1934. Its purpose was to spread the work to a surplus of workers.

This 36-hour week persisted into 1942, and though in many departments it became merely a point at which to begin computing overtime pay at time and a half, hundreds

of tyre builders still kept to 36 hours. The new plants and new departments in old plants operated on longer hours. Last fall, employers were ordered to take 48 hours as their target. By February, they were averaging 45 hours, with other employers at 43½ hours. Tyre builders resisted the extension, on the ground that to go to 48 hours would release a number of workers who would have to take jobs paying so much less, that even at extra hours, they would make no more money than they formerly did. The hours were steadily lengthened, however, and today some of the experienced men put in 56 hours and receive extra pay enough to give them the equivalent of 68 hours. A pay check of \$100 a week is not uncommon in Akron today, repeating an experience in the last war. The total payroll is now about \$23,500,000 a month, giving the city one of the largest per capita incomes in the world. Retail sales have been more than doubled in the last two years; shortages of merchandise are chronic there; and all the phenomena of inflation are present.

Working Weeks and Overtime

Today Akron industry has a conglomeration of working weeks, running from 36 hours in a few jobs to 56 in others. Bartenders in the city's pubs happen to be on a 48-hour week, and are petitioning the War Labour Board to give them a 40-hour base, so that they can collect some overtime pay without having to go into the mills. Some officers of rubber unions want the 48-hour week spread over seven days so their members can receive double time for Sunday work. Women are prohibited by Ohio law from working more than 45 hours in manufacturing, but the law is widely ignored.

The main resistance to the new standard 48-hour week comes from mercantile and similar establishments which say they can do no more business in 48 hours than they have been accustomed to do in less time. More than 200 exceptions have been filed to the Manpower Commission's 48-hour order, and it is announced that these will take some time to apply. Where they can show that no persons

ORDINARY FIRE DAMAGE ONE-THIRD GREATER THAN PRE-WAR

Serious Handicap to War Effort

SINCE the war, loss to the nation through ordinary fires has gone up by one-third. Last year, well over 1,000 fires broke out in Britain every day.

This figure represents a serious handicap to the war effort. More serious still is the diversion of manpower, of raw material and of shipping required to repair the loss.

Who is responsible for this needless destruction, and why cannot precautions be taken, in the national interest, to stop it? Here is the answer:

Most fires are caused by some simple act of carelessness by a normal person who thinks that he (or she) is careful.

It is estimated that nearly 50% of the fires are caused by matches and cigarette ends.

Every reader of this paper is asked to help to reduce this terrible national loss from fire. Smokers are

specially appealed to. Remember, that it's "careful" people who start fires—and that means you! Be more than careful, be sure. Be absolutely certain that your match is quite out before you throw it away. Never leave a cigarette end burning even in an ashtray. Stub it out.

**Most fires are caused by 'careful' people.
Don't just be careful—take EXTRA care.**

would be released, employers are not required to conform.

The Akron situation is being closely watched by employers in Cleveland, who have been notified they must go on a 48-hour schedule in about four weeks. The metal-working plants in Cleveland are now nearly all working 48 hours, some of them many more. The firm of Jack and Heintz, a new concern between Cleveland and Akron, keeps its force employed seven days of 12 hours each, the overtime payments adding enormously to the incomes of the workers. This plant, the object of much inquiry by national magazines lately, is noted for its plant "spirit," its bonuses, its monthly banquets and its free vacations in Florida. Production per worker is phenomenal, but only the stronger are able to stand the pace.

American Notes

Behind the Truce

The coal truce expires on May 19th. As yet there is no assurance that that day will not bring another walk-out, although the President, in his press conference, pointed out that the miners were working for the Government and that in all his years of public service he had not heard of a strike against the Government. The impasse appears to remain the same—that the Administration requires a settlement between the union and the operators agreeable to the War Labour Board, and that Mr Lewis refuses to recognise the Board and demands a contract from the Government. The Board's fact-finding panel has begun its hearings, in public, because of the ostentatious absence of any representative of the miners, and with an inviting reminder that "the latch-string is on the outside of the door." The period of the truce has been called a war of nerves. There are two hints of what may be about to happen. Congress has lost no time in preparing anti-strike legislation. The Senate, by a vote of 63 to 16, has passed a Bill (introduced by Senator Connally, Chairman of the Foreign Relations Committee—a fact which may prove to have its significance) providing that the Government may seize war plants where stoppages occur and that it then becomes a crime punishable by fine or a year's imprisonment to instigate further strikes in these plants. The House is said to be considering more drastic legislation. Such a law, if the President signed it, would provide an effective weapon in the present crisis, but it would embitter the miners and alienate the other great labour bodies, which are already proclaiming that a "war against labour" has been declared. The conservative press, on the other hand, feels that it penalises the innocent owner more than the strikers. Another possibility is suggested by reports that the War Labour Board itself feels the "little Steel" formula is unenforceable in the face of the rise in living costs unless it is further clarified—which can only mean weakened to permit further increases. The Senate, in voting to give a statutory basis to the WLB, adopted an amendment which, it is said, would make it possible to ignore the little Steel formula and by-pass Mr Byrnes's powers over wage stabilisation. Congressmen, in short, are more interested in preventing strikes than inflation, and if the heart of the public could be searched, its attitude would probably be the same, in spite of all the propaganda on the effects of inflation. This is the fundamental weakness of the President's position and the strength of Mr Lewis's. The Administration is working hard to "roll back" the cost of living, but it is doubtful whether time is sufficient for its efforts to convince the miners and conquer the profound scepticism of their leader. The way in which the coal dispute is handled over the next few days will be momentous both for the stabilisation programme and the future of labour relations.

The Cost of Living

The coal dispute is a symptom, although admittedly a violent and complicated one, of the broader struggle to adjust the cost of living. The problem has become so urgent, if wage stabilisation is to have even a chance of success, that the Price Administrator has announced that on June 1st the retail prices of meat, butter and coffee will be "rolled back" by about 10%. According to reports, this is to be accomplished by the use of subsidies to the processors. As Congress has turned a hostile ear to earlier requests for funds for subsidies, the money is to come from

the Reconstruction Finance Corporation, and there are stories of a \$2,000 million a year programme. Attempts will also be made to reduce the price of fresh vegetables and fruits. The over-all aim is to reduce the cost of living by about 2½%, and bring it back to the levels of September 15, 1942. At the same time, an energetic effort is to be made to enforce the ceiling prices, which should be easier now that dollars and cents retail ceilings are being established. It is expected that they will cover 80% of all consumers' goods by June 1st. The belief is that once the cost of living is cut back, and firmly under control, the ground for further wage demands will no longer exist. Opinion in the United States, which has been strongly against subsidies, appears to be gradually changing, and a number of commentators have pointed out the success of the British subsidy policy. It remains to be seen, however, how gracefully Congress will accept this open by-passing of its long-standing aversion to the use of subsidies by the Administration. There is almost sure to be an accusation of political manoeuvring in their use. Mr Davis, the Director of the Office of War Information, was quite right in calling the step the "most decisive action yet taken in the endeavour to hold the line against inflation." One can only hope that it has not been put off too long.

Trade and Peace

This week the House of Representatives is debating the extension of the Trade Agreements Act. The final vote on the Act, and on any amendments which may be brought forward by the Republicans, is expected to take place on Thursday. If the vote follows strictly party lines, as it did in the Ways and Means Committee, it will be close, for there are 221 Democrats to 209 Republicans, with 4 members independent of either party. While it is true that the defection of a small number of Democrats might make possible the crippling of the Act by providing that agreements must be submitted to a Congressional veto, such action is becoming more remote in view of the powerful, and at times unexpected support the Act has been receiving. The US Chamber of Commerce last week passed a resolution calling for renewal of the Act, and even Mr Harrison Spangler, Chairman of the Republican National Committee, has given it a qualified blessing. Mr. Sumner Welles continued his campaign in a speech at Toledo in which he argued that the decision on trade agreements was in effect a decision for economic peace or for trade war, and that it was of crucial importance to all living Americans, and generations yet unborn, that the principle of economic co-operation be upheld. The opposition has apparently been unable to produce any new reasons for amending the Act other than the recurrent desire to clip the wings of executive freedom.

War Production

Mr Nelson's ninth report on war production showed an increase of 165 per cent in munitions production over March a year ago, although the quarter's output is only 18 per cent of that scheduled for the year 1943 as a whole. If this year's goals are to be met, the average output of future quarters will have to be half as large again as in the first three months. Mr Nelson pointed out that the very great gains of last year could not be repeated, and that the necessary increase would have to be brought about through more ingenuity in the use of substitutes for steel, and in meeting the shortage of skilled labour by adapting machines to replace hands, and in more training of women. Scheduling of production was beginning to show results, but here too he felt that more might be done to improve the control of materials and reduce dislocation in shifting from one type of production to another. One step which has been taken and may have to be extended is an order forbidding manufacturers from placing orders for materials with more than one producer. Presumably in the interests of better distribution the manufacturer will be willing to accept being "tied" to a supplier, although the American consumer is as yet unwilling to see this curtailment of his freedom. Mr Nelson's report was not pessimistic, however. New records were made in March, particularly in the production of planes and of Liberty ships. It is noteworthy that the Truman Committee, which is usually chary of praise, in a recent statement congratulated Mr Nelson on his success in scheduling and in the allocation of critical materials, although it urged that he be given—and exercise—more authority over his subordinates.

THE WORLD OVERSEAS

Laval and After

(By a Correspondent)

DURING the last few months, the attention of Frenchmen outside France has centred on the military and political developments in North Africa. The protracted and somewhat intricate negotiations between General de Gaulle and General Giraud have figured in the headlines almost daily; compared with these the internal developments in France itself have almost faded into insignificance. Yet it is in Metropolitan France, and not in its colonial possessions, that the future of France will ultimately be shaped. Now, when the French African Empire has been definitely freed from the Axis, the political outlook in France itself has come to the fore again.

Towards the end of its third year, the *Révolution Nationale* shows unmistakable symptoms of exhaustion. It started with the avowed purpose of replacing the Third Republic, as a regime of national rebirth after a military disaster. Instead, it has proved to be merely the reflection of the military collapse in the sphere of politics. Even the most ardent prophets of the *Révolution Nationale* must be aware by now that the regime which they had proclaimed a new era of French renaissance is only a transient armistice regime, and that in order to perpetuate it the armistice itself should first be perpetuated.

The failure of the Vichy regime has been due to its inability to rally a genuine social and political mass movement around it. True, the legend of the "victor of Verdun" exercised an overwhelming influence immediately after the collapse. But this was not the "dynamic" legend of a Fascist demagogue, Pétain's was a legend which, at its best, inspired only passive confidence and apathy. Betrayed by some of the traditional politicians and frustrated by others, the mass of Frenchmen in 1940-41 believed that Pétain would neither betray nor disappoint them. He was the "conscience of the nation" and a reliable trustee for the whole of France. The *Français moyen* instinctively invested Pétain with all those lofty qualities which had to be concentrated in somebody in order that an excuse for the nation's own helplessness and stupor might be provided. But helplessness and apathy are not the stuff of which a revolution is made, not even a *Révolution Nationale*. This was in any case not the political background of National Socialism or Fascism.

No Fascist Movement

The attempts to stir dynamic Fascist movements in France were made by several would-be leaders—by Doriot, Deloncle, Déat. But all these attempts have ended in a fiasco, which has recently been emphasised by Doriot's retirement from the political stage (Deloncle disappeared mysteriously some time ago). If anybody in France possessed the qualities essential for a Fascist leader, then it was surely the former mayor of St. Antoine. Like Mussolini, he had behind him the past of an ultra-Left demagogue; like Hitler he was the born plebeian, able to fan the worst instincts of blind despair in the masses. He failed, not because of his individual "shortcomings," nor even because of Laval's shrewd intrigues, but because the political conditions had not favoured the growth of a vigorous Fascist movement within the framework of the armistice regime. Fascism and National Socialism at least exploited the feelings of national pride. Hitler and Mussolini preached aggrandisement or revenge. All that Deloncle or Doriot or Déat could do in Pétain's France was to stifle popular feelings of pride and to preach capitulation. The atmosphere of nationalist exaltation was entirely absent; and the seed of the *Parti Unique* was killed by the cold breath of national humiliation. The Germans have drawn their conclusions from this. They have dropped Doriot—because he could not deliver the goods—in favour of Laval.

This is the fundamental fact which cannot be glossed over in any political calculations bearing on the future of France. No genuine Fascist mass movement has developed inside France since the collapse of the French parliamentary democracy in 1940. The Third Republic has been temporarily replaced, not by any *Révolution Nationale*,

but by Laval's undisguised police state. Apart from some groups of the French bureaucracy, no section of the French nation has any vested interest in the Vichy regime. For the mass of the bourgeoisie, this regime has meant impoverishment and degradation. Big business has used it as a cover for its opportunist interests; and, as the events in North Africa have shown, it will have few scruples in dissociating itself from Vichy in favour of any other political set-up which will leave property intact. To the peasantry, Pétain and Laval could offer only empty physiocratic flatteries, coupled with requisitioning; and, to the workers, low wages, high prices, compulsory labour and the *relève*.

Laval, endowed with the Marshal's blessings, moves almost alone on the political stage. As the head of the Government, he is at the same time his own Minister of Foreign Affairs and Minister of Interior (i.e., Chief of the Police), and his own Minister of Propaganda. The vacuum around him is growing with every reshuffling of the administration. Only recently, he had to part with two such pillars of Vichy as Marion, the Minister of Propaganda, and Joseph Barthélemy, the Keeper of the Seals and the Minister of Justice. Marion, Doriot's associate, was no longer able to act as the mouthpiece; and Barthélemy, the Sièyès of the *Révolution Nationale*, was no longer able to look after the legalistic respectability of Vichy. Some of those who had hailed the *Révolution Nationale* in 1940 have, in the meantime, taken in North Africa a new oath of allegiance to the Republic; others, like de la Rocque, have travelled from the Vichy couloirs to the prison cells—even Laval's "revolution" devours its own children.

Under any normal, though not necessarily democratic, conditions a regime so isolated could hardly survive in France more than a few months. Laval knows this when he says:

Am I popular? Is anybody popular when he hunts down Bolshevism, the black market, Anglomania? If you were popular, it would be because you were not doing your duty. . . .

But it is not Laval's self-advertised delight in unpopularity that keeps him in power. It is not even his police or his Militias. It is the presence of the enemy on French soil. The recent events in Haute Savoie again demonstrated how little benefit can, under present conditions, be expected from sporadic revolts of Frenchmen, who single-handed try to challenge the joint forces of Laval's police, the Gestapo and the Wehrmacht. The resistance to the *relève* has, therefore, had only a limited success. Many workers hide in the countryside; engineers evade the *relève* by hiring themselves as lumber-jacks. But, in spite of this, more than half a million French workers were transferred to Germany towards the end of last March; and, since then, the transfer has been reported to be proceeding at the rate of 40,000 workers a week. Sauckel has thus been achieving two objectives at one stroke; he has been supplying labour to the German war industries, and at the same time denuding France of its manpower, and thus destroying French military potential for the moment of an Allied invasion. Together with the prisoners of war, at least two million Frenchmen have been removed to Germany; and the figure may rise even higher.

Founded 1835

48 Gracechurch Street, London, E.C.3

Vichy's Police

The *relève* has understandably been the main issue in French internal policy during the past half year. The man-hunting has been done by Vichy's gendarmerie and police. After the various purges in its personnel which have taken place since 1940, the police has been reduced to a ruthless tool of collaborationist policy. In this, France is not alone among the occupied countries; almost everywhere in occupied Europe, the old police forces, with a few remarkable exceptions, have been used against the interests of their own nations. In the case of France, the problem is perhaps aggravated by the illusory sovereignty of Vichy and of its administration. Vichy's police has, perhaps, more than any other similar body in Europe, worked for the Germans almost of its own accord, without the direct supervision or assistance of the Gestapo.

It is not difficult to see the corollary to this. In North Africa, the wish to preserve the continuous functioning of the established administration played, for various reasons, an important part in Allied policy. But it seems fairly clear that the North African pattern ought to be inapplicable on the Continent. Allied policy will surely make it quite clear that in the future it will not sacrifice the interests of the French people to the dubious considerations of legal or administrative continuity.

Axis Economics

[BY A CORRESPONDENT]

May 11th

FOR many years, there has been a striking similarity between the general direction of economic activities in Germany and Italy. The popular assumption that Germany rules Italy like Belgium or Holland is not borne out by the scanty information that is available about Italy's economy. There were periods when Fascist Italy was definitely ahead of Nazi Germany in the application of methods of economic control and planning. The same principles have been used, however, against a very different background, and in certain respects with different results. Under conditions of a Continental blockade the two countries have become to some extent complementary. The superior weight and range of Germany's industry makes itself increasingly felt almost proportionately to the growing threat of an invasion of Italy. The main principle of economic relations between Germany and Italy since the beginning of this war has been the equalisation of economic resources in the widest sense of the word. Italian manpower, foodstuffs, silk, sulphur and mercury have been as important for Germany as German coal and steel for Italy. There is, however, the difference that the resources of the conquered countries were mainly used by Germany. This is clearly shown by the fact that Italy's trade agreements with German-occupied countries are usually concluded in Berlin.

Since last winter, the economic relations between the two countries show many changes which, at first sight, look like Italian concessions to peremptory German demands. Yet there is a striking instance which could be interpreted as a German concession to an Italian demand. Germany and Italy concluded an agreement that unskilled Italian workers should return to Italy, whereas more Italian skilled workers should go to Germany. This agreement, which has been stated only in the most general terms, marks the end of surplus manpower in Italy. Military losses and the greater demands of a detailed cultivation plan for Italy's agriculture have created a serious manpower problem in Italy, where only a short time ago the textile industry worked on a short-time basis. For the first time, the general line of the battle for agricultural production has been extended to a rigid plan fixing the cultivation for each farm in detail. As in Germany, the greater part of agricultural products receive considerable state subsidies. The interdependence of the two countries is obvious in this new plan, which aims mainly at the extension of the area under cereals, maize, potatoes, pulse and oilseeds. Both Italian and German sources state that at one time Germany supplied some wheat and potatoes to Italy, which certainly cannot be repeated. As in Germany, self-sufficiency in staple foods has never been achieved. The surplus of vegetables and fruit is no substitute for cereals, and is still being exported to Germany.

In March, it seemed that Italy followed, under German pressure, the policy of so-called total mobilisation by extending compulsory labour. But it is interesting that com-

pulsory labour was already more extensively used than in Germany. At the end of last year, 5,245,800 workers, of whom 1,247,600 were women, already worked under conditions of compulsory labour. This is a very high percentage of Italy's total labour force, and is explained by the fact that during the course of the war the compulsory labour law was summarily applied to factories as well as to single workers.

In industry, German capital interests are undoubtedly great in the mining industry, and there are numerous companies, new and old, in other industries where German interests amount to 49 per cent of the share capital. A typical instance is the recently founded "Italo-Tedesca Tobacco" company. The atmosphere of equality is even more strongly shown in the exploitation of vital mineral resources by the Axis in South European countries, where the third country is frequently given a share in the capital of the exploiting company. An example is the "German-Italian Mur Mineral Oil Industry," which is domiciled in Budapest. The actual founders are the German-Hungarian Oil Company "Manat" and the Italian AGIP. Three Germans, three Italians, and two Hungarians form the board of directors. The German "Suedosi Europa" Society founded in combination with Italian firms a company for the cultivation of silkworms in Greece. At the same time, Italian textile companies, as well as the concern "Montecatini," have been given spheres of interest in the Balkan countries. It is quite obvious that recent decrees for the improvement in Italy's mining industry needed no special prompting by the Germans. Greater mining output is as much in the direct interest of Italy's autarky as of Germany's.

The equalisation of the resources of the two countries goes even further. The Montecatini concern, which owns an electric grid system, intends to link it up with the German grid system. Germans definitely dominate the scene of economic activity where it is dependent on German machinery. The refrigerator plants for vegetable and fruit, for example, in Italy are entirely in German hands, which also means control over the marketing of these products.

A decisive point is, however, that the Italian administration is as well experienced in central state control as the Germans. It is obvious that the Germans could only dominate the entire economy if the political administration had become a branch of the German administration. But this has not happened. As a politician, Mussolini is undoubtedly superior to Hitler. The impression of absolute German domination has been created by the fact that the highly centralised German industry was much more easily turned into a centrally planned economy than the Italian economy which differs so greatly from one region of the country to another.

The most striking difference, which is at the same time a threat to the relative stability of economic relations between Germany and Italy, is that the control of prices, finances and the markets is less effective in Italy. The price and wages stop, and rationing are as rigidly applied as in Germany. Yet the great differences between the different regions, the greater exhaustion of the resources and the overgrown bureaucracy in the state and party organisations prevent an effective co-ordination, in spite of the attempts made by the Inter-Ministerial Committee for Supplies and Price Control. Since the beginning of the war, prices of the most essential commodities have risen by at least 50 per cent. Clothing and footwear prices show a much greater rise, and have become prohibitive for the majority of the population. Black market activities are undeniable, and could not be prevented because of the largely agricultural character of the country. The price situation made it necessary to raise wages, and this is done characteristically by promising a kind of premium to all workers.

The most disconcerting sign in the Italian economy is, however, that Italy among all belligerent countries covers the smallest part of total expenditure by taxation, that is to say, less than 30 per cent. The annual deficits in the budgets are large, and are covered by issuing Treasury bonds. On paper, taxes have been increased in the main by war surcharges, but the methods of assessment and the collection of taxes are extraordinarily inefficient. Although most of the companies, with the exception of the great armament concerns, report difficulties in production and a general decline, profits are nominally very high. Dividends from 10 to 15 per cent are not infrequent. By nominal capital increases, companies evaded taxation until a decree introduced a 20 per cent tax on all capital increases. By fixing import and export prices in the trade with Germany, some stability in price relations is still secured. In Italy itself, the rise in prices automatically effects a reduction in the consumption of the masses, which could not be done by the necessarily imperfect system of rationing.

Copy for Directors of
REPORT ON COMPANY'S BOILER PLANT
by
THE ADVISORY ENGINEERS OF
The Ministry of Fuel and Power

PLANT SURVEY

Four hand-fired Lancashire Boilers are installed, with steam jet forced draught grates.

The CO₂ indicator, according to the Engineer, never had worked, was no good, and never would work. On inspection it was found that the instrument could quite easily be repaired in the workshop.

The boiler attendant was evidently inexperienced. The boiler fired only at long and irregular intervals

The fire was patchy and the back ends of the grates were thin. The steam jets were on full boiler pressure!

Draught control was stated to be carried out on the boiler dampers. To do this, the attendant had to climb a ladder, walk across the top of the boilers, and operate the usual weight and pulley arrangement. In our opinion, this was seldom, if ever, carried out.

The brickwork was deplorably leaky. The maximum CO₂ obtainable in any side flue was 5% (instead of 10% to 12%). Short circuiting was resulting in side-flue temperatures as high as 830°

The only good features associated with this Plant were that it was free from steam leakages and that the pipe lines were well insulated

CONCLUSION

Two or three further visits will be necessary; the necessary draught control provided, and operation established on sound lines.

It is our considered view that consumption can be cut by something like 15%.

(Signed) J. Jones
N. Clark

We squeeze to save

FROM every ton of coal used by the Gas Industry, no less than half a ton of coke remains after the gas is extracted. Not only coke, but many other valuable materials are obtained in making gas. Tar, for instance, which forms the basis of more than 2,000 substances, from life-saving drugs to the metal-replacing plastics for tank and aeroplane equipment. Benzole, another vital by-product of gas-making, is our only home-produced source of aviation spirit; while the ammonia and sulphur by-products provide the nation with explosives, fertilisers and valuable industrial acids. The Gas Industry squeezes all there is of value out of coal.

Why, then, is the public asked to save Gas? Surely, more gas means more by-products? True, but gas-making plant is not elastic. Gas must be saved by domestic users so it can be diverted to war factories where it is needed most.

Portugal Looks Ahead

[FROM OUR LISBON CORRESPONDENT]

ALTHOUGH no official comment on the monetary proposals of Keynes and Morgenthau has as yet appeared, their simultaneous publication, coupled with the explicit statement that invitations to discussion will be sent to the United Nations, has caused much talk, and some uneasiness, in Portuguese financial and commercial circles. At the moment, Portugal is well in credit, both in Great Britain and the United States. Gold held for the account of the Bank of Portugal is also considerable, and with the Axis clearing system, as well as with Spain, the country is, on paper, a creditor. Therefore, say the optimists, there is no reason for alarm; the war is not over and everything points to the further growth of Portuguese credits held in hard cash or first-class bank paper abroad.

To this, the cautious reply that the war may cease in Europe at any time. If this occurs at short notice, it means cutting the bottom out of Portugal's present export trade and the inrush of large quantities of imports. Such a *bouleversement* of present-day conditions might well have rapidly disastrous reactions on both the bond market and the real estate market, and would be particularly devastating to the latter, where prices have been pushed up madly during the past twelve months. Therefore, it is argued, now and not later is the moment for Portugal to be associated openly and directly with any course of discussion that may be outlined; it should intimate its willingness to share in such plans as may be devised for the stability of capital and the expansion of international trade. Portugal's own standard of living is admitted by its legislators to be low in comparison with other countries of Europe. Hence the Portuguese market is capable of great expansion. Portugal has no reason to pay lip service even to the illusions of the Axis "New Order," and, even if the

Axis debts have to be written off as a dead loss, that would be nothing compared with the cumulative benefit to be gained from making a firm stand financially on the platform of the United Nations. This, it should be repeated, is but the view of private individuals. But it is widely held.

Shorter Notice

"The Theory and Practice of Central Banking 1797-1913." By E. Victor Morgan. Cambridge Studies in Economic History. 252 pages. Price 15s.

This is a valuable addition to the growing but still small number of serious studies of banking theory and practice in this country during the nineteenth century. Mr Morgan traces the development of central banking theory and practice in this country from the Bank restriction period to the eve of the 1914-18 war. He has diligently searched every source of information on this subject, save, of course, those very reticent internal sources which it is to be hoped are now yielding their secrets to Dr Clapham engaged on his history to mark the centenary of the Bank Act of 1844. Mr Morgan provides an admirable description of the economic environment in which central banking policy developed during this period, and of the growing consciousness by the Bank of England itself of the rôle it should play both in the domestic credit structure and within the wider framework of national monetary policy. How gradual and chequered was that process of education is shown by the fact that, while in 1811 Thornton was discussing the frictions and difficulties that would attend business adjustments to a falling circulation, in 1866, a director of the Bank could still accuse *The Economist* of having put forth "the most mischievous doctrine ever broached in the monetary or banking world in this country" because this paper had commended the policy of liberal lending policy by the central bank during the crisis of that year.

Russia at War

The Third Summer

THE victorious conclusion of the North African campaign has been greeted by the Soviet press and radio with a cheerfulness reminiscent of the spirit that reigned after the victory of Stalingrad. "Africa is finished, the battle has now swung to the gates of Europe," was the typical comment of *Red Star*, the paper of the Red Army. Naturally enough, the press stresses the part which the winter campaign in Russia played in weakening the military strength of Germany and thus facilitating the Allied victories. *Pravda* wrote:

The blow which the Red Army inflicted on the enemy in the east is now, for the first time during the war, merged with the blow inflicted on the German fascist invaders by our Allies.

The conclusion of the African campaign has—to judge by the tone of press comments—done very much to strengthen "Allied mindedness" in Russia. This has also been shown in articles devoted to the position on the Russian front itself, in which the deliveries of arms from the Allies have frequently been mentioned. Military writers have stressed the need for a quick and correct distribution of Allied supplies and weapons throughout the fighting fronts.

Stalin's May Day Order has been followed by a spate of didactic articles and appeals to the Army, calling it to prepare thoroughly for the impending campaign. The tone of those appeals is very confident. The war industries, it is said, have worked intensively throughout the winter, and the Army is now amply supplied with all kinds of perfected weapons, and especially with swift aircraft and powerful tanks. Even the customary warnings against undue optimism have been worded somewhat less categorically than they were some time ago; and only limited German offensive thrusts seem to be anticipated.

The enemy is not yet smashed. Stubborn and fierce battles lie ahead against an enemy who is still strong. It is possible that on some sectors our units will have to wage defensive battles. No matter how the situation may develop on one sector or another, they must not for one minute lose faith in victory.

Some idea of the energy with which the preparations for a third summer campaign are being made has been provided by the Government's decree of April 15th, which

introduced martial law on the railways. The official explanation gave a warm appreciation of the devoted work performed by the overwhelming majority of Soviet railwaymen. But some groups of railwaymen, it seems, have lately been slack and irresponsible. This has tended to disorganise railway transport at a time when the fighting fronts are more than ever dependent on quick and regular deliveries. On May 10th, the decree of martial law was extended to marine and river traffic, which has this year started earlier than usual, and is expected to relieve the pressure on the railways. The transport position this year is not easy, because of the heavy wear and tear of rolling stock and the extremely low rate of replacement. Yet, in view of the unexpectedly good performance of the Soviet transport system during the past two years, there is no reason to suppose that transport will not be able fully to cope with its task this year. The introduction of martial law is probably intended to forestall rather than to undo a deterioration in traffic.

In this stern pre-campaigning atmosphere the Soviet-Polish conflict, after a few days during which it stood in the centre of attention, has been relegated to the background. The conflict has not petered out. Soon after M. Vyshinsky's statement to the foreign press, it was announced that the Council of the People's Commissars had authorised the Society of Polish Patriots to organise a Polish division which will fight side by side with the Red Army. The commander of that division is Colonel Bering, a former colonel of the Polish Army.

The formation of that division was acclaimed at the third Pan-Slav conference which met some days ago. This was the third conference of the kind; at the first in 1941, the Poles participated officially and played a leading part. At the second, in 1942, they were absent. This time the members of the Union of Polish Patriots spoke on behalf of Poland and attacked the non-Communist Poles very violently ("Death to the traitors"), although General Sikorski personally was spared. This may perhaps indicate that the Soviets are still careful to leave the door open for negotiations. The Czech representatives at the conference were accorded a very warm welcome. Delegates from the Yugoslav guerillas, as well as Bulgarians, took part in the meetings. The manifesto issued by the conference calls in the name of Slav solidarity all the Slav peoples to immediate armed struggle against the Axis.

THE BUSINESS WORLD

The Future of Industrial Assurance

THE decision of the Government that, with the main proposals of the Beveridge Report, it will have too much on hand to contemplate the nationalisation of industrial assurance throws back on the industry itself the task of remedying its defects. Chief among these is the large cost to the public at which the business is conducted. This feature is likely to be aggravated by two changes which have actually been decided upon, namely, the institution of a universal death grant and the abolition of the approved society system of National Health Insurance. The former will involve the cancellation of a large number of the voluntary funeral benefit policies at present in force, with consequent spreading of fixed operating costs over a smaller volume of premiums; the latter, by taking away a part of the collectors' incomes which the offices may find it necessary to make good in other ways, will also tend to raise costs, but this will be mitigated if the industrial approved societies are retained as agents for the new scheme. In any case, the changes envisaged make the need for rationalisation all the more urgent.

At present, the business is transacted by 14 proprietary and mutual companies and 146 collecting societies; the companies are responsible for four-fifths of the total volume, against only one-fifth for the large number of societies, but not all of the societies are small. The accompanying table, compiled from Appendix D of the Beveridge Report, exhibits the present structure of the business by comparison with the position a quarter of a century ago. The mean annual premium income, expenses of management and dividends to shareholders for the six years 1912-17, and four years 1937-40, are shown, together with the mean annual income-tax in 1937-40, corresponding figures for the earlier period not being available. The fifteen offices treated individually are arranged in order of economy of management, i.e., ratio of management expenses to premium income, in 1937-40. Apart from the very rapid growth of the industry as a whole, the most striking feature of the table is probably the greatly improved working efficiency of the *Prudential*, an improvement known to be chiefly associated with the introduction of the block system of representation, which eliminates overlapping by making one agent solely responsible for each block of streets; that the improvement has been effected while maintaining a good standard of remuneration for the collectors is shown by the figures given in Appendix D of the Report. Under the lead of the *Prudential*, the proprietary companies in

general have made substantial reductions in cost ratios, while the collecting societies have improved but little—even the large societies operating on a country-wide basis—but the resulting competitive advantage is largely negated by dividends to shareholders and income-tax. Nevertheless, the *Prudential* and *Refuge*, with combined expense, dividend and income-tax ratios of 32.9 per cent and 35.7 per cent respectively, both possess a marked superiority over the most efficient of the collecting societies, the *Royal Liver*, with a cost ratio of 39.3 per cent. The *Co-operative*, with a cost ratio of 33.1 per cent, is in a category on its own, deriving its income from members of the Co-operative Movement, and enjoying special facilities for this purpose.

It might have been expected that these variations in working costs, with resultant differences in the benefits available for policyholders, would have led to a concentration of business in the hands of the more efficient offices; but as the third column of the table shows, this has not been the case. On the contrary, some of the offices with very high expenses have made rapid headway, and the *Prudential*, whose business has grown 2.8 times, has actually lost ground in relation to the business as a whole, which has grown 3.3 times. To some extent high rates of growth and high expense ratios may be linked as cause and effect, because of the heavy outlays on new business expenses. But this cannot be a full explanation of the apparent breakdown in the working of competitive forces. One important consideration, often emphasised by the offices themselves, is that life assurance is "sold and not bought." The prospective purchaser of life assurance does not, in general, make careful comparisons between offices before making his decision; had this been otherwise, the *Prudential*—which gives better terms than almost any other office in respect of forfeiture, does not demand an absolute warranty of health in proposals for life-of-another policies, as most of the other offices do, and alone of the large companies' guarantees to its policyholders, by its articles of association, a share of profits—would have tended to drive its rivals from the field. It is one of the ironies of the present situation that an office like the *Prudential*, which has made a real effort to meet criticisms of overselling in the Parmoor and Cohen reports by converting the basis of remuneration of its agents to fixed salaries, independent of the volume of new business procured, should thereby have yielded ground to its competitors which have continued the old methods.

But the crux of the matter goes rather deeper. By passing

NOTES.—(a) The offices are arranged in order of their expense ratios in 1937-40—column 7 of table.
(b) The Co-operative is a company registered, not under the Companies Acts, but under the Industrial and Provident Societies Acts, and has a small paid-up capital on which is based a limited dividend. This dividend does not come from the Industrial Branch.
(c) The Wesleyan and General distributes surpluses in the Industrial Branch not only among industrial policy-holders, but in part also among the holders of Ordinary Branch policies participating in profits; this increases the expenses in 1937-40 from 40.5 per cent. to 42.0 per cent.

on to consumers the benefit of their reduced costs in the indirect form of higher bonuses and improved policy conditions, instead of by a direct reduction in rates of premiums, the high-efficiency offices have failed to press home their competitive advantage. As the Cohen Committee observed, "it is doubtful whether the expectation of bonus makes any strong appeal to the classes from which industrial policyholders are drawn." Bonuses take various forms, and comparisons between the offices are not easy; on the other hand, even the least initiated can understand differences in the amount of contractual sum assured obtainable for each penny of premium. The Cohen Report contained a clear recommendation to the *Prudential* to increase the contractual sums assured even at the cost of a reduction in bonuses, and had this advice been followed the business would surely be in a healthier state now. A competitive system cannot be expected to function unless the rules of the game are adhered to, and lower costs reflected in lower prices to consumers.

Admittedly, such a rate-reduction policy could not have been adopted without risks for the shareholders. But the taking of risk is the essence of private enterprise, and the only justification for the making of profits. Life assurance can be conducted in one of two ways, either on a without-profits or a with-profits basis. In the former case it is a highly hazardous undertaking; it is a long-term contract which cannot be terminated by the office, and in which the factors entering into the premium calculation—rates of mortality, interest return, income tax and expenses—are subject to wide fluctuations in the course of years. In such circumstances the shareholders are fully entitled to all the profits, for there will also be periods of loss; almost certainly the ordinary life offices are transacting their business at a loss at the present time. But if the business is undertaken on with-profits lines, practically the whole of the risk is borne by the policyholders, as is shown by the suspension or severe curtailment of bonuses during the war, and this being so the policyholders are entitled to nearly all the profits when profits are made. This is recognised by the ordinary proprietary offices in allocating from the profits on participating contracts only very small sums to shareholders. The industrial offices, on the other hand, have wanted the best of both worlds. They have offered their policyholders no choice between with- and without-profits policies; they have organised their business on a basis of "riskless enterprise," and yet have taken from it large sums as profits for shareholders. Such a state of affairs is fundamentally unsound.

In the light of this record, it would not have been easy for private enterprise to answer the case for transfer of the business to a State Board, had the Government felt able to undertake the complicated problem involved. It seems reasonable to assume that in the hands of a monopoly, and organised on the block system, the working costs over the whole field could be reduced to the management expense ratio of the *Prudential*, and probably lower, even allowing for the fact that the *Prudential* has a higher proportion of monthly business than the other offices. Moreover, there is little justification for policyholders being saddled with the cost of dividends to shareholders, since the business is conducted on lines carrying a minimum of risk. Nationalisation would tend to reduce overselling and improve the lapse

ratio, but too much should not be made of this; experience under a State scheme in Japan shows very high lapse ratios. The lapse problem can best be overcome by improving the underlying economic stability of the worker, and it is to be hoped that the main provisions of the Beveridge Plan will help in this direction.

If there is a case for nationalisation, there are at least some disadvantages in travelling that road. The working-class public, among whom the practice of industrial assurance is widespread, are not likely to appreciate the elimination of the free choice of insurer; in other businesses wartime experience of being tied to one source of supply has not been happy, and it is difficult to believe that under a system of monopoly the collectors would have the same incentive to please their clientele as at present. It is true, as the Beveridge Report points out, that insurance is a long-term contract, and having once made the purchase, the source of supply for that purchase cannot be changed; against this it must be remembered that it is the practice of the working classes to buy their life assurance in small quantities, increasing it as circumstances permit, and that, in any case, the mere existence of a competitor is a spur to effort. Another point is that a State Board would necessarily follow a very restricted investment policy, with consequent adverse effects on the rate of interest earned on policyholders' funds, and on the capital market generally. There is also to be considered the effect which nationalisation would have on the business of the offices in other departments, including, in the case of the *Prudential* and *Pearl*, the not unimportant overseas accounts. Finally, compensation to shareholders and to agents owning "books" would involve the Exchequer in substantial outlay.

Nevertheless, eventual nationalisation seems a certainty unless the industry can put its house in order in the interval which must elapse before it again becomes the subject of official enquiry. An indispensable condition of progress is a programme of rationalisation into a small number of efficient units. The difficulties are formidable—not least among them the problem of book interest—but should not be insuperable if tackled in a spirit of determination. A possible solution might be a consolidation of the offices working for private profit (excluding the *Prudential*) on the one hand, and of the collecting societies and mutual companies—probably more firmly wedded to the book interest system, and less capable of divorcing themselves from it, than the proprietary companies—on the other, forming, with the *Prudential*, three groups of approximately equal size. This would reduce selling competition to reasonable proportions, and make possible substantial economies; the released staff would almost certainly be needed by the Government for the administration of its social security plan. The *Prudential*, which has already done much to bring industrial assurance up to the standard of ordinary assurance, could best contribute to the general reorganisation by introducing straight without-profits policies as an alternative to participating contracts, a measure which the other groups would be obliged by competition to follow. Undoubtedly without-profits assurances would be of greater value to most members of the working-classes than policies carrying hopes of bonus which may or may not materialise, and the substitution in large measure of price-competition for sales-competition could not but have a healthy influence over the business as a whole.

Finance and Banking

Discount Market Consolidation

Considerable interest has been evoked in the discount market this week by the publication of Cater Brightwen's balance-sheet as on April 30th last. The balance-sheet total of this private firm has risen over the year from £36,694,000 to £46,590,000, and is now well within striking distance of that of Alexanders Discount, the smallest of the three discount companies. The time has definitely arrived when reference to the big units in the discount market will have to apply to the "big four" and no longer to the "big three." The main expansion in the firm's assets has been in bills, which have risen from £25,304,000 to £32,983,000. The accompanying increase from £3,686,000 to £4,473,000 in the liability for bills rediscounted indicates that this firm has handled a larger volume of commercial paper. The investments have risen from £10,422,000 to £12,372,000, and in the balance sheet they are shown in exemplary detail.

The position in the money market has shown little change this week, though the superabundance of credit which was in evidence last week has disappeared. The market had again an exceptional amount of Treasury bills to take up, receiving an allotment of 36 per cent on the £90 million of bills that were offered for tender last week. The banks have been fair buyers, but not on the scale that would seem suggested by the exceptionally low level to which their bill portfolios had fallen last month. The banks plead the heaviness of their net Treasury deposit payments as the main excuse for their rather hesitant purchases of bills. This week they had to pay over £50 million against nominal TDR maturities of £30 million and slightly smaller effective maturities. The Bank return reflects the slightly more usable credit conditions experienced this week in a fall of £22,004,000 in bankers' deposits. To the extent of £17 million this is due to the building up of public

deposits from the subnormal level of £3,733,000 to which they had fallen in the previous week. The credit base has also been contracted by a fall of £4,756,000 in Other Securities.

Clearing Banks in April

The April clearing banks' returns reveal little net change in the volume of credit outstanding. Deposits are up by £3,183,000 on the month, but as cheques in course of collection and transit items show a concurrent drop of £18,191,000, it follows that the true expansion of credit over the month has been nearly seven times greater than the diminutive movement shown by the rise in deposits. Changes in assets are of considerable magnitude. The most important, from the banks' point of view, is the further drop of £20,235,000 in loans and advances. At £756,390,000, this item, the most remunerative of the banks' assets, is £254 million lower than in the first month of the war—since when total deposits have risen by £1,303 million. The latest drop in advances is accompanied by a rise of

(In £ millions)

Total assets	3,321.1	3,864.2	3,813.3	3,762.3	3,776.4	3,780.2

£4,361,000 in investments, no doubt representing the banks' continued participation in local Wings for Victory weeks. There have been exceptional movements in floating assets, a rise of £80 million in TDR's being accompanied by a fall of £44,053,000 in bills discounted. This last movement may be wholly attributed to the smaller purchases of Treasury bills and has reduced the bill portfolio to the lowest figure since February, 1942. The bill famine indicated by this exceptional drop in discounts derives largely from the increased competition for bills made available through the weekly tenders. The position is in process of being remedied by the increase to £90 million in the weekly amounts of Treasury bills offered through the tender.

Banking in India

The report of the National Bank of India for the year 1942 provides an interesting picture of the banking situation in that country. Since the bank had only two offices in territory now occupied by the enemy the changes in its balance sheet figures are not so much affected by this factor as is the case with other Eastern exchange banks. Some reflection of the measure of inflation in India is provided by the rise in deposits from £39,696,000 to £48,513,000, but this is only a faint echo of the concurrent expansion in the note circulation which over the year 1942 rose by 80 per cent. This exceptional increase in the circulation, and the corresponding stimulus which has been given to hoarding of precious metals and speculation in commodities, lend particular interest to the recent growth of indigenous banking institutions in India. The chairman of the National Bank of India in his statement accompanying the report points out that the establishment of a considerable number of indigenous banks has been an outstanding feature of the past few months. He adds that some of the banks, judged by the amount of capital with which they have been launched, are likely to become important institutions. The increase in resources at the disposal of the National Bank of India has, unfortunately, not been accompanied by a corresponding movement in the demand for commercial banking facilities. Loans and commercial discounts have fallen over the year from

£9,053,000 to £6,190,000, while there have been considerable increases in the holdings of cash, Government securities and Treasury bills. These changes are likely to prove the pattern to which most Eastern banking reports will conform.

The Dollar in Switzerland

Details of the restrictions which apply to dealings in US dollars by the Swiss National Bank are given in the report of that institution, covering operations for the year 1942. These restrictions arise from the immobilisation of Swiss, together with all Continental, assets in the United States. Switzerland has made repeated efforts to obtain greater liberty in its dollar payments, but the position has if anything become increasingly difficult. The National Bank has, in consequence, had to apply fairly rigid restrictions to the amount of dollars it has been prepared to buy from the local exchange market. It has restricted such purchases to the proceeds of exports and tourist trade, insurance remittances, diplomatic payments, International Red Cross transactions and sums arising out of the dollar investments of individuals whose sole source of income is represented by such investments. The National Bank refuses all US dollars representing capital transfers or investment income other than the special case already mentioned. Even with these restrictions, the dollar income of the National Bank has greatly exceeded its dollar payments, and the surplus holdings have in the main been converted into gold which remains earmarked on Swiss account in the United States. The National Bank has found it increasingly difficult to utilise its dollars in order to finance trade with other countries. This is because the external trade of Switzerland is, perforce, conducted largely with Axis and occupied countries and financed through the clearing. In 1938, only one-third of Switzerland's external trade passed through the clearing. In 1942, that proportion had risen to three-quarters. As the dollar can no longer be used as freely as before as a means of effecting international payments, gold has had to revert to its traditional role in the settlement of Swiss balances of payments. The report of the National Bank states that gold transactions between that institution and other central banks have assumed considerable proportions during the past year, Switzerland being obliged to pay in gold for merchandise imported from other countries and for transport charges. Yet, the Swiss gold holding rose during 1942 from Frs 2,700 million to Frs 3,550 million. The sales of gold made from domestically held metal to finance trade with Axis and occupied Europe have been more than made good by the fresh earmarkings of gold in the United States—an interesting instance of US gold indirectly feeding the reserves of the enemy.

Scottish Bank Notes

The views of certain Scottish bankers—on the desirability of their institutions coming into line with the Bank of England in discontinuing the issue of notes of £10 and over—which formed the basis of the note in *The Economist* of last week—were apparently overborne at a meeting of the Scottish banks held towards the end of that week. The decision then reached was to continue the issue of notes as heretofore and thus disregard the lead given by the Bank of England in this matter. The reasons advanced for this decision are many and not altogether

reconcilable. Two of them which clash somewhat are (1) that the amount of Scottish bank notes of £10 and over is so small as to be negligible; and (2) that the banks have not the paper that would be required to reissue in notes of smaller denominations the larger notes now outstanding. A more convincing argument is that the discontinuance of the issue of larger notes would seriously inconvenience the banks' customers. The closing of country branches in Scotland has greatly increased the use of currency for the transaction of business in districts now deprived of much of their previous banking facilities. This has correspondingly increased the normal and justifiable demand for notes

of larger denominations. They have come to play an unusually important role in cattle dealing and other transactions at local fairs and markets and their disappearance would undoubtedly be an inconvenience to the traders concerned. This argument certainly appears to outweigh any counterclaim that could be made regarding the nefarious work that might conceivably be done by the larger Scottish bank notes in helping infringements of official controls. The position will, however, require careful watching and if there is any indication of abnormal demand for Scottish notes of larger denominations the question will obviously have to be reconsidered.

Investment

Licensing the Accountant

At the annual meeting of the Institute of Chartered Accountants last week, the president, Mr C. J. G. Parmour, disclosed the outcome of the conversations which have been proceeding between the Institute, the Society, the Association of Certified and Corporate Accountants and the Scottish bodies of Chartered Accountants. It is, as had been suspected, a scheme to obtain Parliamentary sanction for the licensing of accountants, and it is a fair guess that only members of these bodies will be eligible for licence. The connotation of the word accountant is not clear, but it is presumably not synonymous with auditor. No details of the scheme are disclosed, but it is not intended that the existing groups shall lose their identity. *The Economist* has suggested that the accountants should put internal reconstruction ahead of application for increased official recognition. It is possible, however, that, with examples of Government conferred privilege on all sides, it is asking too much that they should defer asking for protection until the difficulties of reform have been faced. But, if that be so, Parliament must ensure that in return for the grant of privilege, the public receives full service, and that the only bars upon entry into the profession shall be those arising from the need for its members to be men of education and character.

*

As at present constituted, the profession contains members doing four different types of job calling for somewhat different qualities. Pending clarification of the scheme, only the requirements of the auditor can usefully be discussed. He is, in law, appointed by the shareholder to protect his interests. In fact, the appointment lies with the board of directors, and the powers of the auditor to influence the form of published accounts, except by moral suasion, are negligible so long as the minimum requirements of the letter of the law are obeyed. Apart from the question of what should appear in published accounts, it is eminently desirable that, while the obligation continues to rest on the directors, the auditor should be charged with the duty of seeing that, within the limits prescribed, nothing is concealed which in the public interest should be known. That is to say he becomes a servant of the public, not of any sectional interest. This will be a very responsible duty, calling for considerable qualities, and, while many accountants possess them, it is clear that the existing systems of recruitment and training must be altered. For the auditor—and indeed for the industrial accountant—a training of university standing, with post-graduate specialisation, ought to be concerted between the authorities and the accountant bodies. Staff must be provided in part by the latter and the whole business of training and examining handed over to independent educational authorities. Independence is essential to prevent undue limitation on entry into the profession. This, coupled with a system of personal interview, would provide a body of men and women to whom the increased duties could be entrusted with some confidence. Appointment of auditors might be left to a joint committee of the profession and the type of shareholders' protection panel, advocated on page 152 of *The Economist* of January 30th. But to secure the necessary numbers, and to prevent the profession becoming a closed shop, it would be necessary to dispense with the existing machinery of high premia and limitation on the numbers of trainees. Some such system, coupled with much more drastic requirements as to publication, would go far to remove the basis for

complaints against the system of privately owned joint stock companies. There are not wanting men in the movement who have advocated the educational reforms, among them Mr F. R. M. de Paula, who has a long experience in just such training for undergraduates.

British Oxygen Capital

It seems from the statement of the chairman, Mr S. J. L. Hardie, that the drain upon liquid resources of British Oxygen, mentioned in *The Economist* of May 1st, has reached a point where the consideration of obtaining new capital is necessary. There is no actual mention of a new issue, and in a different part of his speech Mr Hardie referred to Government assistance; but it seems clear that an application to raise new capital is to be made. Some light on the probable level of real earnings is cast by the statement that, since the pre-war standard years, the company has spent over £2,500,000 in capital outlays, with corresponding expenditure by subsidiaries in Australia, Africa and India. It is also stated that the depreciation of the parent company last year amounted to £418,267. This was on a new and higher basis, but it is well over 40 per cent of the disclosed profit, which is net of all charges but fees, staff pensions and income-tax. The accounts give virtually no information as to the value of either fixed assets or investments in subsidiaries, but it was made clear that a considerable proportion of plant will be either obsolete, or redundant, after the war. From the standpoint of the shareholder, this has, presumably, already been replaced out of depreciation and other reserves, and what is now contemplated is a further expansion in physical assets. There is, ignoring the wartime boom, a secular upward trend in demand for most of the company's products, and the really important question is whether the difference between the peak of wartime demand and that of peace will be fully covered by the scrapping of plant, obsolete or obsolescent, at the close of hostilities. There is no means of determining this, and Mr Hardie threw no light on the matter.

* * *

Sydney Conversion

The current year is singularly free from obligatory redemptions among corporation stocks, Home and Dominion, and even from new optional redemptions. The City of Sydney has, however, £1,000,000 of 5 per cent debentures falling due on June 1st. It is offering holders the option to convert into an equal amount of a 4 per cent stock, 1961-63, at 98 per cent. With a flat yield of £4 1s. 8d. and a return, including profit on redemption at the final date of around £4 3s. per cent, the new stock may possibly be considered reasonably attractive, although it yields only about ½ point more than can be obtained on the most recently issued Commonwealth stock. Any stock not converted will be paid off at the due date, and there is no suggestion that there is to be any offer for cash. The list for conversions will close on Thursday, May 27th. The only other compulsory redemption this year in the Dominion Corporation list appears to be some £345,000 Auckland Electric Power Board 5½ per cent debentures, repayable August 1st. There is, however, £10½ millions of 4 per cent New Zealand stock, 1943-63, which is repayable at any time on three months' notice, and a small compulsory repayment of Newfoundland for July 1st.

Company Notes

ICI Group Earnings

The preliminary statement of ICI showed a marked recovery in the profits of the parent company, after the recession of 1941, and the highest percentage earnings on the ordinary since 1939. The full accounts make it possible to fill out this picture. There is a rise in total income of a further £2,225,000, of which virtually the whole is accounted for by manufacturing and trading profits of the group, there being a small fall in revenue from associates and small rises in the amount received on other investments and on property. The consolidated income statements for the past three years are summarised in the following table:—

	Years to December 31st,		
	1940	1941	1942
Consolidated Income:—			
Trading Profits	17,883,456	18,403,870	20,616,996
Total Income	19,482,275	19,956,002	22,181,524
Debt Interest Net	184,350	178,514	192,733
Directors' Remuneration	67,877	66,610	69,169
Pensions Contributions	1,317,535	1,346,437	1,462,712
Taxation	7,385,474	8,761,554	9,720,172
Obsolescence and Depn.	3,070,414	3,045,116	3,617,399
Expenditure Written Off	1,880,724	314,312	246,134
Net Consolidated Income	6,575,901	6,243,459	6,873,205
Less:—			
Outside Interests and Undistributed Profits	337,460	261,353	373,346
Add Back:—			
Obsolescence§	2,180,092	2,180,106	2,680,106
ICI Profits	8,418,533	8,162,212	9,179,965

§ Includes Workmen's Pensions. For 1942 this figure was given only in the preliminary statement. ‡ Includes ARP £466,031.

It will be seen that almost £1,000,000 of the increase in total revenue is absorbed by higher taxation, which is now within sight of the £10 million mark, while obsolescence on an increased scale calls for a further £570,000. Lord McGowan, in his accompanying remarks, discloses that provision is being made out of revenue for a heavy bill for deferred maintenance which is additional to these appropriations. It is interesting to learn that, in addition to the efforts of overseas subsidiaries and associates, the products of the group have been exported in considerable quantities. Capital expenditure on ARP has again been charged to capital and depreciation provided, while war damage has been charged against war contingencies reserve, but maintenance of ARP and war risk premiums on stock have been deducted before reaching profits.

* * *

Increased Liquid Assets

The consolidated balance-sheet shows that the surplus, reduced in 1941 by almost £300,000, was last year increased by more than twice as much. At balance-sheet valuation, capital extensions were rather less than the net addition of £1,420,000 to obsolescence reserves, so that the net value of fixed assets is slightly down. Net liquid assets show an increase of the order of £1,000,000, but even so are still well below the 1940 level. Incidentally, there is an improvement in the statement of debtors and creditors, although a minor one. In the past the liability for final dividends has been included gross, while, it would appear, the provision for tax has also been included gross. This has meant that debtors included the amount recoverable in tax from the shareholder, although, of course, neither the payment out, nor the receipt, in fact occurred. In the accounts now presented, and summarised in the table in the next column, both items are shown net of tax on dividends for both years. The account covers 96 subsidiaries against 105 for 1941. The increase in current assets occurred mainly in holdings of Government securities and in stock-in-trade. It is regrettable that tax certificates are not stated separately and that no market value is given for gilt-edged holdings this year. It is gratifying to learn that ICI is considering a marked postwar expansion of the scientific staff, laboratory accommodation, experimental engineering shops and all branches of research work. It is high time. Unfortunately, some other aspects of Lord McGowan's remarks, dealt with on page 615, are less satisfactory.

II. IMPERIAL CHEMICAL INDUSTRIES AND SUBSIDIARIES

Consolidated Balance Sheet

	December 31st, 1941	1942
Capital Employed:—		
7% Pref. Shares	23,801,482	23,801,482
Ord. Shares	50,401,861	50,401,861
Debs. and Loans (Subsid. Cos.)	4,743,939	4,679,781
Outside Interests in Subsid. Cos.	3,677,075	3,648,223
Surplus	15,915,737	16,621,616
Total	98,540,094	99,152,963
Fixed Assets:—		
Land, Buildings, Plant, etc.	63,492,278	64,699,995
Patents, Rights, Goodwill, etc.*	15,465,335	15,436,638
	78,957,613	80,136,633
Less Obsolescence and Depreciation		
Reserves	8,669,131	10,087,262
Add Interests in Associated Cos.	8,290,116	8,245,966
Total	78,578,598	78,295,337
Net Current Assets:—		
Cash and Bills	6,501,276	6,909,201
British Government Securities	1,772,481	8,170,480
Marketable Investments	1,616,502	
Unquoted Investments	9,545	1,540,800
Stocks	26,303,070	30,353,659
Debtors	18,250,872	16,198,751
	54,453,746	63,172,891
Less Current Liabilities and Provisions		
	34,492,250	42,315,265
Total	19,961,496	20,857,626
Total Fixed and Net Current Assets	98,540,094	99,152,963

* Excess of share considerations over net tangible assets of Subsidiary Cos.

* * *

Stewarts and Lloyds Progress

Trading profits of Stewarts and Lloyds after all tax and war damage insurance increased in 1942 from £1,752,970 to £1,784,315. In addition, £265,494 against nil was received from subsidiaries out of profits earned in former years, although £85,754 was brought back from reserve in 1941. The larger part of the rise in receipts is taken in increased depreciation, for which the ordinary appropriation is raised from £581,279 to £630,183, while the reserve for special depreciation receives £250,000 against £100,000. After meeting the preference dividends, equity earnings are slightly higher at £784,256 compared with £699,727 in 1941, representing 18.3, against 16.6 per cent on the deferred shares, which again receive 12½ per cent. The previous year's transfer of £250,000 to contingencies reserve is repeated, and the carry forward raised some £200 to £193,081. The parent company's balance-sheet (there is unfortunately no consolidated statement) shows stocks some £375,000 larger at £5,158,827, while cash is more than doubled at £772,725. Last year's bank loan of £1,000,000 has been repaid, the present figure of £200,000 representing a liability, taken over from a subsidiary, which is not repayable until end 1946. A new holding of £1,000,000 of tax reserve certificates, and a reduction of over £320,000 to £4,897,031 in tax and contingency reserves help raise net liquid assets to £2,570,237 against net liabilities of £140,049 in 1941. The actual explanation of this improvement lies in the sharp change in the parent's position vis-à-vis its subsidiaries. Net loans to them in 1941 of £1,219,518 have been replaced during 1942 by a net borrowing from them of £940,490, although advances by the parent on capital account are nearly £50,000 greater at £130,000. Shares in subsidiaries have been written down some £396,000 to £4,852,768, while other shares and advances on capital account to allied and other companies stand at £1,001,137 against £847,539.
